The heavy frosts every night for the past week or so have greatly damaged our spring bee-pasture. Bees are idling about, and feel much inclined to robbing. It is hardly safe to open a hive. All the colonies are getting quite strong, in spite of the cold and backward weather, and some new swarms have been hived by bee-keepers residing in the river bottoms, where willows were plentiful. All sorts of tender crops are frozen down to the ground, such as potatoes, tomatoes and corn. Small grain crops look yellow and thin on account of the dry weather. I have been feeding my bees up to now, and will have to continue in order to keep up breeding. Our hope for a good honey season is not entirely blasted, as the white clover and basswood honey is still to be looked for in the near future.

Results of Swarming, etc.—John Boerstler, Vashon Island, Wash. Ter., on May 31, 1889, writes:

As my bees are through swarming, I will give the number of new swarms that I received this spring from 5 colonies, viz: No. 3 swarmed on April 19, 22 and 26; No. 2, on May 1; No. 7, May 8, 16 and 22; No. 4, on May 10, 14, 17 and 20; No. 5, on May 14 and 26; No. 4, on May 18; and No. 7, on May 19. As I had not hives enough for all, I put 2 swarms into one hive, and sold 2 swarms for $10. That leaves me 16 new swarms yet. I have taken out 20 pounds of honey, and there are 50 lbs. more to take out, but as I am very busy with strawberries, I will not take it out for 2 or 3 weeks yet. Bees are doing finely, and I think that Washington Territory will be a great bee-country; I am satisfied that it will pay here. I have been waiting for three years to tell what I think of bee-keeping here, and I cannot help thinking that I am right about it. I worked with bees in Illinois for 20 years. You will hear from me again in the fall, with a big crop of honey from the 5 colonies that I started with, for I am pretty sure that I will have a good report. I sold all the honey I had, at home, at 20 cents per pound, and I could sell more at present, but I am too busy to take it out of the hives.

How to Know Pures Drones.—Ira N. Lyman, St. Peter, Nebr., says:

1. I would like to know if there are any points about an Italian drone by which a person can tell a thoroughbred drone. 2. My drones are of a yellowish color on the lower part of the abdomen, the rings are dark next to the body, and there is a narrow yellow stripe at the rear of the broad, dark band. The yellow stripe is not a bright yellow, as in the workers. 3. I would like to know if the yellow part of the abdomen, next to the body, is connted as one band on the three-banded workers in the Italian race of bees. 4. How long, generally, is it after the drones make their appearance, before the bees swarm, if all things are fair for bees, and the weather is good?

[1. No; you must judge them by the workers.

2. The drones vary in color in different colonies.

3. Yes; count the yellow part next to the thorax.

4. Swarming is generally indicated by the young queen being ready to emerge—not by the drones.—Ed.]

Convention Notice.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

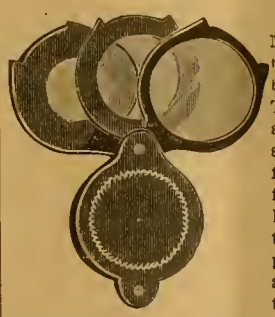
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

DORÉ ART PORTFOLIO,

PRICE, 50 CENTS,

Will be CLUBBED with the AMERICAN BEE JOURNAL, at the low price of $1.25, postpaid.

This magnificent Art Portfolio is in size just 11x14 inches, and besides a picture of Gustav Dore, the great French Artist, it contains the following beautiful engravings: Expulsion from the Garden of Eden—Entering the Ark—Noah Cursing Ham—Samson and Delilah—Ruth and Boaz—Death of Saul—The Judgment of Solomon—Daniel in the Lion's Den—Daniel Confounding the Priests of Baal—The Nativity—Christ Healing the Sick—Sermon on the Mount—The Disciples Plucking Corn on the Sabbath—Jesus Walking on the Water—The Agony in the Garden—Death of the Pale Horse. Seventeen handsome full page plates under one cover.

Scientific Queen-Rearing, as practically applied; being a method by which the best of queen-bees are reared in perfect accord with Nature's ways—by G. M. Doolittle, of Borodino, N.Y. 176 pages.

In this book Mr. Doolittle details the results of his experiments in rearing queen-bees for the past four or five years, and is the first to present his discoveries to the world. It is published in time for every progressive bee-keeper to test the various discoveries which it details, during the present season. Send all orders for the book to this office. Price, $1.00, postpaid. The usual discount to dealers in lots of 10 or more.

Hastings' Perfection Feeder.—This excellent Feeder will hold 2 quarts, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

Alfalfa Clover.—For cultivation of this honey-plant, see page 245, of 1888.—We supply the seed at the following prices:—Per lb., 22c.; per peck, $3.00; per half-bushel, $5.50; per bushel of 60 lb., $10.00. If wanted by mail, add 10 cents per pound for bag and postage.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Clover Seeds.—We are selling *Alsike Clover Seed* at the following prices: $8.00 per bushel; $2.25 per peck; 25 cents per lb. *White Clover Seed:* $10.00 per bushel; $2.75 per peck; 30 cents per lb. *Melilot or Sweet Clover Seed:* $6.00 per bushel; $1.75 per peck: 20 cents per lb.—by express or freight.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage.

Honey and Beeswax Market.

MILWAUKEE.

HONEY.—We quote : White 1-lbs., 15@16c.; 2-lbs., nominal ; dark 1-lbs., 12½@13c. Extracted, white, in tin and pails, 9½@10c.; medium, in kegs and ½-bbls., 7½@8c.; white, in kegs and ½-bbls., 8½@9c.; dark, 5@6c.

Market good for the season of year, prices firm for good qualities, and old crop is being closely sold out.

BEESWAX.—25@28c.

June 6. A. V. BISHOP, 142 W. Water St.

DETROIT.

HONEY.—Best white 1-lbs., 14@15c. Market is dull and lower, but not overstocked. Demand slow.

BEESWAX.—22@23c.

Apr. 30. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—We quote: White 1-lbs. 15@16c.; dark, 10@12c.; California white 2-lbs., 11@12c.; amber, 10@11c. Extracted, white, 7@8c.; dark, 5@6c. Our market is in good condition for the new crop.

BEESWAX.—20c.

May 11. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 8½@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.

BEESWAX.—Scarce at 23c. for prime.

May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote : Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.

BEESWAX.—Scarce, at 26½@27½c. for good.

HILDRETH BROS. & SEGELKEN,

June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote : Best white clover 1-pounds, 18@20c.; best 2-lbs., 17@18c. Extracted, 8@9c.

Sales have been checked a little on account of maple sugar and syrup being so plentiful. Sales of honey are very slow.

May 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Best white comb honey, 11@16c. Demand is fair. Arrivals are plentiful of new comb and extracted honey from the Southern States, where the season had a most prosperous beginning.

BEESWAX.—Demand is good—20@24c. per lb. for good to choice yellow, on arrival.

May 21. C. F. MUTH & SON, Freeman & Central Av.

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

Cheap Extracted Honey.—We have a keg of DARK HONEY, weighing 164 pounds, net, suitable for feeding to bees, which we will sell at **6 cents** per pound, delivered on the cars here.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. June 22, 1889. No. 25.

EDITORIAL BUZZINGS.

Loveliest of lovely things are they,
On earth that soonest pass away.
The rose that lives its little hour,
Is prized beyond the sculptured flower.
—*Bryant.*

Queen-Rearing in the North, during May, was very nearly impossible. The cold and wet weather kept the bees as prisoners. One Queen-Breeder wrote us early in June that he had fed nearly a ton of honey and a lot of sugar to his bees, to keep them from starving during that "cold spell." Those who have ordered Queens in the North must therefore exercise patience, for no one could control the weather. We can furnish Queens from the South *at once.* to those who *need* them, at $1.00 for untested, and $2.00 for tested Italians.

Another Queen-Breeder writes us that the prospect for a good honey crop is nearly ruined—that but little brood is in his hives, and adds, "As the brood reared between May 20 and June 10 gives the bees which gather our main honey crop (from basswood), honey from that source will be less than usual."

We reply, that as the *cold* weather retarded not only the production of bees, but also the flowers, it may be later, but will not be as bad as our correspondent feared, if the fine weather we now have continues without much interruption. Everything has grown luxuriantly, and we continue to look on the bright side.

By Our Clubbing List you will see that, hereafter, we will club the book, "Doolittle on Queen-Rearing" with the AMERICAN BEE JOURNAL, for one year, and send both by mail, postpaid, for $1.75. The subscription to the BEE JOURNAL may commence at any time.

More Bees Poisoned by Paris Green.—Mr. J. A. Pearce, Grand Rapids, Mich., wrote thus to Prof. Cook on June 9. The Professor replied to it, and then sent it to us for publication:

I have 58 colonies of bees. A neighbor of mine sprayed his apple trees, when in full bloom. My bees were working heavily on them at the time. They are badly poisoned, and are dying by wholesale. It was over two weeks ago, and the bees are still dying, workers, drones, young bees, etc. I fear the queens are gone, too. I am going to make an examination to-morrow. I fear the worst, for they must have stored a good deal of the poisoned stuff, and where the end will be I know not. I had hoped for good results, as my bees were very strong. I put 58 colonies into the cellar and took 58 out. They were in there 149 days. But alas, our prospects are now slim for a honey crop. I write you this for the purpose of seeing if anything can be done by the way of Legislation, or in any other way, to stop this worse than useless practice of spraying trees while in bloom. I think you are the right man, in the right place, to see to it.

Prof. Cook wrote a "Caution" to the New York *Tribune* last month, and we gave an emphatic warning on page 355. The former is as follows:

Mr. John G. Smith, of Barry, Ills., reports to the AMERICAN BEE JOURNAL, that he and his neighbors are losing all their bees. A neighbor with 100 acres of orchard sprayed his trees, while in blossom, with Paris green. Thus the bees are destroyed. I have always urged against spraying trees before the blossoms fall. I know it is very easy to poison bees with sweets to which poison has been added. Bees are valuable property, and to kill them as reported, is a crime. Again, the bees are a great benefit to the fruit—indeed, essential to a full crop.

Once more: The codlin moth does not lay eggs till the blossoms fall; so it is not wise to spray before this, even were there no bees in question. Let papers that reach farmers and fruit-growers urge all never to spray trees until the blossoms all fall off of the latest blooming trees, like Northern Spy and Jonathan. Let Legislatures make it a serious offense to do this, and any offender liable for all damages that may result from the inexcusable practice.

It is true that Prof. Cook has advised the use of "Paris Green" or "London Purple"—preferring the latter. But he was careful to say that **the time to apply it** was **"when the apples are the size of small peas."** He also gave this caution: "If applied earlier, it may poison the bees, and would do no good for a few days, until the apple is formed; and before that, it may be all washed off by a heavy rain."

In utter disregard of this, some farmers are now spraying the trees while they are in bloom, and poisoning the bees by thousands. This is criminal, and should be punished by law, if any persist in spraying the trees until **all the blossoms have fallen!**

Prof. Cook should see to it that the Michigan law-makers, many of whom are personally known to him, enact such a law, and provide for its enforcement.

Bee-keepers should warn their neighbors not to use Paris Green on their trees until it can be done with safety.

Our exchanges and all local newspapers will confer a favor by making a note of it, and repeating the caution.

The Stingless Bees of Central and South America (*Aphis meliphona*) do not amount to much, as honey-gatherers. They are of small size, not much larger than the common house-fly, and are marked somewhat like the yellow-jacket. Although these bees are stingless, they are not without some means of defense. With their sharp mandibles they can bite in a manner "more

Stingless Queen, Drone and Worker.

forcible than pleasant." These bees store between one and two quarts of honey, in combs constructed of wax, similar to that of the common honey-bee, only the cells are much larger. These bees seem to be very numerous in certain localities. A traveler in Mexico mentions, that he found upwards of 100 swarms in a single day. He found 25 colonies in a wild fig tree.—*Exchange.*

Public Lectures on Bees are being given now in the East, by Mr. Aspinwall, late editor of the *Bee-Keepers' Magazine*, and in Canada by Mr. G. B. Jones, of Toronto. The *Canadian Bee Journal* has this to say about the latter:

Mr. G. B. Jones, now of Toronto, who will be remembered by many of our readers as an enthusiastic apiarist at Brantford, is again in the ranks of progressive apiculture, and is doing important work in a new field. During his late silence as an active bee-keeper he has been making preparations to bring before the public in a most attractive manner the science and practice of modern apiculture, and is meeting with great success and encouragement in his efforts to interest outsiders in the honey-bee.

He has delivered five public lectures in Toronto on "The honey-bee; its marvelous anatomy; its interesting life, and its important work." These lectures are illustrated by over thirty large colored charts prepared by himself specially for the purpose; large enough to be seen in any hall. A sequel lecture to the above has been delivered once, which explains to the public all the practical management of bees in all departments of our industry, and is illustrated by a full line of supply samples. Its title is "The Honey-Bee as a Man's Servant."

The Toronto press has spoken most highly of these lectures, and of Mr. Jones as a public speaker. All who have heard him, say he has a most happy delivery, and that he presents his subject in a manner which holds completely the attention of his audience during the two hours which each lecture occupies. His language is simple and easy to follow, and the points of his discourse are presented so deliberately and impressively that they are easily remembered. Scientists, physicians, divines, teachers, lawyers, business men and mechanics have all heard these lectures, and have become enthusiastic in their praise.

The First Word of the fifth line of the third paragraph in the last column, on page 361, should be *twenty* instead of "two."

GLEANS OF NEWS.

Our National Flower.—On page 392 Mr. O. L. Hershiser devotes some attention to the matter now being discussed as to which shall be selected as the National Flower of America—the Golden-rod, the May-flower, or the Laurel, etc. It is to be submitted to vote—the "polls" closing next New Year's day.

It is a singular fact that while the *thistle* represents Scotland, the *rose* stands for England, and the *shamrock* for Ireland—America has no National flower! Perhaps this may be accounted for in the fact that our forefathers were much opposed to even acknowledge that this was a Nation—preferring to think of it as a Confederation of States.

Thousands of votes have already been registered, but as there are yet six months in which to register preferences, the result may be in favor of either flower, according to the systematic work done in its favor by its devotees.

Here is a chance for bee-keepers to vote *solidly* for the Golden-rod, and by their united influence have it selected. Reader, do not neglect this opportunity to do our chosen pursuit a good turn.

Mr. Hershiser describes the Golden-rod, and presents its claims in an excellent manner. Read it. As the bees have no vote, let every bee-keeper vote for the bees. The Golden-rod will thrive everywhere.

> France has the lily, England the rose—
> Every one knows where the shamrock grows;
> Scotland the thistle on the heathers nod—
> America's flower—gay Golden-rod!

It may not be uninteresting to learn what other papers have to say on this subject, we therefore copy the following:

VOTING.—When the vote of the people has been taken, Congress would no doubt sanction their verdict by the adoption of suitable resolutions, and the national flower of America would thus for all time be determined. At any rate the discussion can do no harm, and may be productive of much good. Let it go on.—*Ohio State Journal.*

ORN.—In the pleasant affair of a national emblem we can borrow from Germany and from Scotland and adopt the corn flower, and glory in the title of the land o' cakes.—*Cincinnati Commercial Gaz.*

DANDELION.—Several flowers have already been proposed for this exalted position, but no one seems to have thought of the leontodon taraxacum, the king of the American flora. The Press advocates, therefore, the adoption of this modest, hardy, beautiful, and useful flower as the one best fitted to represent our great Nation. Hurrah for the dandelion.—*New York Press.*

VIOLET.—We favor the violet. It stands for modesty, and is, therefore, a true representative of America. Its colors are rich, but not glaring. It grows in the garden and out of it. It loves the sun, but it can sprout and bloom under the snow. This is the flower to symbolize the Republic.—*New York Herald.*

DOG FENNEL.—If a flower of general distribution is wanted, and one that everybody will know as soon as he puts his eye on it, why not take dog fennel? It is abundant, modest, and very difficult to conquer.—*Miami, Ind., Helmet.*

MORNING-GLORY.—The chrysanthemum is the national flower of the Japanese, the China-aster of China, the cactus of Mexico, the lilac of Persia. Garlic we assume to be the favorite with the Italiansas a boutonniere, kale of the Hollanders, cauliflower of the Germans, and the snow-ball of Norway and Sweden. No one as yet has put in a claim for the brilliant morning-glory for America, yet what is gayer or more brilliant than an arboror sides of a cottage embellished with radiant vari-colored morning-glories. Native or domesticated, they are equally lovely.—*Dayton, O., Journal.*

INDIAN CORN.—This was suggested many years ago as a truly national plant, and a fitting emblem for the United States. It is sturdy, yet graceful. Its flower is modest but beautiful. Sculptors have found in its jointed stalk and drooping leaves suggestions for new designs as graceful as the acanthus leaves of the Greeks. It is useful as well as handsome, and no more thoroughly representative plant could be found anywhere.—*Philadelphia Inquirer.*

SNOWBALL.—Annie Whitelaw Houk, of Hutchinson, Kans., writes: "Lucy Stone votes for the sunflower. The sunflower belongs to the women of Kansas by adoption, and hence is too sectional for the floral emblem of our national banner. The same reason I would discard the trailing arbutus and the magnolia grandiflora, and suggest the merits of the variety of viburnum, known as the snowball for that distinction. In color the flower is emblematic of purity, in form of eternity, and in structure it is a fit translation for our Nation's motto, '*E Pluribus Unum*,' being composed of a number of small florets, each one perfect in itself, yet combining to form a grand whole. For these reasons, with the weighty one in addition that it grows well in all parts of the country, I vote for the snowball."—*Chicago Daily News.*

The discussion began over a year ago in the Boston *Globe*. It has now spread over the entire country, and has culminated in the publication of an exquiste little book, by Mr. Praug, entitled, "Our National Flower," which can be obtained at this office (price 25 cents), with postal card vote enclosed. The book contains elegant pictures of the two leading candidates, in lovely colors, with verses pleading for the Nation's choice. When ordering the book, if your preference or vote is expressed, we will publish it in the BEE JOURNAL.

The Golden-rod will be selected, if bee-keepers throw the weight of their influence in the scale, and vote solidly for it. Then it will receive much more attention than heretofore, and will be cultivated in great abundance—as the National floral emblem—and our little winged friends will enjoy its wealth of nectar, where now they have nothing to take its place after the lindens have given their rich yield of honey.

As the National Flower, the Golden-rod will grace every hillside, stream and valley, and will be as dear to patriotic hearts as the National Hymn aod National Flag. Where now it is but seldom seen, it will be cultivated, and thus materially add to the wealth of the flowers, when autumn comes with its tinges of glory and hues of magnificence!

To be instrumental in selecting the "National Flower of America," will be something to be proud of in all your future life, and will be gloried in by your posterity. To do it, you must *act at once*, and give it your full endeavor.

United States Census.—The Superintendent of the Census has issued the following to the medical profession:

The various medical associations and the medical profession will be glad to learn that Dr. John S. Billings, Surgeon of the United States Army, has consented to take charge of the Report on the Mortality and Vital Statistics of the United States as returned by the Eleventh Census.

As the United States has no system of registration of vital statistics, such as is relied upon by other civilized nations for the purpose of ascertaining the actual movement of population, our census affords the only opportunity of obtaining near an approximate estimate of the birth and death rates of much the larger part of the country, which is entirely unprovided with any satisfactory system of State and municipal registration.

In view of this, the Census Office will issue to the medical profession throughout the country, "Physician's Registers" for the purpose of obtaining more accurate returns of deaths than it is possible for the enumerators to make. It is earnestly hoped that physicians in every part of the country will co-operate with the Census Office in this important work. The record should be kept from June 1, 1889, to May 31, 1890. Nearly 26,000 of the registration books were filled up and returned to the office in 1880, and nearly all of them used for statistical purposes. It is hoped that double this number will be obtained for the Eleventh Census.

Physicians not receiving Registers can obtain them by sending their names and addresses to the Census Office, and, with the Register, an official envelope which requires no stamp, will be provided for their return to Washington.

If all medical and surgical practitioners throughout the country will lend their aid, the mortality and vital statistics of the Eleventh Census will be more comprehensive and complete than they have ever been. Every physician should take a personal pride in having this report as full and accurate as it is possible to make it.

It is hereby promised that all information obtained through this source shall be held strictly confidential.

ROBERT P. PORTER,
Supcrintendent of Census.

It is necessary to obtain the co-operation of medical men in all parts of the country to insure a successful result. This is all volunteer work on the part of the physician, but will give material help to a most important branch of statistical inquiry.

It is equally important to the country that the returns in relation to farm products and live stock should be full and correct. The enumerator, in the house-to-house visit he will make, during the month of June, 1890, will be constantly met with the fact that farmers keep no books, and hence returns are not frequently guess-work. The census year began on June 1st, and ends May 31, 1890. If farmers throughout the country would note this fact, and keep account of the products of their farms during the census year, it would be of material aid in securing reliable returns for the Eleventh Census.

Our Convention Hand-Book.—This is a very useful book for those who attend conventions, and should be generally used. Mr. O. L. Hershiser, of Buffalo, N. Y., writes thus concerning it, under date of June 1, 1889:

MR. NEWMAN:—We found your little hand-book for use in organizing conventions very useful. We adopted, with slight modifications, a constitution found therein.

Our meeting was attended with much enthusiasm and good cheer. The bee and honey industry seems to be awakening to new life in this portion of the State. We expect to derive much benefit from our association socially, and intellectually and financially.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

Bee-Atific Law.—Talk about Bee-Legislation!! Here is something that caps the climax! Mr. John Aspinwall, late editor of the *Bee-Keepers' Magazine*, wrote us as follows on June 8, 1889:

FRIEND NEWMAN:—I enclose a copy of a Bee-atific law soon to be enacted by our Bee-adled Legislature. It is quite as intelligent as most of the laws they have made this year, and this has been gotten up by some wag, as a "grind" on our august Assembly.

Our friend Bercaw, of rubber stamp fame, had better come and settle in this State, as soon as this is passed, if he can live long enough to see it in operation.

Here is the Assembly Bill No. 482, referred to in the above letter:

STATE OF NEW YORK.

G. O. 87. No. 482. Int. 4.

IN ASSEMBLY.

January 10, 1889.

Introduced by Mr. COTTRELL—read twice and referred to the committee on general laws—reported favorably from said committee, with amendments, and committed to the committee of the whole.

An act to establish and define the rights of persons, male or female, discovering bee-trees or other natural receptacles containing bees or honey.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. It shall be lawful for any citizen, Indian or Chinaman, first discovering or finding a bee-tree, or tree or other natural receptacle containing bees or honey, to mark the bee upon his business end with a rubber stamp, or indicate the locality and discovery thereof with the initials of his or her name distinctly and openly marked and so placed upon such bee, as above indicated, so that it may be readily seen. Such marking shall be due notice of the discoverer's rights, and shall be respected as such, and shall establish the ownership in said discoverer of the bees, honey, comb and contents.

SEC. 2. If such tree be cut, or such bees be caught, or honey be taken or unnecessarily damaged, or the sting of such bee be removed or disturbed to the detriment of the discoverer, unless sting be lodged in discoverer, the depredator shall, on conviction, be held guilty of a "beeacide," and shall be punished by any court having jurisdiction of horse-stealing, by a fine of five hundred dollars, and the discoverer may authorize his bees to sting the depredator.

SEC. 3. This act shall not be construed as giving permission to commit a trespass, or as relieving trespasser from obligation for damages or prosecution therefor, but the discoverer of such a tree, bees or bee-stings, or honey, may, after having given to the owner or occupant of the premises upon which they were found, reasonable written notice of such discovery, and its locality, with a sample bee, duly marked and stamped, and honey, accompanied by an offer to pay the damages done to the premises consequent thereon (and in case of consent, he shall pay the same at the time of removal), may, in a civil action, recover of such owner or occupant, seven dollars for damages therefor.

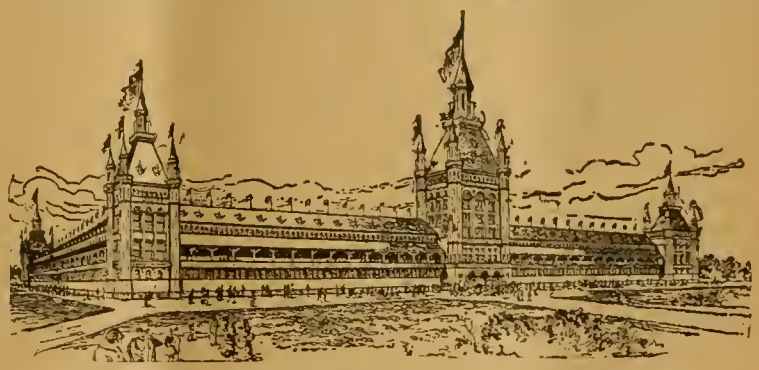
SEC. 4. The owner or occupant of the premises may, if he finds it necessary for his own advantage, or the advantage of the property which he has in charge or occupies, after giving reasonable notice in writing to the said discoverer, with a description of the tree and locality, appointing a suitable definite time for such cutting, destruction or removal, proceed to destroy, cut or remove said tree or other receptacle, having due regard for the rights and property of said discoverer, and the right of the bee and his sting.

SEC. 5. This act shall take effect January one, two thousand one hundred and sixty-three.

Such a law would be quite as reasonable as many that are enacted, and is a laughable illustration of the utter ignorance of our law-makers on many subjects that they legislate for.

Detroit Exposition Building.

The main building for the Detroit Exposition, next September, is claimed to outrival any other Fair building in the United States. The length is 500 feet; height, 70 feet; depth, 250 feet; height of corner towers, 116 feet: main tower over the grand entrance, 200 feet; area of total exhibit surface, 200,000 square feet. The structure covers 3½ acres, is lighted and ventilated by windows requiring 20,000 square feet of glass, and contains booths that, were they placed side by side, would extend over six miles. The total cost, together with companion structures, will be over $250,000.



Main Building of the Detroit Exposition.

It is located on the edge of the Detroit river, overlooking the Canadian shore and the passing commerce between the Great Lakes. Reduced rates on railroads will gather an immense concourse of people. Cash prizes, amounting to $100,000, are offered. For further particulars address the General Manager, C. W. Robinson, Detroit, Mich. The Fair will open on Sept. 17, 1889, and last ten days.

Old-Fogy Extravagance.—Mr. G. K. Hubbard, in the Indiana *Farmer*, scorns the ignorant writers on apiculture and inventions of bee-hives. He says:

The *American Farmer* gives an extended description of how to make a bee-hive, which, it says, is "beyond question, the simplest, cheapest, and best arranged hive extant." These are broad claims, and should interest us all, until we have established their value.

What is this wonderful hive? Fellow bee-keepers, do not smile when I tell you it is actually an old-fashioned box-hive, with cross sticks to support the combs, and two boxes that will hold from 12 to 15 pounds each, placed on top. These boxes are to be made "with glass ends or sides, either plain or ornamental, as the contents may be designed for home consumption, or exhibition at the sale room, or to compete for premiums at fairs." I guess we will have to smile after all, at the thought of honey put up in that style competing for premiums.

As if to excuse itself for going back 75 years and teaching old-fogyism, the *American Farmer* puts forth the protest that the more-improved hives are patented; on the contrary, the fact is, that the majority of apiarists in the country do not use patented hives; and they do not keep their bees in square boxes, and get their honey out in 12 pound chunks, either. The writer of that article undoubtedly knew more about wasting good lumber, than he did about bee-keeping.

The men in this country who are keeping bees successfully would no more think of going back to the old box or gum, than would the wheat raisers go back to the sickle or cradle to harvest their grain.

When building a bee-hive a person might better add a little to the expense and put in movable comb-frames, and have the surplus apartment arranged for one-pound sections, than to try and get it on the cheap order, and for years be compelled to use a fourth-class article....

If you wish to sell honey, you could make no better investment for your bees, as honey put up in this way commands a higher price than it will in large boxes.

In fact, in large packages it is often a drug on the market, and sometimes has to be sold at a great sacrifice, while in sections it can be shipped from one end of the country to the other, and thus the honey crop has an outlet.

Furthermore, when the honey is sold in sections, the honey, frames, and all, are weighed, and the price computed for the gross weight—nothing being deducted for the sections. Seventeen of the new, clean sections as you buy them, weigh a pound; thus, if you sold your honey at 17 cents per pound, you would be getting $10 per thousand for sections that cost you $3.50.

We ask, with renewed emphasis, where is there any saving in trying to do without the improved methods of apiculture that are within reach of all?

Sweet Clover.—R. A. Elliston, of Henry, Ills., writes thus on June 4, 1889:

I enclose a sample of what I think is some kind of clover. What is the name of it? There is a small patch of it growing near my place, and I have never seen bees work on anything so strong as they do on this plant. No one that I have met can tell me the name of it.

It is sweet clover; the seed can be obtained at this office at 20 cents per pound. It is excellent bee-pasturage.

The Doom of the Conemaugh.

Nestled among the mountains,
Cozy and snug and warm,
Town and village and city lay
Seeming secure from harm.
Never a fear of pillage—
Feasting and glad and gay—
Town and city and village
A picketless army lay.
Nestled among the mountains,
With never a thought of gloom,
Peaceful village and city and town
Felt the stroke of the doom!

Age that was wrinkled and hoary;
Youth that was golden and jet;
Manhood crowned with the crown of might;
Infancy toddling yet;
Motherhood time-worn, tender;
Wifehood trusting and true;
Maidenhood in the splendor
Of the old life ever new;
Father and mother and baby—
Lover and bride and groom,
Just in the heaven of holy love—
All went down in the doom!

Out from the east a wailing;
Out from the west a cry;
Up from the south and down from the north,
A moan that will never die!
How shall they wail their terror?
How shall they weep their woe?
Christ be the burden-bearer!
They loved the dear ones so!
Back to them all a wailing—
An echo from the tomb—
To east and west and south and north,
Sound the dole of the doom!

—*R. D. Lane, in Chicago News.*

QUERIES and REPLIES.

Keeping Bees for a Share of the Surplus Honey.

Written for the American Bee Journal

Query 637.—Where one starts an out apiary, and does all the work himself, pays 50 cents a swarm for all the swarms that are hived, and the second party does nothing but furnish the ground for the apiary, and the board while extracting honey, what share of the surplus honey should be given? (The owner of the ground wants honey for pay.)—Iowa.

About 10 per cent.—not over that.—WILL M. BARNUM.

Just the amount that you and the owner of the land can agree upon.—G. M. DOOLITTLE.

I would think that one-sixth part would be a fair remuneration.—J. M. HAMBAUGH.

In such a case, I would not give more than 25 per cent. of the honey.—P. L. VIALLON.

So many things enter into the case, that no specific rule can be laid down.—M. MAHIN.

The best terms that you can secure. No rule can be given. Last year "the board" would not have cost anything.—A. J. COOK.

I should say about one-eighth; but I have had no experience on that line.—C. H. DIBBERN.

Make an agreement that will satisfy the other party, and then do a little better than you agree.—C. C. MILLER.

You had better agree upon the sum to be paid for ground-rent beforehand, whether it is to be paid in money, honey or wheat.—MRS. L. HARRISON.

We give one-fifth of the extracted honey. We produce no comb honey. The party, however, furnishes board at every visit to the bees, and room for the utensils.—DADANT & SON.

Reduce everything to a dollar-and-cent basis, and settle that way. Pay the customary price for board, and charge the regular market price for the honey.—MAHALA B. CHADDOCK.

Add rent of land to the price of the board, and divide the sum by the price you set upon the honey per pound, and the quotient will be the number of pounds that the owner of the land will get.—J. P. H. BROWN.

I do not know. Probably an amount of honey at market value equal to the cash rental value of the land would be right, if agreed upon by the parties.—J. M. SHUCK.

I do not feel like answering this query; so very much depends upon local circumstances that my answer might possibly be the means of doing an injustice to some one.—JAMES HEDDON.

I would not contract to give a share, but to pay a reasonable amount (say $15.00) in honey, for the rent of ground, and board at usual rates.—G. L. TINKER.

This is another of those theoretical questions that must depend upon circumstances. I do not see how any two cases can be so nearly alike, that a guide of value cannot be given to suit general cases.—J. E. POND.

Set a fair price on the rental value of the land used for the apiary, and a fair price for the board, and when you have agreed on that, pay the debt in honey at the price your honey will command in your home market, eh?—G. W. DEMAREE.

It is difficult to tell, for the amount would vary, being dependent upon the number of colonies, and the honey-yield. There might be 100 or more pounds of surplus per colony, and there might be no surplus. It seems to me the better way would be to fix the price in money, and pay the amount in honey at its market value.—A. B. MASON.

As you can agree. Circumstances vary, and you give none which can be made the foundation of a judgment. How much land is to be occupied? Is it worth $5.00 or $1,000 per acre? Is the apiary to consist of 5 or 150 colonies? Are the bees gentle or irascible? Is their location where there is danger of their attacking mankind or domestic animals? What is the average surplus? If I borrow $100 of my neighbor, what is the total amount of interest I should pay him when I finally settle? is like your question.—R. L. TAYLOR.

It would be difficult to arrive at an equitable division of the honey on that plan, because you can neither tell how many meals you would be there, nor the amount of surplus you may get. A better way would be to pay a stated price for all meals, and for all other assistance or rents, to be paid in honey at a stated price.—EUGENE SECOR.

Too much depends upon conditions and circumstances to give an equitable answer to this query. It would be better to ascertain the rental value of the land, and make an agreement based upon that to be paid in honey at the wholesale market value.—THE EDITOR.

Proper Material and Width for Separators.

Written for the American Bee Journal

Query 638.—1. How much less in width should tin separators be, than the inside height of the sections with which they are to be used? 2. What kind of tin do you consider best for separators?—New York.

1. One inch. 2. Common tin.—A. J. COOK.

1. About ¾ of an inch. 2. I use a cheap grade of roofing-tin.—A. B. MASON.

1. There ought to be an inch of space above and an inch below. 2. Any tin will do.—DADANT & SON.

1. One-half to ¾ of an inch. 2. Any kind of cheap tin will do.—EUGENE SECOR.

I do not use separators. I did once, but I discarded them.—MAHALA B. CHADDOCK.

1. There should be about a ½-inch space above and below. 2. Give it up.—WILL M. BARNUM.

1. One-eighth of an inch. 2. The best of any article is usually the cheapest.—MRS. L. HARRISON.

1. About an inch. 1. I think that taggers tin is good enough.—R. L. TAYLOR.

1. About ¾ of an inch. 2. The cheapest, *because* the cheapest.—C. C. MILLER.

I do not use separators of any kind, and I am not prepared to answer either question.—M. MAHIN.

1. Those that I have used are about one inch narrower than the sections. I think that wider ones might be just as good, but ample room must be given the bees for passage.—J. E. POND.

1. One-half to ¾ of an inch. 2. I prefer block tin; taggers tin is too thin, as it gets marred too easily.—P. L. VIALLON.

1. About ½ of an inch. 2. Roofing-tin makes a very good separator; but *bright* tin-plate makes a better one.—J. P. H. BROWN.

1. One-half inch, the same being equally divided between top and bottom. 2. That which you can get at the least price.—G. M. DOOLITTLE.

1. About ½ inch. 2. Do not use tin for separators. I think that perforated wooden separators are not only the best, but the cheapest.—G. L. TINKER.

1. About ½ an inch, thus leaving a ¼ of an inch ingress and egress at the top and bottom of the sections. 2. If compelled to use tin, I would use the thinnest to be had. I do not like tin separators; wooden separators suit me best.—J. M. SHUCK.

1. Just a bee-space, or ⅜ of an inch. If the sections are open-top, ¼ inch will be right; if more space is given, they will lengthen the cells above the separators. 2. Cheap roofing or lead-plate tin is best.—C. H. DIBBERN.

1. For 4¼x4¼-inch sections, separators should be about 3¼ inches wide, which will be the inside dimensions of the section, less a good bee-space above and below. This rule will hold good for sections of other dimensions. 2. I never use tin separators.—J. M. HAMBAUGH.

1. A properly-made section 4¼x4¼ inches, should be just 4 inches in the clear. I have my tin separators cut 3⅛ inches, scant. 2. What is called by the tinners, "Coke tin," gives the best satisfaction in my apiary. It is cheaper and stiffer than the better grades of tin.—G. W. DEMAREE.

With 4¼ sections, 3⅛-inch separators are the rule. I prefer them from ⅛ to ¼ of an inch wider than 3⅛ inches; but we cannot always get tin to cut that width, and as 14x20 inches is a regular size, and that cuts just four 3½-inch separators, we usually make them that size, for it works very well. If they are centrally nailed on the side frames and placed between sections, and the supers properly manipulated, not much trouble will result.—JAMES HEDDON.

There should be at least a bee-space (⅜ of an inch) at the top and bottom between the tin separators and the inside of the sections. From ½ to ¾ of an inch would be better. What tinners call "Coke tin" is generally used, because it is stiffer, as well as cheaper. —THE EDITOR.

CORRESPONDENCE.

SWARMING.

Bees Selecting a Home Before Swarming, etc.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

In regard to bees selecting a home before they swarm, there seems to be a difference of opinion, some claiming that they do select it, while others are equally sure that they swarm without any knowledge of where they are going. In most cases, probably, the latter view is correct, yet I am positive that some swarms do select their future abode some days before they swarm.

When but a boy, I many times saw bees searching the body of a large tree all over, which stood on the edge of the woods, as if looking for some place to enter it, and at that time I wondered what they were doing.

Later on, the same thing was witnessed, only at this time the bees were going in and out of a hole in another tree, as well as to be looking over the trunk of the tree. In this latter case the bees were seen for several days at work during the middle of the day, the bees going and coming from the hole about as bees would work from a nucleus, while in the morning, and after 5 p.m., no bees would be seen about the trees. A few days after that a swarm came out from one of the few hives which father kept at that time, and went straight to this tree without clustering at all.

From this I felt sure that in some instances bees did select a tree to go to before they left the parent hive; but after having bees of my own, and seeing them cluster soon after they had come out for hours, and in one instance stay for 24 hours where they clustered, I did not know what to think of the matter.

At about this time the party with whom I was in partnership in my early bee-keeping life in queen-rearing, told me one day, that, at an out apiary which he was working, which contained only black bees, he had noticed that day Italian bees at work cleaning out an empty hive which stood near one side of the yard. This was something new to him, and he said that he should keep watch of the matter and see what became of it. I was much interested, and told him of the incident related above.

The next time I went there, he told me that the bees which he saw cleaning the hive were his own bees, as he had surmised, after I told him of what I knew in the matter a few days before; for at that time his bees were the only Italian bees within four miles of his residence. He said that a swarm came out of one of his hives, and after circling around a few times, started off in the direction of this out apiary. Having a fleet horse near at hand, he jumped upon it, and in a moment was going at railroad speed for this out apiary, getting there in time to see his swarm of Italian bees rushing pell-mell into the hive that the bees had been cleaning up.

As he kept the wings of all of his queens clipped, he knew that he could soon tell of a certainty whether these were his bees or not, for if they were, he had their queen at home in a cage, and sooner or later they must return to her. In about half an hour they became uneasy, and began to leave the hive, when he returned, only to find them coming back to their old home.

He now liberated their queen, and the next day they swarmed again, and again went to the hive in this out apiary, as before. This was kept up some three or four times, when he divided the colony, and put a stop to their swarming.

The above instances cannot be accounted for in any other way than that the bees had selected their future home before leaving the parent hive; and while I agree with those who think that scouts are sent out in search of a home while the swarm hangs clustered on a limb, yet I think them a little hasty in declaring that bees *never do select a home before swarming.*

The Early "Dollar" Queens.

In regard to ordering "dollar" or "untested" queens, I would say: In the first place, "Queens for a dollar" originated with Mr. A. I. Root, and the only statement which I have ever seen regarding the conditions under which an untested queen could be had at that price, when nothing was said as to time, was *on and after July first,* being the time that such queens can be expected by those ordering them; yet for all this, there are parties who do not seem to realize but what any queen-breeder here at the North, can send them when the snow is on the ground, and rear them by the frosts of winter. At least the above is the only conclusion that I can arrive at, after knowing of orders for such queens, saying, "Send by return mail," before the bees were out of the cellar.

I do not believe that one of the parties so ordering previous to May 20, and living north of latitude 40°, could send me such queens should I order them, making the same request. In fact, parties at the South wrote me in May, that if I insisted on having orders

filled at once, they should have to return the money.

As the season was earlier than usual this year, I thought I would make extra efforts to please, so I began queen-rearing about three weeks earlier than usual, for I do not as a rule, do much at it before June 1. Well, what has been the result? Nuclei were formed to receive the cells, of which I had a large number of extra nice ones, the same being obtained in our warm weather during apple-bloom; but at the time of giving the cells, the weather changed, and we have had ten days of the worst weather imaginable for bees, during which it has frozen so hard that ice formed ¼-inch thick, and the end is not yet. Nuclei are dead, queens and queen-cells destroyed, drones killed off, and my full colonies are damaged to an extent which I do not like to contemplate.

U. S. FLOWER.

Our National Flower—What Shall it Be?

Written for the American Bee Journal

BY OREL L. HERSHISER.

Quite a lively interest is now being taken in the selection of a National flower for the United States of America, and a plan which is meeting with popular favor has been offered by Mr. Prang, of Boston, whereby the people may make a popular choice. A tasteful little volume containing life-like and richly-colored representations of the two most popular floral candidates—the Golden-rod and May flower, or Trailing Arbutus—has been widely circulated throughout the United States, through the medium of news-agents and booksellers. Each flower pleads its merits, and claims for popular choice in an exquisite little poem.

A postal card with ballots prepared and addressed to Mr. Prang, accompanies each volume. After Dec. 31 next, the polls will be closed, the votes counted, the popular choice determined, and the result announced to each voter by mail. The volume is a beautiful little souvenir, and will be highly prized by all who take part in choosing the National Flower.

Thus far the Golden-rod seems to be the most popular. It has been the choice of such noted persons as Jno. G. Whittier, Joseph Cook, T. V. Powderly, Mrs. Harriet Beecher Stowe, and many others. Next to the Golden-rod, the Trailing Arbutus and Laurel seem to be the greatest favorites.

Happily in this floral-political contest, no ill-feeling or jealousy exists. No abuse or ridicule of candidates enters into the discussion. The favorites of one do not seek to injure the reputation of the other, by arraigning and magnifying imaginary faults. If the candidates could express their thoughts, as doubtless they can in "flowery language," the winner would feel sorry for the others' defeat; and the defeated would be glad to see the popular choice thus honored, while the unsuccessful candidates will be the better known and loved for having been contestants for the high distinction.

Loving the Trailing Arbutus and Laurel as we do, we cannot forbear doing a little electioneering for the gay Golden-rod. There are many considerations in its favor, which make it superior to any other flower as a national emblem. It flourishes in every variety of soil and climate, and, like our Revolutionary fathers, it yields to no discouragements, but smiles in the face of misfortune. It is equally contented in dry or wet weather, and makes no choice between poor and fertile soils. It cares no more for extremes of climatic conditions, than it does in its choice of soils, and is happy if possessing some stony pasture or forsaken fence-corner for a foothold. "It takes what is set before it, and asks no questions."

Surely the bee, if it knew of the impending election, would busy itself in a lively manner, and its arguments, too weighty to be repeated, would be in favor of the Golden-rod. It is not altogether certain that it would abstain from fraud in influencing votes, for we know its disposition to rob its neighbors, when it can find no other employment. The bee is a good judge of flowers, and has an eye to their intrinsic merits. The candidate that will secure the largest revenue will capture the bee vote.

The Golden-rod blooms not in the spring and summer, when other flowers are in their prime, and yielding fragrance and honey, often in such abundance that the bees cannot gather it all; but in the fall, when nearly all the beauties of summer have faded, it blooms gaily even at the door of winter, and furnishes delight and plenty to the bees when all other flowers have faded. It is the last sentinel to yield to the rigorous winter, and, like the fabeled Janus, it looks in two directions. It hails the advent of winter, bids adieu to autumn, and spreads a garland of glory over the departed summer.

Though the Trailing Arbutus and Laurel are the more beautiful, and shed a more delicate perfume, they are confined to special soils and climate in mountainous districts. Comparatively few know of their beauty, and still fewer will be able to see and enjoy them often; but not so with the Golden-rod, for it flourishes in mountain and valley, from Maine to California; from our Northern borders of rigorous and long winters, to the land of perpetual summer, where the zephyr is freighted with the delicate perfume of the magnolia and the orange-blossom. It is so wide-spread, and withal so beautiful, that all may know and enjoy it. It is pre-eminently suited in every way, above every other candidate, to be the National Flower.

DISEASED BEES.

The Bees Dying of Some Nameless Disease.

Written for the American Bee Journal

BY JOSHUA BULL.

On page 348, Mr. J. A. Bence describes the manner in which his bees are rapidly dying off, from some unknown disease, and wants to know the cause and the remedy. I also have two strong colonies affected very much in the same way, if I understand his description rightly; although the difficulty did not commence with mine until about the first of May with one colony; and the other colony was attacked within the past week. I have never seen anything like it before, and, therefore, like Mr. Bence, I should be very much pleased to have any one who knows the cause, "arise and explain" without delay, and prescribe a remedy.

In "A B C of Bee-Culture," page 86, and latest edition, is described what the author calls the "Nameless Disease," which I think very closely resembles the condition of my bees; for I see among them some of the black, shiny bees, such as he speaks of, but many more with bloated abdomens, as Mr. Bence describes it.

Mine have no dead brood in the combs, nor any bare-headed brood, but all appear perfectly healthy until they hatch, and then some of them seem to live but a few hours, during which time they crawl around, quivering and shivering as though they had the ague, until they die.

Mr. Root directs as a remedy, to destroy the queen, and divide the brood among other colonies. I fear to do that, lest the disease might be imparted to other colonies also. But I have removed the queen and given them another, hoping that this method may overcome the difficulty when the new stock of brood begins to hatch out.

If I remember rightly, mention has been made in some of the bee-papers,

from time to time for several years past, about this very same trouble amongst bees in different parts of the country; or if not the same thing, something very closely resembling it; and I cannot well suppress some feelings of uneasiness lest this may prove to be a source of serious difficulty to bee-keepers in the near future.

There are some circumstances connected with the breaking out of this disease amongst my bees, which impresses me with the idea that the cause originates with the queen; and may be hereditary with her, and therefore transmissable from one generation to another of her queen progeny; possibly, also, the drones may be contaminated with the disease; and if such be the case, it is not difficult to conjecture how rapidly the difficulty may increase and develop disastrous affects. Of course the foregoing idea is only put forth as a sort of theory, yet I think that I have at least one good reason upon which this theory is based; but I do not feel at liberty to explain that reason at present, for fear that the interests of some other bee-keepers might be affected thereby.

It is a matter of urgent necessity, that every bee-keeper should be on the alert to guard against, and stamp out at once, any and every form of disease on its first appearance amongst his bees; and I would further suggest that no bee-keeper should allow any queens or drones to be reared by the bees in any colony which is in the least degree affected with any symptoms of unhealthfulness, or bare-headed brood, etc. Let all our breeding stock be perfectly sound and healthy.

Seymour, Wis.

ITALIAN BEES.

The Introduction of the Foreign Races of Bees.

Written for the American Bee Journal

BY DR. J. M. HICKS.

In the first place the German or our native bees were first known in America about the latter part of the fifteenth century, being imported by some of the first English settlers; as I well remember bearing Grandfather Dempsey Hicks often state, that his father, James Hicks, brought bees with him when he came from England to this country, and that there were no bees to be found in the forests until after the early settlers brought them.

It was also a very common saying among the Indians, that there was no bees known here until after the pale-faces (meaning the white men) had come to this country. It seems that bees were the proper sign, as recognized by the "red man," of an advancement of the whites in settling new territory, and the Indians were always very jealous, as well as quite superstitious, when they found bees far out from the white settlements. Yet they often got quite a generous supply of honey from an occasional bee-tree.

I do not remember of ever having heard of any very great quantity of honey being taken from a colony or bee-tree in one season, by any of the early settlers of America, from the German or black bees; but since the first introduction of the Italian and Cyprian bees, the great quantity of honey that a single colony of bees would gather and store for ther keeper has been surprising, sometimes running up into the hundreds of pounds. Yet it must be remembered that bee-keeping a hundred, or even fifty years ago, was not so well understood for profit as it is now, especially so when we consider the many improvements that we have in more fully understanding the science of apiculture, and applying the proper rules in accordance with natural laws governing the instincts and intelligence of these most wonderful insects, thus making them very profitable, as well as useful in a proper fertilization of many plants and field crops, now known to produce much better in neighborhoods where bees are kept, than where they are not.

While all the foregoing is a fact not easily controverted, from our long experience in bee-keeping we have to yield the point, and say that in many respects the Italian bees, as well as the Holy Land and Cyprian bees, are by far superior races of bees to those first known in America. In the first place, the Italian bees work on a greater variety of flowers, and on many kinds that the blacks or German bees do not; above all, they are more easily handled, and the queens can be quickly found, being of a beautiful golden color; and, best of all, the Italian queens are not so easily frightened, often going on with their labors in laying eggs, while the bee-keeper is examining a brood-comb. The workers stick more closely to their brood, and are less liable to get irritable while being handled.

It is also a well authenticated fact that the moth-worms do not bother the Italian bees nearly so much as they do the native bees, but these bees are very vigilant in cleaning them out, even from combs given them that have worms in abundance.

I know whereof I speak, when I assert that even among the Italian bees there is quite a difference in their good qualities, just as it is among the different breeds of Jersey cows as to their milking-qualities.

Look well to the bees, and they in turn will more than repay for all pains taken in their behalf. Sow buckwheat about June 10 or June 20, for both honey and a good yield of seed. The "silverhull" variety is perhaps the best; if this cannot be had, I would recommend the Japanese buckwheat as being next best, as well as a fine grain-producing variety.

Indianapolis, Ind.

SIZE OF HIVES.

Large vs. Small Brood-Chambers in Hives.

Written for the American Bee Journal

BY CHAS. DADANT.

In answer to my criticism, on page 342 Mr. Hutchinson writes, that in refusing to publish my article, he was not actuated by any motives of partiality; adding that he prefers to be misjudged by those who cannot take his simple word, rather than still further wound my feelings. This last phrase implies that I would be ashamed to see in print the article refused.

Of course, I am not as brilliant a writer as Mr. Hutchinson, and my article would have lowered the standard of excellence of the *Review*, to use the terms bestowed on his paper by the editor, in his December number. Yet, the article would have been welcomed, had I not praised the large hives, which are the nightmare of Mr. Hutchinson, who can find room in his paper neither for their praise nor for the slightest criticism of the Heddon hive, as I will demonstrate further on.

In their December numbers, both the *Apiculturist* and the *Review* invited their correspondents to write articles on "Hives," for their next issues. The *Apiculturist* published eleven articles on this topic in its January issue, and three in its February number; while the *Review* published but six in all; not for lack of room, for the January number had an article on "Diarrhea," which occupies two-and-half columns; not for want of articles, for Mr. Hutchinson wrote in the February number of the *Review*, on page 27, as follows:

LARGE HIVES.—It is impossible to notice, let alone publishing, all the articles on hives that have been received. A. L. Leach, of Dwight, Ills., very kindly sends an account of his experience with hives of different sizes. His preference is a large hive; and the reasons are that the bees swarm less, and more honey is secured....

Mr. Hutchinson continues with his usual criticism. Was the article sent to the waste basket on account of the

partiality of the editor, or because it would have lowered the *standard of excellence* of the *Review*?

In the same January number in which there was no place for Mr. Leach's article, Mr. Hutchinson has found room to review the eleven articles published in the *Apiculturist*, and to quote, from an article of Mr. J. A. Green, all the part which praises the Heddon hives. The quotation stops short where Mr. Green adds, "And yet in spite of what I have said in their favor, I am, by no means, sure that these hives are well adapted for general use." . . . . . (January *Apiculturist*, page 7.)

Mr. Hutchinson is so impartial that, in his answer to me, he wrote that "if he had given my reasons for preferring large hives he should have been *bound in duty* to mention others who had experienced and arrived at opposite conclusions." I desire to inquire of him, since he is so impartial, why he did not give the objections of Mr. Green, after having given his praises; why, after devoting so many columns to exalt the Heddon hive, he did not give a single word of critism? For instance, why did he not quote Mr. Jones, who, after buying the patent for Canada, abandoned it? etc.

Mr. H. asks: "Can my opponent extract the honey from a large hive with as little labor as from a small one." I can prove that, although living in a country where there is no linden, our six apiaries, numbering more than 400 colonies, and which give a yearly average of more than 20,000 pounds of honey, require less than 200 days of work.

Mr. Stachelhausen, of Texas, who does not use small hives, produced in two apiaries, last year, 17,000 pounds of extracted, and more than 3,000 pounds of comb honey, and did not spend more than one hundred days of work. (See *Apiculturist* for February, 1889.)

The above are facts. Let Mr. Hutchinson and others living in a linden country, and using small hives, bring their accounts in comparison. We want facts, rather than well-spun theories.

Oil-Cloths and Honey-Boards.

Mr. Hutchinson condemns the oil-cloths, as he did the large hives—without having tested them. In his May *Review*, he tries to convince Dr. C. C. Miller, who used both for years, that the honey-board is superior to the cloth.

He objects to the oil-cloth because bees put propolis between it and the frames; while they put honey between the frames and the honey-board. After removing it, he lays the honey-board upside down in front of the hive, where the bees sip the honey from the broken brace-combs. To replace it, he shakes the bees from the honey-board, and drives down with smoke those sipping on the frames. But he does not notice that robbers are more attracted by running honey, than by propolis; that the cloth is removed and replaced faster than the board; and that, being flexible, the cloth shuts the hive more closely! When we want only to see whether our bees are short of stores, we have but to remove a few inches of the cloth, while he removes the whole honey-board, or upturns his hive.

He ends his plea for honey-boards with this phrase: "We are sorry that the Doctor cannot manipulate a honey-board so easily and quickly as he can a quilt; for we honestly believe that the latter is 'going, going, going.'" (*Review* for May, page 75.)

These words show how much Mr. Hutchinson esteems his own opinions above those of one of our most experienced bee-keepers. Like a lover, who considers all the defects of his sweetheart as so many qualities, Mr. Hutchinson has his eyes so blinded, by his love for the Heddon hive, that he does not notice that his impartiality is entirely in his words, not in his acts. Let us hope that, like this lover after marriage, he will, sooner or later, awake to the reality.

Hamilton, Ills.

LAYING-WORKERS.

Getting Rid of these Pests—Concerning Drones.

Written for the American Bee Journal

BY IRA N. LYMAN.

I had two colonies of bees in exactly the same condition as described on page 308, only I did not make them queenless by putting 2 colonies together, as I do not like to disturb my bees more than is necessary in the working season, or at any time.

My hives were of different patterns, so that I could not change a brood-comb from another hive into the queenless hives, and I wanted to keep all of my colonies, for I had but a few, and wanted more. So I would not break up a colony; but to make a colony strong, and get my bees into hives all alike, I sent for Italian queens, so as to Italianize my colonies, as well as to get them into better hives. When the queens came, I took my combs all out that were fit to put into another hive, and put them into the standard Langstroth frames, as they were my choice.

My colonies were very weak, and to give them a good start, after I had got everything else into shape, I put the new queen in her cage into a hive, put the hive in the place of another strong colony, and left the queen caged 24 hours, when I set her at liberty. They worked right along from the time I put them on the stand. That queen was introduced on Aug. 14. The bees did first-rate, and is a strong colony now, but the queen did not prove to be of a three-banded strain, as I expected to get, but produces bees with two broad bands.

One Italian queen I got last season from New York, to put into a queenless colony that had a drone-laying worker, and the bees were trying to rear a queen from the drone-eggs, I just put the queen into the hive in her cage, after smoking the bees well, kept her in the cage 24 hours, and then let her out. This was on June 25, 1888. I had no trouble in introducing her, and that colony swarmed on July 30, and again on Aug. 29. All are in good condition now, and doing well.

I think that this plan works well if a person has but few bees; it is better than to break up the colony. I like to stir up the bees and confuse them pretty well before putting in the new queen, and then I think that there is no trouble in introducing them, even to a colony that has a drone-laying worker, or any other.

Drones made their appearance in my apiary on May 20, and quite a number were flying then. I look for swarms soon, if the weather is good. Everything looks promising. Alsike clover is beginning to blossom.

St. Peter, Nebr., May 21, 1889.

HONEY-DEW.

Great Flow of Honey-Dew—Making Hive-Stands.

Written for the American Bee Journal

BY EZRA J. CRONKLETON.

I work generally about 50 colonies of bees. There are but few bees kept in this county (Harrison), and what are kept here are tried to be worked on modern pprinciples, the box-hive being entirely discarded.

My location is about 50 miles northeast of Council Bluffs, in the Buoyer Valley—probably as good a location for bees as there is in the State. My bees are in fine condition at this time, though it has been rather dry this spring, but lately we have had plenty of rain. It has been very dry here the last three seasons, but I have always managed to get a very good crop of honey. White clover is entirely dried out.

We have had a great flow lately of the much-despised "honey-dew"—in

fact it is all that our bees have had to live on for weeks past, and all they will have for weeks to come, until basswood blooms. I do not see but what this juice is good enough to rear brood with; bees swarm and do well on it, and it beats buying sugar at the present prices. Of course, we are not thinking of taking any surplus from it—we will take no surplus until July 1, from basswood.

How to Make a Hive-Stand.

I wish to give my plan of a hive-stand. I think that this subject has been sadly neglected by the bee-writers. I make the stand 16 feet long, by taking three common fence-boards, some good oak-stakes, and a few nails; this is all the material necessary to hold 5 colonies. Now drive five or six stakes on a line with the 16-feet length of the board, nail one board to these stakes, having it perfectly level lengthwise; this makes the rear side of the stand. The front side is made in the same way, placing the two far enough apart so that the hive will rest on them nicely. The front board should be dropped enough to give the hive a proper pitch.

The third board I nail on top of the edge of the front board; this lays out flat on the ground, or is supported by a few brick, that is, the outer edge. The front of the hive rests on this board, and it makes a nice place to shake off bees, or for young bees to cluster and romp.

I place these stands 8 feet apart. I have used them for five years, and I must say that they are a success in every sense of the word. They are well adapted to the Langstroth hive. This stand is economical and handy, and it "shapes up" the apiary nicely; it gives a chance to keep down grass, weeds, etc.

Dunlap, Iowa, June 8, 1889.

TWO QUEENS.

Experience with Two Queens in One Hive.

Written for the American Bee Journal

BY F. HONE.

There is plenty of clover here, and basswood will also bloom in a short time. The bees could get an abundance of honey if the weather was favorable; but for several days it has been cold and rainy, so that they can hardly leave the hive. They just commenced swarming, when, about four days ago, the bad weather set in and stopped all. As a curiosity, I will state that several days ago, on examining my bees, I found two queens in one hive—one was balled at times, and at times she was treated friendly. On examining closer, I found one open queen-cell, and so I knew that the balled queen was a young one. The old queen was all right, prolific, and all the time laying eggs; the weather had been good for several days, so that she could have swarmed out, if she anticipated any danger from her daughter. I took the young queen out, put her into a paper match-box, and towards evening I put her with the box in a hive, out of which I had transferred a colony with several handfuls of bees remaining in it yet. Contrary to expectation, it rained in the night, the box got wet, and let the queen out amongst the remaining bees, where I discovered her the next morning, being treated friendly. The bees had not become wet, but had found a protected place in the hive. I introduced her into a queenless colony, and have not looked again.

Sigel, Ills., June 10, 1889.

CONVENTION DIRECTORY.

1889.	*Time and Place of Meeting.*
Aug. 31.—	Haldimand, at Fisherville, Ont. E. C. Campbell, Sec., Cayuga, Ont.
Sept. —.—	Maine, at Livermore Falls, Me. J. F. Fuller, Sec., Oxford, Me.
Dec. 4, 6.—	International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

White Clover Full of Nectar.—S. Burton, Eureka, Ills., on June 6, 1889, says:

I had the first swarm on May 3, and then came a check, so that the bees killed off the drones, and the weather kept so cold that they could not work much; but they have had four fine days to work, and plenty to work on. White clover is very fine, and full of nectar, so that it can be smelled when one goes where it is. I look for swarming to commence soon, as the bees are working very hard now.

Making Colonies, etc.—R. L. Tucker, Lexington, Mo., on June 8, 1889, writes:

This spring I had 140 colonies of bees; by uniting the weak and queenless ones, I had about 120 colonies in good condition. My first swarm came out on May 4; since then I have increased my apiary to 145 colonies. I have had about 50 swarms so far, most of which I put back, taking out most of the brood that was ready to hatch, and giving them old combs instead. The increase comes in by putting the combs removed with bees enough to care for the brood, on a new stand. I take out enough from two old colonies to make one new one. This is the best plan that I have tried for producing comb honey, as it allows the bees the privilege of swarming, yet it does not weaken them enough to take them out of the sections. Honey is coming in nicely from white clover; but we are having too much rain for the best results.

Basswood Bloom and Frosts.—F. Greiner, Naples, N. Y., on June 11, 1889, says:

The cold, wet time which we have had for three weeks, has given the bees a severe set-back. Basswood bloom has been injured very materially by frosts, and, in consequence thereof, the yield from this source will probably be very light.

White Honey Crop.—A. W. Smith, Parksville, N. Y., on June 8, 1889, says:

Bees never wintered better in this locality than they did the past winter; but the weather has been so wet and cold, that they have scarcely made a living from the white clover, so far, and the prospects are that the crop of white honey will be very light.

Have Done Well So Far.—Fred Kanzler, Santa Claus, Ind., on June 10, 1889, says:

My bees have done well so far. I took about 40 pounds of honey from 3 of my colonies. I wintered 11 colonies, and one was queenless in the spring, which I united with another, and it was the first one that furnished me with the sweets.

Doing Well this Season.—E. Briggs, West Point, Nebr., on June 11, 1889, writes:

Bees generally are doing well this season. I have had 4 swarms this spring, from 9 colonies, 8 of which were in fine condition in the spring. I have been keeping bees three years, but the first two years my bees made only a fair living. The BEE JOURNAL, I find, is a very valuable paper in the bee-business; it has been about my only instructor.

Do Not be Discouraged.—C. P. Hewett, Kingston, Wis., on June 10, 1889, writes:

Fellow apiarists, harden not your hearts when the north wind bloweth, and the rain falleth, and the frost cometh; for the cornfield will turn to a field of buckwheat; for the sun will shine and warm the earth. Have your sections also ready, for no man can tell when that day cometh, although our apiaries are in a state of starvation. He that tempers the wind to the shorn lamb, will also temper it for the busy bee, or the bee and lamb must both die together.

Good Season Expected.—Frank Coverdale, Welton, Iowa, on June 12, 1889, says:

It has been quite cool and rainy for the past two weeks, but it is warming up again. Bees are swarming right a long. Honey is coming in fast when it is so that they can be out. White clover is an ocean of bloom, and is well filled with nectar—in fact the season has the appearance of a good one.

Basswood and White Clover.—H. M. Seeley, Harford, Pa., on June 7, 1889, writes:

My colonies are extra strong in bees. I have doubled my number of colonies, and they are working in the sections, although it has been so wet that they have only worked on raspberries three days so far. White clover is beginning to blossom, and there will be a large amount of it; also basswood is budded as full as I ever saw it. I have a small patch of the Chapman honey-plant, which is from seed sent me by the Commissioner of Agriculture; it is now about two feet high, and is looking fine.

Constant Feeding Necessary, etc.—D. F. Park, Athens, Pa., on June 5, 1889, writes:

The prospect for a favorable season is not so bright as it was a few days ago. I wintered 80 colonies on the summer stands without loss. They bred up very early, and strong. My first and only swarm came on May 14, which was two weeks earlier than usual. Another colony soon started queen-cells, and every indication pointed to heavy swarming, and a good honey crop. Two weeks ago it became cold and wet, so that no honey was gathered, and the great excess of bees soon consumed the surplus honey, so that, were it not for constant feeding, my bees would starve, although locust and white clover are in bloom. The queen that came out with the next swarm was very prolific, and her progeny were great workers, so that I carefully saved the extra cells, but none of the young queens have been fertilized as yet. Please inform us if the daisy is a honey-producer. Our bee-keepers here differ on that point.

[Almost every blossom contains more or less nectar, and, in all probability, the daisy has some of it, but the quantity is so infinitesimal that it could not be classed with the honey-producing plants.—ED.]

Bees Doing Finely.—John Haskins, Empire Prairie, Mo., on June 5, 1889, says:

We have had an abundance of rain, and I think that I never saw so much white clover in this country before, as there is this year. My bees are doing finely. My first natural swarm was on May 27.

Warm Weather Needed.—A. C. Loomis, Grand Rapids, Wis., on June 6, 1889, says:

My bees are building up strong, but a month of cold and rainy weather has prevented them from gathering honey. I have been feeding all the spring. I think that this will be a good year, if it gets warmer.

White Clover Yielding Honey.—Chas. K. Bixler, Hoyt, Iowa, on June 6, 1889, says:

The bees are doing well now, gathering a good deal of honey from white clover. The latter part of May was too cold, there being heavy frosts on May 30 and 31. Corn on low ground was frozen down to the ground. White clover was hurt pretty badly, but is out in good condition now.

Foul Brood.—I. H. Shimer, of Decatur, Ills., writes:

I consider the outlook quite gloomy in this section for the bee-industry. Nearly three years ago Prof. Gastman, of this place, discovered foul brood in his apiary, and he has let it take its own way since, until his bees are nearly, if not all, dead. I think that it is in my apiary. I did not suspect it until late last fall. I made a preparation by Prof. McLain's formula, but the mixture was so strong that it killed about half of the bees that were living. After spraying 6 colonies, I desisted, and did not renew my work. I have been thinking, that when the Legislature is in session, probably something could be done to protect our industry.

Abundance of White Clover.—A. F. Sanger, Pilot Grove, Mo., on June 8, 1889, says:

The bees are working well, and are gathering plenty of honey. There is an abundance of white clover.

Frost and Flood.—Frank Waring, Philipsburg, Pa., on June 1, 1889, says:

We had a frost here on the night of May 28, which killed all fruit and tender plants. Last night and to-day we have the largest flood since 1647; doing great damage to roads and bridges, as well as to the farms.

Continued Cold Weather.—C. Theilmann, Theilmanton, Minn., on June 10, 1889, writes:

The cold weather continues, with plenty of rain now. Bees cannot get enough outside to live on. Some colonies have swarmed, but the swarms can do nothing at building combs. Red and Alsike clovers, also timothy, are stunted (nearly frozen) from the long-continued cold weather. Corn was frozen to the ground a number of times; but small grain looks well, and oats look exceedingly promising. White, red and Alsike clovers are in bloom, but all of them look very poor and sick. Linden promises well. My bees are much discouraged.

The "Golden-Rod Ticket."—O. L. Hershiser, of Big Tree Corners, N. Y., writes:

I think that it would be nice for the bee-keepers to vote the "Golden-rod ticket" solid, and try to have it selected. If selected to be the National flower, it will afford it some protection. A good source of fall honey has often been the means of saving large expense to apiarists in the items of food and loss of colonies. I have just read of such of a case, where bees did not gather enough to winter on till after Sept. 1. It is well to look to the sources of fall honey, for such emergencies often happen, and it then becomes important. The ballots can be had at the principal book-stores and news-stands.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of boney. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

DORÉ ART PORTFOLIO.

PRICE, 50 CENTS,

Will be CLUBBED with the AMERICAN BEE JOURNAL, at the low price of $1.25, postpaid.

This magnificent Art Portfolio is in size just 11x14 inches, and besides a picture of Gustav Doré, the great French Artist, it contains the following beautiful engravings: Expulsion from the Garden of Eden—Entering the Ark—Noah Cursing Ham—Samson and Delilah—Ruth and Boaz—Death of Saul—The Judgment of Solomon—Daniel in the Lion's Den—Daniel Confounding the Priests of Baal—The Nativity—Christ Healing the Sick—Sermon on the Mount—The Disciples Plucking Corn on the Sabbath—Jesus Walking on the Water—The Agony in the Garden—Death of the Pale Horse. Seventeen handsome full page plates under one cover.

Scientific Queen-Rearing, as practically applied: being a method by which the best of queen-bees are reared in perfect accord with Nature's ways—by G. M. Doolittle, of Borodino, N.Y. 176 pages.

In this book Mr. Doolittle details the results of his experiments in rearing queen-bees for the past four or five years, and is the first to present his discoveries to the world. It is published in time for every progressive bee-keeper to test the various discoveries which it details, during the present season. Send all orders for the book to this office. Price, $1.00, postpaid. The usual discount to dealers in lots of 10 or more.

Hastings' Perfection Feeder.—This excellent Feeder will hold 2 quarts, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

Alfalfa Clover.—For cultivation of this honey-plant, see page 245, of 1888.—We supply the seed at the following prices:—Per lb., 22c.; per peck, $3.00; per half-bushel, $5.50; per bushel of 60 lb., $10.00. If wanted by mail, add 10 cents per pound for bag and postage.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Clover Seeds.—We are selling *Alsike Clover Seed* at the following prices: $3.00 per bushel; $2.25 per peck; 25 cents per lb. *White Clover Seed:* $10.00 per bushel; $2.75 per peck; 30 cents per lb. *Melilot* or *Sweet Clover Seed:* $6.00 per bushel; $1.75 per peck: 20 cents per lb.—by express or freight.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage.

Standard Atlas of the World.

To any one sending us, direct to this office, **Five NEW Subscribers** for one year, with $5.00 (renewals not to count), we will *present* this beautiful Atlas, by mail, postpaid :

This ATLAS

contains large scale Maps of every country and civil division upon the face of the Globe.

It is beautifully illustrated with colored diagrams, showing the wealth, the debt, the civil condition of the people, chief productions, the manufactures and the commerce, religious sects, etc., and a superb line of engravings of historical interest and value, together with many new and desirable features which are expressly gotten up for this work—among which will be found a concise history of each State.

Price, in best English cloth binding (size, closed, 11x14 inches ; opened, 22x14 inches), $4.50.

Always Mention your Post-Office, County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

A Favorable Word from any of our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble.

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

Simmins' Non-Swarming System, and the AMERICAN BEE JOURNAL for one year, for $1.25. The subscription to the BEE JOURNAL may begin now.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now so CHEAP that no one can afford to do without it.

Honey and Beeswax Market.

MILWAUKEE.

HONEY.—We quote : White 1-lbs., 15@16c.; 2-lbs., nominal ; dark 1-lbs., 12½@13c. Extracted, white, in tin and pails, 9½@10c.; medium, in kegs and ½-bbls., 7½@8c.; white, in kegs and ½-bbls., 8½@9c.; dark, 5@6c.

Market good for the season of year, prices firm for good qualities, and old crop is being closely sold out.

BEESWAX.—25@28c.

June 6. A. V. BISHOP, 142 W. Water St.

DETROIT.

HONEY.—Best white 1-lbs., 14@15c. Market is dull and lower, but not overstocked. Demand slow.

BEESWAX.—22@23c.

Apr. 30. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—We quote: White 1-lbs. 15@16c.; dark, 10@12c.; California white 2-lbs., 11@12c.; amber, 10@11c. Extracted, white, 7@8c.; dark, 5@6c. Our market is in good condition for the new crop.

BEESWAX.—20c.

May 11. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 6½@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.

BEESWAX.—Scarce at 23c. for prime.

May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote : Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.

BEESWAX.—Scarce, at 26½@27½c. for good.

HILDRETH BROS. & SEGELKEN,

June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote : 1-pounds selling from 16@18c.; 2-lbs., 15@16c. Extracted, 8@9c. Sales very slow.

BEESWAX.—None on hand.

June 10. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., the market being quiet, with fair demand from the manufacturers. No choice new comb honey being on the market, we quote 11@14c. as the range for best old and new comb honey.

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.

June 13 C. F. MUTH & SON, Freeman & Central Av.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

Cheap Extracted Honey. — We have a keg of DARK HONEY, weighing 164 pounds, net, suitable for feeding to bees, which we will sell at **6 cents** per pound, delivered on the cars here.

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. June 29, 1889. No. 26.

EDITORIAL BUZZINGS.

Brother C. P. Dadant's Family are afflicted. They have lost their "little darling girl baby"—17 months old, and of just the right age to have captured the hearts of all around. She died on the night of the 16th inst. We condole with the stricken family in their great sorrow and bereavement.

The Tune is Changed Now.—Just as we are closing the forms for this issue, the following comes from J. W. Clark, of Clarksburg, Mo., dated June 20, 1889: "The biggest honey flow from white clover I ever saw is here now. Also the swarming fever is the largest."

The warm, moist atmosphere which now prevails in many localities promises a large yield of nectar, if there are enough bees to gather it. Surely, there is a "silver lining to the clouds" which have prevailed so long.

The Lindens in Minnesota appear to be covered with striped worms—or at least those in Douglass county are. Mr. J. M. Doudna, of Alexandria, Minn., on June 18, 1889, writes as follows concerning them:

The linden honey for 1889 is hopelessly lost. The lindens in this county are covered with striped worms, that have stripped the buds, and in most cases the leaves, from the trees, so that we cannot hope for any honey from that source. Dry weather makes the prospect very doubtful for golden-rod honey. I never saw the lindens bud so profusely as they did this spring. Now it would take a busy man to find one bud among a thousand trees.

We hope that such is not true of other parts of that State. Will our friends please report on this subject at once. We want to know all about it.

The Argument of Judge Williams in the appeal of the Arkadelphia lawsuit, to the Supreme Court of Arkansas, which is given in full in this issue, is a masterly defense of the rights of bee-keepers, and a powerful argument against the claim made by many that the keeping of bees is a "nuisance," to be prohibited by law.

So many persons are frightened by the fact that the bees possess a weapon of defense, and thereupon declare them a nuisance. They never stopped to think that the "sting" was provided by Nature for its defense, and to insure the perpetuation of its kind! If an attack is made upon its home, the sting is its only defense—but it is an effective one! When away from its home it seldom volunteers an attack!

It was asserted by the prosecution, that bees were a nuisance because they were liable to sting children. Judge Williams met it with this unanswerable argument: "It is not true, unless children molest them at their hives, or catch them. But because a domestic insect may sting or hurt under some circumstances, no more makes it a nuisance—*per se*—and liable to prohibition, than the fact that a horse may kick, may run away in the harness and kill a child; or an ox may gore persons with its horns, would make these animals nuisances *per se*."

Judge Williams insists that bees were no more of a "nuisance" than cows and horses, dogs and cats, and demands that bees should have equal rights with them!

Cases are numerous where children have been injured, and even killed, by the kick of a horse, by being run over by a cow, the bite of a dog, or the scratching of a cat. The Judge asks, "Shall the keeping of horses and cows be forbidden by an ordinance?" Certainly not! No one would think of such a thing for a moment! Domesticated bees must have an equal chance with all domesticated animals!

On the Constitutional right to keep bees, Judge Williams says that because bees may sting, some seek to prohibit them, and adds: "It would follow that because cows may gore, dogs annoy the sensitive by barking or biting, or running mad, we will also prohibit them. Because vehicles may annoy by raising dust, or making a noise, or animals may run away in the harness, therefore we prohibit them. No such autocratic or despotic power is necessary to preserve the citizen from real harm and annoyance; and the Legislature could not prohibit the keeping of bees, and could not delegate such power under the Bill of Rights. For the right to acquire, possess, and protect property is secured by Section 2, Article 2 of the Constitution, beyond Legislative and Municipal control; and bees are the subject of property. Nor can the citizen be destroyed or deprived of his life, liberty or property, except by the judgment of his peers, and the law of the land." The blow therefore aimed at Z. A. Clark, is a blow at the Constitution of the United States!

Judge Williams concludes his argument by stating that the authorities cited by the opposing Counsel all sustain his position, which he sums up thus:

1. That the power is not given to prohibit bees by the statute.
2. That bees must at the time and place, and under all circumstances, be a nuisance *per se*, or the ordinance violates property right, and is not sustained by law.

Later.—Since "making up" these forms we have received news by telegraph that we have **won this suit.**

This is **another victory for the Union!** The decision of the Supreme Court is that bee-keeping is a *legitimate business*—that it is not to be likened to a "pig-sty or slaughter-house" (as a Judge of a lower Court decided it, in another suit)—that it is **not a nuisance**, and the City Ordinance against bee-keeping in Arkadelphia is *illegal* and *void!*

The Constitutional rights of bee-keepers are proven by the Union, and **we now have a decision that is valuable!**

Reader, how do you like it! Is the Union worthy of your support? If so, give it, in full measure. More next week.

More Falsehoods about the manufacture of comb honey are given in the Philadelphia *Record* of June 18. Respectable publishers ought to be above such wholesale lying. It is a re-hash of the old Wiley lie a year after Prof. Wiley has acknowledged that there was no truth in it! While a falsehood is flashed again and again around the Globe like lightning, a correction travels only like a lame mule. The *lie* of that Professor never can be atoned for.

Mr. Frank E. Sargent sends us samples of the work of his foundation fastener. It presses the foundation into the wood without heating, and without the use of melted wax. He puts the one-piece sections together and fastens the foundation at the same time, at the rate of from two to four hundred per hour. The foundation is well fastened, and if the work can be done as rapidly as that, he, no doubt, has a "good thing," and should put them upon the market as soon as possible.

The Conemaugh Valley Flood drowned bees as well as men, women, children and animals. Mr. L. S. Fleegal writes to us from Coalmont, Huntingdon Co., Pa., that his BEE JOURNALS have gone astray for four weeks, and that many of his colonies of bees were lost in the flood, as well as about 500 pounds of honey. He adds, "And I came very near to losing my family, too." That the latter escaped, is cause for much thankfulness, even though property and bees are destroyed.

The General Report now is, that bees are getting in a large amount of work in "honey gathering," and the prospect for a good crop has greatly improved during the past week.

GLEANS OF NEWS.

The Weather since the ushering in of 1889 has been exceedingly peculiar. Things have been mixed up generally. We had May weather in February, and then the February weather came in May and June. Such "mixing up" is neither pleasant nor profitable. Many of the colonies of bees which were populous in the early Spring, have dwindled to weak and dispirited ones. Feeding has been practiced quite largely, and many bee-keepers have had "the blues."

Mr. G. K. Hubbard expresses the following as his views of the situation, in the *Prairie Farmer* of last week :

We do not remember of there ever being a spring when bees were in greater need of being fed after the fruit trees bloomed, than this spring. The early part of the season was favorable indeed, and the bees were in prime condition at the close of fruit bloom, but at this writing (June 10), we have had three weeks of cold, wet weather, and not a few bees have actually starved. We noticed the first white clover heads on May 19, and during all this time there has not been a day when the bees would fly freely all day. The hives were then full of bees and brood. Since that time many have starved to death, and brood-rearing has been carried on very lightly. A large colony of bees will consume a considerable amount of stores. In addition to this, the large amount that is used in rearing brood has made a three weeks' stand-still in honey gathering, hard to bridge over, and therefore many bees have starved, and a greater number that have not died, have lived constantly on the verge of starvation. At such times, spring feeding is highly necessary, and the bee-keeper who has practiced it will find himself well repaid if good weather does commence soon.

Fortunately now the weather has changed, and it is warm, and the atmosphere is moist —making the best kind of honey-weather. We expect to hear a marked change also in the tone of our correspondence. It will soon be time to get reports about the yield from the lindens. In western Minnesota the lindens are ruined by striped worms—but we hope that such is not true of other localities. In our next issue we hope to be able to give encouraging reports generally.

Bee-Keeping in Missouri.—Mr. E. Liston, writes as follows in the Jerico, Mo., *Optic*, concerning the honey-resources of that State :

My experience covers a series of twenty years, and in that time I have had two years of total failure—so far as surplus honey is concerned. Although in those two seasons bees gathered enough to winter on.

The apiarist who does not read up in the science, and keep Italian bees, or lets his bees set back in the weeds in some fence corner, would not do so well. He would have many failures in that time. The largest yield I ever had was in 1875, and was 160 pounds per colony average the whole apiary through.

With proper attention bees are profitable all over our county. It is the easiest money I make. But locations are best near our creeks, where there is a plenty of sumac and persimmons on the bluffs, and also the bottom timbers, maples, elms, locust, plum, and many other varieties of wild bloom. In our valley, sand-stone, prairie farms we have a yellow flower (in the fall) commonly called Spanish-needle (Coreopsis), which never fails to produce honey, and of a good quality. Our finest honey is from black sumac, and is as fine as linden or clover.

We are too far south—have too much hot sun—for buckwheat to pay for either grain or honey. I was raised in the mountains in the East, in a buckwheat country, and know all about it. I tried it here nine years and quit.....

All fruit-growers ought to keep bees to fertilize their fruit flowers. We would have much better crops of fruits if we could have more bees in the country to carry the pollen from flower to flower. I am sorry to say there is an ignorant idea amongst many of our people that bees injure grapes and other varieties of fruit, which is in nearly all cases an error, except where the skin is broken first by birds or other insects. I know they will in some cases work on red raspberries when honey is scarce, and berries are overripe. Bees are fruit-growers' friends, and our people should read up and inform themselves before they bear false witness against the fruit-growers' best help. I am engaged in both industries, and read up in both of them, and would there be any consistency in me keeping one to tear down the other ?

Influence of Climate on Nectar.—Albert Vought, of Illawara, La., on June 13, 1889, writes as follows :

Last year I sent to the Commissioner of Agriculture for some Chapman honey-plant seed. He replied that he had none, but instead of that, sent me a package marked "Bee or Honey Clover." I sowed it this spring, and it has been blooming for the past three weeks. I presume it is sweet clover. It resembles clover, grows about 12 or 15 inches high, and has a bluish blossom. I have never seen a bee on it. I do not know how to account for it. I was highly delighted when I received the package, and thought, "Now I have it ; when all things else fail, I will have sweet clover to fall back on ;" but I am doomed to disappointment, as I also am on mignonette, of which I sowed a nice bed. Not being able to procure the mammoth at our local store, I sowed some selected from D. M. Ferry's seed-box. Can you explain why the bees will not work on the two named plants ? Is it because the bees find better pasture ? (they are "rolling" the honey in) or do the plants secrete no honey in this climate ?

The alfalfa is doing nicely ; the Alsike is small and scarce. I sowed both with millet, and expect to cut a crop of hay. Will this injure the young crop of clover, provided it is not cut again, or pastured too close this fall ?

The AMERICAN BEE JOURNAL is an invaluable friend and adviser ; without it I could do nothing. I rely wholly upon it and my judgment. I have not a bee-keeping neighbor within thirty miles, so you see I have no one to go to for advice. I am "the bee-man" in this section.

The only reason for the bees neglecting the sweet clover and mignonette must be the absence of nectar in the flowers. That can be accounted for probably in some climatic conditions. Here they work on it eagerly.

To cut the alfalfa and Alsike clovers once will be no detriment to it. It is often done.

Mr. M. H. Hunt intends to make a large display of everything pertaining to Bee-Culture at the Detroit Exposition, next September.

W. S. Hart, of Florida, is well-known among the bee-keepers of America. He has attended many of our National Conventions, and has been a very successful apiarist and enthusiastic orange-grower. The New Smyrna *Breeze* thus tells of his enterprise :

At Hawks' Park, on the first street back from the river, stands the unpretentious ivy-clad home of Mr. W. S. Hart, a bachelor from the Granite Hills of New Hampshire.

Mr. Hart arrived in this State from the West 14 years ago, and a few years later became one of the three earliest settlers at Hawks' Park. Being of an enterprising turn of mind, and having taken an active part in every advance movement, he has made his mark in this section, and evidences of his handiwork are to be seen in all directions. Both officially and as a private citizen he has contributed largely to the opening up and improvement of roads and streets, the building of school-houses, a Town Hall that is a credit to the place, and many other enterprises calculated to advance the public welfare ; nor has he neglected his own interests, but both as an orange-grower and apiarist has had marked success, and is also the owner of considerable of as good and well-located real estate as can be found on this coast. His system of setting groves, is to put them out in about two-acre lots, leaving a belt of heavy timber between, for protection against winds and possible frosts.

Of these groves he now has eight, with land cleared for one more. Although all of these groves are in good condition, there is one of 202 trees in which he seems to take particular pride, he having picked 18 boxes of oranges from the trees in one month, before they had been two years set.

In his apiary the hives are arranged in long double rows, shaded in the summer by a light roof of palmetto leaves, or the ample foliage and fruit of the Thomas and Tender Pulp grapevines. Not aiming to keep a large apiary, he makes the 100 or 150 colonies pay the profit of a much larger number handled with less care and skill in manipulation. Up to the time of the great freeze, the lowest average yield per colony was 130 pounds of extracted honey, while in 1884, 88 colonies, spring count, gave 23,000 pounds, which filled 55 40-gallon barrels, and made an average of 255 pounds per colony, while the apiary was increased to 117 colonies.

The honey-house is 16x30, with three floors, the attic being used for storing empty hives, the floor below for storing frames, wax, empty combs, and for ordinary manipulations connected with the apiary.

Here comb foundation is made for his own and neighbors' use ; and here is the large Stanley automatic honey-extractor, taking four frames at a time, and reversing them without removal from the can. From this extractor the honey passes into a tank of 1,300 capacity, from which it passes by a pipe through the wall into a large sun evaporator, in which it flows a distance of 110 feet under glass, while the heat of the summer sun cures it perfectly, and puts it in the very best condition for shipping, keeping or eating.

From the evaporator it runs into a movable tank standing on a track below ; as soon as filled this tank is run back to the basement, where the honey is barreled and made ready for market.

Mr. Hart is well-known throughout the bee-keeping world by his writings, and his having served for many years as Vice-President for Florida of the North American Bee-Keepers' Society ; as an active working officer and member of the State Horticultural Society, one of the fruit committee for this State of the American Pomological Society. Also the delegate selected to represent Hawks' Park, New Smyrna and Glencoe in the orange-growers convention at Palatka, on June 5, 1889.

JUNE DAY.

The sky is all dappled with azure and white,
The woodlands are dotted with posies,
The blue-hooded larkspur looks smiling and bright,
And the butterfly flirts with the roses.
And jack-in-the-pulpit is nodding his head,
While the *honey-bees* cheerily hum;
The oriole swings in his snug hammock bed,
And the robin sings June day has come!

The hawthorns are drooping their petals around,
The bumble-bee sighs for the clover.
The shy little cowslip in byways is found,
And the king-cups are sprinkled all over.
The dove softly coos in the shade of the wold,
The woodcock is beating his drum,
The moccasin-flower dons her slippers of gold,
And the cuckoo says June day has come!

The swallows have flown to the chimneys tall,
The thrush to his tryst is winging,
The Eglantine over the old stone wall
Her censers of incense is swinging;
And down in the meadow, amid the green grass,
The crickets so lazily hum;
The daisies nod this way and that, as you pass,
And the south-wind says June day has come!

—*Good Housekeeping.*

AUSTRALIA.

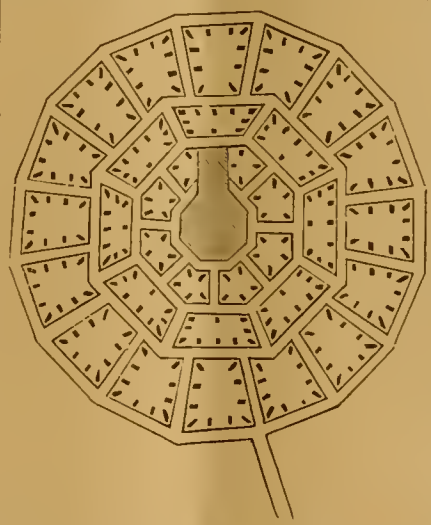
Description of an Antipodean Bee-Establishment.

The *Queenslander*, published at Brisbane, Australia, has an article describing the Æstival Apiary, property of Mr. Æneas Walker, of Redland, which may interest American bee-keepers, and we make an extract below, reproducing in smaller size the large diagram accompanying it:

In all there are 180 colonies, but a considerable number of these are nuclei—that is, small colonies of two or three frames of young bees and larvæ taken from a strong colony and allotted a pure Italian queen; the sale of such nuclei and queens is a speciality. Mr. Walker goes in for more than the production of honey.

Now the trouble of the queen-rearer is, that, when there are many hives in the apiary, the virgin queen, that, on the third or fourth day of her existence flies abroad on her bridal tour, may not sufficiently note which hive she has left, and, upon return, may enter the wrong one, with the certain consequence of being stung to death. Mr. Walker's observations showed him that it is the angle that the face of the hive presents, that is the chief point impressed upon the bee when marking which is its own home. "You may," he told me, "move a colony a few feet to either side, or backwards or forwards, and the outflying bees will not be puzzled to recognize their home; but only turn the face of the hive a quarter turn round, say from facing north, to northeast, then the out-flying bees will be for a time completely nonplussed." He, therefore, designed his apiary on such a plan that not one hive fronts exactly the same point of the compass as another.

It will be seen that a central start is made with an octagon honey-house. Then surrounding this are eight trapezoidal flower-beds, raised one foot above the level of the walks that divide them and that surrounding them. These eight central divisions Mr. Walker distinguishes by marking the first eight letters of the Hebrew alphabet on them, and each contains one strong colony and four queen-rearing nuclei. A walk surrounds this inner circle—this nursery of royalty—and then there is a second circle of eight larger subdivisions. In each of these, ten hives are placed, and a



ÆSTIVAL APIARY.—Honey-house to outer edge of inner circle of hives, 10 feet; thence to outer edge of middle circle, 15 feet; thence to outer edge of the outside circle, 25 feet.

study of the plan will show that no two of these face exactly the same point of the compass.

The entrance to the hive is in every case inwards towards the flower-bed, thus allowing all manipulations to be carried on from behind the hive, and yet the operator not to be standing in front of an adjoining hive, for nothing irritates bees more than a person moving about in front of their hives. This second series of subdivisions is distinguished by letters of the Roman alphabet, B, C, D, E, F, G, H, I, and they represent 80 colonies of bees. A walk surrounds these.

An outer circle of 16 subdivisions, each containing 10 hives, is marked on the plan, but Mr. Walker has not yet occupied these allotments. The total number of tenements that this bee-village will contain is, therefore, 280; and this is quite enough for any one locality, for the range a bee can fly over, seldom exceeds three miles, and honey often gets very scarce on such a limited area. When bees are impelled to fly further to search for honey, the losses that occur on the journey are very great. It is better, therefore, for a bee-keeper to divide his apiaries, than to have too many colonies at one place.

Each of Mr. Walker's hives is placed on a neatly-cemented floor, raised 2 inches above the ground. This floor is made to do duty as bottom-board, and the entrance V is shaped in it just as in the bottom-board of the Langstroth. There are advantages in this cementing, for no weeds grow, it is damp proof, clean, and does not rot, neither can white ants eat it.

The evening that I visited Æstival, Mr. Walker had just mastered one of those extraordinary circumstances which now and again surprise the bee-keeper. The day had been close and hot, especially the early morning; it was the first day after the first rains. Whether this close heat had anything to do with what occurred, I do not know, but I mention it as possible. However, a swarming fever spread through the apiary, and Mr. Walker, as one hive after another poured out its living stream, thought the whole apiary was in the throes of revolution. Finally they settled in one gigantic mass.

Aided only by Mrs. Walker, the owner of Æstival subdivided this mass until he had picked out no less than 24 queens; then, choosing the five best, he allotted the commoners among them.

Mr. Walker is one of those bee-keepers who disdain gloves and a veil, but he did not go and have his portrait taken that night.

"Next morning," he writes me, "I found one other queen at the same place, with a cluster of about a dozen bees around her; therefore, there must have been no less than 25 swarms that issued the day you visited me. Of course a great number of the bees that came out went back to their old hives when they missed their queens, which I had captured. I expected a frightful slaughter among the mixed hives the next morning, but there was very little indeed—chiefly caused, I believe, by the great care I took that none of the lots had *two* queens with them to start the fighting.

"I had a similar experience last year with 7 swarms (my stock then being between 50 and 60), and in putting them up I happened to leave two queens in one lot. The next morning it was quite a case of the 'Kilkenny cats,' as very little more than the two tails were left, in the shape of one queen with a very small company of bees—more than four times the number of bees in the hive being piled up dead in front; they must have been very busy all night."

QUERIES AND REPLIES.

Cleaning a Quantity of Old and Moldy Combs.

Written for the American Bee Journal

Query 639.—What treatment would you advise for a lot of good wired combs in Langstroth frames, all of which contain more or less honey, that have been exposed to the changes of summer and winter for several years, causing the honey to candy, sweat, mold, etc., until the combs seem almost rotten? They are straight, wired worker-combs, in a standard frame, and are very desirable, if cleansed so that they might be stored. I have several hundred of such frames, but have no bees upon that size of frame.—Penn.

Put bees upon them.—R. L. TAYLOR.

If wanted for use, put bees on them. If not, melt them into wax.—J. M. SHUCK.

I think that I should melt them up. Separate the honey, and feed it to the bees, and make foundation of the wax. —A. J. COOK.

If the combs are not injured, allow the bees to clean them ; but if they are filled with webs, you had better melt them up for wax.—J. P. H. BROWN.

I should melt them down, as I do not think that it would pay to attempt to save them as combs for future use. —J. E. POND.

The only rational way to clean them would be to give them to colonies. Can you not arrange them in supers over some strong colonies?—DADANT & SON.

A trial of a few combs in a colony of bees in the spring will show if the combs are still of value ; if not, I would melt them up.—G. L. TINKER.

If the combs are rotten, I would make them into beeswax. If not, one or more at a time may be given to strong colonies to clean up.—A. B. MASON.

If the combs are really rotten, they can only be melted out and thrown away—burned. If they are worth saving, cover them with bees, and let the bees clean them up.—MAHALA B. CHADDOCK.

Give them to the bees—not too many at a time. If you do not intend to use that size of frame, transfer them into the frames that you are using.—C. C. MILLER.

Here, in the spring and summer, I have put such combs into the hives of strong colonies, and had them cleaned and fixed by the bees. In your case, I would put them in a kettle of boiling water, and melt all out.—P. L. VIALLON.

I am afraid that I would not want to give very much for combs, such as you describe! You are truly in a bad "predicament." Now, if it were my case, and the combs were not too badly "rotted," I should proceed to get some bees into Langstroth hives, and then *gradually* give them the combs. This is the only practical way. Have you not a neighbor using this kind of hive? If so, perhaps you could get your combs run through his hives, for a certain per cent. of them.—WILL M. BARNUM.

Select the poorest, and allow the bees to take the honey out ; then melt the combs into wax ; the better ones, store in a dry place until you are ready to put bees on them.—MRS. L. HARRISON.

Shave off the caps and give the combs to new swarms. If you had bees on that kind of frame, the better way would be to give a few at a time in the centre of the brood-chamber of prosperous colonies, using the combs of brood removed to make new colonies.—M. MAHIN.

Cut them out and put the old comb in the sun wax-extractor, and the hot summer sun will soon do the business. You will save the frames, get a nice lot of wax, and some poor honey, that will do for feeding bees.—C. H. DIBBERN.

If I did not intend to use that size of frame again, I would render them into wax. Or they could be transferred to frames of another size, and given to populous colonies in warm weather.—EUGENE SECOR.

Put them one at a time in a good, strong colony of bees, for them to fix up. If these combs are so very valuable, what business have you to have your bees upon some other size of frame? Until you want them to use with the bees, you would better leave them as they are.—G. M. DOOLITTLE.

I would transfer the combs to the size of frames I prefer, and give them to swarms, or exchange them for empty combs in the brood-nest of strong colonies, in the early part of the season, before the early honey harvest begins. Wired combs can be cut out and transferred like other combs.—G. W. DEMAREE.

I hardly know. I would let the bees have access to them, and clean out the honey; and should they then appear worthless, it would probably be as well to cut out the combs and render them into wax. Should you desire to use the frames, wire them the long way, with three strands of wire, and fill them with foundation.—J. M. HAMBAUGH.

Well, really, I do not know. I have seen combs get into what seemed to be a rotten condition. If I had it, I should try the experiment of putting them right in among the bees—good, strong colonies—candied honey and everything, and see what kind of a job they would make of it. Try a few in that way, and then you will know.—JAMES HEDDON.

Old combs, moldy and almost rotten are surely *almost* useless, especially as you "have no bees on that size of frame." It would be better to melt them up, sell the wax, and feed the honey to the bees when necessary.—THE EDITOR.

UNION AND DEFENSE.

THE APPEAL

Of the Arkadelphia, Ark., Suit Against Z. A. Clark.

The following is the argument of the Attorney of the National Bee-Keepers' Union, Judge S. W. Williams, of Little Rock, Ark., in the above-mentioned case, on an appeal to the Supreme Court of Arkansas, in the case of the City of Arkadelphia *vs.* Z. A. Clark :

This case discloses a most flagrant violation of the property rights of the citizen. It seems that Clark, who lived in the outskirts of Arkadelphia, a village of some two thousand inhabitants, scattered over territory enough for one hundred thousand—*a ruse in urbe*—had a few bees, as the record shows (page 1), 35 stands. This gave rise to a persecution unparalleled since the days of the boot and the thumb screw, to force Clark to give up his property.

Those running the city at the time, not content to make a test case, and have the question settled by this Court —after passing this sweeping ordinance, commenced a system of daily arrests, trials without jury, judgments and imprisonments resulting in appeals ; and this is one of a numerous spawn of cases from the same oppressive hot-bed.

At last Clark was compelled, at a great loss, to give up his property, and quit his business of bee-raising and honey-production in Arkadelphia—a principal source of his support—as an alternative to indefinite imprisonment.

When the case came to the Circuit Court, one test case was tried, upon motion to dismiss, and the Court below held the ordinance void, because it did more than regulate the keeping of property—it forbid the owning, or keeping a valuable and useful property in the town ; in effect holding that the bee was *per se*, a nuisance. For if it

was not, then its presence in a town could not be prohibited by any law.

Before proceeding to argue the case, we call attention to the statement of Counsel, at page 9 of their Brief, that it is a matter of common knowledge that they are liable to sting children, etc. It is not a matter of common knowledge, because it is not true; unless children molest them at their hives, or catch them. But because a domestic insect may sting or hurt under some circumstances, no more makes it a nuisance—*per se*—and liable to prohibition, than the fact that a horse may kick, may run away in harness and kill a child; or an ox may gore persons with its horns, would make these animals nuisances *per se*.

I venture the assertion that there is not a town or city in the United States where bees are not kept. I know they are now kept in Little Rock, and have ever been. My nearest neighbors have them. I have kept them in my yard while rearing a family of children, and I cannot recall any instance of an injury from bees. I speak this in the line of common knowledge, which the Court must recognize.

I can recall the kick of a pony, and a cow running over a child—shall keeping of horses and cows be forbidden by ordinance? And while bees have been kept for centuries in towns, it is an argument in their favor that Arkadelphia is the first on record to forbid them. I respectfully submit that while the Court must judicially know the habits of all animals, the "little busy bee" should have a chance with the cow, the horse, the sportive dog, the gentle, purring cat, and even the festive chicken cock. On a par with counsel's skunk-farm story—a pure fiction of Bill Nye.

I may be allowed to refer to the fact that last year two instances are given in newspapers, one authentic at Hot Springs, one elsewhere, not so well established — where children were killed by a chicken cock attacking them. For this reason can the keeping of chickens be forbidden? The bee has no such record of homicidal or infanticidal results. Will these instances, or the fighting of mother-hens over their broods, make chickens *per se* nuisances? Unless bees, under all circumstances, however kept and tended, and in any quantities however small are *per se* nuisances—this ordinance cannot be sustained; for it does not regulate the quantity, or manner of keeping, or make the keeper responsible, as in case of other dangerous animals, and punishable for consequences, but assumes to destroy property in them in Arkadelphia altogether, or compel a man to leave his home and buy another, or quit his business.

The provision of Sections 751 to 764, Mansfield, does not give the city of Arkadelphia power to take a man's property for public use, without compensation, under the power to prevent injury or annoyance. Section 751 invests them with no such *quia timet* jurisdiction.

Because bees may sting or annoy, therefore we prohibit. It would follow, that because cows may gore, dogs annoy the sensitive by barking or biting, or running mad, we will also prohibit them. Because vehicles may annoy, by raising dust, or making a noise, or animals may run away in harness, therefore we prohibit them. No such autocratic or despotic power is necessary to preserve the citizen from real harm and annoyance; and the Legislature could not prohibit the keeping of bees, and could not delegate such power under the Bill of Rights. For the right to acquire, possess, and protect property is secured by Section 2, Article 2 of the Constitution, beyond Legislative and municipal control; and bees are the subject of property. Nor can the citizen be destroyed or deprived of his life, liberty or property, except by the judgment of his peers, and the law of the land.

ib. Section 21. Nor shall property be taken or damaged for public use without just compensation. *ib.* Section 22. This property-right is also protected by the 14th Amendent to the United States Constitution. Stockton laundry case, 26 Federal Rep. 611. The last cited is a case in point. The general law regulating governments of cities, does not give every town council, when, in their judgment, they fear that the keeping of certain kinds of property may annoy or injure, to declare it an annoyance and prohibit it. It must be a nuisance, *per se*, like a mill-pound or a slaughter-house. Many things annoy, and may injnre, that are not nuisances, and cannot be prohibited. Bell ringing, vehicle running, steam-whistles, and railroad trains are often annoying; so are privies and stables. This would not give power to prohibit them, to prevent *quia timet*—the possibility of annoyance or injnry. The viciousness of this ordinance will be manifest, if we keep in view the difference between the power to regulate and keep possession of property, in due bounds, which power is conceded—and the power to prohibit keeping property altogether.

These general clauses of the statute granting powers to towns are to be strictly construed, and this Court has repeatedly held ordinances void, which have been passed under a liberal construction of the general powers given. The first is Waters *vs.* Leech, 3 Arkansas, 114. Thus the right to regulate and license keeping of a dram-shop does not authorize them to prohibit. Tuck *vs.* Waldron, 31 Arkansas, 462. Saloam S. Springs *vs.* Thompson, 41 Arkansas, 456. Nor did the power to suppress gaming-houses empower a city to license them. State *vs.* Lindsey, 34 Arkansas; Goetler *vs.* State Use, etc., 45 Arkansas, 454—and the power given in the act did not give power to declare that which is not a nuisance *per se*, to be one—which was attempted. Little Rock *vs.* Ward, 41 Arkansas, 527. Even the Legislature cannot, by declaration, make anything what it is not. 3 S. W. Rep. 425. 12 Western Rep. 760. 11 Central Reporter, 219.

We may sum up this result: The power to regulate does not give the power to prohibit, though it does give power to license. Russellville *vs.* White, 41 Arkansas, 485; and that the power to prevent and abate nuisance, does not give power to declare that a nuisance which is not *per se* such; and no presumptions are indulged in favor of the rightfulness of an ordinance. A City Council, with full power to declare a nuisance does so at its peril. Americus *vs.* Mitchell, 5 S. E. Reporter, 201. Persons abating a nuisance under a State law must show its existence. Newark & South Horse-Car Co. *vs.* Hunt, 11 Central Reporter 219.

In keeping with the decisions of our own court, to the effect that a City Council cannot by ordinance make that a nuisance which is not such: see the following authorities: Horr & Bemiss, Mun. Pol. Ord. Sec. 252. 24 N. J. Eq. 169.

There is a recent case decided by the Supreme Court of Michigan, in which a city attempted by ordinance, under penalty of one hundred dollars, to punish and prohibit the distribution of hand-bills and cards on any street or alley. The ordinance was held void, and that it was not a proper exercise of the power to clean streets, etc., and to prevent the incumbering of the same, and to regulate the manner in which the streets should be used, and to prohibit and prevent the flying of kites, and all practices, amusements, and doings therein having a tendency to frighten teams or horses, as dangerous to life or property. This was held void in case of People *vs.* Armstrong, by the Supreme Court of Michigan, Jan. 18, 1889, and is reported and commented on in the *Albany Law Journal*, March 9, 1889, with approval.

In that case there was much more pretense for the power than there is in this case; for bees are not named—and the power is claimed here under the general power to prevent injury or annoyance, etc. Mansfield's Digest, Sec. 751.

An ordinance of Grand Rapids, which forbade the marching, parading, riding, or driving upon public streets with musical instruments, banners, flags, torches, flambeaux, or while singing, or shouting, without the Mayor's permission, was void, as prohibiting a thing lawful in itself, and leaving it to an unregulated official discretion. See Frazee's case, 63 Michigan, 396.

All ordinances arbitrary in their terms, and unreasonable, and unnecessarily abridging private rights, are void. 1 Dillon Municipal Corporation, Sec. 253. Clinton *vs.* Phillips, 58 Illinois, 102. Kip *vs.* Paterson, 26 N. J. Law 298. Commissioner *vs.* Gas Co., 12 Penn. St. 318. Commonwealth *vs.* Robertson, 5 Cush. 438.

This ordinance not only does not come within the power granted, but it is also *unreasonable* and *unwarranted;* either is sufficient to make it void. Lynn *vs.* Freemason Building Association, 9 Central Reporter, 360.

Municipalities only have such powers as are expressly granted to them, or such as are necessary to carry those powers into effect. United States *vs.* Ludlow, 9 Central Reporter, 517. Johnson *vs.* District of Columbia, 9 Central Reporter, 653. It is well settled that the general power to prevent annoyance does not give power to declare everything which may annoy or arouse the fears of the sensitive—a nuisance. Nor does the existence of that fact give power to prohibit. See authorities above cited.

It is equally well settled that a city cannot under general power, declare that a nuisance which is not so in fact. Des Plaines *vs.* Poyer, 12 Western Reporter, 760. Stockton Laundry Case, 26 Federal Reporter, 611—where it is held that an ordinance is unconstitutional and void which forbid a laundry in the heart of the city; yet a drying up of stinking soap-suds might become dangerous to health, and annoy; and infected clothing would be more frequent than bee-stings. See also 9 Pacific Reporter, 141.

Mr. Wood, in his work on Nuisance, in the index at page 1021, refers to bees with a reference to title—Dangerous Animals. Under that head, at page 1025, he refers to cases of animals which, by their owners, may be known to injure, referring to page 871 *et seq.*, which recognizes fully the right to keep animals subject to responsibility (*on scienter*) for injuries by those known to be of vicious character.

Strangely enough, of all the cases cited, not an instance of injury by "the little busy bee," or the silk-worm is found; showing how harmless these little insects really are. The habits of the bee lead it to wood, field, and orchard, for pasture, and if it enters a house it is because carelessness has left some sweet uncovered, and exposed, to attract it, and rarely then does it enter a house. Those who thus invite it, are guilty of contributory negligence, and have no right to complain.

I am employed in this case by the American Union of Bee-Keepers, of Chicago, Ills.; and this is the only known case in America or England, where a town has attempted to prohibit bee-culture; and this is a test case to determine the extent of their powers. The burden of showing the nuisance is on the city. Bailey's *onus probandi*, page 233, *ib.* page 460.

A city ordinance cannot be leveled at a mere private nuisance to one or more persons. The nuisance must be public and general in its character, and must be an actual nuisance. Horr & Bemiss, Sec. 252,254. 4 Blackstone's Commentaries, 167. 1 Bishop Crim. Law, Sec. 243. Wood on Nuisance, pages 24, 25, 26, 80, 81, 82. Dillon on Municipal Corporation, Sec. 308.

I undertake to say from a knowledge of the habits of the bee, that it would be impossible for it to become more than a private nuisance, for which the person injured has his remedy, as in case of injury from a vicious animal. The nuisance must not only be public and actual, but substantial. "It is not a mere trifling annoyance with which the law deals in public nuisances," but "real, substantial injuries, that are calculated to offend the sense of men of simple tastes and habits." Conveniences are not balanced. Wood on "Nuisance," page 81.

Even in those acts which are admittedly nuisances, an ordinance is void and unreasonable, where it trenches on private rights and property without corresponding public necessity. Thus, while slaughter houses may be regulated, an ordinance is void which prohibits one from killing an animal on his own premises, unless in a slaughter house—an attempt to drive everybody to one slaughter house. Treford *vs.* People, 14 Michigan, 41. Cannot compel removal of a steam engine from a city not *per se* a nuisance. Baltimore *vs.* Palecke, 49 Md. 217. 33 American, 239. Nor can a city require the owner of a theater to pay a police officer for attendance at every performance. Waters vs. Leech, 3 Ark. 110. In the last cited case, Judge Dickinson, delivering the opinion of this Court, says: "The corporate powers are not only limited, but must be reasonably exercised in sound discretion, and not only strictly within the limits of the Charter, but in perfect subordination to the Constitution, and the general laws of land, and the rights dependent thereon."

In short, I refer the Court to Horr and Bemiss on municipal police ordinance. Sec. 131, for a full review of this point.

Where the instances are given wherein unreasonable ordinances and those in violation of private rights are given, the ordinances must accord with the Federal Constitution, and laws, and with the Legislation of the State.

It is misleading to follow English decisions, because in that country municipal power rests often upon proscription, a source not recognized here. Horr & Bemiss, Sec. 123.

We do not dispute that if there was express power given to enact an ordinance of a certain kind, if constitutional, the discretion or propriety of enacting it, is left to the judgment of the Council, and its decision is final. Horr & Bemiss, Sec. 128. But here is no "express power" given by law to forbid bees; but merely a general power to prevent "annoyance," "injury," etc. Whether an ordinance is within the terms of the power, and is reasonable, the *courts must* determine, and *have* determined in this State, and elsewhere, again and again.

So much for the contention of counsel—that the action of the City Council was final; invoking a correct principle applied to a wrong state of facts. I say to them, show your express power to prohibit keeping bees, or any other animal, or insect, for fear somebody may get hurt, and I will surrender the case, and even waive the constitutional question. There is no such express power given; that is the full extent to which the decisions go. If a power is expressly given by the Legislature, within the Constitution, the decision of the Council, that the power should be exercised by ordinance, is final. Yet this is invoked to bolster up this sweeping *anti-bee ordinance;* about as much akin to the question as a Choctaw Treaty to a Psalm of David.

You cannot stable bees like a horse, but the Court must judicially know to do that, would destroy their value as property, and the Court will judicially know that unless the owners of houses, groceries, etc., are careless in leaving attractions for them, they will not annoy them; and if they do so attract them by carelessness, they cannot complain. The bee, even with these attractions, prefers to pasture among forests, fields, and amidst flowers; so much so, that its habits are crystallized in song, and made subject of poetic simile.

If the people of Arkadelphia will keep the sugar and molasses barrels closed, and the grocers will keep their premises clean, no bee of Clark's will visit them; and from the well-known habits of the housewives of Arkadel-

phia—in perfect order and cleanliness, having no superiors—no bee visits a private house there ; and hurting young fruit and the like, as suggested in the ordinance, raises a suspicion that here is a pretext, and behind the ordinance is a concealed motive. Was it that Clark was making too much out of honey and bees ? or was he competing too sharply with somebody ?

The power given cities must harmonize with constitutional property rights, and must be reasonable and lawful, and not contravene common right. Dillon on Mun. Corp. Sec. 258, 259. And "wherever an ordinance seeks to alter a well-settled and fundamental principle of the common law," or to establish a rule interfering with the rights of individuals, or the public, the power to do so must come from plain Legislative enactment." Taylor vs. Griswold, 2 Green, N. J. 222. Dillon on Municipal Corp. Sec. 55 and Note.

I have already shown that by no possibility can the power be derived from the powers contained in Mansfield's Digest, Sec. 751; which is nothing but a power to punish or abate a public nuisanee, and while the named and defined powers are very full, we look in vain for any power or authority to abate or remove bees, as such ; nor would it be constitutional if there was such a statute. It is only when bees by the place or manner of keeping, or the like, become a public nuisance, and to that extent, and no further, does the general power go. Dillon on Mun. Corp. Sec. 261. Horr & Bemiss, Sec. 252, last paragraph. Emmett vs. Council Bluffs,46 Iowa, 66. Pye vs. Peterson, 45 Texas, 312. State vs. Matt, 61 Md., 292. Davis vs. Clifton, 8 N. C. C. P. 236. Horr & Bemiss, Sec. 144.

The power cannot be given in general terms to abate that which comes under the general definition of a nuisance, in advance of a judicial determination. Dillon on Mun. Cor. Sec. 308 ; and in Gates vs. Milwaukee, 10 Wallace 497. Judge Miller says : "This would place every house, every business, and all the property in the city at the uncontrolled will of the temporary local authority." So the words "injury" and "annoyance," used in Sec. 751, Mans. Dig. have been too often defined in like Charters to need further explanation here. It simply gives a power over nuisances, and does not mean any injury or any annoyance that sensitive or timid or nervous people may imagine or fear.

The bees must be *per se* a nuisance to justify this sweeping ordinance, under which, according to its letter, a man cannot live in Arkadelphia, if he owns bees, no difference where he keeps them ; for personal property wherever kept is in law with the owner. In Harvey vs. Dewoody, 18 Arkansas, 252 ; where the Mayor and other town officers were sued in trespass for tearing down an old house which the owner had permitted to remain vacant and open, and to be used as a privy, until it became unhealthful and dangerous, an ordinance was passed to abate it. To a plea setting up the ordinance and facts on which it was based as a defense, on demurrer to this plea, it was held a good defense.

The counsel for Arkadelphia try to gather comfort from this case, but it would be parallel if the Des Arc Council had passed an ordinance requiring all wooden houses to be torn down, without regard to condition or occupancy, or compensation to the owner. We would then have a case like the sweeping ordinance prohibiting bees, and requiring the removal for the public good, without compensation. Would a plea setting up an ordinance requiring all wooden buildings to be destroyed, have protected the officers in the Dewoody case ?

I shall not attempt to follow the learned counsel, or review their authorities ; as far as they have any bearing on the case, they sustain my position : 1. That the power is not given to prohibit bees by the statute. 2. That bees must at the time and place, and under all circumstances, be a nuisance, *per se*, or the ordinance violates property right, and is not sustained by law.

I have not stopped to criticise the manner in which the ordinance is brought in the record. It is the basis of the action, and by law must be filed, at least in the Circuit Court, for the Court cannot take judicial notice of it. It must be read at the trial, and brought on the record as the basis of the suit. Abbott's Trial Evidence, page 770. Mansfield's Digest, Sec. 2,835.

I suppose, as no point is made in argument upon the motion of appellant to dismiss the appeal, that it was thought to be unnecessary to argue it. Cardon's testimony was taken upon that motion, to prove merely that an appeal was in fact prayed, and to make him amend his transcript, and the Court overruled the motion to dismiss the appeal.

Appeals from Mayor's Courts regulated by Mansfield, Sec. 2,432, 2,435, 2,436, required nothing but a bond ; Perrin *ex parte*. 41 Ark., 194, the jurisdiction of Justice of the Peace ; appeal from Mayor taken in the same manner as from Justice. Mansfield, Sec. 797. This is a *quasi criminal* proceeding ; if so, the appeal was rightly perfected. But if governed by civil code, then it is not to be dismissed for informality. Mansfield 4,141 mode of appeal in civil case, 4,134, 4,135 ; and it was amendable. But all that was required was the filing of the bond, as the proceeding was criminal.

It is desired that the Court pass upon the question, however, for the profession are in great doubt as to what is meant by appeal from Mayor, as in case of Justice of Peace, as provided in Sec. 797. In view of the fact that there are two modes of appealing from a Justice—one by above Sections 2,432, 2,436, in criminal cases ; the other, in civil cases, by Sections 4,134, 4,135, Mansfield, which differs from the mode of appeal in criminal cases. I submit that when the Mayor sits in a misdemeanor case, whether for violating an ordinance, or a law, the appeal must follow criminal procedure. If he sits as a Justice of the Peace in a civil case, the appeal must be taken according to Sections 4,134, 4,135.

[For editorial remarks on the foregoing Argument, see page 403.—ED.]

UNSEALED BROOD.

To Prevent the Swarms from Decamping.

Written for the American Rural Home
BY G. M. DOOLITTLE.

Will unsealed brood prevent swarms from decamping ? is a question often asked, and one which is often answered in the affirmative. I claim that it will, under certain conditions, while under other conditions it is no preventive whatever, but, on the contrary, rather increases the tendency of swarms to decamp. Since this plan of giving unsealed brood—to make swarms stay in the hive in which they were put—was given to the public, I have closely watched the bee-papers for reports, and I find that more reports are given of swarms going away where brood is so given, than of those where the writer thought that the brood helped his swarms to stay in the hives that they were hived in.

Previous to 1871, I had never clipped any of my queens' wings, and I was often fearful that my new swarms might desert the hives that they were placed in. During the spring of that year, I read that a frame of unsealed brood placed in the hive at the time of hiving, was a sure preventive of a swarm's decamping. This was read with enthusiasm, as here was a plan by which my fears could be entirely removed. Consequently, when my first swarm issued, I hastened to get a frame of brood in all stages which also contained some honey to start them in housekeeping, as Elisha Gallup, that

veteran bee-keeper, used to tell us that we should do.

They were hived about 2 p.m., and I went to bed that night feeling that my first swarm of the season was well provided for, and would be sure to stay. The next morning I took a look at them, and went into the field some distance from the house to work.

At about 9 o'clock, the cry, "Bees are swarming," was heard, and upon reaching the bee-yard, the new swarm was seen going for parts unknown. My lips were bit, as I thought of some appropriate words to say about the one who had recommended this plan, still I never put those words in print, although I thought the author of this plan of keeping swarms from absconding, deserved a good chastising.

I then resolved that in the future I would keep the wings of all of my queens clipped, which was done without delay. Since that time I have often hived swarms, and given them brood by way of experiment, and have also given brood to swarms made by dividing, and had many of them come out, but their queens could not fly, and so of course they could not abscond. Probably three-fourths of the swarms hived in this way have stayed and worked all right, yet not one in fifty hived in an empty hive has bothered me in attempting to leave, which proves that the brood was, on the whole, no preventive, but, on the contrary, an incentive for the bees to leave the hive.

But, says one, "Bees ought not to leave unsealed brood, as it is contrary to their nature to desert such." Let us look into this matter a little, and see if this claim is correct. When all prime or first swarms issue, they leave brood in all stages in the parent hive, from which they came, whether contrary to their nature or not, and in giving the frame of brood to swarms having the old queen with them, we place them in exactly the same condition, as far as this frame of brood is concerned, in which they found themselves immediately before they swarmed. It is evident that the prime swarms issue because there is a prospect of more bees hatching than are needed to make a fairly prosperous colony, which, with the instinct that is implanted within them, "to multiply and replenish the earth," causes them to swarm. By giving them brood we place the hive in a similar condition to what the one was which they left for the purpose of getting away from those conditions. Is not this plain?

Upon examining hives with brood placed in them, from which a swarm had tried to decamp, I find that they will have two small pieces of comb built, one on each side of the frame of brood given, while queen-cells have been built upon the frame of brood in which the queen has deposited eggs; thus showing that tthey consider the conditions the same, or nearly so, as they were in the parent hive from which they had issued the day previous.

In these cases of desertion, there are nearly bees enough left to protect the brood in the frame, which also shows that they swarm under nearly the same impulse which was upon them when they first left their parental roof. This being the case, when is brood ever a preventive to swarms' absconding? Swarms having virgin queens issue from a plurality of queens in the hive, and not because the hive is becoming over populous; besides, such swarms never leave any unsealed brood behind, without the interference of man. If, now, they have unsealed brood given them, it secures to them the means of rearing another queen, and as such swarms are always smaller than prime swarms, and the queen will not get to laying in nearly a week, this brood is to them a means of safeguard against accident when the queen goes out to be fertilized.

For the above reason it is always best to help such small colonies along a little whenever they are hived, for it not only prevents their leaving a positive means of getting a queen (should the one they have be lost before she gets to laying), but the brood so given helps them to get to be a self-supporting colony much sooner than they otherwise would be; for the few thousand bees which will hatch out of this comb thus given, are a great help, coming as they do in a time when they are the most needed.

In the above we have the true secret of giving brood to swarms when hived, always giving such as have virgin queens, brood, and withholding it from those which have the old or laying queen. This lack of discrimination on the part of those who have recommended the plan, is what has caused much of the trouble in the past.

Borodino, N. Y.

NEW YORK.

Report of the Erie County Bee-Convention.

Written for the American Bee Journal

BY O. L. HERSHISER.

The first regular meeting of the Erie County Bee-Keepers' Association met at East Aurora, on June 15, 1889. The meeting was called to order by President Charles Penton.

After the reading of the minutes of the previous meeting, it was decided that each of the five counties adjoining Erie county be divided into four districts, and a Vice-President chosen from each district. The following Vice-Presidents were then chosen: E. D. Keeney, of Arcade, for the southwestern district of Wyoming county; Milo Bundy, of Angola, for the southwestern district of Erie county; U. E. Dodge, of Fredonia, for the southwestern district of Chautauqua county, and Luther Corry, of Yorkshire Corners, for the northwestern district of Cattaraugus county. The election of other Vice-Presidents for the remaining districts was deferred until the next meeting.

AFTERNOON SESSION.

The following question was propounded, and discussed:

"Can more honey be secured by allowing bees to swarm, than by preventing them from swarming?"

The opinion prevailed that more honey could be procured by allowing the bees to swarm naturally, and then take advantage of the impulse to work, which prime swarms always have. After the bees have swarmed, the hive from which the swarm issued should be moved from its place, and another hive (of the same pattern as the old one) and the swarm should be placed where the old one stood; thus securing all the old working bees in the new colony. The surplus sections should then be removed from the old to the new colony, and a laying queen introduced to the old colony. As all the bees in the old colony are young, no danger will result in introducing the queen.

Italianizing—Laying Workers.

"What is the best method of Italianizing an apiary?"

Mr. Keeney said: "Buy a good Italian colony, and rear queens from it to Italianize the apiary. The colony should be kept, if possible, out of reach of other races of bees. It is much better to rear drones from one colony, and the queens from another. This would necessitate the purchase of two pure Italian colonies."

"Has any one present ever seen a laying-worker?"

In the discussion which followed, it appeared that no one present had ever seen laying-workers, and there was a division of opinion as to whether they really existed. Some thought that what are supposed to be fertile workers, were really nothing more than queens so poorly developed as not to be distinguishable from a common worker. Nearly all had seen the results of laying-workers. Experiments will be conducted, and reports given at the next meeting, to prove as

to whether or not there is such a thing as a laying-worker.

Rev. H. M. Brown then read a very interesting essay on "The Bee's Place in Nature." The essay was full of interesting facts regarding the natural history of the bee, and was listened to with great interest.

Mr. S. S. Sleeper followed with a very interesting historical sketch of the various societies of this county, devoted to the interests of the husbandman. He predicted for the Bee-Keepers' Association—the youngest of them all—a full measure of success and usefulness.

After a short discussion on "Queen-Rearing," the convention adjourned to meet in Buffalo, on Thursday afternoon and evening, Sept. 5, during the International Fair. By having our meeting at this time, we hope to meet some of the noted bee-keepers of the country, and have a social and interesting time.

O. L. HERSHISER, *Cor. Sec.*

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 20.—Northern Illinois, at Guilford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Dec. 4, 6.—International, at Brantford, Ont., Canada.
K. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of futura meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

One Week's Work.—W. T. F. Petty, Pittsfield, Ills., on June 17, 1889, says:

The record of one colony of bees in my apiary, commencing with Sunday, June 2, is as follows: Sunday, 20 pounds; Monday, 12 ponnds; Tuesday, 6 pounds; Wednesday, 10 pounds; Thursday, 10 pounds; Friday, 10 pounds; on Saturday it was rainy, and consequently I took none from the colony. The total is 68 pounds.

Heavy Rains—Swarming.—Mr. Henry Willson, Clinton, Ills., on June 18, 1889, says:

We are having heavy rains every week now. White clover is coming out finely, where it had a start. Bees are working in the sections, but they are doing little so far, except to swarm.

Honey by the Barrel.—E. Stahl, Kenner, La., on June 17, 1889, says:

Bees have done finely this season. I started in the spring with 300 colonies, and increased them to 800 colonies, and have taken, up to date, 23 barrels of as fine, clear honey as can be found anywhere in the United States; and I am yet busy taking off more honey. I expect by the time the season is over, to have 50 barrels. My bees are all kept in one apiary, at home. All the barrels that I fill, hold nothing less than 51 or 53 gallons of honey. Who can say that this is a bad season yet?

White Clover is Thick.—A. R. Simpson, State Line, Ind., on June 15, 1889, says:

The recent rains have started the white clover up thick, and if we have the right kind of weather from this on, I think that we will have a good honey-season.

Spring of 1889.—S. E. Bowen, Shaytown, Mich., on June 15, says:

Bees did quite well the "first spring" of 1889, in this locality; but the "second," which I hope is past, starved out several colonies for some of my neighbors. I had one weak colony to which I fed syrup, and it is all right now.

Profuse White Clover Bloom.—Hiram J. Ward, Farmington, Kan., on June 10, 1889, says:

My bees have not paid very well for the last few years, yet they bid fair to do well this year. I have the supers on, and some colonies have them partly full. I will begin extracting to-morrow—all from white clover. It is very plentiful, and the bloom is profuse.

Enough Bloom, but no Honey.—Telah C. Whitney, Athens, N. Y., on June 17, 1889, writes:

A year ago last spring I sowed a little piece of alfalfa clover, also some Chapman honey-plant seed that I got from Washington. The alfalfa clover is in bloom, and has a kind of purple clover head; I have not seen a bee on it yet—all I can see that the bees work on, is raspberries and asparagus. There is plenty of white clover in bloom, but not a bee have I seen on it yet. I have a stalk of buckwheat in full bloom, right in front of one of my hives, and I have never seen a bee on it. It is very wet here, and bees are gathering no honey. A second swarm came out a week ago yesterday, which I put back; on Monday I looked into the hive, and I could not see as much as a drop of honey; so I fed them about two pounds of granulated sugar syrup, and let them go at that. They seem to be doing very well now. I have only the first swarms, as I put all second swarms back. I lost one large swarm; after hiving them, all went in nicely, and I went to dinner; when I returned, the bees were gone.

First White Clover Bloom.—C. H. Dibbern, Milan, Ills., on June 17, 1889, says:

The bees are now swarming freely, and are gathering honey from white-clover. My first case of clover honey was all capped over, and ready to come off the hive on June 16. With good weather, our prospects are quite flattering for a full crop of very fine honey.

Good Harvest Expected.—J. L. Comstock, Sac City, Iowa, on June 17, 1889, says:

I put 36 colonies into the cellar on Dec. 7, 1888, all of which came through all right except three, which were queenless, and were robbed by the others, leaving 33 good colonies. White clover never looked so promising as at the present time, in this locality, and my bees are in fine condition to work on it. Basswood is just full of buds, so if nothing unfavorable happens, we can look out for a good harvest for the bees.

Report of the Will Co., Convention.—Gastavus Kettering, Secretary of the association, sends the following report:

The Will County Bee-Keepers' Association met on June 15, 1889, at Monee, Ills. The meeting was called to order by President A. Wicherts, and Gustavus Kettering, acting Secretary, read the minutes of the previous meeting, which were approved.

The following officers were elected for the ensuing year: A. Wicherts, President; and Gustavus Kettering, Secretary. As to whether there was any profit in bee-culture within the last two years in this neighborhood, it was reported that there was not much; that the weather had been too dry, especially in the year 1887, which killed out our white clover—the best honey-plant in this vicinity. The question, "What will be the prospect for bees and their keepers this year?" was dis-

cussed, and a majority thought that bee-keepers would be all right, providing that the wet weather would continue a few days longer, and assist the white clover, which is now coming up very thickly, which would make the bee-pasturage as good, if not better, than heretofore. It was decided that the President and Secretary call the next meeting the latter part of next September; the date and place to be announced in the AMERICAN BEE JOURNAL, and also to notify each member by postal card. The convention then adjourned.

Hives Boiling Over with Bees.—A. M. Day, Bowling Green, Mo., on June 15, 1889, writes:

My hives are boiling over with bees, and I never saw as much honey in the fields; no matter what kind of weather we may have, it will last over a month. My 42 colonies are all working in the sections, and some of them need tiering up. I have "hit the nail" this year—have doubled my bees, and will average $10 per colony on honey.

Very Rainy Weather.—E. W. Councilman, Newark Valley, N. Y., on June 15, 1889, says:

We are having a bad time here for bees and honey. Day before yesterday I had the first swarm, yesterday three swarms, and to-day one. Bees commenced in the sections two weeks ago, but have as yet accomplished nothing, on account of cool and rainy weather. For over two weeks, all kinds of farming has been at a standstill, on account of the rain. A neighbor 82 years old says that he has never known so wet a time. So bees must necessarily be kept back in their work.

Storm-Warners—Salt for Bees.—W. A. Hodge, Victory, Wis., on June 4, 1889, writes:

1. Do bees have a forecast or knowledge of an approaching change in the weather or cold storm, as do the migratory birds and other winged fowls, such as geese, ducks, etc.? In cleaning out my cellar, I put outside a barrel of cucumber pickles, put up in salt or brine, and the bees are swarming on it as they would on honey. Will they kill themselves, or not? 2. Will bees use enough salt or brine to injure the young brood, if placed where they can have as much as they will use? We had some very cold weather for May. White clover is a very heavy crop with us; the roadsides and fields are nearly white with it, but the bees do not seem to notice it—perhaps the cold and wet we have lately had is the cause. There seems to be no honey in it as yet. We had three or four quite hard frosts the last days of May, that killed corn, beans and tomatoes; but I think that our small-fruit crop will be large. Bees are working on blackberries and raspberries very strong. I have about five acres in small fruit, all loaded down with fruit, and with that and my bees I expect to be kept out of mischief for awhile.

[1. Yes; bees are sagacious storm warners. On the approach of thunder-storms, gentle bees sometimes become irritable, and will attack even their usual attendants. Anticipating a drouth, they have been known to store more water in their combs than usual.

2. Bees often hover over brine, and will dig into sawdust where brine has been thrown. They need some salt, but there is no danger of their taking enough to injure the brood from the pickle-brine mentioned. Salt is often scattered in the hives, and on the ground outside to drive away ants and moths.—ED.]

Two Colonies in One Hive.—F. W. Harvey, Mt. Auburn, Iowa, on June 12, 1889, writes:

If 2 colonies of bees should be placed one above the other, with but the lower entrance, each colony having its own queen and brood-combs, and separated by a honey-board that would keep the queens apart, would the bees affiliate and use the lower entrance? Our 220 colonies are just aching for something to do. There are acres of Alsike in bloom, but no honey. I am with Dr. Jesse Oren, learning the practical part of the art.

[All the bees of one colony would use the one entrance, without doubt, even if there are two queens in separate apartments—but trouble may come from one queen becoming aware of the presence of another, unless they may be a mother and daughter.—ED.]

Prospects Never Better.—Byron Iiams, Worcester, Mo., on June 17, 1889, writes:

The weather is fine, and bees are booming. White clover is the finest for years here. Bees got a good start on it from May 20 to the 27th, then rain and cold weather interfered until June 3, when everything became fair and lively, and so continues. My 24 colonies wintered on the summer stands without any loss, and have increased, by natural swarming, to 42. I have extracted 200 pounds of honey, and have some 400 or 500 pounds now ready to take off. The prospects were never better here for a honey crop. Spanish-needle—our source of the main and sure honey crop—carpets all fence-corners and waste-places. You can look out, Mr. Editor, for another "fabulous" report from this direction, when the season is over; and I would like for "Ye Editor" to peep into my honey-house about that time.

Unfavorable Weather, etc.—D. Millard, Mendon, Mich., on June 10, 1889, says:

Bees in this locality wintered with trifling loss. They have bred up strong, and a few swarmed in May. On May 29 a severe rain-storm set in, and on May 30 it snowed nearly 2 inches, followed by sleet and rain that lasted for 2 or 3 days; after which the weather brightened up, but it has been wet and cold up to date. Colonies are strong, but very short of honey. Should it turn warm again soon, the prospect for a crop of honey would be good.

Cold and Wet Weather.—V. N. Forbes, West Haven, Vt., on June 14, 1889, writes:

Bees in this vicinity generally came through the winter in excellent condition, and the very warm weather of April was favorable for their building up rapidly; but that was followed by very wet and cold weather the latter part of May, which told seriously on the bees. Fruit-bloom did not amount to much for the bees; raspberries were loaded with bloom, and honey, too, but the cold and wet of the last three or four weeks has very nearly caused a failure from that source, and that is a serious one, as we depend largely upon the raspberries for the bees to get filled up, and ready for the clover. There is a good show of clover, and if the weather is as favorable as for the last three or four days, we may have some honey yet.

An Old Bee-Keeper.—C. W. Hellems, St. Catherines, Ont., on June 11, 1889, writes:

Last year was the poorest one for honey that I have ever seen. I have always kept bees in a small way, ever since I have kept house, which is now over 51 years, and I was about the first one in this section of the country that

made use of the Langstroth improvements in movable-comb hives when they first came out, and I found it a great advance over the box-hive. I found a description of them, at that time, in the *Scientific American*. Bees are not doing well here this season yet; the weather has been very cool and wet so far, but to-day it is quite warm, and bees are taking in some honey. I am now in my 81st year, and my sight is rather poor; I have thought that a "magnifier," like the one described on page 381, might help me some in looking for bees' eggs.

Bee-Culture and the Weather.

—Marion Miller, Le Claire, Iowa, on June 10, 1889, writes:

The spring in this part of Iowa was very favorable for bee-keepers—the weather was nice and warm very early, and at the close of fruit-bloom all the hives contained more honey than usual at that time of the year; but the weather changed to cloudy, rainy and cold, and remained so for about four weeks, during which time the honey contained in the hives was nearly used up—in fact, feeding became necessary to prevent starvation. Since then we have had a few days of nice honey-weather, but the rain has commenced again, and no telling when it will quit. The bee-keepers surely have had, and are having a hard road to travel; for the business appears to depend more upon the kind of weather than almost any other business.

Sweet Clover on the Roadside.

—C. A. Huff, Clayton, Mich., on June 15, 1889, writes:

Will you please tell me whether or not it is lawful for a person to sow sweet clover in the road, on the side next to his own place. As the editor of the AMERICAN BEE JOURNAL and Mr. A. I. Root advise bee-keepers to sow it by the roadside, I took it that I had the right to sow it on the roadside, along by my place, and it is making some talk. People say that it is worse than Canada thistles, and pull it up if it gets on their side of the road. I care nothing about that, but when they want me to pull and dig it up on my side, I am not going to do so, unless I am obliged to, as it does no harm, and I tell them so, but all to no use. There is lots of it in the road a few miles away from here, and I have never seen it spread in the fields.

Bees are in poor condition here. We had heavy frosts in May, and on May 29 and 30 it rained very hard all day, and at night the thermometer was at 40°, and was very cold and cloudy for several days afer the rain; but it is now warmer, and the bees are at work on the clover. A good many bees starved during and after the storm and cold weather.

[As the land to the middle of the street belongs to the owner of the fields, he can sow what he pleases on the roadside, unless it be a noxious weed which is prohibited by law. Sweet clover is neither prohibited nor is it a noxious weed. It will not spread into the fields, and dies root and branch after the second season. To cut it two seasons, before the seed matures, will free the land from it entirely. It is in no manner like Canada thistles, except in that it is an excellent honey-producer.—ED.]

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

Scientific Queen-Rearing, as practically applied; being a method by which the best of queen-bees are reared in perfect accord with Nature's ways—by G. M. Doolittle, of Borodino, N.Y. 176 pages.

In this book Mr. Doolittle details the results of his experiments in rearing queen-bees for the past four or five years, and is the first to present his discoveries to the world. It is published in time for every progressive bee-keeper to test the various discoveries which it details, during the present season. Send all orders for the book to this office. Price, $1.00, postpaid. The usual discount to dealers in lots of 10 or more.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

Honey and Beeswax Market.

CHICAGO.

HONEY.—The old crop is about exhausted, and not any new has been offered, especially is the foregoing applicable to the state of the comb honey market. Extracted, very little demand, at 7@8c.
BEESWAX.—25c. R. A. BURNETT,
June 10. 161 South Water St.

DETROIT.

HONEY.—No attractive honey in the market, and sales are slow at 12@15c.
BEESWAX.—24@25c.
June 22. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—We quote: White 1-lbs. 15@16c.; dark, 10@12c.; California white 2-lbs., 11@12c.; amber, 10@11c. Extracted, white, 7@8c.; dark, 5@6c. Our market is in good condition for the new crop.
BEESWAX.—20c.
May 11. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 6¼@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.
BEESWAX.—Scarce at 23c. for prime.
May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote: Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.
BEESWAX.—Scarce, at 26½@27½c. for good.
HILDRETH BROS. & SEGELKEN,
June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: 1-pounds selling from 16@18c.; 2-lbs., 15@16c. Extracted, 8@9c. Sales very slow.
BEESWAX.—None on hand.
June 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., Demand slow for table use, and fair from manufacturers. Several lots of new comb have arrived, but quality being off, it finds slow sale at 12@14c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
June 22 C. F. MUTH & SON, Freeman & Central Av.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Hastings' Perfection Feeder.—This excellent Feeder will hold 2 quarts, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

Cheap Extracted Honey.—We have a keg of DARK HONEY, weighing 164 pounds, net, suitable for feeding to bees, which we will sell at **6 cents** per pound, delivered on the cars here.

Convention Notices.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. July 6, 1889. No. 27.

EDITORIAL BUZZINGS.

R. F. Holtermann, Secretary of the International Bee-Society, who has for the last five years been in charge of the bee-keepers' supply business of E. L. Goold & Co., Brantford, Canada, and lately edited the *Canadian Honey Producer*, has left for Romney, Kent Co., Ont.

Mr. Holtermann, although only on salary, has, we believe, given first place to the interests of those with whom he has been employed. He will continue to edit the *Canadian Honey Producer* until the end of the present volume. Bee-keeping and store-keeping combined, will occupy his attention hereafter. He writes: "I am going to an excellent locality for clover and an abundance of basswood and excellent fall pasture; no bees at all are kept within three miles, and I believe even four."

The Prospect Brightens for a good crop of honey. As a sample of the many, we give these few lines from C. A. Bunch, of La Paz, Ind., dated June 27, 1889:

Look out for a big crop of clover honey this season. The bees in this neighborhood have been working between showers on red, Alsike and white clover equal to any season that I ever saw.

Mr. Bunch sends us a sample of his bees. They are very fine, large, and bright in color.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

More Falsehoods.—The Chicago *Daily News* of June 27, 1889, contained an article on page 6, which, for misrepresentations and unmitigated untruths "beats the world!" The last paragraph reads thus:

The worst enemy of the honey-raiser is the producer of artificial and adulterated honey. It is easy to adulterate honey, but only recently have men become ingenious and skillful enough to make honey in the comb, both the honey and the comb being artificially produced. The spurious product looks almost exactly like that created by bees, and it is put up in the little square boxes, windowed sides, like those used in hives. It is possible to detect the imitation only by tasting it, by which test anybody who has a tooth for genuine honey can easily detect the fraud. The counterfeit is so skillfully executed, however, that it frequently deceives a novice. A New York man in a restaurant in this city the other night called for honey in the comb, and five boxes were purchased for him at as many different groceries before one of genuine honey was obtained. He then described the method of artificial honey-making, and in conclusion said that he was a drummer for a New York honey-house.

We defy the *Daily News* to bring proof of its foul charges, and we *brand* them as lies without the least shadow of truth to rest on!

There is no such thing in existence as combs *made* of paraffine, or similar substances, and filled with glucose, which the *Daily News* calls "artificial honey!"

There is no such "spurious product" which "looks almost like that created by bees, and is put up in the little square boxes with windowed sides, like those used in hives!"

There is no "counterfeit" comb honey "so skillfully executed that it frequently deceives a novice," or "any other man!"

The silly story, or, more properly, the wilful lie, which the *News* parades in proof of its "comb honey" story, is simply diabolical!

The idea of a New York man in a "restaurant" calling for honey in the comb, waiting there for the "buyer" to go out *five* different times and buy a "box" at five "different groceries," just to please a single guest! New York men do not wait a couple of hours at a meal, for different courses, and especially not for an article to be purchased for them five times in one course!

Restaurant keepers do not undertake to buy at retail for any single eater; they buy at wholesale, lay in a stock, and if anything is called for not in stock, they are so informed, and that ends it!

New York men, and especially "drummers," are too busy to spend so much time, even if restaurant keepers would go out and buy, at five different times, from five different grocers, a single box of honey to accommodate a notional crank! These "drummers" are after *business*—not such foolishness as that!

New York honey-houses do not have *drummers* out to sell honey—especially at this time of the year when the old crop is nearly exhausted, and the *new* crop is not yet harvested!

No "factory" for making the so-called "artificial honey" is in existence, and hence it could not send out such a "drummer!"

No such "artificial honey" with combs "artificially produced" is in existence! If one such "paraffine comb filled with glucose and sealed up by machiney" (as the newspapers so often put it) is produced—yes, even *one* is presented at this office—it can take a thousand dollars, which is offered for the proof of the existence of such an artificial humbug!

Now the *Daily News* should either produce one of those "artificial boxes of honey" that are so plentiful at the groceries that "five boxes were purchased" "before one of the genuine honey was obtained"—or else make an apology and retraction for publishing such villainous falsehoods!

Paris Green on Potatoes.—S. R. Norton, Lemont, Ills., on June 22, 1889, writes this inquiry:

Would there be any danger of poisoning my bees if I use Paris green or London purple on my potato vines, to destroy the bugs? The potatoes are in bloom.

At our request, Prof. Cook replies to this question, in these words: "There is no danger of using Paris green or London purple on potatoes. The bees do not gather nectar from potatoes, and so could not get the poison. Indeed there is no danger of spraying our orchards except when the trees are in full bloom. At that time spraying should never be done."

Comb Foundation is now in almost universal use. Those who object to it, do so principally on the ground of cost. Its use in the brood-chamber pays well in results; but in sections, for comb honey, is where its utility is more manifest. Of course none should there be used but thin, which is made expressly for the purpose. Its use greatly aids shipping—for breakages are less frequent than when only natural comb is allowed.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

Lindens were reported on page 403, to be stripped of buds and leaves in Minnesota. Now we have another report from that State. C. Theilmann thus writes on June 28:

Lindens here are loaded with good, sound buds, which will open in a few days. I have traveled about ten miles this morning through a timbered country, and nearly every linden tree is loaded with buds. White clover is in full bloom also, but we have too much cloudy weather.

GLEANS OF NEWS.

The Paris Exposition.—The Paris correspondent of the *British Bee Journal* has this to say about the Bee and Honey Department:

I may say that only three countries are at all completely represented. These are the United States, who have a general collection grouped together from all the principal manufacturers there; France, with one fairly complete installment, but many of the goods in this are apparently of English manufacture; and Great Britain, represented solely by Mr. Thomas B. Blow, with a large and imposing collection of both appliance and honey and wax, also working bees.

All the collections of bee-keeping appliances are situated in the Agricultural Galleries, which stretch right away from the main entrance of the Esplanade des Invalides to the Camp de Mars. For the guidance of English visitors who may wish to see the various collections of bee-keeping appliances, I would advise that they should enter the Exhibition by the Invalides entrance, which is the one nearest to Paris, and is quite close to the Place de la Concorde. The Pont de la Concorde should be crossed, and the turn to the right taken (opposite is the Chamber of Deputies), and the handsome and imposing entrance is straight ahead.

The Agricultural Galleries commence quite close to this entrance, and are altogether about one mile in length, and apart from bee-keeping are well worth a visit. Mr. Blow's exhibit is quite close to the entrance of the first gallery, and we are quite sure that he will be glad to be of any service possible to any English bee-keepers who may call upon him.

John Y. Detwiler has certainly "raised a breeze" in Florida! He was the first editor of a paper called the *Breeze*, which is published at New Smyrna, and is now in its third year. In its issue for last week, we notice the following:

J. Y. Detwiler, on the peninsula, is engaged quite extensively in bee-culture, and has made the business quite remunerative. He has given the subject a great deal of study in all its branches, and has edited the bee-department of several agricultural periodicals. He was the first editor of the *Breeze*.

Plant-Louse.—H. W. Haag, Pettit, Ind., sends a "bug," and writes thus to Prof. Cook: "I enclose some kind of an insect pest, that is injuring wheat and oats in this vicinity. Will you please answer in the AMERICAN BEE JOURNAL, telling what it is?" Prof. Cook sends the following, which he has prepared concerning it:

THE GRAIN APHIS.—In Indiana it is called, very incorrectly, the "green midge." This plant-louse is very abundant, and often does serious damage to wheat, rye, barley, and oats. Like all the *aphides*, it sucks out the juice, and thus ruins the grain. Dry weather is favorable to the growth and development of all plant-lice, and, no doubt, the exceedingly dry spring—April and May—explains the great abundance of this grain *aphis* this season. It is probable that the abundant rains of June will lessen their numbers and injury. I hope that the rains are in time to prevent any serious mischief.

Although we know how to kill plant-lice, and can always do so by the use of kerosene and soap mixture, yet the very nature of the case prevents the use of this specific in case of this grain *aphis*. There is no way to apply the remedy in this case without doing more harm than good.

This grain *aphis* has often been observed, and has not infrequently done great harm. One comforting fact may be given: This enemy rarely confronts the farmer's success on two successive years.

The Chicago Tribune of Sunday, June 23, 1889, at the bottom of the fourth column, on page 16, contained an article with this heading: "The Busy Bee's Occupation Gone—Paraffine Honey-Comb Filled with Glucose Honey." It then avers that bee-keepers have been guilty of adulterating their honey, and then made a "great discovery," which it describes thus:

This was that glucose, or grape sugar, closely resembled honey in appearance, and was a very fair counterfeit as far as taste was concerned. Then there appeared in the market paraffine honey-comb filled with glucose honey, and the occupation of the bee was gone. The first attempt was simply an adulteration of honey with glucose, and the proportion of the latter was gradually increased until there was little or no honey.

The above, together with the whole article, copied from the Philadelphia *Record*, is *an unmitigated falsehood!* We call upon the *Tribune* to retract it, and thus show its desire, at least, to be just, and treat every honest pursuit honorably. Surely, this is an age of misrepresentation!

Encouraging Words are always welcome: when they come from a lady, they are doubly welcome; and when that lady is one held in universal esteem, its welcome is greatly enhanced thereby. Her Royal Highness, the Princess Christian, is honorary President of the Berkshire Bee-Keepers' Association in England, and addressed to that body, at its late session, the following very encouraging communication which we extract from the *Berkshire Bee-Keeper*, published at Reading, England:

I am glad to hear that the interest in bee-keeping is decidedly increasing throughout the country, and that with the cottager class a more humane method of taking the honey is superseding the old "rough and ready" system. There is a question which I do not think has yet been sufficiently answered, as to how far bee-keeping, except perhaps on a large scale, has been found to pay, and yet no doubt the hope that it will be a source of income, is a great inducement to keep bees. Apart, however, from the "profit-and-loss" view of the subject, associations of this kind do good in many indirect ways. A bee-keeper to be successful must study the habits of bees, and the interest of the subject will well repay him for the time and attention he gives to it.

Again, any scheme which brings persons of different classes together, who would not perhaps otherwise meet, must have a beneficial effect. These County Associations promote good fellowship, stimulate a healthy rivalry, and encourage interchange of ideas. They break down those accidental barriers between class and class which so often prevent one section of society from coming in contact with another, to their mutual advantage.

I have often remarked that sociability seems a special characteristic of bee-keepers; they have interests in common; there is a bond of sympathy between them. The experience and the scientific knowledge of the professional are placed at the disposal of the beginner, who knows that he can always get help and advice; and in his turn he is prepared in after years to assist others in the same way. All such intercourse is most desirable, and is in every way to be encouraged.

I am told that a London Guild has in contemplation the founding of an Agricultural College, and it has been suggested that something might be done in connection with such a scheme to forward the "honey industry." It would give a great impetus to bee-keeping throughout the country, were so important a society as the Mercers' Company to lend its powerful aid to the development of this subject....

The last two bad honey seasons have, I fear, had a very discouraging effect on bee-keepers, especially on those of the cottager class, and something must be done to revive the spirits of those to whom the last inclement season has brought nothing but disaster. I venture to express a hope that the changes that have lately been made in the rules of organization of this association may prove beneficial to the members. I trust that none will be discouraged by past failure. It may be true of bee-keeping as of other veotures, "That there is a tide in the affairs of men which, taken at the flow, leads on to fortune." HELENA.

Cumberland Lodge, May, 1889.

Tiering Up, etc.—J. F. Gile, Basswood, Wis., on June 24, 1889, asks the following questions:

1. Is sweet clover desirable for hay?
2. Will it do to tier-up when comb honey in brood-frames is wanted?
3. I have a nucleus covering five Gallup frames, that is queenless, and to which I have given a frame of unsealed brood at two different times. The last time I examined them, I found three empty queen-cells, but no queen or eggs deposited. What is the cause of this?

1. No. 2. No. 3. It is sometimes difficult to account for the action of bees, not knowing all the circumstances. If they have laying-workers, that may account for it.

Poisoning Bees.—Prof. A. J. Cook, to whom we referred the matter of Legislation relative to the use of London purple when trees are in bloom, in Michigan, writes as follows to us, relative thereto:

You may be sure that I will attend to the matter of Legislation on the London purple question, at the first opportunity. It is a matter of vital importance, and I am glad you are moving energetically. I felt sure you would, as you are always ready to strike when our industry is assailed.

After the first one hundred days, our Legislature is not permitted by the Constitution to introduce new Bills. Thus it was too late to move in the matter with our present Legislature, when my attention was first called to the danger. I have never heard of any loss until this year.

I have again called attention to the matter in the New York *Tribune*. I will do so in other papers.

It is unfortunate that the Michigan Legislature could not have dealt with this matter at the session which closed last week, after a six months' sitting. It passed bills to reduce railroad fare to two cents per mile, and to enact "local option."

Bees Not a Nuisance!—Last week we gave in brief the decision of the Supreme Court of Arkansas in the celebrated bee-lawsuit of the City of Arkadelphia *vs.* Z. A. Clark. We expected to be able to give the decision of the Judge in full, this week, but in this we are disappointed. We have made several applications for a copy of it, but so far have not succeeded in procuring it. We will give it to our readers as soon as it comes to hand.

At present it is enough to know that the National Bee-Keepers' Union has succeeded in making itself felt, and has obtained the first decision on the question of whether bee-keeping can be lawfully construed as a nuisance or not.

The **highest Court** in that State, on an appeal from the decision of the Circuit Court in favor of the bees, has again **decided**

This Rooster Croweth for the Bees, because the Bees cannot Crow for Themselves.

that the pursuit of bee-keeping is legitimate and honorable—that bees are not a nuisance!

We now warn all the "ignorant" and "prejudiced" to keep their hands off—and inform them that bee-keepers have **rights** guaranteed by the Constitution of the United States, **that all are bound to respect.**

The **Decision of that Supreme Court** is a document that will become of great use as **a precedent.** It will be a guide for the rulings of Judges—for the information of Juries—and for the regulation of those who may dare to interfere with a respectable pursuit by law or otherwise!

The National Bee-Keepers' Union, in this one instance alone, has been of great **benefit** to bee-culture, even though it has received but very poor encouragement and support from bee-keepers in general!

Its legitimate work, however, is but just begun, but if it is to continue in the good work, it must be supported both by the financial as well as moral influence of all the apiarists of America.

The General Manager has labored incessantly, without the hope of reward, except such as comes from a consciousness of having done his full duty. Reader, have you discharged your full duty in this matter?

To Stay at Home is Best.

Stay, stay at home, my heart, and rest;
Home-keeping hearts are happiest,
For those that wander they know not where
Are full of trouble and full of care;
To stay at home is best.

Weary and homesick and distressed,
They wander East, they wander West,
And are baffled and beaten and blown about
By the winds of the wilderness of doubt,
To stay at home is best.

Then stay at home, my heart, and rest;
The bird is safest in its nest;
O'er all that flutter their wings and fly,
A hawk is hovering in the sky;
To stay at home is best.

—*Longfellow.*

Some Legends and Superstitions About Bees.

As originally printed by Lippincott & Co., Philadelphia, some 23 years ago, the *Bee-Keepers' Magazine* gives some curious "Legends and Superstitious Beliefs and Ominous Signs" connected with bees, as follows:

I. "A certaine simple woman having some stals of bees which yielded not unto her hir desired profit, but consume and die of the murraine; made her mone to another woman more simple than hir self; who gave counsel her to get a consecrated host or round Godamighty and put it among them. According to whose advice she went to the priest to receive the host; which, when she had done, she kept it in her mouth, and being come home againe she took it out and put it into one of the hives. Whereupon the murraine ceased, and the honey abounded. The woman therefore lifting up the hive in the due time to take out the honie, sawe there (most strange to be seene) a chapel built by the bees with an altar in it, with the wals adorned with marvelous skill of architecture with steple with bels. And the host being laid upon the altar, the bees making a sweet noise flew round about it."

II. "A certain peasant of Auvergne, a province in France, perceiving that his bees were likely to die, to prevent this misfortune, was advised, after he had received the communion, to reserve the Host and blow it into one of the hives. As he tried to do it, the Host fell to the ground. Behold now a wonder! On a sudden all the bees came forth out of the hives, and ranging themselves in good order, lifted the Host from the ground, and carrying it upon their wings, placed it among the combs. After this, the man went out about his business, and at his return found out that the advice had succeeded ill, for all his bees were dead."

From Butler's "Lives of the Saints" we have the following:

III. "The birth of St. Ambrose happened about the year 340 B. C., and whilst the child slept in one of the courts of his father's palace, a swarm of bees flew about his cradle, and some of them even crept in and out of his mouth, which was open, and at last mounted into the air so high that they quite vanished out of sight. This," concludes the Reverend Alban, "was esteemed a presage of greatness and eloquence."

In East Norfolk, England, if bees swarm on rotten wood it is considered portentous of a death in the family.

IV. In Western Pennsylvania it is believed that bees will invariably sting red-headed persons as soon as they approach the hives.

V. A North German custom and superstition is, that if the master of the house dies, a person must go to the bee-hive, knock and repeat these words: "The master is dead, the master is dead," else the bees will fly away. This superstition also prevails in England, Lithuania, and in France.

VI. On swarming is found the following observation in Tusser Redivius 1734, page 62: "The tinkling after them with a swarming-pan, frying-pan and kettle, is of good use to let the neighbors know you have a swarm in the air, which you claim wherever it alights; but I believe that it is of very little purpose to the reclaiming of the bees, which are thought to delight in no noise but their own."

To cure stings:

VII. "Moreover, as many as have about the bill of a woodspeck (woodpecker) when they come to take honey out of the hive, shall not be stung by bees."

VIII. Longfellow, in his song of Hiawatha, in describing the advent of the European to the New World, makes his Indian Warrior say of the Bees and the White Clover:

Wheresoe'er they move, before them,
Swarms the stinging fly, the Alimo,
Swarms the Bee, the honey-maker.

Wheresoe'er they tread, beneath them
Springs a flower unknown among us,
Springs the White Man's Foot in Blossom.

Frank Leslie's Popular Monthly for July has a picturesque and well-illustrated article, entitled, "Into Oklahoma with the Boomers," giving much interesting information about the settlement of the Promised Land, as well as of the adjoining Cherokee Strip. "The Samoa Cyclone" vividly depicts the great naval calamity of last March, which has been compared to the historic destruction of the Spanish Armada. The biographical and natural history papers, sketches of travel, short stories, poems, etc., are numerous and excellent.

QUERIES and REPLIES.

Moving Bees Nearer to the Basswood Bloom.

Written for the American Bee Journal

Query 640.—What difference would it make in the amount of honey gathered in moving bees ¾ of a mile in the direction of basswood and bottom-land, instead of remaining from 1½ to 3 miles away, where they now are?—Illinois.

I should expect, perhaps, one-third more. —WILL M. BARNUM.

I have no facts to found a judgment upon.—R. L. TAYLOR.

I could only guess; possibly 20 per cent. increase.—C. C. MILLER.

Not enough to pay for the moving, as you state it.—G. M. DOOLITTLE.

I have never tried it, but I believe that it will often pay handsomely for the trouble.—EUGENE SECOR.

Perhaps one-third in the amount of surplus from basswood.—G. L. TINKER.

I could only guess, and guesses are not very satisfactory. Only guesses can be given to such questions.—A. J. COOK.

I do not think that it would pay for the trouble.—C. H. DIBBERN.

I have no experience along this line. I should not expect much difference.—J. M. SHUCK.

Not difference enough to pay for the trouble of moving, I should say.—JAMES HEDDON.

I do not think that it would make any great difference in so short a distance.—J. P. H. BROWN.

I would prefer to let them remain where they are, than to move them only ¾ of a mile.—P. L. VIALLON.

At a rough guess, I would say from one-half to twice as much more.—J. M. HAMBAUGH.

I do not think that any appreciable difference would be found; certainly not enough to pay for moving.—J. E. POND.

It might make considerable difference. A neighbor living 1¼ miles from me had his hives filled up with basswood honey one year, when I had none at all.—MAHALA B. CHADDOCK.

It is difficult to say what the difference would be. We have had the best results (other things being equal) where the flight of our bees has not been over one mile, or thereabouts.—MRS. L. HARRISON.

It would make some difference, but how much, could not be determined without many and careful experiments; but ¾ of a mile could not make much difference.—M. MAHIN.

I do not know what the difference would be, but I should not expect much yield from flowers three miles away. One season I got an average of 70 pounds (from 75 colonies) of extracted sweet clover honey, from a locality about 2½ miles away from the clover. —A. B. MASON.

I cannot say what the difference would be in the case you mention, but I know by experience that your bees would do much better work if they were located in the midst of the harvest field. There is more importance attached here than many good bee-keepers seem to be aware of.—G. W. DEMAREE.

It would probably make some difference, but hardly enough to pay for the trouble of moving them the distance mentioned.—THE EDITOR.

Supers with a Bee-Space at the Bottom.

Written for the American Bee Journal

Query 641.—I use the open one-piece sections with the wood strips to rest the sections on; these fit close at the ends, which is not the case if I use the **T** tins. Old bee-keepers tell me that a super is not as good with a bee-space at the bottom, as at the top. Is it not as good? If not, why not?—Bee-Man.

Yes, it is as good.—MRS. L. HARRISON.

I prefer the space at the bottom.—WILL M. BARNUM.

The difference lies in the ease of manipulation.—G. M. DOOLITTLE.

I find no difference as regards the space—but I *prefer* it at the bottom.—J. P. H. BROWN.

I use supers with a bee-space at the bottom. I have had no experience otherwise.—J. M. HAMBAUGH.

It is just as good, but it costs more to make it.—G. L. TINKER.

I do not use separators, and have had no experience with the **T** super. —MAHALA B. CHADDOCK.

I have had no experience with a bee-space at the top of either the super or the hive.—A. B. MASON.

I see no difference, if hives, honey-boards, etc., are made to correspond. I do not think that the bees care.—A. J. COOK.

I prefer a bee-space both at the top and at the bottom. There are many reasons for such, but it would require more space than is allowed here, to explain fully.—P. L. VIALLON.

One reason is, that if a section projects above the edge of the super, as it sometimes will if a bee-space is at the bottom, another super will not fit on top.—C. C. MILLER.

My supers have a "bee-space" in both the bottom and the top, and it seems, to me at least, that it is forever settled that I would not have them any other way.—J. M. SHUCK.

I do not see that there can be any difference to the bees, where the space is; the only questions to consider are economy, availability and practicability. Possibly I do not understand the question, it being rather blind; but I answer it as I do understand it. —J. E. POND.

Because it is very important to have a bee-space at the top of the hive, and the case, so that the cover can be quickly put on without crushing bees. Also, if there were no bee-space between the sections and cover, the sections would be badly glued.—R. L. TAYLOR.

I understand that your sections are side-opening, and I consider such sections no advantage in any way, and do not look so well. There is no difference whether the bee-space is in the top or bottom of the case, so that they are uniform.—C. H. DIBBERN.

I want a bee-space at both the top and the bottom. The one at the bottom should be in the top of the hive, or in the honey-board; and the one at the top should be in the top of the super. Most hives and fixtures are made that way; if not, they should be. The space here forbids giving reasons. —EUGENE SECOR.

All well-made standard hives—I mean the brood-chamber—are made so as to have the tops of the frames a bee-space below the upper rim of the hive; or, as I prefer them and make them, with half a bee-space at the top and bottom, and this necessitates making the cases so as to adjust the sections either flush with the bottom, or with the divided bee-space. It is simply a matter of taste, or a matter of mechanical convenience. I have had cases in all the "ways" in use, and as to the amount of honey stored, I have seen no difference.—G. W. DEMAREE.

No, your super is not a good one. Wood strips are not at all proper for sections to rest upon. If you have a bee-space in the bottom of the super, and one in the top of the hive, you bring two bee-spaces together, and that is simply disastrous. If there is no bee-space in the top of the hive, the wooden rest would be glued to the top of the frames. It is always the best and only proper place for a bee-space, at the top of all brood-cases and surplus-cases. Proper manipulation with the bottom-boards and covers makes this true. There is not space enough to explain it all here.—JAMES HEDDON.

I prefer wood strips for the ends of the sections to rest on. I have strips the width of the sections nailed on the bottoms of the section-cases; these

have openings corresponding with the openings between the sections. Strips the thickness of a bee-space are laid across these slats for the ends of the sections to rest on; but the openings between the slats and between the sections, while corresponding in size and shape, are not one over the other, but the joints are broken. There is thus a double bee-space, *a la* Heddon. The plan works well every way.—M. MAHN.

Bee-spaces should be at the top to prevent the crushing of bees, in all hives, cases, supers, etc., then there is a bee-space between each. — THE EDITOR.

CORRESPONDENCE.

HIVES.

The "Coming" Hive—Prevention of Swarming.

Written for the American Bee Journal
BY GEO. F. ROBBINS.

Mr. J. E. Pond, on page 377, refers to Mr. Tefft's article on page 346, on the "Coming Hive," and proceeds to argue that the "coming hive" "is here." This hive he claims to be the "ordinary Langstroth," made 14½ inches wide, to take a frame holding—in length I suppose—four 4¼x4¼ sections.

Suppose that we agree that the hive is here, in the shape of the "ordinary Langstroth"—that hive *does not* contain ten frames. The ten-frame hive men are in the minority in this day of apicultural progress. It has, it seems to me, been demonstrated quite often enough, that eight Langstroth frames are sufficient to accommodate any queen. Seven frames will usually, if not always, be all that a queen can fill in 21 days. We add one extra frame for pollen and honey, which, with the upper corners of the other seven frames, is ample. To give more room than that, is to have honey stored below, that should go above.

Mr. Pond has, himself, somewhere in the AMERICAN BEE JOURNAL, argued that to get bees into sections, the brood-frames should be close enough together to keep the combs only about ⅛ of an inch in thickness, without cappings, so that they would be filled with brood quite up to the top-bars. I think that I am safe in saying that bees will never fill the combs of a ten-frame hive up to the top-bar. If there is room to spread the brood horizontally, they will fill the upper part of the frame with honey.

I have used eight and ten frame hives, side by side in my apiary for five years, and I would exchange all I have of the latter kind for the former, and pay 25 per cent. "to boot," quickly. They can be contracted and expanded at will, that is true; I am doing that all the time, and I know how it goes. I seldom can use a brood-chamber of a ten-frame hive to its full capacity. I generally have two dummies below; then when I put on surplus arrangements I must have division-boards, or boards to cover a part of the surface of the lower story, as the case may be.

I have had in the two stories, six dummies, with a lot of moth-cocoons wedged in the crevices, and a mouse-nest in the bargain. Dummies, honey-boards, supers, covers, chaff-cushions, *dummies*—over and over, again and again. I am sick and tired of so much lumber. Dummies! Why I have stacks of them, poking them here, tossing them yonder, "toting" them in and "toting" them out. With the hive I have, I could not do without them, perhaps never altogether; but with a hive of the right size—11½ inches wide—the need of them would be reduced more than one-half.

Mr. Pond highly commends this thought of Mr. Tefft, viz: "Keep the bees in one strong colony until after the honey harvest," etc. So do I! It is like many another good thing that we cannot have. I read Mr. Tefft's article about three times. It is a wonderful article. The remark quoted is a sample of much more contained therein. His ideal is a wonderful ideal indeed. I cannot even dream of such an one. Allow me to speak a parable:

A youth dreams: "If I could have all the money I want, a fine, beautiful estate, the prettiest, smartest, sweetest girl in the world for a wife, no pains, no sickness, no cares, no discontents, no work—everything that heart can wish, and nothing to do but enjoy my lovely wife, and eat ice-cream and cake, and never have dyspepsia—oh, how happy I would be." So would I! Mr. Tefft so mixes the actual points of his hive and system with the ideal, that we cannot quite separate the one class from the other; but that he does not possess all his ideal, is pretty evident. If he or any other man can ever "keep the bees in one strong colony until after the honey harvest," and yet "keep the brood-frames full of brood, and no honey in them during the harvest," (especially with Mr. Pond's ten-frame hive) as he says in the same sentence; have reversible frames, brood-chamber, cover, dummies, chaff-hive, and no chaff-hive, and yet have it simple; have a double bottom with tarred paper between the boards—and everything else that he mentions and wants, and yet have it cheap—I hope he will tell me. All these are veritable points of his ideal hive.

"High as the heavens" his "name I'll shout,"
If he'll give me all the good, and leave the bad out.

Seriously, does not every bee-keeper know that to keep honey out of the brood-chamber, *it must be crowded out*? It cannot be done altogether even by contraction, although that will go a long way toward it. If the lower story is large, much of it will be filled with honey and sealed. In any case, when honey is flowing in, an old bee comes in laden with honey, spies a cell from which a newly-hatched bee has lately emerged, disgorges its load, and returns in haste to the cups of nectar it has left behind. To be sure, this may be carried up by the younger bees, but the process keeps cells all through the hive pre-occupied a great deal of the time. That is bee-nature, and no hive or system can change it.

Moreover, just at this juncture—the early part of heavy honey-flow—the hive is fullest of bees, and bees throng the brood-chamber in spite of supers above. Indeed, to get bees above, they have to be crowded—pushed—fairly propelled, like water in a fountain-pump. Think of that, my bee-keeper friends! Consider that well.

Talk, plan, work as we will, the lower story will become crowded, and swarming is the result. The man who works chiefly for extracted honey, may so manipulate as to keep the bees in one strong colony until the harvest is over; but he who produces principally comb honey, never can—unless, indeed, the dreamy future should have such a corresponding reality as a non-swarming bee.

A Lady's Experience Among the Bees.

Written for the American Bee Journal
BY MISS IDA HOUSE.

I have been a silent reader of the AMERICAN BEE JOURNAL for a number of years, but I have seen very little from bee-keepers of this State, and I often wonder why they stand back, and let the bee-keepers from other States do all the talking. So now I am going to set them an example, by telling them what our bees are doing.

I have helped my brother-in-law, Wm. Lossing, care for his bees for nearly six years. He has often asked me to write something for publication, and as I have just finished reading the

BEE JOURNAL, and found no letters from this State, I have concluded to write; and if it is found worthy of publication, I will write again.

My brother-in-law, on page 297, told of his removal from the southern part of the State, to Howard Lake, Minn.; since then we have sold nearly 60 colonies, which leaves us 135, 90 of which are pure Italians. We are equalizing them now, that is, taking frames of sealed brood from the strong ones, and giving to the weak ones. This, I think, will make them all ready for basswood, which will bloom in about three weeks.

Since white clover began to bloom, the bees have stored honey in supers and sections, and if the weather continues pleasant, we will have to begin extracting soon. White clover is very abundant here, and we never had a better prospect for basswood honey than we have had this year.

We are talking of starting a bee-keepers' convention here. I am always glad to read letters from my sister bee-keepers, and I wish there were more of them. I think that bee-keeping is one of the most pleasant occupations that a lady can engage in.

I hope that the golden-rod will be adopted as our "National Flower," as it has always been my favorite.

Howard Lake, Minn., June 22, 1889.

HINTS.

Honey, Extractors, Buying Bees, and Humbugs.

Written for the Massachusetts Plowman

BY GEO. A. STOCKWELL.

There is honey in the market labeled "Honey thrown from the comb by machinery." Every word after "Honey" is superfluous. The honey must be thrown from the comb because it is not found in anything else, and it must be thrown by machinery because there is no other way to throw it. The label on all honey should read, "Honey," simply, not "Pure Honey," nor "Strictly Pure Honey;" if it be honey, it is pure honey, otherwise it is not honey.

Extractors.

Speaking of extracted honey leads to extractors. It is one of the mysteries of the bee-world why a Western manufacturer makes ten or a dozen extractors, varying in size, when one would answer the purpose. The result of placing so many extractors in the market is to confuse the buyer. One man ordering three times by number has not yet been able to get the extractor he wants. The attempt has been made by the manufacturer, apparently, to produce an extractor for every size of frame. Why would not one extractor, the largest, be enough? It would admit all the small frames. This much making of extractors recalls the farmer who cut two holes in his barn—a large one for the old cat, and a small one for the kitten.

Buying Bees.

The best way to begin bee-keeping is to begin by practice and not by theory. You may learn from books, but you must get knowledge by actual contact with the bees. To begin, there must be bees, and how shall bees be bought? A dealer in bees said, "I will sell a colony of bees for three dollars, or a colony for twelve dollars."

In many cases the novice will decide in favor of the three-dollar colony. What is the difference in these colonies? Let us open the twelve-dollar colony. As soon as the covering is removed, bees, bees by the thousand come pouring out. Really the kettle boils over, and so many bees come out that you wonder how they will all get back. And they are demonstrative, too. They are plucky and determined, for they know that they are strong, and they as much as say, "Look out! We are fifty thousand strong, and will not be trifled with."

Now we open the three-dollar hive, A few bold ones come slowly to the top, but the most of them hug the combs, and huddle closer together for they are weak and know it. There is only a small cluster in the centre. As far as immediate results go, the colony is worthless. They have a queen, but there are so few bees that they make no progress in early spring. They will no more than build themselves up in one season. A student might use them in preparing for the next season, but it were better to study a live, kicking, rebellious colony. In any case it were better to buy the twelve-dollar colony.

Lizzie's Periodic Humbug.

The tricks of a New England bee-keeper have been exposed repeatedly in bee-papers and agricultural papers, but the advertisements of this bee-keeper still appear to the beguilement of the unwary, and to their ultimate confusion and discouragement.

The plan of this bee-keeper is to feed an inferior syrup to the bees, and then sell the product as honey. This is fraudulent, and whoever practices it, practices dishonesty. By this plan the bees gather no honey.

Does molasses, sugar or corn-syrup become honey by the bees' manipulation? No. They may be changed slightly, but cannot be honey. A bee-keeper in a New England State produced this kind of "honey" for years, feeding barrels of sugar, or sugar and water, or glucose. The fact was admitted by the bee-keeper himself. Daily the feeders were filled, and the bees kept at home, at work in their own domicile.

This bee-keeper produced in one year 6,000 pounds of honey, or what was called honey. As he kept a large co-operation store, he could sell, or "trade" this sugar and water. That happened several years ago, and it is said that a large quantity of this product is now packed in grocery cellars, a dead commodity. Some talk was made about it, the people found it out, and would not buy. And yet the appearance of this product of feeding was more attractive to the casual buyer than honey.

The bee-keeper referred to in the beginning attempts to popularize apiculture on the basis of feeding a syrup costing two or three cents a pound, and selling as honey at 25 cents a pound—attempts to lead bee-keepers into cheating the people. But the people are not long deceived. They soon learn the difference between honey, and sugar and water.

PAINTED BEES

Used When Hunting Bee-Trees —Working on Clovers.

Written for the American Bee Journal

BY JAS. F. WOOD.

On page 371 of the BEE JOURNAL appears an editorial, headed "A Painted Bee." As I read it, I was reminded of the days when a barefoot boy, I hunted bees in trees all around the neighboring towns, and used vermillion paint to mark the bees, and then they were "timed," to see how long they were gone to the tree. Now this paint was just touched on a bee's back, and it remained there a bright red, as long as the bee lived.

I remember of once marking three bees, and in two weeks, when the tree was cut, and I hived the bees, I saw two of these painted bees. The paint was used in a dry powder, as fine or finer than flour, so you see the bee could fly just as well after being painted.

It might be of interest to some, to know that more depends upon the condition of the atmosphere, as to how long it takes a bee to go and return a certain distance, than the actual distance. For instance, I have known a bee to go 1¼ miles and return, in eight minutes, in a warm day, when the wind did not blow, and in a damp,

windy day it took the same bee fifteen minutes to return.

Red and Alsike Clovers.

There is plenty of clover bloom here this season, but my 40 full colonies have not a pound of honey to the hive. It is so wet and rainy that bees get very little time to work. I have about one-third of an acre of Alsike clover, and I notice that this is visited by the bees much more than is the white clover. Some seasons my Italian bees work on red clover, but this season it is not visited by them. I once saw a field of red clover covered with Italians, and all underneath was a perfect mat of red clover, and this was covered with black bees, and hardly any Italians; while the red clover was not visited by a single black bee. The conclusion that I came to was, that the Italians could reach a little deeper for honey than the blacks, and that the red clover sometimes secretes more honey than others, and then the bees can reach it. Perhaps the petals are shorter in some seasons than others, and this may account, in part, for Italians working on red clover in some seasons, and not visiting it in other seasons.

North Prescott, Mass.

IMPARTIALITY.

Large vs. Small Brood-Chambers Again Considered.

Written for the American Bee Journal

BY W. Z. HUTCHINSON.

The old question of "Large *vs.* Small Hives" seems to be fading in the distance, while that of "impartiality"—has the *Review* editor been impartial?—is bobbing up serenely.

It is an easy matter to go through a book or a magazine, and by making selections give a wrong impression. Mr. Dadant fails to say that the *Review* has contained a few articles favoring large hives. In his revision of "The Honey Bee," he quotes from French authors in favor of large hives. Why not have given a few quotations in favor of small hives? Instead of so doing, he says:

> We take this opportunity of again *energetically* asserting that our preference for large hives is based on a successful practice of more than twenty years, with several hundred colonies in different sized hives, while our opponents could bring forward nothing but their preconceived ideas.

My ideas in regard to the size of hives are not wholly theoretical. I have kept bees for twelve years, and used hives ranging in size from a two-frame American to one holding 33 American frames. Mr. Heddon has used many different sizes of hives: among others he had 30 "long idea" hives, that held 30 frames each, and he used them two years before throwing them away. Mr. Doolittle is well-nigh universally looked up to as a leader, and always "gets there" in the production of honey, and he has for years been pleading for a small brood-chamber.

Adam Grimm has been quoted as "the man who made a fortune out of bees," until a mere mention of the matter leaves a "chestnutty" flavor upon the palate. He used an 8-frame Langstroth hive.

But why multiply examples? And yet, in the face of all this, my opponent asserts that those who argue in favor of small hives can bring forward "nothing but their preconceived ideas."

Even if large hives were my "nightmare," as Mr. Dadant asserts, I fail to see what bearing my preference for the Heddon hive has upon the subject; because, as explained in my last article in the AMERICAN BEE JOURNAL, the Heddon hive is *endlessly large.* No one can be rightfully accused of mercenary motives in advocating either a large or a small hive, as any one is perfectly free to make any size of hive.

Mr. Dadant asks "why I did not quote Mr. Jones, who, after buying the patent (to the Heddon hive) for Canada, abandoned it?" One reason is, that nothing of the kind has appeared for me to quote; and I am at a loss to know why my opponent should ask such a question.

In his first article, Mr. Dadant asserts that a large colony requires no more labor than a small one, and I asked him if he could extract the honey from a large colony as soon as from a small one. This he evades by telling with how few days' work he and Mr. Stachelhausen have produced large crops of honey—all of which no one doubts; but the question is: Can you extract the honey from a large hive as soon as from a small one?

Mr. Dadant says that I have condemned oil-cloths, as I have large hives, without testing them. Large hives I *have* used, quilts I have not, to any great extent, and I said so; that seeing other people use them had satisfied me; and from this, and from correspondence, and from *reasoning* upon the subject, I honestly believed that the quilts would yet be discarded, and said so, and see nothing in such actions that calls for condemnation. In hives with raised covers or "caps," I presume that quilts are a necessity, but this style of hive is being superseded, and with it will go the quilts.

All through Mr. Dadant's article runs a thread of opposition to my "love for the Heddon hive." That the Heddon hive is my preference, I do not dispute. I used and advocated it before I began the publication of the *Review;* and when I became an editor, the question arose: "Shall I now become a 'bump on a log,' or shall I have ideas?" I decided to have ideas, and to express them. If I preferred the Heddon hive, I should say so, giving my reasons; if I thought that the Bingham smoker and honey-knife were superior, there would be no hesitancy in allowing that fact to become known; the same would be true in regard to the Given foundation, four-piece poplar sections, etc., clear down through the category. I would always hold myself in readiness to give reasons for my preferences, or acknowledge my errors; at the same time allowing others the privileges claimed for myself; and when I cannot run the *Review* upon this plan, I shall simply write its obituary, and turn my energies once more to the production of honey.

It is true that I have declined many articles (what editor has not?), some of them from the best writers, and I must continue to do so, unpleasant though it be; but I have never been actuated by motives of partiality, and have never declined one simply because it "advocated large hives."

Flint, Mich.

NEBRASKA.

The Season and Bee-Keeping in Nebraska.

Written for the American Bee Journal

BY CHESTER A. MOTT.

Bees have been a little backward here this spring, on account of cool nights, which we are apt to have through May and the forepart of June. The bees are getting out in the morning now—I do not know how early, but I believe that they go to work before they get their breakfast, or else they get it pretty early, for they are at work before I am out of bed, and all good bee-keepers get out in the morning—if they do not, I think that they should.

Nebraska has not been a very good State for a large crop of honey in the past, although what honey there is, is very nice; but I believe that in the near future, it will be a very good State for honey. White clover is spreading fast, and it grows well; the yards and roadsides, and some of the fields will soon be white with clover; also heart's-ease, smart-weed and milk-weed are plentiful. The propects are good for a big crop.

Bees are swarming in full blast, and the increase will be good. There are about 400 or 500 colonies in this (Lancaster) county.

There are a few box-hives in the county yet, but most of their owner's become tired of them, when they see their neighbors getting more of increase of bees, better yields of honey, and the honey in finer shape, and they bid farewell to the old box, and present their bees with a handy house.

I would like to have this question answered: Is it a good plan to put old black comb into a hive for the bees to breed in?

Emerald, Nebr., June 18, 1889.

[The color amounts to nothing, and unless the cells are much smaller by reason of repeated cocoons being left therein, they are just as good, practically, though we should prefer to renew them when convenient.—ED.]

WATER IN HONEY.

Evaporating Water from Honey in the Cells.

Written for the American Bee Journal

BY HENRY PATTERSON.

Query 636, on page 374, brings out a chorus of "yes." Now before I make my decision, I wish to draw a shadow of the other side. We know well that water will evaporate from honey if kept warm in a dry atmosphere, which can be said of most liquids; and as Mr. Heddon says, it "may absorb water" in damp air; but does this answer the Query? The direct point is, does the water escape from the honey in the individual cell, before sealing?

The thought of wax-secreting creeps in here, which is an unsolved question, as to the direct cause for it. Now if Mrs. Harrison will promise to hold her criticism, I will drop in a thought on a new theory (at least it is new with me).

First, do bees build comb faster from thin honey, than from ripened honey? We notice that bees build thicker comb at times, caused from an over supply of wax, which is readily seen by their bridging and daubing everything inside of the hive. Is this caused from an over estimate on the part of the bees—hardly, I think.

Again, we notice that the first honey that comes in, is always placed low down in the combs; if it is to be evaporated by generated heat, why has not Nature placed it above? Now, will some one say, for convenience for dishing out to the young bee? Prof. Cook tells us on page 375 of the last issue, that it must be digested before the young can receive it.

If we look at the process of securing gum from trees, we find that it is done by breaking cells, and allowing the sap to flow to the surface, allowing the air to take up the water, and leaving the crude gum. This we can see on our peach and cherry trees, caused by insects. Now is it not possible that the secretion of wax is similar? When bees gather nectar, is it not possible for the evaporation to be done by the bees filling their honey-sacs, and clustering so that perspiration will begin, and the heat that the bees generate is for evaporating the water from the wax on the bee, and not for the honey in the cells?

Has any one ever seen bees gather nectar, but what in a very few days they were secreting wax? This will occur in a hive full of comb, as bees have no use for wax only for capping; and in this case, if I am correct, you will find the frames and bottom-board glazed with a substance similar to wax, which, I think, is wax unprepared for comb-building, which is removed with the water as fast as it comes to the surface; and, also, is this not the glue that bees leave on glass, when confined in a room?

If this theory seems plausible, will some one, who is situated so that he can experiment, test it by feeding well-ripened honey, with the bees excluded from water? for if wax is caused by perspiration, force of nature would cause the bees to use water in the absence of it in the ripened honey.

Humboldt, Nebr.

SWARMING.

Bees Selecting a Home Before Swarming, etc.

Written for the American Bee Journal

BY FRANK COVERDALE.

"Do bees select their home before swarming?" is a question that is of at least some importance to the whole bee-keeping fraternity. The loss of a great many swarms is vested here. I do not know whether all swarms send out spies or not, but even inasmuch as one swarm does, we will take it for granted that all that swarm under a normal condition will do the same, though, in my opinion, they do not all succeed before swarming.

For five successive years I placed in a certain oak-tree, a box or nail-keg, and every year except one there came a swarm into these kegs and boxes. As I was plowing corn or making hay each season near this tree, I could see quite easily just about what was going on during nearly all the swarming season. At first I would see perhaps one bee, after that the number would increase, and one not posted would be very apt to think that there was a swarm in the keg. They would usually protect and clean this keg from one to three days before they would take full possession; at other times they would come in great numbers, and in due season disappear, in which case they had been captured, or found more suitable quarters.

Place a keg in each of two trees 40 rods apart, and the same swarm will hunt through both of them, and make their choice. I do not think that there were any chemical changes taking place in these kegs, as Mr. Demaree mentions on page 456 of the BEE JOURNAL for 1888. Nature does not intend to send the busy bee wandering from place to place, just happening to come across a hollow tree or log. Let any who doubt this, do as I have done, and they will be sooner or later convinced.

Swarms that have chosen a new home close by, are very apt, when swarming, to rise high up in the air, and go quickly, never stopping to cluster, as they have a string or trail of bees all the way from the hive, or swarm, to the new home—the less the distance, the more bees on the trail, or the thicker they fly; thus the further away, the better are the chances for them to cluster, for these bees flying back and forth have quite an influence on the swarm. It was such cases as these that so strangely induced me to adopt the method of clipping all of my queens' wings; for there is no one thing pertaining to bee-keeping that puts me more out of patience than to have a portion of my swarms leave me; for in so doing, there goes the profit.

Alsike Clover in Bloom.

I have at present about 20 acres of Alsike clover in full bloom. It grows with red clover, in the proportion of about ¼ Alsike and ¾ red. It promises well for hay, as it grows finely, and just as tall as the red. It grows many sprouts from one root, and looks as if the hay would be superior to the red. The bees take well to it. I sowed Alsike in with all my 40 acres of seeding this spring, that is growing finely.

Welton, Iowa, June 13, 1889.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 20.—Northern Illinois, at Guilford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Aug. 31.—Haldimand, at Fisherville, Ont.
K. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Dec. 4, 6.—International, at Brantford, Ont., Canada.
R. F. Holtermaon, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

SELECTIONS FROM OUR LETTER BOX

Busy Gathering Honey.—R. L. Tucker, Lexington, Mo., on June 24, 1889, writes:

We are in the midst of a busy honey season at last. Swarming is about over, and clover is still in bloom, with linden also, and when the weather is warm and nice, the bees store rapidly. I have taken 1,700 pounds of extracted honey—all clover—from 30 colonies. I am running 90 old colonies, with their increase, for comb honey, and expect quite a nice crop, as they already have over 3,000 sections about ready to take off. I will give a complete report a little later on.

Bees are Booming.—O. B. Barrows, Marshalltown, Iowa, on June 21, 1889, says:

To-day it is cool, and yesterday it rained all day, but before that the bees were booming—swarming and gathering white clover honey. Many colonies have the second tier of sections on, with basswood, buckwheat, goldenrod, Spanish-needle, and all the "back counties" to hear from. Who says the prospect is not good for a honey crop this year?

Good Weather Needed.—Vet Tucker, Shelby, O., on June 24, 1889, writes:

I packed 55 colonies on the summer stands last fall, and they were all in fair condition this spring, except that three were queenless. They built up rapidly until about May 10, when a cold, wet spell set in, which has continued to the present. To-day it is cold, with a north wind, so that the bees can work only a few hours in the middle of the day. During this cold, wet weather, they consumed all their stores, and had to be fed, and as I expected that each succeeding day would bring fair weather, when they could gather stores, I fed only sufficient to carry them a day or two, and of course brood-rearing nearly ceased. In this locality there was an abundant raspberry bloom, and now acres and acres are covered with Alsike and white clover blossoms, furnishing plenty of honey, if the weather were suitable. I have had no swarms yet, and do not expect any soon, though the hives are full of brood. The basswood promises a very heavy bloom, and I hope that I may yet get some honey. My bees are a sample of the bees in this section. They generally wintered well, did well during April and the first of May; many starved in May and the first part of June, but they are getting some stores now. Very few swarms issued, and bee-keepers are generally discouraged.

Bees Doing Well.—S. Burton, Eureka, Ills., on June 24, 1889, says:

Bees are doing well both in swarming and storing honey. I shall have to begin taking off honey next week, I think, if they continue to do as well. I think that they will do better now, as white clover is in abundance here. I have had 22 swarms, and lost one that absconded; it was a second swarm, and a small one at that.

New Honey. — Mr. S. D. Haskin, Waterville, Minn., on June 24, says:

I have just taken off several cases of sections of honey pretty well filled and capped. I have often remarked that Minnesota was not blessed with honey-dew, but this year, so far, it is not snow-flake or golden-rod honey. Bees are swarming cautiously. It is oh, so dry; and yet my bees have done well.

Peculiar Season for Bees.—Geo. Gale, Adams, Nebr., on June 22, 1889, says:

The season, so far as it relates to bee-keeping, has been a very peculiar one here, yet in the main it has been favorable to increase, but bees have stored no surplus, as yet. Crops of all kinds are looking as well as ever I have seen them. Late frosts have not damaged anything except some of the small fruits, and that only to a slight extent. Bloom has been pretty plentiful most of the time, but we have had a good deal of cool and windy weather, so that the bees could not work. I look for a good season yet. The hives are overflowing with bees, but I have had only one swarm from 15 colonies, so far.

Disposing of the Honey-Dew.—P. M. Richardson, Magnolia, Iowa, on June 22, 1889, writes:

Bees came out in good condition in the spring. At present the outlook for a good surplus yield is favorable. Last year, when basswood blossomed, my hives did not average one pound of honey in the brood-chamber; now the hives are full, with some honey-dew in the sections. When honey comes in more freely, to prevent the bees from gathering honey-dew, I will take it off. One of my neighbors has a lot of it sealed in sections—what shall we do with the stuff? Will it do to keep it and feed it to the bees next spring? In 1888 I took off more than 100 pounds of comb honey per colony, spring count. I hope to do as well this year.

[Yes; it can be used for spring feeding, when the bees can fly occasionally.—Ed.]

Reversing and Uncapping.—Mrs. Ada Dorsey, Holliday, Mo., on June 25, 1889, says:

My bees are doing real well, but I have lost several young queens. Please tell me how old a queen has to be to lay worker eggs. Whoever that was that advised reversing a hive and uncapping the honey, ought to have a shaking; for I have just tried it, and lost lots of honey and several colonies. No more uncapping for me! I have had one prime swarm that weighed 12 pounds. How is that for size?

[Queens usually begin to lay when 8 or 10 days old.—Ed.]

The Season in Nebraska—The Union.—James Jardine, Ashland, Nebr., on June 24, 1889, writes:

I put 81 colonies into the cellar on Nov. 20, 1888, and took them out on March 25, 1889. I had 80 colonies in good condition. I kept the cellar temperature as near 42° to 45° as I could. I tried some 20 colonies with a piece of gunny-sack over the brood-frames, and they did finely. I will prepare the most of them that way next winter. I never had so many queens die as early this spring; so I had to give them brood to rear queens. I had lots of drones in some strong colonies to mate with, so I did very well. I never have seen so much honey-dew in May and June as there has been this year. It kept the bees with plenty of food for the young brood. They have been swarming since the middle of May. I am looking for lots of swarms in July, this year. The bees are working on

the sweet clover, mustard, and the sumac at present, and the basswood will be ready about July 1. It looks fine this year, and it appears at present that I will get more honey than I have had in two years. We have had fine rains lately, and everything looks nice. I have two of the Heddon hives to try this summer.

I was happy to see that Mr. Rich, of New York, came out all right in his bee-lawsuit, and his neighbor got the sum of six cents! It seems so strange, to me, that we cannot have more bee-keepers to join the Union. No man can tell when he will get into trouble with such fellows that know no better. I have been told a number of times, that if I was inside the city limits, they would make me move my bees out, as the bees troubled the grocery stores so much; but this year they have not been troubled with the bees, and now they feel slighted. I tell them that I have been getting an honest race of bees, that do not believe in stealing.

Too Cold and Too Wet.—John R. Sample, Elizaville, Ills., writes:

Bees in this neighborhood are not doing any good. In the spring it was too dry and cold for them to get honey enough to breed on; then it commenced raining on May 25, and has rained nearly every day since.

Unfavorable Weather, etc.—John Dewar, Tiverton, Ont., on June 15, 1889, says:

Bees generally came out in good condition this spring. The latter part of April, and up to about May 20, was very favorable for the bees, with no spring dwindling, at least with my bees; but since May 20, the weather has been very cold and wet, so that the bees could not leave their hives. It is now warmer, but still wet. If we should get favorable weather after this, we expect a good yield, as the colonies are very strong.

Selecting a Future Home.—W. C. Steddom, Oregonia, O., on June 24, 1889, writes:

As there has been a great deal written about bees selecting a future home, I wish to add the result of my observations. Some three weeks since, I was expecting a swarm; in my apiary, consisting of about 50 colonies, was an empty hive, and on the opposite side from the hive containing the colony which I thought about ready to cast a swarm. Bees had been at work cleaning up and guarding the empty hive for several days—I think that some of them stayed during the night; by watching them after sundown, when other bees had ceased to fly, I could easily follow them as they would go home, and they went directly to where I expected the swarm. In a few days, out came the swarm, and streamed across the apiary to the empty hive, and were pouring into it before more than one-half were out of the parent hive. What more do we want, to prove that bees do select the future home?

Queens Too Old to Lay, etc.—Wm. Anderson, Sherman, Mo., on June 17, 1889, writes:

I have not seen a better season for honey than this, though it is very backward and late. The rains and cool weather has put the bees back in this part of the country. I have been very much discouraged on account of so much failure in honey and bees, but I see before me a bountiful harvest of honey, though having lost very nearly all my bees with foul brood and starvation. 1. What is the cause of a queen's stopping laying for the space of three weeks? 2. How old is a queen when she is too old to lay, if she is ever too old to lay?

[1. In cases of scarcity of food, queens sometimes stop laying, or the bees will not allow the eggs to hatch until favorable conditions exist.

2. A queen should lay for three years or more, all other things being favorable; but sometimes she becomes sterile from other causes than age.—Ed.]

Bees Eating Brood, etc.—Rev. Stephen Roese, Maiden Rock, Wis., on June 10, 1889, writes:

Up to yesterday, bees in this section of the country were almost in a starving condition, owing to the heavy frosts and cold weather; but since the rain, a few days ago, white clover blossoms have opened, and the bees find something to do. On a careful examination, I found, in spite of my feeding, that all colonies were much lighter than in the early spring, and some were even in a starving condition. One colony I found dead, having had a vigorous young queen, and breeding rather ahead of her stores; six frames were full of sealed and unsealed brood; the latter, it seemed that the dying colony, after all the honey was gone, subsisted upon, judging from the unsealed brood mostly consumed. Has anything like this been known before? Upon further examination, I found that many colonies had made prepartions for early swarming, but in consequence of the cold weather and destructive frosts, they had torn the queen-cells down, and were killing their drones.

P. S.—At this date (June 16) the weather is quite warm, and bees are very busy gathering nectar from white clover and raspberry. The good-nature and cheerful hum of the honey-gatherers is an indication that the hard-times and honey-dearth are over for the present, and the apiarist is looking forward with a good hope that he will be well rewarded for his labor and toil. Many hundred acres of buckwheat are sowed in this immediate neighborhood, and about one-fourth of it is the Japanese variety. I am putting on sections, but I have had no swarms as yet, and do not look for any for eight or ten days yet, as I have built up the weaker colonies by taking brood from the stronger ones.

Starting Again with Bees.—H. G. Heckman, Clark, Dak., on June 19, 1889, says:

I am again trying to begin the bee and honey business, as I have purchased several colonies, and I believe that I can make it a success here in Dakota, but I am more than five years behind the times. I have 2 colonies of pure Italian bees—perhaps the only ones in this (Clark) county. I am living on the edge of a thriving village, engaged in farming, and I am well satisfied with this country. I have seeded two acres to buckwheat, and we have wild mustard and golden-rod, and some other honey-plants.

Chloroform and Swarming.—L. B. Graves, Nineveh, Ind., on June 22, 1889, writes:

On page 823, of the American Bee Journal for 1888, Mr. W. H. Kirby, speaks about chloroform for the prevention of swarming. I would like to know just how he uses it, and just how much. I tried it on two colonies, but it had no effect. I used a cold-blast smoker, and put a small piece of cotton in the muzzle, poured chloroform in on it, and puffed it in at the hive-entrance, but I could not even stupefy the guards. If there is a better way to use it, I would be glad to know it. The season has been very backward here—very cold and rainy, until the last few days it has been very warm, and now the bees do nothing but swarm. I gave them more room both in the brood and the surplus departments, but they would not occupy it—only hang around the entrance for a day or two, and then swarm.

White Clover and Basswood.—J. W. Collins, Clarksville, Mo., on June 4, 1889, writes:

I began the season with 40 colonies, and have increased them to 68. I have sold a few pounds of white clover honey at 13 cents per pound. I think that the price is low and so I will hold my honey for better prices. The outlook here is fine. White clover has been in full bloom for two or three weeks, and the highways, byways and hedges are just white with clover, also the pastures and fields. Basswood will be in bloom in about ten days, and with the abundance of it together with clover, we bee-keepers are, or ought to be, happy.

Very Good Honey-Yield.—D. R. Fox. M. D., Jesuit's Bend, La., on June 18, 1889, writes:

The honey-yield of this portion of the parish has been very good this year, owing to the low stage of the Mississippi river. There has been scarcely any rice planted, consequently the white clover and wild flowers have been quite abundant. I extracted from about 90 colonies of bees, 275 gallons of orange-flower and white clover honey, during the month of April; and my hives are full again, mostly of white clover honey. I will get 280 or 300 gallons of honey during this month.

Large Crop Expected. — The "Moriah Center Mill-Company," of Moriah Center, N.Y., on June 20, write:

It has been very wet for the last week, but the bees are doing well now—they are swarming and storing honey in the sections. There are not a great many bees in this vicinity. Three-fourths of all the bees in this locality were lost one year ago this spring. The prospects are good for a large honey crop, if the weather is favorable.

Ripening Honey by Solar Heat.—Fayette Lee, Cokato, Minn., on June 20, 1889, writes:

Last summer I extracted some very thin honey, and put it into glass jars, which I then put in the sunshine; in three days the honey was thick and very nice, and the flavor was good. The jars must be so that the air can get in. The heat of the sun was from 95 to 110°. I believe that every bee-keeper could make a tank about 4 inches deep, as large as desired, and cover it with glass, to ripen the honey that way, and keep the bees strong. Try it and see.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

Honey and Beeswax Market.

CHICAGO.

HONEY.—The old crop is about exhausted, and not any new has been offered, especially is the foregoing applicable to the state of the comb honey market. Extracted, very little demand, at 7@8c.
BEESWAX.—25c. R. A. BURNETT,
June 10. 161 South Water St.

DETROIT.

HONEY.—No attractive honey in the market, and sales are slow at 12@15c.
BEESWAX.—24@25c.
June 22. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—Very nice new comb in 1-lb. sections is selling at 18c. Very little old honey of any kind is on the market, and no new extracted.
BEESWAX.—None in the market.
June 26. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 6½@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.
BEESWAX.—Scarce at 23c. for prime.
May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote: Fine orange-bloom at from 7@7½c.; off grades of Southern, 6@7c. per gallon.
BEESWAX.—Scarce, at 26½@27½c. for good.
HILDRETH BROS. & SEGELKEN,
June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON

HONEY.—We quote: 1-pounds selling from 16@18c.; 2-lbs., 15@16c. Extracted, 8@9c. Sales very slow.
BEESWAX.—None on hand.
June 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., Demand slow for table use, and fair from manufacturers. Several lots of new comb have arrived, but quality being off, it finds slow sale at 12@14c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
June 22 C. F. MUTH & SON, Freeman & Central Av.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows :

For 50 colonies (120 pages).....	$1 00
" 100 colonies (220 pages).....	1 25
" 200 colonies (420 pages)	1 50

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Favorable Word from any of our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble.

Advertisements.

EDITOR.

Vol. XXV. July 13, 1889. No. 28.

EDITORIAL BUZZINGS.

The National Flower, what shall it be?
Of all the flowers where men have trod
In mountain home, or near the sea—
Give me the stately golden-rod.
—JUSTUS CHAPMAN.

Woodville, Mich., June 30, 1889.

Father Langstroth is still in poor health, and is yet this side of the borderland. Those who subscribed to his annuity last year, will please not forget to send him the amount for this year. He is needy, we know, and will appreciate it to its full extent.

The National Flower.—Since our article on this subject appeared, several papers have noticed our advocacy of the claims of the "Golden-rod" for the National flower. The New York *Tribune* for June 26, notices it thus:

Mr. Thomas G. Newman thinks that bee-keepers should vote for golden-rod as "the National flower."

We expected that the *Tribune* would either approve of the golden-rod or advocate some other flower—but it leaves that for others.

The *Tribune* sums up an interesting article from the AMERICAN BEE JOURNAL into a paragraph, and adds:

Marvellous, indeed, from every point of view, are these useful little insects, and if the foregoing data—condensed from a current column article—incite any young reader of the *Tribune* to desire further knowledge of their wonderful ways and mechanism, we commend to him or her the reading of Prof. Cook's admirable book; and in the way of periodical publications, Mr. Root's standard fortnightly *Gleanings*, and Thomas G. Newman & Son's old and always perennially-inviting weekly, the AMERICAN BEE JOURNAL.

A Grand Precedent is established by the decision of the Supreme Court of Arkansas, that "bee keeping is not *per se* a nuisance!" Bro. A. I. Root, in *Gleanings* for July, makes these comments on it, and the defense carried on by the Union:

The aid of the Bee-Keepers' Union was at once solicited, and the case was tried in Circuit Court, where it was decided that "the city ordinance was illegal and void;" that "keeping bees is not a nuisance." The case was carried to the Supreme Court, and Brother Newman just announces that the Union has, after an immense amount of worry and expense, again *won* the suit, and that a *grand precedent* has been established.

In no single instance has the Union been defeated; and it begins to seem now that, in view of its past victories, to enlist its aid means success every time.

It would be a terribly bad thing to have bees declared a nuisance by a Supreme Court, and perhaps there are but few bee-keepers who realize what the decision in the case of Mr. Z. A. Clark means.

Mr. Newman, the Manager of the Bee-Keepers' Union, informs us that $1,000 will be needed to prosecute the cases now on hand. Remember, you cannot expect assistance from the Union unless you are a member. The fees are $1.00 per annum.

Perhaps we should say here, that we are not in favor of trades-unions in general; but the Bee-Keepers' Union, under its present able management, we are sure has been productive of good. After we have a few more precedents established like the Arkadelphia case, outside parties will be slow to declare bees a nuisance.

We are just as much opposed to "trades-unions in general," as Bro. Root—the National Bee-Keepers' Union is quite another thing, however! It simply sets up a *defense* when its members are unjustly attacked! It will not defend even a member, unless his cause is *just;* and attacks growing out of ignorance, jealousy, prejudice, and the like, which threaten the pursuit in general, should of necessity be *repulsed vigorously!*

The "Union" orders no strikes, and makes no attacks—it simply *defends* the pursuit of bee-keeping, and fights in a *moral* and *legal* way, for *right, justice and truth!*

We publish a condensed history of the case in this issue of the BEE JOURNAL, so that all may get a proper understanding of it, and the points ruled upon by the Supreme Court. We shall also print it and the arguments and decisions of the Courts in pamphlet form, so as to be useful in all cases of similar import. Any one interested can obtain copies free at this office, by sending a stamp to pay the postage.

Encouraging Science.—The Vermont Microscopical Association has just announced that a prize of $250, given by the Wells & Richardson Co., the well-known chemists, will be paid to the first discoverer of a new disease germ. The wonderful discovery by Prof. Koch of the cholera germ, as the cause of cholera, stimulated great research throughout the world, and it is believed this liberal prize, offered by a house of such standing, will greatly assist in the detection of micro-organisms that are the direct cause of disease and death. All who are interested in the subject and the conditions of this prize, should write to C. Smith Boynton, M. D., Secretary of the Association, Burlington, Vt.

Taxing Bees.—Henry Stark, Plier, Wis., on July 2, 1889, asks this question:

The assessor valued my bees last year at $4.00 per colony, and this year at $1.00. There are others who have bees, which were not taxed. The assessor did not tax all the bees in the town or county. Must I pay a tax on my bees, or not?

It was the duty of the assessor to treat all alike—either to assess all, or not to assess any. It is very difficult to get justice done in this matter, and place every locality on the same basis. In some counties bees are always taxed, and in others they are never assessed. An assessment on the basis of one dollar per colony is quite reasonable—if all were treated alike. As you have this rate, it will not pay to kick very much. It may be increased, perhaps.

The Union.—Here is a letter just received from Mr. J. E. Pond, of North Attleboro, Mass., and dated June 29, 1889, which speaks for itself: "BRO. NEWMAN:—I have read the exhaustive argument of Judge S. W. Williams with pleasure, and *as a lawyer*, I wish to say that no Court can honestly differ from it or decide against it. When I say 'exhaustive,' I mean just what I say. It covers the whole ground; the decision in the Clark case must be for the defendant on constitutional law, and local law cannot avoid the Constitution. The decision *must* be for the defence; it cannot be otherwise."

Now what will our bee-keepers do? Will they say the Union is fighting for us, and we need do nothing; or will they do as they ought in reason and honor to do? viz: to aid the Union by becoming members thereof? Common decency would imply that they should. Now will they, or not?

On the Prevention of Swarming. Dr. C. C. Miller writes for *Gleanings* that he thinks he would give more to learn the best possible way to prevent swarming than to find out any other thing connected with bee-keeping. To the objection that "it is natural for bees to swarm," he replies: "It is just as natural for the swarm to go off." That is true; but the aim of the bee-keeper of to-day is to improve upon Nature's ways, by judicious breeding. Whether the propensity to swarm *can be* modified or bred out, remains to be seen.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Bees settled in the top of a house near Atlanta, Ga., eight years ago, and the other day, when the gable end was removed, the entire roof was found to be filled with honey. So says an exchange.

To-Day and To-Morrow.

"Build a little fence of trust
Around to-day;
Fill the space with loving work,
And therein stay.

"Look out from the sheltering Bars
Upon to-morrow;
God will give grace to bear whate'er may come
Of joy and sorrow."

GLEAMS OF NEWS.

The Country is Flooded with that article which was written by a sensational reporter for the Philadelphia *Record*, and by it published on June 18, 1889. Now it is appearing in hundreds of papers all over the country. It being only the results of the "vain imagination" of the reporter, dished up in a sensational style, it is all the more acceptable, and "spreads like wild-fire."

The heading of the article is a triple one, and reads thus: "Bees Can Take a Rest. They are No Longer Needed as Honey-Makers. Commercial Cunning Makes the Comb of Paraffine and the Honey of Glucose, and the Public Can't Detect it." Then it goes on in this manner:

Wooden nutmegs must now yield the palm to bees' honey in the comb, *manufactured from paraffine and glucose.* The good old father of hymns, Isaac Watts, in the innocence of his heart, wrote these lines:

How doth the little busy bee
Improve each shining hour,
And gather honey all the day
From every opening flower.

All this, however, is but an illusion, for the bee has lent itself to the deceitful practices of scheming men, and, instead of diligently buzzing from flower to flower and gathering the sweetness thereof, the little deceiver now loafs around in the sweetly scented garden, while a few wicked bee-culturists fill a paraffine comb with syrup glucose and send it broadcast over the land as the honest product of the hard-working bee.

Here is the secret revealed by a confiding grocer, whose enthusiastic explanation of the bee-rearer's deception overshadows the ardor with which he sanded his sugar and put peas in his coffee: You see, there was a time when honey was honey, and honey-comb was pure beeswax, but, like everybody else, some bee-rearers wanted to get rich more rapidly, and the Simon-pure products of the bees would not yield sufficient profits, so the anxious seeker after wealth cast about him for an easier and more rapid road to riches.

It was first found that paraffine closely resembled beeswax, and after many trials combs were produced which were scarcely distinguishable in shape and geometrical accuracy from those actually built by the bees themselves.

Then this scribbling mephistopheles gets his foolish story mixed up in this fashion:

It was then found that when these artificial combs were placed in the hives the bees took to them as if they were of their own making, and filled them with honey. This plan once in operaton became a great saving to bee-culturists, as the bees no longer had to make their own comb, but were able to put in all their work making honey. Of course, now and then somebody objects to the quality of the wax, but the bee-raisers never minded any little thing like that, and they thought that they had struck the acme of success, until they made their next and greater discovery. This was that glucose, or grape sugar, closely resembled honey in appearance, and was a very fair counterfeit as far as taste was concerned. *Then there appeared in the market paraffine honey-comb filled with glucose honey*, and the occupation of the bee was gone. The first attempt was simply an adulteration of honey with glucose, and the proportion of the latter was gradually increased until there was little or no honey.

The Philadelphia *Record* here boldly asserts that "paraffine comb filled with glucose" has "appeared in the market." We ask **when** and **where** it has appeared on the market?

We **demand** that the *Record* find some of it to prove its story! Nothing else can save it from the infamy which attaches itself to the wilful fabricator!

A thousand dollars are offered for a single pound of the "paraffine comb filled with glucose and sealed over by machinery." Now the *Record* must either **put up** or **shut up.**

The last paragraph reads thus in the *Record:*

THE BUSY BEES' OCCUPATION GONE.—Nowadays the vitiated public taste scarcely recognizes pure honey when it is found, and ninety people out of every hundred eat their glucose in blissful ignorance, and a firm belief that they are partaking of the honest fruits of the labors of the diligent bee. All bees are not so depraved as to lend themselves to the deceptive practices of unscrupulous honey raisers, and some pure honey is still to be had, but it takes a long hunt to find it.

This is simply given to try to cover up its tracks! The statement is made that there **is** some pure honey—that is generous in the *Record* to allow that there **is** some pure honey on the market, but when it says that it "takes a long hunt to find it," it utters a *diabolical lie.*

Pure honey is now being industriously gathered by the bees, and is put up in immaculately pure combs, made of pure beeswax, and all done by the bees; and more, it can be found by any person in every market in America. Tons of it can be procured at market rates on a few days notice at this office.

Now the *Record* must either produce a sample of the bogus comb-honey it talks about, acknowledge that it was imposed upon by a reporter, or else rest under the odium of having told *wilful lies* for the sake of lying and injuring a legitimate pursuit!

Which horn of the dilemma will it take? Several copies of the Philadelphia *Record* have been received from our friends. One each came from the following: D. Marshall & Bro., Philadelphia, Pa.; George L. Transue, Easton, Pa.; and Geo. P. Howell, New Orleans, La.; the latter remarks as follows:

The enclosed article, copied from the Philadelphia *Record*, was published in the *Times-Democrat* of this city.

There are some mighty smart men in this world, and the father of the enclosed must consider himself one; on the other hand the balance has its share of fools that will believe every line in that article.

Yes; it is because of "the fools who will believe the article," that we demand that the charges be substantiated or the author of the falsehood be severely censured.

The Hot Weather which usually prevails in North America during May and June, "slipped a cog" this year, and jumping the Atlantic Ocean, prevailed all over Europe. The Government has issued a pamphlet, giving the report of the statistician, which gives the following for the different European countries named:

ENGLAND.—May has made a particularly good record, and we enter into June with every prospect of an abundant harvest. There has been a prevalence of brilliant sunshine with high degrees of heat both day and night, which has pushed forward vegetation at rapid pace. Such tropical heat in May has seldom been heretofore recorded, and coming after periods of rain, the result is highly satisfactory.

FRANCE.—With the exception of too frequent rain-falls the month marks a satisfactory progress in all vegetation, and the change to bright sunshine, which prevailed for the last four days, will speedily allay the fear of damage from moisture. Outside of any abnormal change in the weather, an abundant harvest is in prospect.

GERMANY has had fine forcing weather during much of the month of May, which closes with good reports from nearly all sides.

ITALY.—The general condition of the Italian crops has lost no ground in the month past.

AUSTRIA-HUNGARY.—In the official report of the Austrian Minister of Agriculture, published about the middle of the month, high mention was made of the beneficial effect of the weather upon the crops. The condition of the winter and spring crops were in most provinces excellent, and in some most favorable. The outlook is said not to have been so promising for years, the only region in which the expectations were moderate being Galicia.

The New Era Expositon will be held at St. Joseph, Mo., commencing Sept. 3 and closing Oct. 5. It has been urged by those responsible for the financial success of Expositions, that unless the horse-jockey had a chance at a purse of thousands of dollars, while the farmer competed for premiums of from fifty cents to five dollars, that the Exposition could not be sustained. The New Era Exposition will try the Experiment of reversing the order of things, relying on the Agriculturists (who have hitherto loudly and justly complained) for an appreciation of efforts and a hearty co-operation. It offers premiums amounting to nearly $3,000, for all products of the farm, including fruit, live stock, BEES, poultry, etc. The list and rules governing exhibits will be mailed on application. Address, The New Era Exposition, Rooms 5 and 6, Post Office Building, St. Joseph, Mo.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

BIOGRAPHICAL.

HUBER.

His Life and Services to the Bee-Keeping World.

We take the following interesting sketch from Gravenhorst's *Illustrated Bee Journal*. It was written by Mr. T. Kellen, of Luxemburg. The translation is furnished by W. P. Root, for *Gleanings:*

Francis Huber, by his investigations and researches in apiculture, did more to promote this science than all his predecessors who had employed themselves in the study of this interesting insect. It is his discoveries alone that marked that golden age in the history of apiculture which is destined to remain for all ages. Huber's observations are not only of the greatest importance of themselves, but wonderful for the manner in which they were made; for Huber was blind.

This distinguished man was born in Geneva, July 2, 1750. He was the son of a prosperous and respectable family, which as early as the 17th century were celebrated for their knowledge of the arts and sciences. His father, John Huber (born in 1722, died in 1790), was well known on account of his attachment to the celebrated French philosopher Voltaire.

From his earliest youth Huber showed a passionate predilection for natural history, and he applied himself to study with such zeal as to endanger his health, so that at the age of fifteen the reflection of blinding snow destroyed his sight. If ever a man bitterly deplored the loss of eyesight, that man was Huber. But his misfortune did not hinder him from applying himself to the study of those insects for which he had an especial liking; namely, the bees. It was this little insect that turned the darkness of the investigator into day; for Huber was the first to see clearly into that domain which to the best eyes had previously remained in darkness.

Huber did not lose his vigor of mind, for he went forward in the study of bees: but he could do this only by the help of his wife, Marie-Aimee Lullin; his neice, Miss Jurine, and, above all, his servant Burnens. He himself manifested the most untiring perseveranee, and the greatest ingenuity, so that, by Burnens' sagacity, all of Huber's experiments with bees were practieally demonstrated.

Miss Jurine, who loved natural history above all else, supplemented Huber's work all she could, fearing not to take up the dissecting-knife and microscope in his aid. She was the first after Swammerdam to demonstrate that worker-bees are females. She it was, too, who, with Huber, established the principles on which the sages of our century grounded the doctrine of parthenogenesis. Besides that, Miss Jurine was Huber's secretary, full of willingness and self-devotion. Every day she noted down the results of the new investigations, and she also wrote the letters, which Huber dictated, to Charles Bonnet and his friends, and imparted to him the results of his labors, and directed their attention to numerous questions relating to bees.

Huber's interest in bees was greatly enhanced by the researches and writ-

FRANCIS HUBER.

ings of Swammerdam, Reaumur, Schirach, and probably also the celebrated Swiss bee-keeper, Duchet de Remauffens, and the Messrs. Gelieu. As a conclusion to the investigations of these men, it was possible for him, in spite of his unfortunate surroundings, to add greatly to the realm of apiculture; hence we may not forget that he everywhere encouraged and helped others by the nobility of his life.

In his latter days he lived retired, but in peace, at Lausanne, where he died Dec. 22, 1832, at the age of 83.

Huber's discoveries are known to scholars through his letters to Charles Bonnet; and they made his name so celebrated in all Europe, and even in America, that for many years he was recognized as the greatest apicultural genius; and even yet Hamet calls him the greatest of the lovers of bees (*le plus grand des apiphiles*).

It was in 1796 that his first epoch-making work was brought to light, bearing the title, *Nouvelles Observations sur les Abeilles* (New Observations on Bees). His son, Peter Huber, in 1814 issued the work in two editions, and added thereto an appendix in regard to the origin of wax.

Huber's work is, not only on account of its contents, but for the peculiar circumstanees under which it was first brought to light, entirely without parallel in scientific literature. The recognition which it received was universal, so that, after the first appearance of the work, Huber was received into the French Academy of Sciences, and other scientific bodies.

The New Observations were translated into nearly every European tongue. The Saxon commissariat Riem, in Dresden, translated it into German in 1798, and Pastor Kleine, of Luethorst, translated it again in 1856, and published another edition in 1869, with notes.

Huber, by his observations on the secrets of bee-life, made clear what the most sagacious and learned observers from the time of Aristotle and Aristomachus down to Swammerdam and Reaumur had sought for in vain; and it is to be the more regretted that some German bee-keepers of great influence, such as, for instance, Spitzner and Matuschka, gave him no recognition.

He gave interesting explanations in regard to the habits of bees, their respiration, the origin of wax, the construction of comb, etc. He confirmed Schirach's proposition, that by a change in the mode of treatment and food of larval bees, queens could be reared from worker-eggs, and showed, likewise, the influence which the cell exerted on the insects.

He showed further, that not only the queen but a certain species of worker-bee could lay fertile eggs, and showed, likewise, the function of drones. In opposition to Braw, Hattorf, Contardi, Reaumur, and others, who held very peculiar opinions in regard to the fertilization of queens, Huber showed that the fertilization takes place outside of the hive, at the same time that drones are flying, and that the union is effected in the air, and that the queen, on her return from the flight, has adhering to her body the evidences of fertilization, and that egg-laying takes place about 46 hours afterward.

These and numerous other experiments he often proved in his works with the utmost exactness; and especially did he lay down the most important and interesting information in regard to feeding bees, their method of building, the leaf-hive, foul brood, etc., in his letters to an eminent apiculturist in Switzerland, Mr. C. F. P. Dubied. These eighteen very long letters of Huber, the first of which was

dated Oct. 12, 1800, and the last Aug. 12, 1814, were written partly by Huber himself, partly by his wife or daughter, to whom he dictated. So far as I know, this correspondence has never been translated into German, which is greatly to be regretted.

When one reads of Huber's observations, it becomes evident that the author interested himself in bees, from a scientific stand-point only. In one of his letters to a friend, he writes that he never realized any material benefit from bees. This is easy to understand when we consider that his experiments with them lasted the entire year through, and were conducted only for the sake of science; and one naturally inquires how he found bees enough to carry out his numerous experiments.

QUERIES and REPLIES.

How to Secure Large Increase of Colonies.

Written for the American Bee Journal

Query 642.—I have between 80 and 100 colonies of bees, and desire to increase them greatly by natural swarming. 1. What shall I do to accomplish it? 2. Will liberal feeding do it?—VA.

Your second query answers the first. —J. M. HAMBAUGH.

1. Confine them to the brood-apartment. 2. Early feeding will help, if short of stores.—H. D. CUTTING.

1. Feed and give no surplus room. 2. Yes, with treatment as just stated. —MRS. L. HARRISON.

Liberal feeding and contraction of the brood-chamber will promote it.— J. P. H. BROWN.

Let them swarm. You will probably get all you want this year.—C. H. DIBBERN.

1. Feeding liberally for three weeks before an expected flow of honey, will accomplish it.—G. L. TINKER.

Stimulate by feeding sparingly until the harvest opens, then work for swarms, not honey.—A. J. COOK.

2. It will do it sometimes, but not always. Daily moderate feeding is better than liberal, for the purpose.— P. L. VIALLON.

1. They will do it themselves, probably too much. 2. That will help, but it may not pay in all cases.—C. C. MILLER.

Liberal feeding and contraction of the brood-nest will undoubtedly accomplish the desire of your heart.— EUGENE SECOR.

1. If I desired to increase greatly, I would not do it by natural swarming. I would rear queens and divide, using full sheets of foundation. 2. Liberal feeding will promote swarming, of course, provided that it is done regularly and steadily, when natural resources are not abundant.—M. MAHIN.

Yes, and crowding the queen by contraction; but it is a poor way. We would prefer rearing good queens, and making swarms by dividing.—DADANT & SON.

If your yield is good, and you hive after-swarms, they should increase all you desire without feeding.—G. M. DOOLITTLE.

1. Have prolific queens, and do not try to secure any surplus honey. 2. If there is not an abundance of honey being gathered, judicious feeding will help.—A. B. MASON.

1. If there is a good honey-flow, they will be apt to swarm at least once. I have tried everything that I ever read of, to prevent swarming, but never succeeded. 2. Feeding will be a help, if honey is scarce.—MAHALA B. CHADDOCK.

Adopt the nucleus plan of "artificial" swarming; feed liberally when needed, and build up. Keep at least one-half of the colonies intact, to draw brood from, with which to build up the nuclei.—J. E. POND.

A good honey-flow is what you should have. Liberal feeding will help greatly—but, it is "dangerous." I think, upon the whole, if it were me, I should let Nature have her own way.— WILL M. BARNUM.

1. Hive each swarm on a new location, and retain with the swarm only sufficient bees to build up into a good colony, letting the rest go back. If that does not make it lively enough for you, feed in times of scarcity.—R. L. TAYLOR.

If the season does not furnish the means to your ends, produce them by feeding. Feed just enough to promote the rearing of brood, and feed daily. Do not feed so much as to gorge the combs, but feed just enough—observe closely, and feed "just enough."—J. M. SHUCK.

You can encourage swarming by giving the bees only just enough surplus room at once to keep them busy; that is, none to spare. Do not keep them well shaded, but allow solar heat to make their home uncomfortable. Pray for a favorable season for swarming. You need not feed.—JAMES HEDDON.

1. Go right ahead, and take all the comb honey that you can procure by good management, and if the season is a good one, the bees will swarm more than would suit me. 2. Yes, if your bees are short of stores, liberal feeding will hasten swarming, if done at the right time in the spring; and if the bees have plenty of stores, uncapping some of it will stimulate breeding. It will pay you best, in the long run, to take all the honey you can while your bees are increasing.— G. W. DEMAREE.

Probably it will be as well to divide the colonies and thus increase them. If honey is plenty, they will not need feeding; if it is not, then feed them liberally.—THE EDITOR.

CORRESPONDENCE.

VIRGIN QUEENS.

The Successful Introduction of Virgin Queens.

Written for the American Bee Journal

BY E. STRONG.

In the near future a method of introducing virgin and "old maid" queens will be established, which will be reasonably successful in the hands of experienced men. We shall all be pleased to learn how; and to this end I will relate the circumstances of a recent case:

Finding several young queens in one hive, kept in by the bad weather, I separated them into small nuclei. The bad weather continued, and at the end of five days a swarm issued from another colony, as soon as the sun came out. From the old colony I removed two frames from one side, and in their place I put the two frames, bees and all containing the virgin queen, leaving her on the outside, and leaving a half-inch space between the two frames and the other frames of the old hive.

The old hive was placed in the rear of the new swarm. This space being more than a bee will readily cross, acts, in this case, as a division-board, and the young queen will naturally remain in her division for a number of hours, but not longer, and she probably will not be seen there again. The increased heat and noise of the new home will induce her to mate without delay, and her return to the old stand of the nucleus, increase the danger of her loss.

This introduction succeeding, I tried another of similar age (five days), by placing her on a frame of mostly young bees, put down outside the hive. But they made a furious attack, and the poor queen yelled for help. By the peeping of an introduced queen, the "balling" can be discovered without opening the hive.

This introduction *not* succeeding, I returned her to her nucleus, and

when she was seven days old, and unmated, I succeeded in introducing her to a full colony, covering 30 frames and filling three brood-chambers. This colony lost its queen with clipped wings, by trying to swarm. Three frames were removed from the top story, and at the side, and the three frames of the nucleus substituted, leaving space as before. There were about fifty bees with the queen in the nucleus. In two days after, I found her in the bottom story mated, but not laying. This young queen was very dark, so that there was no question as to identity.

I am aware that to make these introductions beyond question, the wings of the queens should have been clipped, so that they would have remained unmated; but some one else can try that. I am satisfied.

Of course, hatching queens can be run in at the entrance, or under the quilt, with an average loss of about one-third.

Kalamazoo, Mich.

QUEENS.

Results of Experiments and Observations.

Written for the American Rural Home
BY G. M. DOOLITTLE.

In this article I wish to give a bit of my experiences as regards introducing queens, rather than to point out any particular method for so doing.

In a practice of nearly twenty years, many things have come under my observation which have been interesting, and have thrown light on an operation which has many times proven, not only to myself, but to multitudes of others, to be not always a successful one.

Heretofore the loss of the queen has been charged mainly to the bees rather than to the queen, parties even being so rash and provoked as to crush a ball of bees enclosing a queen, under their feet, when in reality the queen was the one to blame. Many queens would never be molested in the least by the bees if they would behave themselves as they did in the hive they were formerly in; and I venture the prediction, that when we arrive at a plan that will always place the queen with strange bees in the same quiet condition she was in while in the hive in which she was reared, we shall be successful every time. To substantiate this position, I will give some of my experience in the matter.

Some years ago I had a queen which began failing during the forepart of the season. Wishing to replace her, I went to a nucleus and took out their queen, which had been laying about a week; then going to the colony having the failing queen, I removed her and placed this young queen on the combs instead of the old one. She immediately commenced to "peep," just as a virgin queen does when there are rivals in the cells in a hive calculating to send out an after-swarm. To this the bees paid no attention, but came to her, with the intention of feeding her, to all appearances; but instead of taking food offered by them, she put out her foot and struck at them, or laid hold of their heads with her feet, and continued "peeping." She passed around among the bees, "peeping" at intervals for about five minutes, I should judge (I watching all the while), when she came to a young bee just hatched, all white and fuzzy. She immediately uttered a short "peep" and then clinched the little thing, and stung it so it curled up and died in an instant. At this the bees became exasperated, and showed signs of hostility for the first time, they now beginning to lay hold of the queen for the first time, as far as I had noticed.

With a little smoke I dispersed them and still continued to watch. In about 15 minutes she stung and killed at least a half dozen of these young bees, and was seized each time by the bees, but I as often dispersed them with smoke; at all other times they were ready to feed her and treat her as they did their old queen. Once or twice she took food of them, but as a rule, struck at them with her feet when they offered her food. I closed the hive and left them then.

Upon looking the next day, I found queen-cells started, and supposed her dead; but in about two weeks, or such a matter, they cast a swarm, and, lo! there was my queen running around in front of the hive, for her wings were clipped. I opened the hive, but found no eggs or brood (except sealed brood), cut off the queen-cells, and returned the bees, upon which she commenced laying, and made a fine queen. I have had several such cases since, yet none quite as persistent as was this queen.

Again I have had queens which the bees treated as they would their own queen, but they would not stay in the hive at all. They would run out at the entrance, often followed by a few anxious bees which would feed them and keep them alive. I had one out thus till I had put in another queen, and she had begun to lay when I found the first under the bottom-board of the hive with a few bees with her.

Thus many facts in my experience go to prove that the queen has more to do with the loss sustained in introducing than the bees. Well, says one, "If this is so, how can I remedy it?"

The plan I have lately adopted is this: Make a cage out of wire-cloth, having about 16 meshes to the inch, large enough so that it will cover some honey and quite a little hatching brood, by cutting little squares out of each corner, and then bending the sides up at right angles, so as to form a bottomless box, as it were.

Remove the queen you wish to supersede, shake the bees from the comb, and place your queen on it where there is some honey and hatching bees, and then place the cage over it, pressing the edges of the wire-cloth into the comb till the cage does not project beyond the surface of the comb more than half of an inch.

Hang the comb in the hive, leaving three-fourths of an inch between it and its fellows, so that the bees can go all around the cage.

In a few hours, or the next day, open the hive, and if the queen is reconciled to the strange colony, she will be quiet, and the bees quiet on the cage. When you find it thus, it is generally safe to lift the cage, when she will go quietly among the bees the same as she would have done in her own hive.

The presence of the young bees with her, which have hatched from the brood enclosed within the cage, has much to do in expediting matters and reconciling the bees and queens.

If on the contrary the queen is found running around, and the bees are biting at the cage, do not let the queen out, till such conditions cease to exist.

The above are the conclusions which I have arrived at, which may not be entirely correct, still I believe them to be nearly so, in the main. I have introduced hundreds of queens as above, and rarely if ever lose one.

SEPARATORS.

Their Proper Width for Use in One-Pound Sections.

Written for the American Bee Journal
BY JAMES HEDDON.

The 4¼x4¼ sections to hold a single pound of honey usually measure just 4 inches in the clear, inside. If the separator is less than 3½ inches in width, the apiarist will not use it long before he will sincerely wish it was not.

A quarter of an inch is ample passage way for bees when passing one at a time, there being no wood directly above the edge of this separator, but a bee-space; if you will measure from the upper edge of the tin on an angle of about 45° to the nearest edge of the wood to the section, you will find you

have ⅞ of an inch, or sufficient space to allow two bees to pass at a time, if one was carried on the back of the other.

Every observing comb-honey producer well knows that under conditions which frequently happen during our honey harvests, if these separators are misplaced the least bit, so as to leave a little more than ¼ of an inch between the top edge of the separator and the line of the edge of the top-bars of the sections, the troublesome extended cells will result. Where the wide frames, or storing cases, are not to be reversed, even with a 3½-inch separator, I prefer to put it 1-16 of an inch nearer to the top than the bottom of the inside of the sections.

HONEY.

Is it Digested Nectar? If Not, What is It?

Written for the Rays of Light

BY J. E. POND.

I am not a scientist, neither do I wish to provoke an acrimonious discussion, still I ask in all seriousness, What is honey?

In days past we have been told it was the nectar of flowers from which the water has been evaporated by the bees. This answer would seem "to fill the bill;" still, when viewed on a strict scientific basis, it does not, for the reason that it does not quite "come up to the mark," in that it does not "tell the whole story."

Next we hear of some digestive process that this nectar undergoes in the stomach of the bee; this again does not satisfy us, for the reason that it neither explains that "digestive process," or offer any proof of the same.

Then we have the bee-sting or "formic acid" theory, which, while plausible, is not satisfying; no proof at all being offered. In fact, all and every idea advanced is theory, and theory only.

Now what is the fact? Is there anyway by which the truth of the matter can be arrived at? Diluted sugar, when sealed up in the comb, comes out as sugar; if scented or perfumed in any way, that distinct scent or perfume remains. Now if sugar-syrup undergoes no change while being carried to and deposited in the hive, what evidence is there that the nectar of flowers undergoes any change while in transportation to the hive or after being deposited therein? Can any one explain, if any digestive change does take place, just what that change is? or why it does not affect sugar-syrup or other artificial food, as well as the nectar of flowers?

As I said at the beginning, I am not a scientist. I am after information. I do not want theories, though, but facts; I want to know if any one does *know anything positively* about the matter; or whether any one has by any experiments conducted on purely scientific principles, ascertained any facts that they dare give as such, that explains the matter fully and completely? That is, Can any one tell us why sugar syrup remains such, while nectar undergoes a chemical change in the stomach of the bee, while in process of transportation?

For myself I believe as a matter of theory, the "formic acid" exponents have the best of it; but who can say that they are right or wrong?

North Attleboro, Mass.

One Hundred Years Ago.

(TUNE—*A Thousand Fathoms Deep.*)

Our's a land baptized in blood,
One hundred years ago!
Brave and grand, it proudly stood,
One hundred years ago!
In Freedom's name it sealed the height,
Of peace, and truth, and moral might,
And planted there its starry sign,
Its honored flag—our flag divine!
One hundred years ago!
One hundred years ago!

Wives and mothers mourned their slain,
One hundred years ago?
Bore this cross of cruel pain
One hundred years ago!
God's will it was that heart and hand,
Should strike the shackles from our land,
And cause the power of pen to trace
Eternal rights for all the race
One hundred years ago!
One hundred years ago!

Loyal, earnest, gathered few,
One hundred years ago!
Planting better than ye knew,
One hundred years ago!
Sixty millions now we count,
Who daily drink from freedom's fount
And kneel before the shrine
Ye built by deeds divine
One hundred years ago!
One hundred years ago!

SEPARATORS.

Their Use a Necessity in Producing Comb Honey.

Written for the Western Plowman

BY C. H. DIBBERN.

As to separators: I claim that no strictly A No. 1 honey can be produced without them. What I mean is, that it is so perfectly built in the sections that all can be glassed on both sides if wanted. I always thought that honey produced with separators was whiter, and there is good reason for this, too, as separators get fully half of the travel of the bees.

I know that many otherwise good bee-keepers differ from me on this point, and even claim that they can have comb built almost as straight without separators. I have never seen such, and I cannot produce honey without separators that is satisfactory to me. If only a small quantity for one's own use is produced, it would make little difference. When thousands of sections have to be handled, however, combs should be so straight that any two should fit up against each other without the comb interfering.

I imagine that in the near future, grocers will be more discriminating on this point, when they once fully realize the difference. They may be impertinent to ask, "Did you use separators?" and, if not, refuse to buy, or "dock" you one to three cents per pound. Some have contended that not nearly so much honey would be stored if separators are used; but my experience is that it makes no difference. I certainly do not want any surplus honey stored without separators.

Dividing Colonies.

A party writes me and asks why I do not divide my bees, and thus get around the nuisance of natural swarming; and claims that it is much the best way. Now, I had the "dividing craze" some 15 years ago, and it proved no "howling success," either.

The objections to dividing about swarming-time, are many and well founded. Take a good, strong colony, that might be expected to swarm soon, and storing nicely in the sections, and what is the result? The bees are divided, each half, if rightly done, and a queen given has double the space needed in the brood-chamber that will be filled before there is any more storing in the sections. Perhaps if the hive had been left alone, it would not have swarmed for two or three weeks, and perhaps not at all, and storing surplus would have been going on all this time. It is not dividing that we want, but rather contracting and doubling up.

The Kind of Sections.

I am often asked what kind of sections I prefer to use, and if it is really necessary to use separators? I have tried many kinds of sections, and studied the matter a good deal, and although I use several sizes, I prefer the white-wood one-pound dove-tailed sections. They are so immaculately neat, and the demand seems to be more for that size, so that honey in such sections sells for one and two cents more than larger sections.

Now the question arises, can we produce honey as cheaply in the one-pound as in the two-pound sections? I have studied this matter for some years, and have come to the conclusion that there is little difference as to

cost. Of course, two one-pound sections cost a little more than one two-pound section, but as they are sold with the honey, they will weigh a little more, too. I think that the bees will store just as much in one size as the other, and I think that the one-pound sections make the best-sized cases to put on the hives. They are also a little the nicest to handle in every way.

The one-piece basswood sections I do not like so well, although they are more quickly put together. They are never so white, and are often inclined to be "woolly" and rough. The naughty corner is also liable to spoil some adjoining comb, if not carefully handled.

Milan, Ills.

MICHIGAN.

Its Northern Resources for the Production of Honey.

Written for the Michigan Farmer
BY GEO. E. HILTON.

As several have written me, asking if I thought their locality adapted to bee-keeping, I have prepared the following, hoping it will aid many in judging for themselves.

If one takes the time to observe, and the trouble to enumerate them, he will be astonished at the almost endless variety of honey-yielding plants within the State. It would require a skilled botanist to name them all. The all-wise Father has provided nearly all trees and plants with either honey or pollen to attract the insect world. He spreads a continual feast for the bee, that the important object of perfect fertilization may be more easily attained.

The bee that sips from flower to flower, rollicking in the golden dust among the newborn anthers, playing "hide and seek" in the opening corollas, is performing a work of untold value in the wise economy of nature.

The honey secreted in the blossom is for the purpose of inviting cross-fertilization, and to prevent in-and-in breeding. If no insect is there to utilize the drop of nectar, it is evaporated and scattered to the four winds of heaven. No one is richer for the ungathered sweets; and no one is poorer whose fields are searched by the tireless little workers, whose instinct leads it to garner the evanescent riches which, of a truth, take to themselves wings and fly away.

From the trailing arbutus, that peeps out of the snow on some hillside, to the last frost flower in autumn, there is almost a continual succession of honey-producing flowers, whose wealth of nectar ought to be utilized as one of the resources of this grand State.

California may occasionally astonish us with her magnificent honey crop, but in Michigan, where "the early and latter rains" are not only promised but sent, we are always confident of a reasonable surplus.

The pastures and roadsides are covered with white clover, which yields the finest honey in the world. The rivers and lakes are generally skirted with basswood timber, one of the best honey-producing trees in America, yielding a nectar that is prized for its beautiful amber color and aromatic flavor.

Every fence corner and neglected field is planted by the hand of Nature, as though she were trying in some way to counteract man's shiftlessness, by making the earth bring forth abundantly some of the good things of life.

It is of importance to bee-keepers to know just when this succession of bloom occurs, that they may have their bees in the best possible condition to secure the nectar. So far as my observation and knowledge extends I will briefly enumerate them:

About the first pollen comes from willow and soft maple, usually about the middle of April, varying with the season. In the early part of May comes the hard or sugar maple, and this tree deserves more than a passing notice; it produces both honey and pollen in large quantities, and I sometimes feel that were our bees in the same condition they are at the approach of basswood bloom, we would receive nearly the same results.

Fortunately, my bees three years ago were very strong early, and many of them stored considerable honey from this source, and it being followed closely by the raspberry and blackberry bloom (with which this country abounds), I secured at least a thousand pounds of surplus previous to the opening of white clover bloom, from 60 colonies in my home apiary.

White clover opens from the 1st to the 15th of June, and in my 12 years of bee-keeping, has but once failed to give us a fair surplus.

There is no gap between clover and basswood in this latitude; in wet seasons the clover often continues until after basswood ceases. The basswood opens from the 4th to the 20th of July, according to seasons, but cannot be depended on in this latitude; it is more sensitive and more dependent on atmospheric conditions than any other bloom. In this latitude we usually get one or two days however, and once I remember that ten days it secreted honey during the bloom. I find it does better along rivers and lake shores than on the uplands.

After this there is a gap in the honey-flow until the buckwheat, fireweed, golden-rod, asters and boneset come into bloom, in which, aside from buckwheat, this country abounds: it usually affords us some surplus, but the greater part goes to the brood-nest for winter stores; in fact I have never had to resort to sugar for winter stores, and I hope I never shall.

There are many more annuals and shrubs that go to make up the honey flora of northern Michigan, and we have some disadvantages our Southern brethren do not have, but taking all in all, I think the northern half of the lower peninsula better adapted to the pursuit of bee-keeping, and that the honey is of better quality than in the southern half.

Fremont, Mich.

Z. A. CLARK.

Bee-Keeping Declared Not a Nuisance.

A Condensed History of the Case,
DEFENDED BY THE UNION.

In May, 1887, the Arkadelphia City Council, Ark., passed an Ordinance, which, with its preamble, read thus:

The preamble states that, "Whereas, a petition from many citizens of Arkadelphia, having been previously presented to this Council, setting forth that the raising of bees or keeping them in the City of Arkadelphia was injurious and destructive to property, such as early fruit, and dangerous to citizens when riding in vehicles or on horseback upon the streets, and a pest in many of the houses in said city, having stung many persons, and especially children, while walking the streets and sidewalks."

The ordinance as adopted is substantially as follows:

"Be it ordained by the City Council of the City of Arkadelphia, That it shall be unlawful for any person or persons to own, keep or raise bees in the City of Arkadelphia, the same having been declared a nuisance.

"That any person or persons keeping or owning bees in the City of Arkadelphia are hereby notified to remove the same from the corporate limits of the City of Arkadelphia within thirty days from date hereof."

SECTION 2 provides a penalty of not less than $5.00 or more than $25.00 for a violation of the ordinance.

The cause for this action was the fact that Mr. Z. A. Clark, who has kept bees in that city, was not in political harmony with those in power, and the latter sought to punish him and get rid of his presence, by prohibiting the keeping of bees within the corporate limits of the city.

Some of the more ignorant ones declared that his bees were "eating up the peaches!" and others, that they were "eating up the young ducks!" Preposterous as it may appear to those who are better informed concerning

the formation and habits of bees, yet it is true that many accepted these ridiculous charges as *truth !*

Mr. Clark was ordered to remove his bees by June 6, 1887. He did not remove them ; and on Jan. 2, 1888, he was arrested; and fined, day after day, for ten successive days, for maintaining a *nuisance*, by keeping his bees in the suburbs of that city.

Not paying the fines, Mr. Clark was committed to the city jail, by order of the Mayor.

Mr. Clark being a member of the "National Bee-Keepers' Union," very naturally appealed to it for protection. Being clearly in the right, and worthy of defense, the "Union" engaged the services of Major J. L. Witherspoon, ex-Attorney-General of Arkansas, and several other attorneys, to defend the bees and their keeper.

This case was important because it was the first time that it was sought to exterminate the bees from the suburbs of a city, by declaring them a nuisance, by Ordinance. If allowed to stand, it would be a precedent to be followed, wherever a bee-keeper was obnoxious to the ruling majority ; his *rights* would be ignored, and the bees condemned by ignorant and prejudiced persons for selfish motives.

The National Bee-Keepers' Union, therefore, concluded to carry the case to the Circuit Court, for it would be very detrimental to the pursuit to allow an ordinance against bee-keeping to remain uncontested, and to be quoted as a precedent against the keeping of bees, because it had been declared "a nuisance" by a City Council in Arkansas.

By the enforcement of that unlawful ordinance of the city, Mr. Clark was deprived of his liberty, and the constitutional rights guaranteed to every citizen in the United States.

Even granting that it was wrong in Mr. Clark not to obey the city authorities, he should have had a speedy trial by an *impartial jury*—all of which had been denied him. Even when released under a writ of *habeas corpus*, he was, within three hours, re-arrested and fined.

After demanding a change of venue, because of the prejudice of the Mayor, that functionary again fined him, denying him his constitutional rights.

The Circuit Court convened in July, 1888, and the Hon. Sam W. Williams, of Little Rock, was added to the attorneys for the Union. Our attorneys, Judges S. W. Williams, Witherspoon, Murray and McMillan, made a motion to dismiss the case against Mr. Clark, "because the ordinance of the City of Arkadelphia, on which the prosecution is founded, is void and in violation of law."

Then Judge S. W. Williams read section after section of law, in Mr. Clark's favor, showing that a man's right to hold property is paramount to all Legislative power; and any attempt to take away such right is unconstitutional.

After which, Judge Hearn stated to the attorneys that he had lived a long time in Arkadelphia, and that bees had been kept there all the time, and that he had not heard any complaint until this case came up. He added that the case would go to the Supreme Court, no matter in which way it was decided in his Court, and he wanted to be found on the right side when decided in the Supreme Court.

He then sustained the motion of the attorneys for the Union, to dismiss the case, and he declared the ordinance of the city "*illegal and void !*"

The city attorney then gave notice of his appeal to the Supreme Court.

The appeal to the Supreme Court was heard on June 22, 1889.

Messrs. Crawford & Crawford, attorneys for the city, argued in favor of the validity of the ordinance. Their argument may be summed up thus :

In Huckenstein's Appeal, 70, Penn., St., 102, s. c., 10, Am. Rept. 669, *supra*, it was said, "If a man lives in town, of necessity, he must submit to the consequences of the obligations of trades, which may be carried on in his immediate neighborhood, which are *actually necessary* for trade and commerce, also for the enjoyment of the inhabitants of the town." However convenient for Appellee to own, keep and raise bees in the City of Arkadelphia, it cannot be contended that the business is at all necessary for trade and commerce, the enjoyment of property, or for the benefit of the inhabitants of the city. His business can be carried on just as successfully at a distance from the city, without interfering with the comfort and convenience of its inhabitants.

Bill Nye, in a recent communication to the press, tells of a Mr. Joseph Lininger, near Huntington, Ind., who has established there a "Skunk ranch," and is doing a very profitable business in that line. Should he conclude to move his ranch into the City of Arkadelphia, he could object to having his business declared a nuisance, with as much show of right, as the Appellee now maintains.

"There is no common right to do that, which, by a valid law, or ordinance, is prohibited : and courts will not declare an authorized ordinance void because it prohibits what otherwise might lawfully be done."

It is contended that this ordinance is invalid, because, instead of regulating the keeping of bees, it prohibited the business altogether. We can see how the City could regulate the keeping of goats, dogs, hogs and cows, but it would be impossible to pass an ordinance allowing bees to be kept within the corporation, and at the same time regulate the business so as to prevent them from flying abroad. You cannot build a wall high enough to keep the bee from ranging. Suppose an ordinance should be passed, allowing the owning, keeping and raising of bees in the city, but prohibiting any one, under the penalty of a fine, from allowing his bees to fly in the streets, or trespass upon other people's premises. Such an ordinance, with the condition annexed, would deprive Appellee of the claimed right, and would be a kind of Legislative juggling that would

"Keep the word of promise to the ear,
And break it to the hope."

This ordinance in this case would not have been a whit better if it had allowed every citizen to keep one or more hives of bees. If one hive would not be a nuisance, how many would be? Where is the line to be drawn ? We contend that the City Council ought to be, and is, the only proper judge, and its action will be final, unless it has clearly exceeded its authority in the passage of the ordinance.

Among the abstract of decisions, prepared for the Arkansas *Gazette* by W. H. Pemberton, of the Little Rock Bar, dated Saturday, June 22, 1889, we find the following opinion by the Court :

127 (Crim.) City of Arkadelphia *vs.* Z. A. Clark.

The Appellee Clark was convicted in the Mayor's Court of Arkadelphia for a violation of the city ordinance. The ordinance under the prosecution was had provided that it shall be unlawful for any person or persons to own, keep or raise bees in the City of Arkadelphia, the same having been declared a nuisance. Upon an appeal to the Circuit Court, that Court sustained a demurrer filed by the defendant, and dismissed the prosecution.

HELD.—Neither the keeping, owning or raising of bees is in itself a nuisance. Bees may become a nuisance in a city, but whether they are so or not, is a question to be judicially determined in each case.

The ordinance under consideration undertakes to make each of the acts named a nuisance, without regard to the fact whether it is so or not, or whether bees in general have become a nuisance in the city. It is therefore too broad, and invalid.

Affirmed.

The reply of Judge Williams was lately given in full, because of its great importance and value for reference.

THOMAS G. NEWMAN,

ZOOLOGICAL.

Ravages of the Grain Plant Louse, Incorrectly Called "Green Midge."

BY PROF. A. J. COOK.

FRIEND NEWMAN :—Having received many letters about this insect, asking for replies in the AMERICAN BEE JOURNAL, I send you the following, being Bulletin No. 50, published by the "Agricultural College of Michigan," which I wrote for the Experimental Station on June 27, 1889. This will

answer all the questions sent to me, and anticipate others, perhaps. It is as follows :

The present season is characterized by one of those wide-spread and very damaging insect invasions that is so discouraging to the farmer. I refer to the present onslaught on the wheat crop by the grain aphis or plant louse, *Aphis avenæ*. This louse attacks wheat, barley, oats and rye, and is to be found in small numbers on these grains every year. This year occurs one of those terrible attacks that seem to threaten very serious loss. This raid extends from Ohio west to Indiana, and north to Grand Rapids, Mich. Of this much I am certain. I do not know whether it reaches in such overwhelming numbers to other States or not. So abundant are these lice that they have attracted wide attention and awakened serious alarm. For the past two weeks I have received daily numerous specimens of these lice with the inquiry : What is to be the outcome of this attack ? I have received as high as 15 such communications in a single day.

What is It ?

This is a plant louse, or aphis, and is very similar to those that attack our house plants, cherry, plum and apple trees, cabbages and hops. Indeed, so numerous are the species of these lice that hardly one of our valued plants but has its plant-louse enemy. These plant lice have flask-shaped bodies, are usually green or black, though sometimes they are yellow or red, and are usually quite small. In looking at the grain aphis at this season, four forms will be seen : A small wingless louse, a large wingless form—the full grown apodous or wingless louse ; the pupa of the winged louse which has short wing pads ; and the mature winged louse. We usually find these four forms at some season of the year in all plant-lice colonies.

Frequently, and this was true a few days ago of this grain aphis, we only find the wingless forms. Later the pupæ with wing-pads and the fully developed winged forms are seen. These winged lice are doubtless developed that the lice may spread before their food is wholly destroyed, and they are confronted by famine. The mature wingless louse of this grain aphis is about one-tenth of an inch long. The winged louse is nearly twice as long to the end of the wings.

This louse is not quite as slim as is Aphis mali (see Fig.) As will be observed by examining the lice, or by studying the figure, these lice have long, seven-jointed antennæ—the horn-like organs appended to the head, and the winged lice have simple veined wings. The main vein of each wing is branched. There are four branches in the front or primary wings. The outer one is strongly curved, and the next one branches twice. There are two simple branches on the posterior wing. This style of venation is characteristic of the genus aphis. We also note (see Fig.) that there are two short spine-like projections, black in the grain aphis, on the hind part of the abdomen. These are the nectaries or honey-tubes ; so called because there frequently exudes from them a nectar which attracts ants and bees to these lice.

Just now (June 26, 1889) a species of plant louse on our Norway spruces are secreting nectar so profusely that in the early morning it stands on the leaves in drops, so that it can be tasted. It seems very pleasant to the taste, and is giving the bees a fine harvest. This peculiar physiological characteristic serves the louse in this way : by attracting ants, wasps and bees, the birds and insect enemies of the lice are frightened away. I find that the oats and wheat are visited by ants that the nectar secreted by this grain aphis may be secured. The beak of this grain aphis is strong, dark in color, and about one-third the length of the body. With this the louse sucks the sap and devitalizes the plants. The feet and joints of the legs, and also the antennæ are dark or dusky in color.

The color in these lice varies greatly. Early in the season while they are on the leaves or stalks they are green. This is the color now of all healthy lice on the oats. After they migrate to the heads they often turn yellowish green, and even rust red, though I find that now the green color prevails even with the lice which are gathered thickly about the kernels. Some of the winged lice are very dark, almost black. It is probable that the nature of the food affects the color. As the berries mature I think the yellow and red colors will prevail to a larger degree.

Reproduction of the Lice.

The reproduction of plant lice is very curious. Late in the season we find both sexes. This is the only time that we find males. The sexes now pair, and eggs are laid about buds, in crevices, or where they will best survive the winter. In the spring only females hatch from these eggs. These do not lay eggs, but each gives birth to from three to five lice each day. In about four or five days these young lice begin to produce living lice, each contributing daily its four or five new lice to help on the general devastation.

Such early and rapid breeding implies great nutrition, and we easily understand why the plants wither and dry up. We also see how the lice become so quickly numerous and widespread. Calculation shows that in less than a month, if no lice die or were killed, a single louse might be the progenitor of more than several million lice. To follow the numbers further defies comprehension. Many have written me : "We cannot imagine where the lice could come from so quickly and rapidly." The above fact explains this physiological riddle.

Why so Numerous this Year.

This is not the first season that this avenæ has come like a destroying flood upon the grain fields. In 1861 the lice swarmed upon the cereal crops of New England and New York, at which time Dr. Asa Fitch fully described it in his sixth report. In 1866 and again ten years later it did great damage in various sections of the West. We see then that this louse does not come yearly, but only at long intervals. Why is this ? It is doubtless owing in some measure to the weather, but more to its insect enemies.

We readily see that its enormous prolificness would make it as the sands of the seashore every year, except that some natural agent held it in check. Fitch describes three such enemies. Even now, as we visit the oat and wheat fields, we find many forms different from any previously described. These have short, rounded bodies, which are of a dirty white color. The cause of this is that these are attacked by parasites, which are eating them up.

We have reared several of these little benefactors, and find them now busily engaged in the fields laying the eggs that will destroy the lice. These minute parasitic insects lay a great many eggs, one in each louse, and their presence and prosperity mark the doom of the lice. Thus through the agency of these minute parasitic forms, aided by climatic influences, we are to be saved from a raid by this grain aphis next year, and will be greatly benefited this year. Indeed, in some cases, these little friends will very likely save us from serious damage. Why the parasites are not able to come successfully to the rescue each year is still unknown. Very likely this problem will receive a very valuable practical solution in the future. In these parasites the entomologist sees the doom of the lice, but not, I fear, till great harm is done.

Dry weather is a great promoter of insect productiveness. It is more than probable that the exceeding drouth of 1887, 1888, and of the April and May just past, together with the mild winter of 1888 and 1889, have had much to do with the present invasion. We might expect much aid from our frequent June rains, but I fear they were too late. Observation shows that the

lice are more than holding their own, so we may conclude that the warm rains are not greatly depleting their ranks.

Apple Tree Plant Louse—*Aphis Malt.*
Winged form, natural size, and also much magnified —Wingless form, much magnified. The short lines show the natural size.

Where the lice are very numerous, as they seem to be over a wide-spread area of our country, they must do great injury. Where ten or twelve are collected about a single kernel of wheat, as I have actually seen in the past few days, there is little hope for that kernel. I have counted 160 lice on a single head of wheat. It is hoping too much of the little parasitic flies to expect them to save the present crop. We can but expect much injury, especially where the lice are in such countless numbers as are now seen in many of our wheat fields of Indiana, Ohio, and Michigan.

The excellent specific against plant-louse ravages, the kerosene and soap mixture, cannot be used without much injury to the crop. To apply it might be like the jump from the frying pan to the fire. Again, the lice are so protected by the close cluster of the kernels that very likely the remedy would not be fully effective. I could not, therefore, recommend its application in this case. We are now making extensive and accurate experiments, so that at the time of a future raid we can speak with positiveness in this matter. We are aiming to find just what the damage is, just how many lice it requires on a head or kernel to blast it, and just how effective the remedy is, and how serious the damage of its application will be to the plants.

The name "green midge," which is going the rounds of the papers, is very incorrect, and should not be used. The Hessian fly and wheat midge are very different insects. These midges are two-winged flies, whose larvæ are footless maggots. They belong to the great two-winged fly order, Diptera, while these are plant lice or aphides, and belong to the order of bugs, or Hemiptera. Let all speak of this as the grain aphis, or plant louse, and not as the green midge, which is entirely wrong, as they are not always even green in color.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 20.—Northern Illinois, at Guilford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Dec. 4, 6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Good Prospect for Linden Honey.—J. S. McIntire, Maple Plain, Minn., on June 28, 1889, writes:

Bees in this locality are generally doing well. I had a prime swarm on June 10, and to-day they have the brood-chamber full of comb, and 48 sections nearly filled and capped. They had nothing but starters to work on in either chamber. White clover is good, and the prospect for linden never was better. I examined one tree to-day, and could not find any worms, as described on page 403. I visited my friend Albert Moses (5 miles from here) to-day; he has over 100 colonies, and his bees are just booming. The prospects now are very flattering for a big honey yield. I am located 20 miles west of Minneapolis.

Too Much Rain.—C. D. Robinson, West Groton, N. Y., on June. 17, 1889, says:

I put 44 colonies of bees into winter quarters, and in the spring I had 38, all in good condition; but it has rained for the last three weeks almost every day, and still rains. I had 2 swarms on June 14. I hope that it will stop in time to secure the linden honey.

Linden Bloom—White Clover.—J. M. Young, Plattsmouth, Nebr., on on June 28, 1889, says:

Bees are doing their level best on the linden bloom throughout this section, and from morning until night. The white clover was extra good, and bloomed early this year, and has crowded the hives full of bees. We have already placed both new comb and new extracted honey on the market, and the prospects are excellent for a large crop. Bees are swarming all over the county, and the weather is fine.

Bees Doing First-Rate.—James Jaggard, Oak Hill, Ills., on July 1, 1889, says:

My bees are doing first-rate. The first swarms have stored 40 pounds to the hive, and they are swarming besides storing honey. I never knew the first swarms to swarm so much. My location is a first-rate one, having white clover in abundance. Basswood is beginning to bloom, and we have any quantity of it.

Extracting Honey.—I. N. Arnold, Richmond, Iowa, on June 28, 1889, writes:

We extracted 1,900 pounds of honey in eight hours, with a three-frame honey-extractor. I broke my four-frame extractor just when we were ready to commence.

Covered with Bloom.—W. V. King, Princeton, Mo., on June 24, 1889, says:

Bees are doing well. I never before saw such a large crop of white clover bloom as we have now, and have had for the last five weeks. The pastures are almost as white as if covered with snow. North Missouri may be put against the world for clover, timothy and blue-grass.

Bees in Fair Condition.—J. P. Montgomery, Cordona, Ind., on June 26, 1889, says:

I think that the AMERICAN BEE JOURNAL is one of the best bee-periodicals that can be found. I cannot do without it. My bees are in fair condition. I have 23 colonies, which I am working for comb honey.

A Great Honey-Flow.—S. J. Youngman, Lakeview, Mich., on July 2, 1889, says:

Bees emerged from the cold spell of one month ago in good condition, and have been gathering honey for three weeks, from the clovers very rapidly, and nothing could prevent excessive swarming, some colonies having swarmed three times. I will give an instance of the great honey-flow: A friend near me hived a swarm in a Langstroth hive, on 8 frames, with 28 sections, which were filled in seven days, and it *swarmed again!* I think that this great honey-flow will be followed with one equally as great from the basswood bloom, as I have personally inspected the trees, and find the buds very promising.

Misrepresentation about Comb Honey.—John Hager, Jr., Arabi, La., on July 2, 1889, writes:

I have sent you a copy of the New Orleans *Times-Democrat*, wherein is an article copied from the Philadelphia *Record*, headed thus: "Bees Can Take a Rest." If such should be a fact (which I can hardly believe), it will cause many bee-keepers to seek for new fields of employment; but as I do not believe that there is a word of truth in the article, I think that it is the duty of all bee-keepers to have the article in question pronounced a myth, and a base fabrication, which will cause honey to become a drug in the market, consequently it will take years to build it up again. Honey, as we are all well aware, is cheap enough now—how much lower it will fall in price, we cannot tell, if such articles like the one referred to are allowed to go by unheeded.

[We are making it hot for the Philadelphia *Record*, and all others who publish such fabrications. They ought to be sued for injuring a legitimate business, but alas, bee-keepers are afraid to furnish "the sinews of war." As proof of this, notice how poorly they support the Union.—ED.]

White Clover Plentiful.—Geo. Eidemiller, McGregor, Iowa, on June 27, 1889, writes:

Bees are doing nicely. I started with 24 colonies, spring count, and increased them to 38 colonies thus far by natural swarming. White clover is plentiful this year. My bees gathered honey freely in the forepart of May, but after that we had about three weeks of cold weather—cold north winds and frosty nights, which put the bees back, and so I fed them sugar-syrup to keep up their courage. I also sowed seven acres of Alsike clover, which the "old reliable" AMERICAN BEE JOURNAL induced me to do. It stands nicely.

Making up Lost Time.—J. W. Sanders, Le Grand, Iowa, on July 4. 1889, says:

I am too busy to write very much, but I will say that the bees in this section have been booming most of the time for the past three weeks. They seem to be trying to make up the lost time for May, when so many came very nearly starving out. It seemed odd to have to feed bees the first of June, to keep them from starving. Breeding was cut down a good deal by the cold weather. I will give a full report soon.

The Red, White, and Alsike Clovers.—A. J. & E. Hatfield, South Bend, Ind., on July 2, 1889, write:

The past week ended our very busy season of marketing strawberries, only to be followed by still greater hurry with raspberries and other fruits; and above all, with the care of nearly 200 colonies of bees that are doing exceedingly well on red, white and Alsike clovers, with a fine prospect of a good yield from basswood, to open in a few days. We never saw the first crop of red clover so full of seed as this season, and we attribute it to our Italian bees, or nearly so, as there are but few bumble-bees so early in the season.

Good Prospects for Basswood.—Wm. Lossing, Howard, Minn., on July 1, 1889, says:

Basswood never promised better; it will be out in a few days. I have good prospects for a heavy flow from basswood.

A Large Honey-Flow.—W. H. Shaner, Leechburg, Pa., on July 1. 1889, says:

We are in the midst of a great honey-flow, but the bees cannot work half of the time on account of the continued wet weather. The ground is white with white clover everywhere. Swarming is in order every day; I never saw the like—the bees build queen-cells when they cannot do anything else.

Heavy White Clover Bloom.—D. Millard, Mendon, Mich., on July 1, 1889, says:

We are now in the heighth of the heaviest white clover bloom that I have known in this section for five years. The weather has been rather too rainy, but it is all that could be asked to-day, and the bees are bringing in the honey with a joyful hum. The lindens do not promise quite as profuse a bloom as usual, but the leaves and buds are in a *very* healthy condition, and, with favorable weather, it cannot fail to furnish a good yield of honey.

The Season in Kansas.—Geo. W. Hanson, Chapman, Kans., on July 1, 1889, writes:

My 15 colonies of bees wintered nicely in the cellar, although I had 4 swarms as late as Sept. 7, which I fed. They commenced gathering pollen about March 15, from soft maple, from elm on March 21, cottonwood on the 28th, and from box-elder on April 7. They commenced gathering honey about April 13, from plum, peach, cherries and apple blossoms. I had 2 swarms as early as May 9, and 4 or 5 almost ready to swarm, when it set in cold and rainy—in fact there was nothing for them to gather honey from to keep them alive. There is no white clover that grows here, and from May 10 to June 15 they were left without anything to work on; then came the milk-weed. My bees are doing well now, and are getting ready to swarm. They are filling one-pound sections, and it looks as if I am going to have some honey to eat soon.

Honey and Beeswax Market.

CHICAGO.

HONEY.—The old crop is about exhausted, and not any new has been offered, especially is the foregoing applicable to the state of the comb honey market. Extracted, very little demand, at 7@8c.
BEESWAX.—25c. R. A. BURNETT,
June 10. 161 South Water St.

DETROIT.

HONEY.—No attractive honey in the market, and sales are slow at 12@15c.
BEESWAX.—24@25c.
June 22. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—Very nice new comb in 1-lb. sections is selling at 18c. Very little old honey of any kind is on the market, and no new extracted.
BEESWAX.—None in the market.
June 26. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 6½@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.
BEESWAX.—Scarce at 23c. for prime.
May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote: Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.
BEESWAX.—Scarce, at 26½@27½c. for good.
HILDRETH BROS. & SEGELKEN,
June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: 1-pounds selling from 16@18c.; 2-lbs., 15@16c. Extracted, 8@9c. Sales very slow.
BEESWAX.—None on hand.
June 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., Demand slow for table use, and fair from manufacturers. Several lots of new comb have arrived, but quality being off, it finds slow sale at 12@14c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
June 22 C. F. MUTH & SON, Freeman & Central Av.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Subscribers who do not receive this paper promptly, will please notify us at once.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

Lovers of the Beautiful in art will learn with pleasure of the treat that is being prepared for them by the management of the Minneapolis Industrial Exposition, which re-opens on Aug. 21 for a period of 34 days. Art Director Smith has put forth every effort to make this season's art display the finest ever placed on exhibition in the West. In this he has been well seconded by the artists in the East, who have gladly furnished the choicest treasures of their studios for exhibition in the handsome art galleries of the Minneapolis, Minn., Exposition. Taken in connection with the best of other features provided, this season's Exposition will exceed in interest those of previous years.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

EDITORIAL BUZZINGS.

Some murmur when their sky is clear,
And wholly bright to view;
If one small speck of dark appear
In their great heaven of blue.

Honey has been gathered in abundance during the past few weeks. There is every prospect now for a large crop of honey this year.

Again We Caution the small honey producers not to be in a hurry to put their honey on the market, unless they get good prices for it.

The Canadian honey crop promises to be a satisfactory one. Swarming has been quite profuse, and the lindens and white clover blossoms are abundant.

The Australasian Bee Journal has added a Poultry Department to its paper, following the lead of the *Canadian Bee Journal* and the *Bee-Keepers' Advance*.

Carniolan Bees are rapidly coming into favor. Among all those who have tried them, we hear of none who are not pleased with their many points of excellence.

Capt. Evan P. Howell, of the Atlanta *Constitution*, who is a capital story teller, illustrated the persistent industry of the Chattanoogans by an anecdote of a man in Georgia, who kept bees, and, not satisfied with their proverbial industry, actually attempted to cross them with lightning bugs, in order to secure a continuation of honey gathering through the night.—*Boston Herald.*

Father Langstroth, as we stated last week, should not be forgotten in these days of plenty. We hope that all who subscribed to his annuity last year, will be prompt in sending the same this year. We sent to him our subscription a few days ago, and here is the acknowledgement of it from his daughter:

DAYTON, O., July 9, 1889.

THOS. G. NEWMAN & SON—*Kind Friends:*—I write in behalf of my father, to thank you for the received expression of your interest in, and friendship for him. Father has been very feeble for the past four months—a partial return of his old "head trouble," accompanied by unusual prostration. I often feel that it may be he is slipping away from us, but still hope for his restoration. He desires me to express to you his "love, friendship and grateful thanks for the enclosure ($25.00) you sent him," which I may add was a real "God-send." Very kindly yours,

ANNA L. COWAN.

No Nuisance.—Mr. W. H. Fletcher, of Sauk Rapids, Minn., wrote us as follows on July 5:

It has occurred to me that a full history of the Arkadelphia lawsuit, in pamphlet form, would be an interesting, if not valuable addition to the bee-literature of the day. Should you publish such a pamphlet, you may put me down as a subscriber for several copies.

The "Union" has published such a pamphlet. Any one interested can have it by sending a stamp to pay postage. We hope thousands of bee-keepers will now so far appreciate the efforts of the Union in their behalf, as to send a dollar to the Manager and become members. A dollar will pay for all dues till January, 1890.

The Original Home of the honey-bee is a matter of considerable conjecture. An exchange says that "C. J. Robinson thinks that bees had their original home in Egypt, and notes that with the Egyptians the picture of a queen-bee was an emblem of royalty. In the Egyptian picture-writing, the picture of a bee represented Lower Egypt or the Delta; and probably implies that the Delta was the sovereign mother country of the rest of the Nile valley."

The Prospect is a magnificent one for bee-keepers. Sugar is dear (made so by a sugar trust); small fruits are scarce, and not well developed; but the honey crop will be a very large one. Prices of honey ought to be good, and the demand lively.

Our Friend, A. I. Root, editor of *Gleanings*, gave us a short call on Friday of last week. He was on his way to see the honey-flow in the great linden belt in Wisconsin, and wanted us to accompany him, a thing we should have been delighted to do, but a "rush" of business at this time made it impossible for us to leave home. The time was short, but we spent it very pleasantly until separated by the departing train at the depot.

The Management of the Apiary is the title of a new work on apiculture, by Mr. Ed. Bertrand, of Nyon, Switzerland. The book has 178 pages, and is arranged so as to give a detailed management for each month in the year. It describes three types of hives (Dadant, De Layens and Jeker), and has 80 illustrations. Of course it is printed in French, as that is the language used in Western Switzerland, where our friend Bertrand lives.

We remember with a very great deal of pleasure our visit to M. Bertrand's very beautiful residence, and also to his apiaries. He is an enthusiastic apiarist, and his book is written in his happiest vein; with details so plain that any one can thoroughly understand it, and will in all probability become "enthused" like the author. The large folding-sheet illustrations at the end, are marvels of information concerning each of the three types of hives named, and give full details for their construction. It is published at Geneva, Brussels and Paris.

Shipping Nuclei in Switzerland is thus described by M. Vogl, of San Anselmo, Calif., in the *Western Apiarian* for July:

In Switzerland (my old home), I got my Italian nuclei from the Italian side of the Alps (Canto Ticino), each separately packed in a little box of ⅛ and ¼ inch stuff 6x9x9 inches, with four little combs (no frames) filled in, separated by little sticks, fastened by the bees to the sides; no wire-cloth is on the top, and instead of costly wire-cloth, it has only a few slits in the top and sides, sawed into the wood with a key-hole saw, each box corded with a strong string.

Bees settled in the top of a house near Atlanta, Ga., eight years ago, and the other day, when the gable end was removed, the entire roof was found to be filled with honey. So says an exchange.

A Busy Time with Busy Bees.—Fred Lincoln had six swarms come out in less than two hours, five of them alighting in the same place, and following each other in such rapid succession that he could hardly clear the tree before another swarm was ready to take the place.—*Brandon, Vt., Union.*

A Generous Physician.—Mrs. Blinkers—Well, did you go to the doctor to see about that bee-sting on little Johnny?

Mr. Blinkers—Yes. He said we should put mud on it. He charged me $2 for the prescription, but he gave me the mud for nothing.—*New York Weekly.*

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

GLEANS OF NEWS.

Circulate Truths about Honey.—Rev. J. D. Gehring, Lawrence, Kans., on July 5, 1889, writes thus:

Almost every day I hear people mention as a reason for not eating honey that it makes them sick. Explaining the difference between white section comb honey and honey taken from the brood-nest in the old way, does but little good. Like the "Wiley lie," the old story sticks.

Only a few days ago a young man, whose brother is a bee-keeper a few miles out of town, assured my wife that he knew that comb honb was made artificially. He was a traveling salesman for a Chicago firm where it was made by the ton, he said.

I was not at home at the time, or I should have made him give me more definite particulars. The ignorance of the general public on the subject of bees and honey is simply astounding. We bee-keepers should make a special effort to remove this ignorance, and thus increase the consumption of our product. Your leaflet, "Why Eat Honey," may be a good A B C book for the infant class. Bee-keepers ought to scatter it by the thousand.

It is only another phase of the Wiley *lie*, which has gained a world-wide circulation. That falsehood contained all the essential points for rapid propagation. It was readable, spicy, and *a falsehood!* With this trinity of requisites it has been carried at lightning speed, and varied to suit every land.

The only way bee-keepers can hope to gain a hearing is by scattering the honey Leaflets and Pamphlets, and thus inform all they can reach, about the value and uses of honey—and that comb honey is *not* adulterated.

June was a magnificent honey month in England. The *Bee-Keepers' Record* thus describes it in its issue for July:

A genuine bee-month has been that of June, 1889; and very fully indeed has the "hopeful prospect" pictured in our last issue been verified; indeed, for some years past we do not remember a time when greater progress was made by bees than in the last three weeks.

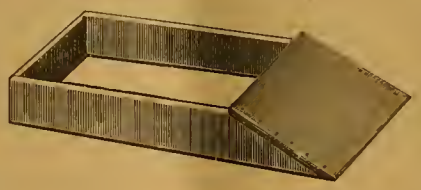
A swarm of our own, hived on the evening of Saturday, the 8th inst., on ten standard frames of foundation, was examined on the following Saturday, after only seven days' work, and it was just a sight to see. Brood and sealed honey in every frame, and "room wanted" at once! A shallow surplus chamber with ready-built combs was then given to it, and three days later these had quite a good show of honey in them.

From Scotland, and from the North of Ireland, too, correspondents write of a "land flowing with honey;" and from other parts of the kingdom similar good accounts are given. In some apiaries the bees have taken a swarming fever; one writer who owns 60 or 70 colonies declaring that the bees have gone "swarming mad," not that their owner will be likely to follow suit, and go mad too, in consequence, for swarms should find a ready sale, yielding a fair profit with little trouble.

It would appear, too, as if even the comparative scarcity of bees this year will be a sort of blessing in disguise to bee-keepers, for if the weather continues as favorable in July, and if all the colonies alive last autumn had been living now, honey would probably have been a complete drug in the market. As it is, those who are fortunate enough to possess good colonies will be likely to secure a big harvest, while the price of honey will be maintained at a fair figure, owing to the smaller number of sellers this year.

As we write, mid-June has only just passed away, yet in many districts the hay-crops are already cut and gathered in, so that we may expect a luxuriant and early bloom on second-crop clover, yielding honey for some weeks to come.

Here is an engraving which illustrates the Stand and Alighting-Board as used by Mr. F. Greiner, of Naples, N. Y. He says:



"It does away with all detachable alighting-boards. Further comment is unnecessary, as the engraving explains itself and its use."

Bees and Honey at the St. Joseph, Mo., Exposition (Sept. 3 to Oct. 5) are subject to these rules:

Exhibitors will not be allowed to remove honey from their exhibit during the Exposition, but may sell from a reserved supply, for which no charge will be made.

Exhibitors who sell honey must enclose it securely in paper cartons.

Honey exhibited or sold must be this season's crop, and all honey must be the produce of the exhibitor.

Colonies of bees must be exhibited so as to be readily seen.

All exhibits must be in place on opening day of the Exposition. The exhibit must be creditable.

A breach of these rules will forfeit all premiums that may be awarded to the offending party.

And the following are the premiums offered:

	First.	Second.
Display of comb honey, largest and most attractive	$50 00	$25 00
Display of extracted honey, largest and most attractive	50 00	25 00
Display of bees and queens, largest and most attractive	50 00	25 00
Largest and most complete line of apicultural implements exhibited by manufacturer, quality of workmanship to be considered	50 00	25 00

Heat.—S. R. Norton, of Lamont, Ills., asks the following questions on July 8, 1889:

What is the trouble with a swarm of bees I have? On July 5 they swarmed about 10 o'clock. I put them into a Langstroth hive, on 6 or 8 frames of foundation, and at 2 o'clock they left the new hive. I succeeded in putting them in again. I had scarcely hived them, when they left the second time. Thinking something might be offensive to them in the hive, I fixed a box and put in the frames of foundation and some empty ones. I put the swarm in this box, but about 4:30 p.m. they left this, and I again made them settle. I left them on the branch until sundown, when I put them into this box again.

The next day, between 9 and 10 a.m., they left the box, but I made them settle, and, as soon as I had them into the box, I closed the entrance with a wire-screen. I took a frame of brood from the parent hive, and gave them also a saucer of water. On Sunday I left the entrance closed until 5 p.m. They seem to be working all right now. This case has puzzled all the local bee-keepers. I hope that you will give me some explanation of this in the BEE JOURNAL.

At our request, Dr. C. C. Miller gives a reply to the above question. He says: "Without having fuller particulars it is not safe to give a positive answer, but it is quite probable that the trouble was heat. At any rate, bees hived in a box or hive, standing in the hot sun, would get just as these bees did. A swarm, when hived, should be set in a shady place, or else the hive should be in some way shaded."

A Bee-Parasite.—The Department of Agriculture publishes, in "Insect Life," the following account of an insect that is said to be causing great annoyance to Alabama bee-keepers:

In August, 1887, Dr. W. B. Rohmer, of Grand Bay, Mobile county, Ala., wrote us concerning an insect that had caused much trouble to bee-keepers in this vicinity, accompanying his communication with specimens of the imago, and also of the eggs which he had observed the insect in the act of depositing.

Noticing the insects alighting in the vicinity of his hives, his attention had been drawn to them, and he found that they introduced their ovipositors beneath the entrance blocks, or in the cracks between the hives and the bottom-boards, and remained in this position several minutes, perfectly motionless, repeating the operation a number of times.

Upon investigation a large number of eggs were always found deposited. When the hives were removed for the purpose of cleaning them, worms in all stages of growth were found upon the floors, especially in recently transferred hives, where there had been a large accumulation of *debris* incident to cleaning away and sealing comb to the frames. In this *debris* of wax and foreign material, all sizes occurred, from the tiny worm just hatched, to the large one snugly ensconced in its web.

Where the hives were clean, and there was nothing in the bottom for the worms to subsist upon, the newly-hatched larvæ made their way up, unobserved, to the combs at the bottom of the frames, eating and growing as they advanced.

The perfect insects were also seen laying their eggs in the cracks in the sides of old hives where the boards were nailed together, and for the reason that they have so many points of introduction these hives are more infested.

The specimens sent proved to be a true Dipteron, Hermetia mucens, which belongs to the Stratiomydiæ. Nothing similar to these habits has ever been published, so far as we are aware. In fact most of the species of this family, except some which are aquatic in their early stages, live underground, and their life history is not thoroughly understood.

This, therefore, is a matter of not only considerable scientific interest, but also much economic importance from the standpoint of the bee-keeper. That the Hermetia occurred in such locations, and laid the eggs mentioned, there can be no doubt; but that Dr. Kohmer has confused the larvæ of Galleria or some other Guest-moth with the larvæ of the fly, seems probable.

We Have Received a 12-page Poultry Circular from Mrs. W. P. Carpenter, of Harmony, N. Y.

"TO THE HILLS."

The following was written in London, and published in the *People* of Sunday, June 9, and affords one exhibition of the intense feeling excited in every section of the civilized world by the great disaster at Johnstown, Pa., the incidents of which, true or imaginary, have been set to music on both sides of the Atlantic:

"To the hills! to the hills! It's coming!"
The cry rings sharp and dread,
As a horseman, racing madly,
Adown the glenside sped.
"To the hills!—oh, God, why wait ye?"
He shouts as they doubting stood;
"'Tis the lake—it comes—oh, believe me!"
"To the hills, for your lives!—the flood!"

The crags with a startling echo,
Catch up that awful cry;
The dirge of the unknown hero,
Who thunders reckless by.
"To the hills! to the hills! God help them!
They heed me not—they wait.
Hark! now they mark their peril,
To the hills—ah, me—too late."

The warning cry grows fainter,
In the swell of a muttered roar
That follows the horse and its rider—
That sweeps all things before.
"To the hills!" ten thousand voices
Now shriek in wild despair,
As horror heaped on horror
Fills the vale and rends the air.

"To the hills!" 'Tis the voice of the rider,
Now sunk in a feeble wail,
'Midst the noise of the seething waters,
That tumble and leap o'er his trail.
"To the hills! to the hills! Lord help me!"
Now the cry of a drowning man,
As the billows hurry him onward,
Overleap the narrowing span.

Borne aloft is the corpse of the hero,
On the crest of a mountainous wave,
Tossed hither and thither—ever downward,
'Midst that ghastly wreck to his grave.
There hidden from those who would honor him,
His name ever lost to fame,
He rests with the simple record;—
"Here a Johnstown man died game."

—*Farquhar E. Palliser.*

Doolittle's Book on Queen-Rearing is not only of great interest to queen-breeders, but it is also of vital importance to every bee-keeper, even if he may have but two or three colonies of bees. It contains much that has never before been in print, and is as interesting as a novel. This is what Mr. A. I. Root says of it in the last number of *Gleanings*:

Friend Doolittle's book is as interesting, at least to me, as anything I have ever read in regard to bees, hardly excepting Father Langstroth's book, when I first got hold of it.

One reason is, that it is right along on a line where I worked for months, several years ago. I experimented by placing wire cloth between the upper and lower stories. Perforated zinc was not then known—at least I had not at my command anything to permit the worker-bees to go above and hold back the drones and queen; therefore my experiments amounted to but little more than having queens reared in nuclei above, in strong colonies. These nuclei were either shut off entirely by wire-cloth, or else these drones and queen had free access to the upper story. By having upper entrances, I succeeded in getting queen-cells built and queens fertilized to some extent; but it did not pay, and I was continually annoyed by being obliged to disturb the nucleus every time I wished to get into the lower story of the colony.

In Chapter VIII, we are told how to get queens fertilized in the same hive where there is a laying queen. These two chapters are certainly worth the price of the book to any bee-keeper. In fact, it seems to me that every man, woman, or child at all interested in bees, ought to read Friend Doolittle's book. *The accounts of his discoveries read like a book of fiction.* In fact, it sounds to me in some parts like the Arabian Nights; and yet it is absolutely true, every word of it. You can verify it yourself with your own bees. I know it, because I have experimented all along in the same line.

Those who are unfamiliar with this intricate, complicated, and wonderful matter of securing queens from an egg that would, in the usual course of events, have produced a worker-bee, will become familiar with the matter by reading Friend Doolittle's story. The whole of it seems to have been written in Friend Doolittle's happiest vein. I should judge that he had given the book great care and pains; and I believe that is the way he usually does every thing.

In order to correct some false impressions, Mr. Doolittle writes thus:

I see that some think that my book was written for queen-breeders, who follow the rearing of queens as a business; but this is a mistake. The book was written for the sole purpose of benefiting *all* in the bee-business, from the man who counts his colonies by the thousand, down to the amateur who has but two or three.

All want queens for any case of emergency which may come up, or for the purpose of superseding those which are past their usefulness, or not of the "blood" which they wish, or to give to the parent colony after the old queen has gone out with the swarm, so that second swarming may be prevented.

How handy it is, then, to rear such queens in an upper story, get them fertilized in the same by slipping in a perforated zinc partition so as to enclose a comb or two on each end of the hive, from which the queen may issue to meet the drones, and, after returning, be kept laying here till she is wanted for use, thereby aiding the queen below with brood all the time she is being held before she is wanted for use.

The possibilities which are before us along the line which this perforated metal may bring us, have only begun to dawn upon us. Queens can be reared and fertilized by the thousands in any apiary, and yet no colony be kept queenless for a single moment, nor any nuclei made, but all work in the apiary be going on just the same as if no queens were being reared. The advent of the perforted metal is likely to mark an epoch in our history, fully equal to that of the honey-extractor or the movable-comb hive.

The book costs one dollar, or will be clubbed with the AMERICAN BEE JOURNAL for a year, and both sent postpaid for $1.75.

Here is what the *Bee-Keepers' Record*, published in England, says of the book:

We have read Mr. Doolittle's book with much pleasure, not that we can—for the present at least—hope to profit so largely as we could wish by mastering all the very interesting methods of queen-rearing, detailed with the utmost minuteness by the author. To those, however, who can enjoy more close companionship with their bees than other occupations permit us to do, the work under notice will be a most enjoyable "find," even if it be but to read of the many wonderful things in queen-rearing accomplished by Mr. Doolittle.

To say that queen-rearing is a science does not go far enough; in his hands it is, in a great measure, a *mechanical* science, for he scoops up queen-larvæ, royal jelly, etc., from queen-cells reared by the bees, distributes both larvæ and jelly just as it suits his purpose, and rears queens by the hundred for a season extending over many months of each year.

Imagine the queen-breeder gravely setting to work with his wax dish, spirit lamp and *tools*, moulding queen-cups (or cells), arranging a dozen or more of these in line on a "stick," supplying each "cup" with "royal jelly" and a "little larva;" fixing the "stick" on a frame of comb, and setting it in a hive to be completed by the bees, the queens being hatched, and actually fertilized, while all this goes on in a fully-stocked hive with a laying queen; the operator meanwhile rearing as many as 100 queens in one colony without interrupting the work of the colony for an hour.

The business of queen-rearing is, in America, more entensively practiced than here; apiarists proper, or persons who cultivate bees as a sole source of income, being quite numerous as compared with this country! We have but little notion of the number of queens required for the trade demands of a regular queen-breeder like Mr. Doolittle. To meet these requirements, the skill of the breeder is taxed to the utmost; and in the book before us the details of each operation is described with such careful accuracy, and in such simple, homely language, that any one with time and equal skill may work on the same lines as the author, and hope for equally successful results. We have not space for saying as much as we could wish on Mr. Doolittle's work, but can promise any one interested in the subject a full dollar's-worth for their money, should they invest that sum in "Doolittle on Queen Rearing."

A LITTLE FORESIGHT.

Why It Is of More Use Than An Unlimited Quantity of Afterthought.

A little foresight is of more value than much aftersight, says the Sunday-School Times. Foresight is the planner, aftersight is the critic, of our deeds. What painful scenes, embarrassments, regrets, disappointments, self-accusations, the habit of looking ahead and planning to meet and to arrange the future will avoid? Time and money spent in designing a building perfectly, in definitely predetermining principles and rules of action, and marking off limits before embarking in any new project, in mapping out work, in arranging engagements, in avoiding conflicts of duty and the impossible demand to be in two places at one time, are well spent. But the forethought is more difficult than the afterthought. The one requires intense application to systematic consideration and search of the field of the possible; the other suggests itself instantly and naturally. Any body can see that the door is in the wrong place after the house is built, or can say that the speech was a mistake after it had been delivered and its effect noticed. It is easier to criticise well than to construct well; but it is more useful to construct a plan perfectly beforehand, than to criticise it afterwards.

Convention Notices.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

A JULY DAY.

With song of birds and hum of bees,
And odorous breath of swinging flowers,
With fluttering herbs and swaying trees,
Begin the early morning hours.

The warm tide of the southern air
Swims round, with gentle rise and fall,
And, burning through the golden glare,
The sun looks broadly over all.

So fair and fresh the landscape stands,
So vital, so beyond decay,
It looks as though God's shaping hands
Had just been raised and drawn away.

The holy baptism of the rain
Yet lingers like a special grace;
For I can see an aureole plain
About the world's transfigured face.

—*George Henry Boker.*

QUERIES and REPLIES.

Use of Sulphur Before Shipping Comb Honey.

Written for the American Bee Journal

Query 643.—Is it necessary, before shipping comb honey, to always subject it to the fumes of sulphur, for the purpose of killing the bee-moth larvæ?—W. R. H.

No. It never is, with me.—R. L. TAYLOR.

In some localities, where the bee-moth is troublesome, it is best to do so. We do not do it here.—H. D. CUTTING.

No; but it is the safest way.—A. J. COOK.

Yes, if before September. Not after that date.—DADANT & SON.

No; excepting where it is of long standing.—WILL M. BARNUM.

Perhaps not always necessary, but usually a wise precaution.—MRS. L. HARRISON.

I think it is advisable, but not generally practiced.—P. L. VIALLON.

Not if properly cared for, when removed from the hive.—A. B. MASON.

I do not. If it is the practice of honey-producers generally, I shall also be glad to know it.—EUGENE SECOR.

Not if it is cold weather. It might be uecessary in warm weather.—J. M. HAMBAUGH.

It depends upon circumstances. If the shipment is made early in the season it would be best to do so.—J. P. H. BROWN.

If very white, with no pollen in it, it may not be necessary, but is always safe.—C. C. MILLER.

No, sir; I consider such an arrangement all wrong. Do not keep bees in such a manner as to have your surplus honey infested with the eggs of the moth.—JAMES HEDDON.

It is safer to fumigate comb honey before sending it, when it may be kept on hand for sometime. I saw moth-worms in comb-honey in a store here in Ipava, that had not been there very long.—MAHALA B. CHADDOCK.

It is necessary to know that the worms are all killed, and that no eggs remain, else trouble will ensue, as the worms eat very rapidly after they once begin.—J. E. POND.

I think not. I have never used brimstone for that purpose, and have never seen a worm in comb honey. With Italian or with Syrian bees, and careful handling, I think the use of sulphur is entirely superfluous.—M. MAHIN.

Yes, sir. I have seen honey in the market in such bad condition on account of the moth, that it was almost worthless, and a disgrace to the bee-keeper who produced it.—C. H. DIBBERN.

No; but care must be taken to select out all combs having pollen in them. The moth-larvæ cannot live and develop on wax alone, but will thrive on old brood-combs, or new combs containing bee-bread.—G. L. TINKER.

Not with me, if the honey has been properly managed for a week or ten days after it has been removed from the hives, and before it is shipped. I prefer not to *crate* my honey till I have kept it for about ten days, so as to see if any moth-worms are likely to hatch on the honey.—G. W. DEMAREE.

If the comb honey has been carefully secured free from pollen, *no*. Honey secured in the brood-nest, or stored at the sides of the brood-nest, or stored by queenless colonies will have pollen-cells scattered throughout the product most certainly, and will as certainly be wormy honey. Have your honey stored above a colony in a normal condition, with a queen-excluder, and you will have no pollen, and therefore no worms.—J. M. SHUCK.

I do not sulphur my honey unless I see the signs of the bee-moth larvæ upon it. Unless they commence operations within three weeks after it is taken from the hive, they never will, if your honey is kept in a warm room, as it should be.—G. M. DOOLITTLE.

The safest way is to keep the honey in a warm room at home about twenty days after removing it from the hive. Then it is not necessary to sulphur it, unless the moths have already commenced to work on it. The condition of some honey on the market shows slovenly work, and it should have been sulphured before shipping it.—THE EDITOR.

CORRESPONDENCE.

BEES AND COLORS.

The Relation of Bees to the Floral Kingdom.

Written for the American Bee Journal

BY J. F. LATHAM.

In contemplating the relationship of bees and flowers, a comprehensive view of the subject may be attained by adopting, as a basis for thought, the fact that, in every element of nature contributing to the development of organic life, there exists, to a certain extent, an affinity, or a co-operation of affinities influencing, in a major or minor degree, the collective welfare of all. Among the most potent agencies contributing to the growth of vegetation, especially the melliferous flora, are the influences of light and warmth.

As a large number of the nectar-yielding flowers are borne by plants that propagate from the seed, the claims of relationship in the economy of bees and flowers are well established. The bee is dependent upon the flower for its sustenance, and the flower receives a generous return in the distribution of its fecundating element of the bee, when, in eventual instances, the general methods of propagation are rendered abortive.

But without a desire to criticise, or an attempt to controvert the teachings of those who occupy the position of monitors in the schools of the natural sciences, it seems that, in detailing the processes of nature as revealed to the eye, due credence must be allowed for elasticity. To say that the melliferous flora secretes its sweets for a specific purpose, unconnected with the constituent principles of its organic growth—*i. e.*, for the sole purpose of supporting tribes of parasitic insects to perform the operations, and accomplish the designs of its existence—does not accord with the broad outlines of Nature's plan.

That the forms of many flowers are such that the visitations of insects, when searching for nectar or pollen, aid materially in enhancing their productiveness, is beyond doubt; but to assert that such flowers would fail to fulfill the design of their existence; and that the plant species which they represent would become extinct without the ministrations of insects, appears too broad, in a technical aspect, to merit the claim of infallibility.

In the early ages of the earth, vegetation must have existed that accomplished the various stages of growth, and perpetuated its kind without in-

sect aid ; and although flowerless, its organic germs were no less a reality than at a more recent date, when the requirements of its existence developed efflorescence ; and a less cloudy atmosphere allowed a more favorable potency to the fructifying influence of the sun's rays.

Among the species of marine plants are those which grow a long distance from the bottom of the sea, to reach the surface of their watery bed, and embrace the stimulating elements of an open firmament ; some to bud, and bloom, and yield seed after their kind in congenial conditions ; and others, to absorb the exhilaration of light and warmth only. I have "paced off" sections of the "kelp" stalk 40 feet in length, that had been rent from the growing plant, and driven on shore by storms at sea.

The fresh-water lily will grow 10 feet to reach the surface ; and will not unfold its snowy petals until it can receive the full force of unrestricted light. On land, many species of flowering plants that open their buds to the rising Sun, close them on his decline.

The sun-flower—helianthus—unfolds its disk to the East, in the morning, follows the Sun in his diurnal course, and closes it again on his disappearance beneath the Western horizon ; turns again to the East during the night, to again repeat the process of each preceding day, until the requirements of light and wamth, as stimulants to the development of its reproductive functions, are no longer needful.

The dandelion, and many other flowering plants less conspicuous than the sun-flower, fold their petals during the night, and during stormy weather, and even during very dark, cloudy days.

That any flower which fails to display its bloom at unfavorable times, should be conscious that its insect friends are prevented in their ministrations by inclement weather, does not seem probable. Many showy flowers which do not secrete nectar; and many others which do, propagate from bulbs or root-seeds. I have been shown the root of the red clover, with what were described to be seeds existing in openings along its tap-root. If these are true seeds, should the plant "run out," its extinction could hardly be attributed to the absence of insect aid in distributing the pollen from its bloom.

The bloom of the potato vine is very profuse, and yields pollen abundantly, but it is never visited by bees, to my knowledge. The potato propagates from the seed and tuber, and, as is well known, is one of the most prolific food-producing plants of the vegetable world.

The common sheep-laurel is very conspicuous in its crimson bloom, in the old hill-pastures of New England, but being very poisonous, it is not visited by the honey-bee. I am not informed whether the laurel of the North yields nectar, but I have watched the bees while at work on inconspicuous flowers near by its flaming clumps, and have never seen them give its showy inducements any attention.

Bees will search out a single flower of the wild raspberry when isolated from its kindred bloom, and hidden among other shrubbery so that its approximation to the querist might be discovered only by the hum of the insects. This I have noticed many times in connection with the raspberry and a late-blooming aster, with a very small purple flower, which grows on the margin of ponds, among the dense foliage of the sweet-bay. After a severe frost has killed all flowering vegetation in the open lands, this reclusive gem, protected by the shrubbery in which it delights to nestle, will retain its vitality, and secrete nectar, and produce pollen until cut off by the more severe cold of approaching winter.

Another very inconspicuous flower which occupies the attention of the honey-bee, is found on the witch-hazel. The first time my attention was called to the witch-hazel as a honey-producer, happened while passing through a clump of bushes, and hearing the hum of bees at work. Casually, I could discern no bloom, but after a more careful search I discovered the flowers with the bees at work on them, gathering pollen, surely, and nectar apparently.

Many other instances might be enumerated that would serve to contract the showy-inducement theory, but it seems that a strictly practical observation will convince the most skeptical, that the odor of the flower, and the habitual requirements of nectar-loving insects, are realities in the relations of bees and flowers that need no modifying. Bright, or variegated flowers, are no more attractive to the hive-bee that those of a plainer hue. The best nectar-producing trees and plants here, taking them in their seasons, are the sugar maple, raspberry, locust, white clover, aster, and—what it is hoped will be our "National flower"—the golden-rod !

In the apple bloom, on many trees, a pale pink color predominates, while others are tinged with pink, but the major part are destitute of color. Notwithstanding the extent and brilliancy of the fruit-bloom, my bees will give the more modest bloom of the maple the preference, when both kinds of trees are in blossom at the same time, and yielding nectar quite plentifully.

In an objective capacity color may be useful to bees when foraging, but they often wing their way from one flower to another, giving to each a casual glance, without stopping to apply the ligular to the chalice.

Here, again, it may be observed, if care is exercised, that plain uni-colored petals are as forcible in their attractiveness as gaudy multi-colored petals. Bloom, in the vegetable species, is but an indication of the sexual impulse inherent in the object it represents ; expressive of what may contribute to the perpetuation of its kind in the sphere which it specially fills in the economy of Nature ; as when expressive of the same impulse manifested through the medium of the animal organism ; and it seems next to an absolute certainty that, if the nectar-yielding trees, shrubs and plants, in their floral display were prompted by no other cause than that of inducing insects to fructify their seed germs, they would not bloom at all. On the other hand, it is very certain that, if the hive-bee was actuated by no other motive than that of conveying pollen from flower to flower, it would obtain its food from some other source.

The limits of human knowledge are, uncertainty ; but when we take into consideration the facts that the animal is the offspring of the vegetable ; the vegetable an out-crop of the mineral, and that the vegetable absorbs from the mineral the ingredients, which, by the rays of light, are modified, and develop in changing hues of mirrored beauty ; the teachings that the melliferous flora adorns itself in those pleasing colors, as an allurement to induce insects to sip the nectar from its cup, and gather the pollen from its stamens ; when that same nectar and pollen are the only food accessible to animals organically constituted to obtain their sustenance from the flower ; and which can have no other inducement to prompt them to visit the flower—do not accord with the evolving disclosures that may be deduced from cause and effect, in which there is no accidentalism.

Again, when we take into consideration the fact that the elements in the dust-grains upon which we tread are but representative of the elements which comprise the make-up of the blazing suns of planetary systems in the boundless realms of space, where suns are but as drops of water in the ocean, the shadowy assertion of accidental development will meet with a frail support ; for, in every pulsation of Nature, there is revealed to the senses,

evidence, realistic of a guiding and modifying agency; and, to repeat, the gratifying odors emanating from the nectaries, and the pleasing colors displayed in the petals of the floral world, are manifestations of an Omnipotent Director's handi-work.

West Cumberland, Maine.

LIVELY WORK.

Bees are Booming, and Apiarists are Kept Busy.

Written for the American Bee Journal

BY E. W. COUNCILMAN.

Things have changed here in this section of the country since my letter was written on page 412, in regard to the prospects for a honey crop. Then it was gloomy, cold, sour, rainy weather, bees out of honey, and only occasionally the sun would shine out just long enough for the poor little things to skip out and get enough to just keep "soul and body" together. In quite a few instances bees actually starved to death.

But now, how changed! Bees are just booming; plenty of sunshine, flowers full of honey, bees swarming so rapidly that one has to hustle to get them hived before another is out, ready for its new home. From 44 colonies I have already had 30 new swarms, and I do not think that they are half through swarming yet.

White clover is plentiful, and is yielding abundantly. Basswood seemingly was never in better condition. The abundant rains have filled the ground with water, so that the linden will have no excuse for not "giving down" an abundance of nectar this year.

Bees have stored quite a little surplus from white daisies—at least the combs in the sections are yellow, and the honey slightly bitter; I have seen the bees working on the white daisies, and come in with their little bodies covered with yellow pollen dust. Some of my neighbors have already got new honey in the groceries for sale.

I am cutting out the queen-cells and putting the bees back. Is this the correct way to do? Is there more money in the surplus than in the new swarms?

Newark Valley, N. Y., June 30.

[That depends entirely upon whether you want "honey" or "bees." If you want to enlarge your apiary, then run for increase; but if you want honey, then bend all your energies to get the nectar—cut out queen-cells, putting the bees back, etc.—ED.]

QUEENS.

Giving Laying Queens to Colonies Immediately After Swarming.

Written for the American Rural Home

BY G. M. DOOLITTLE.

For years we have been told that no colony should go without a laying-queen a single day, if it were possible to give them one, and plans for introducing queens, which required that the hive should be queenless a few days previous, have been severely critised. We have also been told for years, that the bee-keeper who wished to secure the best results from his bees, should have a laying queen ready to give each old colony as soon as they swarmed, as the time lost to them, by rearing a queen, was equivalent to a swarm of bees.

Being eager to know for myself, all the plans which would give the best results, I have experimented largely, and the truth of the statement that the time lost to the bees in rearing a queen in natural swarming, was equivalent to a swarm of bees, is the reason it has not proven a success. If it were bees I was after, the case would be different.

With me, white clover yields only enough honey to keep the bees breeding nicely, and prepares them so that they mainly swarm from June 20 to July 1. Our honey harvest is from basswood, which blossoms from July 10 to 16.

Now, all who are familiar with natural swarming, know that the bees are comparatively few in numbers in the spring, and increase by the rapidly increasing brood produced by the queen, which, in due time, hatch the bees, until a swarm is the result.

By giving a laying-queen to a colony immediately after it has cast a swarm, we bring about the same result (swarming) as before, for we place the bees in the same condition. The only difference is, that having plenty of brood, they build up quicker, and are prepared to swarm in a shorter time.

As this second swarming, brought about by giving the laying queen, comes right in our basswood honey harvest, it cuts off the surplus honey, for it is well known that bees having the swarming fever, do little or no work in the section-boxes, and if allowed to swarm, the object we have sought after (section honey) is beyond our reach.

Having given the result of my experience on this point, let us look at how the same colony would work, had we not given the bees a laying queen. Eight days after the swarm has issued, the first young queen will have emerged from her cell, as a rule, when the apiarist should remove all the other queen-cells from the hive, so that second swarming is entirely prevented.

In ten days more our young queen is ready to lay, which is about the time the basswood begins to yield honey largely; during this period, between the time the swarm issued and the young queen commences to lay, the bees not having any brood to nurse for the last half of the time, consume but little honey; hence as fast as the young bees emerge from the cells, they are filled with honey; for bees, not having a laying queen, seldom build comb in the sections, especially while there is no unsealed brood in the hive.

Thus, when the young queen is ready to lay, she finds every available cell stored with well-ripened honey. At this point, the instinct of the bees teach them that they must have brood, or they will soon cease to exist as a colony, and a general rush is made for the sections, the honey from below is carried above, so as to give the queen room, and, in a week, we have as a result, the sections nearly filled with honey.

I have often had such colonies fill and complete 30 two-pound sections in from 8 to 12 days, while those to which I had given the laying queen immediately after swarming, did little but swarm during the same time.

Borodino, N. Y.

THE UNION.

Value of the Argument in the Arkadelphia Bee-Lawsuit.

Written for the American Bee Journal

BY EUGENE SECOR.

I am glad that the argument (page 406) of the Counsel for the "Bee-Keepers' Union" in the Arkadelphia bee-lawsuit was published. It will be a valuable contribution to the legal literature of bee-keeping. I do not suppose that any well-informed person thought for a moment that the final termination of the case could be against the right to keep bees.

If my cows should break out of my pasture and injure my neighbor, no one except a lawyer who was "feed" to argue the case against me, would be so foolish as to maintain that the cows should be abolished; but I would be liable for damages. So in keeping bees—the owner should be held liable for damages caused by his negligence, carelessness, and perhaps ignorance.

If I keep my bees so near the street as to annoy teams, or passersby, I could undoubtedly be restricted for the

general good; but the idea that bees can be prohibited from entering within corporation limits, by ordinance, is too ridiculous for serious consideration; because they could be placed just outside the limits, and as they do not appear to respect an ordinance of the City Fathers, nor a barb-wire fence, the annoyance from an occasional intruding bee, would not be removed.

But town counsels—ignorant sometimes of matters pressed upon their attention by interested and unscrupulous persons—do some very unwise, as well as unlawful, acts; hence the need of just such a precedent as this case will furnish for the protection of bee-keepers in the future.

Had it not been for the National Bee-Keepers' Union, that furnished the "sinews of war," this case might have gone against us by default.

A case so wisely managed, and so successfully teiminated, ought to inspire confidence enough in the Union, that its treasury shall never lack "the needful" to defend every worthy case.

Forest City, Iowa.

SWARMING.

Some Experiences with Bees in Swarming Time.

Written for the Prairie Farmer

BY MRS. L. HARRISON.

"Mrs. Harrison, why do you put that little tea-strainer in your pocket?"

O! this is not a tea-strainer, but a queen-cage, and it is very handy, just now. Yesterday I caught four queens out of six swarms, and it saved a deal of work. I put this little cage over a queen, and set it down on the top of a hive, anywhere, until I was ready for it. I then moved the hive from which the swarm issued, and put the new hive in its place, with the caged queen at the entrance.

As soon as she is missed, the bees return, and when they are quiet, I release her. Once I released her too soon, and she flew away, the bees following her. Again, as I released her, she flew, but immediately returned. Perhaps, if the swarm had not been placed upon the old stand, she might not have returned. I had four queens caged at one time, the other day. I take no further care of a swarm when I have the queen caged, and a hive prepared for their return.

One time, I "got left," as the children say. I caged a queen, and moved the old hive, placing a new one on its old stand, with the queen at the entrance. There was another swarm in the air at the same time, and they united. They often do this, when the queen accompanies them, and one will be destroyed. I then returned the old hive to its old stand, and gave the queen to them.

Bees will accept any queen when they swarm, but I noticed lately one balled, where two colonies had united. I had one of the queens caged, and when I saw this one balled, I put her in a cage, and left her in front of the hive among the bees for several hours. As the bees remained and united peaceably, I smoked them, and let the queen run in at the entrance, when she was well received.

Sometimes united swarms will leave the hives after remaining together over night, and return to their old home. Two swarms recently clustered together on a peach tree; the weight of the peaches and bees was too much for the limb, and down it came. I had placed a hive under where they clustered, and one remained and entered the hive, while the other returned home in disgust.

One swarm came out and returned for three consecutive days, and, as this was getting to be rather monotonous, after they returned the third time, I took the swarming business into my own hands. I removed the old hive and placed a new one in its place. Then I removed a frame from the old hive, containing a mature queen-cell, to the new hive. All the field-bees returned to the old stand, and I shook the bees from the combs of the old hive in front of the new one. I did not see the queen, and do not know which hive had her, but it makes little difference, as both had mature queen-cells.

One day last week two swarms issued at the same time and united. Before they were fairly hived, out came a third. I moved the hive immediately to where it was to stand, and spread my apron over the entrance. On came the third swarm and clustered upon the sides and back of the hive, until they were two inches deep; how to get them off and not have them mix with the first swarms, as their hive was then full to overflowing, was the question.

I lifted the hive with its adhering bees from the stand and placed a hive where it stood, and drove them off the sides of the hive. Then I carried the united swarm to a new stand, and all was lovely. As the united swarm was too large for the body of the hive, I put on a case of sections, and drove the bees in from the portico.

When bees leave a hive and are offered another just like it, it would seem that they ought to know what it is for, but they never seem to. I had one exception to this of late. A swarm clustered upon a grape-stake, and as soon as I placed a hive close to it, they came from the stake in a steady stream, and marched right into it.

The rains have caused weeds and grass to grow luxuriantly, and they should not be allowed to interfere with the flight of bees to and from their hives. If a blade of grass knocks down a loaded bee, it either has to crawl into the hive or take wing again, which may take it more time to do than it consumed on its flight from the flowers. Time means honey to bees, the same as it means money to men.

HIVES.

Will the "Coming Hive" have Less than Ten Frames?

Written for the American Bee Journal

BY J. E. POND.

That the matter of the "coming hive" is one of interest, "goes without saying," if I can judge from its prominence as the subject of thought among our ablest bee-men; but prominent as it is, some may say that enough has been said already on the subject. I admit that the question of size depends largely upon locality and individuality; still the beginner is the one most to be benefitted, after all. Mr. Doolittle, who must obtain all of his surplus in a few days, may well say that the Gallup hive is the one for him; but he is an expert. A novice would do far better at first, even in Borodino, with a larger hive.

I am only led to write this article by reading that of Mr. Robbins, on page 423, in reply to a former one of mine.

Mr. Robbins says: "The 10-frame hive men are in a minority." This I deny; statistics, and my own correspondence, prove to the contrary. If I had a queen that would not fill more than 7 Langstroth frames with brood in 21 days, I should exchange her for a better one at once.

In replying to Mr. R., I am at a loss for argument; but I will say this, that if I was working an apiary for "moth-cocoons," and "mouse-nests," I presume that I should prefer a smaller hive than one 14¼ inches wide; but working my apiary as I do, for surplus comb honey, I want just that size; with it I can work my bees more nearly in accordance with natural laws, than with a smaller hive.

Mr. R. is sick of dummies. Well, who is not? He admits that he must use them, though, even in his hive. I use them, but seldom with a 10-frame hive, and with a decent colony I only use one—½ inch thick—to a hive. I do not use them at all in winter, as I consider a frame of comb a better pro-

tection (because natural) than a dummy.

Take it all in all, however, I only state my own views. Mr. Robbins states his. The question itself will probably never be settled. One thing is sure, however, viz: the 10-frame Langstroth hive leads, so far as the one from which the *best* yield as yet has been obtained.

North Attleboro, Mass.

ITALIANIZING.

How to Secure Pure Italian Colonies of Bees.

Written for the Indiana Farmer
BY J. M. HICKS.

How can we successfully and with certainty rear pure Italian queens, is a question we have often been asked. We answer, just procure a pure tested queen (two are better) early in the season, and introduce her into a full colony after taking the old queen away; then stimulate the colony with some sweetened water (evening is best), in order to prevent robbing. This will start early breeding.

As soon as you have combs containing drone-brood, you can make a few queenless colonies, and at the end of eight days cut out all queen-cells you find, and interchange a frame of brood from the Italians to the queenless ones, and they will again make more queen-cells from the fresh eggs given them.

Then is also a good time to kill a few more black or impure queens, and insert one or two cells taken from the abundance of those you first gave Italian brood, which will hatch in ample time to head off any that might be made from any impure colonies. By this time you will have plenty of pure Italian drones for all practical purposes.

This plan of rearing queens in strong full colonies I think will give better satisfaction than the nucleus method, giving stronger and more vigorous queens. My idea for using two queens in starting is very obvious, that of having drones from two different mothers.

It would be well for all practical bee-keepers to remember that in order to succeed with bees and make them profitable, we must provide pasturage for them, such as Alsike clover, buckwheat, mustard, etc. These and many other farm crops are very valuable for honey.

I feel impressed with the importance of having at least a few acres of Alsike clover, as it is the best crop for having a fine quality of honey; perhaps it is the best flavored of all others.

As to quantity or number of pounds per acre, it is not excelled by any other clover, often producing 500 to 800 pounds. I now have a nice sample of Alsike clover honey 20 years old, as nice flavored to-day as it was when extracted in 1869.

Indianapolis, Ind.

IN CLOVER.

Written for Vick's Illustrated Magazine
BY EBEN E. REXFORD.

Let me lie down in the Clover,
Where the Daisies scatter snow,
And the yellow bees fly over
As my fancies come and go.

Dwellers in a royal palace
Have not softer couch than mine;
And, lo, here's a lily chalice,
Brimming with the morning's wine.

Yonder brook sings low and softly;
But I cannot catch its words,
As they blend in silvery music
With the notes of breeze and birds.

In this sweet, still summer weather
It is easy to forget
That our life has toil or trouble—
Has a cloud, a jar or fret.

Why should we try to remember?
It is well to dream and rest,
And forget that we grow weary,
Though our dreams are dreams at best.

Happy he who puts away
Thoughts of daily life and strife,
Who is deaf to din and discord
Jarring through the chords of life.

Let me lie thus in the Clover,
As a child on mother's breast,
And, awhile the hours fly over,
Dream sweet dreams of peace and rest.

OUR RIGHTS.

Bee-Keepers Have Rights that Must be Respected.

Written for the Colorado Farmer
BY GEO. A. STOCKWELL.

Animal and insect life contributing to man's welfare is entitled to consideration and support. Of all insects bees are the most useful. Other insects distribute pollen and fertilize flowers, but only for their own use. If all insect life should perish, a great shrinkage in the products of the fields would result. The flowers of some plants are so constructed that they cannot fertilize themselves—the pollen must be distributed by insects. The bee is the servant of man, even if it gathers honey for its own use only.

In some cities and towns, bees have been sought to be banished beyond the limits. It is believed that, in all cases, this action of the authorities has resulted from spite on the part of those who made complaint, or from misapprehension of bee-nature.

If a person unacquainted with bees be stung by a wasp, then the colony of bees in the neighborhood is condemned. Bees mind their own business, and molest none unless they are disturbed. In a large city, within twenty feet of the sidewalk of a great thoroughfare, bees, sometimes 4 or 5 colonies, have had their head-quarters for 25 years. As the bees' houses cannot be seen from the street, probably the neighbors, unless old residents, or acquainted with the owner of the bees, do not know that thousands of bees dwell within a stone's throw.

The bees' pasture is the world at large, unhemmed, or not hemmed by board or barb-wire fences. Thousands of bees come and go in every garden, and no one is the wiser, but every garden-holder is richer. One man, out of spite, sued his neighbor for damage done by bees. As there were many bees in the place, the bees complained of might belong to bee-keepers other than the neighbor prosecuted.

[A high-board fence should be maintained between the apiary and the sidewalk, for safety as well as for privacy. It would save apprehension. —ED.

QUEENS.

Their Improvement Means Better Bees and More Honey.

Written for the Western Farmer
BY DR. J. W. VANCE.

As so much depends on the quality of our queens, it is very essential that we should be posted in the best methods of producing queens of the highest grade. A good deal has been written on the subject during the past ten years. Many have turned their attention to it, and developed a regular business of producing queens for the market, shipping them to all parts of the world through the mails.

No doubt apiculture has been greatly benfited by it, for there has been undoubtedly a steady improvement in the quality of bees, in gentleness, in activity, and capacity for work. There has been a looking forward for the "coming bee," and occasionally some enthusiastic bee-keeper has shouted "Eureka!" as he beheld the bee that his careful and persevering efforts have developed. But the end is not yet. Perfection is yet in the future. Perhaps improved methods, and a clearer understanding of the nature and physiology of this most wonderful insect, may enable us to reach the result sought.

Mr. G. M. Doolittle, of New York, has written a most admirable work on the subject, giving a very interesting and instructive account of his experience in queen-rearing. He has given such a clear and minute description of the methods he has adopted that almost any bee-keeper can follow him, and attain equal success. He has made many useful discoveries, and perfected the inventions of others. We have read the book with the deepest interest, and do not hesitate to recommend it to any one interested in bee-culture.

Madison, Wis.

OVER-STOCKING.

How Many Colonies to Over-Stock a Locality?

Written for the American Bee Journal

BY W. A. HODGE.

The following is a small list of bee-keepers, and the number of colonies kept by each, who live inside of a range of four miles of me. I give it simply to show the magnitude of the bee-keeping industry in a very small portion of Vernon county, Wis. :

C. Lawrence, 90.	J. T. Elgar, 20.
A. Cuen, 30.	B. Nighlan, 20.
J. Holender, 18.	R. Valliant, 15.
J. Getter, 10.	Mr. Winneweazer, 15.
W. A. Hodge, 80.	

Besides the above, there are several other parties who keep a few colonies, and a few more who tell me that they are going into the bee-business next year.

Now, it occurs to my mind, that if this state of affairs continues to exist, and each bee-keeper keeps a cow or two, that one of two things is sure to happen, and that is, we are going to over-stock the country with bees, or the valleys of Wisconsin will "flow with milk and honey," and that very soon. I should be pleased to have some, who have had lots of experience, to tell, if they can, about how many colonies of bees can be profitably kept to the square mile, with a reasonable amount of pasturage.

Cold, but Sweet, Wisconsin.

Bees are doing splendidly at the present time, and since June 10 they have been storing honey very fast; and should the weather continue favorable, and we get our usual fall run on the islands and river-bottoms, we will make the best honey-record that we have ever made—at least in the past twenty years. I think, perhaps, the consequence will be that we can all eat our honey, or keep it to look at, as prices will run away below paying expenses; but I, for one, say: Good for old Wisconsin; she is *sweet* if she is *cold!*

Victory, Wis.

INCREASE.

My Plan for Making It by Dividing.

Written for the Farm, Field and Stockman

BY S. E. MILLER.

No doubt most of the readers have seen a great deal that has been written about artificial swarming, but perhaps have not taken the pains to try it. As my brother and I tried last year with one swarm, and were so well pleased with the result, that we tried it on several colonies the present season with satisfactory results, I will give our method.

As the bee-keeper with a number of colonies has generally plenty of other things to occupy his attention during swarming time, it is not at all a small job to be continually on the watch during the hours that they are likely to swarm, viz., from 10 a.m. until 3 p.m. Therefore we concluded to help all of those along that were making preparation for swarming, and thus relieve ourselves for a time, of the trouble of watching them. Even though our queens' wings are clipped, we do not like to have a swarm issue and return again without us having any knowledge of the fact.

We go to a colony that is strong enough to cast a good swarm (and are likely to be making preparations to do so), remove the hive far enough from its original stand to be convenient, and place a new hive on said stand.

The frames may be filled with empty combs, full sheets of foundation, or foundation starters, at the discretion of the operator. We use only fonndation starters, and I would not advise using empty combs, for in case there is a large flow of honey the bees will soon fill the combs with honey, and the queen will be left without cells in which to deposit eggs. If honey is coming in at a rate to warrant it, and you wish to run them for comb honey, put on the surplus receptacles at once, and close the hive, all ready to receive the bees. To insure their staying, it may be well to put a frame of brood in the new hive.

You are now ready to open the parent hive, and shake the bees in front of the new one, and let them march in. If the weather is warm, you can take nearly all of the bees from the old hive, as the new one is the one from which you must get your surplus; be sure to get the queen into the new hive, or she may get lost in the grass and never find her way into the hive, that is, if she has clipped wings. You can now move the parent hive to a new stand, but before leaving it, cut out all queen-cells but one (the best looking and furthest developed), and in eight days cut out all new ones that they may have started.

If they have no cells started at the time of swarming, they will only need to be removed the eighth day, of course leaving the best one to hatch as before stated. I am well aware that many older bee-keepers than myself will not favor this method, while there are some of the successful veterans who practice it, or something similar, almost exclusively. Taking all things into consideration, I think there are some advantages in it, while we have yet to find any disadvantages.

What bee-keeper has not seen a colony apparently in a condition to cast a powerful swarm, lingering day after day with a great cluster hanging on the outside of the hive that might just as well be storing many pounds of honey, as lounging around doing nothing?

This was the case with those that we tried last summer, and although it was at a time when other colonies were doing almost nothing but trying to rob, they drew out the foundation, and in a short time built up to be a strong colony, wintered well, and came out in the spring quite strong.

We have now in our apiary a number of colonies that were swarmed artificially on or near the same dates as others that cast swarms naturally and were hived according to the same method. Taking it on an average, I can see no difference in their present condition.

I would not, however, advise any one to practice this method on a large scale, without first trying it with a few colonies to see how they like it, and it would not be wise to try it when bees are not swarming naturally.

SELECTIONS FROM OUR LETTER BOX

Cold and Wet Weather.—J. F. Latham, West Cumberland, Maine, on July 3, 1889, writes:

Bees are not doing very well in this vicinity. There is an abundant bloom, but the weather is, and has been so far, very cold and wet.

Bees Doing Well.—J. V. Caldwell, Cambridge, Ills., on July 2, 1889, writes:

Bees have done well here this season. I have had some trouble in keeping down the increase to where I want it. Bees would swarm, with all the room they needed. I have not taken off much honey yet. I have increased so far from 112 colonies to 180. My first swarm from a new swarm came off to-day—after completing 56 one-pound sections.

Good Honey Weather.—Geo. F. Robbins, Mechanicsburg, Ills., on July 5, 1889, says:

The last ten days have given us the best honey weather that we have had this year.

Basswood all Right.—I. E. Myers, Mahtomedi, Minn., on July 9, 1889, says:

The lindens here are all heavily loaded with sound buds, that now begin to open. It is high time for it to bloom, for bees have been looking almost in vain for nectar; since the honey-dew ceased the bees continue to rob, and do not visit the clover nor any other blossoms which abound in this region. They store little or no honey, and build very thick comb ahead of their apparent wants. Colonies have given, on an average, 30 pounds of new honey so far.

Expects a Big Crop.—H. C. Gifford, Morris, Ills., on July 8, 1889, writes:

I wintered 21 colonies, and have now 44. I have taken off 30 pounds of new honey, and have at least 1,000 pounds in the sections. I will take off, this week, I think, from 300 to 500 pounds. I have had a time of it with swarming, but have doubled up and put back nearly half of the swarms. Moving the old hive to a new place did not prevent them, this year, from casting the second swarms, and tiering has seemed to have not much effect on them. I have 2 or 3 tiers of sections on all my hives, to prevent swarms, but as others have had so much more swarming than I have, I ought to feel satisfied. I expect a big crop of honey. Basswood is just a-blooming on the Illinois river bottoms.

Experience in Bee-Keeping.—M. M. Ritter, Canoga, N. Y., on July 8, 1889, writes:

The AMERICAN BEE JOURNAL is a great guide for me on bee-keeping. I could not get along without it, any more than I could without bread. I commenced with a colony in an old box-hive, and I went slow but sure. Three years ago this spring I wintered 5 colonies, and now I have 14 good ones, whose hives are full of bees and lots of honey. I had 2 swarms on June 9, and from one I have taken 30 pounds of comb honey in one-pound sections. On June 28 and July 6 they swarmed, when I put them back again, and they have staid all right up to this time. The bees in the box-hive I transferred, and they are doing well, and are working in the sections. I am pretty sure of 300 pounds of comb honey this season.

Foul Brood.—R. P. Blades, Carmi, Ills., July 6, 1889, writes:

The question most agitating the bee-rearers of Southern Illinois, and almost every other part of the country is this: How shall we avoid foul brood? There is foul brood in almost every county in the State of Illinois, and the owners do not know what is the matter with their bees. Even if they do, they do not know how to get rid of it, and just leave it to infect the whole country. They think their bees are gone, and do not care whose bees go next. There are men who have standard works on bees, and yet fail to recognize the disease. Sometime ago, a man, who possesses Root's A B C book, called me in to ask me what was the matter with his bees. The first look at them ought to have satisfied any sensible man what the trouble was—"foul brood" of the very worst character. After being told that it was foul brood, he readily recognized it, after having lost 12 out of 15 colonies of bees, and the other three, after being united, made one fair colony. Now let every bee-man in the country take measures to get rid of it. Call meetings and give and take advice. Ask the next Legislature to appoint inspectors for each county in the State to see that the bees are kept in a healthy condition. Give him power to destroy foul brood wherever found. This is the only way to get rid of what is to-day to bee-culture the same as the pleuro-pneumonia is to the cattle-raiser, or cholera with hogs. If not stamped out quickly, it will get past control.

Good Bee-Pasturage, etc.—E. Briggs, West Point, Nebr., on July 5, 1889, writes:

One man's bees have died, and I fear that foul brood is in the neighborhood. I began the spring with 9 colonies—7 in good condition, and 2 light. I have had only 4 new swarms, but they were strong. There are as many drones as workers in almost every colony of bees that I have seen in the county. I think that is not right. The bee-pasturage is the best that we have had for several years.

A Woman's Success with Bees.—Mrs. Anna Thompson, Knoxville, Iowa, on July 9, 1889, writes:

My husband, C. B. Thompson, died on May 14, and left me 50 colonies of bees. We had a man that knew a great deal about bees, but the first day that we had 3 swarms, we lost 2 of them, and the man went with them. I then hired a boy that did not know all about bees, but who was willing to learn, and we have since increased the bees to 81 colonies, and have taken 320 pounds of extracted honey, and 3,000 pounds of splendid honey in one-pounds sections. I have always been in mortal terror of the bees, but I was placed in a position that I was obliged to attend to them, so I hunted up all the old bee-papers, and held my breath to keep from being stung, and I think that in a year or so, if I follow all the rest of the advice that I find in the bee-papers, I will know as much as the man that left with the swarms. I vote for the "Golden-rod" for the National Flower.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

Honey and Beeswax Market.

CHICAGO.

HONEY.—New crop is appearing, and prices range from 15@17c. An active market is not looked for till later. Extracted, new crop, 7@8c. Very light receipts, and few sales.
BEESWAX.—25c. R. A. BURNETT.
July 11. 161 South Water St.

CHICAGO.

HONEY.—Old crop of 1 and 2 pound white clover honey exhausted, but considerable 1-lb. buckwheat is being offered. Our first receipts of new 1-pound white clover were in this week, and is selling at 14@15c.; dark 1-lbs., old, 10@11c. Extracted, dull, 6@8c.
BEESWAX.—25c.
July 11. S. T. FISH & CO., 189 S. Water St,

DETROIT.

HONEY.—No attractive honey in the market, and sales are slow at 12@15c.
BEESWAX.—24@25c.
June 22. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—Very nice new comb in 1-lb. sections is selling at 18c. Very little old honey of any kind is on the market, and no new extracted.
BEESWAX.—None in the market.
June 26. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, in barrels, 6½@6¾. Excellent demand for clear, bright in barrels. Dark, 5¾@6c.
BEESWAX.—Scarce at 23c. for prime.
May 22. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote: Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.
BEESWAX.—Scarce, at 26½@27½c. for good.
HILDRETH BROS. & SEGELKEN,
June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—Not a case of comb honey in our store—something unknown for a long time. Expecting the new crop every day. Price will be about 18c. We have some new Vermont extracted white clover, which sells at 8@9c.
BEESWAX.—None on hand.
July 10. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and 12@15c. for fair to choice comb. Demand slow, and arrivals are fair of the new crop.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
July 13 C. F. MUTH & SON, Freeman & Central Av.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40
Bee-Keepers' Review	1 50	1 40
The Apiculturist	1 75	1 65
Bee-Keepers' Advance	1 50	1 40
Canadian Bee Journal	2 00	1 80
Canadian Honey Producer	1 40	1 30

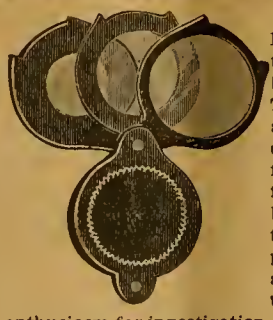
Weekly Inter-Ocean	2 00	1 75
How to Propagate Fruit	1 50	1 25
History of National Society	1 50	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

Subscribers who do not receive this paper promptly, will please notify us at once.

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

EDITORIAL BUZZINGS.

Love is where the sunshine glows,
Love is where the lily blows;
Is with yonder little bird,
Is with all the wildwood herd.
If no human love be near,
Love from God is always here.

Entrancing.—That is the word used by the editor of the *Farm, Stock and Home* when noticing the Doolittle book, entitled "Scientific Queen-Rearing." After describing it, he says:

The reputation of the author is ample guarantee of the practical value of the work. To the apiarist it is almost invaluable, and to the ordinary reader, or the student of Nature's wonders, it is entrancing as a fairy story.

Every reader of the AMERICAN BEE JOURNAL should send $1.00 to this office for a copy, and read it, too. If you send a year's subscription at the same time, $1.75 pays for both the BEE JOURNAL and Doolittle's book.

Father Langstroth's address is 928 Steele Avenue, Dayton, Ohio. By an oversight this was omitted last week. Concerning his annuity, we do not wish to say much, because he is naturally sensitive, and of course sees the BEE JOURNAL whenever he can see or read anything. "A word to the wise is sufficient."

Mr. Jas. F. Wood, of North Prescott, Mass., when sending his mite to this office for Father L., writes thus:

Can any one who has realized the benefits of the movable-comb hive, concientiously let Father Langstroth want for the comforts of life? But few of us ever bought the right to his invention—let it not be added, and but few of us ever helped him!

Send direct to his address, unless you prefer to send to us and have it go in bulk to him. Any way, so long as it is done.

Inexcusable Falsehoods.—O. S. Compton, of Glenwood, Mich., sends us the following, which he says was clipped from "The Family Herald and Weekly Star," published at Montreal, Canada, on July 10, among its "items of interest." Here is the mischievous item:

Artificial honey, which is more common in the market than consumers know, is made of potato-starch and oil of vitriol. Some rash optimists think that they are sure of getting the genuine product of bees and flowers by purchasing honey in the comb. Deluded mortals! The exquisite white comb that pleases them is often made of paraffine wax.

Mr. Compton remarks, "What a mess it would make? When will newspapers stop this lying?"

Aye, that's the question—*When?* At present they seem to be vieing with each other in telling the most inexcusable falsehoods about our pursuit! There is neither sense nor reason, neither object nor excuse for such paragraphs as the above! The idea of potato-starch and the oil of vitriol making "honey!" It is not only untrue, but absurd nonsense!

The "deluded mortals" are those who believe the story of the *Star* about paraffine combs, potato-starch, and oil of vitriol!

Bro. D. A. Jones should see to that "deluded mortal" who scribbles such foolishness for the Montreal *Star*.

Those who assert that "honey-combs are made of paraffine," filled with glucose, potato-starch, oil of vitriol, etc., and "sealed up by machinery," should produce a crate of such stuff, and obtain the $1,000 offered by Bro. Root for a sample of it—or else cease to repeat their villainous falsehoods, which are a detriment to an honest industry.

Many Persons are always seeking for something *new*—and, while this stimulates invention in legitimate lines, it also makes some would-be inventors "crazy" to dig out from the unfathomable depths, that which rewards them only with disappointment. Again, there are other "lunatics" who conceive the idea of having evolved from their brains something that will "revolutionize the world." The latter are caricatured very spicely by the following which has just come to hand from one of our correspondents. He says:

How can the bee-keeper manage in order that his hives may be full of bees ready for the honey-flow, has long been a subject of much discussion among the bee-keepers of to-day.

The machine I use in my apiary, the "Patent-Applied-for-Regulator," is an invention of my own, and I find it of great service in this respect, as it is so arranged that I can turn the bees "on" and "off" *ad libitum*.

It is constructed something like the burner of a gasoline stove, and it is operated in somewhat the same way. When there is a good honey-flow I turn the bees "on;" and just as soon as they have gathered it I turn them "off," and they are transferred into a chloroformed apartment, where they lie insensible until needed.

This machine, when fairly brought before the eyes of a waiting and appreciative public will, no doubt, be capable of meeting "a long-felt want."

Dr. Dzierzon has again been "decorated"—this time with a diploma, as will be seen from the following from the *Revue Internationale*, published by our friend, Mr. Ed Bertrand, at Nyon, Switzerland:

Dzierzon, born in 1811, is still living a retired life in Brieg, Silesia, where he has been for several years. The University of Munich has awarded him the diploma of Doctor of Philosophy, as a reward for his numerous scientific works, and for his theory in regard to parthenogenesis.

Ten years ago we witnessed a pleasant ceremony when he was "decorated" by Dr. Butlerow, Councellor of the Government of Russia, by Order of the Czar, with the Order of Sauta Anna.

This new "honor" adds to the many laurels of distinction worthily worn by a grand and distinguished apiarist. We hope he may long enjoy the proud distinctions so honestly and honorably earned.

A Lady writes from Missouri for information in this manner:

Please answer through the JOURNAL, whether or not ladies are entitled to vote for the National Flower.

We reply, of course they are entitled to vote. All they have to do is to send for the pamphlet, and a Postal Card "Blank Vote" will be found in the package addressed to Mr. Prang. This they should fill up, and drop in the mail—and there is no restriction—every man, woman and child has a right to vote for the National Flower; for the children soon take the places of father and mother. Let every one vote.

Every Person who orders any article should make that order complete in itself, and not say, "send the same as you did last year," or "last month;" or the same as you sent John Jones. Not any one of all the supply dealers can afford to waste the time to look over thousands of orders to find out what was sent before—and even if they did do so, the time would be worth more than the profit on the order would amount to.

Last week a man sent an order for goods to a supply dealer, and neglected to sign his name, and the order had to be laid aside until he should be tired of waiting, and write again. He waited several days, and then sent a telegram, but then only signed two initial letters—no name—and hence he could not get a reply. He telegraphed from another town than that at which his letter was mailed. There is no reason for such carelessness. At this writing, he is still waiting for the goods, which the dealer has all ready for him, but awaiting a *name* to ship to. It is a good rule, never to send a letter without re-reading it, and being *sure* that it contains your name, post-office, county and State.

After Nearly Ten Years of suffering, Mrs. J. Vandervort, of Laceyville, Pa., passed peacefully away on July 12. The AMERICAN BEE JOURNAL condoles with Brother Vandervort in his bereavement.

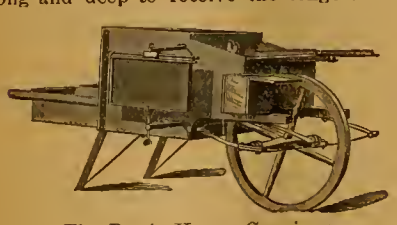
GLEAMS OF NEWS.

In the Paris Universal Exposition, the Swiss Department was to have contained (according to catalogue) 137 hives of all kinds, but the Paris correspondent of the *British Bee Journal* could not find them. He says:

For days and weeks past we have been in and out to see whether the exhibit of Mr. Zimmerman had arrived. In the official catalogue Mr. Zimmerman is described as exhibiting no less than 137 hives of all systems, but, alas! for human promises, there is only one bee-hive in the whole section, and that is by another maker. It would have been a real novelty to have seen 137 bee-hives at one exhibition, and would have filled pages of your *Journal*, but they are not there; and the officials, whom I have closely questioned, know nothing whatever about them.

Portable Tool-Box.—A correspondent remarks that he feels certain that almost every one handling bees has felt the need of an easy and convenient method of carrying honey from the hives to the extracting room, and returning the empty combs to the hives, and at the same time have a full supply of apiarian tools, scrap-pans, etc., always at hand and ready for immediate use. He desires to know the probable cost, and where such can be obtained.

The best thing we know of in that line is called the Davis Honey-Carriage. It contains a honey-comb safe, made sufficiently long and deep to receive the longest and



The Davis Honey Carriage.

deepest honey-frames in use, and wide enough to hold all the frames used in a story in perpendicular position. It has a dripping-pan to save the honey from being wasted or dripping around.

One of its principal features is a Tool-Box, in which to carry the smoker, fuel for the smoker, matches, queen-cages, transferring clamps, etc.; also, all the tools needed in an apiary. The cover of this box is hinged at the front end, and when turned forward so as to open the tool-box, it rests on an adjustable device so as to form a convenient and strong writing-desk, on which a memorandum book or sheet of paper, or both, may be fastened, and be always convenient for making notes and keeping a record of your work.

It also has a revolving comb-hanger, and is an invaluable article in an apiary.

Its price is $18.00, and it can be obtained at this office.

Surplus Boxes and Sections.—Alexander Le Roy, Amiens, France, asks the following questions:

1. What was the origin of the honey sections or surplus-boxes?
2. Who first thought of them?
3. Was it the Rev. L. L. Langstroth?
4. Did Mr. Langstroth invent sections when he devised his frame hive?
5. Were sections in four pieces when first made, and then one-piece sections with square grooves; and after that, those with the V groove?

In reply we offer the following as nearly as we can remember the facts. If we are in error, we shall thank any one to give a correction, for only the exact truth on every subject is of any value:

1. The *origin* of "boxes" for surplus honey was probably in the "California frames," first used by Mr. J. S. Harbison, who was most likely the inventor of such frames, which were made something like the

Dovetailed Sec'n. Nailed Section. California Frame

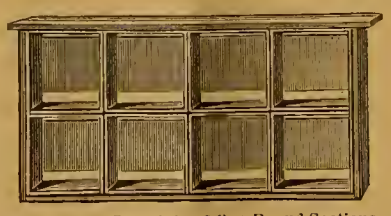
brood-frames, only they were about 6x6 inches in size, and the sides and top were 1½ inches wide, with narrower bottoms.

2. The first "honey boxes" were made to hold several combs about 6 inches square. A. G. Hill, of Indiana, conceived the idea of sawing about half through these boxes every 2 inches, so that the retailer could with a knife cut the combs apart, without injuring the honey-combs.

About the same time Geo. T. Wheeler, of New York, invented honey-boxes for single combs, having wood tops and bottoms, glass ends, and when taken from the hives (where full sized tin separators were used) the sides were also glassed. The entrance for the bees was through a "slot" in the bottom pieces.

Then N. N. Betsinger, of New York, we think, invented the honey-box made by nailing 2x⅛ inch sides to 1½x1¼ inch tops and bottoms, to be used with tin separators, and glassed on the sides after being taken from the hives. These were to hold 2 pounds of honey.

Then Mr. A. I. Root, of Ohio, we think, invented one-pound sections, eight of them, 4¼x4¼ inches, to fit into a "wide frame"



Wide Frame Containing 8 One-Pound Sections.

of the same size as the Langstroth brood-frame. These were of ⅞-inch wood all around, and were "dovetailed;" the sides being 2 inches, and the tops and bottoms 1¼ inches wide, leaving room for the bees to enter between every two—to be used with tin separators 3½ inches wide.

3. No.

4. Honey sections were unknown when the Langstroth hive was invented—it had frames for surplus honey similar to the brood-frames, but one-half their depth, and were used above a honey-board having holes bored in it to admit the bees to the surplus apartment.

5. After the four-piece dovetailed sections before mentioned, Prof. Cook used berry-box stuff bent to shape around a block, and nailed. Then several attempts were made to get the sections made all-in-one-piece; but that was not perfected until about 1880,

One-Piece One-Pound Section.

in Watertown, Wis., when the present one-piece section with V groove was made and put upon the market.

Later the square groove section was made by Mr. A. I. Root, of Ohio, but it was abandoned as soon as the Forncrook patent was invalidated by the United States Supreme Court decision. Now the V groove one-piece sections are universally used—all others are abandoned.

Another Falsehood Retracted.—On page 339, we called attention to an item in the *Sanitary Era*, averring that "comb" was "made artificially," and that "artificial honey, of glucose and sugar, with a little bitter almond flavoring," was upon the market, etc.

We then denounced the article, and demanded that the *Era* make a correction in its columns. It has done so, but very reluctantly. It says:

We are very glad to learn both that pure honey can be had of any honest honey-dealer, and that artificial comb is not filled with glucose, nor even successfully manufactured as yet. Honey in the comb, it seems, can be relied on.

We are pleased to see that the *Sanitary Era* may be classed among the honest papers, which are always willing to correct a false statement! We wish some other papers who have lately transgressed, would do the same—and thus place themselves in the truth-loving class.

The Completion and dedication of the National Monument to the Forefathers at Plymouth, Mass., the corner-stone of which was laid thirty years ago, gives timeliness to the well-written and beautifully illustrated article of "The Pilgrim Fathers," which leads off this number of *Frank Leslie's Popular Monthly* for August. The short stories, illustrated poems, miscellaneous essays, etc., are up to the first-class standard, and the new literary department begun in this number promises to be a valuable feature.

How to Join the Union.—Several have lately sent inquiries to know how to become members of the Union. In order to answer all at once, and save writing a letter to each, we invite attention to the following:

The Entrance Fee is $1.00, and that pays for the Dues of any portion of the unexpired current year, ending Dec. 31.

Then it costs only one dollar for Annual Dues, which are payable every New Year's day, and must be paid within six months, in order to retain membership in the Union.

If membership ceases, all claims against former members also cease; and all claims to the protection of the Union are dissolved.

The Constitution as last amended reads as follows:

ARTICLE I.—This organization shall be known as the "National Bee-Keepers' Union," and shall meet annually, or as often as necessity may require.

ARTICLE II.—its object shall be to protect the interests of bee-keepers, and to defend their rights.

ARTICLE III.—The officers of this Union shall consist of a President, five Vice-Presidents, and a General Manager (who shall also be the Secretary and Treasurer), whose duties shall be those usually performed by such officers. They shall be elected by ballot, and hold their several offices for one year, or until their successors are elected; blank ballots for this purpose to be mailed to every member by the General Manager.

ARTICLE IV.—The officers shall constitute an Advisory Board, which shall determine what action shall be taken by this Union, upon the application of bee-keepers for defense; and cause such extra assessments to be made upon the members as may become necessary to their defense; *provided* that only one assessment shall be made in any one fiscal year, without a majority vote of all the members (upon blanks furnished for that purpose), together with a statement showing why another assessment is desirable.

ARTICLE V.—Any person may become a member by paying to the General Manager an Entrance Fee of ONE DOLLAR, for which he shall receive a printed receipt making him a member of the Union, entitled to all its rights and benefits. The Annual Fee of $1.00 shall be due on the first day of January in each year, and MUST be paid within six months in order to retain membership in this Union.

ARTICLE VI.—The Funds of this Union shall be used for no other purpose than to defend and protect its members in their rights, after such cases are approved by the Advisory Board; and to pay the legitimate expenses of this Union, such as printing, postage, clerk-hire, etc.

ARTICLE VII.—This Constitution may be amended by a majority vote of all the members at any time.

The Entrance Fee and Dues must be sent direct to the General Manager, Thomas G. Newman, Chicago, Ills., who will record the names, and send receipts for every dollar sent in. The Union needs funds now, and at least one thousand bee-keepers should each become members immediately.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

QUERIES and REPLIES.

Advisability of Clipping the Queen's Wing.

Written for the American Bee Journal

Query 644.—1. Would you clip the queen's wing? 2. Why? 3. When?—T. F.

No.—J. P. H. BROWN.

No.—DADANT & SON.

I do not practice it. I can see some things in its favor, and some against it.—H. D. CUTTING.

No! I work on the non-swarming plan.—J. M. HAMBAUGH.

1. Yes, every time. 2. To save work. 3. The first time I see her after I find eggs.—A. J. COOK.

1. Yes. 2. So that the swarm may return. 3. In the spring, when cleaning out the hives.—MAHALA B. CHADDOCK.

1. Yes, every time. 2. So as to prevent swarms absconding, and for convenience in hiving. 3. Just as soon as convenient, after she has begun to lay.—A. B. MASON.

No; I want no queens that cannot fly, any more than queens without legs.—C. H. DIBBERN.

1. Yes. 2. To keep her from going to the woods, and to facilitate hiving swarms. 3. As soon as she begins to lay.—M. MAHIN.

1. If I did not want her to fly, I would. 2. To prevent her flying. 3. The very first chance. I do not think that clipping is so prevalent as formerly.—J. M. SHUCK.

1. Yes. 2. To mark them, to control swarming, etc. 3. Any time after laying well.—P. L. VIALLON.

1. Yes. 2. So that she cannot lead swarms to the woods. 3. Generally in the spring, before the colony increases much in strength.—R. L. TAYLOR.

1. I have never clipped a queen's wing—and I do not know that I ever shall. 2. To aid in swarming. 3. As soon as she commences to lay.—WILL M. BARNUM.

1. That would depend upon the situation and surroundings of my apiary; if near heavy timber, or surrounded by tall trees, yes. 3. When my little scissors were sharp—almost any time before swarming.—MRS. L. HARRISON.

No, sir. I am opposed to clipping queens' wings. I know that excellent and successful bee-keepers clip them. There are advantages and disadvantages both ways.—JAMES HEDDON.

1. Indeed, I would. 2. So she cannot fly with a swarm. 3. The first time that I see her after she lays. If not before, certainly prior to swarming time.—C. C. MILLER.

1. I would not. Those who do, claim that swarms are saved by so doing, and much trouble avoided. I do not see it so. 3. I should clip the wings any time after fecundation had taken place; it makes no matter when.—J. E. POND.

1. Yes. 2. Because there are more reasons in favor of so doing than there are against it. 3. At any time, when you see the queens after they become fertile. I usually do it when apple trees are in bloom, because this is at the beginning of the season, and also because there are not so many bees in the way then as later on.—G. M. DOOLITTLE.

1. I do not now clip the wings of my queens, but I did formerly. 2. I do not now, because it is not necessary, as it is so far to timber (about one mile), that the bees never go away without first clustering near by. Did I live near timber, I would use queen-traps in preference to clipping.—G. L. TINKER.

1. Queens at the head of my honey-producing colonies (not my breeding queens), yes. 2. "Why?" Because I can manage the swarms with less labor, and without danger of loss of swarms, and especially as there are some trees of considerable height near my apiary. 3. In the early spring, when the colonies are at their smallest, when the queens can be most readily found.—G. W. DEMAREE.

1. That depends. If I were a woman, I would, always. If among high trees, it is a good thing to do so anyway. I think that it is a good practice, even for men, unless they like to try Franklin's method with the lightning, and bring them down with a kite. 2. It saves work at swarming time. The bees cannot abscond. You are more sure of the age of your queens. 3. Any time after the queen has mated.—EUGENE SECOR.

1. Yes; if near timber. 2. So that the swarms would return and thus save labor. 3. Soon after she begins to lay, or before swarming time.—THE EDITOR.

Convention Notices.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

What Makes the Summer?

It is not the lark's clear tone
Cleaving the morning air with a soaring cry,
Nor the nightingale's dulcet melody all the balmy night—
Not these alone
Make the sweet sounds of summer;
But the drone of beetle and *bee*, the murmurous hum of the fly,
And the chirp of the cricket hidden out of sight—
These help to make the summer.

Not roses redly blown,
Nor golden lilies, lighting the dusky mead,
Nor proud, imperial pansies, nor queen-cups quaint and rare—
Not these alone
Make the sweet sights of summer;
But the countless forest leaves, the myriad wayside weeds,
And slender grasses, springing up everywhere,
These help to make the summer.

One heaven bends above;
The lowliest head ofttimes hath sweetest rest;
O'er song-bird in the pine, and *bee* in the ivy low,
Is the same love, it is all God's summer;
Well pleased is He if we patiently do our best.
So hum, *little bee*, and low green grasses grow,
You help to make the summer.

—*Maricita Holley, in Queries.*

CORRESPONDENCE.

THE SEASON.

Swarming Out, Comb Surface Measuring, Failures, etc.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

I am asked to tell why bees swarm out in early spring, upon the first really warm day which occurs, as they frequently do. This is a hard question to answer, for I have had them do so at times when I could see no cause for it at all. At other times I was satisfied that moldy combs, together with many dead bees upon the bottom-board, which emitted a foul odor, was the cause.

Again, when bees come near to starvation, in early spring, swarming out is quite liable to occur; for where there is anything about the hive which causes great dissatisfaction, the bees seem determined to see if they cannot better their condition, by leaving their uncomfortable quarters in the hopes of finding something more pleasant. So far all bee-keepers seem to agree, and were it not that I have had bees swarm out, when all about the hive was sweet and clean, with plenty of honey and brood in the hive, I might believe that I knew something certain about it.

In several instances I have had small swarms come out apparently under almost the same conditions which they do in summer, except they were not getting honey and pollen. Some try to account for this kind of swarming, by supposing that it always happens before any young bees hatch out in the spring, consequently when the old bees go out for their first play-spell, the queen is left alone, and not liking to be so left, she goes out after the bees. There must be some mistake in this, for I have had them swarm out many times when there would be many young bees that were so young that they were unable to fly, and would be left on the ground in front of the hive after the rest of the bees had gone, as we frequently see them after a swarm has issued in the summer time.

One thing I have noticed, however, that while we cannot fully account for the reason why bees thus swarm out, we can tell pretty nearly when they will be likely to do so. After a very severe winter, when the bees have suffered from being long confined to the hive, this thing is the most likely to occur; while after a mild winter, during which the bees have had frequent chances to fly, and have consequently wintered well, very little, if any, swarming out occurs.

Measuring Comb Surface.

There seems to be a confusion of ideas regarding what is meant, when the comb surface and square inches of comb are mentioned in our different bee-papers. As I understand it, when any one speaks of comb surface, he means the surface measure of the combs, measuring each comb on both sides, and multiplying the amount thus obtained for one comb, by the number of combs that there are in the hive. Thus, one Gallup frame gives a surface measure of 115 square inches on one side, and the same on the other, hence we have 230 square inches of comb surface as the amount contained by one frame. As I use nine of these frames in a hive, this gives 2,070 square inches of comb surface for the whole hive.

Now, for myself, I rarely use the term "comb surface," but nearly always speak of the number of square inches of comb which a hive contains. Thus, in speaking of the amount of comb contained in one of my frames, I say that it contains so many square inches of comb, the same as I would say that a board was so many inches long and so many inches wide, giving so many square inches, or so many feet. Surely, we do not measure a board on each side to tell us how many feet there is in it.

So when I say that one of my frames contains 115 square inches of comb, I measure the comb the same as I would a board, for one of my division-boards contain just as many square inches as does one of the frames. As I use nine frames in a hive, this gives me 1,035 square inches of comb, which amount I claim is sufficient for any brood-chamber, where we are working for comb honey.

Mr. Editor, if I am not right, will you please set us all right on this subject ?*

1889 Almost a Failure.

So far the present season has come the nearest to being a failure of any that I have ever passed through in my bee-keeping life, unless it was the season of 1869, and as that was the year in which I commenced to keep bees, I cannot tell just what might have been accomplished by a skillful apiarist.

The spring opened very propitiously this year, and kept so till May 20, when it came off cold and rainy, and continued so up to June 18, at which time we had a couple of days of warmer weather that let the bees out for a play-spell, for there was very little that they could do but play, as there was no honey in the flowers on account of the wet.

It soon began to rain again, and has kept it up for about one-half of the time ever since. For the past week, when it has not rained, the bees have got a little more than a living, for the weather has been very warm during this latter time; yet there is not a hive in the apiary which has five pounds of honey in it.

This warm weather has given me a chance to get started in the queen-business again, for to try to do anything at queen-rearing was only a waste of time and bees, as a rule, although I have succeeded in filling some orders.

Many things which have worked well in the past have failed to work at all this season, and among other things has been the getting of queens fertilized over a queen-excluding honey-board, as I described in my book. As I had in previous years sold my apiary short of bees, and used so many from my stronger colonies to start the queen-business early, I had not tiered any hives for extracted honey, till the basswood was in bloom, which may, in a measure, account for this failure in a time when no honey was coming in, and the bees using all their energy at brood-rearing when the weather would permit.

The queens have been allowed to hatch in the upper stories, the same as usual, but soon the bees would begin to persecute them, which would finally result in their death, and sometimes in a general row "up-stairs," in which many bees would be killed. Now, while this part has failed, the getting of nice queen-cells built above the queen-excluders has been a perfect success where the colonies so tiered were strong enough to occupy the upper stories as they should be occupied to do good work. In fact, I

never had so large a proportion of the prepared cups completed as I have had all along during this worst of all years.

The queens hatching from these cells have been splendid, but when it came to getting them fertilized, either in upper stories or in nuclei, it has been uphill work, for I never lost so many queens from nuclei in the same length of time as I have this year, that I remember of.

Basswood promises to be about one-half of a crop, according to the showing of buds. As these buds will open in a few days, I hope for better times in the near future.

Borodino, N. Y., July 3, 1889.

[*On each comb there are two surfaces, with cells extending down to the centre wall (or "mid-rib," as they call it in England), and a Gallup frame contains 230 square inches of comb surface, as Bro. Doolittle remarks in the first paragraph.

His second paragraph is clearly wrong. A board cannot be compared to a comb, unless it is two inches thick (or, if we may be allowed the expression, unless it is a "double board"). Then it would be calculated by "board measure," and both surfaces would be taken into the calculation, like the comb surfaces of the frame. While "we do not measure a *board* on each side to tell us how many feet there is in it," we invariably do measure or calculate both sides when that board becomes a two-inch plank—and more nearly resembles a frame of comb with two surfaces.—Ed.]

BASSWOOD.

My Management of Swarms in the Apiary.

Written for the American Bee Journal
BY MISS IDA HOUSE.

Basswood is very rich here; one colony brought in 12 pounds of honey on July 12. On July 10 we extracted 40 pounds of white clover honey from the same colony, and did not extract from the brood-chamber.

We find it almost impossible to get along without the queen-excluders. We have had a number of sections of honey spoiled by neglecting to put the queen-excluders on.

I am guarding against swarming all that I can, until basswood is done with. I take four frames of brood from a hive for a nucleus, put in four empty frames, and cut out all remaining queen-cells; as far as I have gone, this method works splendidly, but I find it impossible for me to get along very fast among so many bees.

My brother-in-law has charge of an elevator here, so he can help me only at night and morning with the bees. On July 7 we had 15 swarms, and also on July 10 we had 15 swarms; but with my sister's help, I hived them without the loss of one. We have not lost a swarm of bees for six summers.

All of our queens have their wings clipped, and when a swarm comes out, we go to the hive, pick up the queen, take out all the brood from the hive, and put in empty frames; then put the queen in front of the hive, and the bees will soon return, and go to work again.

Our colonies are all very strong, and in splendid condition. We could not ask for more favorable weather than we are having. When I have more time, I will tell how we winter our bees, which I hope will help some bee-keeper who is unsuccessful in wintering his bees.

Howard, Minn., July 13, 1889.

REARING QUEENS.

Results of Some Experiments in Bee-Keeping, etc.

Written for the American Bee Journal
BY FRANK S. JOHNSON.

On page 362 I related my experience in bee-keeping up to the hatching of the queens in my two nucleus colonies. Although I felt rather nervous as to the result of my experiment, for there were several queen-cells in each hive, still the first queen hatched must have destroyed the other cells, as there were no "second swarms."

The weather at this time came on cold and rainy, and in consequence I was uneasy about their welfare while on their "bridal tour." After about a week, however, one commenced to lay; but I could discover no eggs in the other hive. I waited a few days longer, and then, thinking that the "lady" had met with some mishap, I sent for a Carniolan queen, thinking that I would give that race a trial, as they are well spoken of as to their prolificness and comb-building abilities.

The queen came all right, but in the meantime the other queen that I thought was missing, began to lay, and she proves to be a fine one, for she has everything filled with brood.

I took two frames of brood from the old colony, and put the Carniolans upon the comb in a Peet cage, but through some fault of mine, the queen gnawed through the comb into the cage, and killed a few of the attendant bees. Of course, as I saw the dead bees at the entrance, I thought that my queen was gone; but upon examining the hive the next day, I found her moving around, and quietly depositing eggs.

I examined her again a few days ago, and found four and five eggs in some of the cells. What does that signify?

In this country we get no early surplus. There is very little fruit except wild plums, and no clover at all. Elms, box-elders, and cotton-woods furnish pollen. Just now (July 10) bees are storing a light, mild honey, but what they obtain it from, I am unable to determine. I supposed that it was sumac, but I have been unable to find any bees working on it, although there is any quantity of it in bloom near here.

After harvest is when we get our surplus. The stubble-fields will be fairly red over acres and acres of heart's-ease or smart-weed. The honey is rather dark, but of quite good flavor, and sells well.

I have 36 pounds nearly all capped over, in one-pound sections, on my old colony. One of my neighbors says that I will be the cause of all this county being covered with bees.

Two of my neighbors have already spoken for queens from my old colony. The record they made last year, and so far this season, causes every one here, who has bees, to want a queen from them.

I have sent for Mr. Doolittle's "Queen-Rearing," and propose to learn all that I can by experience and study, about the business; and perhaps sometime I may engage in the bee-business extensively.

Golden-Rod the National Flower

In regard to the National Flower: I think that it would be rather unjust to choose a flower that blooms only in certain parts of the United States, like the trailing arbutus; although this is much more beautiful and fragrant than the golden-rod, still, if I am correct, golden-rod is found in some of its varieties nearly all over the United States. We certainly have several varieties of it in great profusion here, making great golden masses on the prairies in all directions. I would speak for "golden-rod."

Campbell, Nebr.

[A good queen lays the eggs in regular order, and one in a cell. The presence of 4 or 5 eggs in a cell suggests that either the queen is a poor one (or drone-layer, as she is sometimes called), or that the hive contains laying workers.—Ed.]

JULY.

Clover — Absconding Swarms— Honey Crop, etc.

Written for the Western Plowman
BY C. H. DIBBERN.

Bees have swarmed a good deal, and there has been a good deal of trouble from absconding swarms. By careful watching and good management we have lost none by absconding, and have captured at least two swarms that were flying over and settled with swarms that we happened to have in the air. I now think that swarming is pretty well over, and the bees will now settle down to the more profitable business of gathering honey.

Absconding Swarms.

Now what causes a desire to abscond? Usually when but a few bees are kept, and swarms are kept entirely separate, and are properly hived in a good, clean hive, there is but little trouble on this point. What I mean by properly hived, is that the bees are not only shaken in front of the hives, but are kept stirred up till about all have run in. It will not do to leave them covering the outside of the hive, or to cluster under it, as in that case the queen may be outside, and perhaps not know that it is a hive at all.

It sometimes happens that when a swarm issues, the queen seems to become frightened and runs back into the hive, and still the bees will cluster on some branch just as they would if she was with the swarm. Now if they are hived they soon become uneasy, and generally dwindle away, either going back to the old hive, or going in with some other swarm just hived. Sometimes they will also go to a hive that has just swarmed, or one that is about to swarm.

When a swarm that has been hived a day or two comes out with a rush, you may be sure that they have a queen, and perhaps two or three. I believe what causes large swarms, that are perhaps parts of a number of swarms, to desert a hive is, that the question of supremacy of the queens is not decided, and one of them starts to leave the hive when all the bees speedily follow.

Usually when more than one queen is hived with a swarm, the bees speedily ball one, or all but one, and they are soon stung and killed. Such swarms usually remain without further trouble.

It is usually contended when a swarm once deserts a hive it is useless to put them back in the same hive in the same place. That is not my experience, however, as I have had quite a number leave their hives this year, and I have put them back just as they were, and they have generally stayed. Somehow the shaking and mixing up in swarming out and being rehived seems to settle the question of which shall be queen.

The Honey Crop.

Now that we are reasonably sure of a fair honey crop, the question comes up, what are we going to do with it? Now do not be in a hurry to get it off the hives before it is really ripe; hurrying it off to town to get ahead of somebody else, and sell it to the first store-keeper for anything he offers.

The white honey should be left on the hives till about the close of the basswood harvest, to fully mature. If more room is needed, add cases of empty sections by putting them under the full ones. Honey thus left on the hives may not be quite so white, but the quality is greatly improved. Then, too, the bees can take care of the honey much better than we can.

When honey is removed too soon, before all the cells are capped, it soon becomes leaky, the honey souring in the uncapped cells, and the appearance is greatly damaged. This is especially so in damp weather, but if left on the hives till the usually dry weather of the middle of July, it is all right.

Then there is the moth, always present, even on our snow-white honey, especially if it contains a few cells of pollen. Now if the honey is left with the bees, they will remove the moths as they hatch out, and when it is taken off, at the end of the white honey season, there are no more moth-eggs to hatch.

The Price of Honey.

Bee-keepers should remember that we have had almost no crops for two years, hardly honey enough to sell for the sugar we have had to buy to keep the bees alive. If we have a good crop this year, the next may again be a failure. Now why should we be in a hurry to get rid of the finest honey that the world produces? Judging from an experience of over twenty years, I know that the best honey cannot profitably be produced for less than 15 cents in the comb, or 10 cents for extracted. The late and dark honey, of course, must be sold for less. Keep up a reasonable price; that is the only thing that will make bee-keeping worth following. It is hard work, all know, and requires ceaseless watching and care, and why should we not be paid for all this?

If you have taken our advice to have the honey stored only in neat, clean new sections, between separators, you have something you need not be ashamed to ask and get a fair price for. Now before taking it to market, be sure and scrape every section of propolis, and pack it in new crates, with glass on at least one side.

Marking Crates of Honey.

Mark the gross weight, tare and net. This will save much trouble and quibbling. Your name and address should also be stenciled on the cases. Remember that if honey is properly ripened on the hives, and stored in a dry, warm place, it will keep; and if not all sold this year, it may come very handy the next.

Milan, Ills.

SELLING HONEY.

Do Not Sell the New Crop Too Soon or Too Cheap.

Written for the American Bee Journal
BY JAMES HEDDON.

Pleased at the partial improvement upon the past two seasons, many bee-keepers have been praising 1889 as a honey year. It begins to look plain to me, that, taking the country all over, we are not going to have an average crop, by considerable. The past two poor seasons have cleared the market of honey, and got consumers into the habit of paying better prices than formerly. As it is a fact that we need it to keep our business equally profitable with other lines, let us hold up to these prices.

In this location the season is not as good, up to this date, as were the past two very poor years. We have not one-sixth of a crop. Basswood is in full bloom, all of half passed, and not anything like an average yield so far. Clover bloomed profusely, but yielded very stingily. This ends the white honey crop.

Pleurisy-root is not yet plentiful enough here to produce surplus honey to much extent in so large apiaries as mine. It is just getting into bloom, and the bees are thick upon it, while they leave every other plant for the basswood. We can see the honey standing in the blossoms in little drops, and the bees crawling all over it, rapidly loading and going home. Only a few years ago we could not find a dozen plants within the radius of our apiaries. In a few years more, we expect it will yield us a good surplus crop, if nothing unforeseen happens.

Do not be in a hurry to sell your honey. What you do sell early, do not sell it cheap. Let us wait till we see that we have to.

Dowagiac, Mich., July 13, 1889.

HIVES.

Has the Ideal Hive Yet Made its Appearance?

Written for the American Bee Journal

BY J. W. TEFFT.

I have been called upon to explain more fully the frame that I employ in "The Ideal" hive, and take pleasure in doing so. I will also mention a few additional important points connected with the internal arrangements of the hive, and to correct an error which appeared inadvertently on page 347.

The description will at once show the applicability of the term "universal frame," by which I also designate it. The frames are composed entirely of wood; the top, bottom, and end-bars are at each corner, 1½ inches wide, the body of the bars being recessed to allow the bees a passage-way.

One of the longer bars is slit from end to end, to permit the easy and speedy adjustment of foundation for brood-combs. Each frame *spaces itself* when placed in the brood-nest. The frame is reversible and interchangable from the brood-nest to the surplus chamber, and *vice versa* in every hive in the apiary.

When empty, the same frame answers for a section frame, and thus is, *par excellence*, a universal frame, and preferable to any other heretofore in use.

I can, and do, use these frames in the same manner as a hanging or suspended frame, and am not compelled to reverse, but the advantage of being able to reverse those brood-combs which become clogged with honey, is simply immense.

I uncap the honey in one frame on one day, and in another the next day, reversing, placing the honey part down and the brood part up. The honey will then be at once carried by the bees to the sections in the surplus chamber, thereby freeing the brood-comb of honey more quickly, and better than can be accomplished by means of the extractor.

This gives the queen the room in which she desires to deposit her eggs, with a less number of brood-combs, and secures a gain of 50 per cent., at least, in this connection; the result being solid frames of brood and full combs of honey in the sections above. This procedure also completely upsets the swarming fever right away, and also keeps the bees all together in one large, powerful colony under perfect control.

When the comb at the outer sides of the brood proper is two-thirds filled with honey, I reverse the frames (do *not* uncap the cells), and the now upper portion of the comb will be entirely filled with honey in a very short time. As soon as this is accomplished, I remove them and lay them by for winter feeding. (Ripe honey is the only proper food for wintering bees upon. This fact cannot be too strongly insisted upon!)

The result just described cannot be accomplished with hanging frames. The apiarist who makes a specialty of extracted honey, will appreciate the advantages of having combs attached to all parts of the inside of the frames.

In early spring I find the interchangeable frame indispensable. My method is to fill two frames with sections of last year's combs, and place one on each side of the brood-nest as soon as there is any sign of a honey-flow. In this way I can determine whether the bees are bringing in honey, without disturbing the brood-nest.

When the honey in these combs is partly capped, is the right time to put the surplus chamber on, and I then lift these side-storing sections, bees and all, less the queen, into that chamber, and fill it with frames of sections and separators, replacing the two frames removed from the outside of the brood-nest with two of the sections containing foundation.

As the honey is being sealed in the surplus chamber, I reverse those frames, the combs in which are not filled to the bottom, and when at last completed, I remove one frame at a time, and replace it with one of the side-storing frames of sections, repeating this operation over and over again.

Another advantage of the interchangeable frame is that in wintering, should the four frames of stores in the surplus chamber not be quite filled with honey down to the bottom-bar, the frames are reversed, and the honey part placed in juxtaposition with the honey in the frames below, thus putting the feed in its natural and most convenient position.

My universal reversible frame is adapted to all known methods and systems, does not vary in size, and its dimensions are designed on the metrical system for sections, so that one frame may contain sections of different sizes. The frame is 15x10 inches, and will hold four sections of 7½x5, six of 5x5, eight 5x3¾, twelve 5x2½, or twenty-four 2½x2½; these latter for one-fourth pound honey-sections, or used as a queen-nursery cage. All the above sizes of sections can be contained in one frame at the same time.

The Ideal hive can be run for extracted and comb honey simultaneously, and indeed for all purposes.

On page 347, fourth paragraph, second column, I am reported as saying, "These surplus chambers have intermediate honey-boards or zinc queen-excluders between the honey-boards"—a very obvious error of expression, doubtless due to hurry and indistinctness of copy. I should have written, "No intermediate honey-boards or zinc queen-excluders between the brood-nest and the surplus chamber." My universal, reversible frames, with the separators between them when in position in the surplus chamber, form "The Ideal" honey-boards and queen-excluder, no extra furniture is required, and nothing whatever is intervened between the brood-nest and the surplus chamber to interfere with the worker bees' passing freely, easily and safely from the hive entrance to the very topmost sections. There is no fear of their scraping off the wax scales or paring off their wings or legs, such as undoubtedly exists under other circumstances.

I would suggest to those using zinc honey-boards and excluders, that they examine the edges of the apertures and bottom-board therein, with a lense. Perhaps they will discover something that they had not previously expected. "The Ideal" hive contains no such clumsy inconvenience as an intermediate honey-board or queen-excluder, and is not troubled with brace-combs!

"The Ideal" surplus chamber is composed of end and side boards, like a box with no top or bottom; but it is provided with a cross-strip at the bottom for the foot-corner of the frames to rest upon. The sides of the chamber are preferably supplied with movable portions, held in place by a simple contrivance. If desired, the movable parts may be of glass, for convenience in observing the bees at work on the sections. When these parts are removed, room is given to move the frames laterally, into or out of the chamber. This is of itself a very great convenience and advantage. The chamber will hold five frames exclusive of separators, and may be conveniently used as a temporary hive for summer or for a nucleus.

In winter, when placed above the brood-nest and surrounded by forest leaves, peet, moss, or other suitable material, and with a proper cushion over the top, it cannot be excelled as a means of warmth, at the same time securing absorption of moisture and efficient ventilation. The bees thus cared for on the summer stands will be comfortable in the severest weather, and the combs dry, pure and clean.

"The Ideal" separators are entirely of wood, and of the size of the frame. The separator is edged all around by a band, like unto the frame of a school-

boy's slate. The band serves the purpose of keeping the edges of the sections just bee-space from the body of the separator, thus allowing the bees free access to all parts of the chamber in the same manner as, though with better result than, by the use of four-open-side sections.

The development of "The Ideal" hive is the result of laborious thought and investigation, added to persistent and careful practical experiment during many years, and apiarists who have enjoyed the privilege of using it, are delighted with the result, and are pleased to speak of it as "the laughing success" of the Nineteenth Century, in the matter of apiculture.

MOVING BEES.

How to Prepare the Hives to Do it Safely.

Written for the Farm, Stock and Home
BY F. C. ERKEL.

I have had considerable experience in hauling and shipping bees, and I find that they will stand a great deal more moving than most people think. One time I moved 35 colonies 13 miles by wagon over the roughest roads I ever traveled; there were a number of log bridges we had to cross, and out of the 350 combs in those 35 hives only 3 were found broken, the greater part of those were only one year old, and I do not think more than 15 or 20 had wire in the frames.

To successfully move bees, the bottom as well as the top of the frames should be securely fastened, so they will not shuck together and kill the bees. To fasten the bottom of the frames, cut ten notches in a stick one inch wide, or just wide enough to correspond to the ten frames; or you might drive small nails through a thin strip in such a way that a nail will come between every two frames. Now, with smoker in hand, pry up the hive from the bottom-board, and give them a puff or two of smoke to drive them out of the way; then, before they get time to come down, slip the projection on the notched stick, or the nails between the frames, using one, or better, two of these sticks; let down the hive, and the frames cannot get out of place. I generally fasten the top of the frames by placing a thin strip of enamel cloth on top of them, and carefully shove, not pound, ½-inch wire brads through the strip and down into the frames.

If it is warm weather, and the bees are to be on the road for sometime, they must have plenty of ventilation. This must be regulated according to the weather. Sometimes it would be advisable to remove the enamel cloth and put a wire screen over the whole of the top; but, as a general thing, I pull back the enamel cloth two, three or four inches from the end and fasten wire screen over this opening. Do not nail up the entrance, but put wire-cloth over that too, which will give circulation through the hive.

If you move your bees by wagon, put a wood-rack on a lumber wagon, nail boards inside the stakes, and fill up the space about two feet with hay, and then place the hives on the hay with the frames crossing the road-bed. I consider the hay better than springs.

By following these instructions bees can be safely sent several hundred miles by express or freight; if to be sent by freight, however, I should place several thicknesses of old cloths wrung out in water, over a part of the wire-cloth. If they have young brood, they need water anyway.

Le Sueur Co., Minn.

CONVENTION DIRECTORY.

1889.	*Time and Place of Meeting.*
Aug. 3.—	Darke County Union, at Greenville, Ohio. J. A. Roe, Sec., Union City, Ind.
Aug. 20.—	Northern Illinois, at Guilford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.
Aug. 31.—	Haldimand, at Fisherville, Ont. E. C. Campbell, Sec., Cayuga, Ont.
Sept. —.—	Maine, at Livermore Falls, Me. J. F. Fuller, Sec., Oxford, Me.
Sept. 5.—	Erie County, at Buffalo, N. Y. O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.
Dec. 4, 6.—	International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Satisfactory Yield.—E. W. Grinnell, Casey, Iowa, on July 10, says:

The white clover yield has been very satisfactory here. At the commencement of the flow, the combs were entirely empty of honey; now combs and supers are well filled. White clover has come up thicker than before the drouth. The bee-keeper smileth, and is made glad by the change. Basswood will be a short crop.

Bees Have Done Well.—E. J. Hiatt, Chester Hill, O., on July 12, 1889, says:

Bees are doing very well here this season. White clover is abundant, but it is beginning to fail some. The best of the honey season is about over. I have 22 colonies in Simplicity hives, and winter them packed in chaff on the summer stands.

Best Season for Years.—Mr. L. Chandler, New London, Minn., on July 13, 1889, writes:

This is the best season, so far, for honey that we have had for several years. Nearly every colony of bees in this vicinity has swarmed, and the hives are filled with brood and honey. A part of mine have stored some in the sections from honey-dew. The basswood began to open yesterday. There are insects destroying the bloom here. At present the prospect is very promising for a good crop. The golden-rod is growing finely, and has no insects on it yet. I think that it is going to bloom earlier than common. It is my choice for the National flower.

Honey Crop Yet to Come.—H. H. Knapp, Danbury, Conn., on July 11, 1889, writes:

I started with 16 colonies of bees the past spring, and increased them to 25. I had more swarms, but I put them back again where they came from. White clover has been very abundant in Western Connecticut, but no honey, as it has been too wet for the secretion of any nectar. I do not believe that they stored five pounds of surplus during the white clover season. Breeding has gone ahead with a rush, and bees are working on sumac now, and have been putting in honey for the last three days. Our crop, if any, is yet to come.

The Union—Lucky Streak.—D. Y. Kennady, Batavia, Iowa, on July 11, 1889, says:

I send $1.00 to pay my dues as a member of the Bee-Keepers' Union. I have thought for a long time that I and all other bee-keepers should belong to it. My bees, as well as myself, are in luck this season; if the honey-flow remains as good as to-day, for one week longer. I will have at least 5,000 pounds of fine honey.

Sell the Honey at Home.—Geo. E. Hilton, Fremont, Mich., on July 18, 1889, writes:

Where is the surplus honey crop? Echo answers, "Where?" While a few reports are coming in, of a fair yield, it is very evident that the crop of white honey is going to fall far short of the average; but there is still a silver lining to this dark cloud, if properly manipulated. The large markets are entirely bare, prices are ranging high, and if we do not rush our honey (what we have) upon the market too early, we may realize a good price for it. Clover is practically gone,

and basswood is in full bloom, but neither has produced honey as in days of yore; but swarming has been above the average. The prospects are good for a fall crop, but I believe that all the honey produced in this State this season can be sold at the home market, and a better profit realized than to ship to the cities; in fact, this is the great mistake of bee-keepers in general; they seem to think it more business-like to ship to Chicago, New York or Boston, when the facts are that a little effort around home would realize them from 3 to 5 cents per pound more for their honey; and remember this is all profit, the first cost, or cost of production, must be paid before our margins begin. I certainly hope that the bee-keepers will profit by the lessons of the past, and thus get as much money from half a crop, as they usually do from a full one.

Basswood Rich in Nectar.—J. F. Eikenberry, Greene, Iowa, on July 16, 1889, writes:

Bees have been doing well ever since the white clover began to bloom, and the linden nectar is very rich and in great quantity in this locality. I started out with about 50 colonies, and have increased them to 69. I have a large quantity of honey almost ready to take off. I have taken 325 pounds of extracted honey, which is something unusual at this season of the year, in this climate.

Good White Clover Yield.—B. Volkering, East Farmington, Wis., on July 14, 1889, says:

Bees have been booming for the last month or more. I have some colonies each of which have filled 72 one-pound sections from white clover alone. I do not expect to get much honey from basswood, for the nearest trees are two miles distant. The buds are just beginning to open. I am well pleased with the AMERICAN BEE JOURNAL—in fact I could not get along without it.

Dragging Out Bees—Dummies.—Matthew Rebholz, Kane, Ky., on July 13, 1889, writes:

1. What was the matter with my bees? The first week in May one of my colonies dragged out young, live bees, and piled them up in front of the hive. These young bees were apparently just hatched. The next day 2 other colonies did the same, and so it went on through my whole apiary of 14 colonies. The dragging out lasted about two days. Now what was the reason of it? 2. Since I have been reading the BEE JOURNAL, I came across the word "dummies," and as I am yet somewhat young in bee-keeping, I would like to know what is meant by it.

[1. They were short of stores, and destroyed the brood to prevent destitution and starvation.

2. A "dummy" is a close-fitting division-board, used for contracting the brood-chamber when that is desirable.—ED.]

Bees on Scales.—E. E. Smith, Clayton, Mich., on July 12, 1889, says:

I received the new scales all right, and I am well pleased with them. I put a colony of bees on the scales this morning early, and they gained 16 pounds for their day's work.

[That is a good day's work for one colony.—ED.]

Caring for Honey—Uniting.—Judge Ware, Maywood, Ky., asks these queries:

Please answer the following questions: 1. After taking the honey from the hive, what is the best plan to take care of about 200 pounds for family use? that is, to protect it from the wax-moth, ants, etc.? 2. How shall I proceed to break up a colony of bees, and give them to 10 other colonies? I want to give each one of the 10 a frame of bees and brood to strengthen them.

[1. See page 454 of last week's issue. 2. Sprinkle all the colonies with peppermint water, and then give them each the desired frame.—ED.]

Sweet Clover and Figwort.—L. R. Williams, Paris, Texas, on July 8, 1889, writes:

1. I send a piece of a plant—we call it "bee-clover." It grows from 4 to 6 feet high, and comes up early in the spring from the old stalk (or roots). 2. I send one piece of another plant. It has large leaves. Please give the proper names, and which is best for honey, if either are good.

[1. The first plant sent by Mr. Williams is common sweet clover, or melilot. 2. The other is figwort. Both are most admirable honey-plants. I doubt if any plant is better for bees than sweet clover.—A. J. COOK.]

Healthfulness of Bee-Keeping, etc.—John B. Davis, Council Hill Station, Ills., on July 15, 1889, writes:

During the five years I have kept bees, my health has been good, but for 20 years before, at times I suffered from indigestion, and paid many dollars for medicine which often did no good. I never used honey until I kept bees; now I eat lots of it, and I think that the honey has wrought the change. I had 7 colonies in the spring, and have 12 now. I have extracted 550 pounds of nice white clover honey, and in a day or two I will extract about 200 pounds more. I made a solar wax-extractor as described in the BEE JOURNAL, and it does its work so well that when I see the wax running into the pans, I feel sorry that I did not make one before.

Bee-House—Good Season.—H. A. Morgan, Brazil, Ind., on July 11, 1889, says:

I have 35 colonies of bees in good condition. They are doing better here this year than for 4 or 5 years. I have a bee-house, and it is a success.

A Profusion of Bloom.—Milton Newlin, Georgetown, Ills., on July 12, 1889, writes:

I send a flower to be named, as the bees love to work on it early and late, and it continues to bloom for quite awhile. I have some Chapman honey-plant nearly ready to bloom. It looks excellent. Linden bloom is almost a failure in this locality. White clover has been very good. I had some Alsike clover, and the bees kept a perfect hum all the day long on it, for quite awhile.

[The flower is one of the asters—excellent for honey.—ED.]

A Swarm on a Carriage.—Wm. Oldfield, Tickfaw, La., writes:

As a most curious instance of selection by bees, of an object to settle on, I will tell you of what I saw in New Orleans on April 4. I was standing on the gallery of the St. Charles Hotel, when, seeing a large crowd gathered around a hack, I thought there must have been an accident, and went down to the street to ascertain, and was considerably surprised to find that the attention of the crowd was attracted and retained by observing a very large swarm of bees which had settled on the handle of a carriage which stood immediately opposite the St. Charles Hotel. The bees were entirely good-

natured, and though hundreds of people had gathered around, notwithstanding the angry remonstrances of the hack-driver. No one, I believe, was stung, neither were the horses. The driver, having procured a sugar-keg, succeeded in housing the swarm without accident, which he deposited inside of his vehicle, and, mounting his box, drove off with his novel fare, that doubtless will not forget to richly pay the bill for transportation when their coupons mature in the fall.

An Immense Honey-Flow.—H. S. Hackman, Peru, Ills., on July 16, 1889, says:

There are now but a small number of colonies of bees in this locality, but the honey-flow is immense at present. Bees have swarmed a good deal, except mine (for a lack of honey-flow at a certain time after fruit-blossom) have failed to swarm, and are now strong and doing well.

Honey in California.—P. W. McFatridge, Ontario, Calif., on July 8, 1889, writes:

It seems that there will be a short honey crop here this year. One of my neighbors, three miles away, got 100,000 pounds of extracted honey last year, which he sold at 6 to 6½ cents per pound at wholesale; $6,000 is not so bad from 600 colonies. I have 10 colonies, and expect to increase them to 10 more before next spring. I think that my bees brought in honey and pollen every day last winter. We do not have to fuss with bee-cellars and chaff hives here. The cheapest kind of hives with a board on top, with a stone on to keep it from being blown off, is all that our bees ask of us. The honey product of this county, last year, was 435 tons. How is that for *one county?*

Bee-Keeping in Florida.—W. S. Hart, Hawk's Park, Fla., on July 12, 1889, writes:

In January and February the season promised well, and the bees gathered some honey, but brood-rearing was behind the average year. In March our usual drouth came, and stopped the preparations for swarming, so that very little increase by swarming was made, and as the hives were full of brood—13 and 14 Langstroth frames of it in several of my hives—they used up honey very rapidly, and soon required feeding. I gave my 96 colonies about 2½ barrels of honey, saved over for that purpose, which carried them through. In May they began to gather from saw-palmetto, and other sources, and on June 14 I began extracting, and took about seven barrels. They filled the hives about half full again, and then the flow checked up, and has been very light ever since. The black mangrove is now opening, and although it is very late for it, we still hope for a fair crop from it, as it promises a very full bloom. The bees generally are hardly in as good condition to work upon it as usual—in fact I know of no one within ten miles of here who has taken any honey thus far, besides myself.

Bright Prospects.—John Krahl, St. Joseph, Mo., on July 10, 1889, says:

My 50 colonies of bees are doing finely, and the prospect is bright for sometime to come, as we had a good rain last night, which will put new vigor into white clover and other flowers.

Less than Half a Crop.—B. H. Standish, Evansville, Wis., July 16, 1889, says:

The white honey harvest is practically closed here. We had a full bloom, but of short duration, and little honey. Comparing it with 1886, I find that then I extracted eight times, and this year but three times. The comb honey product doubtless will not compare as favorably. So it is safe to say that we have less than three-eighths of a full crop. I have kept bees for ten years, and now have 300 colonies.

White Clover—Little Honey.—J. C. Zimmermann, Wabash, Ind., on July 16, 1889, says:

Bees wintered well here, but cool weather in fruit-bloom kept them from gathering much stores; quite a drouth followed, and after that we had a very wet and cold spell, so that quite a number of colonies had to be fed—in fact some bee-keepers (?) left some to starve at that time. But since about June 12, it has been tolerably fair weather for the bees. There is more white clover here than I ever saw before, but for as much white clover as there is, I never saw the bees work on it less than they do this season. They seem to work on the linden more than on anything else. There were several days of rain again, so that bees could not get out at all. The plentiful rain keeps up the white clover right along; if it only would yield a little more honey. The honey crop will not be what was anticipated in the spring. I do not think that it will be over half a crop, from present indications.

Swarms Prevented.—L. Wayman, Chanute, Kans., on July 15, 1889, writes:

I extracted 68 pounds the day after receiving a honey-extractor. My bees are doing well. I started in the spring with 23 colonies, in different kinds of hives, in all kinds of shapes; I transferred them into hives that are large, the brood-frames being 13x14 inches, with a super above. It holds nine brood-frames 1½ inches thick. The super holds 42 one-pound sections, 4¼x4¼. The result is that I have not had a swarm this season. I think that bees will not swarm so much in these hives.

Extraordinary Honey-Year.—S. H. Burgess, Chesser, Ala., on July 15, 1889, writes:

We have had an extraordinary year for honey. Bees have gathered large quantities of nectar, and increased wonderfully; the honey is of extra quality. The movable-frame hive has moved forward beyond expectation, and the old-fogies declare it an improvement worthy of great honor. Honey "slinging" is now the talk.

The Season in Ohio.—L. G. Reed, Kent, O., on July 12, 1889, says:

What is the matter with Ohio? In looking over the different reports I observe that there is a dearth of reports from this great State. I put 45 colonies into winter quarters, and lost one from starvation, and 5 from being queenless, which left me 39 colonies; 15 of those were only strong enough to cover from 2 to 6 frames. They built up rapidly during the latter part of April and the forepart of May, but dwindled heavily during the last two weeks of May and the first week in June, on account of cold, rainy weather; but since that time they have built up rapidly, and many of them have cast swarms, but they have not stored honey in the surplus cases anything like what they ought to have done, considering the amount of bloom. What the season will develop yet, is among the uncertainties, and will be reported later on. I like the AMERICAN BEE JOURNAL above all bee-literature, and always enjoy *solid comfort* in reading it. May its editor live long, and be healthy, wealthy and *happy*.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future referenee. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Clover Seeds.—We are selling *Alsike Clover Seed* at the following prices: $8.00 per bushel; $2.25 per peck; 25 cents per lb. *White Clover Seed:* $10.00 per bushel; $2.75 per peck; 30 cents per lb. *Melilot or Sweet Clover Seed:* $6.00 per bushel; $1.75 per peck: 20 cents per lb.—by express or freight.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Honey and Beeswax Market.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.
BEESWAX.—23@28c.
July 16. A. V. BISHOP, 142 W. Water St.

KANSAS CITY.

HONEY.—Old crop all gone. New 1-lbs., 16@18c.; 2-lbs., 14c. No California comb in the market. Extracted, white, 9c.; amber, 7@8c.
July 17. HAMBLIN & BEARSS, 514 Walnut St.

CHICAGO.

HONEY.—New crop is appearing, and prices range from 15@17c. An active market is not looked for till later. Extracted, new crop, 7@8c. Very light receipts, and few sales.
BEESWAX.—25c.
July 11. R. A. BURNETT. 161 South Water St.

CHICAGO.

HONEY.—Old crop of 1 and 2 pound white clover honey exhausted, but considerable 1-lb. buckwheat is being offered. Our first receipts of new 1-pound white clover were in this week, and is selling at 14@15c.; dark 1-lbs., old, 10@11c. Extracted, dull, 6@8c.
BEESWAX.—25c.
July 11. S. T. FISH & CO., 189 S. Water St.

DETROIT.

HONEY.—No attractive honey in the market, and sales are slow at 12@15c.
BEESWAX.—24@25c.
June 22. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—New white comb in 1-lb. sections sells at 16@17c. White extracted, 7@7½c.; dark, in barrels, 6c. An active demand is not expected before Sept. 1. No new extracted in the market.
BEESWAX.—None in the market.
July 20. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, bright, 6½c; dark, 5½c. The market is slow.
BEESWAX.—Scarce at 23c. for prime.
July 20. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Extracted in good demand. We quote: Fine orange-bloom at from 7@7½c.; off grades of Southern, 60@70c. per gallon.
BEESWAX.—Scarce, at 26½@27½c. for good.
HILDRETH BROS. & SEGELKEN,
June 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—Not a case of comb honey in our store—something unknown for a long time. Expecting the new crop every day. Price will be about 18c. We have some new Vermont extracted white clover, which sells at 8@9c.
BEESWAX.—None on hand.
July 10. BLAKE & RIPLEY, 57 Chatham Street.

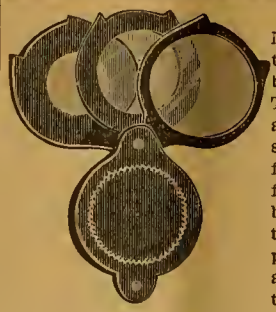
CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and 12@15c. for fair to choice comb. Demand slow, and arrivals are fair of the new crop.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
July 13 C. F. MUTH & SON, Freeman & Central Av.

Always Mention your Post-Office, County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

Alfalfa Clover.—For cultivation of this honey-plant, see page 245, of 1888.—We supply the seed at the following prices:—Per lb., 22c.; per peck, $3.00; per half-bushel, $5.50; per bushel of 60 lb., $10.00. If wanted by mail, add 10 cents per pound for bag and postage.

Cheap Extracted Honey.—We have a keg of DARK HONEY, weighing 164 pounds, net, suitable for feeding to bees, which we will sell at **6 cents** per pound, delivered on the cars here.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

☞ The Darke County Union Bee-Keepers' Society will hold a meeting at Greenville, O., on August 3, 1889. J. A. ROE, *Sec.*

THE AMERICAN BEE JOURNAL CIRCULATES ALL OVER THE WORLD

PUBLISHED BY THOS. G. NEWMAN & SON, CHICAGO, ILL.

THOMAS G. NEWMAN, EDITOR.

Vol. XXV. Aug. 3, 1889. No. 31.

EDITORIAL BUZZINGS.

Let those Who Think that bees will take glucose and put it in the surplus apartment of the hive, so as to be parties to a fraudulent transaction, just try them now. They will not touch it even for food, as long as honey is to be gathered from the flowers. Those who assert that bees will take such stuff when honey is to be had, are ignorant of the habits of the bee.

Mr. E. C. Jordan is dead. On page 339 we stated that Mr. Jordan was bitten on the hand by a pet squirrel. The swelling made amputation necessary. It resulted in death on July 15. He was 66 years of age. He was buried on Tuesday; the Rev. Mr. Dame, of the Episcopal church of Winchester, Va., officiating. He was a generous-hearted brother—always ready to help the needy, and to administer substantial comfort to those in distress. He is greatly mourned by the whole community, and all who knew him far and near. We condole with the widow and family in their bereavement.

The Failure of the Honey Crop in Southern California, this season, is a subject of much discussion in that region.

The Pomona *Progress* publishes reports from the bee-ranches on the mountain sides throughout Los Angeles, San Bernardino and San Diego counties. It is found that even less than one-seventh of an average honey supply will be had in this region this year.

Several bee-ranches which usually have 100,000 pounds of honey each year, will not have 10,000 pounds this year. The general opinion as to the cause of the failure of the crop, is that the heavy rains, early last spring, started the blossoming of the sage, which did not secrete the usual quantity of honey because of the cool nights and damp days for three weeks in succession.

Showing their Colors.—It is encouraging to notice the enthusiasm that is being kindled in favor of the National Bee-Keepers' Union, since the decision in the Arkadelphia case. Mr. B. B. Lee, Manning, Iowa, on July 18, 1889, writes as follows:

I take great pleasure in becoming a member of the Bee-Keepers' Union since its most noble defense in the Arkadelphia case. It is true, "In union there is strength," and I think all bee-keepers should come to the front and support liberally the defender of our business. I have 54 colonies of bees doing quite well.

Mr. R. McKnight, of Owen Sound, Ont., on July 20, 1889, writes thus:

Enclosed please find a dollar for membership fee of the Union. Hitherto I have looked upon it as having no claims upon my support: believing it to be a kind of selfish combination somewhat akin to Trade's Unions—to which I am opposed. Indeed, I scarcely glanced at what was printed relating to it, until that masterly defense in the celebrated Arkadelphia case appeared in the AMERICAN BEE JOURNAL a week ago. *That defense is worth a dollar to every bee-keeper in the land.* The judgment that followed it established a *precedent of great importance* to bee-keepers, and will probably be quoted in the courts through generations to come.

Having once had the honor of defending the industry in a "mock trial" on the "high seas," the defense of the Union's eminent counsel was especially interesting to me. Had the pamphlet containing it been in my possession then, what a reputation I might have made for myself as an amateur lawyer among my fellow passengers, from the product of another man's brains.

Brother McKnight ought to have carefully read the printed matter emanating from the Union before concluding that it was a selfish organization akin to Trade's Unions! Such a Union as that could not have enlisted our energies; but we have given them in unstinted measure to the Union for the defense of our pursuit. It is a pleasure to see that our efforts as Manager are being appreciated. Every bee-keeper who is worthy of the name, should now, without delay, become a member of the Union, just to show on which side he or she belongs. What the Union has already done is a guaranty for the future. Reader, if you approve of its acts, send the membership fee (one dollar only), and be enrolled among those who have borne the burden so far, and, like the Royal Huzzars, "have never been beaten."

The Weather in Massachusetts is thus described by Henry Alley, of Wenham, Mass., on July 24, 1889:

We have the poorest weather for queen-rearing—rain all the time. When no set storm is in progress, then we have almost daily showers; each one giving from one to two inches of rain. Everything in the apiary is wet, and as nasty and uncomfortable as can be.

An Entrance Regulator, made of tin, with two slides, the whole to be tacked on the front of the hive, comes from H. O. Kruschke, Deuster, Wis.

A Full Crop of Honey is generally reported, but there are localities where the crop is *very small*, and others where "no honey so far" is the report, averring that it is "the poorest season since 1866," etc. Truly our country is a large one, and the climatic conditions are as varied as any could desire. New honey is now being received in all the metropolitan honey markets. See new reports in this issue.

Since the above was written, the appended letter has come to hand from Mr. W. D. Wright, of Altamont, N. Y., and dated July 24, 1889. He says:

FRIEND NEWMAN:—Do not cry "large honey crop" too loud. Undoubtedly there has been a good yield in some of the Western States, but in this section, we "got left" on white honey. Basswood and clover blossomed profusely, but the weather has been almost continually cool and wet, so that bees could not do much. They swarmed moderately this season. I have not taken off a pound of surplus honey yet, and have but little anywhere near ready to take off. The prospects for buckwheat are not extra.

I am glad to hear of the continued success of the Union. Why do not more bee-keepers support it?

Our correspondents in the Northwest have simply informed our readers about the honey crop in their localities, and stated that they had a good crop, so far, with excellent prospects for a good fall yield. In other localities, where the crop did not materialize, bee-keepers generally did not report. Now they are beginning to speak out, and we need this state of affairs to bring in such reports. We want all the facts in regard to the honey crop, in order to determine its value and importance.

Doolittle's Methods of Queen-Rearing, as detailed in his book, are being tested in many apiaries this season, but the main experiments will be made next year. Concerning this matter, Mr. Doolittle remarks as follows on July 20, 1889:

You will remember that I mentioned in my book, of having a desire that the plans which I have given may be improved upon, and bee keepers led out to a wider plain than any heretofore enjoyed. It is now evident to me that at times of scarcity in the forepart of the season, or in localities where honey comes in very slowly during May, June and July, that the plan as given in my book for getting queens fertilized, will not always work; but where honey comes in with a rush, as it does with us in basswood, and perhaps at the end of the season in all localities, it is all right; for I am now having the same success in getting queens to laying over a queen-excluding honey-board that I formerly had, and I doubt not that this will continue to the end of the season. Honey from basswood has not come in so plenty as in former years, yet the plan works equally well.

Our honey crop will be light in this locality, for the basswood is nearly done, and I have not taken off 10 pounds of honey. I hope that teasel may help us out a little.

One-Third of a Crop is all that is reported by G. M. Doolittle, of Borodino, N. Y., and he adds: "The honey season is over now in this section." We are sorry to hear such a discouraging report.

GLEANINGS OF NEWS.

Why Bees Desert their Hives.—The inexperienced often ask why bees desert their hives. The following from an exchange will give some of the reasons in detail:

When bees swarm during a hot day they get very warm with the excitement and exercise, and sometimes the sun shines directly on the cluster. If they are then put into a hive that has stood in the sun, and has but little ventilation, who can blame them if they leave it and seek cooler quarters? If a newly hived swarm is left in the sun, it will desert the hive.

I once had a large swarm desert its hive the next morning after hiving. When it was hived it was placed in the shade, but the morning after was very warm, and the sun shone directly upon it, when it came out and left without clustering. I once hived the same swarm four consecutive days; each day they came out and clustered. At last I put them into a different hive, and they stayed all right. On examining the hive that they had deserted, I found it to be a clean, new hive, but the entrance was so small that a drone could enter with difficulty; therefore it was evident the swarm deserted rather than suffocate for want of air.

A bee-keeper was once puzzled to know why all his swarms deserted, as they were put into clean, new hives. On investigating, he ascertained that his new hives had the odor of kerosene; they had been manufactured during the winter and stored in the back-room adjoining his grocery, where were stored barrels of kerosene and other supplies, and the hives had imbibed these odors. The smell of kerosene is very distasteful to bees; I drive off robbers when they are attacking a hive by rubbing it over all places of attack, when they leave quick.

Hives that have been used, and the combs left to be eaten up with moths, should be thoroughly cleansed. When a colony dies from any cause, I prefer to cleanse the hive thoroughly, and rinse with boiling water.

Hives accumulate dust while standing, and before I put in a swarm I rinse it out with cold water, which freshens and cools it. If a swarm is put into a clean hive and properly shaded until it is well established, it will seldom desert.

The Nameless Bee-Disease.—Letters are coming in almost constantly, complaining of an unknown disease which is affecting the colonies. The symptoms given are always identical to the symptoms given in the A B C book, under the head of "Nameless Bee-Disease." It is pretty evident that this trouble is getting to be more and more common. Fortunately, however, it is not a serious one. The removal of the queen, so far as we have ever known, always effects a cure. For the benefit of a good many who do not know how to recognize the disease, we give the symptoms here: The bees have a swollen appearance—that is, the abdomen is distended. The fuzz is entirely worn off, and the bee itself has a black, shiny appearance, very much unlike a healthy bee. And just as soon as they become a burden to the colony the healthy ones boost them out of the entrance, where they may be seen crawling around in the grass, as if equally desirous of ridding the colony of their miserable presence. You will find quite a good many bees, doubtless, dead at and around the entrance—bees that have died from this trouble. We make this statement so that we may be saved the trouble of answering correspondents.—*Gleanings.*

Mailing Bees to Canada.—We are requested to print the order from the Post-Office Department, relative to the transmission of "queen-bees and their attendants" to Canada. Here it is:

POST-OFFICE DEPARTMENT,
OFFICE OF FOREIGN MAILS,
WASHINGTON, D. C., July 14, 1888.

The Canada office having assented to the proposition of this Department to admit to the mails exchanged between the United States and Canada, packages of Queen-Bees and their attendant bees, when so put up as to prevent injury to those handling the mails, while at the same time allowing an easy verification of the contents; packages of Bees will hereafter be entitled to transmission by mail to Canada, provided they conform to the conditions prescribed for them in the domestic mails of this country; and similar packages received in the mails from Canada should be promptly forwarded to their destinations and delivered to addresses.

By direction of the Postmaster General,

NICHOLAS M. BELL,
Sup't. of Foreign Mails.

Of course these packages are subject, upon their arrival in Canada, to all the Canadian customs, regulations relative to importations from the United States. But of these we are not advised, except to know that bees, like all animals for breeding purposes, are not subject to duty. Perhaps D. A. Jones & Co. can enlighten our correspondent as to the wording of such regulations. We have asked them, by private letter, to do so.

The Hancock County Fair will be held at Greenfield, Ind., Aug. 20 to 23, inclusive, 1889. Premium lists can be obtained of the Secretary, Chas. Downing, of Greenfield, Ind. Mr. A. Tyner, who intends to make an exhibit, sends us the list of premiums, which, though not very extensive, are as follows:

Crate of comb honey in the most marketable shape, and not less than 20 lbs.	$2 00	$1 00
Two dozen packages of extracted honey, in the most marketable shape, not less than 20 pounds	2 00	1 00
Largest display of honey of all kinds, the product of one apiary, present season, including all entries	5 00	2 00
Largest exhibition of bee-keepers' implements and supplies	Diploma.	
Most complete plan for wiring frames by hand, and placing foundation in or on the same	Diploma.	
Surplus arrangement for taking comb honey	Diploma.	
Bee-hive	Diploma.	
Display of appliances and fixtures in actual use, any one apiary	2 00	1 00
Five pounds of beeswax	75	50

Cure for Insomnia.—A Swedish servant-maid, finding that her mistress was troubled with sleeplessness, told her of a practice of the people of her country who were similarly afflicted. It was to take a napkin, dip it in ice-cold water, wring it slightly and lay it across her eyes. The plan was followed, and it worked like a charm. The first night the lady slept four hours without awaking, something she had not done before for several months. At the end of that time the napkin had become dry. By wetting it again she at once went to sleep, and it required considerable force to rouse her in the morning.—*Selected.*

Why Bees Destroy the Brood.—The New York *World* has this to say about the spring weather, the honey crop, and why bees sometimes destroy their brood:

The season of 1889 opened very bright for bees, and the general prophecy was "a good honey season," but with the middle of May came a change of weather, with cold rains and frosts, which are very damaging for the bees at that season of the year. The results have been that instead of the bees storing honey, bee-keepers have quite generally had to feed their bees to keep them from starving; many colonies having starved when not cared for; especially swarms which came out before the cold weather, as they did in many places.

The first signs that a colony is getting short of honey in the breeding season, is to find the drones being killed off. If they are not fed, they soon tear the drone-brood from the cells, and after having sucked all the juices out of it, the remnant is cast on the alighting-board. When bees get so short of honey as to do this, brood-rearing ceases almost entirely, and the apiarist is very short-sighted indeed that allows his colonies to get in this condition, for the brood which is then being reared is to make the bees which are to gather the honey.

If the bees are not fed, and the weather still continues to be bad, the bees next treat the worker-brood in the same way they did the drone-brood; soon after which all starve, although the bees can be revived by pouring warm honey or syrup on them, after nearly all of them have become so near dead that they can scarcely move. The bees may be worth saving if they are found in this last condition, but to think of getting any surplus honey from that year is out of the question.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

Another Opinion to be put upon record concerning the Doolittle book, is the following from the *Practical Poultryman*, the apiarian department of which is conducted by that excellent apiarist, Mr. Willis M. Barnum. He says:

"Scientific Queen-Rearing, as Practically Applied," is the title of a new bee-book by Mr. G. M. Doolittle, that veteran among bee-keepers, who has made the *practical* side of bee-keeping his hobby for more than twenty years. Probably no other one person has written so much upon the subject of bee-keeping as this prince of bee-keepers! The book is nicely gotten up, and details Mr. Doolittle's method of rearing queens according to Nature's way. The price is $1.00, and it is published by Messrs. T. G. Newman & Son, Chicago, Ills.

Babies of the White House.—These are the bright faces that interest us most in this week's *Frank Leslie's Illustrated Newspaper*. But which is Baby McKee?

Queen of the Flowers.

Beautiful queen of the garden,
The lovely, blushing rose,
Drinking the morning dewdrops,
As the night draws to a close.

Wafting the delicate perfume,
Through the summer air,
Beck'ning the *honey-bee* to you,
In its roaming everywhere.

Peonies, pansies and tulips,
"Rich as the crown of a king;"
Hyacinths, dahlias and snowdrops—
But none like the rose—sweet thing.

—*Mrs. B. Briggs, in Western Rural.*

QUERIES AND REPLIES.

Changing Worker Foundation Cells into Drone-Cells.

Written for the American Bee Journal

Query 645.—Do worker bees ever make worker-foundation cells into drone-cells?—O.

Yes.—C. C. MILLER.

Yes.—H. D. CUTTING.

Yes, a few.—EUGENE SECOR.

Yes, but not often.—R. L. TAYLOR.

I do not know.—MRS. L. HARRISON.

I have known them to do so.—J. M. SHUCK.

Not that I have ever noticed.—J. M. HAMBAUGH.

Not unless the cells are bruised in some way.—P. L. VIALLON.

No, I have never known them to do so. Neither have I ever heard of such a case.—WILL M. BARNUM.

They frequently do, particularly in case the foundation cells should get out of shape by a sag.—J. P. H. BROWN.

Not that we know of, unless it stretches or sags, and the cells become larger by that means.—DADANT & SON.

No, not in the central portion of the sheets of foundation, at least.—G. L. TINKER.

If there is no drone-comb in the hive, they will build a few drone-cells if they have to do it on worker-foundation.—M. MAHIN.

Not often. They do rarely cut down worker-comb, and build drone-cells.—A. J. COOK.

They lengthen them out with raised caps, and rear drones in them, occasionally.—MAHALA B. CHADDOCK.

I never knew them to do so, except as they cut away the foundation and then built drone-comb.—G. M. DOOLITTLE.

Yes, bees do cut down worker-cells, and on the same bases build drone-cells. This, however, occurs only rarely in small quantities.—JAMES HEDDON.

Yes, when they are obliged to do so, not having any place to build drone-comb.—C. H. DIBBERN.

Yes; and I am in a "peck of trouble" about it, too. I never had so much of that kind of work done before in a whole season as has already been done this spring—now May 8.—A. B. MASON.

Yes; that is, they often rear drones in worker-cells, but as they cannot enlarge the cells in diameter, such drones are necessarily smaller than those reared in full drone-cells.—J. E. POND.

In my experience, only when the sheet of foundation sags so as to stretch the worker embryo-cells, as impressed on the sheet to an unnatural size, in which case the bees will turn them into drone-cells.—G. W. DEMAREE.

Yes; if the foundation is injured in some way or out of shape, and when they want drones. This is rarely done, and usually on the outside edges of the foundation.—THE EDITOR.

A Plan for the Prevention of Increase.

Written for the American Bee Journal

Query 646.—1. How would the following plan work to prevent increase? When colony No. 1 swarms, hive the swarm as usual. When No. 2 swarms, take two or three of the center frames out of No. 1, replacing them with frames of foundation, cut out all the queen-cells, and put the swarm from No. 2 into hive No. 1. When No. 3 swarms, prepare No. 2 in the same manner, and put in the swarm from No. 3. 2. Would this satisfy them so that they would not swarm again?—Ohio.

We hardly think it would in a good season.—DADANT & SON.

It is a matter of experiment. Try it and let us know.—P. L. VIALLON.

It will usually satisfy them if they have plenty of room.—A. B. MASON.

In most instances it would, and there would be but few exceptions.—MRS. L. HARRISON.

It will do some good toward preventing increase, but will not be infallible.—EUGENE SECOR.

About the same thing has been practiced for a long time, and is said to work well.—C. C. MILLER.

Your plan will work in many cases, but you will meet with failure in actual practice. You will find that they are not satisfied every time.—H. D. CUTTING.

1. I have no experience with this plan in detail, but I see no reason why it will not work. 2. Try, and then you will know.—J. M. HAMBAUGH.

1. I do not think that it would work satisfactorily; besides it involves too much labor to carry it out in a large apiary. 2. Not in all cases.—G. L. TINKER.

This plan has often been tried, and while it does well in a general way, it will not prevent swarms from issuing.—J. P. H. BROWN.

I have often practiced this, except that I did not take out the frames. It usually works well, but sometimes fails to subdue the swarming impulse.—A. J. COOK.

1. That plan and similar ones have never proved satisfactory with me. 2. Now and then a swarm would be satisfied, but generally they would swarm again.—R. L. TAYLOR.

I think that your plan would work well, but the way to make sure, is to try it. Those who do, please report through the BEE JOURNAL. I believe that it would practically kill the swarming fever.—WILL M. BARNUM.

I have tried this, and found no objection to it, except the complication and labor. It does not pay me. I do not find it the cheapest way to get the most surplus honey from a field.—JAMES HEDDON.

I have never tried this plan, but I doubt its success. With a continued honey harvest, the swarming fever would be continued or revived. I would prefer returning the swarm to the hive whence it came, without the queen, and in six or seven days destroying all queen-cells but one.—M. MAHIN.

I would not go to any such labor as is suggested by the querist. What is known as the "Heddon method" is the simplest and most effective. I have practiced it ever since the war, and I want nothing better. It permits the swarm to issue, carries the whole force of the old hive to the new, and rears a new queen besides.—J. M. SHUCK.

I practiced this plan some six years ago, and one season satisfied me. The bees will usually prepare to swarm at once, and become sulky and work but little, though the fields abound with honey. Then, too, (if it prevented swarming) your queens would soon be old and worthless.—C. H. DIBBERN.

This is exactly the plan I am using this season, except that I use empty combs instead of the foundation, and so far it has worked well. Remember, however, that we are having a poor season, and I am only doing this in our basswood bloom, so as to keep forces together as much as possible, hoping to secure more honey in the sections by so doing.—G. M. DOOLITTLE.

1. Your plan has been tried often, or at least plans substantially the same, and they do not give satisfaction. The better plan is to keep each colony together. This can be done by hiving the swarm on the old stand, putting a

perforated zinc excluder on the new hive, and place the brood-chamber of the parent hive on the excluder above the swarm. A colony managed in this way will not attempt to swarm, and will work all right. Colonies that have very old queens that they wish to supersede, are very hard to satisfy short of superseding the old queen.—G. W. DEMAREE.

This is a sort of variation from an old plan that has been mentioned several times in the bee-periodicals. It will probably work well enough if one has the time and patience to bother with it. Whether it would prevent swarming again, or not, is a matter of great uncertainty. "It might, and then again it mightn't."—J. E. POND.

The method is not new, and it has been practiced with varying success for a long time. It is a laborious method, and does not invariably prevent increase.—THE EDITOR.

CORRESPONDENCE.

HONEY.

What is Honey? Is it Digested Nectar?

Written for the American Bee Journal
BY DR. J. W. M'KINNEY.

As all apiarists are interested in the honey product, they cannot fail to take deep interest in everything pertaining to the subject of its production, its purity and use. All alike feel a deep interest in maintaining the *true facts* as to the production of this, the most delicious of all sweets. Therefore, I am led to call in question the statement made in the article appearing on page 375, written by Prof. A. J. Cook.

As much as I admire the writings and opinions of Prof. Cook, I must enter a protest against the idea as advanced by him, in reference to the production of honey. In the article referred to, entitled "Bee-Glands," we find this statement, when speaking of the probable function of certain glands in the honey-bee: "All honey is completely or partially digested nectar." If this be true, then honey is not the pure essence of sweetness distilled through the nectaries of flowers; but is largely the product of the glands of insects; for the Professor says, just preceding the above quotation, that the "cane-sugar of neetar is changed to the grape-sugar of honey," by the action of these certain bee-glands.

We have always been led to believe—and the facts on investigation prove it true—that syrup made from cane-sugar and given to the bees, will be deposited in their combs just as taken from the feeder. So, also, the nectar taken from flowers is deposited without change.

As evidence of the foregoing fact, we see that nectar gathered by the honey-bee and deposited in combs, retains its color, flavor and aroma peculiar to the vegetable bloom from which it was gathered by the bee. All the change that can be perceived by any test from the time the nectar is gathered, deposited in the comb, and sealed over, is the evaporation of a portion of water it contained. This is done after being deposited in the comb by the heat in the hive and the fanning process by the bees' wings, and not by the *digestive* process of the insect.

Digestion in all animals is a function by means of which alimentary substances, when introduced into the digestive canal, undergo different alterations. The object of this is to convert them into two parts—the one a reparatory juice, the other, deprived of its nutritious properties, to be rejected from the body.

Nectar is gathered by the bee and received into a sac closed at its lower end, lying above and behind the digestive canal, in which condition it is carried to the hive and deposited in the comb, without change by the process of digestion.

The digestive function in the honey-bee is called into action on honey and pollen when taken into the digestive canal for the purpose of furnishing food for their larvæ, and for sustaining their own existence, or for the elaboration of wax.

When digested for food for their larvæ, we see that in appearance and taste the honey and pollen has undergone a very great change. It is now a white, opake substance, with a slightly sub-acid taste.

When honey is taken in abundance for two or three days, and perfectly digested and assimilated, we then have the elaboration of wax.

In no sense can we conceive of the digestive organs of the insect being brought into requisition in the production of honey. Just as sipped from the nectaries of flowers, with whatever peculiar characteristic the nectar may have—whether from white clover, with its delicious flavor and slight tendency to granulate, or from the Spanish-needle, with its golden color and aromatic flavor, and no tendency to granulate; or from the boneset (*eupatorium perfoliatum*) with its pungent and bitter taste—it is carried home to the hive, and there deposited in the combs.

When reflecting upon the number of trips made by the bees each day during a good flow of honey, we must regard the time entirely too short for digestion to take place, did the nectar enter into the digestive canal when gathered. Including the time going to and coming from the fields, and the time occupied in filling its honey-sac, there is only from 25 to 30 minutes consumed by the bees.

If syrup is fed near the hive, only from 10 to 15 minutes time is consumed in making the round-trip. Could digestion be so rapid as to change the cane-sugar to the "grape-sugar of honey" in so short a time? Certainly not.

With all due respect, then, I would suggest that the bee-fraternity be always on guard against a "scientific pleasantry," as its effect is sometimes baneful.

Camargo, Ills.

HINTS.

How to Make Lazy Bees Go to Work—Honey Packages.

Written for the Prairie Farmer
BY MRS. L. HARRISON.

Bees have been living this season, one day with Dives, and the next with Lazarus; consequently, the honey will not be so fine as it would have been had the flow been continuous. One season the honey came so fast that the bees were saving of their wax, and the comb was so delicate and thin, as to be almost imperceptible. This was during clover bloom. Owing to the heavy rains that have fallen so often, and so abundantly, clover bloom has lasted much longer than usual.

Lazy Bees.

Bees are proverbially industrious, but now and then a colony will be found that does not deserve the title. I have been watching with interest a very large colony with the surplus-boxes full of bees; also the portico and the outside of the hive covered to the top. They have been loafing for more than a fortnight, and the honey in the surplus-boxes increased very slowly. I was tired of such folly, and moved their hive and put in its place a hive containing young bees and a virgin queen.

I obtained these bees in this way: A colony swarmed, and, as I do not desire increase, I hived them and moved the old colony, putting the swarm where it stood. The next day I took out all the combs belonging to the old colony, brushed off the bees, and extracted the honey. There was no young brood, as the colony had swarmed before, and there was a num-

ber of queen-cells that their inmates had lately left. All bees that had been working in the fields flew to the old stand and joined the swarm.

I put back the frames and carried the hives to where the loafing colony had stood, and dipped out the bees with a long-handled spoon from the crowded portico, and gave them to the new hive. The bees that were working in the fields, as they returned, entered the hive upon their old stand. There are now two good working colonies in lieu of one loafing one.

Honey Plenty.

Bees are as good-natured to-day as a fat alderman after dinner, fanning himself and calling to his fellows, "We are rich, and folks know it." I took off sections and emptied the case upon a board placed upon an adjoining hive, selected those that were sealed, and put back those that were not, and filled up the case with empty sections. In the operation some honey leaked out upon the board, and I placed it in front of the hive, thinking that the bees would gather it up, but they would not look at it.

I would like to see those persons who think that honey is glucose fed to bees. Try the experiment of feeding them now. The Creator never intended bees to sip syrup, like flies, but to gather the juices of plants. When honey is as plentiful as it is to-day, it is a pleasure to work with bees; they can be brushed from their combs, or switched off with little twigs, and they do not even take any umbrage at it.

Removing Sections.

When sections are sealed, they should be removed so that they will not get soiled by the travel of the bees. They should be put into a tight box, so that the moths cannot get at them to deposit eggs. Shipping cases are just right for this purpose. I first make a sort of pan of manilla paper, fitting it nicely into the bottom of the case, and, after the sections are scraped free of propolis, fit them in nicely, cover them securely, and pile them up ready for market.

Packages for Extracted Honey.

I do not like wooden receptacles for extracted honey, for several reasons. It is difficult to get barrels that will not leak, and when honey granulates, it is hard to dig out. Those who produce honey largely, must of necessity use barrels or large tanks, but it is different with those who only produce a few hundred pounds in lieu of thousands. Large jars that are glazed as smooth as glass make good receptacles, as they can be set in tanks of water to melt the honey when it is granulated. Tin cans, of dimensions of eight or ten gallons, are a pet package with me, as they are lighter than jars. If jars of extracted honey are exposed to a very low temperature, they will burst with the expansion of the honey.

Many bee-keepers are opposed to the idea of straining honey, as all bits of comb or bees will rise to the top, and can be removed; but I prefer to tie cheese-cloth over cans or jars, and let the honey, as it runs from the extractor, pass through it. When a jar is full, remove this strainer, and tie a fresh piece of cheese-cloth over it, so that it can cure and evaporate.

Some of those who produce extracted honey largely, have run-ways covered with wire-gauze to keep out insects, so that the honey is boiled down by the sun's rays in passing along to its final tanks or store-house. I have a few glass jars of very fine extracted honey, covered with cheese-cloth, kept in place with rubber bands, daily in the hot sun, to evaporate and thicken.

Peoria, Ills.

HEAT.

The Reason Why Bees Leave the Hive—Smokers, etc.

Written for the American Bee Journal

BY CHAS. H. WIELE.

Dr. C. C. Miller is right when he says that heat will make the bees leave the hive. My bees are mostly in the shade of plum-trees, which are trimmed high, so that the limbs will not interfere with the working amongst them. If I am forced to place a new swarm in the sun, I try to get an armful of grass or weeds, and cover the whole hive with it, then they will seldom leave.

What I have never seen before is, that colonies would swarm again after 5 or 6 days, having received an empty hive and all the surplus boxes of the old colony nearly filled with honey. The brood-frames were built half way down, with no other than drone-combs, and the rims of the combs covered with queen-cells—as many as fifty, perhaps; of course the bees were returned, all the drone-combs taken away, and then I put in some empty combs of worker-cells, which made them stay and go to work with a will.

Even with experience, a man has to learn every day. There will always be something to turn up that he did not see before.

The "Doctor" smoker is a real comfort; it smokes away for almost half a day, and with nearly 200 colonies it is a necessity to have a good smoker.

Bees are booming, and there will be a big crop of clover honey. I have about 2,000 pounds. They have slacked off a little with swarming, but will surely commence again when golden-rod and other fall flowers commence blooming; the hives are overflowing with bees.

Stoddard, Wis., July 18, 1889.

TRANSFERRING.

How to Proceed When About to Transfer Bees.

Written for the American Rural Home

BY G. M. DOOLITTLE.

A correspondent writes, saying: "I have several colonies of bees in box-hives; how am I to get them out of these hives into movable-frame hives, as I wish them?"

The first thing to do, is to get things in readiness for the work, which will be to bore some small holes through the end-bars, and top and bottom bars of the frames, so that when the combs are fitted into them, small wooden pegs or wire-nails of suitable length can be pushed through these holes into the combs, to hold them in the frames until the bees have made them secure, when the nails or pegs are to be drawn out; some prefer to wind twine or wire around the frames, but I do not like this plan, for wherever the wire comes over the brood, the bees gnaw the brood out, which hurts the combs, besides spoiling so much brood.

Besides having the frames and wire-nails ready, a board will be needed that is about two feet square, and a barrel or box of convenient height for the operator to place the board upon. On one side of the board should be tacked three or four thicknesses of cloth, so that the brood and combs will not be injured by being placed upon it.

There are only two really favorable times for transferring, although it can be done at any time, by using care. The first is during fruit or apple bloom. If done in fruit bloom, but little brood and honey are in the way, while honey is coming in to prevent robbing, as well as to enable the bees to promptly repair their combs. The second, is 21 days after the first or prime swarm issues.

When done 21 days after swarming, there will be no brood in the hive except a little drone-brood, so there will be no loss from cutting through it, as all the bees from the eggs laid by the old queen will now be hatched, while the young queen will have only just begun laying.

Having the things above alluded to in readiness, together with a long-

bladed knife, proceed to the hive and blow a few puffs of smoke in at the entrance to alarm the bees, when the box-hive or log-gum is to be turned bottomside up, and the frame hive placed on the stand that the other occupied. Blow a little smoke over the bottoms of the exposed combs, and place the cap of the hive, or any box, over the bottom of the hive, or a little to one side, for the bees to crawl up into.

It is said that the box must fit so tightly that no bee can escape, and that the bees must be "drummed" up into it; but I find that the tight joint is unnecessary, and that all the "drumming" required is done by splitting the old hive apart, preparatory to getting the combs out.

Select the side of the hive to which the combs run parallel, if possible, and proceed to pry off the side, or split the old log open, using a cold-chisel to cut the nails, where such is necessary. If there are cross-sticks through the centre of the hive, these must be cut off in some way, otherwise each comb is liable to be injured to a more or less extent.

By this time the bees will all be off the combs next to you, when the first one is to be cut out of the hive and laid on the prepared board. Now lay the frame on the comb, and mark the comb by the inside of the frame. Take off the frame and cut the comb a hair larger than the marks, so that it will fit closely. Next, press the frame over the comb until it nicely fills the frame, when the pegs or nails are to be pushed through the holes into the combs, so as to hold it in place in the frame when hung in the hive.

To take the frame from the board, raise the board and all until the frame stands in the position that it does when it hangs in the hive, when there will be no danger of the comb falling out in lifting. Place in the hive, when the bees which have returned from the field will take possession of it, licking up the drip, etc.

Proceed to cut out the rest of the combs, and fit them into the frames in the same way, until all are used, and then place them in the new hive, in the same relative position as nearly as possible, which they occupied before. By this I mean, place the brood in the centre of the hive and near together, instead of scattering it about among the honey or empty combs, for if so scattered, some of the brood will be liable to perish, if there should come a cold spell soon after the transferring is done.

If some of the combs with brood in will fit the frames better if turned bottomside up, from what it occupied in the old hive, I see nothing in the way of placing it in the frame as it will fit best, for with our reversible frames it has been proven that it makes no difference which side up the brood goes.

If drone-comb to any amount is found, it is well to leave the most of it out, if not the whole, for only a few drones in each apiary are needed for all practical purposes. Many pieces of nice worker-comb are made by the combs cutting to disadvantage; they can be fitted into the frames and a little melted wax dropped between each joint, so as to hold them in the position you wish.

As soon as all the combs are in, close the new hive, and hive the bees which are in the cap or box, into it, doing this in the same way that you would hive any swarm. If a scarcity of honey exists at the time you wish to transfer, so that robbing is liable to occur, it is then best to "drum" the bees out into the box, after which the old hive can be carried into a room while the combs are being fitted into the frames. Something still better than this, would be to use a bee-tent over both the hive and the operator. In this way the work can be done at any time right in the apiary where the hives stand.

In a few days, or as soon as the bees get the combs fastened to the frames, the nails or pegs can be drawn, when you have something nearly as good as if the combs were built in frames originally.

Borodino, N. Y.

HIVES.

Impartiality and Veracity—the Large vs. Small Brood-Chambers.

Written for the American Bee Journal

BY CHAS. DADANT.

After reading the article of Mr. Hutchinson's, on page 425, I had resolved not to write again on the same subject, for I do not like to overthrow my opponent; but another fact, of which I may write hereafter, changed my mind, and incited me to show the means used by some writers to support a bad cause.

In answer to my argument, that the bee-keepers who oppose large hives have never tried them, Mr. Hutchinson answers: "*My* ideas in regard to the size of hives are not wholly theoretical. I have used hives ranging in size from a two-frame American to one holding 33 American frames."

While he wrote this, Mr. Hutchinson forgot a Latin proverb: *Verba volant, scripta manent*—"The words fly, the writings remain;" for I have under my eyes two letters from him; the first says: "I must say, though, that I used large hives, 11 American frames for several years, and gradually changed them for smaller, so that I am not wholly without experience."

After receiving my answer, that 11 American frames were not larger than 10 Langstroth, Mr. Hutchinson wrote the second letter, in which I read: "When I wrote you how large hives I had used, I, of course, knew that you had used larger ones."

Then the 33 American frame hives were invented by Mr. Hutchinson just for the need of his cause.

He adds that "Mr. Heddon has used many different sizes of hives; among others he had 30 'long idea' hives, that held 30 frames each, and he used them two years before throwing them away."

In the book, "Success in Bee-Culture," by Mr. Heddon, on page 85, we read: "Some advise us to have extra-prolific queens; put each one in a hive containing 30 combs, then shift the combs every few days, and make her keep them full of brood. I tried it—to my satisfaction. I found that this method demanded an extra amount of labor—a labor that would pay the interest at 20 per cent. on every dollar of the capital invested. So I just cut up these large, long hives, making five out of each one, and divided those 30 combs among these hives, and reared four more queens."

Then, according to Mr. Hutchinson, Mr. Heddon made 150 6-frame hives, since he had 30 to divide. I would be glad to know the number which was added by Mr. Hutchinson to the true quantity of "long-idea" hives used by Mr. Heddon. Perhaps he added but a cipher after the number 3.

Be it as it may, an experience with such an extravagant hive and system has no more to do with our large hives than the names of Messrs. Doolittle and Grimm, cited by Mr. Hutchinson, since they have never used them.

Mr. Hutchinson continues: "In his first article, Mr. Dadant asserts that a large colony requires no more labor than a small one, and I asked him if he could extract the honey from a large colony as soon as from a small one. This *he evades* by telling with how few days' work he and Mr. Stachelhausen have produced large crops of honey—all of which no one doubts; but the question is, 'Can you extract the honey from a large hive as soon as from a small one.'"

Scripta manent. If the reader will take the trouble of looking at the bottom of page 342, in the first column, he will read in the article of Mr. Hutchinson: "Can he (my oppon-

ent) extract the honey from a large colony with as little labor as from a small one?" I defy Mr. Hutchinson to show where he used the words "as soon as," which have very little significance, and were evidently devised by him to *evade* answering my argument; for he knows perfectly that it is easy to prove its truthfulness.

In the Hutchinson *Review* of May 10, page 74, Mr. Heddon writes: "Our method in running three large apiaries, is to keep a good man in each one...." The six apiaries of the firm of Chas. Dadant & Son, are cared for by a single good man, Mr. McDaniel, who attends also two others—one for himself and one for another bee-keeper; while each one of the Heddon apiaries is kept by a good man; yet we do not use a system which permits the handling of hives rather than frames; but for 20 years we tried to realize the motto of Mr. Heddon, as given in his "Success," page 10: "He who produces at maximum cost will fail; he who produces at minimum cost, will succeed;" and our large hives helped us to realize it better than its author did, even with his new hive.

Mr. Hutchinson continues: Mr. Dadant says that I have condemned oil-cloths, as I have large hives, without trying them. Large hives I have used, quilts *I have not to any great extent...*." *Scripta manent.* We read in the *Review* of Mr. Hutchinson's January issue, page 11: "Perhaps our genial friend can do better with quilts than we can; we think he could, because we have *never* used them—seeing others use them satisfied us."

Well, I think that an advocate is very short of arguments, who uses the means to which Mr. Hutchinson had recourse, and that such a poor way is far from giving confidence to his readers.

Hamilton, Ills.

THE QUEEN'S VISIT

To the Bee and Honey Show at Windsor, England.

From the British Bee Journal OF JULY 4, 1889.

Bee-keepers who have this year visited the annual show of the Royal Agricultural Society of England in its year of Jubilee, have had a treat of a high order. About ten miles of shed, some 130 acres of a specially suitable part of Windsor Great Park, gave ample room for man and beast to move about in comfort.

"When Greek met Greek, then came the tug of war," but when bee-keepers met those whose friendly faces had been pictured but in the mind's eye since the last Royal, then came the tug of kindly greeting, in many cases accompanied by some enthusiastic argument as to the varied points of perfection (or otherwise, alas!) of this or that exhibit, this or that method of procedure, amidst the changes and chances of modern apiculture.

Amongst the many, to us, unknown apiarists of the old benighted schools of arrant skeppists and self-opinionated bee-keepers who persist in walking in the lines their fathers trod, no doubt were many who, so to speak, "came to scoff and remained to pray" for the multitudes of appliances on exhibition, the exceedingly fine show of immaculately pure honey in sections and bottles, and the practical illustrated teaching by Mr. S. J. Baldwin, in the bee-tent of "How to do Rightly," must have convinced many who still remain obdurate, or obstinate, that there is but one way for bee-keepers to pursue—the humane method taught by the British Bee-Keepers' Association, and its affiliated offshoots in the counties, the modern scientific way of management in the frame-hive.

At an early hour on Friday morning, June 28, it was evident that something out of the ordinary routine was about to transpire. In the bee-tent all was activity, and the officials in charge were busy making preparations. The exhibits were being arranged, and Mr. Huckle was all energy and action. The floral decorations, which were becoming a little faded, were being rearranged by Mrs. Bligh, who kindly undertook this part of the programme, and accomplished her task to the satisfaction of all in a way only possible for a lady, and the various flowers visited by bees arranged amongst the other exhibits, formed one of the most attractive features of the show.

The Chairman (Mr. T. W. Cowan), who had been present during all the week, the Vice-Chairman (Hon. and Rev. H. Bligh), and the Rev. R. Errington, were also early in attendance, and active. It was not definitely known until the day before, that Her Majesty, the Queen, intended honoring the bee-department with a personal visit, hence these preparations. It had been arranged that on Her Majesty's arrival at the department, the Baroness Burdett-Coutts was to present her with a bouquet of flowers visited by bees. This the Chairman and the Rev. J. L. Seager arranged with Messrs. Sutton & Sons, that they should prepare from bee-flowers growing on their farms at Reading. The bouquet, which arrived at 11:30, was artistically arranged, and fitted in a handsome gilt holder, and tied round with white satin ribbon with flowing ends. In the holder was an inscription stating that it was presented to Her Majesty by the British Bee-Keepers' Association.

About 12 o'clock the Baroness drove up, and was received by the Chairman and Committee, and the bouquet, which was greatly admired by all present, was handed to her. After viewing the parade of cattle from the Grand Stand, the Queen proceeded on her round of inspection, the crowds of people cheering vociferously. From the bee-department the noise was heard in the distance, and the advance of the Queen's carriage could be marked by the gradual swell of the applause.

Soon after 12 o'clock there was a rush of policemen, who cleared the shed and formed a line to allow the procession to pass. It was a pretty sight, as those who were to take part in the reception of the Royal guests, looked up the avenue and saw the Royal procession advancing at a foot pace. Mr. Jacob Wilson, the Honorary Director of the Show, headed the procession on horseback, and was followed by the outriders and equerries in waiting. Then came Her Majesty's carriage, drawn by four horses. In the carriage the Queen was accompanied by the Prince of Wales, and the Prince and Princess Henry of Battenberg.

The Baroness, Mr. Cowan, Mr. Bligh, and Mr. Errington, were ready waiting to receive Her Majesty; and as the carriage stopped in the centre of the stand, the Baroness handed the bouquet of flowers to the Queen, and explained that they were specially selected as representing flowers visited by bees. The Baroness then presented Mr. Cowan to the Queen as Chairman of the British Bee-Keepers' Association. Her Majesty received him graciously, and he briefly explained the objects of the Association, and drew Her Majesty's attention to some of the principal exhibits in the show. She showed great interest in the honey, and at this moment Mr. Bligh handed to Mr. Cowan a specimen of comb honey. This was a beautiful specimen of sainfoin honey, from the exhibit of Mr. W. Woodley, and the device worked by the bees consisted of the following letters:

R.A.S.E.
JUBILEE,
89,

enclosed in a frame and covered with glass. Mr. Cowan held it up, and explained that it had been worked by bees in the county of Berks, and asked if Her Majesty would graciously accept it from the British Bee-Keepers' Association. The Queen bowed most graciously and replied, "With great pleasure," and as she thought they

could hardly find room in the carriage for so bulky a present, the Prince of Wales suggested it should be sent to the Castle. Much interest was also shown in the method of folding a one-pound section. The Queen then shook hands with the Baroness and Mr. Cowan, thanked them, and drove off.

In the other carriage were Prince and Princess Christian, and Prince Albert of Schleswig-Holstein and suite.

The weather was all that could be wished, and it is some years since a show of the Royal has passed off without umbrellas being called into constant requisition ; but during this show they have only been required to keep off the sun's rays.

An amusing incident happened just before the Royal procession passed. The refreshment contractors had placed their cooking furnaces quite close to the skeps that were kept for driving the bees and other operations in the bee-tent. These furnaces were used at night for cooking the joints for the day's provisions. The heat made the bees rather uncomfortable, and a swarm issued and passed over the route to be taken by the Queen. Thousands of bees were flying to and fro, and Mr. Baldwin got a skep and induced the bees to settle by sprinkling them on the canvas of the bee-tent. It was not a moment too soon, for no sooner had the bees settled quietly, when the Queen drove up. All the arrangements were perfect. The device, accompanied by several one and two pound sections of comb honey of first-rate quality, selected from the exhibits of Mr. Woodley, of Newbury, and Miss Gayton, of Much Hadham, were in due course conveyed to the Castle, to be placed on Her Majesty's table. Mr. Huckle has since received the following communication :

WINDSOR CASTLE, June 29, 1889.

SIR :—I am commanded by the Queen to request that you will convey to the Committee of the British Bee-Keepers' Association, Her Majesty's thanks for the honey and honey-device which they have been kind enough to present the Queen.

Yours, faithfully,
HENRY PONSONBY.

The bee-department of the Royal has been honored twice previously by Royalty. At the Kilburn show in 1879 the Prince of Wales visited it, at Norwich in 1886 it was visited by the Prince and Princess of Wales, whom Mr. Cowan, with other members of the Committee, had the honor to conduct around the department.

The visit of Her Majesty and the Royal Family will cause the Royal Show at Windsor to be long held in remembrance by all bee-keepers. The status of bee-keepers has been raised by the honor conferred upon them. It has been shown that bee-culture is an integral part of agriculture, and that the connection between agriculture, horticulture and apiculture is very intimate. The Royal notice, the magnificent weather we are enjoying, and the hopeful honey season, will impart a heart of grace to all bee-keepers, and cause them to go on their way rejoicing.

QUEENS.

New System of Rearing Several Queens in a Full Colony.

Written for the American Bee Journal

BY DR. G. L. TINKER.

It has long been sought to rear and secure the fertilization of a number of queens, and get them all laying at once in a full colony of bees ; but the well known antagonism of queens has heretofore prevented the accomplishing of that object. While it may, or may not, be of any advantage to the honey-producer, to have a multiple of queens in a hive, it must be conceded that a successful system of rearing queens, as indicated, in full colonies, will be a boon to queen-breeders, and a great improvement over our present methods of rearing queens.

At last I have a successful plan—what I call a "Queen-Rearing Chamber"—by which may be readily reared from 10 to 20 queens in any full colony of bees, and get them all laying at once, the worker bees all flying from one entrance, but having access to all of the queens.

It seems almost incredible that we should be able to so interfere with the usual course of nature, as to bring about such a result after so many years of having colonies with only one laying queen, or, at the best, a young one and a superannuated old one !

To the introduction and successful use of perforated-zinc in our methods, is due the success of this new plan ; although, with what I now know, I could make a hive of all wood and succeed ; but the perforated-zinc is the most practical excluder thus far put to use.

To successfully rear a number of queens at once in a hive, it is only required that we keep the queens apart by the use of the zinc, and give them separate entrances. However, one sheet of the zinc intervening between the queens is a partial failure, as the rival queens will discover each other and quarrel ; the result being that one of them takes fright and swarms out, or may be killed. To remedy this difficulty, I began to use two sheets of the zinc between the queens, with a bee-space between the sheets, or solid wood. Thus arranged, there is no trouble about getting the queens mated.

The principle here outlined was published in the BEE JOURNAL on page 26—see next to the last paragraph of the third column—which another season's experience has shown to be correct in every word. Thus it will appear, that while queen-cells will be cared for and allowed to hatch above zinc excluders in full colonies, it is impossible to secure the mating of the young queens while there is a laying queen in the brood-chamber below.

I wish all queen-breeders to mark this fact, for it is the sole reason why the perfection of the "queen-rearing chamber" has so long been delayed ; for both myself and others have often had queen-cells hatch above queen-excluding honey-boards for years, and although the young queens were given a chance to fly out, not one of them was ever fertilized without a coincident loss of the laying queen below in some mysterious manner. Hence, I feared that we should never be able to get two or more young queens laying in one hive at the same time. I then began to experiment with two virgin queens of the same age, and to my astonishment I succeeded in getting both laying the first trial.

The principle having been discovered, it only remained to make a practical application of it, and the result is the new "queen-rearing chamber." Now we shall be able to have several laying queens in a hive, and after they get to laying, one sheet of the zinc between them is all-sufficient for continued harmony ; the bees seeming to care for one queen as much as another in the same hive.

I have had four queens of the same age together in one hive for the past two months, and numbers of other colonies with two and three laying queens for shorter periods, until I know that the system is not only possible, but a great practical success.

In perfecting this method I have spent much time and hard study, besides money, and I came to the conclusion that I ought not, in justice to myself, to *give* it to the public. After perfecting the plan during the season of 1888, I applied for a patent which has just been granted, and now I am ready to make the matter public.

Being the first to discover this new system of queen-rearing, and to make a practical and successful application of it, I shall therefore claim all queen-rearing chambers in which the foregoing principle is made to appear.

How to Make the Chambers.

The chambers, as I have perfected them, are divided into compartments by three partitions made of part wood

and part perforated-zinc. The partitions are so placed that two brood-frames will go into the apartments at each side, and one frame in each of the middle apartments. The outside dimensions are 12½x19⅛ inches, or the same size as my hive, and takes the same brood-frame. The depth is 7⅞ inches, so as to allow a bee-space above and below a 7-inch brood-frame.

On the bottom of the chamber is attached a sheet of perforated zinc, or a wood-zinc combination, which is attached also to the bottom of the partitions, which extend through the chamber to the top, so that a sheet of perforated-zinc laid on the top, or the wood-zinc honey-board, will close the four apartments to the queens.

When the chambers are storified, a zinc excluder is used between each one of them to form the necessary bee-space; but an exeluder is not required under the lower one, as we may put on a strip of perforated-zinc over the entrance in the bottom-board on which the chamber is placed; or, we can place a queen-trap or a simple excluder before the entrance. This prevents any queens or drones from getting under the chamber out of sight, and will compel both the queens and drones to go in at the holes in the sides of the chambers. It is remarkable to see the drones go out and in at the holes, apparently visiting the young queens in the several apartments, but the queens return to the holes from which they came, with almost unerring certainty. The holes are made with a ⅝-ineh auger, near the bottom of the chamber, one to each of the apartments.

Where the holes come near each other in storifying, I place a twig of green leaves or other object to aid them in locating the right hole. I have also painted the chambers with red, white, blue and yellow sides, but I do not think it neeessary, if twigs of leaves are attached about the holes. The twigs are pinned on with common pins.

In starting the chambers with queen-cells, all of the holes are stopped with common corks until the cells are hatehed. On the third or fourth day after, the corks must be removed about 12 m., and if the eolony is strong, the corks may be left out. After the queens have mated, the corks may be put back again. But very few workers are seen to issue from the holes, so that they may as well be stopped after the queens are laying, unless drones are in the chambers, in which ease the holes may be left open at least during the middle of the day.

I find it best to rear about the number of queens that a colony will usually start, or 12 to 16; but if the colony is built up very strong by hatching brood from other colonies, after the first lot of queens are taken out and disposed of, it may be started with 6 to 8 of the chambers, and from 20 to 30 queens reared at a time. If the cells given will all hateh at about the same time, I think that it would be possible to rear that many queens every two weeks in one of these colonies.

In taking out the queens, one, two or more may be taken any time after they begin laying, but no re-queening can be done till every queen is removed and the colony has been queenless at least three days; and it is better to wait until some of the cells started are sealed over; then eells should be given that will hatch very soon, and all within a few days. With our present method of getting cells, this is very easy to do. Either the cells may be introduced, or they may be hatched in nurseries, and then a queen allowed to run into each of the apartments in all of the chambers used; but if eapped queen-cells are in any of the apartments, it is safer to introduce the cells. If we tear down the cells (and it is the best plan at this time of the year), then a queen just hatched will be accepted every time.

How to Get Queen-Cells.

My method of getting queen-cells I think to be far superior to any other plan. It was first made known at the late Columbus International Convention, and is as follows:

Take the queen and brood from any colony, and give combs of honey or sealed brood, leaving out a central comb. Cage the queen removed, and put her over the frames to keep the bees quiet until evening. Then take her away, and leave them queenless until the next day, when they will not destroy eggs that are given to them to rear queen-cells.

Prepare the eggs for them as follows: Take a brood-frame, remove the bottom-bar, and nail in a cross-piece one inch wide, and as long as the frame inside, 1⅛ inches from the lower end of the end-bars. Fasten in a sheet of foundation that will come down nearly to the cross-piece, and the frame is ready for the eggs.

Select the colony to breed from, and cut out a piece of comb 2 inches square, containing eggs about ready to hatch, and cut up the comb into single rows of cells; then cut off two-thirds of the comb on the opposite side of the septa, after which cut up the rows of cells into cells having an egg in each. These are to make the queen-cups, and I let the bees make them.

Hold the frame bottom up, and drop a little melted wax on the cross-piece about an ineh apart, by means of a small camel's-hair brush, and, before the wax chills, attach the cells so that they will point mouth downwards, when the frame is placed in the hive. My brood-frame is 7x17 inches, and I can attach in this way 16 cell-cups without danger that the bees will build any of them together.

As soon as the frame is prepared, place it in the queenless colony, and they will start 12 to 16 cells. As soon as they are well supplied with royal food, the bees are to be shaken off, and the frame placed in the super of a strong colony over a zinc-excluder, for completion and care.

Give another prepared frame to the queenless colony, and remove as before, which may be done three or four times, when the colony had better be given a laying queen. All of the cells may be given to the strong colony to care for till nearly ready to hatch.

If no honey is coming in, the colonies building the cells should be liberally fed.

My new brood-chamber holding the suspended Langstroth frame, size 7x17 inches, I regard as the best adapted to the new system of queen-rearing, as it is also the best for the producer of comb or extracted honey; for wintering, or for breeding up strong colonies in the spring.

New Philadelphia, O., July 22, 1889.

HONEY SHOWS.

How to Make a Good Display—One that Will Attract.

Written for the Rural Canadian.

As very many will be making exhibits of honey before long, a few suggestions will not be out of place.

Do not attempt too much; do whatever you undertake in a thorough manner, a credit to yourself and the industry which you represent. Exhibits of anything gotten up in a hurried and incomplete way, reflect very unfavorably upon whoever makes them.

If you have not a good article, or if a display is required, and you have not the proper material to make it with, what benefit will you derive? None. The neatest display you can make of honey would be a combination of comb and extracted honey.

If you wish to relieve the monotony of a honey show, some curiosity, by way of a frame of brood; if it contains worker, drone and queen cells, so much the better; also drones and workers. Of course it is not at all likely that you will be able to have queen-cells and a queen upon the same frame. Then photographs of your

apiary, or prominent and useful members past and present, of the Bee-Keepers' Associations are of interest and help to break the monotony of a honey display.

Regular shelves are not desirable; make them irregular, and give the shelves an appearance of variety.

Glass as a package for extracted honey is desirable if the honey is free from granulation, and of a proper color; it must, however, be remembered that, in transit, it is more easily broken. It is more liable to leak than a first-class tin can, therefore it is well not to show too much in glass.

One-pound and even two-pound jelly glasses and the different sized gem jars sell well, as the careful housewife can use them in doing up fruit later.

Tag everything carefully; mark on the outside of your cans what the contents are, so that you do not require to rush about in a frantic manner tearing open every case, and then in the last one find what you require. Depend on no one, bring your own tools.

If you calculate to return your goods, have a tag with the proper address underneath the one you put on to the exhibition, then when there, all you have to do, is to tear off the top tag, and your package is properly addressed. Do not allow your outside packages to be removed, as you may not be able to get them, but utilize them for stands, and cover all neatly with paper. In selling honey you will find that there are just certain hours when there will be many customers, and have everything convenient, and be prepared for a rush.

Keep your money in your pocket; it is surprising how far back you can reach for that article. Your pocket may become sticky with honey, but there is no use feeling stuck up about that. It would be a pleasure not to pen it, but sad experience prompts otherwise. Do not have any help in selling honey unless you can absolutely depend upon the honesty of such help.

Convention Notices.

☞ The Darke County Union Bee-Keepers' Society will hold a meeting at Greenville, O., on August 3, 1889. J. A. ROE, *Sec.*

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

THE DANDELIONS.

Written for the Portland Transcript
BY E. CAVAZZA.

The gay young Dandelions had gold,
They cast it here and there;
On hill and dale their coins were found,
By roadside and in planted ground;
Their wealth of money manifold
They squandered everywhere.

The Dandelions grow elderly
And penniless and gray;
Their store of gold is spent, no doubt,
For now white missives fly about—
The poor old spendthrifts give, we see,
Their promises to pay.

The wayside and the meadow hold
Their promissory notes,
The banks receive them—and next spring
The honest Dandelions will bring
Ten thousand thousand disks of gold
Where now the seed-drift floats.

CONVENTION DIRECTORY.

1889.	*Time and Place of Meeting.*
Aug. 3.	Darke County Union, at Greenville, Ohio. J. A. Roe, Sec., Union City, Ind.
Aug. 20.	Northern Illinois, at Guilford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.
Aug. 31.	Haldimand, at Fisherville, Ont. E. C. Campbell, Sec., Cayuga, Ont.
Sept. —.	Maine, at Livermore Falls, Me. J. F. Fuller, Sec., Oxford, Me.
Sept. 5.	Erie County, at Buffalo, N. Y. O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.
Dec. 4, 6.	International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

White Clover and Basswood.—S. G. Soverhill, Tiskilwa, Ills., on July 19, 1889, writes:

I had 30 colonies of bees to start with the past spring, and have 68 now. I have taken off 1,800 pounds of comb honey, and extracted 1,140 pounds, besides there is more ready to take off now. The bees are still storing from white clover. The flow from basswood is over. There is plenty of rain, and white clover will last sometime yet.

A Continued Honey-Flow.—S. J. Youngman, Lakeview, Mich., on July 21, 1889, says:

I predicted, a short time ago, that we would have a great flow of honey from the basswood bloom; excessive swarming has, however, interfered with the honey gathered, to a great extent. The basswood flow is over, at this date, but there is no stop to the honey-flow, as the clover on all pastured lands is blooming profusely again, and seems to yield honey the same as in early spring. Many swarms have gone to the woods.

Plenty of Bee-Forage.—A. W. Cumins, Woodstock, Ills., on July 22, 1889, says:

Bees are doing well. There seems to be more forage than they can handle—white clover, sweet clover, and basswood; but I notice very few on either of the last two plants. I had 7 colonies in the spring, and I now have 19.

Good Yield of Honey.—C. W. McKown, Gilson, Ills., on July 22, says:

My bees have done unusually well this season, and still the good work goes on. I had 98 colonies in the spring; now I have 140. Over half the old colonies have not swarmed at all. They seemed to be too busy to think about swarming. The white clover crop was very abundant, and the honey is of excellent quality. We have taken over 7,000 pounds from the hives—one-third of it comb, and two-thirds extracted; and there is a large quantity almost ready to take off now—in fact considerable of it ought to come off to-day—but, oh! we are so busy. My hired man took from the hives 700 pounds of extracted honey, and returned the empty combs, all by himself, one day last week. The sections have been filled more uniformly with straight combs this year than ever before for me.

The Basswood Honey-Flow.—S. D. Haskin, Waterville, Minn., on July 23, 1889, writes:

Bees began to work on basswood on July 4 a little, and on July 6 they were in full blast; it closed on July 20, with no interruption except a couple of light showers. I never saw any vegetation so weighted down with bloom as it was this year; but the nectar-flow was not over-abundant—only just tolerable, and during none of the time did the bees work strong on it all day. At the first it was in the morning or forenoon, and the last was in the afternoon. It was very warm weather. The honey is of the very finest quality, thick and heavy, ready to seal as soon as gathered.

Strong Colonies.—S. N. Black, Clayton, Ills., on July 20, 1889, says:

On June 1 bees were in a starving condition, but I never had so strong colonies in my life as I have to-day. I have hived but 3 or 4 second swarms, having put back the rest. A great many bees have swarmed 3 or 4 times. The increase is greater than I ever knew. I have 400 to 500 pounds of comb honey.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

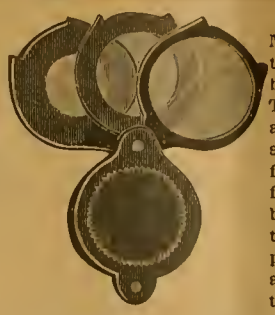
Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arousea in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Queens.—We can supply Tested Italian Queens at $1.50 each; Untested, $1.00 each, by mail, postpaid.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40
Bee-Keepers' Review	1 50	1 40
The Apiculturist	1 75	1 65
Bee-Keepers' Advance	1 50	1 40
Canadian Bee Journal	2 00	1 80
Canadian Honey Producer	1 40	1 30
The 8 above-named papers	5 65	5 00
and Langstroth Revised (Dadant)	3 00	2 75
Cook's Manual (**old edition**)	2 25	2 00
Doolittle on Queen-Rearing	2 00	1 75
Bees and Honey (Newman)	2 00	1 75
Binder for Am. Bee Journal	1 60	1 50

Weekly Inter-Ocean	2 00	1 75
How to Propagate Fruit	1 50	1 25
History of National Society	1 50	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

Cheap Extracted Honey.—We have a keg of DARK HONEY, weighing 164 pounds, net, suitable for feeding to bees, which we will sell at **6 cents** per pound, delivered on the cars here.

Honey and Beeswax Market.

NEW YORK.

HONEY.—New extracted sells as fast as it arrives. Orange blossom, 7½@7½c.; inferior Southern, 70@75 cts. per gallon. Some demand for the comb, but we have no stock yet.
July 22. F. G. STROHMEYER & CO., 122 Water St.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.
BEESWAX.—23@28c.
July 16. A. V. BISHOP, 142 W. Water St.

KANSAS CITY.

HONEY.—Old crop all gone. New 1-lbs., 16@18c.; 2-lbs., 14c. No California comb in the market. Extracted, white, 8c.; amber, 7@8c
July 17. HAMBLIN & BEARSS, 514 Walnut St.

CHICAGO.

HONEY.—New crop is appearing, and prices range from 15@17c. An active market is not looked for till later. Extracted, new crop, 7@8c. Very light receipts, and few sales.
BEESWAX.—25c. R. A. BURNETT.
July 11. 161 South Water St.

CHICAGO.

HONEY.—O'd crop of 1 and 2 pound white clover honey exhausted, but considerable 1-lb. buckwheat is being offered. Our first receipts of new 1-pound white clover were in this week, and is selling at 14@15c.; dark 1-lbs., old, 10@11c. Extracted, dull, 6@8c.
BEESWAX.—25c.
July 11. S. T. FISH & CO., 189 S. Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb. No desirable old stock left.
BEESWAX.—24@25c.
July 24. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—New white comb in 1-lb. sections sells at 16@17c. White extracted, 7@7½c.; dark, in barrels, 6c. An active demand is not expected before Sept. 1. No new extracted in the market.
BEESWAX.—None in the market.
July 20. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, bright, 6½c; dark, 5½c. The market is slow.
BEESWAX.—Scarce at 23c. for prime.
July 20. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Market for extracted is quite active. Orange blossom, fine quality, sells readily at from 7@7½c. Off grades of Southern find quick sales at 60@70c. per gallon. No new California honey on this market. Extracted would bring from 7½@8c.—Too early to quote prices on new comb.
BEESWAX.—Dull and declining—25@25½c., good yellow.
HILDRETH BROS. & SEGELKEN,
July 22. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—Not a case of comb honey in our store—something unknown for a long time. Expecting the new crop this week. Price will be about 18c. We have some very fine new extracted white clover, which sells at 8@9c.
BEESWAX.—24@25c.
July 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and 12@15c. for fair to choice comb. Demand slow, and arrivals are fair of the new crop.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
July 22 C. F. MUTH & SON, Freeman & Central Av.

Vol. XXV. Aug. 10, 1889. No. 32.

EDITORIAL BUZZINGS.

All the Long August afternoon,
The little drowsy stream
Whispers a melancholy tune,
As if it dreamed of June,
And whispered in its dream.

The thistles show beyond the brook
Dust on their down and bloom,
And out of many a weed-grown nook
The aster flowers look
With eyes of tender gloom.

—*American Agriculturist.*

Ole J. Johnson writes us to send him a pamphlet, but while he puts "Box 100" in one corner, fails to state what post-office, county or State he receives his mail. We must therefore wait for further information.

Mr. Cowan, editor of the *British Bee Journal*, has just removed Mrs. Cowan from Switzerland to England, her health having much improved. It will be remembered that he lately brought her on a visit to America on account of her ill-health, and her many friends here will be pleased to hear of her convalescence. Mr. and Mrs. Cowan spend the month of August in Scotland, and September in Iceland, and will then return to England for the winter. Mr. Cowan writes that the weather in Europe has been generally excellent for honey.

A Little Three-Year-Old had the following experience with a bumble-bee recently, as described by Mr. D. R. Rosebrough, of Casey, Ills.:

The other morning Mr. James Emley's little three-year-old daughter was playing in the dooryard, where a big bumble-bee was working on some morning-glory bloom. The little Miss thought that she would take the bee in for a pet; but she soon dropped it, and went into the house crying, and said: "Mamma, I caught a big, yellow bug, and the dirty thing stuck a needle in my thumb."

Another Scientific Blunder.—The *Medical Standard* for June, 1889, published by G. P. Engelhard & Co., 69 Dearborn St., Chicago, contains as a leader, an article on "Embryology," by Edward C. Spitzka, M. D., of New York. The learned Doctor talks very knowingly of parthenogenesis, or "virgin generation," (*i. e.*, the development of living beings without a father), and then adds:

Bees, some butterflies, ants and wasps, notoriously multiply their kind without sexual congress. As a rule, the parthenogenetic offspring are themselves incapable of further procreating their kind.

But to this there are remarkable exceptions. The aphides multiply for many generations without the intervention of a male. Weigenbergh has shown that the silk-moth can be propagated as long as the male element is permitted to act at every fourth generation. The Artemia salma, a minute crustacean living in saline springs, reproduces its kind for years without a male being present; males being produced at definite intervals only (v. Siebold). Among the vertebrata parthenogenetic development has also been observed, though rarely reaching maturity. Thus segmentation occurs in unfertilized ova of the chicken (Oellacher), of the fish (Burnett and Agassiz), and of frogs (Moquia-Tanden). The author saw a blastoderm form in unfertilized ova of the toad-fish (Batachus tau).

The Doctor then proceeds to prove "that even the human ovum is capable of parthenogenetic development," and declares that "embryology, while declaring immaculate generation improbable, does not pronounce it impossible." However reasonable this may be, the learned physician is unfortunate in the following which he adduces as proof of the proposition:

A worker-bee is a highly-organized creature, with a well-developed brain, wonderful sense organs, intricate muscular apparatus, and yet it is an offspring of unimpregnated queen-bee. What is a regular occurrence in one class of animals is sometimes observed as an exceptional one in another class.

The astute Doctor **ought to have known** that a worker-bee is NOT "an offspring of an unimpregnated queen-bee!" Having made the subject of parthenogenesis a study, it is inexcusable for him to make such a *blunder*. An unimpregnated queen is only capable of laying drone (male) eggs —*she is utterly powerless to reproduce herself*, or to produce the worker-bees, which are undeveloped females! The worker-bees are able, under certain circumstances, to lay eggs, but as they are also incapable of impregnation, such eggs produce only males of doubtful use in the economy of nature.

Ignorance about Comb Honey.—It is amazing to notice the amount of wilful ignorance about comb honey that prevails among those who should know the truth concerning its production. We were forcibly impressed with this fact recently, while visiting a retail grocery in this city. Upon the counter we discovered a beautiful sample section of new honey, whose pearly-white and very even comb was encased with glass, showing all the contents of the section to the very best advantage possible.

Wishing to learn at what price the grocer retailed one-pound sections of honey, we enquired, and was told that it was "20 cents per box." We then remarked that it was a fine specimen of what the bees could do in their line of business, when the grocer, with a knowing (?) smile, said, "Oh, yes, it's nice honey, but then the *comb is manufactured*; at least that is what they tell me." And just because "*they* tell me," the stupid fellow believed it, and no doubt had so informed customers concerning something of which he did not have sense enough to know that what "*they tell*" is not always the truth.

We at once informed the grocer that there was no such thing as "manufactured comb," and that it was utterly impossible and impracticable to make honey-combs and fill them with honey; also, that there is now, and has been for years, a standing reward of $1,000 offered by Mr. A. I. Root, for a single pound of manufactured comb honey. We also have given him a copy of the BEE JOURNAL containing the denunciation of the malicious falsehoods about honey, published awhile ago by the Philadelphia *Record* and the Chicago *Tribune* and *News*; and which, we regret to be compelled to record, neither of those metropolitan newspapers have retracted, so far as we are aware. It is almost discouraging to fight such brazen misrepresentations, when such leaders of public opinion as the daily newspapers refuse to correct their slanderous statements, when they have been shown that their utterances were entirely wrong and wholly unwarrantable.

No Duty on Imported Queen-Bees.—An exchange has the following item relative to a package from Carniola, Austria, containing queen-bees. The Custom House officials ought to know that there is no duty on such. It says:

Collector Anderson, of Portland, Maine, received a notice from the post master at Mechanic Falls, saying that a sealed package had arrived there from Upper Carniola, Austria. It was marked "Supposed liable to custom duties." From the buzzing sound inside the package the post-master judged that it contained a queen-bee. According to the regulations, he notified the nearest collector of customs. Collector Anderson has instructed him to open the package, and if it contains nothing but a queen-bee, to deliver it as addressed. Queen-bees are not subject to duty.

Bro. Mason should teach the post-master at Mechanic Falls, Maine, not to be too officious. He ought to know that queen-bees are admitted into America free of duty. If it is *news* to him, then he will learn something.

Bees are not transmitted through the mails to all foreign countries from America as yet, but a proposition is pending which, if adopted, will admit them to the mails exchanged between all the countries of the Universal Postal Union. We will give timely notice to our readers whenever that matter is accomplished.

Miss Abbie Spencer, an enthusiastic bee-keeper, daughter of D. C. Spencer, M. D., of Augusta, Wis., and a subscriber of the AMERICAN BEE JOURNAL, died of consumption on July 18, 1889, aged 19 years. From her windows she eagerly watched the work in the apiary, and her ear could quickly discern the first notes of swarming. She calmly gave directions for the distribution of her little earthly effects, and died the death of the righteous. Her next younger sister, Hattie M. Spencer, now takes her place in the apiary, at least in part.

Dr. Spencer writes as follows concerning the honey crop: "Bees have done well in this part of Wisconsin. We have not had so good a white clover harvest for years as this season has given us, and the prospect is good for a good autumnal gathering."

Uniting Colonies.—N. A. Dahn, of Jefferson Co., Mo., asks the following question:

I would like to know when to unite bees—in the spring or fall. I have 20 colonies of bees, and I would like to double them up.

They should be united either in the spring or fall, as the "conditions" make it desirable. If they are weak in early spring, they may be united, so as to encourage them to breed up and be ready for the honey harvest. If they are weak at the end of the harvest in the fall, they may be united for winter to conserve heat and stores. It depends on the "conditions" more than on the "time." Consult a good Manual, which is a very convenient companion in every apiary. By the aid of its liberal index, you can determine when, what, and how to do things with ease as well as pleasure.

Convention in Chicago.—By notice on page 501, it will be seen that we are to have a convention of bee-keepers in Chicago this fall. The time is Oct. 16, 17 and 18. The place is at the Commercial Hotel, when we had such a nice time at the "National," in 1887. Reduced rates are given at the Hotel, and reduced rates may also be had on all the railroads, because it comes near the close of the Chicago Exposition. Every arrangement will be made for the convenience, comfort and pleasure of those who attend. Let there be a generally rally, and "a good time" will be the result.

Ells & Co., Chicago, are advertising recipes for making artificial honey, among other useless recipes for artificial humbugs. Look out for them. They are flooding the mails with their circulars—looking for "dupes." Do not be "fooled" with their artificial traps.

Heavenly Echoes is the title of the piece of music given this week, and it is a delightful song. We hope all our many readers will learn to sing it, for the words and music are alike enchanting. *We promised another treat in that line, and here it is.*

Why Vote for Golden-Rod.—The writer of "Rural Notes" for the Hartford *Times* (Conn.), asks why bee-keepers should vote for golden-rod for the National Flower. Golden-rod should be voted for by bee-keepers in preference to any other flower, because of its usefulness to the bees in yielding honey. During the fall months thousands of colonies derive the principal part of their winter stores from it. Prof. A. J. Cook pronounces the flavor of the golden-rod honey "unsurpassed by any other." Making it the National Flower would give it better protection, scatter it more thoroughly over the country, increasing its usefulness to bee-keepers. At a recent meeting of school-teachers in this State, golden-rod received 16 votes and the the laurel 19, which shows that golden-rod has other admirers than the honey-bee.—*The Bee Hive.*

Comb Honey Fumigation.—M. Miller, of Le Claire, Iowa, asks these questions, and desires answers in the AMERICAN BEE JOURNAL:

How often should comb honey be fumigated; that is, how many days should elapse between each fumigation?

Should it be fumigated as soon as taken from the hives?

Should all of the cells around the edges of the section be sealed before the heney is removed from the hives; that is, should the last row of cells next to the wood of the sections, especially at the top, be all sealed over?

Deeming the subject a timely one, we have procured an article from Mr. Doolittle on the subject, and it may be found in this issue. It answers the above questions, and also those sent in by others. See page 504.

We have received a copy of the "New Bee-Keepers' Text-Book"—27th edition. It is revised, enlarged and illustrated by John Aspinwall, New York. It was sent to us by the present proprietors, J. B. Mason & Sons, Mechanic Falls, Maine. It contains 228 pages, and is nicely bound in cloth. Price, 75 cents in cloth, or 50 cents in paper covers. It is simple in language, can be easily understood, and is therefore just the thing for beginners. For sale at this office.

Extracted Honey.—Mr. F. Wilcox, Mauston, Wis., July 30, 1889, asks:

In selling extracted honey in wooden pails or other similar packages, is it customary to *tare* the pails, or are they weighed and sold by the pound with the honey they contain?

In selling extracted honey it is customary to *tare* the honey-receptacle, no matter what the kind or the material of which it is made.

The Address of Geo. Neighbour & Sons will hereafter only be 127 High Holborn, London, W. C., England. They have discontinued their business on Regent Street. It is an old and reliable firm, and it is always a pleasure to do business with them.

A New and Effectual Cure for so-called foul brood is announced in the *British Bee Journal* for July 18, 1889, in the following paragraphs. If it is as potent when administered to larger quantities of diseased colonies, as it was in the individual case described, it will be a valuable remedy, because of its simplicity, and the very little work necessary to apply the remedy. We expect fuller particulars soon, and will then lay them before our readers. Our British cotemporary says:

I have just cured a colony of foul brood in three weeks without feeding or destroying an atom of comb or any larvæ. When I started it was full of dead larvæ, and cells full of putridity. Now it is one mass of healthy larvæ, without the slightest sign of disease. If it answers on all colonies as it has done in this, foul brood will be soon banished from everywhere. It is something quite fresh, not entirely my own doings, although the experiment was entirely conducted by myself. It is really marvellous. I am quite excited over it. You have no conception of the change in the colony from its (the cure) first application, without even opening the hive after the first time.

[We have received the above communication in a private letter; but the announcement it contains is so pregnant with bright hope that we have ventured to give it publicity, in order that our correspondent, who is one of our most advanced bee keepers, should have whatever credit or advantage may accrue from priority of publication.—ED.]

A Privilege.—C. F. Thomas, of Dorchester, Nebr., on July 17, 1889, writes as follows:

I have been thinking for a long time past that it was my duty as well as privilege to help pay the expenses of the fight on bee-keepers' rights, and to become a member of the Union, but with me; it is as with lots of others, I presume—it has been neglected from time to time. The Manager has done good work, and is entitled to the support of every bee-keeper in the country.

Yes; Bro. Thomas is right. It is not only a *duty*, but a privilege for bee-keepers to join the Union, which has accomplished so much good in defending our pursuit.

Fun.—The *American Agriculturist* for August has an engraving showing some hives of bees on a bench, and a boy from the city leans over the bench between the hives, and says, "I smell honey." A farmer who is raking hay near by remarks: "You will smell something warmer than honey, if you don't get out of there pretty quick."

The British Bee Journal has been reduced in price to one-penny, or about one-dollar a year. It is published weekly, and is well edited and printed. The extra postage to America is 50 cents. It will be clubbed with the AMERICAN BEE JOURNAL in the United States and Canada for $2.40.

The Third annual Territorial Fair of North Dakota will be held at Grand Forks, Sept. 17 to 21, 1889.

Blessed are the Poor.

Written for the Illustrated Home Journal
BY EUGENE SECOR.

Ye toilers for bread in the world's busy field,
All the avenues of Industry thronging;
Complaining, perhaps, that your toil does not yield
The riches for which you are longing.
O little ye dream of the blessedness given
To the *poor* of this world, by our Father in heaven.

The *rich* are not of necessity blest,
Nor free from dull care, nor from sorrow;
Ambition for wealth oft begets an unrest
That blights the sweet hopes of the morrow.
No poverty eats so into the soul
As selfish greed, when it once gets control.

I have seen a rich worm, by some called a man,
And whose acres by hundreds were numbered;
Who had but to speak and his hired lackeys ran,
And whose happiness *seemed* unincumbered;
But poor as a pauper in generous deeds,
With a soul too narrow to feel men's needs.

Another I knew whom the world called poor,
Who scarce had the means for his burying;
But no worthy man was ere turned from his door
Whose case could be bettered by tarrying.
His heart beat responsive to every kind thought,
And the world was made better by the good that he wrought.

Then blessed are the poor in this world's sordid gains,
If but wealthy in mind and heart treasures;
And happy are they who feel not the dull pains
Of the seekers for gold and its pleasures.
The honors of lucre are empty and vain.
Good works are sure riches—contentment is gain.

Forest City, Iowa.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on Wednesday, Thursday and Friday, Oct. 16, 17 and 18, 1889. Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be very low. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."
W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.
H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills.
D. A. FULLER, *Sec.*

QUERIES and REPLIES.

Allowing for Drone-Comb in Making Comb Foundation.

Written for the American Bee Journal

Query 647.—1. When a sheet of foundation 8x17 inches will stretch ¾ of an inch with a new swarm, where will the drone-comb come in? 2. Ought not the ¾-inch be allowed in rolling foundation?—Ills.

1. Principally along the edges. 2. Yes.—M. MAHIN.

I do not think that I understand this question.—A. J. COOK.

I have had little experience with foundation.—MRS. L. HARRISON.

1. At the top, if not wired. 2. I think not.—G. L. TINKER.

At the bottom, sides and top—there is always room for drone-comb.—WILL M. BARNUM.

Wire your frames, and you will have very little trouble.—C. C. MILLER.

The drone-cells will be constructed around the margin, and the bees will take advantage of the *stretched* cells in the foundation.—J. P. H. BROWN.

I never had foundation to stretch half that much. It should not. I infer that you mean to put the sheet which you describe, in a horizontal position.—JAMES HEDDON.

1. Allowing your supposition to be true, I should think that there is just where drone-comb could "come in." 2. I do not understand what you mean.—EUGENE SECOR.

Bees will always find places for drones, by cutting down worker-cells if no other room is available. Foundation 8x17 inches allows the ¾ inch in the Langstroth frame. It is not advisable to give unwired foundation to new swarms.—P. L. VIALLON.

1. Wire your frames, and there will be no stretch, but drones will be reared in sufficient quantities, nevertheless. 2. If you wire your frames properly, no.—J. M. HAMBAUGH.

1. On the outside ends, just where it does not stretch much. The cells will stretch out of shape about one inch from the top-bar, but you will seldom find drones in such cells. 2. I do not think that I understand your second question.—H. D. CUTTING.

1. The drone-comb will be near the top, if there is any. Hang your foundation so that two sides of the cell are perpendicular, and it will sag less than otherwise. 2. We do not understand this.—DADANT & SON.

1. It would not "come in"—there would generally be a few rows of cells just under the top-bar, misshapen by stretching, and would then be neither drone nor worker comb. 2. For various reasons, that would be impracticable.—R. L. TAYLOR.

1. If a horse will travel eight miles in an hour, what will a ton of hay cost? Foundation 8 inches wide, that stretches ¾ of an inch, is "no good." 2. No. Use good foundation, and if wired, all the better.—A. B. MASON.

If a sheet of this size stretch ¾ of an inch, the bees can use the cells very well to rear drones. I have seen just such combs full of drone-brood. Foundation should be wired, or heavy enough to prevent much stretching.—C. H. DIBBERN.

Such stretching results in such shaped cells in the upper half of the frame that they are of no earthly use to the bees except to store honey in. This was one of the reasons that led me to decide against the use of foundation in the brood-nest, but not the main reason, however.—G. M. DOOLITTLE.

Good foundation, properly used, will not do that way. Foundation cannot be rolled as suggested, but might be so made in a press, but *then* if it did not stretch as anticipated, the difficulty would be as bad as the one sought to be avoided. It is not safe to figure on the stretch of anything.—J. M. SHUCK.

1. I do not find that foundation of proper thickness, say 5 or 6 sheets to the pound, will stretch so as to do any harm. Wiring the frames will prevent it. It strikes me that an attempt to obviate the difficulty in rolling the sheets, would not be likely to prove a success, as the stretching in any case would be uneven, and so could not be rectified in that way.—J. E. POND.

1. If properly managed, a sheet of foundation should not stretch over ¼ of an inch, and this should not affect the size of the cells. If you do not know how to get good, straight, all-worker combs from sheets of foundation, without wiring the frames, you had better use wire; or, what I think is a better way, have your combs drawn out in the upper stories of the hives, where they are not so heavily weighted by the bees. If I want to hive a swarm on full sheets of foundation, I cut the sheets in two in the center, and lap the edges ¼ of an inch, and weld them together; this center rib will hold the sheets in position with the weight of the bees.—G. W. DEMAREE.

1. Even passably good comb foundation does not stretch like that. Drone-comb will be built around the edges. 2. To calculate on the stretching, and to make accordingly would be very unreliable and unsatisfactory.—THE EDITOR.

COMB HONEY.

Caring for Comb Honey After it Leaves the Hive.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

Two questions have been sent to me regarding the care of comb honey, the first wanting to know if honey can be taken from the hive before all the cells next to the wood are sealed up; and the second, desiring to know about the moth-worms on comb honey in sections, and how they can be got rid of. As these questions can best be answered by an article, I will give in brief how I manage comb honey after taking it from the hives.

The first requisite for caring for honey after taking it from the hives, is a good, warm room in which to store it. I use a room 7x10 feet, in the southwest corner of my shop, having the outside painted a dark color, so that the rays of the afternoon sun will make it as warm as possible.

Some use an upstairs room, which will generally be warm enough without any pains being taken with it, especially if this room is under the south roof of the building, with no partition between the roof and the room. The only objection that I have to such an upper room, is the amount of heavy work it makes in lugging the honey up and down the stairs.

As a body of honey, once thoroughly warmed, will hold the heat for a long time, the average temperature of such a room will be pretty high, ranging from 80° to 100° most of the time, thus ripening the honey splendidly. The object of this is to have the honey growing better, instead of poorer, from the moment that it leaves the hives, and have the honey in those unsealed cells around the outside of the section next to the wood (which is spoken of above) grow so thick that it will equal any in the section. These unsealed cells next to the wood of the sections are rarely all ever sealed up, and to wait for them to be so, is only a waste of time; so I take off my honey as soon as the honey in the body of the section is fully capped over.

When the honey is taken from the hives, that in the unsealed cells is so thin that if the section is held so that the mouth of the cells are down, it will leak or run out badly; but by leaving it in a warm room for a month, it can be handled as we please, tipping it over, etc., and not a drop of honey will run out; and if after it gets to market, it is stored in a damp, cool place, it will be some time before it will take on moisture enough to affect it to any great extent.

Perhaps all will not agree with me, but I think that all comb honey should be stored in such a room at least a month before crating, to ripen and sweat out. I know that it is a saving of time and labor to crate it at once; but I think that it pays for all of this extra time and labor, in the better quality and appearance of our product.

Having the honey placed in a warm room, the next thing that will need our attention will likely be the larvæ of the wax-moth, which brings us to the second question.

Comb Honey and Moth-Larvæ.

After the honey has been away from the bees for about ten days, where placed in a warm room, if we inspect the cappings of the honey closely, we will detect little places of white dust, resembling flour, upon the surface of the comb, and usually most abundant near the bottom of the section. Although the moth is not as troublesome as it used to be, still it is always well to keep a good lookout for it; and although this place resembling flour may not be larger around than a fine needle, still it tells us for certain that a tiny worm of the wax-moth is there, and that unless it is killed, it will destroy more or less of the nice, white comb which encases the honey.

While in one of our cities a number of years ago, I saw sections of honey which had worms in them as large around as a slate-pencil, and an inch or more long, which had nearly denuded the honey of the nice white cappings to the cells, making the honey an object of disgust, rather than of attraction, the same caused by the producer not knowing how to detect the first appearance of the worms, or being too shiftless to kill them after he had found them; or, perhaps, being in too big a hurry to rush his honey to market, instead of ripening it as I have advised.

If, after several examinations, you fail to find such little, white, flour-like places, you may well be glad, for it is no small task to keep the worms from honey during the latter part of the summer and fall, where they are as plenty as they were here 15 or 20 years ago.

If you should find these flour-like places, the next thing is to sulphur the honey. To best do this, the honey should be stored on a platform, which I build as follows:

Take pieces of 2x12 inch plank, and cut them 3 feet and 9 inches long, and spike two pieces together, thus making a stick 4x12 inches, and 3 feet and 9 inches long. Use three of these on a side, the platform running the 7-foot way of the room. These are set the 12-inch-way up, and on them are laid four 3x4 inch pieces 7 feet long. Across these last pieces are laid sticks 3 feet and 9 inches long, by 1½ inches square, they being placed so that the sections will stand on them the same as they did on the hive, and have the ends of the sections meet in the centre of these 1½x2½ sticks. Piled in this way the fumes of burning sulphur can penetrate the whole pile, by placing sulphur under it.

Having all in readiness, put some ashes in an old kettle, so that there will be no danger from fire resulting from the heat from the coals, which are to be placed therein.

Take the kettle of coals to the honey-room, and pour sulphur (which has been previously weighed) on the coals, to the amount of one-fourth of a pound to every 75 cubic feet contained in the room; when the kettle is quickly pushed under the pile of honey, and the room closed. Leave it thus closed for 15 minutes, when it should be opened to let the smoke out, for if it settles on the combs, it will give them a greenish tint.

Just how the eggs of the moth get into the surplus apartment of the hive, is not known, but it is supposed that they are carried there on the feet of the bees. Combs having pollen in them are more subject to the moth than are those having no pollen in them; therefore, those having pollen should be kept separate from the main crop of honey. If more honey is put into the room later, sulphur it again ten days after putting in.

Borodino, N. Y.

HONEY SHOWS.

How to Make a Good Display—One that Will Attract.

Written for Gleanings in Bee-Culture

BY R. M'KNIGHT.

There has been a good deal in the bee-papers of late, respecting the best method of arranging for and setting up honey shows. If these be made large and attractive, they serve a good purpose in promoting the interests of bee-keepers by attracting attention and promoting sales.

To do the work well, is no easy matter. This arises mainly from the absence of variety in the article shown. Extracted honey is extracted honey in whatever form it may be shown. Monotony can be broken only by variety in the design of the packages in which it is put up, which is in itself limited.

The same may be said, but in a still more marked degree, of comb honey.

I suppose the main object the writers have in view in these articles is to aid bee-keepers in making good displays at local fairs. It is noticeable, that those who have treated the subject describe the methods followed by themselves or those they have seen adopted by others, which have met their approval.

At honey-shows the competitive prizes are usually confined to the *quality* of the article shown, and it is upon this that judges usually base their awards. This is right as far as it goes, but the prime object of honey-shows is to attract attention and advertise the goods.

As 90 per cent. of the visitors at fairs cannot tell, by cursory inspection, between what is good and what is poor in quality, it follows that attention should be given to appearance. To this end, a departure from the usual rule cannot be made too soon. Prizes should not be confinded to quality. Good taste and neat arrangement should come in, be recognized, and rewarded. This may be done without injustice to any one. A man with 200 pounds of honey may make as neat, tasty, and symmetrical a display on 3 feet space as one with 4,000 pounds can make on 20 feet of space.

Any hard and fast rules laid down for the form of staging, upon which exhibits are to be set up, are entirely useless. It is manifest, that, to do justice to all, no competitor should have advantages over his fellows in a more advantageous arrangement of the frame-work upon which the show is to be made. It follows, then, that whatever the design, the staging should be uniform throughout. The taste and ingenuity of the respective exhibitors will then be brought into play in the superstructure he raises to show his wares.

Most of the designs I have seen for staging are after the step-ladder style. To my thinking, this is the worst form in which staging can be built for honey-shows. It gives little or no opportunity for the exercise of judgment, or the display of ingenuity in the make-up of an exhibit. If "variety is the spice of life," it should have a place in all honey-shows. Little of it can be thrown in if this style of frame-work is employed.

What, then, is the best form for the permanent fixtures in a building where honey is to be displayed? Where a number of people are to compete, the simplest is the best—at least this is my opinion, and the simplest is common tables. These should not be less than six feet wide. Space upon these should be allotted, in proportion to the quantity each has to show. Then each will be called upon to build up his own superstructure and decorate it. It is easy to understand, that by this arrangement variety will be secured; for every man will have his own notion of what is most suitable.

These superstructures will take different forms in proportion to the amount of honey and the character of the packages to be placed upon them. I hold that no man can have a correct notion of what is the best form in which his exhibit should be arranged, without a full knowledge of what is available to make it with. How can a man suggest a design for his neighbor's show, without a knowledge of what his neighbor had to show?

Owen Sound, Ont.

VIRGIN QUEENS.

Safe Methods of Introducing Virgin Queens.

Written for the American Bee Journal

BY G. W. DEMAREE.

No important manipulation of bees seems to be so poorly understood as that of utilizing *virgin queens* in the stocking of the apiary, or in furthering the interest of the queen-traffic. Most apiarists imagine that because a virgin queen cannot with any certainty—except the certainty of failure—be dumped into a hive among queenless bees, the whole thing is impracticable.

Then, again, they are puzzled because a virgin queen that has just cut her way out of the cell, may stagger in among any queenless bees unnoticed and unmolested, while if she is detained until she is several days old, she will be treated as a disturber of the peace, and usually "balled" and killed. Let us look at this matter a little as it applies to the economy of the propagation of the race.

When a colony prepares to cast a swarm, the bees do not "hew to the line," and rear just the number of queens that will be needed to carry out the enterprise, but nature displays a profuseness sometimes in connection with swarming, that astonishes the old veteran himself. A "surplus" of virgin queens becomes a disturbing element in the settlement of life in the economy of the honey-bee. Every close observer has seen swarms of bees with a half dozen or more virgin queens with them, and have seen the swarms divide into two or more clusters when they "settle."

Sometimes such swarms are unmanageable until the disturbing element is removed by the apiarist. Such swarms will often sulk when hived with all the young queens, and finally "run off" because of their unsettled state, and discontent. I lost a large swarm (the colony having superseded the old queen) the present season from this cause.

The *why*, then, that queens, after they become old enough to be a disturbing element are instinctively rejected by queenless bees, is apparent enough, and this instinctive suspicion and hatred of virgin queens by the workers, when they approach the mating period, stands in the way of easy or careless manipulation. The apiarist must understand the instincts and habits of bees in this connection, to enable him to overcome the difficulties in the way.

When a laying queen is taken away from a colony or nucleus, a period of time must follow when the worker-bees despair of finding the lost queen, and before queen-cells are started. At this stage of things, a queen—either a virgin or laying queen—will usually be accepted with tokens of gladness. This crisis takes place in about six hours after the queen has been removed, but as the time varies considerably, I take the precaution to cage the queen on top of the frames where I can see the actions of the bees towards her, by simply turning up the quilts.

If I find the bees (when the quilt is first turned up) clustering on the cage, and biting at the wire meshes, the queen is left in the cage for a reconsideration. At such time as the cage is found nearly deserted by the bees, and only a few bees are found crawling over the cage with the careful circling motion, like bees guarding a queen-cell, the queen will be safe, whether a virgin or a laying queen, and the bees may be permitted to liberate her by eating out the soft candy.

These proceedings are governed by the intelligence of the apiarist, and luck or chance has little to do with it. I frequently introduce virgin queens old enough to mate, in this way. I had a virgin queen mated on the fourth day after removing a laying queen, the present season. Of course there are failures where there are opposing forces to overcome.

Safer Way of Introduction.

Prepare a hive by hanging in it a frame of hatching brood—no unsealed brood is admissible; put by its side an empty comb, and a division-board, and close the top of the brood-chamber with a close-fitting cloth, and close the entrance to the hive so as to exclude the light at that point. Now turn back the cloth and shake into the hive a quart or more of bees—from one or

more frames taken from any strong colony—and fit down the cloth so that the hive will be bee-tight. It is needless to say that care must be taken not to get the old queen along with the imprisoned bees.

Leave the bees in their prison for six hours, and then turn up one corner of the quilt just a little, and let the virgin queen run in among the imprisoned bees. If of any eligible age, she will be gladly received.

Leave the bees imprisoned for 36 or 48 hours, and open the entrance a little while after sunset. The queen will *mate* in a few days after the bees are liberated. This plan has never failed under my direct supervision.

A Safe Way of Introduction.

When we receive a virgin queen through the mail, or have a valuable queen of any kind to introduce, we do not want to take any risk, and I here give the plan.

I have devised what I call an "introducing nursery." It is a super of standard size, that has two partitions in it, and a wire-cloth bottom, so as to give three apartments, all bee-tight and separate from each other. Some strips of enameled-cloth tacked fast to the partitions at their top edges admits of opening or closing any one of the departments without interfering with the others. The wire-cloth bottom is tacked fast to the lower edges of the partitions, as well as all around the rim of the super so as to make the whole, as well as each separate department, bee-tight.

To use it, a slat honey-board made with narrow slats, is put over any strong colony. I put mine on top of the storing super, so as not to interfere with the usefulness of the colony that is to furnish the necessary heat, and then set the "introducing nursery" on the slat honey-board. The honey-board prevents the bees below from propolizing the wire-cloth bottom to the nursery.

When I want to introduce a virgin queen of several days old, a frame of rapidly-hatching brood, after clearing it of all hatching bees, is hung in the nursery, and the virgin queen is immediately turned in on the comb, and and all is closed up closely. In three, four or five days the comb will be covered with young bees, and the queen will be at home with them. The comb is now moved to a hive, together with the adhering bees and queen, and another comb and a division-board is added to make up the usual nucleus. The queen will mate in a few days. There is the least possible risk when following this plan.

Christiansburg, Ky.

MARKETING.

How to Dispose of the Surplus Honey Crop.

Written for the Michigan Farmer

BY GEO. E. HILTON.

The time of year is now at hand when we should begin to arrange for our exhibits at fairs, especially county fairs, and I hope that every county fair in the United States will have a honey exhibit. Space can be secured by applying to the managers now, and although there may be no premiums offered, if you make a good exhibit this fall you will have no trouble in getting premiums for another year. I urge this course, because there is no better way to advertise and sell your honey. You can undoubtedly get permission to sell on the last day, and perhaps all through the fair, providing you do not sell your exhibit until the last.

To sell successfully at fairs, you must have hundreds of small packages that you can sell for five cents each. The Canadians have a little tin receptacle that holds one ounce, that they give away, and it invariably sells from one to ten pounds of extracted honey.

Then, to introduce their comb honey, they have plates and a one-pound section on each, cut from corner to corner, leaving one-fourth of the comb sticking to each side of the section; these they sell for five cents each, thus realizing 20 cents a pound for their comb honey, and sending out one of the best advertising mediums in the world. Their cry is, "Honey on a stick, five cents a lick." I do not know that it has ever been tried in the United States, but I see no reason why it would not work; in fact I know that it will, and it makes a much more palatable sweet for the children, than poisonous candies sold at such places.

Perhaps there are localities where fairs will not be held; in that case, in the fall it is an excellent plan to take a horse and wagon, load up with honey, and go right through the country; get acquainted with your more distant neighbors, and you will be surprised at the amount of honey you will sell, and the amount of pleasure you will receive. I like to get all the pleasure I can out of my work—it shortens the days, and lessens the burden very materially.

Perhaps some will object to this latter plan, because it savors so much of peddling; but after trying it once, you will find it a real pleasure, and a rest from the usual routine of work, and you are doing good; at the same time you are disposing of your honey at remunerative prices.

The main honey-flow is now over, and you should begin to crowd the bees down by removing all the finished sections of comb from the two crates now on the hives, and putting all the unfinished ones into one crate, with a view of getting them finished up and avoid carrying over so many unfinished sections until another year. This has a tendency to make the bees store honey in the brood-nest for their consumption during the coming winter. This may seem a little early to commence to prepare for winter, but it is the only safe way.

There are those who recommend and practice taking all the honey gathered by the bees, then feed them sugar syrup for their winter stores; but I cannot recommend this plan. If I find any of my colonies short of stores, they are fed extracted honey until supplied. By taking this course, or giving them combs of sealed honey, you will hear less about adulterated honey.

I want to call attention to the Detroit International Fair and Exposition, to be held at Detroit from Sept. 17 to 27 inclusive. There will be a large apiarian and honey display there, and the premiums are liberal. I certainly hope that the bee-keepers of Michigan will show to their sister States, and to the world, that we are up with the times. I shall expect to do something, and be in attendance at least a portion of the time. You can get a premium list and full particulars by addressing C. W. Bobinson, General Manager, 7 Merrill Block, Detroit, Mich.

Fremont, Mich.

Discussion on Small vs. Large Brood-Chambers.

Written for the American Bee Journal

BY W. Z. HUTCHINSON.

The last article by Mr. Dadant, on page 488, calls for but little in reply, except a few words of explanation.

It is possible that I was not *strictly* fair in saying that I had used hives holding 33 American frames. It was done by using hives three stories high, allowing the queen to rove at will through all three of the stories; and she, in several instances, had brood in all of the stories. As we were discussing the size of brood-nests, and as this method allowed the queen to extend her operations as far as she pleased, I felt justified, in this connection, in saying that I had used hives containing 33 American frames.

Still, as I have said, perhaps it was not fair. In the light in which we were discussing the question, that of large *vs.* small brood-nests, I think

that it was admissible; but, if I am wrong, I am willing to be set right.

In regard to quilts: I have several times bought bees in the spring in such hives that quilts were a necessity. When the bees were brought home, and the wire-cloth covering taken off, the frames were covered with a quilt. The bees were soon transferred to more fashionable hives, and the quilts removed; and this is the extent of my using quilts. When I wrote that I had never used them, I meant that I had never deliberately introduced them into my apiary, and given them an extended trial; and when I wrote later, that I had not used them *to any great extent*, I was simply being very precise, because this point was under criticism.

I am not particular whether Mr. D. tells whether he can extract the honey from a large hive with as "little labor" as from a small one, or whether he can extract it "as soon as" he can from a small one; and the fact that an Illinois man can care for eight apiaries, while a Michigan man employs a man in each apiary, does not touch the point.

The last article by Mr. Dadant is too much given to hyper-criticism, to evasions, to quibbles, to hair-splitting, and, more than all, to accusations of untruthfulness; and when discussion has reached this plane, it is time that it was dropped. Besides, to continue it now would be to give my opponent an unfair advantage, as I have unbounded confidence in his integrity and veracity.

Flint, Mich.

[Both sides having now had three articles each, and the discussion having degenerated to personalities, this article will end it in our columns.—ED.]

SWARMING.

Eggs from Laying Workers are Useless.

Written for the American Bee Journal

BY BRUCE KNIGHT.

Having discovered a strange performance in one of my new Italian colonies, I will relate the case, which I desire answered in the BEE JOURNAL.

I first discovered that the hive was being filled with drone-comb, and then I thought that the queen was a drone-layer; but after securing a new queen from a nuclei, I tried to introduce her, but I could find no old queen. I looked several times, but she could not be found. There was any amount of eggs—sometimes four or five in a cell—but what puzzled me was the queen-cells that they had started. The queens were well along, some almost ready to seal over. I believe that there must have been laying workers. I did not think that queens could be reared from their eggs; and upon looking at them in a few days, I saw that they had torn down the cells.*

Experience in Hiving Swarms.

I wonder why it is, that when a bee-keeper has a swarm of bees in a hiving-box, and meets people, they will give the bee-keeper the whole road, without a word. This was my experience a few weeks ago. It was after I had chased the bees for half a mile or so, and had succeeded in stopping them in the middle of the town. I succeeded in getting them into a hiving-box, and then started toward home.

It surprised me to see how everybody rushed out of my way, just as if I had been a cyclone; until I met a young German, who was just starting out to work. He evidently did not see the bees, for his eyes were on the red handkerchief which, I afterwards found, contained his clothes. One bee, which was rather inclined to be cross, darted forward, and met the young fellow about ten feet away (I was very thankful that he was no closer); the poor fellow jumped up in the air, and said something which I could not understand, but it sounded very much like swearing. He then swung his hat and budget around his head, and started on a bee-line across the field; so did the bees.

He had not gone ten yards before the budget became untied, and there was a terrible spill of its contents, and also of the poor fellow's wrath. The last I saw of him he was gathering his clothes up in his waist-coat, wiping his face with his handkerchief, and muttering something in German about "dem pees." The foregoing incident occurred on May 25, and with my first swarm. I have taken 60 pounds of honey from that same colony this year, and have had all that I could do to prevent it from swarming. This is the "Italian" of it.

Utica, Mich.

[*The colony doubtless had laying workers, the eggs of which would not produce worker-bees nor queens.—ED.]

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 20.—Northern Illinois, at Guilford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Sept. 14.—Susquehanna Co., at New Milford, Pa.
H. M. Seeley, Sec., Harford, Pa.

Oct. 16—18.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4, 6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER-BOX

Moths in Comb Honey.—Mrs. P. W. Minthom, Elsinore, Calif., propounds the following questions:

What is the cause of moths in white, new comb honey? How can we prevent them? How can we get rid of them? The honey has been out of the hives but a few weeks. It was put into tight wooden boxes, and placed in the upper story of the house. The weather is very hot and dry. The moths seem to eat the caps, and most of the honey.

[For reply to the above, see Mr. Doolittle's article on another page.—ED.]

Good Season—Prolific Queens.—J. M. Pratt, Todd's Point, Ky., on July 22, 1889, writes:

We have had the best honey-flow in five years. It is the only good honey crop in this section since 1880 and 1884; and it may be four or five years before we have another such a one. I wintered my bees without any loss for two years. I extracted 50 pounds per colony last year; but this year I have taken 150 pounds per colony, spring count, and doubled my number of colonies. Our honey season ends about July 15 for surplus honey. I have secured from one hive 179 pounds of extracted honey, and cut out 4 pounds of comb honey. It had to build only four combs this year, neither did I let it swarm. I am selling my honey at 10 cents a pound, as heretofore I never have sold any for less. We should not increase our bees faster than we build up a trade for honey. Honey, like everything else, if forced upon a market, will bring the prices down. On

page 423, Mr. Robbins says that seven frames will usually, if not always, be all that a queen can fill in 21 days. If I had a queen that would not fill more than 7 frames with brood in 21 days, by the 15th of May I would rear another, or exchange her for a better one at once; for the bees are usually in the second story by that time. I use 9-frame 3-story hives, and I wish they held 10 frames; I would have no objection to 12, as they would be less liable to blow over in storms. While speaking of queens, I have one that I bought for $3.50 three years ago, and I was told that she was two years old, and was a "two-story" queen—she was in the second story when we found her, and it was half full of brood at the time. She has never done less, but a great deal more. This year I have taken 8 or 10 frames of brood from her to rear queens from, giving empty combs in exchange. Sometime in May I divided her colony, giving each brood and empty combs. On June 7 she swarmed out, and I hived her on empty combs in a three-story hive. She is now in the second story. I shall not supersede her while she does so much, regardless of age. I have no queens for sale.

Half a Crop—Marketing the New Honey. — J. Richards & Co., Brooklyn, Wis., on July 29, 1889, says:

The white honey crop is a little better than last year, but it is not more than half a crop. Now because sugar is high, and because we have been losing money in the business for the past two years, we ought to have a good price for our one-half crop this year. Let shippers limit commission men to last year's prices, and hold fast. Wisconsin has no more than we can use at home.

Cause of Swarming.—Mr. Aaron Benedict, Bennington, O., writes:

On reading Mr. Doolittle's article about swarming (page 470), I thought that I would help him a little. What seemed to him to be rather dark, is plain to me. As a rule, the queen or mother-bee is the instigator, or cause, of bees swarming. In natural swarming, the cells are filled with larvæ, eggs and honey, the queen has nowhere to deposit her eggs, and she passes rapidly through the hive; this excites the workers, and out they come, the queen following. This is pure natural swarming. I have no doubt but Mr. Doolittle, as well as other queen-breeders, have been bothered with their nuclei swarming out, when the queen has been left several days after she commenced to lay. By examining, you will find she has laid eggs in all the cells that the bees could cover, and sometimes two or more eggs in a cell. The queen is uneasy, this excites the bees, and out they come, the queen following. I have no doubt that the case where Mr. D. says the bees left where there was honey and brood, was because there were not bees enough to cover the eggs. Now all this swarming is natural, and caused by the queen having no where to deposit eggs. There is another kind of swarming that is not natural; early in the spring a swarm comes out for lack of food, and such are called "starved-out swarms."

BELLS OF THE AGES.

BY BRET HARTE.

Bells of the past whose unforgotten music
Still fills the wide expanse,
Tingeing the sober twilight of the present
With color of romance.

I hear you call and see the sun descending
On rocks, and waves, and sand,
As down the coast the mission voices blending,
Girdle the heathen land.

Within the circle of your incantation,
No blight nor mildew falls;
Nor fierce unrest, nor lust, nor lost ambition
Passes those airy walls.

Borne on the swell of long waves, receding,
I touch the farthest past—
I see the dying glow of Spanish glory,
The sunset dream and fast!

Oh, solemn bells! whose consecrated masses
Recall the faith of old—
Oh, tinkling bells! that lulled with twilight music
The spiritual fold.

Your voices break, they falter in the darkness—
Break, falter, and are still,
And veiled, and mystic, like the host descending,
The sun sinks from the hill.

Large Crop Anticipated.—John Moller, Sr., Fremont, Nebr., on July 25, 1889, says:

This is undoubtedly the best honey season that we have had in Nebraska for many years. The bees are so eager to store honey now, as is usually the case with them in the fall of the year. I anticipate a large crop of honey during the year 1889.

Satisfied with the Results.—R. L. Tucker, Lexington, Mo., on July 24, 1889, writes:

My crop, up to date, amounts to nearly 11,000 pounds, of which 7,000 pounds is extracted, and nearly 4,000 pounds of comb honey in one-pound sections. My crop is in very fine condition, and I am having some success in disposing of it at fair prices. I believe that this will be a profitable year for bee-keepers generally, and if the report is true, that the California crop is a partial failure, we need have no uneasiness in regard to good prices, as wherever I have tried to sell, I have found a bare market, and some demand. Prospects seem to be fine for a fall yield, and if we have even our usual one, it will make our average unusually large. My crop is from 120 colonies, but it is no fair test, as I had to let 100 colonies lay idle for 10 days in the best flow, on account of not being prepared with enough surplus sections, and being unable to obtain help when needed. But I am well satisfied with the results, and I will try and not be caught again prepared to save only a fair crop. My apiary now numbers 190 colonies.

Extra Good Honey-Flow. — John Nebel & Son, High Hill, Mo., on July 1889, write:

The honey-flow has been extra good so far this season, but at the present writing the flow has ceased. The continuous rain that we have had for the past two weeks has made the weather unfavorable for secreting nectar; though what little sweet clover there is in this vicinity, seems to be yielding considerable nectar now. We are looking forward for an immense yield from Spanish-needle this fall.

Bee-Keeping in Germany.— Rev. Stephen Roese, Maiden Rock, Wis., writes:

Your pamphlet, entitled "Honey as Food and Medicine," is most excellent, and will be of great help for bee-keepers to advertise and sell their honey. I am going to have a lot with my address printed on them. The German bee-papers that you sent me I read carefully, and I find a wonderful improvement in the art of bee-keeping in Germany since my absence from there. It seems that they are trying to keep pace with the forward march in bee-culture; discarding the old-fogy way of keeping bees in straw hives; and it seems that their regulations in regard to bee-periodicals is different from that here in America. The editor, or manager, receives a salary, and the paper goes to each member of the bee-societies, free of extra cost; but the payment of a yearly fee or dues seems to pay for it. Lords and noblemen are in the ranks of bee-keepers there, and the American bee-keepers are often mentioned at their annual meetings.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Queens.—We can supply Tested Italian Queens at $1.50 each; Untested, $1.00 each, by mail, postpaid.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	...
and Gleanings in Bee-Culture	2 00	1 75

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

Honey and Beeswax Market.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extra ted increasing: demand light, at 6@8c.

BEESWAX.—25c.

Aug. 1. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—New extracted sells as fast as it arrives. Orange blossom, 7½@7½c.; inferior Southern, 70@75 cts. per gallon. Some demand for the comb, but we have no stock yet.

July 22. F. G. STROHMEYER & CO., 122 Water St.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.

BEESWAX.—23@28c.

July 16. A. V. BISHOP, 142 W. Water St.

KANSAS CITY.

HONEY.—Old crop all gone. New 1-lbs., 16@18c.; 2-lbs., 14c. No California comb in the market. Extracted, white, 9c.; amber, 7@8c.

July 17. HAMBLIN & BEARSS, 514 Walnut St.

CHICAGO.

HONEY.—New crop is appearing, and prices range from 15@17c. An active market is not looked for till later. Extracted, new crop, 7@8c. Very light receipts, and few sales.

BEESWAX.—25c. R. A. BURNETT.

July 11. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb. No desirable old stock left.

BEESWAX.—24@25c.

July 24. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—New white comb in 1-lb. sections sells at 16@17c. White extracted, 7@7½c.; dark, in barrels, 6c. An active demand is not expected before Sept. 1. No new extracted in the market.

BEESWAX.—None in the market.

July 20. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, bright, 6½c; dark, 5½c. The market is slow.

BEESWAX.—Scarce at 23c. for prime.

July 20. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—Market for extracted is quite active. Orange blossom, fine quality, sells readily at from 7@7½c. Off grades of Southern find quick sales at 60@70c. per gallon. No new California honey on this market. Extracted would bring from 7½@8c.—Too early to quote prices on new comb.

BEESWAX.—Dull and declining—25@25½c., good yellow.

HILDRETH BROS. & SEGELKEN,

July 22. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—Not a case of comb honey in our store—something unknown for a long time. Expecting the new crop this week. Price will be about 18c. We have some very fine new extracted white clover, which sells at 8@9c.

BEESWAX.—24@25c.

July 22. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and 12@15c. for fair to choice comb. Demand slow, and arrivals are fair of the new crop.

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.

July 22 C. F. MUTH & SON, Freeman & Central Av.

The Michigan State Fair.—The Michigan State Agricultural Society has made some important changes in the Bee and Honey department for 1889. Instead of exhibiting full colonies of bees, the premium list calls for "nucleus colony." It was the intention to have it read "1-frame nucleus," as it gives so much better satisfaction to the visitors and exhibitors; it will be adopted by many other exhibitions. If those contemplating making an exhibit of bees will bring just one frame in each nucleus, it will save much confusion with the judging. Extracted honey, which had been dropped from the list, has been replaced, and the premium raised to put it on par with comb honey. The Michigan bee-keepers try to make it pleasant for all exhibitors outside of the State, and cordially invite all to come and make an exhibit. H. D. CUTTING.

THE AMERICAN BEE JOURNAL CIRCULATES ALL OVER THE WORLD.
PUBLISHED BY THOS. G. NEWMAN & SON, CHICAGO, ILL.

THOMAS G. NEWMAN, EDITOR.

Vol. XXV. Aug. 17, 1889. No. 33.

EDITORIAL BUZZINGS.

The Buffalo International Fair opens on Sept. 3, and closes on Sept. 13. Mr. O. L. Hershiser is the superintendent of the Apiarian Department, which is just added to the fair. Mr. Hershiser remarks thus, concerning the exhibits of Bees, Honey, etc.:

Not least among the new features added is the Honey and Apiary Department. The managers have made this a special feature and offered a larger amount of money in premiums than has ever been offered by any other American Fair. The rules governing this Department have been arrauged with great care, in order that all honey producers may have an equal chance to dispose of their crops either at wholesale or retail. The benefits arising from a large exhibition of bees, honey, etc., will be permanent, and the opportunity of creating a good market and a steady demand for honey will be all that can be desired.

We hope that the exhibition will be large enough to do credit to the Fair, as well as to the apiarists of New York.

A New Book is on our desk. It is entitled "The National Bee-Keepers' Directory," and contains a classified list of 2,000 bee-keepers of the United States and Canada, (including adout 200 supply dealers), with essays and hints regarding the successful management of the apiary. It is "compiled by Henry Alley, Wenham, Mass." It contains 140 pages, one-half of which are devoted to names and addresses of bee-keepers, and the other half to the practical hints mentioned above, including Mr. Alley's "method for rearing queens in full colonies, while a fertile queen has possession of the combs." Price $1.00 in paper covers, and $1.25 bound in cloth.

The Annual Basket Picnic of the Cortland Union Bee-Keepers' Association will be held at the Floral Trout Park, in Cortland, N. Y., on Aug. 20, 1889.

The S. W. Rich Lawsuit, we notice by a news-item in the New York *Sun* of July 30, has again been decided, this time in the Circuit Court, which, it is said, has affirmed the decision of the County Court, which gave banker Olmstead damages of 6 cents, with costs.

He sued for $1,200.00 damages for injuries inflicted by the bees upon his person and property, but the jury (from which every person having bees was excluded) gave him but *six cents* to cover wounded feelings and damaged property ! !

If the Circuit Court has confirmed the decision of the lower Court, as is alleged in the *Sun*, that just gives us the opportunity, so much desired, to appeal to the Supreme Court of New York, and there have a decision to place by the side of the one from the Supreme Court of Arkansas. This will give us some grand precedents, for we are making history now, and creating "decisions" for posterity.

At the former trial Judge Boardman ruled against the bees every time ; and, in charging the jury, compared the bees to a "pigsty" and a "slaughter-house." This was the first case, with one exception, ever tried in the State, and the Judge having no law or precedent to go by, ruled just as *he* thought proper.

Now if the case goes to the Supreme Court, (and we are strongly in favor of its going there), no Judge will have the least excuse for such outrageous comparisons—for the law will have provided "precedents."

It remains for bee-keepers to say just what shall become of the case. It takes money to get "decisions of law." At least 500 members of the Union must be had, if we carry this case any further. Reader, what is your decision ?

The Union ought to have ten thousand members. There are many things it could do, if it had that many. It could *compel* Metropolitan Newspapers to *tell the truth* about honey, and command respect everywhere ! If *new officers* would "enthuse" apiarists—just a *hint* will cause a vacancy in the office of General Manager, for we know that he would gladly welcome a more energetic successor.

Honey from Alsike.—Mr. J. W. Wilcox, Scales Mound, Ills., states his experience in scattering the Alsike leaflets, and it is worth the consideration of others. He said :

Leaflet No. 2, purchased of you in the spring of 1888, was the means of sowing 10 bushels of Alsike clover seed, and the sowing of more last spring, in this vicinity. I am well paid for my investment of 50 cents, in the way of the very best white comb-honey.

Please mention the fact, that my brother bee-keepers may "go and do likewise;" for it has paid me *very well*. Result: 21 colonies spring count, and 42 colonies now, with 2,500 pounds of comb-honey, and 200 pounds of extracted honey.

Without the Alsike, I could not have done so well, for the white clover was badly damaged during the past dry seasons.

The Tri-State Fair (Ohio, Michigan and Indiana) will be held at Toledo Ohio, September 9 to 13, 1889. Competition is open to the World. As usual, Dr. A. B. Mason is superintendent of the Department of Bees and Honey, and Preserves, Pickles, etc. In class 56, "Bees and Honey," entries close Sept. 9, and colonies must be exhibited in such shape as to be seen on at least two sides. Here is a list of the premiums :

Most attractive display of Comb Honey..	$8 00	$5 00
Most attractive display of Ext'd Honey..	8 00	5 00
Display of Comb Honey, not less than 10 pounds, in best shape for shipping and retailing	3 00	2 00
Display of Extracted Honey, not less than 10 lbs., in best shape for retailing	3 00	2 00
Colony Italian Bees	4 00	2 00
Display of Bees	4 00	2 00
Most attractive display of Beeswax	2 00	1 00
Display of queens, put up in such shape as to be readily seen by visitors	5 00	3 00

In Class 57, "Apiarian Supplies," the premiums are as follows :

Comb foundation machine	$4 00	$2 00
Comb foundation for brood chamber made on grounds	4 00	2 00
Honey extractor	2 00	1 00
Machine for making holes for wiring	2 00	1 00
Largest Display of honey-bearing plants properly named and labeled	4 00	2 00
Best display of Apiarian Supplies		Diploma.
Honey-vinegar, not less than one gallon, to be exhibited in glass	2 00	1 00

The Doolittle Book on Scientific Queen-Rearing, is thus mentioned by Mr. G. D. Howe, North Hadley, Mass. :

I thought as I was an amateur that it would have no particular charm for me, but suffice it to say that after picking it up I didn't drop it till nearly through it, and then only to eat supper. The natural, story-telling style, in narrating the discoveries the author made, particularly with reference to the building of artificial queen-cups and the fertilizing of queens from the upper story of the hive, is what took my attention. It must prove a great addition to bee-lore, and anyone at all interested in the subject will spend his time very profitably in reading it.

Prepare the Bees for Winter.—Under this heading, the *Apiculturist* for August gives this advice :

This is the month to get your bees in condition for winter. All colonies that do not have good queens, and all those having old queens, should be requeened. A good prolific queen introduced at most any time during this month will fill the hive with bees in four weeks. As a rule, the queens cease laying Sept. 20, and all the young bees are hatched out by Oct. 10.

New Yorker's Latest Fad.—The latest fad in New York is to take a ride in a double-decked Fifth Avenue Stage Coach—an amusement open to all classes of people. FRANK LESLIE'S ILLUSTRATED NEWSPAPER last week contained a very spirited picture of one of these stages. That excellent number also contained negro sketches by Kemble, a supplement entirely devoted to Detroit, Vanderbilt's famous trotting team, and many other good things.

We have received an excellent German pamphlet on bee-culture, written by the Rev. C. Weygand, pastor in Flach, Germany. It is well-written, brief and to the point.

Comb-Honey Slanders.—It is no more the duty of the editors than it is of other bee-keepers, to refute the slanders of newspaper correspondents, and others, about comb honey. All are alike interested in circulating the truth about our pursuit. Mr. A. I. Root, in the last *Gleanings*, makes some very excellent and pratical suggestions about preventing the publication of the slanders on comb honey, and averting their baneful influence by immediate action being taken, in the locality of the transgressor, by the interested bee-keepers themselves. Here is what he says :

If there is anything that the veracious scribes like to talk about in the press, and roll under their tongues as a precious morsel, and finally spit out upon the public, it is the subject of adulteration. They seem to have gone wild on the subject. They know that people like to be told that they are being humbugged ; and they know that the story of "Yankee ingenuity" will cause the gullible public to hold up their hands, "Did you ever!" and as long as there is a demand for it, so long the same old story will be rehashed, unless there is a stop put to it.

"Manufactured comb honey," "artificial combs deftly filled and capped over by means of appropriate machinery"—oh dear! how stale it sounds ! If the reporters could only change their tune a little it would be gratifying ; but "appropriate machinery" has to be stuck in every time. Well, within the last few weeks, or at least since the Philadelphia *Record* began republishing the comb-honey story, the whole press all over the land has been reiterating it in long and short squibs. Clipping after clipping has been sent in until we feel discouraged. We have published them and refuted them publicly, and have sent marked articles to the editors, calling upon them for retraction. We have written private letters, asking them in all fairness to be kind enough to make some amends. Nor has Bro. Newman of the AMERICAN BEE JOURNAL been less vigilant.

We have about come to the conclusion that the bee-papers need assistance in helping to cry down the evil. Jones sees a false statement about the comb-honey business, in one of the columns of his local paper. He cuts it out, marking the date and issue of the paper and sends the same on to us, or to Bro. Newman, of the AMERICAN BEE JOURNAL. Well, so many clippings like this have come in that it would almost fill one issue to make any thing like an appropriate denial for each one. Quite recently some four or five correspondents, instead of sending the marked article to us for refutation, have themselves called upon the editor, showing the absurdity of the statement in a recent issue of his paper. In two or three instances they have written out a refutation themselves, and this refutation appears in the very next issue of the paper, so that the false impression is *corrected right where the mischief is done*, and not in the columns of a bee-paper whose readers know perfectly well the untruth.

The following is a spicily written article from the pen of one of our subscribers, Mr. Julius Gerard, of Mariposa, Texas ; and as it illustrates the point we are getting at, we reproduce it here entire :

A PROFESSOR MISTAKEN.

Glucose as Artificial Honey. A Practical Bee-Keeper's Knowledge of the Facts.

EDITOR BRACKETT NEWS :—I suppose when you want to get the real facts about anything you refer to your Encyclopedia Britannica ; for instance, if you wish to know how far it is from Brackett to the sun, you refer to the Encyclopedia ; and whatever the given number of miles may be, you or any one else will accept it as a fact. I am sorry to say, however, that my confidence in the American Encyclopedia has been lowered 100 per cent., because I see at least one instance in which hearsay is given out as true science.

Mr. Chas. Morris, of the Philadelphia Academy of Science, writes concerning glucose, in Vol. III of American Suplement, page 537, in the left-hand column, 21st line from the top, as follows :

"Glucose is used chiefly in the manufacture of table syrups and confectionery, in the brewing of ale and beer, and to some extent as food for bees and in the making of artificial honey. No reliable statistics can be had as to the quantity used in brewing, since brewers seek to conceal the fact of its employment. When it is fed to the bees, the honey yielded by the bees is almost pure glucose. In artificial-honey making, the comb is made of paraffine, and filled with pure glucose by machinery. For whiteness and beauty it rivals the best white-clover honey, and it can be sold for less than half the price. Its one defect is, that it is not honey."

Now, sir, this falsehood is given by a professor of science, and published as a fact in the Encyclopedia Britannica—a work to which thousands of people refer as authority.

If the author of the article on glucose will take the trouble to come out to the Mariposa apiary, I will convince him that his education as a bee-keeper has been sadly neglected, and that what he wrote about artificial honey being made of glucose and then put in artificial comb by machinery, is false ; and if he has taken no more pains in writing the other parts of his work than he did in this, I would not give a nickel for all the volumes of the Encyclopedia Britannica.

Mr. A. I. Root, of Medina, Ohio, offers a reward of $1,000 to any one who will show or tell him where artificial honey is made ; this offer was made because so many false reports have been cast abroad about honey. Mr. Root has not yet found anybody who claimed the reward.

If Prof. Morris, the glucose gent, tells us that the distance to a certain star is just 400,000 and ½ of a mile, I for one am willing to swallow it, even to a fraction of a mile. But when he wants to tell me or any other progressive bee-keeper any thing connected with our industry, he should be a little more careful, as we never go by hearsay, but by facts. That man is doing a hard-working class of men a great injury. I can assure you, dear sir, that there is no artificial comb honey made by machinery, and that there was never any made.

Mariposa Apiary. JULIUS GERARD.

Another one of our subscribers, also secretary of the Ohio State Bee-Keepers' Association, Miss Dema Bennett, of Bedford, O., who, after having read the usual yarn about manufactured comb honey "deftly filled by appropriate machinery," in a large Cleveland daily, called upon the city editor in person, proving the falsity and absurdity of the statement respecting manufactured comb honey, which appeared in a recent issue of his paper. After telling him that tons and tons of honey are produced honestly, she referred him to us. As a result of this visit he wrote us a letter asking for facts in regard to the honey business. We immediately sent him a card, offering a thousand dollars for a sample of manufactured comb honey, "deftly filled by means of appropriate machinery." We also sent him a long letter, detailing the importance of the honey industry in the United States, telling him where he could find out just how bees "make honey," by sending a reporter. We referred him to Dr. A. B. Mason, Auburndale, O., and to H. R. Boardman, of East Townsend, O., and we requested, as a special favor to bee-keepers, that he send a reporter to either one of these gentlemen, and report what he sees, in his own paper.

A personal letter written to the editor who has damaged the bee-keeping industry by one of the falsehoods, or, better still, a personal visit itself, will

secure the attention that a prompt denial from a bee-papers might fail to do. In one case Mr. Gerard wrote an article to the Brickett *News*. In the other case a lady bee-keeper (and what editor would not give one of the opposite sex a fair hearing?) called upon the city editor and enlisted his interest so that he even wrote to A. I. Root for information.

The point is, that *refutation or denial should appear in the paper in which the falsehood has been published*; in other words, those in whose minds the false impression has been created should have a speedy denial. These large papers will rarely deign to publish any thing from a small paper, but they will take something first-handed, as a general thing, providing the right influences are brought to bear. Now, then, we suggest that, instead of sending so many of these clippings to us, *you sit down yourself* and write to the editor of the paper in whose columns the false statement appeared. We will furnish free all the $1,000 reward cards you can use, and other matter you may call for. The more bee-keepers who will do this, the more effect it will have.

Be sure to write in a gentlemanly manner. Do not call them a "pack of fools" or a "set of liars;" but write in such a way that they will respect the writer. Of course we shall not cease pecking away at the falsehood, as we have done in the past, but we solicit the most hearty co-operation of our subscribers. Do not forget that when the item appears in your local paper, a *prompt denial from yourself*, especially if you are a man of influence, and one whose word even the editor has no reason to doubt, will have more effect upon the editor than the denial from a bee-paper perhaps several hundred miles away. Do not leave any local editor unvisited, who dares to slander our industry by publishing any thing about "artificial combs deftly filled and capped over by appropriate machinery."

These *earnest* words of Bro. Root are excellent suggestions, and we endorse them most fully. We hope our readers will be on the alert, and strike the nail on the head every time. The only way to kill this venomous, hydra-headed snake of comb-honey slanders, which extends its loathsome presence all over the country, is for every bee-keeper to consider himself a committee of one to chop off a head every time it appears in sight. Then send a marked copy of the local paper when the amputation is chronicled, to the bee-papers, which will cheerfully applaud it.

Bee and Honey Exhibitions at the Expositions.

The following is a letter from Mr. S. B. Pratt, father of E. L. Pratt, editor of the *Queen-Breeders' Journal*, published at Marlboro, Mass. It will be read with interest because it is the impartial testimony of one who is traveling abroad for the benefit of his health, and who sees things from an American stand-point:

I spent one day in the great English Agricultural Exposition at Windsor, with my family. I gave much of the day to the Bee-Department. It was very fine. A large building was given up wholly to an exhibition of every kind of bee-appliances. Large prizes were given for hives, smokers, honey displays, etc. There were some very fine models of large bee-farms. At a little distance there was a large tent of mosquito-netting, within which an expert operator every two hours gave a lecture to a large crowd, handling the bees and instructing as to how to do the whole business. He was very bright and well posted.

The Baroness Burdette-Coutts took great interest in the bee-department, and the Queen herself visited the bees when the great awards were made. The boxes of honey were very fine. Some very curious work in the way of names and dates were displayed in comb filled with honey. Much credit was given to America for new suggestions. Flat sections, made in Wisconsin, have been introduced by many English apiculturists. Every leading display contained these American sections, although most of the honey shown had been stored in paste-board boxes of the same size, with glass front and back, and trimmed around the edges with fancy paper. One exhibitor had sections made wholly of glass, held in place by hoops of fine wire.

All the honey shown seemed to be of very superior quality, every section being filled even to the corners. The honey from some localities was golden colored, from others very white, while some was very dark colored.

Many styles of honey extractors were shown, and immense displays of extracted and granulated honey, put up most beautifully in cut-glass jars.

The English have a great many devices for feeding bees, some of them very small, while other feeders covered the whole size of the bee-hive. Many Englishmen still cling to the old-fashioned, conical straw-hives. The lecturer declared that these straw-skeps were the greatest obstacle to bee-progress. Most of his exhibitions were given with straw-hives. A great many bee-keepers in England still destroy the bees by sulphur, to get at the honey.

The Carniolan queens are daily becoming more popular in England. The black bees had the whole field to themselves. The Italians had a hard fight to gain recognition, but the Austrian bees are winning great favor. The only criticism I heard on them was by one man who declared that the capping to the cells was too thin for transportation.

Australia has a large building devoted to bee-products. One large show-case was filled with honey in the comb, and in glass and earthenware. This honey had been brought such an immense distance, that it arrived in very poor condition. It seemed to be made mostly from the bloom of the encalyptus tree, having a very peculiar and unattractive taste.

The Paris Exhibition.

We have given two days to the great Paris Exposition. I found there a small display of bees from Luxembourg. These are all kept in hives about the standard American size, and covering every hive was a wooden screen, looking for all the world like green blinds of heavy slats.

The English display of bee-products here was very good. America, also, had some large show-cases filled with the most recent inventions; but no one seemed to be in direct charge, and it looked as though these inventions had been pulled about and left in more or less disorderly confusion. The moral to be drawn from these distant contributions in both the great national exhibitions would indicate that unless these contributons are under the constant watch and guard of some friend, who will give his whole attention to their proper display, they had better not be sent.

America has more bee-papers than any other nation, and a copy of each publication was on file here, including the AMERICAN BEE JOURNAL.

Many other countries sent bee and honey displays, but the French display outranked the combined results of all other nations, and was more extensive and grand than we expected to see. Tons of honey, in the most attractive forms, were displayed. One straw super that we noticed, was filled with over 150 pounds of dark-colored honey.

Many individual exhibitors were in attendance, and everything was done to charm and fascinate the visitors.

S. B. PRATT.

QUERIES and REPLIES.

Size of Cells in the Sheets of Comb Foundation.

Written for the American Bee Journal

Query 648.—Ought not comb foundation sheets to have a top and bottom, with smaller cells at the top, and grow larger nearer the bottom?—Moline.

No.—M. MAHIN.

No.—A. B. MASON.

No.—J. P. H. BROWN.

Why?—C. C. MILLER.

I think not.—EUGENE SECOR.

I see no reason for it. Why?—A. J. COOK.

I cannot see what would be the advantage.—P. L. VIALLON.

I would prefer the cells all worker.—MRS. L. HARRISON.

No. No more than a cart should have five wheels.—J. M. HAMBAUGH.

See answer to querry 647. My experience says, always put brood-foundation on wires.—R. L. TAYLOR.

I know of no particular necessity for it; or, having the cells of different sizes!—WILL M. BARNUM.

Why not reverse the thing, and make the larger cells at the top, where they belong? The foundation as made at present suits me.—H. D. CUTTING.

No! if you are afraid of sagging, use plenty of wires, or use foundation six or eight months old, as it sags less than fresh-made.—DADANT & SON.

I have never found any such need. It would be impractical to make such foundation, except on a press.—JAMES HEDDON.

I do not see why they should. Wiring frames does away with stretching, and is but little trouble or expense, compared with an attempt to graduate the size of cells in the rolling mill.—J. E. POND.

No! No! Buy good foundation. It is not a new thing. Most bee-keepers know where to get good foundation. The trouble with foundation arises from two facts—it is either not good, or it is badly used.—J. M. SHUCK.

I can see no need of such an arrangement. No one can calculate how much a sheet of foundation, under all circumstances, will or will not stretch. With a little experience, it is not an insurmountable difficulty to get good, straight combs from good sheets of foundation without wiring.—G. W. DEMAREE.

No. I have practiced, however, making foundation with a thick and a thin edge; that is, running it through the rolls with one side pressed thinner, using the thick in the upper part of the frame, and I would that it stretched very little.—C. H. DIBBERN.

No. The smaller cells would be of no use to the bees, no matter if they were stretched twice their width the other way. If you use foundation at all, use it in connection with wires running through it, unless you can find a kind which will not sag or stretch.—G. M. DOOLITTLE.

I think not. Comb foundation as now made by leading manufacturers, is entirely satisfactory. I am strongly opposed to wiring foundation in brood-frames, but I do not approve of the above plan to prevent the evils of sagging. It will be found that a brood-frame about 7 inches deep, will obviate all difficulties.—G. L. TINKER.

Certainly not. It would land us all in confusion to attempt any such thing.—THE EDITOR.

Is it Necessary to Shade Hives in the Apiary?

Written for the American Bee Journal

Query 649.—1. Is a portico (or its equivalent) to shade the entrance of a hive, *essential?* 2. If not essential, is it *desirable?*—WIS.

1. No. 2. No.—M. MAHIN.

1. No. 2. No.—R. L. TAYLOR.

1. No. 2. No.—EUGENE SECOR.

1. No. 2. I hardly think so.—C. C. MILLER.

1. It is not essential. 2. It is undesirable.—J. M. SHUCK.

It is neither essential nor desirable.—P. L. VIALLON.

I deem it both essential and desirable.—WILL M. BARNUM.

1. No. 2. I think not. See my "Bee-Keepers' Guide."—A. J. COOK.

It is not essential nor desirable.—J. P. H. BROWN.

I use no such thing, nor do I consider it essential.—G. M. DOOLITTLE.

No; neither is it desirable.—J. M. HAMBAUGH.

A *shade* is desirable, but we do not like the portico.—DADANT & SON.

I do not know that it is essential, but our hives all have porticos. I would not like to do without them.—MRS. L. HARRISON.

No. If you shade at all, use a shade-board on the top of the hive.—H. D. CUTTING.

It is not essential, and I doubt very much if it is even desirable.—C. H. DIBBERN.

1. No. The entrance to the hive should not be shaded, except in the hottest part of the day in summer. 2. No.—A. B. MASON.

1. No. 2. It is desirable with me, as protection to the queen and drone-traps; but it also gives shade to the entrance, and comfort to the bees.—G. L. TINKER.

1. No, not in my apiary. 2. No. It is a nuisance. A hive, to be susceptible of handy manipulation, should have a loose bottom-board, and should be made so that the sectional parts will duplicate each other on the square-joint principle. See my answer to query No. 646.—G. W. DEMAREE.

After much experience with porticos on hives, I found them worse than useless, and discarded them. They were never made to shade the entrance and keep the bees cool; they have just the reverse effect. They were designed for protection against wind in prairie countries.—JAMES HEDDON.

It is not; and for myself I do not deem it desirable. Its greatest use is for spiders to spin their webs, and for millers to lay their eggs. Shade can easily be arranged when needed or required, much better than can be done with a portico.—J. E. POND.

Upon weighing all the advantages and disadvantages on the balance, we conclude that it is neither essential nor desirable—though porticos are quite generally seen in small apiaries.—THE EDITOR.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on Wednesday, Thursday and Friday, Oct. 16, 17 and 18, 1889. Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be very low. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."
W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.
H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary,—R. F. HOLTERMANN, Sec. Brantford, Ont., Canada.

☞ The Iowa State Bee-Keepers' Association will meet at the State Fair Grounds during the State Fair week, commencing on Sept. 3, at DesMoines. The meetings will be held in our large Tent, and an invitation is given to all bee-keepers to meet with us, bringing their families and friends, and help to make our meeting one of interest to all bee-keepers.
MRS. O. F. JACKSON, PRES.

☞ The Northern Illinois Bee-Keepers' Association will hold its next meeting on Aug. 20, 1889, at R. Marsh's, in Guilford Township, 4 miles northeast of Rockford, Ills.
D. A. FULLER, *Sec.*

Subscribers who do not receive this paper promptly, will please notify us at once.

CORRESPONDENCE.

LESSONS.

Some Important Facts from the Experiences of the year 1888.

Written for the American Bee Journal
BY FRED KANZLER.

Our excellent AMERICAN BEE JOURNAL has brought several valuable lessons, which the poor season of 1888 taught us, viz: That if comb honey could be "manufactured," it would have been done very extensively, but we saw not a single pound in our markets, therefore it is an impossibility; and Prof. Wiley did not tell us a "pleasantry," but a simple *lie*; that mixed farming is more safe than specialties; that we start with a clean market for the next year, and can sell our honey on hand for a good price, etc. But there may be a dozen or more lessons yet to learn, and I will name a few more:

1. The year 1888 teaches us that not the number of colonies can be blamed for the poor season.

When over the whole country (a few places excepted) the honey-flow failed, then has a man with a few colonies as much surplus honey as the man with many colonies, *i. e.*, *none*; therefore the number of colonies has nothing to do with the poor crop, but the poor season is the cause.

2. Our idea of "overstocking" must be modified.

If I had, in 1888, 20 colonies, and my neighbor 200, and I would say; "Neighbor, you overstocked our country," what would be the answer? He would say, "Friend, if I had 20 or less colonies instead of 200, you would not have an ounce more honey than you now have;" and if overstocking means a small crop of honey, then the whole country is overstocked. I, for my part, think that if I keep more colonies than I can profitably handle, then my yard is overstocked, and I will blame neither my neighbor nor his many colonies.

3. The year 1888 occasioned good feeling among the bee-keepers.

Some time ago a few big bee-keepers living on a good honey-belt said to the small apiculturists, "You had better keep no bees at all, but buy your honey of us!" What would those great men say now, if the small bee-keepers and the public came to buy honey, and they had none left over from last year? Would they (the big bee-keepers, with hundreds of colonies) not be ashamed of their own folly, self-conceit and self-interest?

As misfortune cuts," Bl[illegible] and brings even foes together," de[illegible] near nothing more of the foregoing talk, but find a more friendly feeling among all the bee-keepers, and I hope that this good feeling will grow from year to year, so as to embrace all bee-keepers in the land, making them one brotherhood.

It would also create a good feeling among bee-keepers and correspondents, if the latter would drop all personalities, and take more into consideration the difference of localities, climates and degrees of latitude.

Between bee-keepers there should not be any professional envy or jealousy, as we sometimes find among other tradesmen; for, if I have no surplus honey, my neighbor has none; and if he has a good crop of honey, I have also much surplus honey, all other things being equal.

Santa Claus, Ind.

BEE-ITEMS.

The Distance that Bees Fly for Honey.

Written for the American Rural Home
BY G. M. DOOLITTLE.

A correspondent writes that he has seen the statement that bees do not fly more than one and one-half miles from their hives in any given direction, and desires to know if this is a fact. I know that there are a few who claim what our correspondent writes, but the majority of bee-keepers believe that bees go double that distance for honey; while some have traced their bees so that they were positive that they were at work on flowers seven miles from where the apiary was situated.

The most of my experience along this line was obtained when the first Italian bees came to this country, as they were then located three miles from me, in a straight line. The next spring after they were thus brought here, I was watching the bees at work on apple blossoms, and soon saw an Italian bee at work in my orchard, when there could not have been any of this variety of bees nearer than the three miles spoken of above. Upon examining more closely, I found that on an average, one bee in five were Italians, and this with apple blossoms in profusion everywhere.

Again, in haying time, as I was cutting a field of clover one mile from home, or four miles from the same Italians, I saw bees at work on the clover. Having heard so much about Italian bees working on red clover, I got off the machine, and, to my surprise, counted five Italians to two blacks, with fields red with clover everywhere.

Once more: One year still later, there was not a piece of buckwheat in sight of my apiary, and the nearest of any amount was four and one-half miles in a southerly direction, where there was from 20 to 30 acres, while about six miles away, there was nearly 100 acres. I sold 900 pounds of buckwheat honey that year, and the bees wintered on at least 2,500 pounds of buckwheat honey.

From the above I became satisfied that bees went from five to seven miles for honey, although I believe that they will work to more advantage when they do not have to go more than from two to three miles away.

Bees with Jagged Wings.

Another correspondent writes about seeing many bees with jagged wings during the month of June, and wishes to know what caused it. Some suppose that it is caused by the bees flying so far during basswood and other bloom, which tends to lead the bees far from home for honey; but I think that this is a mistake, for basswood does not bloom in this locality till about the middle of July, while, as our correspondent states "we see the tattered-winged bees in June more plentifully than any other time during the year," at which season the white clover is in bloom.

White clover, with us, grows mostly in the meadows, and in order to get it the bees must fly down in the herd's-grass, and so by constantly hitting the wings against the grass they become worn, as our correspondent has observed. By the time basswood is over, we see but few of these bees with jagged wings, as the ones which worked on clover have mostly died by this time.

Light-Colored Bees.

Another writes, wishing to know if the light-colored Italian bees are as good honey-gatherers as the dark ones, having heard that the light-colored bees were lazy.

I never had any dark Italian bees, but have plenty of blacks and hybrids, and with me the nearer pure the bees are, the better honey-gatherers they make. To illustrate:

Several years ago, when the basswood was all gone, I did not have a single section filled with honey. After a week or so, the seed crop of red clover came into bloom, and my Italians and hybrids commenced to work on it; but the black bees did nothing but consume their own stores, and carry what little honey they had in the boxes, down into the hive. The best and lightest Italians filled their hives, and stored from 45 to 60 pounds in sections; and the hybrids stored just in proportion to the amount of Italian "blood" there was in them.

Those that were one-fourth Italian, got about enough to winter; but all the blacks I had to feed, taking frames of honey from the Italian colonies to do that feeding with.

Right here is where many make a mistake, when they claim that hybrid bees will store more honey than the Italians, as it sometimes happens that the Italians under poor management fail to put as much honey in sections as do the hybrids. Looking at the sections, it would appear as if the hybrids were the best, but when we come to prepare the bees for winter, then we find that while we have to feed the hybrids to fix them so they will not starve before spring, every hive having the light-colored Italians in them, has an abundance of stores, and often enough to spare, to put the hybrids in good condition as to stores also.

Some think that it is best to have the brood-chambers of the hives nearly or quite empty in the fall, as the hybrid bees generally have them, so that they can sell the honey and feed the bees for winter, claiming that bees will winter better on sugar syrup than on honey. I know that bees will winter well on sugar syrup, but so far my observation says that they will do equally as well on the honey.

It is a job to feed a whole apiary in the fall of the year, when the bees have stopped getting honey, and one that I do not hanker after, after having tried it once or twice from necessity. My belief is, that the Italian bees are the best bees in the world, taking all things into consideration.

Borodino, N. Y.

THE UNION.

How the Arkadelphia Argument Prevents Bee-Lawsuits.

Written for the American Bee Journal

BY JOHN M'KEON.

DEAR EDITOR:—As I have a guilty conscience, and think it only right that I confess that I have wronged you, and without doubt robbed you of some laurels, because, as I understand, there has been some under-handed plotting in regard to making us remove the bees out of the corporate limits, although our bees have never troubled any person or thing yet; and they are not less than 40 feet from the sidewalk, for they are hemmed in by young trees, and only five houses on the whole street, and only on one side at that, the other side being farming land.

On June 30, three small children were sent down this back street, and for the purpose of getting those innocents stung, as I could see no other purpose, for [illegible] ones were hemmed on both sides by a swarm, but they were not harmed. A lawyer came down, and tried to quarrel, and endeavored to frighten the people, saying that it was dangerous to pass. Teams were driven by, and people that came from church passed without harm. (Now I don't think that it is at all necessary that because a man is a lawyer, he must be a scamp.)

As I kept hearing these things, I was exceedingly anxious to hear of Z. A. Clark's case, and when I received the BEE JOURNAL, of June 29, I was happy. I showed it to very many, and said, "Read that, and compare it with the rulings of that old fossil of Ithaca"—I meant Judge Boardman—in the rich bee-case, as they were acquainted with his rulings, likening an apiary to a pig-sty and slaughter-house. A very worthy young disciple of Blackstone, after reading Judge Williams' argument, declared that it was a most powerful defense.

Now, Mr. Newman, if you feel hurt at losing a chance to be defendant in a bee-suit, then I humbly ask your pardon; for the argument of Judge Williams has "cooked" those fellows. But you may say, "Mc Keon, I do not know you as a member of the Union." Well, I am one by proxy, for my wife is. In 1882 she said that she would buy two colonies if I would take care of them. A few years after, I said to her that if she kept bees she must join the Bee-keepers' Union. She replied, "John, you don't think that we will ever have any trouble, do you?" I said, "No; yet we can't always tell, and it is better to prepare for war in time of peace."

Buckwheat is just beginning to bloom, that is, the earliest sown, and if the weather is only favorable, we shall get a good crop of honey, as there is a large acreage of it in range of our bee-yard,—perhaps not less than 200 acres, and maybe more. The farmers tell me that there is more sown than ever.

Dryden, N. Y.

[No, indeed; the Manager of the Union is in no wise "hurt" over such a matter. He does not covet lawsuits and all their consequent annoyances. He was drawn into the position without any thought of what it entailed, or he would not have dared to have accepted the office. It has taken *months* of labor, and caused many a sleepless vigil. And all he gets for it is the "glory" or "laurels" you mention—but he is quite willing, yes anxious to *divide* them, in cases similar to the above.—ED.]

BEE-TALK.

Hints about Bee-Keepers' Conventions, etc.

Written for Gleanings in Bee-Culture

BY DR. A. B. MASON.

It may not be uninteresting to learn that, in this locality, or within the bounds of our Tri-County Agricultural Society, comprising the counties of Lenawee and Monroe, Michigan, and Lucas, Ohio, the bee-keepers are awake to the importance of improving every opportunity to educate the people in regard to our important and growing industry.

A year ago last winter the society held a three-days' meeting at Monroe, Mich. It was just "chock-full" of enthusiasm, and the bee-keepers did their full share. It was so arranged as to have our specialty discussed in the evening, when there would be a full attendance of people from the city, whom it is quite desirable to disabuse of ther false belief in regard to the adulteration of our product, and correct the false impressions made by "Wiley" lies and newspaper squibs—the product of the fertile imaginations of reporters.

The next week after the above-mentioned meeting, a farmers' institute, under the auspices of the Ohio State Board of Agriculture, was held in the county, ten miles from Toledo, at which our friend T. B. Terry was one of the lecturers, and our specialty was again brought to the notice of the farmers and others by the reading of a paper by myself, and the subject received its share of attention. And again at a like institute held in another part of the county, on the last day of last year and the first day of this, the subject was again presented by an essay that gave something of the natural history of bees, and the benefit they are to the farmer and to the agriculturist.

Last winter at Adrian, Mich., was held the anniversary of the Lenawee County Horticultural Society, and one of the principal addresses, through the efforts one of your patrons, Mr. D. G. Edmiston, of that place, was on the relation of bee-culture to horticulture. It was well received. Again in January last was held at Adrian the meeting of the Lenawee County and the Tri-County Agricultural Societies; and on the programme for one of the evening sessions, half of the time was given to an essay on bee-keeping, etc., by H. D. Cutting, of Clinton, Mich., and to one by your humble servant. The subjects of both papers were discussed by such bee-keepers as D. G. Edmiston, Mr. Ellis, A. M. Gander, and others; and the discussion showed

that a lively interest was taken in the subject. I never was at a gathering of any kind where so many sample copies of bee-peridiocals were asked for by interested parties.

Mr. Newman had kindly sent some copies of the AMERICAN BEE JOURNAL for distribution, and I had some extra numbers of *Gleanings* to distribute also, and they were given to interested parties, and I doubt not you will hear from some of them. I had some copies of "Dot Happy Bee-Man" song with me, and at the close of the discussion of the bee-essays, the glee-club sang it, to the evident satisfaction of the hundreds present.

At the close of the institute, at the solicitation of our friend H. D. Cutting, we (that's my better half and I) went home with him, 22 miles by rail, and had a good three-days' visit with him and his family.

Of course I had to take a good peep at his bees. Till the last two or three winters his bees have been wintered out-doors, packed on their summer stands, but he is now a thorough convert to the benefits of cellar-wintering. His cellar is under the house, and is used as a family cellar for vegetables, etc., and is 16x24, and seven feet high. He has made a kind of rack along one side and end, so as to hold three tiers of hives, which are set with their entrances toward and with a few inches of the wall, each one being easily removable without disturbing any of the others.

The frames are covered with enamel cloth, and the bottom-board is left on. Some of them were placed in winter quarters October 20, and the last on Nov. 20; and I am safe in saying there were not two quarts of dead bees on the cellar-bottom, from about 40 colonies, and none had been taken up. A small window at one end admits light at all times, sufficient so that no artificial light is needed to see to get things from the cellar, and but little light reaches the bees. He prefers a temperature of from 38° to 40°. If with the temperature of my cellar, 50°, I were to admit light, I should have to carry out mostly dead bees in the spring.

On the evening of the second day of the institute I had the pleasure of going home with, and being entertained by, Mr. E. W. Ellis, president of the Adrian Scientific Society. He lives five miles in the country, and, metaphorically, is full of bugs, beetles, reptiles, etc. Being rather timid, and having no special liking for such animals, you can perhaps imagine my feelings on being ushered into a room about twelve feet square, more or less, "zhust zhammed crammed full of dose pets vot vorks all der day, und nefer schleep nights, more'n ten tousand hundret, I bets." But then I soon found they were all dead. Mr. Ellis is a very enthusiastic entomologist, and he has a large library of scientific books, and seemed to know all that was in them. Of course, he keeps a few colonies of bees, and tries all sorts of experiments with them.

We were entertained at Adrian by Mr. Edmiston and family; and of course he keeps bees, or how else could I possibly have stayed over night with him? His bees are wintered on the summer stands, in chaff, and other hives of that character; and being a small-fruit grower and nurseryman he does much toward properly educating the people of his locality in regard to bees and their work and production.

During the last two winters I have attended five of these institutes, held in the three above-named counties, and made special preparation to present our branch of agricultural or horticultural interest, bee-culture, etc., in the most interesting and attractive form that it was possible for me to do. If any other bee-keepers were present, they have willingly "lent a helping hand." In no case has any effort been made to induce any to engage in bee-keeping as a business, but to give, in as entertaining a way as possible, a brief natural history of bees; tell where the honey comes from, and how the bees gather, store, and ripen it; how extracted honey is secured, and if possible illustrate; tell how and in what way bees are a benefit in fertilizing and cross-fertilizing fruit and other blossoms.

Also tell about the reported injuries done to fruits, grapes, etc., by bees, and how they have been accused of "eating young ducks," etc., and correct these false impression. It is the bee-keepers' own fault if our business is not properly brought before the public at agricultural, horticultural, scientific, and other gatherings. To be sure, it is not an easy matter for a large majority, perhaps, of bee-keepers to prepare entertaining articles on our specialty; but "there is nothing like getting used to it." If one is not accustomed to it, and does not feel capable of preparing an entire article, just let such a one get, if he has it not already, a work entitled "Bees and Honey," by Thos. G. Newman, and the first fourteen pages will make an interesting introduction. It is just such information as is interesting to the general public, and written in a very interesting way. When the next opportunity presents, make a selection from Prof. Cook's Manual of Apiary, the A B C of Bee Culture, either or both, always giving proper credit, of course, and you will be surprised at the amount of interesting and valuable information that can be thus furnished to willing listeners. And now that the new edition of Langstroth on the Honey-Bee, just revised by Charles Dadant, is to be had, there seems to be no end to interesting matter. New ideas are put forth, and the old ones are put in new dress, so that one is almost "lost in wonder, love and praise."

Then the different bee-periodicals are constantly teeming with things new and old, so that, if one had nothing else to enjoy or do he might almost revel in the elysium of bee-lore. We bee-keepers should be part and parcel in all agricultural and horticultural gatherings, whether for discussion or fun and frolic, and also of many scientific and social gatherings, and should "let our light shine." In order to have the amount of time allotted to us at these gatherings we must be on hand and have a hand in making up programmes, and see that the right ones are put in to fill the bill.

Auburndale, Ohio.

SWARMING.

An Interesting Experience in Hiving Bees.

Written for the American Bee Journal

BY W. HOOD.

So far as honey-gathering is concerned, the season of 1889 has been, thus far, almost a falure in this vicinity. White clover furnished but little nectar. There is but little basswood timber near us, and what there is failed to give its usual amount of honey. Mint—our last chance—is coming into bloom, but owing to the parched condition of our sandy soil, we cannot hope for much.

This is my first season with bees and we are not on the best of terms, especially when they strike a soft spot on my armor. I think that they are a little too quick-tempered, and rather previous in their conclusions; but, thus far, I have consolation in knowing that I have killed more of them than they have of me. I have thirty-eight colonies to look after; sometimes I do it with one eye in a sling, and sometimes two.

My troubles commenced on the day that I got my bees, and will perhaps continue until one or all of us have passed into the great beyond.

They are very stubborn. They won't do anything that I expect them to do. This spring I sat around and wore the paint all off the hive-covers, expecting them to swarm; but they utterly refused to do so, until I became the laughing-stock of the village, and even my own family began "firing" squibs at me. My youngest hopeful, one day,

in passing, stopped with the remark, "Say, Dad, when are you going to Kansas?" I informed him that I never intended to emigrate to Kansas. "O," he said, "I thought that was your advertisement on page 320 of the A B C book." I stood their jeers, Micawber-like, and waited for something to turn up. It finally turned up one day in the top branches of a sturdy oak-tree, fifty feet from the ground, in the shape of two swarms of bees.

In my palmiest days I never was considered an expert climber, and how much less now that youth has long lingered on the sunny side of the hill of life! I had all the modern appliances for catching bees from the ground, but alas! my puny arm was too short with all my fixtures to gather in the benighted bees that were so lost to reason as to settle on the topmost branch of the tallest oak in the yard.

I stood around, taking it cool, as bee-men advise, and secretly hoped that my wife would volunteer to go up and fetch them, but these hopes were soon dashed to pieces, by her suggesting that if I proposed saving those bees, I had better move up the tree. Whatever she thinks, I invariably think, too, or at least *try to*.

I placed the ladder against the tree. It looked awfully short, and then, not having had any experience, I did not know which of my kit to take; so, to ease up my mind, and save coming back, I took them all—hiving-box, pole, sack, saw and rope. I succeeded very well until I reached the top of the ladder, and there my troubles began.

By hard scratching I gained a few feet, but my wind was getting short, so that I hung the box on a friendly knot, and proceded a few feet farther, where I left the pole dangling from a small limb; next the rope and then the saw were filed away for future use.

When I reached the top, or as near it as I could get, I had only the sack, and the bees were still far out of my reach. While thinking what to do next, I glanced earthward, to see if I was still in sight, and right beneath me stood my wife, with her hands on her hips, her hat tipped back, and a broad smile illuminating her usually stern countenance.

I remarked, "Why this seeming levity on so grave an occasion?" She replied, between peals of laughter, that "it seemed so funny to have a Christmas tree in June, and the funniest part of it was, to have a red-whiskered Santa Claus up in the tree-top, holding the sack, while in the pictures he always had white whiskers." One glance down the body of the tree convinced me that all that was lacking was a tin-horn and a few sleigh-bells.

I returned and brought forward my supplies. After locating myself after clothes-pin fashion, on a limb beneath the cluster, I snapped the pole to the box, and then laid for my first swarm of bees. I passed the box up till it almost touched the cluster, and then fired away.

It was a deep laid scheme, but poorly executed. A limb caught the side of the box, and I spilt the cluster, getting one half in the box, and the rest on my devoted head.

In my rambles up and down the tree I had torn a hole in my veil, which came directly over one eye; before I got into position to defend myself, about two quarts of bees had gone in and registered. I began to get hot, both in mind and body, but I succeeded in landing them on the earth, and emptying them in front of a hive; and up the tree again after the others.

When I arrived at the top, I found two swarms instead of one. I soon had one of them down in front of the hive, and back after the remaining swarm. When I again reached the top, instead of one, I found two swarms hanging as quietly as if they had hung for years. I gathered in one and carried it down and filled another hive. While toiling up the tree after the last one, puffing like an engine, I decided that if the rush continued, I would order a car-load of hives, and employ the village hook-and-ladder company for a few weeks to help me out.

I got the last one down all right, and then while all was quiet, I went to examine No. 1, to see if they had settled down to business yet. I lifted the cover gently, and peeked in. There was not a solitary bee there to defend the castle! Nos. 2 and 3 were the same. A streak of light began to dawn upon my benighted mind—those bees, as the boys would say, "had been monkeying with me," while I had toiled up the body of the tree, they went straight across and were waiting to be carried down.

To say that I was mad, would be putting it rather mild. I had labored fully two hours in the heat of the day, and had one eye fast closing on the beauties of earth, my clothes dilapidated, the bark worn from the oak, ditto my side that came between me and the tree. I never allow myself to use profane language, nor approve of its use on all occasions, but had a "street Arab" happened along, that could have done the case justice, he would have struck a paying job.

My wife intimates that it is not necessary for me to hire anyone to do my talking for me, even if I do not swear. I may possibly have spoken disrespectfully of their parents, and think I did intimate that I should be highly pleased to have the lightning remove all future swarms that have such high notions.

Some ladies may think it fun for an old fellow to hive bees, when he has to climb rough-bark trees until he gets stuck full of knot-holes, and does not have rind enough left on his carcass to make a cover for a base-ball; but *I* do not think so.

My burdens are so heavy that I fear I shall have to join the Bee-keepers' Union, get a divorce, or swear off on keeping bees.

P. S.—I would tell what become of the swarm that I did save, only I am afraid that I would be laughed at.

Spring Green, Wis.

HOUSE-KEEPING.

Some Old Cook-Books—Honey Used in Cooking.

Written for the Illustrated Home Journal

BY LUCY LANGDON.

Among the cook-books in my possession is one dated 1836, another 1839, another 1840, and still another 1845. The last is entitled, "Every Lady's Book," and is arranged "By a Lady of New York." The title page declares it to be, "An instructor in the art of making every variety of plain and fancy cakes, pastry, confectionery, blanc mange, jellies and ice-creams; and containing other useful information for ordinary holiday occasions."

The most noticeable feature in this book is the frequency with which wine, brandy and punch occur in the directions. In this particular, surely the world moves. Also, the recipes make quite expensive "dishes."

Far more economical is "The Good House-keeper," dated Boston, 1840; which claims to be, "The Way to Live Well, and be Well while we Live," by Mrs. Sarah J. Hale, author of "The Ladies Wreath," "Traits of American Life," and "Northwood."

Of this cook-book there were two edtions, the second containing extracts from a cook-book prepared by Sir Walter Scott, under the *nom de plume* of "Mrs. Margaret Dods," and an amusing account of the experiments of the "Cleikum Club." Sir Walter extols French cooking, and calls upon the Muse to

Sing the man who to Paris did go,
That he might taste their soup, and their sauces know.

In the first-mentioned book, I find the following recipes:

"To preserve bees from worms and insects: About May 1 raise the hives and sprinkle some fine salt under the edges."

"To separate wax from the comb: Tie the comb in a bag, and place it in

a kettle of cold water over the fire. As the water heats, the comb melts and rises to the surface, while the impurities remain in the bag."

"To make the teeth white: Rub them with a mixture of pure honey and charcoal."

"HONEY CAKE:—3½ pounds of flour, 1½ pounds of honey, ½ pound of sugar, ½ pound of butter, ½ of a nutmeg, 1 tea-spoonful of ginger, and 1 tea-spoonful of salarratus (I keep the old spelling). Roll thin, cut in small cakes, and bake in a quick oven."

MRS. MADISON'S WHIM:—2 pounds of flour, 2 pounds of sugar, 2 pounds of butter, beaten to a cream; 12 eggs, the yolks beaten with the sugar, and the whites to a froth; 2 wine glasses of rose-water or brandy, in which lemon-rinds have been steeped; 2 nutmegs grated, 1 tea-spoonful of salarratus or volatile salts, dissolved in hot water. Beat well together, add 2 pounds of raisins, stoned and chopped; bake in a quick oven. This cake will keep for three months."

In the "American Frugal Housewife" (1836), by Lydia Maria Child, we are told that "honey and milk is good for worms."

The necessity of frequent eating in these hot, oppressive days, sometimes becomes very wearisome to the housekeeper. For the benefit of such, and for the sake of adding dignity and grace to such a humdrum thing as getting breakfast and dinner, I give a few quotations from known *Literati*. Here is a recipe for "Salad Dressing," by Sidney Smith:

To make this condiment, your poet begs
The powdered yellow of two hard-boiled eggs;
Two boiled potatoes, passed through kitchen sieve,
Smoothness and softness to the salad give.
Let onion atoms lurk within the bowl,
And half-suspected animates the whole.
Of mordant mustard add a single spoon—
Distrust the condiment that bites too soon;
But, deem it not, thou man of herbs, a fault,
To add a double quantity of salt.
Four times the spoon with oil from Lucian crown,
And twice with vinegar procured from town;
And, lastly, o'er the flavored compound toss
A magic soupcon of Anchovy sauce.

Some anonymous writer declares that bread is

The very staff of life,
The comfort of the husband, the pride of the wife.

Another thus sings of cake:

With weights and measures just and true,
Oven of even heat,
Well buttered tins and quiet nerves,
Success will be complete.

Again, "To make a salad one must have a spark of genius." Also, "The proof of the pudding lies in the eating;" and, "A hasty plate of soup."

Solomon said: "All the labor of man is for his mouth."

Owen Meredith writes:

We may live without friends, we may live without books,
But civilized man cannot live without cooks.

Longfellow said: "Who'll dare deny the truth, there's poetry in pie?"

Shelley writes: "Custards for supper, and an endless host of other such lady-like luxuries."

Cicero: "Hunger is the best sauce."

Massinger: "Cheerful looks make every dish a feast."

Shakespeare: "And then to breakfast with what appetite you have." "Now, good digestion, wait on appetite." "What say you to a piece of beef and mustard?"

I will close with two seasonable recipes:

FRUIT SALAD (for dessert):— "Slice 3 oranges, 3 bananas, 1 lemon, and 1 pine-apple, and add 3 cups of sugar; let it stand 3 hours, and serve with cake."

SMALL FRUITS PRESERVED WITHOUT COOKING:—"Crush the fruit and add ¾ of a pound of sugar to 1 pound of fruit. Stir several times from the bottom. When all the sugar is absorbed by the fruit, put it in air-tight cans or jars."

HONEY.

What is It, if It is Not "Digested Nectar?"

Written for the American Bee Journal

BY PROF. A. J. COOK.

Such articles as that on page 486, surprise me very much; especially that a person who subscribes himself "Dr.," would do so. Perhaps we can excuse a lawyer for such palpable ignorance, but how, a doctor? Nearly every assertion there made is untrue, as any doctor ought easily to convince himself. Cane-sugar fed to bees is changed to a glucose-like sugar, and from a neutral to an acid substance.

Does the Doctor know what litmus paper is? If so, let him dip such paper into sugar syrup, then into honey, which is the same syrup digested, and he will see his error.

Does the Doctor know of Fehling's test for glucose-like sugar? If so, let him try it on the syrup, then on the "honey" made from it; he will find that the first does not decompose the copper salt, while the latter does. Now this is all true of nectar and honey. Neetar is neutral, and cane-sugar, with this formula, C_{12} H_{22} O_{11}; while honey is acid, with this composition, $2(C_6$ H_{12} $O_6)$. To say that nectar and honey are identical, shows a total ignorance of the subject.

Our friends, whether they be lawyers or doctors, should inform themselves before they speak; especially when it is so easy to do so. We never gain anything by concealing or misrepresenting the truth.

I would never lie to make people eat more honey. Thus I shall continue to speak the truth, and say that honey is "digested nectar;" and as long as honey is so good, I shall have no fear about people rejecting it from their tables, because of this fact. Everybody knows just what an oyster is; yet who refuses to eat oysters?

I earnestly hope that the Doctor will "post up," and then beg the pardon of bee-keepers. I forgive him in advance.

Agricultural College, Mich.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 20.—Northern Illinois, at Guilford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 3.—Iowa State, at DesMoines, Iowa.
J. W. More, Sec., DesMoines, Iowa.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Sept. 14.—Susquehanna Co., at New Milford, Pa.
H. M. Seeley, Sec., Harford, Pa.

Oct. 16—18.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4, 6.—International, at Brantford, Ont., Canada.
E. F. Holtermann, Sec., Brantford, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Melilot-Clover Honey. — Wm. Stolley, Grand Island, Nebr., on Aug. 2, 1889, says:

Notwithstanding the excessively wet and cold weather that we have had here in central Nebraska of late, the bees are doing very well, and from my limited number of colonies, I have so far already secured 1,000 pounds of melilot-clover honey.

Drone-Comb, Buckwheat, etc. —T. F. Kinsel, Shiloh, O., on Aug. 3, 1888, writes:

As a result of experiment and experience I would say that "worker foundation" will not *prevent* drone-comb, though given in full sheets. Bees draw out foundation and *enlarge the cells* to accommodate drone-brood, if they want drones. Bees gather honey and pollen from buckwheat and work on it only in the forenoon; unless the weather is lowery, damp or reasonably cool, they work all day. I have 5 acres of Japanese buckwheat sown and it is now in blossom. Bees work yet on white clover, though through cool wet

weather during apple, clover and basswood bloom, the surplus will not be large. The recent copious rains have caused white clover to come out in bloom and secrete nectar. Can Alsike be delayed by pasturing, and thereby secrete nectar out of its natural season of blooming? Who has tried it? I never knew white clover to secrete, out of season, so much as this year. I have had no swarms. I have had bees enough and do not allow swarming. It is no patent process—just cut out the queen-cells and shave off the drone's heads. Wicked? Selah! It is not half so hard as to see the poor "fellows" driven out and starved to death.

Only One-Third of a Crop.—Sidney S. Sleeper, Holland, N. Y., on Aug. 5, 1889, writes:

I shall have to report about as Mr. Doolittle has—⅓ of a crop; that is, if we get a good supply of buckwheat and fall honey. Now, the prospects look very good. Our white honey crop was very small—not enough to supply the home demand.

Light Crop of White Honey.—A. W. Smith, Parksville, N. Y., on Aug. 5, 1889, says:

The crop of white honey in this locality is very light—probably ¼ of an average crop, or a little less; and what there is, is not of very good quality, as there has been so much rain.

Wood-Sage and Loose-Strife.—Geo. W. Hanson, Chapman, Kans., writes:

I send two kinds of flowers that bees gather honey from. Please give me their names in the BEE JOURNAL. The AMERICAN BEE JOURNAL is a welcome visitor to our house, and is read before any other papers.

[No. 1 is "wood-sage" (*Teucrium Canadense L.*), of order Labiata. No. 2 is "loose-strife" (*Lythrum alatum Pursh.*) order Lythracea.—CLARENCE M. WEED.]

Bee-Pasturage — Saving Seed.—Louis Ahlborn, Patriot, O., on Aug. 3, 1889, says:

Bees have been doing well in this part of Ohio for having so much rain. I commenced the season of 1881 with 4 colonies, and increased them, by natural swarming, to 83, which now are in good condition. I have a bee-shed. In winter I pack my bees on their summer stands, with straw around them, and fodder put on the outside. I have two tiers of hives, one above another. 1. Will it pay to let sumac and persimmon grow up for bee-pasture? 2. In saving the seed from mammoth or pea-vine clover, is the first or second crop saved?

[1. Yes. 2. We think it is the seed from the first crop that is saved.—ED.]

Bees Doing First-Rate.—James Jaggard, Oak Hill, Ills., on August 1, 1889, writes:

Bees are doing first-rate. Each of 5 colonies in 10-frame Langstroth hives, have stored 80 pounds of honey. The basswood did very well this year; our hillsides are full of it.

Bee-Parasite.—Mr. C. C. Parsons, Mount Pleasant, Texas, on Aug. 4, 1889, writes:

Some time since I wrote about worms (moth-larvæ) injuring my trees, and the editor wrote me for a more definite statement. You will find in the AMERICAN BEE JOURNAL for July 20, 1889, on page 452, a description of the insect in question, by Dr. W. B. Rohmer, of Grand Bay, Ala. While the insect may be a wax-moth, its greatest work of destruction is caused by the larvæ penetrating the cells of capped brood. I have not been able to tell whether it feeds upon the young brood or not. Stray colonies are not exempt from its depredations. How to get rid of the pest is the question. Can Prof. Cook tell us through the BEE JOURNAL?

[If Mr. Parsons or Dr. Rohmer will send me specimens, I will cheerfully answer. In order to speak correctly in such cases, one must see the insects.—A. J. COOK.]

The Michigan State Fair.—H. D. Cutting, of Clinton, Mich., says:

The Michigan Agricultural Society has made some important changes in the Bee and Honey department for 1889. Instead of exhibiting full colonies of bees, the premium list calls for "nucleus colony." It was the intention to have it read "1-frame nucleus," as it gives so much better satisfaction to the visitors and exhibitors; it will be adopted by many other exhibitions. If those contemplating making an exhibit of bees will bring just one frame in each nucleus, it will save much confusion with the judging. Extracted honey, which had been dropped from the list, has been replaced, and the premium raised to put it on par with comb honey. The Michigan bee-keepers try to make it pleasant for all exhibitors outside of the State, and cordially invite all to come and make an exhibit.

Honey and Beeswax Market.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.
BEESWAX.—18@20c.
Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extracted increasing; demand light, at 6@8c.
BEESWAX.—25c.
Aug. 1. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—New extracted sells as fast as it arrives. Orange blossom, 7¼@7½c.; inferior Southern, 70@75 cts. per gallon. Some demand for the comb, but we have no stock yet.
July 22. F. G. STROHMEYER & CO., 122 Water St.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.
BEESWAX.—23@28c.
July 16. A. V. BISHOP, 142 W. Water St.

KANSAS CITY.

HONEY.—Old crop all gone. New 1-pounds, 16c.; 2-lbs., 14c. No California comb in the market. Extracted, white, 8c.; amber, 7@8c
Aug. 7. HAMBLIN & BEARSS, 514 Walnut St.

CHICAGO.

HONEY.—New crop is appearing, and prices range from 15@17c. An active market is not looked for till later. Extracted, new crop, 7@8c. Very light receipts, and few sales.
BEESWAX.—25c. R. A. BURNETT.
July 11. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb. No desirable old stock left.
BEESWAX.—24@25c.
July 24. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—New white comb in 1-lb. sections sells at 16@17c. White extracted, 7@7½c.; dark, in barrels, 6c. An active demand is not expected before Sept. 1. No new extracted in the market.
BEESWAX.—None in the market.
July 20. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, bright, 6½c; dark, 5½c. The market is slow.
BEESWAX.—Scarce at 23c. for prime.
July 20. D. G. TUTT & CO., Cummercial St.

NEW YORK.

HONEY.—Market for extracted is quite active. Orange blossom, fine quality, sells readily at from 7@7½c. Off grades of Southern find quick sales at 60@70c. per gallon. No new California honey on this market. Extracted would bring from 7½@8c.—Too early to quote prices on new comb.
BEESWAX.—Dull and declining—25@25½c., good yellow.
HILDRETH BROS. & SEGELKEN,
July 22. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Comb, 17@18c.; extracted, 8@9c. Sales a little slow on account of the warm weather. Quality of new honey is very good.
BEESWAX.—25c.
Aug. 9. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and comb honey, in 1 and 2 lb. sections, 12@15c., for which demand is good. Trade is also good in the extracted, in square glass jars for table use, and in barrels for manufacturers.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Aug. 9. C. F. MUTH & SON, Freeman & Central Av.

Convention in Chicago.—By notice on page 501, it will be seen that we are to have a convention of bee-keepers in Chicago this fall. The time is Oct. 16, 17 and 18. The place is at the Commercial Hotel, when we had such a nice time at the "National," in 1887. Reduced rates are given at the Hotel, and reduced rates may also be had on all the railroads, because it comes near the close of the Chicago Exposition. Every arrangement will be made for the convenience, comfort and pleasure of those who attend. Let there be a generally rally, and "a good time" will be the result.

AMERICAN
ESTABLISHED IN 1861
OLDEST BEE PAPER IN AMERICA
BEE JOURNAL

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

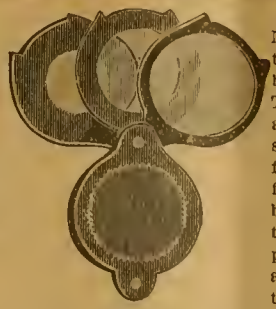
Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Queens.—We can supply Tested Italian Queens at $1.50 each; Untested, $1.00 each, by mail, postpaid.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40
Bee-Keepers' Review	1 50	1 40
The Apiculturist	1 75	1 65
Bee-Keepers' Advance	1 50	1 40
Canadian Bee Journal	2 00	1 80
Canadian Honey Producer	1 40	1 30
The 8 above-named papers	5 65	5 00
and Langstroth Revised (Dadant)	3 00	2 75
Cook's Manual (**old edition**)	2 25	2 00
Doolittle on Queen-Rearing	2 00	1 75
Bees and Honey (Newman)	2 00	1 75
Binder for Am. Bee Journal	1 60	1 50
Dzierzon's Bee-Book (cloth)	3 00	2 00
Root's A B C of Bee-Culture	2 25	2 10
Farmer's Account Book	4 00	2 20
Western World Guide	1 50	1 30
Heddon's book, "Success,"	1 50	1 40
A Year Among the Bees	1 75	1 50
Convention Hand-Book	1 50	1 30
Weekly Inter-Ocean	2 00	1 75
How to Propagate Fruit	1 50	1 25
History of National Society	1 50	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

THE AMERICAN BEE JOURNAL
CIRCULATES
ALL OVER THE WORLD.
PUBLISHED BY
THOS. G. NEWMAN & SON,
CHICAGO, ILL.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Aug. 24, 1889. No. 34.

EDITORIAL BUZZINGS.

My Baby's Face.—On the next two pages we present another beautiful piece of music, which doubtless will find a pleasant welcome in all bee-keepers' homes, around whose firesides are woot to play these happy baby faces. Some of those homes may be babyless to-day, which but recently were made joyous and happy by the prattle and laughing sunshine of the little darlings' angelic faces; and to such we trust that not only the sweet melody of the song, but also the touching sentiment expressed by the words, may help to make more blessed the "living memory" of the "sweet baby faces" which are now "up there with my Father," who has also "saved a place for you."

A Patent was granted on Aug. 13, 1889, to L. W. Spradlin, of Kansas, for a "bee-house." It says: "The bee-house is built of ordinary coustruction, having suitable studding for supporting the same. The inside of the house is lathed and plastered in the usual manner, and the intermediate space filled with sawdust, in order that the house may be dry and cool in summer and warm in winter," etc. Its floor is of "rock," cemented, and has a ventilator in the roof. The patent is "*rich*," but we fear the patentee never will be enriched by it.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

All the Votes received so far, at this office, have been for the Golden-Rod as the National Flower.

The S. W. Rich Lawsuit, which we mentioned on page 515 of our last issue, it seems has been tried by the "Supreme Court," and the next resort is the "Court of Appeals." They call the Courts by different names in New York from what we do in the West. There they also call the judge of one of their Courts a "Recorder," instead of Judge. Mr. John McKeon, Dryden, N. Y., sends this correction of the matter:

You say that the case was tried in the County Court before Judge Boardman. Judge Douglass Boardman was a Judge of the Supreme or Circuit Court, and the case was tried in the Circuit Court at Delhi, New York. The next highest Court is the General Term of the Supreme Court, and that is the Court which confirmed the decision of the Circuit Court last month. The next higher Court, which is also of last resort, is the Court of Appeals.

Thanks for the correction. It means the same thing, only the names differ. The "Court of last resort" in New York is the Court of Appeals—in many other States it is called the "Supreme Court." In National affairs, also, the Court of last resort is the "United States Supreme Court." This will account for our misnaming the Courts in New York. The *facts* remain unchanged.

Mr. McKeon adds: "Judge Boardman has been caught by old age, and will never again decide against the bees. He is retired." It is a *relief* to know that the Judge who likened an apiary to a "pig-sty," or a "slaughter-house," is now retired to private life. We fear he is in his "dotage."

Swarming.—"I should be glad if I could prevent so much swarming." That is what Dr. Miller and all other prominent bee-culturists would like to do. A writer in the *Prairie Farmer* tells us how to do it. It would be big money in his pocket if he would go around and keep bees from swarmiug. I could afford to go down pretty deep in mine. Why do bees swarm, and why do people get married? Why do birds build nests? The Creator commands them to "multiply and replenish the earth," and when the bees swarm they "found" another family.

As to cutting out queen-cells to prevent swarming, I have had a great many swarms that had not even started a queen-cell. Second swarms may be prevented by cutting out queen-cells, but not the first. The writer claims he "can control swarming every time." This is what I cannot do, and what those who own bees by the thousands of colonies would be glad to do. This question, like Banquo's ghost, is always present at all bee-conventions, and no one has ever claimed to be able to solve it.—*Prairie Farmer.*

Last week's Frank Leslie's Illustrated Newspaper shows a strong artistic taste. The Highland Light, President Harrison's visit at Bar Harbor, The Cricket Plague in Algeria, make it the best number under the new proprietors.

White Clover Honey. — A subscriber to the Massachusetts *Ploughman* asks: "Do bees really obtain from white clover as much honey as is supposed? I never see many bees on white clover, and farmers say the same." It is answered thus:

White clover is the best of the small honey plants, but the yield, quantity and duration of flower, depend upon the season. In some seasons it secretes honey only two or three weeks, and, often, no honey is found in the blossoms after the sun is high in the heavens. The reason you do not see the bees working on the blossoms may be that the bees visit the plants only very early in the morning, before the sun is above the horizon.

A farmer sowed buckwheat for his bees, and to plow under as a fertilizer. Visiting the field several times during the day, he was surprised that he could not see nor hear a bee anywhere in the field. He decided to plow under an once, and went to the field for the purpose very early in the morning. Such a bee-picnic, such a carnival of bee sounds greeted him, that he did not dare to drive the horse on to the buckwheat. At that time in the season, buckwheat secreted honey only in the night, and it must be snatched before the sun came up when it would be lost.

The same fact applies, more or less, to clover after the 1st of July. But whatever comes from white clover is the most delicate, most delicious of its kind.

Canadian News is thus given in the last *Honey Producer:*

Almost all necessary steps have been taken to secure a very hearty reception to the members of the International American Bee-Association when convening, in December next, at Brantford.

The honey season to date, (July 10) has been remarkable neither for its success as such, or its falure. Of course localities vary considerably. The amount of honey secured has been affected by the strength of the colonies when the season opened. The number of colonies kept in a locality no doubt also influences the crop. On the whole, a fair crop thus far has been secured. Linden will tell the tale.

Upon the question of misrepresentations about honey and the like, Bro. Newman of the AMERICAN BEE JOURNAL, is continually compelling the leading papers of the continent to withdraw statements made, and statements which if not retuted would be very injurious to the bee-keeping industry. We congratulate Mr. Newman and trust he may continue to perform this often *unpleasant* task, without flinching.

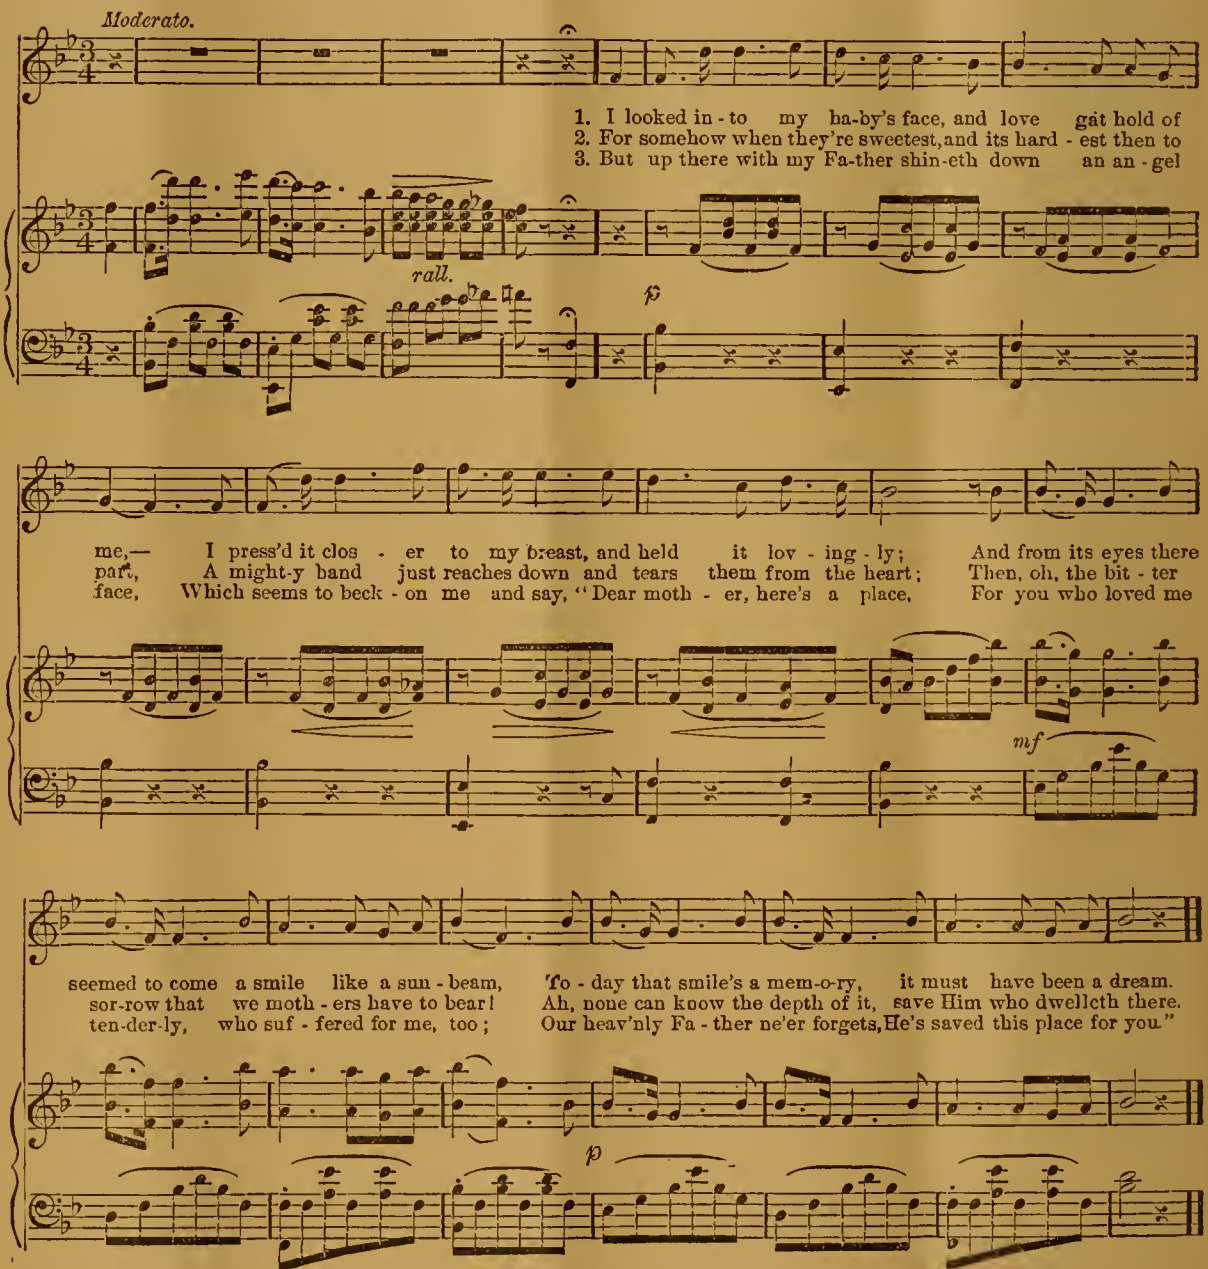
Bees Looking for their Tormentor.—The following item is taken from an exchange:

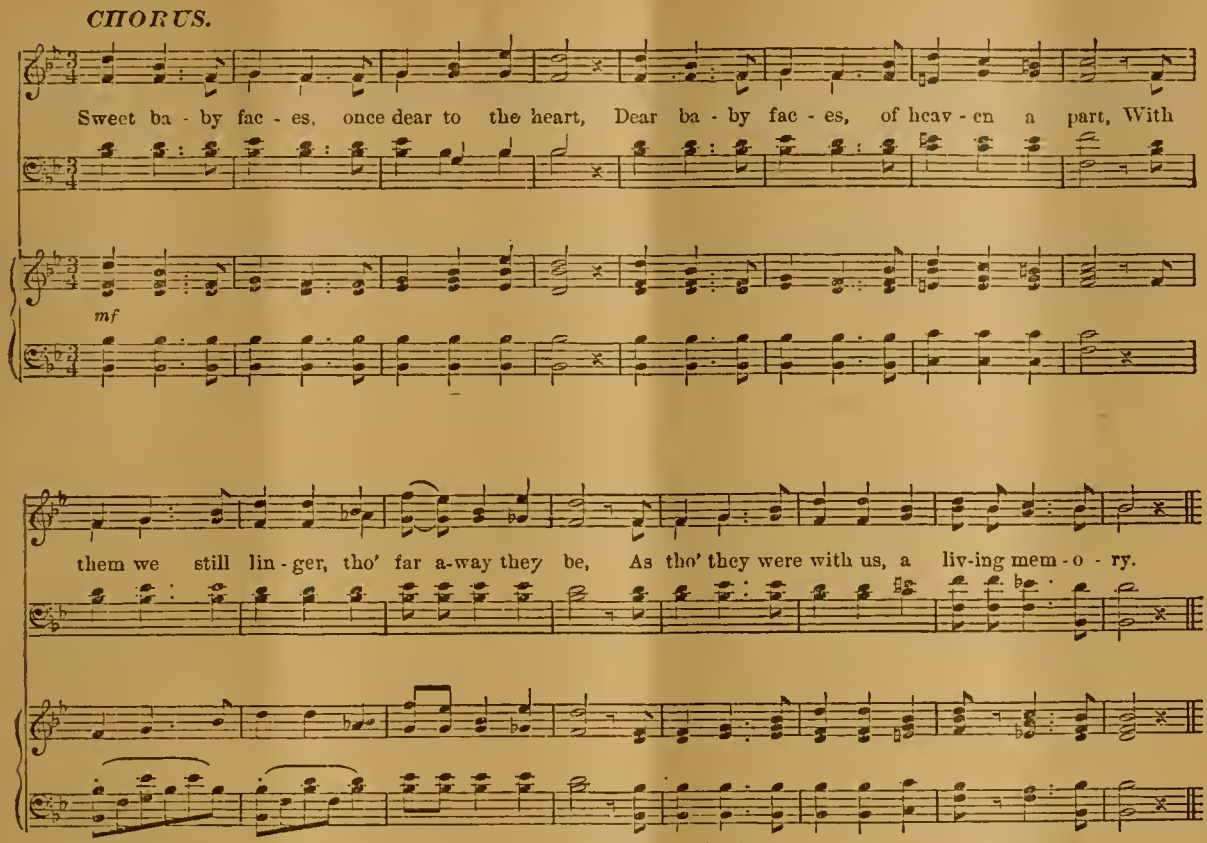
A steamer which arrived at Colombo recently from Bombay via coast ports, reports that at Cannonore, where she lay two miles from the shore, a large swarm of bees, numbering some tens of thousands, settled on her foreyard, forming a cluster about three feet long by eighteen inches in depth. It was considered inadvisable to attempt to dislodge them before the arrival of the vessel at Colombo, as at each of the coast ports she lay some miles from the shore. But several nights after, the third officer, enveloped in a blanket and armed with a hose, climbed the mast and gave the dangerous visitors a dose of salt water. The infuriated bees flew about the ship all night in search of their disturber, but not finding him in the morning, they concluded to quit. They were last seen making a bee-line for the northern suburb of Colombo.

MY BABY'S FACE.

Written expressly for The American Press Association.

By JOHN de WITT.





The What and Why of Agricultural Experiment Stations—Farmers' Bulletin No. 1—issued by the Office of Experiment Stations of the U. S. Department of Agriculture, Prof. W. O. Atwater, Director. This is a brief account of the Experiment Stations, what they are, what they are doing, and how they do it, together with a short history of the origin and development of Experiment Station work in this country, and an account of the work in the same line in Europe. An immense amount of interesting and valuable information is compressed within the narrow limits, 16 pages, of this little pamphlet. Amongst other things we learn that no other country in the world has undertaken scientific work for the benefit of its farmers on such a vast scale as the United States; that in a great many cases a single line of investigation pursued at an experiment station has saved more money to the farmers of the State than its entire cost of maintenance; that the effect on the farmers themselves in spite of the short time the experiment stations have been in existence has been most marked, inducing them to seek to apply the results of scientific research to their work. This work costs the country, including both state and national appropriations, over $700,000, and employs over 370 scientific men. This expense, however, is a trifling one in comparison with the annual value of our agricultural products, which is not less than 2,200 million dollars.

GOLDEN-ROD.

From the flying train, behold,
Ever changing fields of gold,
Sunny slopes in luster laid,
And old gold the hills in shade;
Golden, golden! Wave the plume,
Freedom's fallows give the room;
Unsubdued by wit of man,
Symbol flower, American.

Like a bit of sky at night,
Full of constellation light,
Comes the vision of the plume
Bending o'er with starry bloom,
Sunshine, dew and burnished gold,
Each declare the story old,
How in endless chain of thought,
Wisdom unto wonder wrought.

Symbol flow'r American,
Underneath I see thy plan—
Brotherhood of stems that run
Closer till they meet in one.
Type of higher federation—
States unite, and lo, a nation!
To the world the lesson give,
How to govern, how to live.

Rich the bounty, here we see,
To the pople ever free;
Plenty flows as beauty beams
In a thousand golden streams.
To a nation Golden-Rod
Lifts its head above the sod,
Love and justice to propose,
Gold for friends, and rod for foes.

—*Vick's Magazine* for August.

The "Queen-Breeders' Journal" is to be consolidated with the "Western Apiarian." It lived six months.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on Wednesday, Thursday and Friday, Oct. 16, 17 and 18, 1889. Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be very low. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.

H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Romney, Ont., Canada.

☞ The Iowa State Bee-Keepers' Association will meet at the State Fair Grounds during the State Fair week, commencing on Sept. 3, at DesMoines. The meetings will be held in our large Tent, and an invitation is given to all bee-keepers to meet with us, bringing their families and friends, and help to make our meeting one of interest to all bee-keepers.

MRS. O. F. JACKSON, *Pres.*

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

QUERIES AND REPLIES.

Future Inventions and Experiments in Appiculture.

Written for the American Bee Journal

Query 650.—1. Of what nature will be the next economic invention? 2. What great ecomomic invention is most needed, and now called for by honey-producers? 3. Does anything remain to be invented by man, which shall be as revolutionary in its effects as the application of movable-comb frames? 4. Have we arrived at the summit of excellence in our apicultural implements and fixtures? 5. Is it worth an inventor's time to make improvements? That is, could he receive remuneratioo, or a respectable hearing from supply manufacturers? 6. What experiment is required as to breeding bees?—First, as to grade, heredity, "blood," character and color; Second, as to hardiness and honey-gathering. —J. W. Tefft.

You have taken my breath away. This is too much, all at once.—H. D. CUTTING.

1. I give it up. 2. Ask Messrs. Heddon, Bingham and Shuck. I think the great hope is in the direction of breeding. Much may be done in that. —A. J. COOK.

1. I do not know—probably a bee with a longer tongue. 2. Nothing more is needed. 3. No. 4. Yes. 5. No, it is not worth his time till after it is done—then, if he is succesful, it pays. Everybody can have a respectable hearing.—MAHALA B. CHADDOCK.

When the bee-keepers of the country feel the need of something radically different from what we now have, some one will arise to supply the want.—G. M. DOOLITTLE.

If I could answer all these questions, I would astonish the world by bringing forward the discoverics, and talk about them afterward.—EUGENE SECOR.

1. To prevent swarming. 2. A machine that will uncap and extract at the same time. 3. No. 4. About half way. 6. Breed always from the best.—MRS. L. HARRISON.

1. Who knows? 2. Very likely the next important invention will come unasked, just as the extractor did. 3. I cannot tell till after its invention. 4. Probably not. 5. A real improvement would doubtless command attention—C. C. MILLER.

1. In all probability, a telephone to the moon. 2. A process by which they can realize the most money from the sale of their products. 3. Yes, sir, a machine to keep Alliance men, Wheat men, etc., in the ranks until trusts and combines are "bursted." 4. No. 5. Yes. 6. This ground has been thoroughly gone over.—J. P. H. BROWN.

1. I do not know. 2. A cheaper and better extractor is yet to be invented; and, I believe that a way will yet be found by which most of our sugar will be made of honey. 3. I believe so—many things. 4. No! not by many miles! 5. Yes. 6. In answer to this question, the first great experiment should be to find some cheap and practical way of breeding queens at control. If this were made possible, the great and unexpected results would be obtained. There is a great field here for the explorer, and it is worthy of his attention.—WILL M. BARNUM.

1. This is a *stunner*—I give it up. 2. To produce plenty of bloom, and put the honey in it. 3. Certainly, and some man will bring it out. 4. Yes, if *really* an improvement. Manufacturers would readily take hold of anything of real merit.—C. H. DIBBERN.

1. I do not know. 2. If I knew, I would supply the need by the invention. 3. I think not. 4. I presume not. 5. That depends upon whether he can invent anything of real value. 6. It would require a series of articles to answer this question.—M. MAHIN.

1. It will not be a hive composed of enough lumber to build a small house. 2. I do not know. 3. I think not. 4. In many things we have. 5. Probably not. 6. It is not easy to fore-cast the results of experiments; they must be made, and the requirements and results determined by subsequent observation.—G. L. TINKER.

1. Who can tell? 2. Who knows? 3. I think not. 4. Pretty nearly so, as the field is narrow, and is pretty well occupied. 5. I do not think that any patent on bee-hives or appliances, will be a paying thing. 6. It would take a whole volume to answer this question. A single experiment would amount to nothing, as it will take years to fix any essential trait, and then prove nothing.—J. E. POND.

1. What? 2. Several; but what are they? 3. No doubt it will be many years yet, but it will come. 4. We have got pretty high, but not to the summit yet. 5. It depends upon the improvements. No doubt, if his invention is useful, etc. 6. Practical experience, intelligence, energy and good judgment.—P. L. VIALLON.

1. I do not know, but I wish it might be something that would do the household drudgery, now done by our good wives and mothers. 2. Something to prevent the swarming impulse in bees, when the mercury is trying to reach 100° in the shade. 3. I guess not. 4. I believe not. 5. Yes, but all inventions are not improvements. 6. An answer would require too much room for this department.—A. B. MASON.

1. A stunner. 2. Non-swarming, non-drone-producing, queen-fertilizing hive. 3. Yes—the above. 4. Who can tell when we are at the top round of the ladder? 5. If the improvements are of sufficient magnitude, yes; and the inventor should receive a handsome competence, and "paddle his own canoe," by manufacturing then himself. 6. I will leave this to Doolittle and others more competent.—J. M. HAMBAUGH.

1. I am not a prophet, Mr. Tefft. 2. An automatic machine to do all the work in the apiary, while I stretch my bones in the shady arbor, and look complacently on, or doze dreamily under the soothing hum of a thousand winged workers. 3. The best thing that we can get, so that it is not a "patent bee-gum." 4. Yes, lots of things yet uninvented could be used by the inventor if no one else. 5. Never mind the respectable part of the business, a patent wooden "nutmeg" is as liable to win "respect" as anything else. 6. Oh, don't!—G. W. DEMAREE.

1. Of an unexpected nature. 3. An automatic, triple-acting, self-binding swarmer. 3. ? 4. No. 5. No. Do you not read current apicultural literature? Intelligent bee-keepers make their own fixtures, largely. Manufacturers of supplies make goods to sell, and the great mass of those who use the goods know nothing of improvements in this line, except what they read in manufacturers' circulars and price-lists, and so, having no ability to judge of defects or improvements, they are well satisfied with what they got before. Besides, manufacturers dislike change, have pet inventions of their own, and are interested in keeping up the vicious prejudice against patents, so that it is all that one's life is worth to introduce the most obvious improvement is existing fixtures, if he seek any pecuniary recompense, as the history of these things during the last few years shows; indeed it is hard to introduce such an improvement as a gift, if one insist on having the honor of having made the invention. 6. ?—R. L. TAYLOR.

1. I give it up. 2. It seems to me that the most-needed invention is in connection with honey-extractors. So far as I know, we never had a half-way-decent honey-extractor; that is, one at all worthy of the use of a bee-keeper who produces tons of extracted honey. The best of our present machines are just good enough for amateur bee-keepers, who have from three to ten colonies of bees. 3. I presume so, but I do not know what, or I should get right to work on it. 4. Certainly not. 5. Certainly it is, but he would not be apt to get much reward unless he got a good, strong patent, and then enforced the law, which he would certainly do if he had any energy and intelligence. We have had ample evidence, in more cases than the Langstroth invention, that quite prominent

bee-keepers will prevaricate, and try to rob an honest inventor. Perhaps your aim in asking this question, Mr. Tefft, is what I have many times been sorry that I did not do—try to draw out of every bee-keeper possible, all he knew and conceived about certain lines of inventions connected with bee-keeping, and then it would be a little darker, after something had been brought out, for them to say, "Oh, I thought of that long before." 6. For 12 or 15 years I have made the breeding of bees for business, a special part of my work, as the readers of the AMERICAN BEE JOURNAL very well know, and my method has been not to aim at any particular color, "blood" or grade, but to breed direct for hardiness and honey-gathering qualities, and this is the simplest thing in the world. It is very easy to know what you want, and very easy to discover where it exists in your apiary, and just as easy to breed in that direction, without any power to fertilize queens in confinement. —JAS. HEDDON.

1. I do not know. 2. I do not know. 3. I do not think of anything just now, and I have tried *very* hard. 4. I hope not. 5. Yes, always. The inventor will probably never be paid for his troubles. An inventor, as a rule, never is paid. The public is even *cautioned* (by moulders of public opinion, in print and elsewhere, who could not otherwise be seen except to hoist themselves upon the structures reared by these inventors), to invest in new things sparingly. Personally, I have no complaint to make, but the inventor in "bee-fix-in's" meets very little encouragement in our modern literature, and, in some cases, opposition that is almost malicious. 6. "What experiment?" I should like to ask the querist what *first* experiment out of the many, many thousands of experiments yet to be made? This sets us loose in the field, where the vender of "traps and sticks" and the employer of child-labor will be obliged to seek the shade, along with the balance of us, and depend upon his own resources, at least, till he learns something. Ring the bell, Mr. T., and call the school to order.—J. M. SHUCK.

These questions are unanswerable. If any one *could* answer them, he could supply the want by inventing the article. Men may speculate, but inventions do not come in that way. They are usually "sprung" upon a wondering world, when it expects nothing of the kind. We have done all we can do to encourage invention, but while the Patent Office is run in the way it is now, there is little prospect for anyone to obtain a sufficient "remuneration" for inventions of any kind used by apiarists. The amount involved is so small.—THE EDITOR.

CORRESPONDENCE.

QUEEN-REARING.

Candy for Queen-Cages, Securing Queen-Cells, etc.

Written for the American Bee Journal
BY S. W. MORRISON, M. D.

A great many leading queen-breeders have at various times written to me, asking how I made the food that I used in my queen-cages. I have had good reason to decline to give it, but I now feel free to do it.

It requires a candy expert to make it, and is made simply of apple-blossom honey (any other good honey will do as well) and confectioner's "A" sugar, boiled together, and kneaded while hot. I furnish the honey, and ask the confectioner to make me "cream candy," using *no glucose* or water; the result is a candy which will never get dry, and will keep in a dry room in a close tin vessel for years.

If the confectioner should get it too thick, a little more honey can be worked into it; if too thin, a little pulverized sugar can be added.

I provision my queen-cages with this candy, send them to Austria, and have queens sent to me from there. Another secret of my success in mailing queens is, that I never neglect to pour into the space intended for food, melted wax or paraffine, and, thus prepared, the candy can remain in the cages for a year, and used successfully.

Securing Queen-Cells.

Mr. Alley's method of queen-rearing is a grand success. I can readily get from fifty to seventy queen-cells every time, by only following his directions. His method can be applied, and as many fine queen-cells obtained from a colony that is just made queenless. Take a frame of empty comb, insert a knife at one end of the comb, about 3 inches from the bottom, draw it towards the other side of the comb in a circular line, striking the middle of the comb about 1½ inches from the bottom, and coming out on the other side of the comb 3 inches from the bottom; now have a very sharp, thin-bladed knife, a little wax just melted, and a tin cup of hot water, all handy in a room warmed to about 100°.

Secure a comb of eggs from the selected queen; cut a sufficient amount of it up into strips of one row of cells, cross-cut these strips into two-cell pieces; dip each piece into the melted wax and quickly fasten to one edge of the cut comb, which stands inverted convenient to the melted wax. These little pieces of comb should be about ½ inch apart, and project slightly outward. Another row can be placed on the other side of the comb projecting slightly outward.

Give at once to a colony from which the queen is just removed, and they scarcely ever fail to give a good queen-cell for every egg that is thus given them in good condition.

If the comb containing the eggs is old and tough, it is well to pair down with a sharp knife these rows of cells, taking off about one-third. I would prefer the old, tough comb because it is more easily handled.

After three or four days it can be removed to the upper story of a colony, with a queen-excluding honey-board, to be finished, and another frame of eggs given; and when it is ready for removal, other cells will be found in the colony, which can be removed, and the process repeated. I have never by any other method secured finer queens, nor half the number.

Oxford, Pa.

COMBS.

Preserving and Caring for the Empty Combs till Needed.

Written for the American Bee Journal
R. F. HOLTERMANN.

There are doubtless very many like myself, who have had great difficulty, and even suffered loss from moth in wax-comb. By this I do not mean that the moth destroys the comb upon which the bees are in the hive, for whenever any one makes the assertion that "my bees have been destroyed by the miller," I come to the conclusion that ninety-nine times out of one hundred, yes oftener, the bees did not perish through the work of the "miller," or they were black bees. For this reason, and for many others, I should condemn anything but a sprinkling of "black blood" in the apiary of the inexperienced bee-keeper, and probably even that.

To what I desire to make special reference in preserving comb, is to comb used for extracting, or comb not occupied by the bees—these have to be guarded against moth.

I never have any objections to leaving supers with comb upon the hive until I wish to prepare my bees for winter. The bees will draw from them, if uncapped, any honey that they may require for immediate use, and, if room, even for winter, and I prefer this method to suplying it to them through artificial feeders. Here, too, the honey is ripened and kept from granulating—something of no small importance.

If for any reason one has combs otherwise, then I find, if free from honey, the best place is a cool, dark room; a cellar partially underground is very good—of course it will not do to have honey in the combs, as it will absorb moisture and sour.

I have found it no easy matter to keep moths out of combs in a warm room, with fresh pollen in the combs. Brimstone is all right enough, but when our time is fully occupied, the first thing we know, the combs will be destroyed. The ease of doing the work looks nice on paper, and also looks well to say, "If you have not time to attend to combs, don't keep bees;" but the fact remains that many do keep them who often are so busy that they forget such a matter.

If well fitting, moths can be kept pretty well out of supers, by putting one on top of another, with a layer of paper between each — the entrances should be stopped up, of course.

I thought perhaps a few hints upon the subject might be of value to beginners. Many are in a position to so place their combs.

Romney, Canada.

SUNDAY.

Do Bees Swarm more then than any Other Day?

Written for the Prairie Farmer

BY MRS. L. HARRISON.

Many persons think that bees swarm more on Sunday than any other day. I do not think that they do, but we notice it more. It is a day of rest, and after hiving all the week, bee-keepers would like to enjoy a rest. Last Sunday I felt that swarming was about over, and that I could enjoy a day of rest, and lie down upon a lounge, with some choice reading-matter, when that familiar cry, "Bees swarming," sounded upon my ear. "Where are they from?" "Don't know; they are clustering in the peach tree."

I tied on my bee-hat, with a resolve to find out where they came from, even if I had to look at every colony in the apiary. This can be definitely ascertained, by the young bees in the grass, that are trailing after them. I soon saw that they had come from a hive where the bees had been clustered out. This colony had swarmed about nine days before, and I had caught the queen, caged her, and left her on top of a hive; it was a very hot day, and although it was but a few moments before I returned, I found her dead, and no mistake about it. I know that no bees had stung her, and what killed her I do not know, unless it was the heat. The top of the hive where I placed her, covered with a wire-gauze cage, was painted white.

The bees, missing their queen, returned to their hive and clustered on the outside, and remained there, waiting for the young queen, when they would swarm again. I do not take much stock in such sulking and idleness, and resolved to return them when they swarmed. They had plenty of room, and why not go to work? I let them hang clustered, while I took off their case of nearly-empty sections, and lifted out the combs. There was very little brood, and what there was, was sealed, and not a large amount of honey. I saw where two queens had left their cells, and there were a number of small ones on the face of the comb; these I removed, extracted the honey, and replaced the combs.

When I removed the combs, the remaining bees clustered on the outside of the hive. There were not more than two quarts of them, and it would have been poor economy to let them have the use of hive and combs, as it would have been all that they could possibly do to get strong enough to endure the cold of another winter, without laying up any surplus. The swarm was a very large one, and when I had brought part of them back, securing the queen, the rest soon followed. I knew there were two queens, and supposed one would be destroyed.

I noticed this morning that, apparently, the bees that remained in the hive were clustered on the outside, hanging in a cluster to the projecting edge of the cover. I lighted a smoker, and taking a long-handled spoon, slowly dipped them off, and placing them in front of the entrance, watched them carefully as they marched into the hive. I soon saw a queen, which I picked up and gave to a queenless colony. These bees were devoted to their queen, and if she had not been removed, might have taken wing. When she was removed, the bees united with the swarm, and all was lovely.

Queenless Colonies.

I never remember of finding so many swarms that had filled their hives with comb and honey, and yet did not contain one cell of brood, which was proof that they were queenless. I have supplied a number of such, by letting virgins run in at the top, or down through the sections as soon as they left the cell. They are well received; the bees seeing the young, downy things, appear to take no notice of them. If they are a few hours old, it makes a difference.

When I have had second swarms issue, I take out the combs and carefully remove all queen-cells, preparatory to returning the swarm. Many times the queens come out while I am doing it, as the guards are disturbed. As fast as I can, I drop them into other colonies where they are needed, being careful to disturb the bees as little as possible. Those cells containing queens I place between combs, where they can come out at their leisure.

Peoria, Ill.

EXCLUDERS.

Making Wire-Cloth Excluders for Queen-Rearing.

Written for the American Bee Journal

BY DR. G. L. TINKER.

Many bee-keepers are desirous of rearing queens over full colonies, while there is a laying queen in the brood-chamber. I have now found a plan by which this can be done, viz.:

Take any strong colony and place on a zinc-excluder, then the "Queen-Rearing Chamber;" put in combs of brood from other colonies and introduce queen-cells about to hatch. Two days after lift off the chamber, leaving the cover on, and take away the zinc-excluder, and put in its place a wire-cloth excluder. Put on the queen-chamber, take out the corks, and the the young queens will duly become fertilized.

Lest the queen coming out in front over the entrance, should find her way into the brood-chamber with the flying bees, and destroy the laying queen, I put over the entrance a zinc-excluder: this obviates all danger of the reigning queen.

The wire-cloth excluder is made as follows:

Take a frame of the same size, and simular to the framing of the wood-zinc honey-board; put in a cross-piece, and then tack on one side a sheet of wire-cloth, 12 meshes to the inch—the common painted article. Nail in between the cross-piece and the frame, narrow strips of wood, to come up against the partitions in the queen-chamber, so as to close each of the apartments from below to the bees. Thus the heat of the colony will pass up, and aid in protecting the brood above, and keep the bees in the queen-chamber of the same scent as the colony below, so that they may be re-united at any time. This arrangement may also be used over any colony working in the sections.

My present belief is, that this is the easiest and cheapest method that we shall get to rear and secure the fertilization of queens.

New Philadelphia, Ohio.

EXPERIMENTS

In Getting Young Queens mated Above the Zinc.

Written for the American Bee Journal

BY E. L. PRATT.

I have been experimenting considerable this season, on getting queen-cells, and young queens mated behind and above queen-excluding metal. I have found that Mr. Doolittle was a little bit hasty, or much mistaken about getting queens mated as he decribes in his book, do everything you will with the young queen until she takes it into her head to fly out to mate. This is where the plan has failed with me every time. Out of the many times that I have tried it, in various ways and under different circumstances, she has been balled. I cannot account for it in any way. Why the bees will tolerate a second queen in the same hive for several days, and then ball her, is a question with me. If the queen in the other part of the hive is failing, balling does not happen.

If a hive is divided into two parts, and a cell put into each, both will hatch, and the queens will mate all right; but if they are left in the same hive any length of time, one of them is sure to be balled. The only way that I have been able to get a queen in each section, is through a cell. Strange virgin queens will not be accepted. I have picked off the combs in one side of a hive, divided in this way, eight young queens about two hours old. They were unharmed by the bees, or by each other. They did not seem to notice one another at all.

In a private letter from Dr. Tinker, he says that he has no trouble in getting queens mated from his "chambers," which are arranged with double metal, and a frame of comb between, in such a manner that the queens cannot peep through the perforations at each other.

The plan of securing cells over a zinc honey-board is an easy and inexpensive one, but the serious defect with it is, the young larvæ are neglected, to a certain extent, and poor queens the result. One day I "pinched" about thirty queens from these cells, on account of their small size.

The zinc is valuable for preserving cells from flying queens. One time I had given a queenless colony forty-five fine, large cells, many of them natural, to care for until they were cut. When I went to them, a few days later, I found that a virgin had got in, and was having great sport tearing down my "dollar bills." Since then I keep all cells where flying queens can not enter.

The new Alley plan has been successful with me, as far as I have tried it, as given in his pamphlet. It requires constant attention or swarming will result. By combining the two methods I found that this *constant* watching was done away with, and swarming was impossible. On the second day, just before sundown, transfer all cells from the building colony to an upper story of a strong colony, over zinc, and have them completed there. The great risk is in waiting until the third day.

The crowding-out method of securing cells is good, but the draw-back is incessant swarming. The plan that suits *me* best, is a combination of the Doolittle and Alley plans, with a little Tinker and Pratt mixed in. It is simple, not very expensive, and effectual. The queens are well developed and strong. When I put one of the cells (secured by this method) into a nucleus, I can go to them in ten or twelve days, and take out a fine laying queen, invariably.

Securing Healthy Queen-Cells.

The method which I employ for securing healthy queen-cells in abundance, is as follows:

The colony chosen should be of good strength, and prepared after the Doolittle method of taking away the queen, and feeding for three days.

I use the Alley plan for preparing the larvæ; but, instead of attaching the strips to an old comb, I use a bottom-bar that will just fit between the end bars of my frames, to which the strips are attached.

A piece of foundation about three inches wide is fixed to the top-bar of an empty frame, and this prepared bottom-bar is put just below the foundation.

If the colony is very strong, give it an extra empty frame with a small piece of drone-comb starter: this will keep the bees from building drone-comb on the cells, to bother one when cutting them out.

Date the bar and insert the frame between two combs of pollen and honey. *Feed all the while.* On the third day, remove the frame and cells to a full colony, separated by queen-excluding metal. Give to the rearing colony the queen on the frame of brood from the next most populous colony. In three days' time the colony from which the queen was taken will be ready to rear a batch of cells, when the balance of the brood can go to the colony that just finished theirs.

In this way, two colonies with one prolific queen will give from twelve to fourteen cells every six days, and no colony need to be queenless for more than six days. If the finishing and capping of the cells is done in the super over the queen-excluding honey-board, one day can be saved on each batch of cells.

To cut out the cells, remove the bar to which they are attached, or nursery-cages can be slipped over each cell, and the frame left on the super until the cells or virgin queens are needed.

If the cells are finished by another colony over the excluding metal, the super should be well stocked with hatching brood, and the prepared frame should be placed between two frames of brood in the larval state. This is to insure abundance of food to the young queens.

Marlboro, Mass.

GRANULATION.

How Can Extracted Honey be Kept in Liquid Form?

Written for the American Bee Journal

BY GEO. P. HOWELL.

Can any of the readers of the AMERICAN BEE JOURNAL give me some light on the question of keeping extracted honey from granulating in cold weather? or if not keeping it from granulating, at least delay it?

Last winter, although very mild, I was so much troubled with my honey in glass jars, candying, that I gave up selling it at a time when my sales would have been very good. I had to take back the honey so often, put it through the process, that is, putting the pans in hot water, renewing lables, etc., that there was not much money coming to me.

I am aware that granulated honey is sold in the North in great quantity, and that most prefer it in that condition; but down South they do not want it that way, and one can not talk them into buying it.

The moment a jar shows white, its fate is sealed, and it is destined to remain on the shelf until taken back.

Last winter, a dealer, so much annoyed by all sorts of questions asked, and by the assurances of knowing ones, that "that white stuff" was not pure, etc., so disgusted him, that no talk on my part, or evidence offered to prove the purity of the goods, and even better terms could move him. His answer was, "I would not handle that honey, if you gave it to me." Why, it takes all of my time trying to convince the people that it is pure—a thing they do not want to believe.

If the producer could have a talk with every consumer, at every store, he might make this matter clear, although I know from expierence that his task will be anything but sweet.

Some may ask, "Why use glass jars?" I do so because they come to me cheaper than tin pails, are a neater package, etc.

I do not wish to adulterate the honey, but it seems to me that some harmless substance could be worked up in the honey, that would stop or delay its granulation. I make a little living by producing and selling honey, but I cannot do anything in winter, hampered as I have been.

P. S.—I forgot to state that all my jars had on the back, a notice lable. such as dealers keep in stock, in regard to granulation.

New Orleans, La.

[We do not know of anything which will make honey remain liquid, without at the same time adulterating it.—ED.]

OUT-APIARIES.

The Management of Several Apiaries at One Time.

Written for the American Bee Journal

BY JAMES HEDDON.

I have been interested in reading Dr. Miller's series of articles on "Out-Apiaries," in *Gleanings*. While perusing them, I have noticed how very different are many of the conditions in different localities. I am the more induced to say something upon this subject, by reading the controversy between Messrs. Dadant and Hutchinson, which makes a very good text for this article; the more so because Mr. Dadant mentions the number of colonies which his man can manage, and quotes himself as saying that *I* want "a good man in each apiary."

From what I have read from the pens of Western apiarists, and what I have seen while visiting them, and from what I know about honey-production, I can very readily account for the great difference of opinion between such thoroughly honest and practical men.

I remember once having a lively discussion with Mr. E. J. Oatman, of Dundee, Ills., on the question of working several apiaries; namely, whether it were best to have a good man in each apiary, with a number of colonies equal to his time and skill, or whether it were better to keep a less number of colonies in a larger number of apiaries, and have one or two parties to do the work by driving from one to the other. I took the former ground, while Mr. Oatman took the latter. He tried it his way.

A few years later he visited me, when the same subject came up, and he said that he had changed his mind after trying it, and that he should thereafter have a good man in each apiary, with bees enough with each apiarist to be worthy of his hire. But further, my locality more readily demands that closer-attention system than does Mr. Oatman's at Dundee; and no doubt his is more like ours in that respect, than is that of Mr. Dadant's.

Then, again, Messrs. Dadant & Son produce extracted honey exclusively, while Mr. Oatman produces comb honey, and in this locality we get both in the same apiary, sometimes running more to one, and sometimes to the other, according to circumstances.

Although I have never tried it, I have often thought, and now believe, that with my new hive (with its divisible brood-chamber and plenty of those brood sections) I could very readily so manipulate an apiary run for extracted honey, that so very few swarms would issue that it might pay me better to work several apiaries on the drive-around plan, that to keep a man in each yard. I do not know, but I fully believe this. It seems very clear to me that all this wide difference of opinion between two honest bee-keepers, has grown out of a hasty blindness, or not understanding the circumstances and conditions of each other.

The early honey crop here, namely, clover and basswood, is almost a total failure. The fall harvest promised fairly, but the cold nights of the fore-part of August hurt that, and what the outcome will be, it is too early to say, yet.

Dowagiac, Mich., Aug. 10, 1889.

PRICE OF HONEY.

Honey Market Ruined by Short-Sighted Bee-Keepers.

Written for the American Bee Journal

BY A. J. DUNCAN.

I am glad to notice in the AMERICAN BEE JOURNAL that there is quite a revival in the "Bee-keepers' Union," since the successful termination of the Arkadelphia lawsuit. That is well. Nearly everything now is run by combinations and trusts; we have sugar-trusts, salt-trusts, and, more recently, an ice-trust—in short, every industry is run by trusts, and I sometimes fear that some enterprising individuals will get up a trust on the water that we drink, or the air that we breathe. Why, then, should not the bee-keepers combine for protection?

But the greatest protection that bee-keepers need in *this* section of country, is to be protected from the bee-keepers. That may look paradoxical, but nevertheless it is true. The last two or three years, as every bee-keeper knows, were very poor years for honey; what little surplus we had, we sold readily, but at rather a low price, for people here will not pay a high price for honey, for they consider it more of a luxury than a necessity.

This season so far has been a little over an average for the production of honey. I was working hard and selling my neighbors some very nice extracted honey at 10 cents per pound, and congratulating myself that this year I would make up some of my losses for the previous poor years. But went to our county-seat (Indianola) on Aug. 3, on business, and, to my surprise, I found the town full and running over with honey, both comb and extracted, and it was not brought there by the "small fry" that generally spoils our honey market, but large producers had brought it in by the barrel, and fine extracted linden honey was retailing at 6¼ cents per lb; one-pound sections at 8 cts.—and these same individuals pay 10 cents per pound for the commonest kind of coffee C sugar!

I came home feeling thoroughly discouraged, and utterly disgusted, and feel like giving the worst enemy I have my bees, and quitting the business. One thing is sure—if I cannot get better price than the foregoing, I will have a good start for a crop of honey next year, for I won't sell!

Hartford, Iowa, Aug. 6, 1889.

HONEY.

Encouraging the Production of Our Own Sweets.

Written for the American Bee Journal

BY SIDNEY S. SLEEPER.

Having been interested in apiculture for the past thirty years, I have been called on occasionally to give an essay on the subject at our State and county institutes. I had occasion to attend the Cattaraugus county institute, held on July, 2, 1889. In doing so I had to pass through Wyoming county, the home of Mr. E. D. Keeney, a professional druggist and apiculturist, and so concluded to call on him, having seen him but once before, and that was at the first meeting of our Erie County Bee-Keepers' Society, held on June 15, 1889. He then became a member.

When calling, I asked him to explain how he obtained such a large yield of honey, as I had heard reported from his apiary. He could not do so without showing the quality of the bees

that gathered it. We went to his apiary, and he there showed me the finest and most beautiful queens, drones and workers that I ever saw. I was not long there before I tried to persuade him to make an exhibit of his fine stock at the International Fair, to be held in Buffalo, commencing on September 3, and continuing ten days.

I now have a letter just received from Mr. Keeney, saying that he will make an exhibit of queens, drones and full colonies of his bees, at the Buffalo Fair; and he will give his experience in judicious breeding at our next society meeting, which is to be held in Buffalo, on September 5, during the fair. I consider his exhibit and experience of great value to our pursuit.

It is my object to induce more people to keep bees, for the reason that we have only 300,000 bee-keepers in the United States, and only an average of 10 colonies each. They produce annually about 120,000,000 pounds of honey, and at the same time we import 2,400,000,000 pounds of sugar, at a cost of about $75,000,000. Not more than ten per cent. of those favorably situated for the cultivation of bees, are engaged in the pursuit. If they were so engaged, the annual product of honey would not fall below $150,000,000, for honey alone.

Instead of being importers we would be exporters of sweets, with a balance largely in our favor. A large percentage of these imports do not bring with them a character above suspicion. Instead of paying our money for the vile adulterations of foreign importations, our apiculturists should gather the pure and wholesome nectar annually wasted in their own fields.

I do not think that there is any fear of over-production, for consumption generally keeps pace with production. It cannot be expected that we will have a full crop of honey in all parts of of our vast domain every season.

To induce more people to engage in the pursuit of apiculture, our queen-breeders should breed for docility, so that even the timid may handle bees with impunity.

I hope that all who can, will attend our great Fair. Mr. O. L. Hershiser, of Big Tree Corners, N. Y., is the superintendent of the honey and apiary department, and also Corresponding Secretary of the Erie County Bee-Keepers' Society, and will gladly answer all communications.

Holland, N. Y.

A Favorable Word from any of our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 3.—Iowa State, at DesMoines, Iowa.
J. W. More, Sec., DesMoines, Iowa.

Sept. 5.—Erie County, at Buffalo, N. Y.
O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Sept. 14.—Susquehanna Co., at New Milford, Pa.
H. M. Seeley, Sec., Harford, Pa.

Oct. 16—18.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER-BOX

Heart's-Ease Bloom, etc.—Mr. Frank S. Johnson, Campbell, Nebr., on Aug. 10, 1889, writes:

I took a long drive over the country yesterday, and the stubble-fields are one mass of pink bloom, of the heart's-ease, or heart-weed. The bees are working finely, making very white, delicate comb, and storing a very mild amber honey. My Carniolan queen is doing finely, and has her hive well filled with white-banded bees. Judging from the descriptions of the Carniolans, I should say that she was a pure one. The golden-rod is blooming every where. I think it is rather earlier than usual. I believe that there will be a great yield of honey in this State.

Puff-Ball Smoke—Uniting Colonies.—Samuel Flory, South English, Iowa, writes:

Probably many are not aware of the effect that smoke from puff-balls has upon bees—(I say puff-balls, for I know no other name.) It grows on damp places, a little like mush-room; when dry it is like dust inside. I gather them, get them thoroughly dry, put them into the bee-smoker, mix a little dry, decayed wood with it, so that it will hold fire better, then blow the smoke into the entrance of the hive until the bees become stupid and drop down, which will not take long, probably five minutes, or a little over. In order that I may be fully understood, I will give my method of proceeding: Wishing to unite colonies No. 1 and No. 2, and wanting to save the queen of No. 2, I smoke those in No. 1 first; after smoking, as above stated, I uncover the hive, lift out the combs, and brush off the bees that may hang to the combs; this done, I pour the bees on a cloth (a board will answer), then hunt the queen, which is easily found, and destroy her. Then go to colony No. 2, smoke it the same way, until stupefied, remove the hive-cap and honey-board, pour the bees from No. 1 on top of the frames, cover it up, and the work is done. By the time the bees revive, they will be all mixed up so that there will be little or no fighting, and but very few bees will return to their former place. I have practiced this for several years, and it has always "worked like a charm" for me, and has never caused any bad effect whatever.

One-Third of a Crop.—Matthew Rebholz, Kane, Ky., on Aug. 10, 1889, says:

The season opened with the finest prospects for a full crop of honey; white clover was plenty, but June came and our hopes were blasted, for the first week in June it was very cold, the second week it rained all the time, and the remainder of the month was entirely too wet. One of my neighbors, who started in the spring with 10 colonies, did not get over 100 pounds of honey. I got about 40 pounds of honey to the colony. Take the whole country over, there is not more than about one third of a crop; but we will not despair.

Little Colony in a Small Hive.—Edward Clark, Nat, Ala., on August 5, 1869, writes:

On June 22 I found about a pint of bees clustered on a bush in the woods, near where there had been a bee-tree cut. I put them into a little hive containing three frames, which were about six inches each way, the center one being filled with comb containing eggs; one outside frame filled with comb was about full of uncapped honey, and the other frame had a small piece of empty comb in it. In about a week I examined them, and found a queen-cell with an egg in it. In about a week more I examined them again, and found that the egg had hatched into a worm. I then thought I would soon have a nice little colony of bees; but the next time I examined them, about a week later, they had torn down the queen-cell and enlarged four or five other cells to a little larger than drone-cells, and put all the eggs into them, except about half a dozen, which they had carried to another comb. The next time that I examined them, they were all dead. I am a little boy, only ten years old, and know nothing about bees except what I have learned this year, and would be glad to learn through the AMERICAN BEE JOURNAL.

why they tore down the queen-cell, and then enlarged other cells, and put all the eggs into them. So far this has been a very poor season here for honey. Bees have swarmed but little, and have hardly gathered enough honey to live on.

Mr. G. M. Doolittle replies to the above in this way:

The above is evidently a case of laying workers. The writer says he gave the bees a comb having eggs, and after a week had elapsed an examination showed "a queen-cell with an egg in it." Now all the eggs that he gave the little colony at first, would have been hatched at the end of the third day, hence if there was an egg in a queen-cell, something in the hive must have put it there, or the bees must have stolen it in order to have found it there one week after he gave the eggs. That the bees did not steal it, is proven by finding more eggs the next time he looked; and that the something which put it in the queen-cell was not a queen, is proven by the fact that queens never deposit eggs in queen-cells under such circumstances. The second examination proves conclusively to my mind that there were laying workers present, inasmuch as there were now eggs in two combs, and the fact that they tore down the first queen-cell; for bees seldom bring a queen-cell to completion, where the product which it contains comes from an egg from a laying worker. Wherein our young friend makes a mistake, is in supposing that the eggs which he saw each time were the ones that he put into the hive on the start. The only puzzling question there is about the matter to me, is, why the bees did not try to rear a queen from the eggs first given. This may be accounted for by the laying workers being long present with the bees, in which case bees rarely ever start queen-cells from brood thus given. This is also proven by the bees all being dead at the last examination, showing that they died of old age.—G.M.Doolittle.

Tobacco and Bees.—L. T. Hill, Canton, Dak., on Aug. 11, 1889, writes:

Will tobacco kill bees? On July 4 I had a swarm of bees to come out and cluster. I took a new Langstroth hive, and, as usual, prepared some salt and water to wash the frames with. Not seeing a piece of cloth handy, I took a sack that had contained smoking tobacco; I turned it in-side-out, shook it, and brushed it until I was sure that there was no tobacco on it, and used it to wash the frames and side of the hive. I put the bees into the hive at 11:30 a.m., and at 3 p.m. they were there, but at sunset they were not there—they had left. In course of a few days, I had another swarm come out; I put them into the same hive, after washing it with salt and water, but with another dish and clean rag. The third day after, the bees came out, flew around a few moments, and went back; and about ¾ of them went into the same hive, and the other ¼ into the next hive to them. Three or four days later I saw no signs of life around the hive, and upon opening it, I found the bottom-board covered about two inches deep with dead bees, and not a live bee in the hive. What killed the bees?

[We have never used tobacco-smoke on bees. Will some one please answer the above question?—Ed.]

Only a Moderate Yield.—E. M. Showers, Pine Bluff, Wis., on Aug. 12, 1889, writes:

The honey harvest seems to be over for this season. It has not been very good. There was a good deal of white clover and much Alsike, but neither seemed to produce much honey. Bees quit storing honey on July 15. I never had my bees to swarm so much as this season, while the honey lasted; so I did not get a great deal of honey—only about 1,200 pounds from 22 colonies in the spring, and increased to 45 colonies; 600 pounds of comb and 600 of extracted, which I sell at 12½ cents per pound for the former, and 10 cents for the latter. Some, I see, are selling honey for 8 cents; I guess they do not take the Bee Journal, or they would know the price of honey better.

Honey Crop Almost a Failure.—D. F. Park, Athens, Pa., on Aug. 8, 1889, writes:

I am pleased to learn through the Bee Journal, that bee-keepers are getting a fair crop of honey in the West. Throughout northern Pensylvania and southern New York, the crop is almost an entire failure. My apiary of 80 colonies, has, to date, given me a total surplus of 40 pounds of inferior honey. The most expert bee-keepers of this vicinity have done no better. White and sweet clover have bloomed profusely, but constant rains and cool nights have prevented any flow of nectar. Golden-rod is abundant, but merely keeps up brood-rearing, and gives no surplus. Buckwheat is now coming into blossom, As this county (Bradford) is the banner county of the United States, for the amount of buckwheat raised, we might hope for something from it; but so far we have only the smell, but not the sight of honey.

Trembling or Nameless Bee-Disease.—Wm. Beall, Kimmell, Ind., on Aug. 12, 1889, writes:

I have 30 colonies of bees, and they are doing very well at present; Honey will not be plenty here. I had one colony that had some kind of disease; the bees would come out of the hive, and fall on the alighting-board, crawl around, and then fall on their backs, tremble, and some died. In twelve hours the rest were all right, and are all right now. I would like to know what ailed them. Please state in the Bee Journal. I cannot afford to do without the American Bee Journal; but there are some things in it that I cannot believe, and one is that the old queens come out with the swarms. They may sometimes. I have clipped the queen's wings, and have had swarms to come from the same hive. It may be that their wings grew out again. I have found several this year, that were young queens, and unable to fly.

[This "trembling disease" has been repeatedly commented upon, in the Bee Journal, and on page 541 of this issue, Mr. Alonzo Skinner gives his remedy for it.—Ed.]

A Good White Clover Honey-Flow.—Joseph Moser, Festina, Iowa, on Aug. 8, 1889, says:

We have had one of the heaviest flows of white clover honey that I ever saw. My bees averaged 90 pounds of white comb honey per colony, and I extracted 200 gallons from 13 colonies. The fall crop is to come yet; it promises to be a good one, as I usually get some surplus from red clover, which is very abundant here. My bees are storing honey now from the acorns, which were pierced by an insect, thus causing honey to run out. We have had a very dry time for the last four weeks, and the white clover is almost dried out, but we are getting a nice shower to-day.

Successful Bee-Keeping.—I. N. Arnold, Richmond, Iowa, on Aug. 14. 1889, writes:

I will now offer a report of my honey crop. I have been a reader of the Bee Journal for eleven years. I am a bee-keeper by trade. I helped my father-in-law, J. O. Todd, three years before I owned a colony of bees; I now have 100 colonies in fine condition. Mr. Todd and I, together, will get over 20,000 pounds of honey for the season. I used to be a telegraph operator, and

could not work at it on account of my health. I like the bee-business the best of any thing that I have followed. Since I began keeping bees, I have lost all but one colony (in the winter of 1884–85). I had 400 empty combs, 100 pounds of foundation, and lots of hives; but I did not quit in despair. I invested $40.00 in bees the next spring, and filled up my hives that season; and during the season of 1885 my bees cleared me $400 in cash, and left all of my bees not owing me a cent; but if I had not known what bees would do in a good season, I suppose that I would given up the bee-business in disgust.

The Nameless Bee-Disease.—Alonzo Skinner, Mesa City, Ariz., on Aug. 6, 1889, writes:

On reading Mr. Joshua Bull's article about the "Nameless Bee-Disease," on page 392, I felt somewhat impressed to give my views concerning the matter; and seeing the item on page 484, I thought, "why keep my light under a bushel?" Two years ago last April I had one colony that was affected just like Mr. Root describes on page 484, and I put about two table-spoonfuls of salt at the entrance; in a very short time all was right. Then came a query in the BEE JOURNAL, bearing on the same thing, in which all who answered it, confessed that they knew nothing about it. Then I received the *Apiculturist*, in which Mr. Alley set forth his plan of spraying the combs with salt and water, and stated that he had published his salt-and-water cure for years. Since that time I have had about twelve colonies affected, and I just lifted up the front end of the hive, and poured in about ½ pint of strong salt-and-water—not going to the trouble of doing anything else—and all was right in a short time.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Modern Bee-Farm and its Economic Management, by S. Simmins, of Rottingdean, Brighton, England, is the title of a new book of about 200 pages, printed on excellent paper, and nicely bound in cloth. Price $1.00. For sale at this office.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

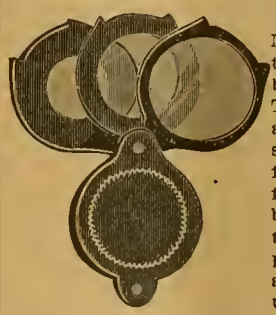
Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Honey and Beeswax Market.

PHILADELPHIA.

HONEY.—Prices are not fully established, being a little too early. Only a few shipments have yet arrived, which sold readily as follows: Best white, in 1-lb. sections, 16½c., and 2-lbs., 14c. Off grades generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Aug. 15. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.
BEESWAX.—18@20c.
Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@18c. Receipts of extracted increasing: demand light, at 6@8c.
BEESWAX.—25c.
Aug. 1. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—New extracted sells as fast as it arrives. Orange blossom, 7½@7½c.; inferior Southern, 70@75 cts. per gallon. Some demand for the comb, but we have no stock yet.
July 22. F. G. STROHMEYER & CO., 122 Water St.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.
BEESWAX.—23@28c.
July 16. A. V. BISHOP, 142 W. Water St.

KANSAS CITY.

HONEY.—Old crop all gone. New 1-pounds, 16c.; 2-lbs., 14c. No California comb in the market. Extracted, white, 9c.; amber, 7@8c.
Aug. 7. HAMBLIN & BEARSS, 514 Walnut St.

CHICAGO.

HONEY.—Coming in freely, but sales are not easily made at over 15c. for the best, while we are trying to get 16c., and think that later we can get it, as all buy sparingly now. Extracted sells at 6@8c., but chiefly at 7c. for white.
BEESWAX.—25c. R. A. BURNETT.
Aug. 12. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb. No desirable old stock left.
BEESWAX.—24@25c.
July 24. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.

HONEY.—New white comb in 1-lb. sections sells at 16@17c. White extracted, 7@7½c.; dark, in barrels, 6c. An active demand is not expected before Sept. 1. No new extracted in the market.
BEESWAX.—None in the market.
July 20. CLEMONS, CLOON & CO., cor 4th & Walnut.

ST. LOUIS.

HONEY.—Extracted, bright, 6½c; dark, 5½c. The market is slow.
BEESWAX.—Scarce at 23c. for prime.
July 20. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—We quote: Fancy white 1-pounds, unglassed, 16c.; off grade 1-lbs. 14c.; fancy white 2-lbs., glassed, 14c., and off grade 2-lbs., 12c. Extracted in good demand as follows: Orange blossom, 7¼@7¾c. White clover and basswood, 8@8½c. Off grades of Southern, per gallon, 60@70c.
HILDRETH BROS. & SEGELKEN.
Aug. 12. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Comb, 17@18c.; extracted, 8@9c. Sales a little slow on account of the warm weather. Quality of new honey is very good.
BEESWAX.—25c.
Aug. 9. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb., and comb honey, in 1 and 2 lb. sections, 12@15c., for which demand is good. Trade is also good in the extracted, in square glass jars for table use, and in barrels for manufacturers.
BEESWAX.—Damand is good—20@22c. per lb. for good to choice yellow, on arrival.
Aug. 9. C. F. MUTH & SON, Freeman & Central Av.

THE AMERICAN BEE JOURNAL
CIRCULATES
ALL OVER THE WORLD.
PUBLISHED BY
THOS. G. NEWMAN & SON,
CHICAGO, ILL.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Aug. 31, 1889. No. 35.

EDITORIAL BUZZINGS.

Bill Nye on Bees.—Some time since, Mr. Edgar W. Nye, the humorist, wrote one of his peculiarly-funny articles on swarming. It appeared in the New York papers, but it was copyrighted. We wrote to the author for permission to place it before our readers, so that they might have a good laugh. He was then in Europe, but we have just received a letter from him with permission to print the article. We have had the engravings re-produced and present it to our readers in this issue. Bro. Heddon wrote us as follows concerning the article:

FRIEND NEWMAN: I have laughed heartily over the Bill Nye article on bees. He knows more *facts* about them than Agassiz did! No such a humorist ever graced the world before, it seems to me.—JAMES HEDDON.

Read it, and laugh and "grow fat," is good advice. Those who have any relish for humor will no doubt enjoy it, as we and many others have done. Several of our subscribers cut it out, and sent it to us, asking for its insertion in the next BEE JOURNAL, but we could not do so until the author gave permission. Now, here it is.

It has Often been Asked what would be included in the free list of animals imported into Canada for breeding purposes. We lately sent a request, through D. A. Jones & Co., to the Canadian Department of Agriculture for a definite classification of such, and here is the reply:

Pedigreed animals for the improvement of stock (viz: horses, cattle, sheep and swine) under special regulations of the Treasury Board, come in free, but other living animals imported, are liable to a duty of 20 per cent. I should understand the term "animals" to include "queen-bees," but this, however, is a question for the interpretation of the Customs.—Signed, J. LOWE, Ottawa, Ont.

I. R. Good, Nappanee, Ind., has sent us a sample of his new Combined Introducing and Shipping Cages. The Introducing Cage is made of bent wire-cloth, 1¼x3 inches and half-an-inch thick, with a wood-stopper in one end having three holes through it; these holes are filled with "Good" candy. When shipping, it is enclosed with a frame work of thin wood around the sides (with a hole in two sides for air), and a thin piece of wood on both sides. Mr. Good says:

I believe it to be one of the best and most successful Introducing Cages made. To introduce a queen, all you have to do is to lay the cage on top of the frames, under the cushion, or thrust it down between the combs, and the bees will eat the candy out and liberate the queen. How do you like it, Mr. Editor?

We like it very much. It is so simple, and will save much labor in introducing the queens.

Several more papers have been sent to us, which have published the item from the *Herald of Health*, about making artificial honey from oil of vitriol and potato starch. What stuff for a magazine to publish! It ought to be called the "Herald of Death" instead of the Herald of Health!

A Man who has not enough interest to subscribe for the BEE JOURNAL, requests us to write him all about how to manage bees, how to build a bee-house, with full particulars as to dimensions, etc.—as though we had nothing to do but to write a book for his benefit, and present it to him in manuscript. He little dreams that while we write this, there are 50 unanswered letters on our desk. We want to accommodate all, but have no time to write for anyone the details of what they can purchase in a pamphlet or book. We are too busy.

Who is the Handsomest Woman in New York? Frank Leslie's Weekly is trying to settle this question by printing every week a picture of one of the loveliest young ladies in New York society. This week a large picture of Miss Sallie Hargous is produced. She is certainly a beautiful woman. President Harrison's visit to Bar Harbor, the striking picture of a life-saver rescuing a child at the beach, glimpses of the operating room of the Western Union Building, and of scenes at the watermelon-dock, help to make up an unusually interesting paper.

Statistics.—In answer to a set of five questions, sent out by the Editor of the *Gleanings*, to ascertain the real facts concerning the honey crop, reports were sent in from every State, which are summed up as follows:

On account of the cool wet weather in the early part of the season, which, according to the reports, seems to have pervaded almost all of the United States, the honey-crop is considerably less than it might have been. First, because this weather continued clear up, in a good many of the places, into the time of year when the main nectar-bearing flora was in bloom. Second, the bees were unable to breed up properly on account of the cool and rainy weather, and hence the actual working force of the bees was considerably lower than it should have been. But in spite of all this, the season has been decidedly better than last year, in most localities, although there are some exceptions.

Twenty States report a good season: namely, Alabama, Arkansas, Georgia, Illinois, Iowa, Kansas, Kentucky, Louisiana, Minnesota, Missouri, Nebraska, Nevada, New Jersey, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Wsconsin, Arizona.

The following States report a poor season generally: California, Connecticut, Florida, Indiana, Maine, Maryland, Massachusetts, Michigan, Mississippi, New Hampshire, New York, Tennessee, Texas, Vermont, Virginia, West Virginia.

Michigan, though usually among the foremost, gives as unfavorable a report as any of the States enumerated.

It is interesting to note that a number of States report 200 per cent. as the average crop of honey received. W. P. W. Duke, of Alabama, and J. L. Clark, of Florida, report 200 per cent., while a large number of others give 175 per cent. as the average crop. Taking it all in all, we find that the average crop of honey secured in the respective localities, stands 75 per cent. The same average a year ago was only 50 per cent; so that, according to the reports, 50 per cent. more honey has been secured this year than last, although the general average is still down.

Perhaps we should remark that the report has probably been under-estimated rather than the reverse. The tendency of human nature, and especially when its hopes are set high, is to look down instead of up. Farmers, as well as bee-keepers, are much inclined to complain about the poor season, too much drouth, or too much wet, or something else that is not just exactly right.

Introducing Queens.—Mr. Wm. Beall, Kimmell, Indiana, asks us to state what is the best way to introduce queens. This would take more space than could be spared in this department, to give in detail. The best way to do (for Mr. B. is evidently a beginner), is to buy a good manual, and then he will have something to refer to at any moment, which will tell him *what*, *when* and *how* to do anything that is desired to be done in the apiary. There are so many ways, that we should hardly like to decide which method was the *best* one. Mr. Beall remarks thus about his honey crop:

The honey crop is light here, this year. It is only about half a crop. Is it healthy to feed bees? if so what way is the best to feed them?

Yes; if the bees are short of stores, feed them. Get a Shuck feeder and put at the entrance of the hive.

THE FLOWERS AND THE BEES.

BY E. H. R.

'Twas Spring. Each tendrilled vine, each shrub and tree,
Were clothed in tender green, the buds set free.
But some in discontent were prone to linger,
Till Beauty, in her flight among the trees,
Did pause and lightly pressed them with her finger.
Her fairy touch, distilling magic power,
Each lagging bud burst fourth a perfect flower.
The gladsome news went floating on the breeze
O'er hill and dale, and left the fields aflame
With blossoms. Then arose glad jubilees
Among the birds, and from the echoes came
The burden of repeated song. The bees
From dreams awoke; in wonder and delight
They murmered low and took a sudden flight.
Each year since then, when earth and skies are warmed
And floral fragrance fills the air, the bees have swarmed.

—*Inter-Ocean.*

GLEAMS OF NEWS.

Aggressive Work Needed.—J. C. Armstrong, Bromley, Iowa, on Aug. 8, 1887, says:

I think that the time has come when bee-keepers should be the aggressors, and commence suit against some of those who are asserting that honey is being manufactured, and compel them to bring on their proof or pay the penalty of their falsehoods. You ask where the money is to come from? The heavy shippers of honey are the ones to prosecute; for it is they who are injured by it. The small bee-keepers, who sell their product at home, are not affected by it.

The National Flower.—Mrs. L. Harrison, Peoria, Ills., on August 13, 1889, writes:

I lately attended a picnic given by the Scientific Society of Peoria County. I consider myself "part and parcel" of Agricultural, Horticultural and Scientific gatherings. I questioned some of the prominent botanists, with reference to their choice for a "national flower," among them Dr. Stewart, who, as authority on botany, has a national reputation. He said "that the Asters were indigenous to this country, and in no country in the world did they flourish as they do here; but that the Golden-Rod had much in its favor, by reason of its name." In interrogating a representative of the Scientific Society of Fulton county, who was present, he said that he could not see why we could not vote for a "national flower" without buying a book; and that puzzles me. I am in favor of the Golden-Rod, both heart and soul.

We do not know, but presume Mr. Prang thought that the most desirable way, at least for him, for we learn that he has sold many thousands of the books. The Golden-Rod is evidently away ahead in the race.

Asters and Bees.—W. Harmer, Manistee, Mich., on Aug. 12, says:

Please name the blossom which I mail to you. It grows in the woods here; I got it from a neighbor who said that she had quite a scramble to get it away from a bee, as it alighted on it after it was plucked. Of course she knew not the innocence and harmlessness of a busy bee in search of sweets a long way from its home. I do not know that it is plentiful, and as I did not gather any of it, I would like to know its value for bees, and on what kind of soil it would feel at home.

It is one of the numerous family of Asters, rich in honey, and thriving on almost any kind of soil.

The Richest Legacy that parents can leave to their children is not a matter of silver or gold, or bonds or real-estate. It is not a thing of cash but of constitution—not of good investments, but of good health.

The young man or woman that has inherited from his or her parents, a sound constitution and its concomitant of perfect health, has no earthly reason to complain of parental shortness in the matter of a legacy of dollars. They have received a capital which is far more valuable than money, or of anything that money can buy. They have received that which lawyers cannot melt away, or financial storms destroy. The superb pricelessness of this legacy should not be lost sight of, by parents or by those whom they have brought into this world of weaklings, of sick and suffering men and women whose burdens of ill-health are traceable to their ancestors. Let all care for such an important matter, so that the future generations may inherit this priceless legacy.—*Pittsburg Bulletin.*

Maj. W. C. Stevens, of Ann Arbor, Mich., formerly of the Ninth Michigan cavalry, still owns and uses the horse that he rode in the army. He bought him in Kentucky in 1862 and rode him in many battles.

Johannes Brahms has just completed a new work, "Deutsche Fest und Gedenkspruche," for double chorus a capella. The novelty is to be performed for the first time under Von Bulow's conductorship at the Hamburg musical festival in September.

The sale of the contents of the late M. Cabanel's studio has produced about $28,000 for paintings, sketches and drawings. His well known picture of "Cleopatra Experimenting with Poisons Upon Condemned Prisoners" fetched $4,000, and his "St. John the Baptist" $2,500.

ELECTRIC NOTES.

The phonograph has lately been employed abroad in diplomatic correspondence.

The formal opening of the Chicago Electric club took place in the new quarters recently.

Telegraph poles in India are made of iron, on account of the destruction of wooden ones by the white ants.

Professor Blake is experimenting with the view of perfecting a system of telephonic communication at sea.

Coal cutting machines run by electricity are now so far perfected that they can cut between 200 and 300 tons per day.

The Niagara Falls convention of electricians gives promise of a full attendance and an exceedingly interesting exhibit.

In 1868 the average charge per telegraphic message was $1.04, and the profit 41 cents. In 1888 the corresponding figures were 31 cents and 8 cents.

In Spain the native electric light companies have been so unsuccessful that the whole matter of lightning has been turned over to English companies.

SCIENTIFIC SQUIBS.

It is proposed in France to substitute death by electricity for the guillotine.

The maximum intensity of the light from the Eiffel tower is 500,000 carcels, giving a range of 127 miles.

It has recently been proposed to use an alloy of zinc and phosphorus in boilers to prevent incrustation and pitting.

After more than twenty-seven years the pearl oyster has produced pearls off the Madras coast in sufficient quantities to be worth the expense of fishing.

A steam carriage in which coke is used as fuel has lately appeared in France. The driving is effected by two hind wheels and the speed attained is about fifteen miles per hour, twenty-eight and three-quarter gallons of water being sufficient for a run of twenty-five miles.

Both the French and German governments have provided facilities for the examination and certification of electrical instruments, and it is now found that apparatus bearing the official indorsement brings a better price in Continental markets than non-attested instruments.—New York Times.

An authority upon provisions estimates that half a pound of butter a week is a good allowance for each person; half a pound of coffee a week and a pound and a quarter of sugar for each person make liberal allowances. Families are apt to differ in these respects.

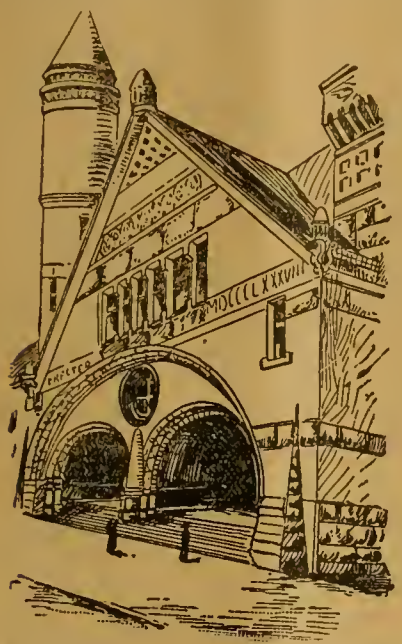
Smoke extends from California to western Kansas, a distance of 1,000 miles. At first the smoke partially shut off the rays of the sun, making the air cooler, but now it adds to the already high temperature. It is supposed to be caused by the mountain fires in Montana.

A very desirable corner of the earth is the Puyallup reservation, which the Puyallup Indians are ready to hand over to purchasers, in whole or in part. Some of the finest hop growing land in America is on this reservation. Washington territory is famous for its hops, which are quite as good as those of Kent.

PITTSBURG'S EXPOSITION.

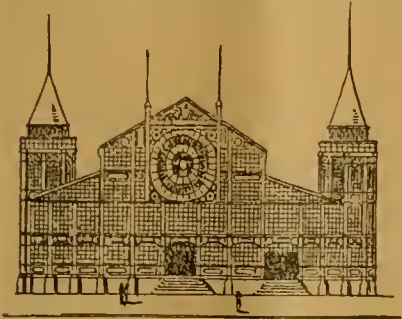
It Will Open Sept. 4 and Continue Until Oct. 19.

Pittsburg is going to hold an exposition, beginning Sept. 4 and closing Oct. 19, the object being, of course, to make the world acquainted with Pittsburg's resources. Since 1886 the era of improvement has been marked. Many who are interested in the material interests of the United States have been attracted to Pittsburg by the introduction of natural gas, and it is predicted that Pittsburg will eventually rank first in the manufacture of finished articles, as she now leads in the manufacture of iron, steel and glass.



EAST ENTRANCE, MAIN EXPOSITION BUILDING.

The importance of an industrial exposition was recognized four years ago, when the Western Pennsylvania Exposition society was incorporated. The object of the association was "to advance the industrial arts and sciences, and of agriculture and horticulture; also the establishment of a polytechnic school." The site chosen for the buildings is between Third street and "the Point," on Duquesne way, opposite the old Exposition buildings. Allegheny river bounds the northwestern, the city the southeastern side of the new buildings. The cost of the exposition building, the machinery hall and a smaller building to be used as a restaurant, will



MACHINERY HALL, PITTSBURG.

amount to $350,000. It is also intended to erect a music hall of magnificent proportions, and there is a possibility of the levee between the exposition grounds and the Sixth street bridge being turned into a public park and promenade; active steps have already been taken in that direction.

These They Cede and These They Keep.

The map here given shows the Sioux reservation, parts of which were recently ceded to the United States by the Indians. The 11,000,000 acres which will be thrown open to settlement, and for which the government is to pay $14,000,000, are shown in the shaded portion, and comprise about one-half of the entire reservation. This tract extends from Missouri to the Black Hills, and then north;

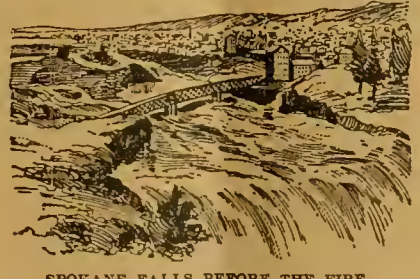
1. Proposed Standing Rock reservation. 2. Proposed Cheyenne River reservation. 3. Proposed Preshe Lower Brule reservation. 4. Proposed Crow Creek reservation. 5. Orallala Sioux reservation. 6. Proposed Pine Ridge reservation. 7. Proposed Rosebud reservation. 8. Military reservation.

SIOUX RESERVATION.

it embraces also a part of the fertile Winnebago-Crow Creek reservation on the east bank of the Missouri river, south of Pierre. The area of this great tract is equal to that of New Hampshire and Massachusetts combined. Two great railroads run into Pierre, which is opposite the centre line and but half a mile distant from the border. It is estimated that farms can be provided for not less than 70,000 families. Already the clans are gathering along the shores of the Missouri, and a rush equal to that which marked the opening of the Oklahoma lands is expected to begin as soon as President Harrison shall give the word.

It Will Rise from Its Ashes.

It is gratifying to know that Spokane Falls, the Washington city that suffered so severely from fire the other day, will shortly be re-



SPOKANE FALLS BEFORE THE FIRE.

built, and that in a more substantial manner than before. The cut of the city before the fire here given is from a photograph, and shows the beautiful falls from which the place takes its name.

PERSONAL GOSSIP.

Oscar Wilde, so it is reported, wears a flannel shirt embroidered with flowers.

Baldwin, the balloonist, has made $60,000 by his parachute descents in England.

The Duke of Fife is one of the incorporators of the British South African company.

The venerable Professor Sir Richard Owen has entered his 86th year in excellent health.

Owen K. Studebacker, the well known brewer of San Francisco, wants to be governor of California.

Mr. D. C. French, the sculptor, has completed his model for the Starr-King monument at San Francisco.

A 16-year-old boy, "Professor" Frankenstein, wields the baton at the concerts of the West Side park in Chicago.

Ferdinaud Guzman, the most famous bandit in Spain, is a dwarf, who at one time kept a small store in Granada.

Hon. Samuel S. Cox is said to be the only living man in public life who voted for the admission of Oregon as a state Feb. 14, 1859.

Thomas A. Edison rarely sleeps more than four hours a day. He says that when he sleeps eight hours he feels badly when he wakes up.

Senator J. P. Jones, of Nevada, and D. O. Mills, of New York, own gold mines in Alaska which are said to yield a net profit of $1,800 a day.

The leading tenor of today, Tamagno, is about 40 years of age, and originally assisted his father in the manufacture of mineral waters in Turin.

Ronald McDonald, son of the distinguished English writer, George McDonald, has been appointed head master of Ravenscroft school, at Asheville, N. C.

Gen. Gordon's cook has turned up alive at Assorean, having come into the English lines from the Mahdi's camp. He has blossomed into a doctor.

The Rev. Dr. Edward Everett Hale says that when he was a college student he and his chum took the first daguerreotype picture ever made in Boston.

Ivan Stepanoff, of Tobolsk, Siberia, was at one time governor of one of the Siberian provinces. He is about 5 feet 9 inches in height and weighs 150 pounds.

Ex-Congressman William L. Scott has acquired another large tract of coal lands, and is said to be the largest owner of this species of property in Western Pennsylvania.

Dr. Charles G. Eames, of New York city, owns an old stone house in Berkshire county, Mass., and close by it is the veritable blacksmith shop of Elihu Burritt, the linguist.

Governor Beaver, of Pennsylvania, determined when he assumed his present office to visit every county in the Keystone state. He has just completed his task by his visit to Pike county.

According to Mr. Ruskin's recent criticism, there is no genius about the English language. He defines the Welsh language as the language of music, the Scotch of poetry and the Irish of wit.

The pope recently gave Archbishop Corrigan, of New York city, two of his jubilee presents—a chalice and a ciborium—both of which are of gold, while the chalice is studded with amethysts and rubies.

EARN YOUR HONORS.

Of course you are proud that your fathers were good:
'Tis a pleasure to know they were great
In the field, on the bench, or in science or art,
Or as leaders in matters of State.

But we all should remember our ancestors' fame
Is not for their children to wear;
To the fame of the great man, the family name
Is the only legitimate heir.

The fame that is yours, is the fame you have won;
If you have not won it yet, look ahead—
But don't claim an honor because you're the son
Of ancestors centuries dead.

Of proud ones who live on the fame of their sires,
Examples in plenty are found:
Like the turnip and parsnip, they seem not to know
That the best of them lies under-ground.

Look ahead to the future—the past is not yours;
For your prize, trust the future alone.
The fame of the past is another's reward;
Make the yield of the present your own.

Inherited titles of honor are vain;
In the heat of Fame's handicap chase
The plain man looks forward: the noble looks back
And oftentimes loses the race.

Look forward! toil onward! and when in the end
Well-merited honors you've won,
Be proud that your claim to the prize did not lie
In being a somebody's son.—*Selected.*

QUERIES AND REPLIES.

Italianizing an Apiary with Home-Reared Queens.

Written for the American Bee Journal

Query 651.—Give the best manner of Italianizing an apiary of hybrids, supposing the owner, of course, to rear his own queens or cells.—Michigan.

Buy "dollar queens."—MAHALA B. CHADDOCK.

Consult the standard works on our specialty, or the bee-papers.—A. B. MASON.

The space here is too small. Consult any of our standard bee-books.—J. M. HAMBAUGH.

Rear queens during the swarming season, and select the best in the fall, to supersede all doubtful ones.—MRS. L. HARRISON.

I know of no better plan that that given in my book. It is too long an answer for this department.—A. J. COOK.

I will let some of the queen-breeders answer this, as I know of no *easy* way.—C. H. DIBBERN.

Kill the black queens, and "introduce" the Italian queens. Or, you can use the queen-cell method; either one is good enough. For details, refer to your bee-book.—WILL M. BARNUM.

To answer this with any satisfaction, would require more space than we are allowed. Consult any good work on apiculture, and you will find what you want.—H. D. CUTTING.

The manner and process is fully explained in the bee-books. Send a dollar to the editor, and he will send you the book with the process.—J. P. H. BROWN.

I cannot see how you are going to Italianize, if you rear the queens in your own apiary. Fertilization in confinement is not a proven fact.—EUGENE SECOR.

I would suggest that the querist read bee-books, and back numbers of the bee-papers, for the information he seeks. A worthy answer would be too long for this department.—JAMES HEDDON.

Remove the old queens, and replace them with others of known purity. Get "Doolittle on Queen-Rearing," and "Alley's Handy-Book," which will give the "*modus operandi*" in full.—J. E. POND.

Procure a pure queen, and permit no queens in the apiary except daughters of a pure queen. Supersede those known to be mismated, by queens supposed, or known to be, purely mated. To work on this line, get the method of queen-rearing that suits you best. Several are published and all are good.—J. M. SHUCK.

This you will find fully explained in back numbers of the AMERICAN BEE JOURNAL, also in several books on apiculture. If every one of us here would give the manner, it would take more space than can be afforded in this department.—P. L. VIALLON.

When you have the queen-cells reared, (which should be after the honey harvest), just kill the reigning queen in each hive, and two days later give one of the cells.—G. M. DOOLITTLE.

Get Doolittle's book, and rear your queens; then kill the old queens, and introduce the Italians. If you do considerable increasing, you might leave the old queens and take pains to have the increase pure. You will probably have some hybrids, do the best you can.—C. C. MILLER.

First, put on drone-traps, take out the queens, and destroy the drone-brood. Nine days after, cut out all queen-cells — shaking the bees from each of the combs to make sure. *Then wait 12 hours*, and introduce Italian queen-cells. Remove the traps four days after the cells hatch, that the young queens may fly out. Pure Italian queens and no others within one or two miles should be allowed to fly.—G. L. TINKER.

The term "hybrid," as applied to bees, is a misnomer. There are no hybrid bees, and probably never will be. If I had an apiary of mixed bees, I would get a pure queen of the race which I desired, and rear queens from her, and let them mate with the drones of the apiary, as circumstances might determine; and then I would supersede all the queens whose progeny should not show the required characteristics.—M. MAHIN.

The best way, though perhaps not the cheapest, is to form some nuclei and rear queens, and introduce laying queens to all colonies that do not have purely-mated queens. When a hybrid colony casts a swarm, destroy all the queen-cells, and give them a mating queen-cell from the best colony. Keep straight on in this way, and if there is plenty of "black blood" in your vicinity, you will find it a life work to keep your apiary nominally pure.—G. W. DEMAREE.

Procure the production of queen-cells by an approved method to be due to hatch soon after swarming begins, and during the swarming season; then from each colony casting a swarm, and soon after the swarm issues, remove all queen-cells, and give a virgin queen or a ripe queen-cell. When swarming ceases (or before), destroy the old queens, as circumstances or convenience dictate, and introduce a young queen or a ripe queen-cell, as the bee-books explain.—R. L. TAYLOR.

You cannot, with any certainty, rear your own queens in an apiary of hybrids, and get pure Italians, no matter how careful you may be. The best is to purchase the queens of some reliable breeder, which are fertillized, and then you may soon have pure stock.—THE EDITOR.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on Wednesday, Thursday and Friday, Oct. 16, 17 and 18, 1889. Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be very low. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.

H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Romney, Ont., Canada.

☞ The Iowa State Bee-Keepers' Association will meet at the State Fair Grounds during the State Fair week, commencing on Sept. 3, at DesMoines. The meetings will be held in our large Tent, and an invitation is given to all bee-keepers to meet with us, bringing their families and friends, and help to make our meeting one of interest to all bee-keepers.

MRS. O. F. JACKSON, *Pres.*

CORRESPONDENCE.

WEIGHING BEES.

The Exact Number of Bees in One Pound.

Written for the American Bee Journal

BY PROF. JOHN PHIN.

A great deal has been written about the "little black bee," the insinuation being that in size it is greatly inferior to the Italian. The so-called black bee was the bee of England and America until less than fifty years ago, and any English statistics that we may have prior to that time, undoubtedly refer to the black bee.

In writing the article *Bee* for my "Dictionary of Practical Apiculture," I wished to give as accurate *data* as possible in regard to the weight of certain numbers, etc., and I weighed several lots to determine this point. My determinations varied between 4,500 and 5,000 bees to the pound. I preferred, however, to give the series of determinations by Keys, who wrote nearly one hundred years ago, and who gives 4,640 bees to the pound. He also gives the number of drones, etc. See Dictionary, page 12.

I was led to give Keys as the authority, because 4,000 bees to the pound was the number adopted by dealers generally. It impressed me at that time, that if these dealers were correct, then the bee under cultivation by them (which is almost always the Italian), must be larger than the bee of 100 years ago, in the proportion of 4.5 to 4 (the inverse ratio of the number per pound). But not being quite satisfied as to the trustworthiness of the dealers' *data*, especially in view of my own experiments, I did not embody this inference in the article, or allude to it.

Now comes Mr. A. I. Root with a new and carefully-made determination, in which he gives 5,333 bees to the pound, instead of 4,000, as previously published by him; but he estimates that if the bees had very much honey in their sacs, the number might be reduced to 5,000 to the pound. If we accept these *data* as correct, it is evident that the bee has not increased in size during the last hundred years.

Keys tells us that the results of such weighings will never come out twice alike, owing to the difference in the fullness of the bees. Collin gives 5,000 bees to the pound, when in their normal condition, and 4,300 when filled with honey—a difference of 800 bees to the pound. Keys, no doubt, gave an average, and he has struck very nearly midway between the two determinations of Collin. An exact number would have been 4,700 instead of 4,640.

Numerous attempts have been made to increase the size of the bee, by increasing the size of the cell, and when foundation was brought forward, it was thought that this question had been solved; but the plan did not work. Neither does the bee seem to deteriorate in size by the gradual filling up of the cells with the cocoons of the young bees. However careless Nature may be of individual bees, and individual colonies, she seems to be wonderfully careful of her types.

Cedar Brae, N. Y.

BILL NYE.

The Humorist Studies the Habits of Bees,

AND WROTE THUS CONCERNING IT.

(*Copyrighted.*)

It is now the appropriate season for hiving bees. Bees should not be hived until they swarm. Bees begin to swarm as soon as the new queen takes the oath of office. The queen is a long-waisted bee who does the toil. The

Nye begins to get Restless.

honey-bee proper belongs the order Hymenoptera. All bees, according to Linnæus, who kept several stands of bees himself, are included in the genus Apis, but they are now divided into many genera.

I love to study the bee, and at one time kept bees myself. I kept several of them longer than I should have done. But honey-bees are full of interest to me. I often think of the language of a late writer who goes on to state "that within so small a body should be contained an apparatus for converting the various sweets which it collects, into one kind of nourishment for itself, another for the common brood, glue for its carpentry, wax for its cells, poison for its enemies, honey for its master, with a proboscis as long as the body itself, microscopic in several parts, telescopic in its mode of action, with a sting so exceedingly sharp that were it magnified by the same glass which makes a needle's point seem a quarter of an inch across, it would yet itself be invisible, and this, too, a hollow tube—that all these varied operations and contrivances should be included within half an inch of length and two grains of matter is surely enough to crush all thoughts of atheism and materialism."

I also compare sometimes the new colony just starting out to hustle for themselves with the Pilgrim Fathers—where are they?—who came to these wild, inhospitable shores, taking their long, tedious, uneventful voyage across the unknown ocean with no relaxation whatever except prayer.

Professor Jaeger, referring to the pronounced habits of industry born in the bee and frequently alluded to in school-books, says: "It is impossible for any reflecting person to look at a bee-hive in full operation without being astonished at the activity and surprising industry of its inhabitants. We see crowds constantly arriving from the woods, meadows, fields and gardens, laden with provisions and materials for future use, while others are continually flying off on similar collecting expeditions. Some are carrying out the dead, others are removing dirt and offal, while others are giving battle to any strangers who may dare to intrude. Suddenly a cloud appears and the bees hurry home, thronging the entrance by thousands, until all are gradually received within the inclosure. In the interior of the hive we see with what skill they work their combs and deposit their honey, and when their labor is over for the day they rest in chains suspended from the ceiling of their habitation, one bee clinging by its fore feet to the hind feet of the one above it until it seems impossible that the upper one can be strong enough to support the weight of so many hundreds."

The queen, during the propagating season, lays as high as two thousand eggs in a day, and I have given much thought to the grafting of the queen-bee upon the Plymouth Rock hen, with a view to better egg facilities, but so far to meet with little success. My experiments have been somewhat delayed by the loss of time in taking the swelling out of myself after each perusal of the bee character in his or her home life. The queen lives much longer

than any other class of inhabitants, and hangs on to the throne, as the historian Motley says, like a pup to a root. She has a stinger, but does not use it on boys. She uses it simply for the purpose of fighting other queens.

The ancients were aware of the existence of a governing bee in each hive, but they thought it was a king. But a scientist with a keen insight and massive brains, one day saw the monarch come off the nest and leave 2,124 warm eggs. Then it was settled in his mind that it could not be a king, for he was a deep, deep man. His name was Swammerdam and he made the discovery 200 years ago last week. Aristotle and Virgil claimed in several articles, signed Veritas and Taxpayer respectively, that the queen or king, as they called it then, did not lay at all, but secured some kind of pollen or other material from flowers, which produced the maggots from which the bees were hatched.

A writer on the bee says that the best way to ascertain the location of the queen is to divide the swarm, after which it will be noticed that the one having the queen will become very restless indeed. I tried this myself and found that they were restless. They also communicated their restlessness to me. All of us got restless.

Swammerdam tied the queen by means of a long hair to a high pole in order to ascertain whether the swarm

The Bees are Swarming.

would follow. In ten minutes he had the whole colony on top of the pole.

The drones are the male bees of the hive. They do no work except to act in parental capacity and vote. They have no stinger, but in its place a good appetite and a baritone voice. They are destroyed by the workers soon after the honey season, and the widows have it all their own way. The drone leads a quiet and rather sunny life, lasting about sixteen weeks, after which he is put to death by the females of the hive by the Maybrick method.

About nine-tenths of the hive are workers or female, say twelve to fifteen thousand. They are the busy bee referred to in the books. They get up early in the morning, eat a hasty meal and go out looking for honey. They fly with great force and as straight as a bullet. Sometimes they try to go through a man on the way to the hive, but only get part way. A bee likes to have a tender young man with linen trousers sit down on it.

From the time the egg is deposited until the perfect bee is turned out, requires about three weeks. A queen gets her growth in sixteen days and begins to reign.

Moths get into the bee-hives frequently during the winter season and destroy the insects. For this reason bees should be packed in snuff or fine-cut tobacco in the fall. This nauseates the moth and discourages him. Great care should be used not to let the bees out too early in the spring. A good writer says that frozen fruit will still remain on the trees in the spring; while it contains a certain amount of sweet, it is liable to ferment and cause wide-spread colic in the hive, followed by cholera infantum and coma.

Linnæus says that nothing is more pitiful than the picture of fifteen or sixteen thousand colicky bees suddenly called forth in the dead of night, running hither and thither looking for hot cloths and Jamaica ginger, after eating too heartily of frozen apple-juice.

Bees swarm about 10 a.m. or 3 p.m. and enjoy doing so on Sunday if possible. Selecting a hot Sabbath, and waiting patiently until the farmer has shaved one side of his face and lathered the other, the bees decide that they will swarm. The farmer's wife notices it while she is in the garden getting a sprig of caraway to take to meeting. She calls Henry and tells him the bees are swarming. He starts out with a new hive, and looking up in the air he falls over a croquet set and injures himself. His wife says: "Henry, you ought to put on that mosquito bar arrangement I made for you the other day. They are real cross this morning and they will sting you if you don't."

"Git out with your pesky nonsense," he straightway doth reply. "I never put nawthing on me before and I won't do it now."

"But, Henry, they are so feverish today, and you havn't got your other clothes on, so that they wont know you. Do try it this time."

So he wraps up his head in a green mosquito net and puts on a pair of cowhide mittens. The bees alight on a tall elm tree and he gets a ladder up there against it. Then he slowly ascends the tree with a bee-hive under his arm. Just before he put on the mosquito net he took a large chew of tobacco. He now wishes that he had not. People began to go by on their way to meeting and see him up in the tree with a large green head on him and hot leather mittens. They speak to him but he cannot reply because his mouth is full of tobacco. It is very hot indeed. The sun pours down through the hot leaves, and the breeze is taking much needed rest. He gets up in the top of the tree and looks like a new style of lizard. Sabbath-school boys, wearing chip hats faced with gingham, pause on their way to the house of worship and watch him. He reaches out

When the Bees have Ceased to Swarm.

to scoop in a handful of the brown fuzzy insects, but the leather mits smell strangely to them. They do not recognize the proprietor by his paws and his odor. Three or four bees fall down inside those mittens, and, feeling that they must defend themselves, make a hot highway across the back of his hand. Then Henry yells and drops the hive on the Bible class. Some bees get under his green veil and his hair, and finding that they cannot get out, they sink on him with their little heated hypodermics, and he says things which bring the blush to the features of his sad wife.

For days afterward they sit opposite each other at the table and do not say anything. He looks at her savagely with one eye, the other being closed by its creditors. It is three days before he will even ask her to pass the butter, he is so mad.

Bees are very industrious, but fool themselves by accumulating more than they need, forgetting that they will soon die and leave their substance for the use of those who did not earn it. We should learn a lesson from the bee and not run the matter of industry into the ground. We should not strive to accumulate so much that it will prevent our enjoyment during our lifetime and only enrich the idle after our death. Bees should remember that their shrouds will not hold honey. The bee could learn much from man, I think, in this way. BILL NYE.

BEE-NOTES.

Some Interesting and Practical Advice for Bee-Keepers.

Written for the American Bee Journal
BY DR. J. M. HICKS.

All needful work in the apiary is just as necessary to be done at the right time, in order to be successful, as it is that the farmer should sow his wheat and oats, and plant his corn in season, in order to have crops.

The bees should not be molested during "dog-days;" but see to it that all colonies are in good condition, and that the increase of swarms is made at least by the middle of June.

I prefer to make my increase by dividing colonies, which is best done in a movable-frame hive.

In order to succeed, I would advise all to look early in the spring as to the condition of the bees, and if you have a weak colony, see that it has a queen, and feed it a little thin syrup every day, to stimulate the queen for early breeding. This is best to be done in the evening.

To prepare syrup for the bees, I use coffee "A" sugar, at the rate of four pounds to a quart of water, to be heated and well dissolved, and fed in glass tumblers, by tying cotton cloth over them, and then inverted over the bees in the top of the hive; as they are emptied, refill, and replace as before. You will be surprised to see how fast the bees will increase in numbers.

Bees will, as a rule, pay an increase of 200 per cent. in an ordinary season, if properly managed. One colony paid 500 per cent. this season. A good movable-frame hive of the best pattern, a honey-extractor, and a good bee-tamer, are all necessary implements for the bee-keeper to have, and use, in order to succeed.

See to it that all surplus honey is removed from the hives before the fall crop comes on, and have plenty of empty frames or sections in the hives for refilling.

Allow no colony to be without a good, prolific queen, at this or any other time of the year. Now is a good time to procure such, from some good queen-breeder. Italian and Cyprian bees are the best for all practical purposes, and by far the most docile bees to handle, as well as being very prolific.

It is a curious fact that the days of humbugs are still among us, as we notice that the editor of the AMERICAN BEE JOURNAL saw the painful necessity of exposing as a fraud, Ells & Co., of Chicago, who are advertising with circulars, their recipe for making "Artificial Honey." I would urge all to beware of all such frauds, as there is no pure honey except that which the bees gather, and store from the flowers of the field. All efforts to palm off such stuff, calling it "artificial honey" is as much a fraud as with the oleomargarine, and until it is legalized (as all such frauds are usually, when money enough can be paid to do so), it is a fraud nevertheless, both on the public, as well as on the consumer.

Indianapolis, Ind.

CLIPPED WINGS.

Management of Swarms when the Queen is Clipped.

Written for the American Rural Home
BY G. M. DOOLITTLE.

I have four plans which I use, either of which works well. The first is to hive the bees on the returning plan, allowing the swarm to occupy the place of the old colony. This is done as follows:

When the swarm is seen issuing, step in front of the hive far enough so you will not be liable to step on the queen, should she have gotten out before you reach the hive, and also so that you can take in quite a bit of territory with the vision, for if too close you will see but little of the ground, which causes a longer search, with less prospect of finding the queen than if farther off.

As soon as the queen is found, let her run into a wire-cloth cage, entering the same readily if it is held a little in front of her, and in an upright position. When she is in the cage, put in the movable stopper so as to secure her, when she is to be placed in front of the old hive, or anywhere you please, only so you do not step on the cage and hurt her, as I knew a certain person to do once.

Next, move the colony to a new stand, and place a new hive where the parent colony was when the swarm issued, placing the caged queen at the entrance. In from five to thirty minutes the bees will miss their queen (generally in from 5 to 8 minutes), and come back from where they left, in search of her, running with fanning wings into the new hive, when the queen is to be set at liberty and allowed to go in with them.

The second plan is one which I use when I wish to leave the old colony on the old stand, and is as follows:

Proceed to hunt up the queen as before, and as soon as she is found, turn the old hive half way around, and off of the ground (to the rear) where it stood. Now place the new hive where the old one stood, placing the queen at the entrance of the new hive as before. As soon as they come back and all enter the new hive, take the new hive and carry it where you wish it to stand, bringing the old hive back to its former position. By these two ways it will be seen that the bees hive themselves; no climbing of trees, cutting off of limbs, or anything of the kind, which our fathers thought it necessary to do.

My third plan is, when the bees begin to cluster on the branch of a tree, which I care nothing for, I attach a wire to the cage, and hang it with the clustering bees; then when I get ready to care for them, I cut the branch from the tree, and carry them to the hive, which has been previously placed where I wish the colony to stand, or one that I have prepared while they were clustering on the limb. No danger of their going to the woods if you let them hang there all day.

I was amused one day by seeing a swarm uncluster and start for the woods, as I was about to cut off the limb, and take them to the hive. Away they went, clear out of sight, so I sat down to watch operations. In about a quarter of an hour, back they came, and I was anxious to see whether they would go to the tree where the queen was, or to the old stand. I was soon satisfied however, for they soon clustered back on the queen.

If any of the readers wish a swarm to go to work in the open air, this gives them a clew to how it can be done, for after having given up that there is no use of trying to get off, they will settle down to work on the limb where they have clustered. When they get some combs started, they will be liable to stay, after which the queen can be set at liberty.

The fourth plan is to cage the queen as before, when a large corn-popper is to be so held in front of the hive that many of the issuing bees will run into it. If you do not see the queen, so as to cage her before the thickest of the bees have ceased leaving the hive, catch the bees first and then look for the queen.

Having the bees in the popper, and the queen in the cage, attach the cage by means of a wire hook, to the popper so it will hang snugly to one side of the same. Previous to this you should provide yourself with a light pole of sufficient length to reach the highest place where the bees are liable to cluster, into the small end of which there should be bored a hole of the right size so that the popper will screw into it firmly.

Having the bees in the popper and the caged queen attached, screw the popper in the end of the pole, raising the same and carrying it into the midst of the swarm, where they are flying

the thickest in the air. The bees in the popper will fan their wings on the side next to the queen, which tells to those in the air that they have found the queen and are clustering about her, when as a rule the swarm will at once begin to cluster on the popper also.

Some swarms, however, are determined to cluster on a tree or nowhere, and in such a case, as soon as one-fourth of the bees have clustered on the limb, hold the popper immediately under and up against those on the limb, when the balance of the bees in the air will begin to cluster all over the popper. When about two-thirds of the bees are clustered, draw the popper away from the limb a little, so fixing it that you can leave it, when all of the bees will leave the limb and cluster on the popper as you wish. While you are waiting for them to go from the limb to the popper, you can be getting the hive ready, or any other work you may have to do. As soon as they are clustered on the popper, you can carry and hive them where you wish, the same as you would, had you cut off a limb.

Borodino, N. Y.

SUGGESTIONS.

The New Constitution and By-Laws of the Bee-Association.

Written for the American Bee Journal
BY DR. C. C. MILLER.

I see that there are differences of opinion arising from the fact that different persons are quoting from different places. Secretary Holtermann says, "I wonder where Dr. Miller is quoting from." I quoted from the report of the proceedings for 1887 without knowing at the time that the report for 1888 differed. Dr. Mason and Mr. Holtermann have evidently taken the report for 1888. The only question of difference between us is, which report shall we take?

On page 22 of the report for 1888 I find this: "Finally attention was turned to the consideration of the proposed Constitution and By-Laws for the society. This was prepared last year by Mr. Thomas G. Newman.... It was voted to adopt the new Constitution and By-Laws." Now did we adopt what was in the 1887, or the 1888 report? Clearly we could not have taken anything from the 1888 report, for it was not then in existence. I hardly think that any one will think that we adopted anything but the Constitution and By-Laws as given in the 1887 report, for that was the only thing referred to, and, unless my memory is badly at fault, no change was made in it, nor ever talked of. If any error has crept into the following report, that, surely, is not to be accepted as the action of the society.

Messrs. Mason and Holtermann will, therefore, I think, agree with me that, according to Article VII, the President and Secretary "shall constitute an executive committee;" and that according to Article VIII of the By-Laws, "A committee of five *shall* be elected, who shalt have power to organize itself into a 'Honey Company.'"

The Society's New Name.

With regard to any change in the name of the "International American Bee-Association," its present name is so cumbrous that it will probably be used in full very rarely; but it would be better not to make any change, than to change to a name that would appear to be claiming to be what we are not. Other nations charge the Yankees, I am sorry to say, only too justly in many cases, with being given to exaggeration, and if that characteristic should crop out at Brantford, I hope that there will be enough conservative Canadians there to hold things level.

Dr. Mason's suggestion to have an odd number on the executive committee, is a good one. There is some mistake in the report for 1888, as Article IV and Article VII conflict as to the number on the executive committee.

Dr. Mason need not look for any sympathy from me on the President's-address business. I am "furnenst" it, at least till he is out of office: for I feel pretty sure that if he made a closing address, he would quote quite largely from the address that I made (?) when I delivered up the keys of office to him.

Marengo, Ills.

[The above was written some time since, and as it required some comments, was put into a drawer, (as we were then busy), and forgotten until just now found there. We beg Dr. Miller's pardon for the delay. The conflict in Articles IV and VII as to the number in the executive committee should be amended at Brantford. In fact, it needs a full revision. When it was referred to the committee at Chicago, it was expected that it would be carefully revised. As they did not do it, if our memory serves us right, we made some corrections in writing in our copy of the Constitution, (among them the *shall* was changed to *may*) and we intended to present these as amendments at Columbus. We expect that our copy was given out to the printers, without a thought about the changes, and as the printers supposed the changes were made by the convention, they were incorporated into the report. This will explain to both sides of the controversy the cause for the discrepancy, and we hope will satisfy them. If we can get the time, we will prepare some amendments to present at the next meeting, and hope Dr. Miller and others will do the same. All we want is the most *perfect* document on record.—ED.]

COMB HONEY.

How to Care for Comb-Honey, Where to Keep it, etc.

Written for the Iowa Homestead
BY EUGENE SECOR.

As the season for caring for honey is here, and as I am convinced by conversations with some bee-keepers, as well as people generally, that a great many do not know how to care for honey, a few words may not come amiss at this time on the subject.

In the first place, there is no hurry about taking it off the hives. The bees can care for it more cheaply, and even if it is not quite so white as when taken off earlier, its flavor is improved by perfect ripening, which, to my mind, more than compensates for the slightly darker shade which the comb presents.

If taken off during warm weather it will sometimes be spoiled by the larvæ of the bee-moth. The worms can be fumigated with sulphur in a tight box or room, but this is seldom necessary, and is not practiced to any extent by the best honey producers. If comb honey is produced by the best methods there will be scarcely any pollen cells in it, and in the absence of these the moths do little harm. A worm is seldom seen in surplus honey unless there is pollen in some of the cells. When honey is taken off the hive, if in small sections containing only one comb each, it can be held up to the light and every cell of pollen detected. If these are kept by themselves and used or sold first, the rest will be comparatively free from moths.

Honey should never be kept in a cellar—neither comb nor extracted. That is the worst possible place for it. It will gather moisture, or "sweat," and soon become "off flavor," if not positively sour. Store it in a dry, warm room if possible (safe from mice), then it will keep ten years. It will not

granulate so soon in a warm room, and its flavor will improve. I now have some that is three years old, and it is not candied, but is so thick that it will not run. Extracted honey cannot be kept in too warm a room.

Forest City, Iowa.

SWARMING.

Annoyed by Too Much Late Increase of Bees.

Written for the American Bee Journal
BY MRS. MARTHA ANDERSON.

I desire to ask a few questions, to be answered in the BEE JOURNAL, viz.:

1. My bees have commenced swarming over. The old colonies that I wintered through, cast from two to four swarms in June, and now they are issuing as large swarms as I ever have seen. My new colonies have cast from one to three swarms, and I have put a great many back into their old home. If there is any way to prevent their swarming, I would like to know. I like to see swarms in May and June, but at this time of the year I am tired of it.

I have lost several swarms by not expecting them to swarm, and being away from home. I cannot complain of my bees not working, for I think that they have done well. I have taken off over 1,000 pounds of clover honey in one-pound sections. Some colonies have stored 72 pounds each, and cast three swarms.

If the honey-flow continues till Sept. 20, some will store 120 pounds each, while others will not do so well. These are June's swarms.

The bees are working hard on the Alsike and red clovers. We have 15 acres of the former, and it is a continual hum of bees all the time on the clover.

I started last spring with 32 colonies in good condition, and they did not swarm until June 3; then I had from 3 to 10 swarms a day during that month. I put on surplus sections to give them more room, and still they swarmed. I have 101 colonies of bees—more than I care for.

2. I am not a member of the Bee-Keepers' union, and would like to know if it sets the prices on honey. It is only worth 10 cents per pound here, and that is not enough. I live 3 miles south of Bushnell.

Bushnell, Ills, Aug. 19, 1889.

[1. Swarming at this season of the year is unprofitable. To prevent their absconding, about the best thing is to clip the queen's wings.

2. The "Union" has nothing to do about the market price of honey—it is only for the defense of the pursuit of bee-keeping.—ED.]

GERMANY.

What Bee-Keepers are Doing in the Fatherland.

Written for the American Bee Journal
BY REV. S. ROESE.

The following are some facts and notes about bee-keeping in Germany, from the *Bienen-Vater:*

Bee-keeping in Germany, according to current reports from various German bee-keepers, has advanced to a standpoint of perfect organization; associations and conventions having been organized all over the land, which jointly form a General Assembly, to meet annually. The associations are again subdivided into sections with a foreman ("called Opman"), to preside at their quarterly meetings. Such foreman is elected by the General Assembly, or, in case of necessity, appointed by the President of the General Assembly.

Such foreman is to be well qualified to deliver lectures and essays on modern bee-keeping, and impart to all the members of his section the needed instruction to qualify them in apiculture, and keep pace with the main body; and as a body they control the honey markets, to a great extent, all over the land.

Honey markets and honey depots are established in all large cities. The City of Frankfort-on-the-Main alone has 5 of the established depots, whose actions are all sanctioned by the Imperial Government.

The General Assembly for 1889 is appointed to meet at the Giant City (so-called because 2 Giants stand in front of the City Hall) of Arnau, on the Elbe, at the rooms of the Imperial Upper-Gymnasium; and to this effect the Burgomaster has, by telegram, invited the Assembly as welcome guests. August 25 and 26 is the time appointed for the meeting, in connection with the International Exhibition of live bees, hives, products and apiarian supplies, with rich awards and premiums. The programme is a very interesting one, with invitation for all bee-keepers, at home and abroad. Subjects of interest will be discussed, and presented to promote the interest of this art and honest industry.

They mourn the loss of two prominent members of the cause—one in the person of Isador Weber, one of the most active section foremen, who in a short time increased his section to a membership of 110, well-drilled and instructed in the art of bee-keeping. He died on July 2, 1889, of congestion of the lungs, being in the 47th year of his life.

The other was Edward Cori, a prominent bee-keeper and learned man, who since 1831 occupied positions of honor and trust. Friends from far and near came to visit his apiary at the city of Bruix. When at the decline of life, in his 70th year, he reduced his number of colonies to a few, he devoted himself to rose culture, which occupation he followed until his decease. In the fall of 1888, while preparing his large varieties of roses for winter, he felt the symptoms of marmarmus rapidly advancing, and after a slight cold, which he had contracted, he died on Jan. 24, 1889, in the 79th year of his useful life.

I am in receipt of a copy of *Der Deutsche Bienen-Vater*, published at Zwikau, in the interest of apiculture in Germany, and am requested to kindly ask the AMERICAN BEE JOURNAL to publish a notice in its columns, as follows:

The 44th General Assembly of bee-keepers in Germany will hold its sessions on August 25 and 26, in the city of Arnau, on the Elbe, in connection with the International Exhibition of live bees, hives, implements and products, at the Imperial Rooms of Upper-Gymnasium. All bee-keepers at home and from abroad are cordially invited to attend, with the assurance that nothing will be spared to make this gathering a meeting of success and pleasure.

By order of the President,
ADOLPH SCHMIDT.

I am surprised to find Germany advancing so much in apiculture. Prussia, in its kingdom alone, has 1,458,764 colonies of bees, in working order now, and branch bee-keepers' associations without number.

The editor of the *Deutsche Bienen-Vater* sent me an invitation to attend the General Assembly, and a Legitimate Card for half-fare to attend this gathering.

Maiden Rock, Wis.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Aug. 31.—Haldimand, at Fisherville, Ont.
E. C. Campbell, Sec., Cayuga, Ont.

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 3.—Iowa State, at DesMoines, Iowa.

W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of futura meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Honey Crop Almost a Failure.

—H. E. Hill, Bear Lake, Pa., on Aug. 19, 1889, writes:

The crop of white honey in northwestern Pennsylvania is almost a failure, though a few producers report a full crop, while many in Crawford, Warren and Erie counties, in this State, and Chautauqua county, N. Y., claim a complete failure, attributable to the continued cold, wet weather during the clover season. The "good honey crop" so generally anticipated and talked of last May, has failed to materialize in this section of the country. Buckwheat is in bloom, but the weather is too cold for the bees to get out.

Good Outlook for Fall Honey.

—J. W. Sanders, LeGrand, Iowa, on Aug. 21, 1889, writes:

The weather is still fine and bees are doing well. They are still working on white clover, with which our pastures and roadsides are still white in places. How is that for white clover in Iowa? It began to come into good bloom on June 10. Buckwheat and other fall flowers are also beginning to bloom abundantly; so the outlook is still good for more honey and a busy time, if the weather keeps all right. The white honey harvest in this section of Iowa has been good, and many who *keep bees* think that the country is overstocked, and that honey will have to sell at very low rates in order to find consumers for all the grand harvest. I tell them that they ought to take the AMERICAN BEE JOURNAL and keep posted on the general crop. Out of over 60 colonies in the spring, I have had but one to swarm, and that returned in less than ten minutes, and remained satisfied. My queen's wings are clipped. I give plenty of room, help the weak from the strong, make new colonies by rearing queens from my best, and build up the nuclei by giving frames from other strong colonies. I have used this plan for several years, and I have succeeded in keeping swarming and increase almost entirely under control. I prefer it to chasing swarms and climbing trees.

Swarm in a Dwelling-House.

—Noah Clemmons, of Rock Bluffs, Nebr., writes:

I captured a nice swarm of bees from under the weather-boarding of a dwelling-house on May 29, and have it at home, and it is doing well. The bees went in the house through a knothole about 10 feet from the ground, last summer, and built comb from one studding to the other—about 3½ feet long. I took the siding off and got them out nicely. Can anyone beat that? I have just received two nice Carniolan queens, which I am going to try.

Honey Crop Below the Average.

—Martha Smith, Monroe, Wis., on Aug. 8, 1889, writes:

Bees in this locality are killing the drones and sealing their hives. Owing to the cold nights, the honey crop is below the average. My 23 colonies have increased to 43, and given about 500 pounds of comb honey, and about 525 pounds of extracted. There is no prospect for a full crop. The "artifical honey" story, as published by the Chicago *News*, appeared in a recent issue of the *Northwestern Mail*, a temperance paper, in which one seldom reads such *misleading* articles.

Good Results of the Season.

—I. N. Arnold, Richmond, Iowa, on Aug. 14, 1889, writes:

The white honey crop is over for this year, and has been very satisfactory to the bee-keeper, although the linden was almost a failure in this locality. My home apiary was run for increase this season, and my Pilotsburg apiary for extracted honey, managed under the Dadant style. I have 11 colonies that have stored 360 pounds each, and 12 colonies that stored 240 pounds each; this makes 6,840 pounds from 23 colonies in that apiary, with 8 and 9 Quinby frames in the brood-chamber with plenty of honey for the winter. This is no guess-work—the honey was all divided, and one-sixth went to the party where the apiary was. The honey is very fine, almost all being white clover. Who can beat my 23 colonies in Iowa, and leave plenty of honey in the brood-chamber for winter? My honey crop will be between 12,000 and 13,000 pounds for the season. I think that the fall crop will be light, from the present appearance. I sell most of my honey in ten-pound tin-pails, in my home market.

Honey and Beeswax Market.

PHILADELPHIA.

HONEY.—Prices are not fully established, being a little too early. Only a few shipments have yet arrived, which sold readily as follows: Best white, in 1-lb. sections, 16½c., and 2-lbs., 14c. Off grades generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c

BEESWAX.—23½@24½c.

Aug. 15. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.

BEESWAX.—18@20c.

Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extra ted increasing; demand light, at 6@8c.

BEESWAX.—25c.

Aug. 1. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Extracted, California, 7½@8c.; orange bloom, 7½@8c. White clover and basswood, 7½@8c. Common Southern, 65@75c. per gal Fancy comb, white 1-lbs., 16c.; fair 1-lbs., 14c; 2-lbs., 2c. less.—The New York crop being comparatively small, the Western apiarists will find a good outlet here in the East. As prices this season are about 10 per cent. lower than last season, we expect an active demand.

Aug. 21. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Coming in freely, but sales are not eisily made at over 15c. for the best, while we are trying to get 16c., and think that later we can get it, as all buy sparingly now. Extracted sells at 6@8c., but chiefly at 7c. for white.

BEESWAX.—25c. R. A. BURNETT.

Aug. 12. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.

BEESWAX.—23c.

Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.

BEESWAX.—24c. for prime.

Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—New comb arriving freely. Demand is fair, although weather is too warm. We quote:—Fancy white 1-lbs., 16c.; 2-lbs., 14. Fair 1-lbs., 14c; 2-lbs., 12c. Excellent demand for all kinds of the extracted, as follows: Orange blossom, 7½@8c.; white clover and basswood, 8@8½c. Southern, average quality, per gal., 65@70c.

HILDRETH BROS. & SEGELKEN,

Aug. 21. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It has arrived freely, but sales are a little slow, at 17@18c. for 1-lbs.; and 2-lbs., 15@17c. Extracted, 8@9c.

BEESWAX.—None on hand.

Aug. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Demand for extracted is fair from manufacturers, and from consumers for table use. Good demand for best qualities of comb honey, while inferior grades find slow sale. It brings 11@15c.

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.

Aug. 21. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts of comb honey are large, but market slow, at 14@15c. for white 1-lbs., and 13@14c. for 2-lbs. Extracted, white, 7@8c.; dark, 6c.

BEESWAX.—20@25c.

Aug. 22. CLEMONS, CLOON & CO., cor 4th & Walnut.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40
Bee-Keepers' Review	1 50	1 40
The Apiculturist	1 75	1 65
Bee-Keepers' Advance	1 50	1 40
Canadian Bee Journal	2 00	1 80
Canadian Honey Producer	1 40	1 30
The 8 above-named papers	5 65	5 00
and Langstroth Revised (Dadant)	3 00	2 75
Cook's Manual (**old edition**)	2 25	2 00
Doolittle on Queen-Rearing	2 00	1 75

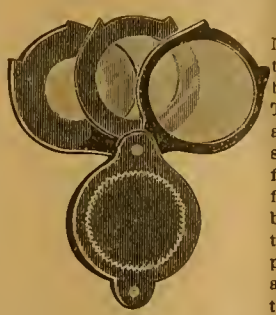
Root's A B C of Bee-Culture	2 25	2 10
Farmer's Account Book	4 00	2 20
Western World Guide	1 50	1 30
Heddon's book, "Success,"	1 50	1 40
A Year Among the Bees	1 75	1 50
Convention Hand-Book	1 50	1 30
Weekly Inter-Ocean	2 00	1 75
How to Propagate Fruit	1 50	1 25
History of National Society	1 50	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Always Mention your Post-Office County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

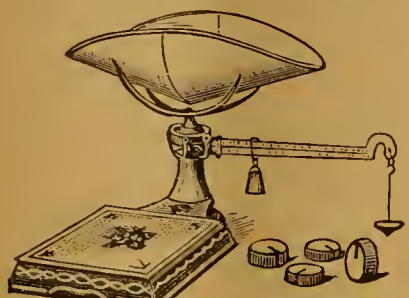
For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Queens.—We can supply Tested Italian Queens at $1.50 each; Untested, $1.00 each, by mail, postpaid.

Advertisements.

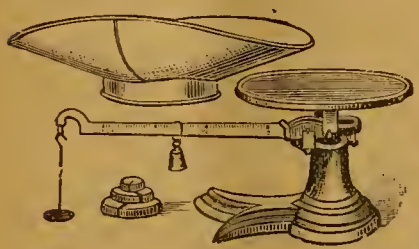
Useful Scales

The Union or Family Scale.



This Scale has steel bearings, and it weighs from ½-ounce to 240 pounds. Price, with a Single Brass Beam, as shown in the illustration, $3.00. With Double Beam for taking the tare, $3.50.

The Little Detective Scale.



This little Scale is made with steel bearings, and a brass Beam, and will weigh accurately ¼-ounce to 25 pounds. It supplies the great demand for a Housekeeper's Scale. Prices:

Single beam,	no scoop	$2.00.
" "	tin "	2.50.
Double "	no scoop	3.00.
" "	tin "	3.50.

☞ All orders filled promptly.

THOS. G. NEWMAN & SON,
923 & 925 W. Madison St., - CHICAGO, ILL.

ITALIAN and ALBINO Queens, by return mail. Tested, 90c.; Untested, 60c. each, or 2 for $1.—3-frame Nuclei, $2 each.
33Atf GEO. STUCKMAN, Nappanee, Ind.

BEE KEEPERS

Should send for my circular. It describes the best Hives, the best Cases, the best Feeders and the best Methods. Address,

J. M. SHUCK,
DES MOINES, IOWA.
1Aly

An Old Bee-Book Revised, and Dadant's Foundation. See advertisement in another column.

Extra Thin FOUNDATION

In 25-Pound Boxes.

WE CAN now furnish the **Van Deusen** EXTRA-THIN Flat-Bottom FOUNDATION put up in 25-lb. Boxes, in sheets 16½x28 inches, at **$12.50** per box. **12 ft.** to the lb.

☞ The above is a **special offer**, and is a **Bargain** to all who can use that quantity.

All orders for any other quantity than exactly 25 lbs. (or its multiple) will be filled at the regular price—**60 cents** per lb.

THOS. G. NEWMAN & SON,
923 & 925 West Madison St., CHICAGO, ILL.

To SPEND the Immense Sum of Half a Million Dollars to advertise a single weekly publication is unparalelled even in this age of stupendous advertising enterprises. The publishers of THE YANKEE BLADE, however, are determined to give every person in North America, a chance to read its entertaining and instructive stories THE YANKEE BLADE has been published without a break for fifty years. It has become firmly established by its long and prosperous existence, and is well and favorably known in every state in the Union Its stories are always of a good moral tone. THE YANKEE BLADE is destined to have

$500,000.00

THE YANKEE BLADE

The Largest Circulation in America.

With this aim in view it is now offered to you on trial at **the lowest price ever before named** by any American publisher for an 8-page, 48-column weekly paper Our offer is actually less than the cost of the white paper before it is printed, and is open only to new subscribers because our regular subscription price is $3 00 per year, six cents a single copy

10 WEEKS FOR 10 CENTS.

There is to be found a vast amount of reading each week in the columns of THE YANKEE BLADE.
It has thrilling serials of the Sea, War, Adventure, City and detective life
It contains six or eight short stories each week intensely interesting, and devoid of any objectionable or impure features
On our Fourth Page are treated Intelligently and Impartially the Various Phases of all the Important Social Movements of the Day.
Free exchange notices are inserted for subscribers
Good advice to the young in our correspondence column.
Our Third Page is devoted to the children's and household departments.
On our Eighth Page appear every week some of the brightest gems of original humor to be found anywhere in America.
THE YANKEE BLADE is the best family weekly published.
Send 10 cents at once for 10 weeks trial.

It is a condition of this offer that every person who sends a subscription shall at the same time send the names and addresses of at least three story readers or female heads of families, to each of whom we may send a sample copy of THE YANKEE BLADE If any one wants to subscribe for a longer time than ten weeks we will accept subscriptions as follows

One year, $1.00; two years, $1.75; three years, $2.40; four years, $3.00; five years, $3 50. One-cent postage stamps will be taken for fractions of a dollar. All large amounts may be sent safely by registered mail or P O money order. An express money order may be purchased at any express office for only five cents and is an absolutely safe way to send money We guarantee you entire satisfaction.

GLASS PAILS

FOR HONEY.

THESE Pails are made of the best quality of clear flint glass, with a bail and a metal top and cover. When filled with honey, the attractive appearance of these pails cannot be equaled by any other style of package. They can be used for household purposes by consumers, after the honey is removed, or they can be returned to and re-filled by the apiarist.

Prices are as follows:

To hold 1 pound of honey, per dozen,			$1.60
"	2 pounds	" "	2.00
"	3 "	"	2.50

EDITORIAL BUZZINGS.

Don't Be Like Moses.

But one step more, disasters teach,
And gloom had all turned sunny.
Like Moses we just fail to reach
The land of milk and honey.

But a great many make a fatal pause from lack of encouragement.—*Scl.*

The Editor of the AMERICAN BEE JOURNAL has been appointed to judge the exhibits of Bees, Honey and Apiarian Supplies at the International Fair and Exposition, at Detroit, Mich., which will be held from September 17 to 27, 1889. He hopes to meet many friends at that time.

The Chicago Convention will be held on **Friday and Saturday, Oct. 11 and 12, 1889.** This change of date has been made, because the Railroad Traffic Association has made a rate of one fare for the round trip from any point within 200 miles of Chicago, good on Oct.10,and can be used on any train returning after that until Monday, Oct. 14. The first session will be held at 9 o'clock in the morning of Friday, and an adjournment can be had on Saturday afternoon in time for those who may wish to return on that day. Those who can remain over Sunday will have an opportunity of visiting our magnificent churches and cathedrals in the morning and evening, and of taking a pleasant walk in the parks or riding on the boulevards in the afternoon, as their inclination and tastes may lead them.

October is usually a very pleasant month, and this will give an opportunity to many who need a recreation, to take it at a small outlay, and at the same time to "take in" the Bee-Convention. The invitation is full and wide—*Come all who can.*

Sweet Clover on the Roadside.—On page 413, Mr. C. A. Huff, Clayton, Mich., complained of his neighbors who objected to his sowing sweet clover on the roadside of his own farm, saying that it was a noxious weed, like Canada thistles, and asked if it was lawful, etc. We replied that as the land to the middle of the street belongs to the owner of the fields, he can sow what he pleases on the roadside, unless it be a noxious weed, which is prohibited by law. Sweet clover is neither prohibited nor is it a noxious weed. It will not spread into the fields, and dies root and branch after the second season. To cut it two seasons, before the seed matures, will free the land from it entirely. It is in no manner like Canada thistles, except in that it is an excellent honey-producer. Of this we sent a printed slip to Mr. Huff, and he writes us as follows, dated Aug. 19, 1889, concerning it:

My neighbor, after going to the pathmaster of our district, and then to the highway commissioner, has let the sweet-clover subject drop. I sent the printed slip you sent me, to Prof. A. J. Cook, and he said that it was correct; then I sent it to D. B. Morgan, prosecuting attorney, and he replied as follows:

"After looking at the printed slip enclosed, and examining the Statute of this State, I am inclined to believe that you have a right to sow it on your land in the highway. This belief is with the understanding that it does not spread in a way to work an injury to adjoining land owners. If it does do so, they might possibly have an action against you for damage, but I do not think that there is any *penalty* for sowing it."

When I showed this to the pathmaster and highway commissioner, they said that they had nothing more to say. Thanks to you and Prof. Cook for your help in this matter

The honey crop is very light in this part of the State.

The National Bee-Keepers' Union, through its Vice-President and Manager, has helped another man out of trouble, threatened by jealous and disagreeable neighbors. Surely it has a good claim to existence.

Ignorance about Comb Honey.—On page 499 we gave an account of an interview with a grocer who believed that comb honey was manufactured, thus proving himself to have been easily duped by the Wiley unpleasant "pleasantry." There may be some excuse for those who know nothing about the *modus operandi* in the production of comb honey, when they have been deceived by false statements; but how a bee-keeper in apparently "good and regular standing" in the fraternity, can be led to believe that comb honey is made otherwise than by bees, is utterly incomprehensible, and a clear case of totally inexcusable ignorance. But such a sad case of stupidity really exists—at least we have discovered him.

One day last week, there called at this office, one who desired to purchase some supplies, stating that he *kept bees.* He remarked that honey would be very cheap this year, as it could now be had on South Water Street (Chicago), for 10 cents per pound; but that the *cheap* kind was the manufactured article. We then asked him if he really believed that comb honey is manufactured. "Why, yes!" he replied. We were simply astonished, to learn that a bee-keeper would imbibe such falsehoods about that which he should know the truth. We of course assured him that what he thought was "manufactured comb honey," did not exist, and that what he saw in market was very likely bought from some country bee-keeper, who knew as little about the price and value of honey, as our customer knew about the *making* of honey. We also gave him a copy of the BEE JOURNAL, for July 13, containing the editorial "showing up" the Philadelphia *Record's* misrepresentation of our pursuit.

Intelligent bee-keepers have an important work to perform, in the the line of educating people about honey and its production. Let all who desire to see the pursuit of bee-keeping occupy its proper position among the honorable industries of the world, do everything they can to educate the masses—not only to the *use* of their wholesome product, but to a clear understanding of the *manner* of its production.

Mr. Charles Dadant gave us a call a few days ago. He was on his way to Northern Wisconsin, with his wife, where he expects to stay a few weeks, in order to escape the usual "hay-fever," which affects him at home during the late summer.

His articulation, together with his foreign accent, make it very difficult to be understood by ordinary persons, though we had no difficulty in that direction. He illustrated this by telling us a good joke on himself, which however makes it necessary to hear him speak to get the *full force* of the "pleasantry."

Soon after he came to this country he went some distance away from his home at Hamilton, Ills., and, upon returning, became confused and lost his way. He met several persons and enquired the way to Hamilton (which he pronounced Ah-mill-tone, emphasizing the "mill") They all, with one accord, declared that they did not know where it was—though they were within a few miles of the place. He surmised that they did not understand him; and when very near to the place he sought, he met another man and made the same inquiry and received the same reply. He then thought of an expedient—he *wrote* the name of the town he sought, and handed it to the man, who exclaimed, "Oh! yes, Hamilton; that is just a mile over there," pointing to a road leading to the village.

He seemed to relish the repetition of the story, for he is full of humor and pleasantries.

His great learning and scientific knowledge show him to be far above "the million" in this particular, but his natural good nature and simplicity make him friendly and thoroughly companionable.

We hope he may spend a very pleasant month in the North, and return with improved health and vigor.

Blackberry Blossoms and Bees.

From a thicket in the corner of a zig-zag fence,
Where the succulent pokeberry stalks up-rear,
With the sassafras and sumach in a wild growth dense,
The blackberry blossoms through the brown rails peer,
With dewdrops shining on their long, white sprays,
Where the yellow bee buzzes and the redbird flies,
They marvel at the world and its new-found ways,
With innocent wonder in their wild, sweet eyes.

Magnolias are white,
And roses are bright,
An many there be that love them;
But with dew-besprinkled faces
And wildwood graces,
Oh, the blackberry blossoms are above them.

When the pine boughs are swinging in the soft May breeze,
And honey-bees are boasting of their spring-tide gain;
And the mockbird is singing out his happiest glees,
To the cotton-tailed rabbit in the end of the lane;
They lean their faces on the moss-grown rails
And listen to the melody the mock-bird weaves;
While the lizards go a-darting with their trembling tails
Like slim, long shuttles through the last year's leaves.

Chrysanthemums are fair,
And orchids are rare,
And many there be that love them;
But with dew-besprinkled faces
And wildwood graces,
Oh, the blackberry blossoms are above them.

—*Samuel Minturn Peck.*

Swarming.—A correspondent having noticed query No. 650, on page 534, asking what would be the next economic invention, replies as follows:

In answer to queries, I have it perfected now. It is a "swarming attachment," and can be constructed and attached to any hive, at a cost of from 25 to 50c. each. It not only makes it absolutely impossible for a swarm to abscond, but it will actually hive the bees in a new or empty hive on any stand the apiarist may desire, when there are no obstructions between the two hives. Or it will conduct the swarm to a convenient place to hive them, settle them in the shade and hold thim there until the apiarist can hive them at his convenience.

In answer to the 5th sub-question, let me say that I insist on having all the honor and glory attached to being the inventor of the first swarm-hiver and controller.

I am perfectly willing that this self-hiver shall be tested and used for a whole season before I receive a single cent for it; and I am satisfied no apiarist will do without it after trying it once.

Now, I propose that the bee-keeping fraternity pledge me $1,000, due one year from this date, providing my invention is a success in the hands of a majority of the bee-keepers. If it is not a success, I do not even want a "Thank you, sir!"

As soon as enough reliable bee-keepers pledge $1, $5, $10, or $20 to raise the whole amount to $1,000, a description of it and directions for using it will be furnished for publication, and a complete attachment will be furnished the editor, to have it engraved and make it plain for everybody. It is just the thing for Sunday; you will find the new swarms just where you leave them when you get home from church; and in out apiaries, there will be no more watching for swarms.

A "Pound" to Imprison Bees.—The New York *Press* of Aug. 6, contained a very amusing article on "Will they Tag the Bees?" and putting them in the "pound" for trespassing, by visiting the flowers in a neighbor's fields. It was sent to us by Mr. Jas. McNeill, Hudson, N. Y., and will be read with great interest. It reads thus:

WILL THEY TAG THE BEES? — The recently-reported decision of the General Term of the Supreme Court in the central part of the State, declaring it trespass for honey-bees to go upon lands not belonging to their keeper, is enough to make the late Mr. Canute, King of Britain, turn in his grave with bones green with envy.

Is each bee to have a little tag fastened around its waist by a delicate little wire? or are bee-collars of brass to be a staple article of Central New York manufacture? And will the statute gravely enact that "any bee found roaming at large or caught trespassing outside on the flowers of any person not its owner, will be put in the pound until redeemed by the payment of one dime?"

In default of payment of the dime by the owner, said owner being presumably notified by the publication, through advertisement in the local newspapers, of the number found on the bee's tag or collar, the bee will probably be put up at auction and sold to the highest bidder. This will require the creation of several local offices, and a bee-pound will be a necessary annex to the office of every country justice of the peace.

It is the solemn duty of the *Press* to protest against this circumscription of the liberties of the bee. Had the bees of ancient Greece been numbered, registered and tagged, they would never have tried to suck honey from Zeuxis' painted flowers or alighted on the lips of Xenophon. Had the bees of Merrie England worn collars in the days of Dr. Watts, they would never have inspired that classical lyric of our childhood, "How doth the little busy bee," etc; for the doctor would have seen that the bee was a slave and a creature of circumstauce, busy only because it had to be, and he would never have held it up for admiration as a model being. The General Term of the Supreme Court should go to the bee, consider her ways and be wise.

The *Press* is right. The General Term of the Supreme Court should learn *wisdom* from the bees. When at home they defend their domiciles, but when roaming around in search for that which Nature has provided for their sustenance, they are timid, and never volunteer an attack. The Court misjudges them and condemns them without evidence, except that which comes from prejudice and malice.

The Erie County, New York, Bee-Keepers' Society will hold a meeting on September 5, during the first week of the International Exposition. It will be a good time for all the bee-keepers of that region in the United States and Canada, to turn out and see the exposition, and meet and get acquainted with each other. Dr. A. B. Mason is to judge the Honey and Apiarian department. The cash premiums in the Bee and Honey Department amount to over $400, besides medals and diplomas.

Eating Five Pounds of honey at one sitting, is the sweet feat performed by a man named Kirkland, of Florida.

The Golded-Rod in Maine.—Mr. L. F. Abbott, editor of the Lewiston, Maine, *Journal*, writes about the season, the national flower, and the crop of honey in Maine, in this language, to the *Rural Home*. He says:

It is evident that while the bee-keeper has had a fairly good season to build up his apiary, the surplus crop of white honey will be much less than the opening spring gave hopes that it might be.

In parts of the State the apiarist has a reserve to fall back upon for a winter's supply for the bees. This is the golden-rod yield—the national flower, by the way, let us hope—which in this section is a bountiful one.

Already the beautiful golden corymbs of the earlier blooming species are tempting the bees to sip the nectar which this flower so abundantly yields up to the last of October in some seasons. Golden-rod yields pollen abundantly as well as honey, and from this circumstance and the pollen adhering to bodies and legs of the bees when gathering nectar from the flowers of golden-rod, a yellow tinge is imparted to the combs from the bees passing frequently over them. Golden-rod honey is rather dark in color, an amber hue, quite handsome when extracted and put up in clear glass jars.

The texture of well-ripened golden-rod honey is not quite equal to clover, but thicker than the average of what is denominated the yield from fruit bloom—the product of orchards and gardens.

Golden-rod honey soon granulates if exposed to the air. For this reason, all uncapped honey, whether in sections or brood-frames, when removed from the hives, should be extracted from the combs. When capped in brood-frames and kept till the following summer a large part will be found to have become granulated. For this reason it is best to dispose of golden-rod honey before it gets many moths old.

The outlook, taking the country over, is far less than an average crop of honey. This with other things will have an effect upon the market price.

The market was never cleaned up better of old stock than at the present time, and the short supply last year improved the price somewhat, and there is no reason that the price should be lowered. At any rate honey producers should not be in a hurry about making concessions to an empty market, until the returns are all in and we know what the crop is.

Settling of Swarms, etc.—In a recent number of the *Prairie Farmer* we find the following paragraphs in regard to swarming:

All this fuss and feathers, rattling a dish-pan and key, to settle bees, is of no use, unless it eases the feelings of the operator. The Creator evidently intended bees for the use of man, and implanted in them the instinct of clustering near to the hive from which they issued. I had a swarm remain clustered over night during a cold rain. This clustering gives the person an opportunity of putting them into a hive, and keeping them, and it is the same in all parts of the world.

"When a swarm issues, does the queen come out first?" I caught four out of six queens that issued one forenoon. Half of the swarm, apparently, would be out before the queen; in several instances she came out so late that I had despaired of seeing her. I am of the opinion that the workers rule the colony, and not the queen. If they miss her, they return, as she is the mother-bee, and when they swarm, they have not the means to rear another.

SUMMER.

But who the melodies of morn can tell?
The wild brook babbling down the mountain's side;
The lowing herd, the sheep-fold's simple bell;
The pipe of early shepherd dim descried
In the lone valley, echoing far and wide;
The clamorous horn along the cliffs above;
The hollow murmur of the ocean tide;
The hum of *bees*: the linnet's lay of love;
And the full choir that walks the universal grove.
—*Beattie.*

QUERIES and REPLIES.

Is the Preference for Italian Bees General?

Written for the American Bee Journal

Query 652.—1. Do bee-keepers in general deem it profitable to keep the apiary stocked with pure Italian bees? 2. Is not their gentleness, and consequent easier manipulation, the chief reasons for desiring them?—Mich.

I so prefer.—G. M. DOOLITTLE.

1. Yes. 2. No.—A. B. MASON.

1. I think so. 2. Hardly. — C. C. MILLER.

1. I think not. 2. It is but one reason—H. D. CUTTING.

1. I think not. 2. Yes, I so believe, together with their color.—R. L. TAYLOR.

1. Yes. 2. And honey-harvesting qualities, with their greater resistance to moths and robbers.—DADANT & SON.

1. They do. 2. Not wholly—they are better honey-gatherers.—J. P. H. BROWN.

1. I hardly think so. 2. I think that they are superior; but the amiability is the main point.—A. J. COOK.

I guess the testimony is about equally divided; there are many smart bee-keepers (who are right), on both sides of the fence. My experience has always been in favor of the pure Italians.—WILL M. BARNUM.

1. Yes, or at least as nearly as the surroundings will admit. 2. No more so than their business qualities.—J. M. HAMBAUGH.

1. Yes, as far as I know. 2. Yes, partly so; but we can add, for their superiority in every other respect.—P. L. VIALLON.

1. Yes. 2. No. They are more profitable, and can better protect their combs against the moth. — MRS. L. HARRISON.

1. Yes. 2. I think they are kept more for their honey-gathering qualities than their gentleness or quietness.—MAHALA B. CHADDOCK.

1. I think not. 2. Yes, undoubtedly a good reason, too, especially when they are equal to the Germans in most other respects.—J. M. SHUCK.

1. I do not know what bee-keepers in general think. As to honey-gathering, I have found bees of mixed blood quite equal to pure ones. The gentleness of pure Italian bees is one of their most desirable qualities.—M. MAHIN.

1. It would seem so, but it is my opinion that when crossed with other races, greater practical results may be obtained. 2. No; I think that they are considered more beautiful and attractive than the dark races.—G. L. TINKER.

1. As a rule, I think they do. 2. Not by any means; they posess many other qualities to recommend them, among which is that of fighting moth-worms, which they will not allow to remain in their hives.—J. E. POND.

I like the Italians for gentleness, but I do not like the color of their white comb honey. The whitest and cleanest of propolis is produced by Carniolans. I aim to increase from the most thrifty bees, rather than pure blood.—C. H. DIBBERN.

I do not know; but I do know that few do it. I can speak for myself, and say "No;" besides there is need of having crosses and any less gentle than the purest of any race, provided the apiary is properly handled. Good "hybrids" are just as easily handled as any bees on earth.—JAMES HEDDON.

1. I do not know, as I am not acquainted with the practice of any considerable number of the great "army." 2. I presume that is one reason for desiring them; but if that were their only recommend, I believe that "bee-keepers in general" would take a few stings for the sake of the "filthy lucre" which bees bred for business bring.—EUGENE SECOR.

1. It is not very easy to know or say what the "general" feeling is on this subject. I know that a great many apiarists deem it profitable to keep and work Italian bees in preference to any other race of bees, or any mixed race or races. But as the first crosses between the Italians and the black bees make good workers, very many honey-producers are content to tolerate the Italian race in a mixed state. I have found it profitable to keep pure Italian bees, though it has required continual watchfulness, and I have never had a visitor to see my apiary, that was not more than pleased with the sight of a pure Italian apiary.—G. W. DEMAREE.

1. The opinions of "bee-keepers in general" are very much mixed, and really prove nothing, except that they generally disagree about it. 2. Their qualities of industry and hardihood, coupled with their beauty and docility, are their chief recommendations.—THE EDITOR.

CORRESPONDENCE.

HONEY-SECTIONS.

What was the Origin of the Honey-Section?

Written for the American Bee Journal
BY L. C. WHITING.

In Vol. II, page 110, of the AMERICAN BEE JOURNAL, is an article written by Bradlow and copied from *Beinenzeitung*, describing a frame like those of the body of the hive, but used in the super in place of boxes. Section-boxes were simply an improvement on these frames.

Which was first will be hard to find out. Vol. III, page 114, tells us that Jas. McMullen put frames in his boxes and reduced the depth to 6½ inches. In Vol. III, page 150, T. F. Bingham speaks of the McMullen frame "as a link in the long chain of facts, obtained accidentally and by experiment in various parts of the country, and is of the greatest importance."

Vol. III, page 155, in an article signed A. Novice; the writer speaks of these frames, as though they were not yet suitable for marketing honey.

Vol. III, page 218, tells us that Giles B. Avery makes his boxes to contain nine small frames, four of which just fill one large frame in the hive.

In 1874, Baker & Dicer advertised their dovetailed sectional-honey-box, and offered $500 reward for any box that would beat it. The sections were 6x6x2, and were held together by pasting paper over the sections, making a box long enough to cover the hive, with wooden separators and glass ends. These were the first dovetailed sections brought to my notice.

About this time Capt. J. E. Hetherington sent 25,000 pounds of section-honey to market, glassed on both sides of each section. He had his section patented with a view of controling the market of honey put up in this shape. The frame was 6x6x2.

The Harbison frames, 5x6½x2 inches, were first mentioned in the market reports of 1874. Harbison's sections were nailed together, as were most of the sections up to this date.

Other bee-keepers were improving their way of making boxes. H. Alley made a box to hold two pounds. Manum's dovetailed sections, made of white-popular, soon made their appearance. Up to this time a large portion of the honey sent to market was put up in boxes holding from 4 to 40 pounds. The V-grooved section followed the basket splint section, as the dovetailed section followed the frame.

The foregoing information is from the early volumes of the AMERICAN BEE JOURNAL. Other papers may add more light. It was a surprise to me to see how little was said in regard to these important improvements.

Other problems that we call new today, were advocated fifteen or twenty years ago.

East Saginaw, Mich.

MILK-WEED.

Bees Loaded with Pollen Masses from It.

From the Farm, Stock and Home.

Chas. Koonze, of Faribault County, Minnesota, writes the Editor as follows:

Can you tell me through your paper what is wrong with my bees? They have done splendidly till the last few days; they now seem entirely engaged in fighting, and thinking that robbers were bothering them, I reduced the size of their entrance, and in so doing I noticed the bees that they were at war with, had peculiar legs. Catching a few, and picking up a few dead ones, and putting them under a magnifier, I saw their legs seemed loaded with what appeared to be the eggs of some insect. I send you a box by mail, enclosing a few bees, and also some dirt which I picked up in front of the alighting-board. Give a remedy if you can, and oblige.

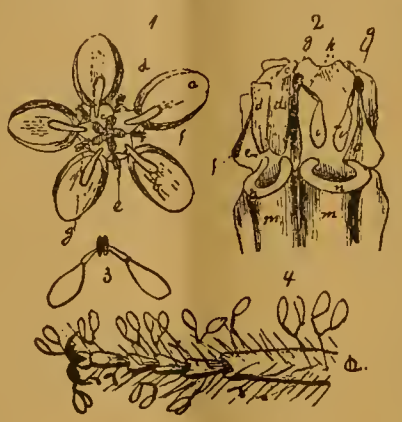
Prof. N. W. McLain, director of the Minnesota Agricultural Experiment Station, by request, replies as follows:

The bees sent are loaded with pollen masses from milk-weed, and the dirt accompanying is chiefly composed of the same material. The pollinia and attaching bands often accumulate on the feet and hairs of the legs of the bees to such an extent as to render them helpless. The efforts of the bees in assisting their mates to extricate themselves was probably mistaken by your correspondent for fighting. The strength and efficiency of a colony is often seriously injured from this cause. The remedy is to destroy the milk-weeds within reach of the bees.

I have asked Dr. Luggar, entomologist of the Station, to make a drawing and write a short explanation of how this mishap befalls the bees when they are seeking for nectar, and also performing the function of fertilizing the flowers. His reply is submitted herewith:

ASCLEPIAS AND BEES.—There are few genera of plants which rival the orchids in the complexity of their perfect adaptation to insect visitors. The species of our common milk-weeds (*Asclepias*) belong to such genera, but their mechanism is so complex that it is impossible to describe its adaptation to the purpose of forcing insects to fertilize the flowers, without giving at the same time some illustrations. To understand the *modus operandi* the readers should pick to pieces one of these flowers and thus learn it.

The two ovaries are surrounded by a flesh column (Fig. 2, *m*), and covered by a thick, fleshy disk, and they are only capable of fecundation at five stigmatic spots close beneath the lower border of the disk (Fig. I, *o*). The column, which really consists of the united staminal filaments, bears at its



Asclepias or Milk-Weed.

upper end five anthers. The anthers lie close around the stigma-disk; each of them lodges two flattened pollen-masses (Fig. 2 *i*, and 3) in two pouches, which are open internally, and are indicated externally by slight swellings (Fig. 2, *d*).

A thin membraneous process of the anther (Fig. 1, *c*) rests upon the top of the stigma-disk, and on each side the anther is produced into a triangular membraneous expansion or wing (Fig. 1, *c*), which stands out perpendicular to the column close to the corresponding process of the adjacent anther.

Between the two adjacent processes of each pair of anthers, there is left only a very narrow slit, which is distinctly wider at the lower end (Fig. 2, *f*). The slit leads into an elongated space which we may call the stigmatic chamber (Fig. 2, *o*), for about the middle of its vertical height the stigma is exposed. At the upper end of the slit, visible from the outside, is a bright, black body of regular shape (Fig. 1, *g* and Fig. 2, *g*), which is seen on closer examination to be a thin, hard, horny lamina. The sides are bent forward for its whole length so that their edges lie close together, and in the middle of the lower border is a wedge-shaped slit. To this lamina (*g*) the two adjacent pollinia of 2 neighboring anthers are attached by bands which lie hidden beneath the anthers (Fig. 2, *h* and Fig. 3). The upper end of the column carries, besides the five anthers, five hollow, fleshy organs, which secrete a large quantity of nectar.

This singular apparatus acts in the following way: Insects, (bees, wasps and flies) in search of honey, attracted by the sweet scent of the flower, slip upon the smooth parts of the flower until a foot enters the wide inferior part of the slit, in which at least it gets a firm hold. When the insect tries to draw its foot out, in order to proceed further, the diverging claws are caught by the opposed edges of the anther-wings, and guided upwards in the slit, so that one or the other of the two claws is brought without fail into the notch at the lower border of the black lamina (*g*) and there held fast. If the insect now draws its foot forcibly out, it brings with it *g*, the two pollina (*i*) attached to it by their retinacula (*h*).

The pollinia stand wide apart when they are extracted; but the retinacula twist inwards as they dry, bringing the pollinia so close together that they may easily be introduced into another slit. As the insect moves on over the flowers, its foot bearing the pollinia slips into the lower part of a slit of another flower; and this time, as the leg is drawn up, the pollinia are left in the stigmatic chamber opposite to the stigma, since the slit is too narrow to admit of their further passage upwards; and the insect, freeing its foot by a violent pull, snaps the retinacula, and so extricates itself. The pollinia are left behind in the stigmatic chamber, while the broken retinacula is carried off still firmly attached to the insect's foot.

The insect continues its visits, and the retinacula attached to its feet now gets fixed in *g*, as the claws did before, and an insect's foot, after repeated visits, may sometimes be bearing many pollen-masses, as seen in Fig. 4.

Frequently insects are unable to withdraw their feet, and they die in the attempt to do so. I have often seen blow-flies, small moths, and even week honey-bees thus captured.

The well known *Physianthus albens* of Australia is a climbing species of milk-weed; it is often sold by gardeners, because it has the habit of catching and holding even large insects in the same manner as our native species of milk-weeds.

OTTO LUGGAR,
Entomologist.

DADANT.

The Horticulturists Meet and See the Sights.

The Keokuk *Constitution-Democrat* reports the proceedings of the Warsaw, Ills., Horticultural Society, which was held at the residence of Messrs. Dadant & Son, at Hamilton, Ills., on Aug. 8, 1889, as follows:

At 2 p. m., H. D. Brown, of Hamilton, President of the Society, called the assemblage to order. In the absence of J. T. Johnson, of Warsaw, the Secretary, C. B. Rockwell, of Hamilton, was chosen Secretary *pro tem.*

An informal discussion of the culture and improvement of small fruits followed, and was participated in by Dr. Lyon, John Holt and others. Many points were brought out, and the discussion proved profitable to those interested in the culture of small fruits.

Jonathan Periam, of Chicago, editor of the *Prairie Farmer*, and professor of hygiene in the Chicago verterinary college, was present and delivered a brief address upon monopolies. Mr. Periam has made a study of all subjects pertaining to the occupation of the farmer, and he discussed monopolies from the stand-point of the husbandman. He advocated the idea that farmers should organize for the protection and advancement of their interests, and should have a hand in making the laws of the nation, but should refrain from entering the political field as an organization.

Mr. Periam's address concluded the programme, and the company spent the remainder of the afternoon in inspecting the factory of Dadant & Son.

The Hamilton, Ills., *Press* gives the following concerning the Dadant Comb Foundation Factory:

The Messrs. Dadants are located two miles north of Hamilton, and as some one expressed it, "away back there in the woods;" and under the unpretentious guise of modesty, no one would suspect that the largest apiary in the world was located there. In fact, people who have lived in the neighborhood for years, did not fully realize the magnitude of the enterprise which these gentlemen are carrying on, and had never paid them a visit before. But so well were they treated, that the gates in the future will have to be barred to keep them out.

Mr. Chas. Dadant commenced on this farm, twenty-five years ago, with two colonies of bees; and a small log cabin—not exactly in the lane—constituted the whole establishment. They now have several rooms and buildings, and are crowded in their work. Mr. Dadant said that when he started, the family grumbled a great deal, and thought that if he would not have his nose among the bees so much, and plow his corn more, they would get along better. They don't say that now.

The firm now have over 500 colonies—112 on the home farm, and the balance on the farms of J. P. LaMonte, and Joe Villum, near Warsaw; Julian Lamet, below Warsaw, Louis Sack and Rollin Sherwood, and are ably assisted in the management by Mr. D. W. McDaniels, an intelligent apiarist. But in order to judge of the magnitude of the enterprise, one must see for himself.

Under the guidance of Mr. Chas. Dadant and C. B. Roekwell, we were conducted into a room where the wax is melted, and sheets for comb foundation are prepared. The beeswax is placed in a large tank, and melted by steam; this is put in a boiler, on either side of which sat Parker Hubbard and John Hammond, who dipped boards up and down in the liquid and placed them in a tub of water to partially cool. Leon Saugier, with surprising dexterity, seized the boards, and with a knife, peeled off the wax into beautiful sheets.

In the next room we found the destination of these sheets. A quantity are placed in a tank of warm water to temper them, and then run through a cylinder which makes the indentations of the comb foundation. There are two of these machines, and are operated by D. H. Coffman and Alfred Gilton at one, and Chris. Koelle and Henry Delarue at the other. Harry Curden then takes a pile of sheets, and trims them to the required size, and then places tissue paper between each sheet, and they are then labeled and placed on shelves ready for market. They have sold 57,000 pounds of comb foundation thus far this season, and orders still coming. The business will exceed that of any other year.

We went into the wax-room and saw stacks of huge kegs of wax and a large bin of dirty-looking wax; how it was cleaned was explained by going into the purifying room, where the wax is placed in a tank with water, and melted by steam. The impurities arising are skimmed off, and it is then poured into tin cans containing more water, which separates the remainder of the impurities.

Our wife being with us, made us brave, and we proceeded to the hives and witnessed Mr. McDaniels remove frames of honey from the hives. After removing the top he smoked them freely, and with a bunch of weeds brushed the bees off on the ground, and even took a handful and fondled them for our gratification. It might have been pleasant to him, but we should as soon think of fondling an untamed tiger.

P. Champeau stood ready with a wheelbarrow on which the precious frames were placed and conveyed to the extractor. Mr. Saugier, Sr., took each frame, and with a sharp knife shaved off the wax enclosing the cells, and placed the frame in a large cylinder, and with a few whirls of the handle the honey poured out in a stream through a faucet below, and was caught in a bucket and emptied into a barrel, when the frames were taken out entirely free from honey.

One of the sweetest sights we ever saw, was the seventy-five barrels of honey containing 550 pounds each, the product of the season, thus far.

If our description of this institution has been imperfect, lay it to our ignorance in such matters, and a first visit. Mr. Chas, Dadant has recently revised Langstroth's bee-book, which is a standard authority on bee-culture, and is meeting with a large sale.

After a basket-dinner in a shady grove, the people were called to order by President H. D. Brown, and a report of committees was heard who said that fruit prospects for another year were favorable.

Messrs. Dadant had on the table samples of honey of 1873 and 1889, which showed quite a contrast; and specimens of comb foundation and their apparatus connected with the business. A large number were present from all over the county and Keokuk, in all numbered about 400. The Messrs. Dadants and their assistants did all in their power to make the occasion a pleasant one, and they succeeded most admirably, their efforts being nicely seconded by the Society and the ladies of the Floral Societies.

BEE-NOTES.

Bees Near a Highway—Cross Bees—Fall Honey, etc.

Written for the Prairie Farmer.

BY MRS. L. HARRISON.

Bees should not be placed near a street or driveway. If a person is so situated as to be compelled to keep them in such a place, a high board-fence is quite a protection against trouble; or a row of high trees or a building—in fact anything that will compel them to rise high, when they fly from the hive. When they are thus situated, persons living in the vicinity, would not be aware of colonies near, as they rise up out of the way of mischief.

Cross Bees.—When there has been a good flow of honey, and it suddenly ceases, bees are excited over it, and sometimes are ready to sting anybody or anything that comes in their way. This year, at the close of the basswood harvest, mine attacked a coop of broody hens. Seeing a commotion among these cackling aspirants for motherhood, I divined the cause, and opened the door, when the hens made a "bee-line" for the raspberry bushes. The cat made frantic leaps into the air, with her tail somewhat resembling a rolling pin. When the bees are cross, it is folly to open a hive.

Fall Honey.—This season hives are very populous and bloom is abundant, yet there is no security that there will be a flow of honey. Hot nights and days are necessary for the secretion of nectar, and yet nights continue week after week to be very cold. There has not been a full crop of honey harvested in Peoria county so far, and those who rushed their honey off to the local market, may wish they hadn't, before the season closes.

Feeding Bees.—I have some nuclei that are not well supplied with the needful honey. Hence, I have been giving them the cappings from the extracted honey to clear up. I take out a panful loosely, and set it in the cap of the hive, making a little aperture for the bees to come up through. It is, of course, apparent that no bees gain access to it from the outside, or robbing will be induced. I lately came to grief in this way: I placed a pan of cappings in the top of a hive and failed to shut down the cover closely. Soon the whole apiary was demoralized, robbing and stinging being the order of exercises. I not only got stung myself by the bees, but the whole family heaped reproaches upon me for my carelessness in making the bees so cross.

Peoria, Ills.

HIVES.

A Further Description of the "Ideal" Bee-Hive.

Written for the American Bee Journal

BY J. W. TEFFT.

The extensive correspondence which I am receiving from all sections of the country, shows that thoughtful and earnest bee-keepers—those who desire to make a profit by Apiculture—are desiring and anticipating a radical change in the construction and management of hives. They are still puzzled by the old drawbacks to ease, comfort and success in the management of an apiary.

Many correspondents express approval, whilst others are more conservative, and seek more light; again, a few, having an established pecuniary interest in the manufacture of hives, have not hesitated to condemn before the evidence is all in; hence I deem it wise to continue the description of my "Ideal Hive" and its merits, simply adding that I shall exhibit the hive at the Buffalo International Fair, on Sept. 3 to Sept. 13, and be in attendance to give information and demonstrate the *modus operandi*.

In reply to the editorial caption over my article on page 473, I am firmly convinced that the answer to the query must be in the affirmative. Yes, the "Ideal" hive *has* appeared. Careful tests, by myself and others, have, during the last five years, demonstrated that the mechanical construction, together with the simple method of management adopted and carried out under my improved system, has removed nearly, if not quite, all the difficulties heretofore standing in the way of pleasant and profitable apiculture, minimizing the necessary labor and care, and thus rendering the pursuit an easy and valuable adjunct to the ordinary duties of the apiculturist and horticulturist, as a source of delight and gradifying gain. It is amongst these two classes of the world's laborers, that bee-keeping properly belongs, and it is with them that it will be most firmly established before many years roll by. Apiculture is, as all good bee-keepers know, most fascinating, and peculiarly adapted to the cultured intelligence and instinctive gentleness of our country ladies.

The hive proper, or brood-chamber, will hold twelve frames (20 inches wide inside) together with partition-boards, but six or eight frames are preferably employed, as experience has demonstrated. The frames, separators, and partition-boards, are supported above and below at diagonally opposite corners, rest squarely and firmly in position, and although unattached or secured, no side or pendulum motion is possible—they are virtually fixtures, and can be removed and replaced, individually, with the greatest ease.

I would here remark that when shipping colonies to a distance, it is only necessary to insert a wooden wedge on each side of the brood-nest, between the partition-boards and the hive-walls, to convert the whole into a solid, immovable block.

The whole of the furniture above mentioned, is, when in position, accurately flush with the top edges of the brood-nest, and necessarily maintains the unvarying vertical position.

The middle section of this hive is a simple rim, 11 inches deep, and resting upon a beading outside the brood-chamber. Within the area of this rim is the surplus chamber; the dimensions of the latter permitting a large free-air space all around between it and the internal surface of the rim. This section has two ventilating apertures, one in each side. The free-air space just mentioned, is, in the winter, filled up with suitable packing, such as dry forest leaves or peet-moss.

[By the way, the compositor persists in representing me as advising packing with leaves, peet *or* moss, which is not as intended. The moss grows on a peet foundation, which is its matrix; hence the name "peet-moss," a mercantile commodity used in many large cities as stable bedding, owing to its lightness and moisture-absorbing qualities.]

The whole hive is surrounded by a peaked roof, with about 4½ inches rise, thus adding to the capacity of the free-air space commenced within the middle section. The *ends* of the roof are pierced with ventilating holes, similar to the middle section. All of these holes are protected by wire-cloth.

Bees are "warm-blooded" respiring insects, and consequently require an adequate supply of pure air, and a means of escape of that which has become obnoxious by reason of its deprivation of oxygen in the process of inspiration, and the subject of adequate *ventilation* and *shade* in the construction of bee-hives has largely engaged my thought and consideration for many years. I am convinced that the Ideal presents a solution of the problem, with all its difficulties, real or imagined.

In the effort to render clearly and distinctly a description of any mechanical contrivance, repetition is necessarily unavoidable, and in this regard I am sure that the intelligent reader will not be hypercritical, but allow me to proceed in the best way I can.

Ventilating and Shading Hives.

The scheme or system of ventilation and shade as applied and practically demonstrated in the "Ideal," is simple and efficient, and may be shortly described as follows:

Protection from solar heat is provided by the hive proper, or brood-chamber, by means of the dead-air chambers at the front and rear ends, and at the sides, by a free-air space, bounded by the partition-boards and the side-walls of the hive. The surplus chamber is protected from the same influence by the free-air space within the central section or rim, and this space is uninterruptedly continuous with that bounded and circumscribed by the hollow upper story or peak roof, which is not otherwise occupied; the top of the surplus chamber being flush with the upper margin of the middle section.

Efficient ventilation is provided in the following manner: The external air enters the hive through the bee-entrance at the bottom of the brood-chamber, is diffused throught the shallow space beneath the arrangement of frames, separators and partition-boards, fills the free-air spaces situated laterally between the partition-boards and side-walls of the brood-chamber, and permeates generally upwards through the passage-ways between the frames and separators in the brood-nest and surplus chamber. In these two compartments it is largely deprived of the oxygen, through its inhalation by the bees, and its temperature is increased by the exhalation and the heat of combustion emitted from the bodies of the bees; and being thus, to a large extent, rarefied, it is readily disseminated, throughout the free-air space, previously described as being bounded by the external walls of the surplus chamber and the internal surfaces of the middle section or rim, and of the peak roof.

From this reservoir it makes an easy and continuous escape, aided by the steady atmospheric pressure from below, through the four gauze-covered ventilators above alluded to.

The ingress of the pure air, and the egress of the vitiated, is so unbrokenly and smoothly assured as to preclude of a sudden or irregular displacement, thus avoiding draughts and dangerous alternations of temperature. An equability of temperature, together with an abundant supply of pure air, as demonstrated in this hive, I claim to be a consideration of the highest importance, as under such a condition there need to exist no anxiety in respect to chilled brood, bee-diarrhea or "foul brood." So much of an unsatisfactory character hes been published concerning the last-named scourge, that I hope to be pardoned for yielding to the temptation to repeat the opinion of a medical friend, in answer to my inquiry, some years ago. The doctor wrote thus:

The Cause and Prevention of Foul Brood.

"*Foul-brood*, so-called, is *typhus*, a disease not necessarily introduced into the hive from the outside, but a condition of death and decay most frequently *originating within* the hive, as a necessary consequence of the absence of pure air, and a *theoretical* disregard of correct methods of ventilation and shade. At times the bees are noticed to be very active in fanning at the entrance of their hive; they are not blowing air into the hive, as some learned writers assert, but *are trying to draw the hot air out* of the hive. This is very easily proven by dropping a feather or light piece of paper in front of the opening when it will immediately be blown some distance away.

"During a heated spell of weather a hive becomes so hot inside (no efficient means of ventilation being provided), that a steaming atmosphere laden with detritus and fetid exhalations is the normal condition, the result being that the exposed brood is directly poisoned, whilst that in the capped cells suffers a like fate upon the bursting of the caps, if it has not already been destroyed by the pressure of the confined and expanded air.

"Decomposition is rapid and highly offensive, destroying the product of the hive, disseminating disease throughout the colony, and risking the infection of the whole apiary. Thus, in my opinion, is solved the secret of the *cause* of 'foul brood.' We may well leave the interesting investigation of the *bacillus alvei* to the microscopical experts. If a bee-hive can be constructed in such a form or manner that it can, at all times, be as thoroughly supplied with pure air without draughts, as the most approved dwelling for the use and comfort of man, we may confidently anticipate for our apiaries an immunity from *bee-typhus*, and the disheartening experience of former years with 'foul-brood' will be merely a dim and fading remembrance, and it would certainly be more joyous tidings to apiculturists, to learn that the fearful scourge could be avoided, than to be instructed in any number of methods for curing, disinfecting or destroying."

I make no comment on the doctor's opinion, but there can be no question that the subject of ventilation and shade has not hitherto received the attention it demands. My bees do not desert their hives even on the hottest days, but keep at work right along, simply because the provision for ventilation and shade secures their entire comfort.

Reversing and Uncapping.

On page 427 is a letter from Mrs. Ada Dorsey, in which she says, "Whoever that was that advised reversing a hive and uncapping, ought to have a shaking; for I have just tried it, and lost lots of honey, and several colonies. No more uncapping for me." Now, although reversing and uncapping enter so largely into my method of management, I do not see how she could have been misled by my writings, and therefore I feel safe in hoping that I am not the culprit to whom the shaking should be administered.

Reversing *en bloc* has always been condemned by me as utterly unpractical. It can only result in chagrin, disaster and destruction. If Mrs. Dorsey will try my system of uncapping *at the right moment*, and reversing *each frame singly*, as it presents the proper condition for manipulation, she will derive abundant satisfaction all around; will find full frames of brood, full combs and sections of honey, no spilling of honey or destruction of bees and combs, but everything clean, neat and pleasant. Experience is a rough tutor at times, and I am truly sorry for the lady in her misfortune.

SHADE.

How to Make a Roof for Shading Hives.

Written for the American Bee Journal

BY A. M. VANNOY.

I am not engaged to any very great extent in the apiary, nor do I propose to set myself up for a pattern for others to follow, but I want to say that I have demonstrated to my own satisfaction, that shade of some kind is both desirable and essential to the apiary in this part of Iowa; also for my own use, the portico hive is best. I shade my hives by making roofs of shingles, thus:

On a piece of scantling (2x4 inches is best), lay the shingles, on the 4-inch side of the scantling first, so that the butt (thick) end will be even with the 2-inch side; nail them fast with 4-penny nails: now turn the stock over, and lay the shingles on the 2-inch side, so that the butts will project ½ inch above those on the 4-inch face of the scantling. This makes a very neat "comb" to the roof; nail all fast as before, when you have a cheap, handsome and durable shade, at a nominal cost (not to exceed for everything, including labor, 15 cents per hive).

These roofs protect the hives from rain as well as sunshine, and gives to the apiary a most unique appearance.

When I have no scantling at hand, I take two pieces of boards, say 3 to 6 inches wide (old, broken-up fence-boards are just the thing), and as long as I want my roof (usually 30 inches is enough); nail the boards together like a trough, V-shaped, then nail the shingles to the trough on the outside, letting the butts project as before; also in nailing on the first side, lay the shingles so as to nail to both pieces of the trough, thus breaking the joint made in nailing the trough together.

I have had such roofs now in use for 5 years, and they are good yet. The roof made with the plank fits the hive, and stays on better than those made with the scantling.

The prospects are good for a large crop of honey in southeastern Iowa. Golden-rod is just beginning to show the yellow. White clover is still in bloom. Smart-weed is our best fall honey-plant, in this part of the State,

and there is an abundance of it this season. So you may as well score one for Southeastern Iowa now, for she will "get there," if the frost stays away a reasonable time.

Hedrick, Iowa.

SYSTEMATIC WORK.

Comb and Extracted Honey in the Same Apiary.

Written for the American Rural Home

BY G. M. DOOLITTLE.

Is it well to produce both comb and extracted honey in one apiary, or shall we divide the number of colonies kept, into two yards, working the one for comb honey, and the other for extracted?

This is a question which often enters the minds of those keeping bees, some thinking that both comb and extracted honey production should not be mixed together in one apiary. I see little if any reason why two yards are necessary for a mixed production of honey, therefore I will say a few words why I should produce both in one apiary.

Twenty yeary ago, when I began to keep bees, I had much trouble to get certain colonies to work in boxes, and often after a colony had nearly completed a given number of boxes, they would swarm, leaving the bees in the hive so weak as to numbers that the boxes would remain unfinshed at the end of the season.

I tried cutting out the queen-cells and returning the swarm, but this did little good, for in a few days they would come out again, and thus keep up their swarming till the honey season was over, doing little or nothing in the boxes, as bees having the swarming fever will do little else save preparing to swarm.

As I had no extractor at that time, the only way that I could do away with this state of affairs was to clip off all of the queen-cells while the swarm was out, cage the queen between two combs and return the swarm, leaving the queen thus caged for eight or ten days. At the expiration of this time the colony was looked over and all of the queen-cells again cut off, when the queen was given her liberty.

As nearly one-half of the brood had hatched during this time, there was plenty of empty cells in which she could deposit eggs and as the bee had no larvæ to nurse, the disposition to swarm was broken up, as a rule, and I would get the boxes completed; but it will be noticed that during these eight or ten days, I got little or no honey, as queenless bees and those having the swarming fever, are practically good for nothing as comb builders, and a colony treated as above was about as good as queenless.

The result was that I lost ten days of the best of the honey harvest, during which time a colony not having the swarming fever would store from forty to sixty pounds of honey. This was a serious loss, but not as great as to have the swarm in a separate hive, in which case I would get nothing but the swarm.

After awhile I purchased a honey extractor, when I found I had this swarming mania, of colonies which should be in better business, practically under my control. When a swarm issued as above, I would extract all the honey from the brood-combs while they were out, and clip off the queen-cells, when they would go to work with a will on being returned, losing all desire to swarm.

Here I had a plan that accomplished the desired result without the loss of ten days in my best harvest, besides I obtained extracted honey enough to pay me for my time, while in the other case I received nothing.

Now and then, a colony would not be cured in this way (although nine out of ten would), in which case I would cage the the queen as first given, and wait three or four days instead of nine or ten, when I would extract the honey as above, letting the queen loose, and in this way I never failed in keeping a colooy which had once commenced in the boxes at work on the same.

In case a colony refuses to go into the boxes, all I have to do is to take off the surplus arrangement and substitute an upper story in the shape of a hive full of empty combs. By raising a frame or two of brood from below into this upper story I was thus master of the situation, and colonies determined not to work in boxes were made to produce an equivalent yield of honey by the use of the extractor equal to those which entered the boxes the most readily.

The aim of every person keeping bees should be, to make all colonies produce an equal value of something readily turned into cash, or of a cash value, and I do not know how this can be successfully done except as we work our apiary for both comb and extracted honey.

Again, we often have a larger number of bees than one man can successfully work for comb honey (which means swarms, taking off sections when filled and snow white, by going over the yard once a week, etc.), while by the using of a part of that number for extracted honey, the whole can be handled by one man, thus saving the wages of an assistant, which would become a necessity if all worked for comb honey, or the same number of bees were divided into two yards.

By setting apart, in the spring, a certain number of colonies for extracted honey, and a certain number for comb honey, one man can care for all by tiering up those worked for extracted honey before his time is fully occupied with those to be worked for comb honey, after which little attention need be paid to them, except to add another story, should they become crowded for room.

After the filled sections are all taken off at the close of the season, then these colonies can be attended to by extracting what honey they have to spare, and fixing them for winter. Thus the apiarist can use all of his time to the best possible advantage, and save to himself and his family that which he would pay out to an assistant in case he had the same bees in two separate yards.

From the above (which are the very plans adopted and used at the present time by the writer), I conclude that all will agree that it is the most profitable for the apiarist to work for both comb and extracted honey in the same apiary, rather than to have two separate apiaries, one to be devoted to the production of either kind exclusively.

Borodino, N. Y.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on **Friday** and **Saturday, Oct. 11th and 12th,** at **9 a.m.** Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be one fare for the round-trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.

H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Romney, Ont., Canada.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Sept. —Maine, at Livermore Falls, Me. J. F. Puller, Sec., Oxford, Me.

Sept. 5.—Erie County, at Buffalo, N. Y. O. L. Hershiser, Cor. Sec., Big Tree Corner, N. Y.

Sept. 14.—Susquehanna Co., at New Milford, Pa. H. M. Seeley, Sec., Harford, Pa.

Oct. 11—12.—Northwestern, at Chicago, Ills. W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada. E. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

SELECTIONS FROM OUR LETTER BOX

California Honey Crop.—J. Few Brown, Winchester, Va., on Aug. 25, 1889, writes:

Our Eastern market price-currents report a very large California honey crop. If their reports are not correct, could the impression they have, or may be trying to create, be counteracted by getting together letters into the American Bee Journal, from the large producers in California? and could you not get such letters from them as early as possible? The crop in this locality, as gathered from the principal producers, will not average more than 20 to 25 pounds per colony.

[We would request each of the honey-producers of California to send us, immediately, a report of their crop, giving the estimate of how it compares with former years.—Ed.]

Symptoms of Foul Brood.—B. F. Sword, Lanark, Ill., on August 24, 1889, writes:

Will you please give a description of foul brood, in the American Bee Journal? I began keeping bees last spring, with two colonies; I had four swarms from the two colonies, but two went off, so that I have left the two old and two young colonies. They have done nothing for me this summer. When I lift the cover from the top of the hive, it smells sour and musty, and the bees are just hanging around, not doing anything. I am just a beginner, and any information will be gladly accepted. I like the Bee Journal, and can hardly wait until it comes.

[Prof. Cook gives the following in his Manual, as symptoms of the disease:

Decline in the prosperity of the colony, because of failure to rear brood. The brood seems to putrefy, becomes "brown and salvy," and gives off a stench which is by no means agreeable, while later the caps are concave instead of convex, and many will have little holes in them. The most decided symptom is the salvy, elastic mass in the brood-cell. With a pin head we never draw forth a larva or pupa, but this brown, stringy mass which afterwards dries down in the cell.

This disease also extends to the mature bees, as well as to the brood. The remedies are salicylic acid, phenol, etc. You should get Mr. Cheshire's pamphlet, if you are interested in that disease, and read it carefully. It can be had at this office for a dime. —Ed.]

Expectations not Realized.—H. C. Gifford, Morris, Ills., on Aug. 24, 1889, writes:

Bees in this locality are doing very poorly. It seems that for the last 5 or 6 weeks they could not get much honey. My crop will fall short of my expectations at least 500 to 800 pounds, but the golden-rod is now in bloom, and they may do well on that, and other fall plants. My vote is for the golden-rod, as our national flower.

Still Working on White Clover—Miss Lucy Jane Sherman, Hanover, Vt., on Aug. 7, 1889, says;

The bees are still working on white clover, as the rains have lengthened the time of blooming. I am still a novice, though I think that I am getting my hand in. I have taken off a little honey, but not much. While they build white comb and gather white honey, and I have room enough, the honey might as well be left in the hive. I prize the Bee Journal highly.

Helping the Union.—B. T. Baldwin, Marion, Ind., on Aug. 21, 1889, writes:

I send $2.00 for the Bee-Keepers' Union. I want to pay my share to have that decision in the "Rich" lawsuit reversed. Our calamity (and it is nothing else, if it stands) is being thoroughly advertised to our enemies. This has been nearly as poor a year for honey as last. We had a terrible drouth until June 10, and after that it was very wet, with cool nights. I will have about 3,000 pounds of extracted and comb honey from 80 colonies, spring count; I have 120 colonies now. I hope that all the bee-keepers will come to the front and help the Union, We might make donations to the Defense Fund for from 25 cents to $25.00, and raise money enough in that way. I am going to try to get every bee-keeper that I see, to help, and hope that every other bee-keeper will do the same.

[Yes, brother Baldwin, that is the way to do it. If the bee-keepers themselves would wake up, we should have enough money to compel everybody to respect our rights. If bee-keepers are willing to be down and give up the fight, by being penurious, then they will suffer for it. Every paper will publish all that can be found against the bees, but it is difficult to get them to publish anything on the other side. —Ed.]

Nameless or Trembling Bee-Disease.—R. S. Russell, of Zionsville, Ind., writes:

I have a recipe for the cure of the "nameless or trembling bee-disease." The disease is not contagious, and usually, I think, caused by a superannuated queen. The recipe is as follows: Remove all combs out of the hive and supply a new hive, or wash clean with brine. Next shake all the bees off the combs about 3 feet in front of the entrance; this will separate the well bees from the tremblers. Sprinkle the combs and brood thoroughly with strong brine, and give the bees the same medicine. Destroy the tremblers, which will remain where you shake them. Give a young queen as soon as possible, and the work is done. This is a sure cure, as I have repeatedly verified for myself and others.

Appeal to the Highest Court.—James Jardine, Ashland, Nebr., on Aug 16, 1889, writes:

I am in favor of the S. W. Rich lawsuit going to the supreme court, and I am willing to pay my share of the expenses, let it be more or less. I also think that if every member in the Union should try to get all bee-keepers that read the Bee Journal or *Gleanings* to join the Union; for all we want is justice, and we have got it every time so far. Now let all work in their localities to get that 500 members. They will come in if we will. If we give it up now, all is lost. We must get every new bee-keeper to understand that all our information about bees comes from bee-periodcials, and lend them papers to read, and they will be sure to come in as subscribers, and supporters of the Union, when they are shown what the Union has done, and

is doing. I do not believe in trying to discourage new bee-keepers in any way, but treat them kindly, and be sure to let them see the excellent books on bee-keeping, and they will see that it takes a good deal of study to know very much about the bee-business.

My bees are doing pretty well now. I have had a good deal of swarming this summer, and still they come. The honey-flow in not very good yet, but the heavy rains that we have had lately have overflowed the river bottoms very badly, where I had lots of sweet clover sown; it killed a good deal of it. I am afraid that it will have to be a pretty poor year if it beats 1887 and 1888, but I look for a good flow of honey yet.

[Yes; we think that the Court of Appeals must decide that question. To do that, we must have 1,000 more members to the Union, whose interest in the pursuit is more than the dollar which the membership costs.—ED.]

Alfalfa Honey.—Frank Rauchfuss, Denver. Colo., on Aug. 20, 1889, writes:

I have sent you a section of alfalfa honey, which was taken from a colony that was hived on June 30, and has produced 60 one-pound sections of honey up to Aug. 10. During June and July the weather was not very favorable for the bees, as we had strong easterly winds most of the time. Bees are working strong on alfalfa and Rocky Mountain bee-plant now. Take it all together, we will have only a medium honey crop this year.

[Coming so far, and being so small a package, of course the express employes threw it around enough to break the comb, and set it to leaking badly. The honey is nice, clear, thick and white, and very palatable. In fact we know of nothing that is superior to it for table use.—ED.]

Large vs. Small Hives.—O. R. Hawkins, of Bellport, N. Y., writes:

I fully agree with Mr. Chas. Dadant in his articles about the size of hives. The large hives are the best, most profitable, and cheapest in the long run. A colony in a small hive will be continually casting swarms throughout the summer, and will store very little surplus. A colony in a large hive will always be strong in bees, and will cast only one tremendously strong swarm a year, and then store a good surplus. A small hive is in nowise profitable to to me, or around this neighborhood.

Good Season in Iowa.—Mr. N. Stainінger, Tipton, Iowa, on Aug. 21, 1889, says:

Bees are booming in Iowa, and prospects are now for a full crop of honey in this part of the state. Our usual slack of about 4 to 6 weeks is this year filled up with a heavy flow of honey-dew—not what we like to see, but it comes all the same. We have had a good yield of white honey, and prospects are good for an excellent fall crop. Our market at home is ruined by small bee-keepers, that do not know what honey is worth. They retail nice honey at 10 cents per pound, while I am getting 12½ cents per pound.

Light Honey Crop.—Mr. Robert Carver, Manton, Mich., on Aug. 23, 1889, writes:

The honey crop in this section of the country is very light, this year, likely owing to the cold, dry weather, prevailing north wind, and occasional frost. We have had, in our apiary, an increase of colonies from 148 to 230. We put back nearly all our second swarms. We have no surplus honey yet worth naming, though our bees are mostly in good condition. The weather still holds dry.

Good Yield of Honey.—Geo. W. Flick, Grinnell, Iowa, on Aug. 26, 1889, writes:

I had 4 colonies of bees last spring, and I have taken from colony No. 1, 66 pounds of honey in one pound sections; from No. 2, 66 pounds; from No. 3, 80 pounds, and from No. 4, 120 pounds. I could have done much better, but I could not get sections or foundation, from the last week in June until July 20th, and consequently I lost at least 200 pounds more of honey. I had three swarms about the middle of June, and have 72 one-pound sections on the hive of each one; the sections are all filled and capped, save from 3 to 5 on each hive, and the hive that I took the 120 sections of honey from, has 30 sections more nearly completed now. If any body that lives in town can beat this, I would like to know how he does it. My bees are Italian, and I take care of them, and they pay me tenfold for the care I give them.

Always Mention your Post-Office County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—It is coming in slowly. We quote: 1-lb. sections of white, 15@16c.; 2-lbs., 14c. Extracted, white, 8@8½c.; dark, 7c.
Aug. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—Prices are not fully established, being a little too early. Only a few shipments have yet arrived, which sold readily as follows: Best white, in 1-lb. sections, 16½c., and 2-lbs., 14c. Off grades generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Aug. 15. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.
BEESWAX.—18@20c.
Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extracted increasing: demand light, at 6@8c.
BEESWAX.—25c.
Aug. 1. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Extracted, California, 7½@8c.; orange bloom, 7½@8c. White clover and basswood, 7½@8c. Common Southern, 65@75c. per gal. Fancy comb, white 1-lbs., 16c.; fair 1-lbs., 14c; 2-lbs., 2c. less.—The New York crop being comparatively small, the Western apiarists will find a good outlet here in the East. As prices this season are about 10 per cent. lower than last season, we expect an active demand.
Aug. 21. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Coming in freely, but sales are not cisily made at over 15c. for the best, while we are trying to get 16c., and think that later we can get it, as all buy sparingly now. Extracted sells at 6@8c., but chiefly at 7c. for white.
BEESWAX.—25c. R. A. BURNETT,
Aug. 12. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.
BEESWAX.—23c.
Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—New comb arriving freely. Demand is fair, although weather is too warm. We quote:—Fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 12c. Excellent demand for all kinds of the extracted, as follows: Orange blossom, 7½@8c.; white clover and basswood, 8@8½c. Southern, average quality, per gal., 65@70c.
HILDRETH BROS. & SEGELKEN,
Aug. 21. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It has arrived freely, but sales are a little slow, at 17@18c. for 1-lbs.; and 2-lbs., 15@17c. Extracted, 8@9c.
BEESWAX.—None on hand.
Aug. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Demand for extracted is fair from manufacturers, and from consumers for table use. Good demand for best qualities of comb honey, while inferior grades find slow sale. It brings 11@15c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Aug. 21. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts of comb honey are large, but market slow, at 14@15c. for white 1-lbs., and 13@14c. for 2-lbs. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—20@25c.
Aug. 22. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—Old crop nearly gone, and new begins to appear, the quality being fine. We quote: New white 1-lbs., 15@16c. Extracted, white, in barrels and kegs, 7@8c.; in tin and pails, 7½@8½c.
BEESWAX.—23@28c.
July 16. A. V. BISHOP, 142 W. Water St.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

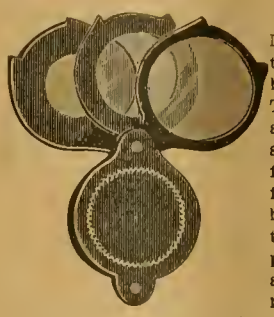
Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

The ILLUSTRATED HOME JOURNAL will be clubbed with the American Bee Journal and both mailed to any address in the United States and Canada, for one year, for **$1.75.** Or both JOURNALS for one year, and Dickens' Works (as described on page 576 of this Journal)—all for **$2.85.** The contents of the September Number—



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

We Want a Representative at all the Fairs to be held this season. The AMERICAN BEE JOURNAL is the recognized defender of the rights of the bee-keepers, against the attacks of the ignorant and prejudiced. There are thousands who would gladly subscribe to it if it were only brought to their notice, and its claims presented. When making an exhibit, please send for our *Colored Posters* and sample copies, and get up a club. In this way you will not only pay yourself for the trouble, but also aid the pursuit, and its defense all over the country.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

Queens.—We can supply Tested Italian Queens at $1.50 each; Untested, $1.00 each, by mail, postpaid.

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Sept. 14, 1889. No. 37.

EDITORIAL BUZZINGS.

Florists Favor the Golden-Rod.—The florists' convention, held at Buffalo, N. Y., on Aug. 22, showed a strong sentiment in favor of the golden-rod as a national flower. We have no doubt but that it will bear off the palm.

In Germany, bee-keepers have just realized the best honey season for many years—this we learn from the Rev. Stephen Roese, who gleans it from letters just received from the "father-land." America sends greetings to Germany, and congratulations upon receiving a satisfactory honey crop, with which America is also blessed.

Now is the Time to Feed if it is necessary, for winter stores, as well as to get the young bees so necessary for safe wintering, with which to stock up the hives before putting them into winter quarters. Feed at night, so as not to induce robbing. Each colony should have from 25 to 30 pounds of the best well-ripened honey for winter stores.

St. Joseph Exposition.—The display in the Bee and Honey Department of this Exposition, this year, is very fine, and will repay any one for visiting the Fair. The Rev. Emerson T. Abbott remarks in a private letter, that "Bee-keepers who attend the Exposition this year, will find a welcome at Nos. 32 to 35 in the Main Hall, also the latest copy of the AMERICAN BEE JOURNAL." Bee-keepers will please make a note of this, and accept the kind invitation of friend Abbott. Other good bee-keepers will have nice exhibits, and the Bee and Honey Show will be an attractive feature of the Exposition, as usual.

The Entomological Club of America met at Toronto, Ontario, on Friday, Aug. 30, 1889. There were about 400 present. A special meeting was held on Wednesday afternoon in Victoria Park.

Prof. A. J. Cook read an account of the depredations of a new kind of furniture insect, which is peculiar, as it not only destroys furniture, but assuages the pangs of hunger on such condiments as red pepper and insect poison. Its one good point is that it has a taste for cigarettes, which it devours with avidity.

Prof. C. M. Weed detailed his experiences with arsenical poisons. He was followed by Prof. A. J. Cook, who also recounted the results of his experiments in the same line.

The following officers for next year were elected by the Club: President, Prof. A. J. Cook, Michigan; Vice-President, Rev. Dr. Bethune, Port Hope, Ont.; Secretary, Rev. F. M. Webster, Indiana.

The above is gleaned from the Toronto *Mail*. We congratulate Prof. A. J. Cook upon the attainment of this new honor. He is "worthy and well qualified" for it. It is a singular coincidence that the editor of the AMERICAN BEE JOURNAL was on the *same day* unanimously elected an officer of the Supreme Council of the American Legion of Honor, which has 63,000 members in North America.

Minnesota State Fair at St. Paul, from Sept. 6 to 14. Mr. L. H. Wilcox is assistant Superintendent of the Honey and Apiarian Department. About $100 are offered in premiums on bees, honey, and implements; then follows a novelty—a special sweepstakes premium of $150 is offered for the "best display of any individual, State, county, or local bee-keeper association, consisting of not less than one ton of honey, five colonies of bees, and all the necessary equipments of a model apiary; also an expert to handle and manipulate bees, extract honey, make and insert foundation, and show the use of modern improvements at any time the superintendent may direct."

This large premium should call out an excellent display, and we hope the hint will be taken by other Fairs next season.

Frank Leslie's Illustrated Newspaper for Sept. 7 is a very striking number. Its interesting pages represent scenes during the Sheepshead Bay racing season, "A Fishing-camp in Maine," "An Evening Procession of Boats on Lake George," and scenes on the grounds of the Hoboken Turtle Club.

Busy as a Bee.—It is said that to collect one pound of honey, 62,000 heads of clover must be drained of their nectar; and to do that requires 3,650,000 visits from the bees. It means something when we say, "Busy as a bee."—*Exchange.*

☞ The bee-keepers of Sangamon and adjoining counties are requested to meet in the Supervisors' Room of the Court House in Springfield, Ills., on Wednesday, Sept. 25, 1889, at 10 a.m., for the purpose of organizing a bee-keepers' association. All are invited.—D. D. Cooper, Geo. F. Robbins, C. E. Yocum.

Brand the Bees.—The papers generally are "poking fun" at the decision of the New York court in the case of S. W. Rich. The *American Analyst* gets off the following:

The general term of the Supreme Court in the central part of this State has decided that it is trespass for honey-bees to go upon lands not belonging to their owner. This may be good law, but the wonder is how this law is to be carried out. It perhaps will offer a new field for the rubber-stamp men to affix the owner's initials to the bees' feet, or Mr. Edison might invent some electric appliance by which trespassing bees could be made to leave their mark; or nature, perhaps, would be sufficient if the bees would notify the owner of the land where the trespass is committed by presenting their "business end" as a sort of card of identification; or the owners of the bees might brand them. Otherwise we cannot see how this decision will help those who are trespassed upon.

The "card of identification" from the "business end" of the bees will no doubt be the most satisfactory and convincing argument of the presence of the winged intruders. The one whose duty it might be to *brand* them would have a picnic—and a red-hot time, at that.

A Dishonorable Transaction stamps the character of the man. Mistakes will happen, but such are always easily rectified if a spark of *honor* remains in the bosom of the person responsible for such. A gentleman in Kansas seeing an advertisement of "Italian Bees for Sale," signed by "A. Meyer, Pekin, Ills.," sent him the price of a colony with sufficient to *prepay* the transportation charges, and received a colony of poor hybrids, and had to pay $2.10 for charges a second time. We wrote to Meyer more than a month ago for an explanation before publishing this. The letter was *not* returned "after 10 days," as requested, but no reply has come to hand. No more money should be entrusted to him until he explains or clears up this transaction.

How Things Have Changed.—Henry Alley, of Wenham, Mass., thus describes the changed aspect of things in his State about the honey crop:

I tell you, friend Newman, things have changed here wonderfully during the past twenty days. Rainy weather has gone by, and our bees have done a heavy business in gathering honey from golden-rod and other fall flowers. All of my hives are solidly full of honey of the best quality, and yet the flow continues. The weather is exactly the reverse of what it was one year ago. It is hot and dry, just the condition all bee-keepers like to have when there is plenty of honey the bees can gather.

The depression in spirits we have experienced for nearly a year has vanished. Every order on our books for queens will be filled on the 7th. We never received more orders for queens than this year, hundreds of them coming from my advertisement in your valuable AMERICAN BEE JOURNAL.

We hope this change is general all through the Eastern States, where heretofore the reports have been so discouraging about the honey crop.

GLEANS OF NEWS.

The World's Fair will be held in some suitable place in 1892 to commemorate the 400th anniversary of the discovery of America. Mr. Aspinwall, upon the presumption that New York will be the place selected, writes us as follows about making a creditable exhibit of bees, honey and apiarian supplies. Such should be done, no matter where it is held, but we imagine that Chicago will very likely put in a strong claim for its location within its spacious borders. But no matter where it is held, let there be a grand apiarian exhibit. Mr. Aspinwall says:

FRIEND NEWMAN:—As there seems to be little doubt that in 1892 there will be a grand World's Fair in New York, would it not be well for our conventions to urge the appointment of some one on the proper committee, to look after our industry? I understand that in 1876 the exhibit of bees, honey and supplies was poor. Do not let this be the case in 1892. We should have the grandest exhibit at that Fair of any ever seen in this or any other country. All it needs is some one to look after the thing here, who has the good of the industry, as a whole, at heart. Let us begin right now to do something, and we will show the world that Wiley is a monstrous calumniator, and that American Bee-Keepers and Supply Dealers lead the world. If the conventions see fit, I will take charge of their recommendations, and will see that they reach the proper authorities, as I am constantly in the city. I have already written the Mayor, asking that some one be appointed to look after the industry, but the recommendations of our conventions will have far greater weight. Yours fraternally,

JOHN ASPINWALL.

Fatal Quarrel.—William Hooper was shot and killed by J. W. Shaw near Highland, Md., Saturday night, Aug. 24. They were farmers. The other day Shaw discovered a bee-hive on the line between his and Hooper's farm. He began taking the honey away when Hooper objected, claiming that the honey was his. Saturday evening the quarrel was renewed at Shaw's house. Hooper's pistol missed fire. Shaw then got his shot-gun and discharged a load of buckshot in Hooper's head.

The above is from the Buffalo *News*. How foolish it is for men to quarrel—yet many do it over very small matters. The above was sent to us by Harry E. Hill, of Titusville, Pa., as an item of news. It might have been a quarrel over a cat, dog, cow, or horse—or even a spoon or dish. It was foolish, very foolish.

Wing-Strokes in a Second.—The following, according to a French physiologist, in regard to the number of wing-strokes made in a second by various insects and birds, will be interesting to all:

The wing of the ordinary house-fly makes 330 strokes in one second; the wing of the bumble-bee, 240; the *honey-bee*, 190; the wing of the wasp, 110; the wing of the dragon-fly, 28; the wing of the sparrow, 13; the wing of the wild duck, 9; the wing of the house-pigeon, 8; and the wing of the osprey, 6.

Educated Bees.—A correspondent in Indiana sends an amusing item taken from the Indianapolis *News*, describing the training of some bees by an "amateur" bee-keeper in Indianapolis. The item reads thus:

Mr. W. C. Bobbs, the amateur apiarist, has succeeded in training a few bees until they have become interesting pets, and their performances are something unusual. Mr. Bobbs lives on Illinois street, near a large conservatory, and thus his bees have the very best of intellectual food from the finest flowers in the land. One large queen-bee of Mr. Bobbs' apiary, has been trained so that she will turn somersaults on a piece of paper, and can furthermore walk a string.

Another bee from the same hive takes a peculiar delight in playing "circus" with a large bloodhound which Mr. Bobbs owns. The busy insect is fond of attaching herself under the dog's collar, and working her "stinger" with great industry.

Mr. Bobbs has learned to charm his bees very successfully, though it required some time, and it was necessary for him to subject himself to many indignities at their "hands." The past week he has been wearing a cold, glittering smile on one side of his face, where the charm did not work very well.

Clipping the Queen's Wing.—A correspondent of one of our exchanges gives his opinion thus, on the subject of clipping the queen's wing, so as to prevent the absconding of the swarm, and consequent loss and annoyance:

I would as soon think of cutting wheat with a sickle, or of threshing it with a flail, as to manage bees without clipping one of the queen's wings. Then as the swarm issues, catch the queen and cage her under a tumbler in the shade. This is done in an instant. Now the bees will invariably return to the old hive, or a new one put in its place; and the hiving is thus done without anxiety or labor. By clipping, we can never lose a colony. The worst that may happen is to lose the queen, which rarely occurs.

Bees and Chickens.—In the *Indiana Farmer* we find the following in regard to keeping chickens in connection with bee-keeping. The testimony is valuable, and is stated as follows:

Mr. Dadant says that he once had an apiary located on the side of a hill, and fenced. He also had at the same time 500 chickens occupying the same inclosure with the bees. He had his hives raised from the ground, and at night the hens brooded their chickens under them. He also taught the chickens to eat drones, by feeding them brood and hatching drones. Furthermore, he has seen a rooster pick them off as they have clustered closely together for mutual protection against their female persecutors, as all bee-keepers have seen them do, until he could swallow no more, then rest a bit, stretch his neck and go for them again—and if corn was thrown to him, he would not notice it.

Fine Portraits of "the American Duchess" (formerly Mrs. Hammersly, of New York) and the Duke of Marlborough, given in connection with an illustrated article on the famous palace and park of Blenheim, are conspicuous among the pictorial features of *Frank Leslie's Popular Monthly* for September. This number of the favorite magazine is unusually strong in short stories and poems.

Ripe-Fruit Beetle.—V. W. Fairbanks, Manchester, N. H., on Sept. 2, 1889, asks the following questions when sending a beetle:

Enclosed find a bug that I do not know. As I was sitting by the side of a colony of bees this bug came crawling from the entrance, and when I touched it, it keeled over on its back and was very hard. When crawling it is ¾ of an inch long. Does it eat honey or bees? What is it? I have 40 colonies of bees, but have had no honey to speak of—there was too much wet weather.

Prof. Cook answers this inquiry as follows:

The beetle is the ripe-fruit beetle—*Euphoria inda*. When flying it looks and sounds like a humble-bee. The grubs work in the earth eating roots. The beetle often does some damage eating into ripe apples, peaches, pears, and even green corn. It very likely was honey hungry, and so entered the bee-hive. It is strange that the bees tolerated it.

Among the Valuable Bulletins prepared in the Office of Experiment Stations of the United States Department of Agriculture, is one, now approaching completion, which will be found of infinite service to the workers in our Experiment Stations, to Agricultural Journalists, Institute Directors, etc. It will be known as Experiment Station Bulletin, No. 2, Part I, and is a very complete digest of the annual reports of some thirty Agricultural Eperiment Stations of the United States for 1888. The special feature of this work is the Index, which is very full and complete, being not only an index to the digest, but practically an index to the reports themselves which are included in the digest.

The work, with the exception of the Index, is already in type, and will soon be completed and ready for distribution. It is issued as Part I, the intention being to include a digest of the reports of the remaining stations in another volume to be known as Part II. This digest work will thereafter be continued periodically, so as to cover all the Experiment Station reports.

Several Eggs in One Cell.—Julius Moerch, of North Indianapolis, Ind., asks the following question:

I have a young Italian queen which lays from 2 to 4 eggs in one cell, at the same time. She does this about once in every six cells. She has plenty of room. What will be the best to do with her?

Either the colony has a drone-laying queen, or a laying-worker, which should be superseded with a good queen, by all means.

Annual Jubilee.—Being an "off year" from political disturbance, prompts the management to extra exertions in making the forthcoming Indiana State Fair, Sept. 23 to 28, excel in every respect. More favorable railroad rates are applied for, to give those at a distance the opportunity of visiting the best Agricultural Fair on the continent, and the Capital City with its many attractions.

THE GOLDEN-ROD.

Written for the Youth's Companion

BY MAHALA B. CHADDOCK.

Yes, let our nation's emblem be
The flower that blooms from sea to sea,
That flings by every roadside free
Its wealth of feathery gold;
That decks the mountains in their pride
And waves along the prairies wide,
And smiles when trailer beauties hide
From autumn's gathering cold.

In fields where happy children meet
And hear the wild bees humming sweet,
And tread the sward with naked feet,
Among the orchards fair;
On banks where scarlet berries grow,
In quiet lanes where lovers go,
Bright bursts of yellow glory show—
The Golden-rod is there.

Where barrens burn, where torrents pour,
Where swells the hill, where sweeps the shore,
Where sparrows flit, where eagles soar,
It shakes its conquering plume;
In the old graveyards, briar-grown,
By cabined poverty, well-known,
Man's friend the Golden-rod alone
Maintains its faithful bloom.

And eyes that weep the year's decay
Smile last to see that flower display
Its fulvid mantle o'er the gray,
While 'neath October's sky;
Its splendor that survives so well,
Flashing from every hill and dell,
Continuous like a sunset spell,
Gilds summer's long good-bye.

Symbol of loyal life, confessed
By North and South, by East and West,
Faith's bravest blossom blazons best
The empire of the free.
And breeze and sunshine, bee and bird,
Will join when patriots speak the word,
And say, "Our floral sign preferred,
The Golden-rod shall be."

Vermont, Ills.

QUERIES and REPLIES.

The Exclusive Production of Comb Honey.

Written for the American Bee Journal

Query 653.—If no more honey were to be extracted, how much would the price of honey in the comb be enhanced?—New York.

Not any.—H. D. CUTTING.

I do not know.—P. L. VIALLON.

Probably none at all.—C. C. MILLER.

None at all, I think.—R. L. TAYLOR.

Not much, if any.—M. MAHIN.

Not one per cent., in my opinion.—J. E. POND.

But very little, if any, in this locality.—A. B. MASON.

I doubt very much if it would affect the price one cent.—J. M. HAMBAUGH.

Very little, I think. I doubt if they compete much.—A. J. COOK.

Too hard a question for me to answer.—J. P. H. BROWN.

It would not be enhanced at all, but would surely drop. It is a fortunate thing for comb-honey producers that so much of the honey crop is extracted, as it supplies different wants, and prevents, to a great extent, an over-supply of comb honey.—C. H. DIBBERN.

Not a particle. Some prefer comb, and others the extracted.—MRS. L. HARRISON.

I do not think that it would better the price more than one-third; and this would be more than depreciated in the great howl which would go up *for* "extracted honey."—WILL M. BARNUM.

It would advance in price, but the supply would also offset the price.—G. L. TINKER.

The extractor has come to stay, so that there is no need of that *if*.—G. M. DOOLITTLE.

If the Emperor of Germany were to buy all the mules in this country, how much would horses be worth?—J. M. SHUCK.

I do not know. Extracted honey, when well ripened, should bring the same price that comb honey does.—MAHALA B. CHADDOCK.

Can you guess? Comb honey will remain a fancy, while extracted will become a staple article, within reach of everybody, rich or poor.—DADANT & SON.

I think that it would be quite a little; but no such condition of affairs will ever take place. When you witness the lethargy with which bee-keepers support their Union, do not think for a moment that they will ever agree upon the kind of honey which all shall, or shall not, produce.—JAMES HEDDON.

If no more honey were extracted, and no more were "strained," and no "imitation honey" were put on the market (imitation extracted I mean, as I do not believe it possible to manufacture comb honey), I think that it would enhance the price 25 per cent. But that millennial time will never come. There is no use to pray for it.—EUGENE SECOR.

Not a cent. Comb honey will always be used as a luxury, and in no very great quantity under any circumstances. The pure article, taken from the comb by means of the honey extractor, is already a *staple* in my home market, and may be made a staple anywhere, if the right man has control of its introduction. One of my customers, the other day, when laying in a supply of the pure article at my honey store-room, remarked that he would "as lief have leather in his stomach, as to have wax there."—G. W. DEMAREE.

It is impossible to ascertain—we may guess all we like. My "guess" would be that the advance in price would be exceedingly small, if any.—THE EDITOR.

CORRESPONDENCE.

MAILING BEES.

Sending Bees by the Pound Through the Mails.

Written as a Private Letter to the Editor

BY G. M. DOOLITTLE.

FRIEND NEWMAN:—You will doubtless remember that I spoke in my book that it was my belief that the day was not far distant when enough bees would be sent in the mails with a queen, so that they would build up into a colony, if sent early in the season. If you do not so remember, you will find the item by turning to page 138 of "Scientific Queen-Rearing." Well, when I wrote that, I hardly thought that the "day" would come so soon as the present; but such is the case, for to-day I am in receipt of one-half pound of bees which came in the mails, all alive but two, and as bright and as lively as "crickets," although through poor directions, they were missent, going to New Jersey, thus keeping them some four or five days en route, instead of two, which would be the reasonable time had they come direct.

Mr. E. L. Pratt, of Marlboro, Mass was the sender, and is, as far as I know, the first one to take advantage of the suggestion which I made.

The cage is three-cornered, or triangular, in shape, to give it strength, and is 11½ inches long, each of the three sides being 4 inches wide. One-and-one-half inches of one end, is partitioned off for candy, thus leaving ten inches for the bees. Equi-distant between the candy and the opposite end are two pieces of ¼-inch stuff, fitted in nicely, to which the sides are nailed, giving it strength enough to sustain all the strain which could ever be brought to bear upon it, thus overcoming any danger of breakage which would let the bees out. Through these partitions are bored numerous three-eighths holes, so that the bees can cling in them and roam through the cage at pleasure. On each of the three sides are three 1⅛-inch holes covered with wire-cloth, which give ample ventilation even in the hottest of weather, while in a cold time the bees can all cluster in the compartment next to the candy, which will allow them to keep warm during frosty nights.

Mr. Pratt says that he considers the cage ample for one pound of bees, and from what I know of the matter, I think that he is right. He writes that if they come all right, he will petition the Government to allow bees by the

pound in the mails. The only thing I see in the way of their granting this is the sugar, which rattles out of the cage into the mail-bags, as it always does from all cages provisioned with the "Good" candy. The use of powdered sugar instead of granulated helps the matter some, on account of that which rattles out of the cages being finer than the other, so that it is not noticed so much; yet I have often feared that even this might possibly be used as an argument to exclude our queens from the mails, and if there is a fear in this direction with queens, it would be multiplied many times, were bees by the pound to be sent; for there is more sugar rattling from this cage of one-half pound of bees than there is from 20 queen-cages.

Mr. P. says that the cage when ready, weighed exactly 8 ounces, and the bees the same number of ounces, when started, yet now the whole weighs only 13 ounces. This loss in weight I apprehend is largely in sugar. There are some among our number who claim that the bees eat the sugar in the "Good" candy, but I am satisfied that this is not so, and believe the same quantity of sand to hold the honey in place would be just as good, as far as the bees are concerned. Be this right or wrong, the fact remains, that I have never received a queen with accompanying bees, but what a pile of sugar would be rattled out on my bench during the few hours that I might happen to leave them there, after their arrival; and the case is the same where I leave them thus before sending out. If this food-matter can be overcome, I do not see but what we are on the road to success.

Will it not be a grand thing for us Northerners, who sometimes lose our bees in wintering, to send South during the month of May, and get bees enough with queens to stock all of our empty combs, for only a few dollars, and these bees come to our very doors, thus saving miles of travel to the express office, saying nothing of heavy express charges? This will give the man living in the remotest parts of the United States, an equal chance with those who live in the very heart of the world.

Well, as I said in my book, I am glad of the privilege of living in this progressive age. The hints contained in the book seem to have waked many up along the different lines which it suggests, for I have many letters speaking in approving terms of the different thoughts which it contains. A day or two ago I received a good letter from that well known bee-keeper of California, Mr. R. Wilkin, in which he rehearses the trials and troubles that he had in rearing queens while in Ohio, some 16 or 20 years ago; telling how well he is succeeding by the plans given in my book, and says: "Like you, I almost stood spell-bound in view of the possibilities the new ideas offered. Accept my gratitude for your success in developing our beloved pursuit."

I take very little credit to myself, for nearly everything the book contains are thoughts which have originated with some one else, yet I must say that it has given me pleasure in being able to so arrange them, after I had collceted them for years, that they are proving a help to others. This would be a very poor world which looked only to the good of self, and I am truly glad that I could be the means of helping some others along, as I have been helped along by others. Many of the very best thoughts which I have been able to secure, have come through the columns of the AMERICAN BEE JOURNAL, and I am glad that your life, Mr. Editor, is spared to make the same so interesting, and keep it at the head of the bee-literature of the day. Truly yours,

G. M. DOOLITTLE.

Borodino, N. Y.

[The foregoing, though written as a private letter to us, contains some of the newest news in the bee-world, and we think it of sufficient importance to present it to our readers, and do so without consulting Bro. Doolittle. The point about the sugar is "well taken," and should be considered in adopting bee-food for use in the mails.—ED.]

SEASONABLE HINTS

About the Care of Honey, and Work in the Apiary.

Written for the City and Country

BY A. H. DUFF.

The honey flow seldom continues longer than July, and in many cases from the first to the middle of the same. Exceptional seasons furnish honey later than this, and sometimes up to the first of September, but we can mostly count on July for closing the heaviest of the crop. At the close of this time we are very liable to omit some very important work in the apiary that may cause heavy damage. The condition of every colony at the close of the honey season should be well examined. If we have allowed of much swarming it is possible that some colonies will be found queenless. In this case robbing is sure to follow. Queenless colonies will not protect their stores as they should do, and will do in if proper condition, and during the dearth of honey they will take advantage of any opportunity that presents itself in this line; hence, the importance of putting them in proper shape, so that they will protect and defend their rights.

If robbing is once commenced in a large apiary, it is very difficult to stop it. It seems that it takes the entire summer and fall before the notion gets out of them to rob.

It is but an easy matter to examine all colonies, and if brood in all stages of development is found, which at the close of the honey season will always be found if the colony has a fertile queen, there will be no danger; but if young brood cannot be found it is evident that there is something wrong, It is true that in such colonies may be found a young queen that, as yet, has not begun to lay. If such a queen is found, we can watch her daily for a few days and ascertain if she is going to prove all right; but it is not necessary to wait more than three or four days. If eggs are not found during this length of time, she should be removed and a fertile queen introduced in her stead.

When such queens are not at hand, we can substitute a comb of brood from some other colony, when they will rear a new queen. All colonies at this time that are entirely destitute of brood should be supplied from other colonies. In this manner we will make them safe, for if they are queenless, the bees will rear a queen from the brood given them. Brood for queen-rearing should not be over three days old, and to make sure that we use brood that is young enough, it is better to have a supply of eggs only, or a frame of brood in all stages, and a quantity of eggs also. The bees will select the proper brood for queens, if thus supplied.

All surplus honey should be removed from the hives at the close of the honey season. If left it will soon become dark and have a solid appearance that will prevent it from bringing a first-class price in the market; and for another reason: the bees cannot protect a large surplus so well, and, unless the hives are very close, robbers will find their way to the honey: hence, we say that all surplus honey should be taken off immediately after the honey flow.

Comb honey should be carefully stored away in a close building so that the bees cannot find it. Honey should not be stored away in cellars or underground repositories of any kind, but should be kept above ground, and should have plenty of light and air and at the same time prevent the bees from entering.

Comb honey can be kept free from ants and other insects by placing it on

tables, the feet of which may set in basins of water and kerosine oil. Ants are very distructive to comb honey, as they will puncture the cappings and destroy its appearance. Extracted honey should not, as yet, be kept in air-tight vessels, as it is still in process of ripening, and if the gas that is produced cannot escape, it will burst the packages; hence, they should have a small opening at least.

Extracted honey may be kept together in any quantity if pretty well ripened; if not, it should be in small quantities. Earthenware and tin are probably the best for keeping extracted honey in, although kegs and barrels can be used, but should first receive a coating of beeswax inside. This can easily be done by pouring into the same melted beeswax, and running it over the surface.

Larned, Kansas.

THE UNION.

Why Do Not More Join the Bee-Keepers' Union?

Written for the American Bee Journal

BY J. E. POND.

It has for a long time been a surprise to myself that the "Union" does not increase in membership faster than it does. Can it be possible that "bee-keepers" are so selfish that they are (or at least the great majority of them) willing to let the few do the work, while they enjoy the benefits?

There is no question but that the Union has done a great work; and its work in the future will only be circumscribed by the smallness of its membership. The work done is national; it strikes at the very root of all troubles that bother us, or dangers that we may fear, and in a way, too, that carries immense weight. Its operations are far reaching; they extend over the whole continent, and if backed up as they ought to be, will strike terror to the hearts of our antagonists.

Even now, with its small numbers, and infinitesimal treasury, the Union is a power in the land, and has already taught many a would-be enemy that it is not safe to trouble its members; that it—the Union—stands as a shield and barrier against all assaults that may be made upon its members. Now, brother bee-keepers, will you not heed the Macedonian cry, and "come over and help us?"

We are small in numbers, yet we have so far proved a perfect "wall of defense" to all who have assailed us. If we could only make the increase in numbers that the quality of our work ought to assure, we should, and would, not only act as a "shield of defense," but by the force of our members, stand as a perpetual menace to our assailants, and drive them from the field by sheer force of members, without being obliged to fire a single gun.

The expense is but small—so small that every bee-keeper can afford it. The advantage gained is immense. It has so proved in the past, and must so continue in the future. Why not, then, aid in the good work, and send in your names till instead of only a "corporal's guard," we shall have enrolled on our books an immense army?

North Attleboro, Mass.

EXPERIENCE

With Bees for a Period of 13 Years.

Written for the American Bee Journal

BY A. C. SANFORD.

I have been in the bee-business for 13 years, starting at first with one colony. My knowledge of bees was at first limited, but being a profound lover of bees, I resolved to know all the mysteries; so I went to work in earnest. My first and second seasons were not very profitable in dollars and cents, but during this time I was studying and practicing.

I think that it was the second season that I purchased an Italian queen, and superseded all native stock. During this time my wife used to say, "Now, Albert, what is the use of your fussing so much time away with the bees? You will never make any thing." But the first thing she new, I had a nice lot of honey, and for it $125.00 in cash; then, of course, she was willing I should spend all the time I wanted to with the bees.

I have taken the AMERICAN BEE JOURNAL for a good many years, and like it very much. I wish every bee-keeper would take at least one good paper, and keep themselves posted.

Since I commenced bee-keeping, I have had as high as 100 colonies. Several winters I lost heavily, and one season I lost all but one colony. I have wintered my bees in an out-door cellar for several seasons, but lost some each time—sometimes half; the fault was not always with the cellar, for sometimes they were short of stores. Experience is the best teacher.

Two seasons I placed them in sheds in rows, bridged the entrances, and buried them in clover chaff and sawdust. One season I covered them in green sawdust, and let it remain till March; I then removed it, packed them with dry clover chaff, and the bees came out in very fine conditon. I have not tried that plan since.

One season I tried wintering my bees out-of-doors without any protection except snow (the previous winter I had lost quite heavily in the out-door cellar); so I concluded to try it once, as I had read about bees being wintered under the snow.

The bees were extra-well provided with honey, but when the next May came, I had only one colony left, and that a weak one. This was the dearest part of my experience. The past two seasons I have wintered them under the kitchen, where I have a very good cellar divided in two parts. I have a stove in one part. If the temperature gets too cool, I raise it by making fire in the opposite room. My loss in this place has been slight. I now have 52 colonies and 6 nuclei. This has been a pretty fair honey season, and the quality of the honey is very fine.

Ono, Wis., Aug. 26, 1889.

LAYING-WORKERS.

How to Avoid the Annoyance of these Pests.

Written for the Home and Farm

BY T. E. HANBURY.

Laying workers, like the moth-worm, are the pests of some bee-keepers. Fortunately, however, for the bee-keeper of the present day, Italian bees have abated the moth-worm nuisance, as they are proof against the latter, but the former has ruined many a fine colony of bees while their keeper, in many instances, was unaware of the cause.

The invention of the movable-frame by the immortal Langstroth, has been a boon to those who delight in keeping bees either for pleasure or profit, and hence, now we can examine any colony of bees in a few minutes. On this account the apiarist, if careful and governed by my advice, laying workers will be the rare exception and not the rule.

When for any cause laying workers have made their appearance, it will be known by the singular appearance of the cells which resemble drone-cells with their protruding caps scattered among the worker-combs. This is because the colony has been destitute of a queen for some time, and some bees (mainly those which were reared in cells contiguous to cells in which queens have been reared) in their great anxiety to rear brood, will commence to lay these eggs, but such eggs will only produce drones, as such laying workers have never been fecundated by a drone.

Unless such an order of things is changed, a fine colony of bees will

soon dwindle down, and become a prey to robbers, or will be ortherwise destroyed. Often if a fertile queen is introduced to such a colony, the laying workers will cease their egg-laying propensities, and will go to work like other bees; but often such laying workers, imagining themselves to be queens, will kill the newly-introduced queen, and then continue to lay their drone-producing eggs. In this case, it would be well to introduce a queen-cell, and if this is torn down, to introduce another, and another, until they accept such a queen-cell.

They may possibly permit such cells to hatch, and the resulting queen will soon become fecundated and commence to lay, and thus the regular order of the colony will be restored. Often, however, they will not allow this, and in such an event there is no alternative but to cage the queen in some other colony, and while thus caged, to smoke both lots of bees thoroughly, and shake the bees from the laying-worker colony in front of the hive in which the queen is caged; and after they have all united, liberate the queen after they have thus been united at least 24 hours.

It may be said, however, as regards this trouble, that "an ounce of prevention is worth a pound of cure," and hence, extra pains should be taken that no colony should be left without a queen very long at a time, say not longer than three or four days. Bees thus left without a queen will not always become infested with laying workers; but in many cases they will, especially in the brood-rearing season, hence, every colony of bees should be frequently looked over to prevent this annoyance, and as soon as a colony is found without a queen, one should be supplied. By being careful in this respect, you will avoid the annoyance of having to deal with these pests.

HONEY-DEW.

Is it a Safe Food for Bees in Winter?—Stung by Bees.

Written for the American Bee Journal

BY F. GREINER.

Buckwheat bloom is now about over, and we have harvested a larger crop of comb honey in sections from this source than usual. But still our bees are booming; the humming that we hear in the morning hours, reminds us of the year 1881, when our bees stored so enormously from linden.

Very few bees come in with pollen in their pollen-baskets, all the many more with distended abdomens, heavily loaded with the sweet found so abundantly on the chestnut leaves—it even drips from them, covering the grass, etc., with the sweetish substance. A light-colored, yellowish, greenish plant-louse, found in great numbers on the underside of the leaves, is probably the cause of the "varnish" on them.

Our bees pass by the golden-rod (which blossoms profusely now), preferring the plant-louse secretion, and not until the latter is dried up, do they return to the former.

I never had any experience with honey-dew before, and I would ask, how can we determine whether or not this class of honey in connection with buckwheat and basswood honey will be wholesome for the bees? Will it insure safe wintering? Who can tell?

Attacked by Bees.

In the New York Weekly *Tribune* of Aug. 28, page 6, we read the following:

ATTACKED BY A SWARM OF BEES.—At Saratoga, Aug. 25, Harry Howlet, a West Milton teamster, met with a terrible experience in Ballston Spa, at a late hour* yesterday. His team and himself were attacked by a large swarm of bees, which stung the horses to death. Howlet, in seeking to rescue his horses, was also attacked and stung into insensibility. At one time it was feared that his injuries would prove fatal, but he had recovered to-day sufficiently to allow of his removal home.

*Are bees in Saratoga like night-hawks?

It would interest us bee-keepers, if one of the readers of the AMERICAN BEE JOURNAL, residing in that vicinity, would give us more particulars of this very singular case.

Naples, N. Y., Aug. 31, 1889.

BEE-DISEASE.

Experience with the "Nameless Bee-Disease."

Written for the American Bee Journal

BY C. THIELMANN.

On page 541, Mr. Alonzo Skinner gives a cure for this alarming bee-disease, but in reading carefully what he says, seemingly he contradicts in the last part what he writes in the first, namely: "Two years ago last April I had one colony affected with the disease; I put about two table-spoonfuls of salt at the entrance, and in a very short time all was right." Then in the last paragraph he writes: "Since that time I have had about 12 colonies affected," etc.

Now a good many bee-keepers who have that alarming and annoying disease in their apiaries, would like to know whether Mr. Skinner purchased the 12 colonies from some other parties, or did they get the disease from the first that he cured?

I would like to have Mr. S. answer the above question, as it is very important to know if the disease runs in the "blood," or whether it is a parasite; and whether salt and water will cure it, or only check it for a time, and then break out again more than before. This seems to be the case with Mr. Skinner's bees, and if correct, then salt and water will not cure the disease, but only check it for a time. The latter is my experience.

Mr. S. speaks of the salt-and-water cure used by queen-breeders. It appears to me that queen-breeders would do the bee-keepers (at least to me) a far greater favor, not to send out queens from such colonies, than to give their "plan" of curing with salt and water. The disease is now spread all over the United States by the unconsciousness of some of our queen-breeders, and no one seems to have courage enough to make it public. But this is a great wrong, and a detriment to the fraternity. It has already done great damage, and no one has yet actually found a cure for it, or even know of what character it is; at least I have never seen it in print, or heard it privately.

Now I will give my experiments as I noticed them: About four years ago I got a queen from an Eastern breeder, and the next season I noticed some of the black, shiny bees at the hive-entrance, where that queen was introduced, but never heard or read about the disease.

It passed on without fear of anything bad the next season. I have seen more of those shiny bees, but I did not think there was any harm. Then a year ago last spring I sold 11 colonies to a man who started in the bee-business; among them was one colony (unknowingly to me, until some time in July) which had some of the diseased bees. When I visited the man in July, he called my attention to it. I then recollected that I had seen something in the bee-papers, shortly before, about the "nameless bee-disease;" and when I got home, I looked over my apiary, and found three diseased colonies.

From that time on I studied the malady, and made experiments, but to no results of an effective cure.

Last spring I had at one time 7 colonies affected; first I tried salt and water; next, carbolic acid, and both of these remedies checked it, but did not cure any of them.

Next I changed frames of brood and bees; one frame would check it some, but 3, 4 and 5 frames would make the colony well. Then I exchanged queens with healthy colonies, and *vice versa*, and it took a long time (5 or 6 weeks) before I could notice a change where the healthy queens were intro-

duced to diseased colonies, and some of them as yet are not entirely healthy in three months' time.

No diseased bees could be seen for 75 days in the healthy colonies, to which queens were given from diseased colonies; but after 80 days, many were sick, and are so now, after a time of 116 days, and after the colonies have swarmed, and have had young queens over two months.

Next I put some swarms with some diseased colonies without removing the queens; the effect of it was charming. In from 48 to 60 hours, hardly a sick bee could be seen, and a week after, all was healthy. A number of the colonies which were diseased in the spring, got well without doing anything to them, but others became diseased.

The greatest harm is done by the sick bees entering any hive in the apiary, and it is a rare case when the sick bees are killed; for they are only gnawed and bitten constantly, which, it seems, does the sick bees good, that is, they like it, and thereby the healthy colonies are diseased. The sick bees, at a certain stage, have no particular home, and therefore enter any hive.

I have come to the conclusion that the disease runs in the "blood," and is also contagious. Sometimes, when I water the bees, it appears as if they had parasites. If any one of the bee-fraternity knows what the disease is, or knows a cure for it, it would be read with interest, if published.

GOLDEN-ROD.

Is the Golden-Rod a Valuable Honey-Plant?

Written for the American Bee Journal
BY EUGENE SECOR.

I wonder if golden-rod is not greatly overestimated by bee-men. So it seems to me. In this locality I consider it of doubtful value to bee-keepers. I have watched many times to catch a bee upon it, but never more than once or twice have I seen a bee touch it; and then it deserted the flower as though it had made a mistake.

The other day I walked a half mile to a rich bottom where there was an abundance of golden-rod in bloom, but with the usual disappointment. I say disappointment, because I have often wished to see bees working upon it. The name is associated with the poetry of rural life, is rich in sentiment to every bee-keeper, and I have often sought for the fullfillment of cherished hopes and life-long desires—but in vain.

I wonder if it can be that in other localities it does really respond to the kiss of *Apis Mellifica*. I hope so. Or is the barrenness only comparative, and on account of the greater abundance of richer flora, the bees visit other species in preference?

In localities where the golden-rod abounds, there is usually an abundance of yellow ray-flowers, commonly called "sun-flowers," and these I know to be good honey-plants. I am never disappointed when I look for bees reveling in their golden dust, if within range of an apiary.

The Dodder—a Parasite.

In my tramp the other day, searching for golden-rod, I came across a very interesting plant in full bloom. It was dodder—a parasite, well known to botanists, but almost unknown to the common people. It generally grows in low bottom-lands, among a thick growth of other, and over-shadowing plants, where coolness and moisture are more sure to be present. It sends up a slender, golden or silvery thread which twines around a neighboring plant, and fastens itself thereon, getting its nourishment from its protector.

When I found it in bloom, coiling around a wild sun-flower, like an immense worm, and about the color of a ripe white mulberry, it was indeed an interesting plant. I do not know whether it yields honey or pollen, but it is quite fragrant. I brought home specimens which were admired by all who saw them.

Forest City, Iowa.

WINTERING BEES.

Preparing Bees for Wintering in Minnesota.

Written for the American Bee Journal
BY MISS IDA HOUSE.

I will now write that long-promised article on wintering bees in Minnesota, and I hope that it will help some of my brother and sister bee-keepers.

I begin at least by August 1, to look through the hives, to see if all have laying queens, and those that have not, I give laying queens, remove all the combs that contain very much pollen, and put in empty worker-combs, as a queenless colony is apt to fill the combs with pollen, and if left in the hive to winter on, it will be almost certain death to the colony.

Then I mark all colonies "light," that have not sufficient honey to winter on. I also mark those that have too much honey. When the honey-flow is ended I remove all supers and sections, also the oil-cloth cover, which I use in summer, and put on a quilt, which is made by placing a layer of cotton-batting between two sheets of cotton-cloth, and quilted. (I would recommend these quilts to all who winter bees in a cellar; they will pay for themselves the first winter.)

I then go to the hives that I have marked "heavy," take all but about 25 or 30 pounds of honey, and give to the light ones. Be sure to give the bees good honey to winter on. Do not give them honey-dew, unless you wish to get rid of them and know of no other way.

I have the bees all ready for winter before the nights get so cold and frosty as to candy the honey in the hive. We winter our bees in an under-ground cellar, 40 feet long, 7 feet high, and 6 feet wide, with a 6x7 inch ventilator near each end; also, three well-fitting doors, which leaves two dead-air spaces between the bees and the extremely cold weather, with the mercury often 40° below zero, in this northern climate,

When you put the bees into the cellar, remove the cover and entrance-blocks, leaving only the quilt over the hive. Put two blocks (2x2 inches, and the length of the hive), under the hive, then put two more on top, on which to put another hive, and so on until they are five tiers high.

One essential thing is a ½-inch entrance, full width of the hive, and left open; by so doing there will be plenty of upward and lower ventilation, and the bees will not smother or lack in any way for pure air.

The bottom have should be not less than 10 inches from the bottom of the cellar, to allow the foul air, if any, to settle below it, and pass off through the under-ground drain, which should consist of not less than two-inch tiling.

Some may ask how the under-ground drain is made. The easiest way would be to place it underneath the doorway, about one foot below the surface.

Bees placed in a cellar as I have described, with a temperature ranging from 40° to 45°, will winter as safely as by any other method, chaff hive not excepted. The temperature can easily be regulated by a slide in each ventilator—(not a toboggan slide), but a sliding door.

In conclusion I will say, on the first sunny day in April, do not rush to the cellar, and take the bees out, but wait until the season is fairly opened, say from April 15th to the 20th, and then not on a chilly, damp day, or when the wind is blowing at the rate of 60 miles an hour.

Howard, Minn.

ALBINOS.

Claim of Albinoism as Applied to Bees.

Written for the American Bee Journal
BY C. J. ROBINSON.

A claim is set forth in the *Bee-Keepers' Advance* that Albinoism does not exist in the *Apis* family. The claim is an absurdity, and not susceptible of proof. It is unwise for mortals to arrogate competency to write a code of Nature's laws. The claimant wrote: "Can the term 'Albino' be applied to the honey-bee? My own answer to the question is no."

He wrote further: "I have never yet seen any (bees) that were worthy the name"—Albino. He fancies that because *he* has not seen Albino bees, there are none worthy the name. He fancies, too, that he is inspired to teach people the possible and impossibilities of Nature's laws as "applied" to breeding, for he wrote: "If it were possible to produce a race of Albino bees, such bees would be of little value, owing to the fact that they must continually grow weaker and weaker, and finally play out entirely." He failed to mention the period of their "weak and weaker" existence, before they "must" become extinct.

Evidently the claimant knows nothing about the so-called Albino bees, but aimed to prejudice the public against the Albino strain of bees. He asserted that, "In fact Albinoism, wherever found, has always been considered an evidence of weakness." This was designed to "kill" breeders of Albino queens, though the assertion is a bounce instead of having any foundation "in fact."

Albinosim is the opposite of Melanism, and Albinos are generally larger than the normal size of the species, while Melanos are smaller.

I refer readers to Alden's Manifold Cyclopœdia—the latest and best authority: "The opinion that Albinos are distinguished from other men by weakness of body or mind, is completely refuted by facts;" and thus the said assertion is completely refuted.

The term "Albino" takes its derivation from the Latin *Albus*, white. The term is legitimately applied in all cases of preturnatural white or whitish appearance, which whiteness is caused by a non-development of coloring-matter in the skin, and its appendages, rendering the creature white or whitish.

Both Melanism and Albinoism are common to insects, as well as to plants and animals. White cockroaches and crickets have been seen about hives, that were Albinos. White rats, mice and rabbits are kept as pets, and have been bred until the peculiarity—Albinoism—is reproduced in every instance; and why not bees, the same as other insects? We have Albinos among cows, black-birds, squirrels, raccoons, and other animals, as well as the human—more common among negroes.

When the whitish Italian bees were first discovered, they were supposed to be a "sport;" but it is not known whether or not the singular phenomenon of colorings was a new diversion from the common type, or a reversion toward the original type. In type, the Italian bee is a composite—not at all uniform in colorings, nor natural habits—a true mongrel.

Instead of the Albino type being a sport in breeding, the evidences go to prove that they are more nearly than common Italians, thoroughbred types of the original *Apis Mellifica* family.

The Cyprian bees are undoubtedly the nearest akin to the original family of *Apis Mellifica* than any other type, their nativity being in Lower Eygpt. The notion advanced by whimsical writers claiming that beautiful bees are not vigorous, not the equal of darker bees for business, is sheer nonsense, completely refuted by well-known facts.

Mr. A. D. Pike was the first who called attention to the Albino type of bees, which appeared in his apiary, and attracted his attention in 1874. He wrote about his discovery to the lamented A. F. Moon, editor of the *Bee-World*, who seemed to suppose the phenomenon an accidental freak of nature.

In answer to Mr. Moon's editorial comments, Gen. D. L. Adair, of Hawesville, Ky., being a scientist, wrote an article explaining the case, since which the Pike white-type have been known as Albino bees.

The Albino bees are like the Italian, in all respects except color. I have bred Italians ever since I obtained a queen (which was one of the first Italian queens bred in America), but I never reared any of the white, or whitish bees, until I obtained queens of the Pike type. With me, the white, beautiful Albino bees have given as good satisfaction in point of profit, as any of the new or old type of bees. I have found Albinos the most docile of any bees, equally as good gatherers of honey, prolific and hardy.

The Pike Albinos are a strain of Italians, disposed to store their honey away from their brood-nest—a most estimable trait. The founder and able editor of the AMERICAN BEE JOURNAL fancied that beauty and intrinsic worth cannot be united in one animate form, and he applies it to "ladies" as well as bees. Women will never decorate his grave, except he repents and confesses that he sinned against beauty.

Richford, N. Y.

SWARMING.

A Beginner's Experience with Keeping Bees.

Written for the American Bee Journal
BY D. A. MONTAGUE.

In the first place, I had not thought of getting more than one colony of bees, but on approaching a bee-man. of the old style, he proposed to trade his whole apiary (of 11 empty hives and about 40 honey-boxes) for a $20 gasoline stove, and deliver the whole business; so accepting the proposition, here I am with 17 colonies now, and no practical knowledge of the business except what little I have gained this season; and I find the BEE JOURNAL a great help.

The bees themselves have given me a few lessons that will be useful to me in the future.

Of course my bees had it all their own way, as they were all in box-hives, or, what was worse, the Thomas hive. The first swarm issued on June 12—one about 11 a.m., which went back without clustering; then about 2 p.m., there were three or four that issued at once, but they got mixed up, and so bewildered, that they all came back and settled promiscuously over the hives, and under the stand. This was a new feature to me, and I was at a loss to know what to do, and I thought that I would experiment a little. Having a very large hive ready, I proceeded to brush off into a box, nearly half a bushel of bees, and dumped them down in front of this large hive, and they marched in, and made themselves at home; then, as they seemed so well suited, I served some more in the same way, but they went back and came out the next day. Afterwards, the bees were more reasonable, and swarms issued one at a time. I had ordered a few Langstroth hives, but before they arrived, the rush was over, and I got only two swarms into them, and they were late—July 1 and July 11. The hives have 7 frames, and 2 wide frames for sections in the body. *Are 7 frames sufficient to winter a colony?

I transferred one of the old colonies into a Langstroth hive, on Aug. 3, and they are doing well. I gave them full sheets of foundation, but no comb.

The old colonies stored no surplus honey, to speak of, and the new ones

but very little, except those in the Langstroth hives, and the large hive; they are doing well now, and I expect to get five or six times the amount of honey from the 2 colonies in Langstroth hives, as from all the others. They had full sheets of foundation, and starters in the sections.

Buckingham, Ills., Sept. 3, 1889.

[*Yes, if they contain from 25 to 30 pounds of honey.—ED.]

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Sept. 14.—Susquehanna Co., at New Milford, Pa.
H. M. Seeley, Sec., Harford, Pa.

Oct. 11—12.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Fumigating a Room.—J. Van Deusen & Sons, Sprout Brook, N. Y., write as follows:

To fumigate a room or receptacle for surplus honey, get a small kettle with a round bottom, and a piece of heavy tin or iron (old or new) 4 or 5 inches long, bent to fit the bottom of the kettle. Put into the kettle what roll brimstone you need for the size of the room, heat the iron and put it on the brimstone. The iron should be just red in the dark, but not to show by daylight. If too hot, the brimstone flames up too much. A small apiary may have a large dry-goods' box fitted for the purpose, where an ounce or two of brimstone will answer, while a building may require one-half to one or two pounds, as to size of the room.

Splendid Honey-Year.—W. R. Tate, Durant, Miss., on Aug. 30, 1889, says:

Bees are doing well in this section of the country. We have had a splendid honey-year, with very little swarming. The swarming and also the honey-season are about over. We get most of our honey from trees, such as the willow, poplar, persimmon, and others. There is no clover raised in this part of the country. I want to sow some clover and buckwheat next year.

The Season of 1889.—Mr. C. Weckesser, Marshallville, O., on Sept. 2, 1889, writes:

The honey season in this locality has been but little above the past two unfavorable and unprofitable seasons, but we are glad to be relieved of the necessity of feeding for winter, as we have been obliged to do heretofore; for the bees are getting considerable honey at present from smart-weed and other sources, apparently, but we may not expect any surplus from these sources. At present we have very hot and dry weather, but bees are breeding strongly, and we notice white specks on the combs, and think that they will go into winter quarters in fine condition; and perhaps we may have a season soon, that will make up for the stingy yields of the past, if we are prepared for it when it comes.

Glassing Sections—The Crop.—J. W. LeRoy, Rio, Wis., on August 29, 1889, says:

I have always had a home market for my honey until now. Is it necessary to glass the sections? My crop is 3,000 pounds of comb honey, in one and two pound sections, and 1,000 pounds of extracted. The honey crop is nearly double this year, per colony, on an average, but less than a few yeary ago.

[It is not necessary to glass sections of honey for the Western markets, but for Eastern markets it is done to some extent.—ED.]

Excessive Swarming.—Geo. H. Auringer, Bonniwell's Mills, Minn., on Aug. 28, 1889, writes:

It has been very dry here all summer, the creeks and wells are drying up. I am afraid our fall crop of honey will be short, on account of the dry weather. I have 45 colonies now from 17 last spring. All are strong, and one stored over 20 pounds of honey and swarmed on May 22. I have taken 700 pounds of honey in one and two pound sections, and I think that I will get 2,000 pounds. I am selling my honey for 18 cents a pound at the stores; it retails for 20 cents. I take nothing but prime honey and well-filled sections to market, and get the highest price. One swarm came out on May 25, and on July 11 it swarmed, and I put back the new swarm, and cut out the queen-cells; and on July 17 it swarmed again, then I put the new swarm into a new hive, and it came out. Then I put it in with a swarm that was queenless, and the next day they swarmed again. I put them into a 10-frame two story Simplicity hive, for it was a very large swarm, but they swarmed again the next day. I put them back in the same hive, for I did not know what else to do. They stayed, but before the hive was one-third full, they started queen-cells, and I have kept cutting them out ever since. Some were capped over. They are doing well now. Hurrah for the golden-rod for the national flower.

Tobacco and Bees, etc.—P. M. Aldrich, Fairmount, Nebr., on Aug. 24, 1889, writes:

"What killed the bees?" is asked on page 540. I cannot tell, but it was not the tobacco or smoke. I use but very little smoke, and that is mostly tobacco-smoke. Sometimes I smoke the bees pretty heavy, but I never see any bad effects from it. I have often used a cigar-box when hunting bees, and they worked readily in it.

I have had to destroy four swarms, as they were affected with foul-brood. Bees had not held their own as for honey this season, until two weeks ago, but are doing finely now on heart's-ease, or "tanning," as it is called here.

Good Fall Crop Expected.—John Nebel & Son, High Hill, Mo., on Sept. 2, 1889, write:

We have an immense Spanish-needle bloom. It has been very dry here for the past three weeks, so much so that Spanish-needle did not yield much nectar, but for the last two days we have had occasional showers, and we never saw bees work better during the few hours of sunshine that we have between showers. If we could be favored with such a condition of things for a few days longer, we can count on 50 pounds per colony, of fall honey.

Marketing the Honey-Crop, etc.—John Blodget, of Flag Springs, Mo., on Sept. 2, 1889, writes:

I think that I am one of the "lucky bee-men," as I will get 6,000 pounds of honey in one-pound sections, from 30 colonies. I have already 5,000 of the clover honey, and now the heart's-ease is coming in fast. My increase was 42 colonies. Some are selling one-pound sections of honey at 12½ cents, and some as low as 10 cents. These very men are the ones who establish the price in our home market, for us who have 5,000 or 10,000 pounds to sell. It is not all the small bee-keepers, but I understand that one

large producer at Standberry, Mo., is selling at 10 and 11 cents per pound. If the Union would establish the price of honey, I, for one, will join it. I am shipping honey to Kansas City, on commission, rather than take so low a price. I have not sold a pound for less than 15 cents, and I will hold it till I can get my price. I think that we ought to be able to establish the price on our honey. The AMERICAN BEE JOURNAL reaches me every Friday, regularly. It is a welcome visitor, and the music is splendid. Give us some more of it.

Hive-Porticoes.—John Boerstler, Vashon, Wash. Ter., on Aug. 24, 1889, says:

In regard to the portico, I would say that I have tried at least 20 different hives, and I have done away with all except the 2-story Langstroth hive, with the portico; and I think that a hive without a portico is like a house without a porch. Why do they put a porch to a house, if it is not for some use? and why do they put porticoes to the finest building, if they are of no use? I think that a hive without a portico, is like a house without a porch, and I, for one, will never be without a portico to my hives.

Short Crop of Early Honey.—W. H. Graves, New Carlisle, Ind., on Aug. 28, 1889, writes:

The honey crop is very short in this part of the country. My early crop is very small—between 700 and 800 pounds of surplus from 92 colonies. Two colonies became queenless, that I lost, and I only hived 12 swarms this season. They failed to swarm as well as to gather much honey. White clover bloomed profusely, but did not seem to secrete very much honey. Some claim that they have not taken a pound of honey this summer. By appearances, we will have a good fall crop, for I never saw so much golden-rod bloom in my life, as there is this season. If I have any vote on the national flower, I vote for the golden-rod. The AMERCAN BEE JOURNAL is a welcome weekly visitor which never fails to come every week.

Bee-Keeping in North Missouri.—P. P. Collier, Rush Hill, Mo., on Sept. 5, 1889, writes:

The honey in this part of Missouri is not an average crop, by 25 per cent.; but the increase of bees is 30 per cent. above an average. The quality of the honey is better than for years. It was gathered mostly from clover and blue-verbena, and some smart-weed. I had 22 colonies in the spring, sold 18 swarms, put back 12 or 13, and 6 or 8 left for the woods, leaving me now on hand 75 colonies in good condition—the best for years. I have taken about 1,000 pounds of extracted, and between 500 and 700 pounds of comb honey. I am selling it at 15 cents per pound for comb in sections, 12½ cents for broken comb, and 10 cents per pound for extracted honey. We will have but little Spanish-needle honey, owing to continued drouth.

An Aster, etc.—C. W. Conner, Ashton, Iowa, on Sept. 3, 1889, says:

I send a specimen of a weed or plant which is abundant here this dry season, and my bees are working on it yet. What is it? Is it a good honey-plant? It is so dry here now that everything but this plant and the golden-rod is dried up. The golden-rod is abundant here. Bees are doing well.

[It is an aster, and is an excellent honey-producer.—ED.]

Queenless Colonies.—S. R. Norton, Lemont, Ills., on Sept. 3, says:

Please inform me in the BEE JOURNAL, how long a colony would be queenless before a laying worker would take possession.

[If a colony be left queenless, and is without the means of rearing a queen, it will be only a few days before some workers will commence to lay eggs, in a vain endeavor to save the life of the colony.—ED.]

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on **Friday** and **Saturday, Oct. 11th and 12th,** at **9 a.m.** Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be one fare for the round-trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The fifth semi-annual meeting of the Susquehanna Bee-Keepers' Association will be held at New Milford, Pa., on Saturday, Sept. 14, 1889, at 10 a.m. There will be essays on different subjects, and also a question-box. Bring your wives along, and please invite your neighbors who are interested in bee-keeping, to come with you. If you have anything new, or that would be of interest in any way, of implements or fixtures, bring them, so that all may see them.

H. M. SEELEY, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec. Romney, Ont., Canada.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—It is coming in slowly. We quote: 1-lb. sections of white, 15@16c.; 2-lbs., 14c. Extracted, white, 8@8½c.; dark, 7c.

Aug. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c

BEESWAX.—23½@24½c.

Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.

BEESWAX.—18@20c.

Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, California, 7½@8c.; orange bloom, 7½@8c. White clover and basswood, 7½@8c. Common Southern, 65@75c. per gal. Fancy comb, white 1-lbs., 16c.; fair 1-lbs., 14c.; 2-lbs., 2c. less.—The New York crop being comparatively small, the Western apiarists will find a good outlet here in the East. As prices this season are about 10 per cent. lower than last season, we expect an active demand.

Aug. 21. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extracted increasing; demand light, at 6@8c.

BEESWAX.—25c.

Aug. 1. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—Coming in freely, but sales are not eisily made at over 15c. for the best, while we are trying to get 16c., and think that later we can get it, as all buy sparingly now. Extracted sells at 6@8c., but chiefly at 7c. for white.

BEESWAX.—25c. R. A. BURNETT.

Aug. 12. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.

BEESWAX.—23c.

Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.

BEESWAX.—24c. for prime.

Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—New comb arriving freely. Demand is fair, although weather is too warm. We quote:—Fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 12c. Excellent demand for all kinds of the extracted, as follows: Orange blossom, 7½@8c.; white clover and basswood, 8@8½c. Southern, average quality, per gal., 65@70c.

HILDRETH BROS. & SEGELKEN,

Aug. 21. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It has arrived freely, but sales are a little slow, at 17@18c. for 1-lbs.; and 2-lbs., 15@17c. Extracted, 8@9c.

BEESWAX.—None on hand.

Aug. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Demand for extracted is fair from manufacturers, and from consumers for table use. Good demand for best qualities of comb honey, while inferior grades find slow sale. It brings 11@15c.

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.

Aug. 21. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts of comb honey are large, but market slow, at 14@15c. for white 1-lbs., and 13@14c. for 2-lbs. Extracted, white, 7@8c.; dark, 6c.

BEESWAX.—20@25c.

Aug. 22. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.

BEESWAX.—22@25c.

Sep. 5. A. V. BISHOP, 142 W. Water St.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	Club
The American Bee Journal	1 00...	
and Gleanings in Bee-Culture	2 00....	1 75
Bee-Keepers' Guide	1 50....	1 40
Bee-Keepers' Review	1 50....	1 40

How to Propagate Fruit	1 50....	1 25
History of National Society	1 50....	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

The Chicago Convention will be held on **Friday and Saturday, Oct. 11 and 12, 1889.** This change of date has been made, because the Railroad Traffic Association has made a rate of one fare for the round trip from any point within 200 miles of Chicago, good on Oct. 10, and can be used on any train returning after that until Monday, Oct. 14. The first session will be held at 9 o'clock in the morning of Friday, and an adjournment can be had on Saturday afternoon in time for those who may wish to return on that day. Those who can remain over Sunday will have an opportunity of visiting our magnificent churches and cathedrals in the morning and evening, and of taking a pleasant walk in the parks or riding on the boulevards in the afternoon, as their inclination and tastes may lead them.

October is usually a very pleasant month, and this will give an opportunity to many who need a recreation, to take it at a small outlay, and at the same time to "take in" the Bee-Convention. The invitation is full and wide—*Come all who can.*

We Want a Representative at all the Fairs to be held this season. The AMERICAN BEE JOURNAL is the recognized defender of the rights of the bee-keepers, against the attacks of the ignorant and prejudiced. There are thousands who would gladly subscribe to it if it were only brought to their notice, and its claims presented. When making an exhibit, please send for our *Colored Posters* and sample copies, and get up a club. In this way you will not only pay yourself for the trouble, but also aid the pursuit, and its defense all over the country.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Clover Seeds.—We are selling *Alsike Clover Seed* at the following prices: $8.00 per bushel; $2.25 per peck; 25 cents per lb. *White Clover Seed:* $10.00 per bushel; $2.75 per peck; 30 cents per lb. *Melilot or Sweet Clover Seed:* $6.00 per bushel; $1.75 per peck: 20 cents per lb.—by express or freight.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Subscribers who do not receive this paper promptly, will please notify us at once.

THE AMERICAN BEE JOURNAL CIRCULATES ALL OVER THE WORLD.
PUBLISHED BY THOS. G. NEWMAN & SON, CHICAGO, ILL.

THOMAS G. NEWMAN, EDITOR.

Vol. XXV. Sept. 21, 1889. No. 38.

EDITORIAL BUZZINGS.

The Perforations in metal sheets that will admit workers and exclude queens should be five thirty-seconds of an inch. This will answer a question by John Blakely, and others.

The Hall County Fair will be held at Grand Island, Nebr., on Tuesday, Wednesday, Thursday and Friday, Sept. 24, 25, 26 and 27, 1889. Louis Von Wasmer is Superintendent of the Bee and Honey Department, and $54 are offered in premiums. Mr. William Stolley will have a nice exhibit of honey and apiarian implements.

The Brown County, Ills., Fair closed on the 7th inst., and we learn with pleasure that the exhibits of Messrs. Hambaugh and Petty were exceedingly attractive. The Versailles *Enterprise* remarks thus concerning them :

The exhibits of Messrs. Hambaugh and W. T. F. Petty & Son covered nearly one whole side of the Farm and Kitchen Product Building, and was the chief attraction of all who entered it.

Mr. Hambaugh's exhibit consisted chiefly of extracted honey put up in glass and tin vessels suitable for the trade, and the honey almost transparently clear, in rows, tiers, and pyramids, fringed on all sides with natural flowers, made a very nice showing.

Mr. Petty's exhibit consisted of comb and extracted honey, principally comb, put up in one-pound sections, and packed in crates of 12 or 16 pounds to the crate, and glassed at the sides. These crates were packed one on another, pyramid shaped, till it reached almost to the ceiling. The virgin white honey, peering through the glasses, was very inviting, and reflects great credit on the gentlemen and the industry. In connection with their exhibits, both parties had live bees in observatory hives, which were a source of curiosity to many.

A Just Rebuke.—The Managers of Fairs should be more particular about getting damaging matters into their premium lists. Last week's *Indiana Farmer* contains the following from Mr. E. H. Collins, President of the Indiana State Bee-Keepers' Association :

I am surprised and annoyed to see in the premium list of the Indiana State Fair a mistake for which some one should be responsible. It is in Class 38, Bees and Honey, where it lists the premiums for "Apparatus for the manufacture of comb foundations, etc., the owner to manufacture comb during the time of exhibit."

An expert bee-keeper would know that the word "comb" could only apply to comb foundation, but the public have been humbugged so much by sensational lies written by "smart" reporters, even describing the manufacture of comb by machinery, and filling it with glucose, etc., that it is a great damage to the business of the honey-producer.

The apiarists of the country have been of late years, constantly correcting such stories, but the papers publishing the sensation do not care to correct it, and the masses do not read the corrections in the bee-papers, so that is strange to see how many intelligent people in this credulous age of invention really believe that comb honey can be manufactured as readily as oleomargarine. Consequently they are suspicious of all comb honey, unless its producer be well-known to them.

Our State Society appointed a committee to look after the exhibit at the Fair, and such a harmful, misleading error should not have been allowed to go out with such an official authority as this premium list. Such things give force and character to the already too wide-spread belief that it is possible and practicable to make comb honey by machinery.

Mr. A. I. Root, of Medina, Ohio, has a standing offer of $1,000 for any one who may show him where they do this thing by machinery.

It was in Indiana that Wiley manufactured his "scientific pleasantry," and imposed on Gov. Porter, who innocently repeated it before the Indiana Bee-Keepers' Convention, when giving that body a welcome at Indianapolis. This called attention to it, and made its odiousness so apparent, that the author of that nefarious "joke" has been compelled to retract it. But the effect of his effort can never be recalled.

Convention Hand-Book.—As the convention season is just approaching, we want to direct attention to the little book which every bee-keeper needs when attending these gatherings. Here is what Mr. J. E. Pond says about it :

DEAR EDITOR :—Your little "Convention Hand-Book" is really a very handy thing. At two or three different times I have been called on to get up something for special occasions, and I have found the "Hand-Book" just the thing to save me quite an amount of time and labor, as it was a very simple matter to use the "book" as a basis, making only such few changes as were necessary to fit the special time and place.

I can cordially recommend it to any one who may desire not only information, but a *perfect form* for organization of a convention of any kind of a convention, as it will "fill the bill" completely.

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions ; Constitution and By-Laws for a Local Society ; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

We make every subscriber this offer : Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year ; send it to us, and we will *present* you a copy of the Hand-Book for your trouble—by mail, postpaid. Here is a grand chance for all to get a valuable book without costing them a cent !

The "Bee-War" has reached St. Joseph, Mo., as we notice by the following item in the daily *Gazette* of a late date :

When the sanitary committee met last night, Clerk Defonds unintentionally created a disturbance at the very beginning of what promised to be a harmonious session, by springing a petition from Marks, the wine maker, out at the end of Grand avenue, asking that the bees of Emerson T. Abbott, the noted bee-keeper, be declared a nuisance and ordered removed. The petition bore the signature of twenty persons.

The matter had just been referred to the sanitary sergeant when Mr. Abbott put in an appearance. He was given the privilege of the floor, and in about twenty minutes had given the learned gentlemen of the committee a vast amount of information on the characteristics of the honey-bee, and had just about stung to death the germane portions of the petition.

Mr. Marks interrupted the gentleman frequently in a broken sort of way, that convulsed Mike Kane, Meat Inspector Pinger, and more or less of the members of the committee.

The matter was taken under advisement, and the committee will go out to-day to eat honey with Mr. Abbott, and ascertain if his bees are of the kicking variety, or just plain, every day, hard-working bees.

With such an able talker as is Mr. Abbott, we have no fear of the ignorant or malicious attacks of any one. He will carry the City Council, Sanitary Committee, Meat Inspector, and all the newspapers, and sweep them all before him, like stubble before the wind. Give it to them, Bro. Abbott, *red hot*, and plenty of it.

Can You Believe It ?—The complete works of Charles Dickens in 15 volumes, nicely bound in paper covers, are mailed to our subscribers, postage paid, with one year's subscription—all for $2.10. No one who sees them can understand how they can be produced at that price, including postage !

It pays to be a subscriber to our papers, for none will be sold at that price to any one but subscribers. They cannot be sent to any foreign country at that price. These books will be sent *as a premium*, postage paid, for four subscribers at one dollar each.

As each set will be ordered from and mailed by the publishers, there will be an interval of a week or ten days between the receipt of the money and the mailing. Complaints should be made if not received within twenty days. Complaints must be made within five weeks to secure proper investigation.

GLEANS OF NEWS.

Conventions of Bee-Keepers is to receive considerable attention in the next *Review*, and as an introduction to the discussion, Bro. Hutchinson starts out with the following hints about their utility and usefulness:

The season for holding conventions will soon be here, thus the topic will be a fitting one. These gatherings are intended for the interchange of thought, the exchange of views and experiences, and the enjoyment of the pleasures that arise from a personal acquaintance with those engaged in the same pursuit as ourselves.

Years ago, bee-keeping literature was not so plentiful as it is now. Then, if a bee-keeper heard of a paper containing an article "on bees," he would tramp away off across the town for the sake of reading it. In those days, to attend a convention was a *great* advantage. Those days are past. Apiarian books and journals are now plentiful and cheap. Through these mediums the diffusion of knowledge has become well-nigh universal. Even a *thought* is no sooner born than it is wafted on the white wings of journalism from one end of the land to the other. So fully do the periodicals keep abreast, yes ahead, of the times, that conventions can do but little more than talk over what has been already discussed in the periodicals. For a few dollars, the bee-keeper can have the best books and all of the periodicals published. With these he can sit down in the quiet of his home and read them at his leisure.

Under such circumstances, every point is taken in and comprehended; in the hurly-hurly of a convention many things are not always clearly understood, or are driven from the mind. How many up-with-the-times bee-keepers now go to these meetings expecting, as the result, to come home loaded down with information? Not many. It is not for that they go. It is to meet with the "boys."

It would be too sweeping an assertion to say that no valuable knowledge is exchanged at these gatherings; but, owing to the thorough manner in which the journals do their work, conventions are, more than ever, great big, visiting-bees. "But to meet our brother bee-keepers, to grasp their hands, to rub our minds against theirs in actual, personal conversation, is a great thing. It brightens us, it sharpens us, it gets us out of the ruts, and we go home with a feeling of vim and freshness about us." So we felt and wrote after returning from the last meeting of the North American at Columbus; and so we still feel, but cannot our conventions and associations be improved; be made to help us more in a financial way?

We know it is not best to so magnify the almighty dollar, that it hides everything else, but of this there is no danger in this connection. The social feature "will out;" the bee-keepers *will* visit; so it is with a clear conscience that we may turn our attention to the more utilitarian advantages that may be gained by association.

After the above the editor of the *Review* devotes two columns on the financial part, and argues well on the desirability of having a good Secretary, and paying him liberally for the work, which he must do to make the convention a success. This is, of course, a feeler, and we shall look with much interest for the opinions of his correspondents on the points presented, and we shall have our say about them hereafter.

Care of Honey.—In the *Farmer and Poultry Raiser* we find the following sensible hints about the proper care of both comb and extracted honey, and the important fall work to be done in the apiary:

All marketable honey should be removed from the hives at the close of the flow. Comb honey, if left on the hive, will become soiled and dark, and its bright appearance as a first class, marketable article will be damaged; hence it should be removed.

If any extracting is to be done, it also should be done at once, and not left to a later day, as it will be found very difficult to uncap and extract honey at a time of dearth. Some very important work is to be done in fixing bees up properly at the closing of the honey season. We very often find queenless colonies now, especially if much swarming is done, and all such colonies are a bait for robbers, and they seldom fail to find them.

After the close of the honey-flow the bees seem to have a mania for robbing, and if we carelessly leave colonies in such condition as not to be able to protect themselves, robbing is sure to follow; and if once they get well started at it, they will give trouble throughout the entire season. Hence, take precaution in time and prevent this difficulty.

Examine every colony and ascertain if they have a fertile queen; there should be brood in all stages now, if the queen is all right. If this cannot be found, something is wrong.

Do not leave surplus honey around where the bees have access to it. You may think that you have stored it away in some house or building, but it must be very securely stored, or the bees will find it; and if they once get a taste, they will bother your dwelling-houses and prove a pest to your neighbors; hence prevent all such, by closing everything well, and making all things secure as you go.

After the close of the honey season, market your comb honey if you can get a fair price for it. If not, hold it. It may be kept in good condition, but must receive the best of care. Look out for ants, as they are very destructive. They will puncture the cappings and ruin your crop. Place your comb honey on tables with their feet set in basins of water and kerosene-oil. In this manner the ants cannot reach it. Cover the honey with thin muslin to keep the dust off, and also give it light. Never put honey of any kind in a cellar or underground repositories of any kind. Keep it high and dry. The garret is better than the cellar.

Heat will not injure honey, it will only tend to ripen it into a better quality.

Do not put extracted honey into tight receptacles until it is thoroughly ripened. Leave an air-hole for the gas to escape.

The Chicago Convention will be held on **Friday and Saturday, Oct. 11 and 12, 1889.** The Railroad Traffic Association has made a rate of one fare for the round trip from any point within 200 miles of Chicago, good on Oct. 10, and can be used on any train returning after that until Monday, Oct. 14. The first session will be held at 9 o'clock in the morning of Friday, and an adjournment can be had on Saturday afternoon in time for those who may wish to return on that day. Those who can remain over Sunday will have an opportunity of visiting our magnificent churches and cathedrals in the morning and evening, and of taking a pleasant walk in the parks or riding on the boulevards in the afternoon, as their inclination and tastes may lead them.

Seasonable Hints.—Now that the principal honey crop for the present year is gathered, we should give attention to another subject which is of more importance just now than securing the crop—and that is, how to successfully put the product upon the market. Mr. B. A. Skinner, in the *American Rural Home*, mentions the following points to which it will pay to give full attention. He says:

In crating comb honey two grades should be made, No. 1 being white and perfect combs, while that which is somewhat inferior should go as No. 2. Never mix two grades in the same crate, putting the white on the outside, and the dark in the center, as I have seen done, as this causes the customer to think he is not getting what he bargains for, and leads to the overhauling of the contents of the cases. This often causes the honey to be bruised and otherwise injured, and made to leak, thereby daubing many of the crates, which results in disgusted dealers and low prices.

Some bee-keepers rush into market with poor honey early in the season, and sell it at unreasonably low prices, thus causing a depreciation in the price of a good article put up with care. This should not be so, and is not doing as we would be done by. There need be no hurry, as honey is not a perishable article like small fruits and some other things; but on the contrary, honey rather improves with age if properly kept.

Judging on Bees and Honey at Fairs.—These are the "points" adopted for the Hall County, Nebr., Fair as the *standard* for judging the exhibits. As they are quite complete, and well digested, we give them in their entirety for the guidance of others:

COMB HONEY.—1. Perfection of capping. 2. Evenness of surface. 3. Whiteness of capping. 4. General appearance as to marketability.

EXTRACTED HONEY.—1. Cleanliness. 2. Clearness. 3. Flavor.

BEES.—Test for colonies shall be the net gain in stores, and will be determined by the weight of honey that can be extracted from the combs of the second and third stories (if there be a third story). Each colony shall be weighed, inspected and sealed at the commencement of the trial, and extracted as above stated at its close. No caging of queens will be allowed, or any practice by which a colony is put out of a normal condition. The bees of each colony shall be the sole progeny of the queen therein, and no colony shall be entitled to compete for a premium not showing, when handled, the ordinary amiability of pure Italians. The test for colonies shall end on Thursday night of the Fair.

No colony shall be admitted coming from any locality in which there is any reason to suspect the presence of foul brood.

Honey-Merchant Dead.—The California *Fruit Grower* of the 7th inst., makes this sad announcement:

One of San Francisco's representative business men has passed away, and we are called upon to record the death of Mr. S. Steiner, a member of the firm of Schacht, Lemcke & Steiner of this city. Mr. Steiner died at his residence on Thursday, Sept. 6, from pneumonia, after a very brief illness. Mr. Steiner was past the prime of life, but apparently strong and hearty, and gave business matters his personal, active attention. He leaves a wife and seven children to mourn their loss.

September Sunrise.

Written for the American Rural Home
BY EMMA LYNDON.

Up from the east in crimson beauty glowing,
The first September sunrise of the year
Ascends the waiting sky—a soft wind blowing,
Tells to the listening earth its Queen is here.

As some swift courier with bright torch glaring,
Scales the steep mountain till the crest is won.
To set the world agaze at its grim daring,
The season's herald mounts his torch, the sun.

The moon grows white, the faint stars fade and flicker,
And die before the splendor of the dawn.
The new day steps abroad, earth's pulse beats quicker,
Night's shadows suddenly are quenched and gone.

Still upward, higher, wider leaps the glory,
The morn's gray bars are lines of red and gold;
Sunflower and golden-rod take up the story,
And nod the news until the day is old.

No after season, dull, or dark or lonely,
Or filled with whirling snows, or gray with cold,
Can quite efface this memory and this only,
Of Queen September on her throne of gold.

QUERIES AND REPLIES.

Are Better Bees than Italians Required?

Written for the American Bee Journal

Query 654.—Is a better race of bees needed than the Italians we now have?—H. F. C.

Yes.—A. B. MASON.

No.—MAHALA B. CHADDOCK.

I think so. I do not like pure Italians.—R. L. TAYLOR.

Should a better race appear, we would say *Yes*.—J. M. HAMBAUGH.

Yes. I do not believe that we have reached the end of all perfection yet.—EUGENE SECOR.

Improvement is always needed. *Perfection* cannot be reached.—DADANT & SON.

Yes, if any can be found. We want the best bees on earth.—C. H. DIBBERN.

A better race would be desirable; but a better race I do not know of.—J. P. H. BROWN.

I doubt very much if the Almighty ever made a better bee. Perhaps He could, but He has not, as yet.—MRS. L. HARRISON.

Most assuredly. We ought to have a race that has all the good points of all the races.—A. J. COOK.

It would seem so, from the efforts of queen-breeders, to produce something better.—G. L. TINKER.

Well, yes, we will always want something better than we have; but no better bee is likely to be brought out than the carefully-selected Italian.—G. W. DEMAREE.

We always want to better what we have, and by all means let us have a better race, if it is possible.—P. L. VIALLON.

Certainly, we need a better race, if it exists; but I have some doubts of its existence.—C. C. MILLER.

In my judgment, and I have tried them side by side for several years, the Syrians are a better race than the Italians.—M. MAHIN.

All progressive persons are looking for something better, and in the near future I look for better strains of bees than we have at present.—H. D. CUTTING.

We will *always* need a better race of everything, bees included. Everything in the world, except the dull preacher, stops when it is done.—J. M. SHUCK.

Yes; a race more gentle, with longer tongues, harder workers, longer lived, and earlier risers; and one that can stand our cold winters, without succumbing in the spring.—WILL M. BARNUM.

I do not think that there is, but new races must be found and advertised in order to create enthusiasm and competition. The Italians are good enough for myself.—J. E. POND.

"Needed" is a curious word for this place. All progressive men want "better" *everything*, and none of us are ready to claim perfection in anything. I now have a much better strain of bees than any pure Italians, and I "need" them every day of the summer.—JAMES HEDDON.

Yes. Just give us a bee of the bumble-bee size, and with all the perseverance and good qualities of the Italians, and I will invest $100 in the first queen you have to spare, which will answer the description.—G. M. DOOLITTLE.

Most assuredly. "Improvement" is the order of the day. We have not yet attained perfection. Every progressive apiarist wants the best on Earth. No matter what are the attainments of the present, there is a longing for "the next progressive step" in all directions. Better bees, with longer tongues, and even greater activity, docility and beauty are *always wanted*. When such are produced, they will find a ready market—but even such will not long satisfy the ever-advancing ideas of the modern bee-keeper! He will still look for the *better* ones—yet unbred, undeveloped, and unborn. Perfection is never attained—it is always a step in advance, to induce a longing for it, and a reaching out after it. Give us the best the Earth affords—always.—THE EDITOR.

CORRESPONDENCE.

MARKETING.

How to Properly Prepare Comb Honey for Market.

Written for the American Bee Journal
BY E. L. PRATT.

For the last few years I have handled a crop of comb honey (from 500 to 800 pounds) in my home market, at prices ranging from 30 to 35 cents, and very often as high as 40 cents for an *extra* nice article.

At the present time, I have at least a dozen people at my heels, all the time, asking for more of that "nice honey." The other morning I brought up a large basket full of this year's crop, and before I could arrive at my destination, it was all disposed of.

Now, how do I work it? you ask. In the first place, I read everything anybody has to offer on the subject of marketing, and profit by any good points discovered.

I keep in my pocket, pamphlets and printed matter, "Why Eat Honey," "Honey as an Article of Food," "Honey as Medicine," etc., and when an opportunity affords itself, the teachings of these are made known.

Bees are mentioned and talked about until everybody for miles around knows that I "keep a lot of bees and sell fine honey, that is warranted pure." Many have bought honey directly from the hive, which is all-convincing to the inexperienced masses.

The honey should be taken off directly after capping, and stored in a warm room until thoroughly ripe. The boxes should be perfectly clean of bee-glue, and as white as possible, before a pound is sold.

I have three grades, and the first and second are carefully wrapped up in very pleasing packages. The third is sold in bulk, or otherwise, to the best advantage.

Before the paste-board cartons were put upon the market, I used to have a plain rim made of white pulp-board, just right to take a one-pound section. I now use the cartons.

After the honey is *thoroughly* ripened, I label each box with a plain, small, neat label, printed with black ink, "Warranted pure honey by————." Each box is then done up in one sheet of white tissue-paper, and slipped into a carton. I now wrap the whole thing in pink-tinted French folio-paper, sealing down the corners neatly with paste or mucilage.

After I have wrapped and sealed enough for a week's supply, I go over

the packages once more, and attach to each a neat, little two-colored label, telling what it is, where produced, and whom sold by. These labels are printed on white paper, with pink and blue-black ink, and are pasted on one of the sealed ends. One series of plain, neat type is used.

On the *very* finest honey, I use red sealing-wax, and a stamp that denotes an "extra brand," which has become quite popular among the classes in my market.

The carton in itself is very rough and crude-looking, and to print huge black letters on a whole broad side, ruins its sale every time in my market.

In a high-price market a great deal depends upon all the little points of neatness.

Many of my customers prefer to buy their honey by the half-dozen pounds, and I find this to be the amount used in ordinary families, so I have white-pulp-board boxes made just the correct size to hold six packages of honey snugly. Very often I can sell 6 pounds in these boxes where the party would have taken but three or four, if in separate pound packages. I have never shipped honey any distance in this way, but if occasion required it, I would make crates to hold just four of these half-dozen boxes, and grade it so each crate would weigh 25 pounds above the tare.

The cost of labor, cartons, paper, labels, etc., is very slight, compared with the price received.

A fair sample of the lot is sometimes finished up with glass at the front and rear, and placed on exhibition with other packages in some neat show-window.

A placard, "Hot rolls and honey," will draw human "flies."

Marlboro, Mass.

LAYING-WORKERS.

An Experience with One of these Annoyances.

Written for the American Bee Journal

BY A. M. VANNOY.

While looking through some nuclei hives to-day, I found what I have the best reasons to believe to be a laying-worker. I caught her, caged her, and now send her to the BEE JOURNAL office for inspection, and whatever use may be made of her for the fraternity. The circumstances are as follows:

About July 1 I procured a lot of bee-entrance guards (zinc), and placed them on all hives having hybrids or black drones (of such I had several colonies then), and having lately introduced some tested queens (from Ohio), it became necessary to place the guards on the hives of two such colonies. One was a strong hybrid, and this hybrid colony "balled" their queen, and killed her. I divided the colony into nuclei for queen-rearing, leaving three frames at the old stand. In due season four queen-cells were constructed and matured; three were removed to other nuclei for nursing, and to be fertilized. The one left at the old stand was either lost or "balled," for after several attempts to find her, I again gave the nuclei brood for queen-rearing, but no queen-cells were constructed.

About ten days ago, I discovered a huge drone-cell on a corner of one of the combs; I took it off, and opened it, and it contained a live drone, well advanced in the chrysalis stage; and noticing the bees hover closely over a small patch of drone-comb on the lower edge of one of the combs, I smoked them away, and found eggs in these few drone-cells.

I then made a most careful examination of every frame, to see if there was a queen, but I could find none; however, I saw this same bee, or one just like her, and saw the the bees feed her and attend her, just as they appear to do for the queens.

I have been watching them from time to time, until to-day I discovered her backing down into one of those drone-cells, and remain thus a short time; and upon closer examination, I found, apparently, fresh-laid eggs in this cell, and in several other drone-cells, which the bees have lately built. Hence I concluded that I have a clear case of laying-worker, and send her to you as such. I used to doubt the laying-worker theory, but now I do not.

P. S.—I neglected to state that the eggs found about ten days ago have hatched, and the bees had a very nice queen-cell constructed, and closed, with another large drone (apparently so) in it. I very thoughtlessly pinched it off the comb—a thing I now wish I had not done.

Furthermore, there are plenty of empty worker-cells in apparently good condition, to receive eggs, but no eggs are there. Nearly one entire comb where the last brood hatched, is empty, and in every other nuclei in the apiary they are either full of eggs, larvæ or sealed brood. This one has none except those in the small patch of drone-cells referred to.

Hedrick, Iowa, Aug. 26, 1889.

[We referred the foregoing laying-worker case to Prof. A. J. Cook, who has kindly given a reply as follows:—ED.]

The bee is a laying-worker. I found several eggs in her ovaries, but the ovaries were small. She had the regular worker-jaw, wing, tongue, maxilla, and legs; and, curious enough, she even had wax-scales in the wax-pockets. This was a new kink. I never saw this before. It would seem that she was not quite satisfactory to the bees, as her hair had been pulled out, and the last four of the tarsal joints of both hind legs were gone. She doubtless found life a struggle.—A. J. COOK.

GERMANY.

The Condition of Bee-Keeping in the Fatherland.

Written for the American Bee Journal

BY REV. STEPHEN ROESE.

The knowledge of bee-keeping in Germany is by no means limited, judging from late reports of the various bee-keeping periodicals of the Empire, and the fact of the passing of a law by both Houses of the Reichstag, of 16 paragraphs, granting permission to all inhabitant to establish apiaries, free of taxation, and affording protection to this honest art and industry, to a great extent.

Bee-keeping societies, associations, and branches are without number. When Germany goes into anything, she goes into it with all her might. Every man, woman and child has an opportunity to receive instruction on all modern improvements in bee-culture, for the various societies are divided and subdivided into branches, and even sections, meeting once a month, and oftener.

Each branch has qualified leaders and speakers, canvassing every city, village and hamlet, delivering essays and lectures on bee-culture; and their activity seems to resemble the stumping of a presidential campaign in the United States, and, as the saying is, not a stone is left unturned.

The division and subdivision into sections, with a leader or foreman, is a movement of great wisdom. It seems to create an eagerness among them to see which one will succeed in getting the largest number of members. An annual fee from each member from 1 to 2 marks does swell their treasury to enable each society to carry on its business in a business-like manner.

The German Central Bee-Keepers' Union has charge over the field of Central Germany, with a membership of 20,600, alone, according to the statement of Pastor Rabbow, acting president of that society. The Government estimates an annual income of each colony of bees in the Empire at 12 marks each, with a grand total of 17,000,000 marks, as the net income

from bee-keeping for the German nation. No wonder Emperor William is so willing to sign the new law, passed by the Reichstag, and intended to promote bee-keeping in Germany.

The German Central Bee-Keepers' Union held its third annual session in the city of Stettin, Prusia, on Sept. 6 to 9, with a grand exhibition on Sept. 7; opening exercises by the honored President Graf (Marquis) Behr Veyerdank; a distribution of grand diplomas and prizes of the value of 4,000 marks from the Union, and two gold medals from Graf Behr Veyerdank.

German Laws on Bee-Keeping.

The folowing is a correct translation of the late enacted laws to promote bee-keeping in Germany:

We, William, King of Prusia, etc., degree throughout our Monarchy, by sanction of both Houses, the following, to-wit:

1. The privilege of bee-keeping to all inhabitants on their own property.

2. The same right to all renters or lease holders, by permission of the owner of the property.

3. Apiaries may be established anywhere, against objections of neighbors, by enclosure of at least 2½ meters high; from April 1 to Oct. 1, 10 meters high (this is in case of neighbors objecting.)

4. Moving apiaries to forests, buckwheat fields, or any other pasture, each must respect a distance of 200 meters, and 25 meters from any public highway.

5. Near bleaching, dyeing or tannery establishments, the distance of 50 meters must be observed.

6. Apiaries will be protected by civil right and law.

7. The swarm issuing is the exclusive property of the owner of the parent colony, with the right to capture the same, wherever found, without trespassing.

8. An absconding swarm is ownerless, as soon as sight is lost of the same.

9. Such swarm will be the property of the capturer.

10. In case of swarms uniting, each rightful claimant has a joint interest in the same; but in case of a disagreement, decision will be made by arbitrary lot, or sale of the same, dividing the proceeds according to the interest of each.

11. If a swarm enters a hive of any other apiarist, inhabited by a colony of bees, all claims on the newly-entered swarm by its former owner ceases at once.

12. All transgressions of rules 3, 4, 5, will be punished by a fine of 150 marks, or six weeks' imprisonment.

13. Any one who wilfully or maliciously in any way destroys (so-called robber bees) by water, fire, steam or poison, or trap, shall be fined 600 marks, or an imprisonment. for one year.

14. A fine of 600 marks will be imposed on any one who sells bees, hives, products, or implements infested by foul brood.

15. A fine of 60 marks, or imprisonment for two weeks, will be imposed on any who (*a*) recklessly sells or gives away hives, boxes, products or implements, etc. (*b*) Who carelessly in his apiary sets up such colonies, or leaves scattered about combs so infested. (*c*) Who neglects to remove foul-broody, infested hives, or close the entrances of the same.

16. This law is to take effect on and after Oct. 1, 1889; after which date all former statuary laws, rules and and regulations relating to bee-keeping, will cease to be in power.

Maiden Roek, Wis.

BEE-NOTES.

Laying Several Eggs in a Cell—Comments.

Written for the American Bee Journal

BY J. H. NEWMAN.

On page 471, Mr. Frank S. Johnson says that his young queen lays 4 or 5 eggs in some of the cells, and asks what it means. My queens often lay several eggs in a cell, when they first begin to lay; the old queens do it when they begin in the spring.

How to Secure Worker-Comb.

I have been trying to find how to get worker-comb built without using foundation. The bees, as soon as they are a fair-sized colony, and honey coming in, think of increase. They can increase by drones or queens, or both; of course it takes both drones and queens for increase; but a colony of bees can increase by rearing drones and letting others rear the queens. They are ready to rear drones long before they are strong enough to rear queen-cells and swarm. So it seems that when they are doing well, if empty frames are put among them, they will—unless it is a very small colony—fill it with drone-comb, because they want drones. The more drones, the more increase of their kind among other bees.

After swarming, they have no brood, and as they must have new worker-bees or die, they give their attention to making worker-comb, because they want workers. Comb built by new swarms, or by nuclei, where the bees plainly see the need of worker-brood, will be worker-comb.

King-Birds and Bees.

There are some king-birds with a nest near here, and the bees seem to chase them whenever they see them fly, and I have seen 4 or 5 bees chasing one king-bird about 40 or 50 rods from the hives. I have not seen the birds catch any bees, and the bees do not attack the birds, except when the birds are flying. The bees did not seem cross at this time, either.

Priority of Location.

On page 284, Dr. Proctor says: "If Mr. Pettit's logic is true, when a man buys a farm and commences to raise corn, cattle, hogs, and poultry, no other should be allowed to come near him and do the same."

No other man *is* allowed to do the same, on the same place. If a man has a place, and begins raising cattle, no one is allowed to raise cattle on the same place, without his consent. But if a man has a bee-pasture, everybody is at liberty to use it.

A man cannot keep bees on his own land as he can other stock, for they have no respect for fences or surveyors' lines. The bee-pasturage does not belong to the man who owns the land, for he has no control of it, but it is common property—the honey belonging to the man who gets it.

Charlevoix, Mich.

QUEENS.

Shall a Colony Rear Its Queen After Swarming?

Written for the American Rural Home

BY G. M. DOOLITTLE.

I am asked to give an article on the plan of giving each colony a laying queen immediately after swarming, as is recommended by some, and also to tell whether I consider the plan a good one or not. As I do not consider the plan a good one, I will try to give my reasons for so thinking.

For years we have been told that no colony should go without a laying queen for a single day, if it were possible to give it one: and plans for introducing queens, which required that the hive should be queenless for a few days previous, have been severely criticized. We have also been told for years, that the bee-keeper who wishes to secure the best results from his bees, should have a laying queen ready to give to each old colony as soon as it has swarmed, as the time lost to them by rearing a queen is equivalent to a swarm of bees.

Being eager to know for myself all of the plans which would give the best results, I experimented largely; and the

truth of the statement, that the time lost to the bees in rearing a queen in natural swarming was equivalent to a swarm of beees, is the first reason that the plan has not been a success with me. If it were bees that I was after, the case would be different. Here the white clover yields only enough to keep the bees breeding nicely, and prepares them so that they mainly swarm from June 20 to July 1. Our honey harvest is principally from basswood, which blossoms from July 5 to the 16th.

Now all who are familiar with natural swarming, know that the bees are comparatively few in numbers in the spring, and increase by the rapidly-increasing brood produced by the queen, which in due time hatch into bees, until a swarm is the result. By giving a laying queen to a colony immediately after it has cast a swarm, we bring about the same result (swarming) as before, or we place the bees in the same condition. The only difference is, that having plenty of brood, they build up quicker and are prepared to swarm in a shorter time.

As this second swarming brought about by giving a laying queen, comes right in our basswood honey harvest, it cuts off the surplus honey; for it is well known that bees having the swarming fever do little or no work in the sections, and if allowed to swarm, the object we have sought after (honey) is beyond our reach.

Having given my experience on this point, let us see how the same colony would work had we not given the bees a laying queen.

Eight days after the swarm has issued, the first young queen will have emerged from her cell, as a rule, when the apiarist should remove all of the other queen-cells from the hive, so that second swarming is entirely prevented. In ten days more the young queen is ready to lay, which is about the time basswood begins to yield honey largely. During this period, between the time the swarm issued and the young queen commences to lay, the bees, not having any brood to nurse for the last half of the time, consume but little honey; hence, as fast as young bees emerge from the cells, they are filled with honey; for bees not having a laying queen or unsealed brood, seldom build comb in the sections. Thus, when the young queen is ready to lay, she finds every available cell stored with honey.

At this point the instinct of the bees teaches them that they must have brood, or they will soon cease to exist as a colony, and a general rush is made for the sections. The honey from below is carried above, so as to give the queen room, and in a week we have as a result, the sections nearly filled with honey. I have had such colonies fill and complete sections of honey to the amount of 60 pounds in from eight to twelve days, while those to which I had given the laying queen immediately after swarming, did little but swarm during the same time.

Bear in mind that we are talking about producing comb honey, not extracted. Different localities may give different results; still, I think that nearly all localities give a large flow of honey at a certain period during the season, rather than a steady, continuous honey harvest the whole summer. To such places these remarks are applicable.

My second reason is, that after basswood we have a honey-dearth, hence the bees from the introduced queen are of no value, but on the contrary become consumers. On an average, it takes 21 days from the time the egg is laid to the perfect bee. Then if the colony is in a normal condition, this bee does not commence labor in the field until 16 days old; hence, the eggs for the honey-gathering bees must be deposited in the cell 37 days before the honey harvest ends, or else they are of no value as honey-producers.

As the basswood is all gone before the eggs of the introduced queen become honey-producing bees, and as the larger part of them die of old age before buckwheat and fall flowers yield honey, it will be seen that a great gain is made by letting each old colony having cast a swarm, rear its own queen; for thereby we save the expensive feeding of the larvæ, which are to become expensive consumers of the honey of the hive. Also the chances are that, when the colony rears its own queen, it will be stocked with younger bees for wintering in November, than where a queen was introduced immediately after swarming.

The one point worth knowing above all others in bee-keeping, is a thorough knowledge of the location we are in, as to its honey-resorces, and then getting the largest amount of bees possible at that or those times to gather the honey, having just as few at all other times as is consistent with the accomplishing of this object. In working so that we get the bees out of season, we have to pay the same price for them that we would to get them so that each one becomes a producer instead of a consumer.

If all who read this article will study their location, and then rear their bees in reference to that location, I think that they will find that their bees will do as well as those of their more successful neighbors. We often hear it said that one colony in an apiary did much better than the rest, and had they all done as well, a large crop of honey would have been the result. The reason that *that one* colony did so well, was because it happened to have a large proportion of its bees of the right age to gather honey just in the honey harvest, and if we can get all in this condition, we can secure a like result from the whole apiary.

Borodino, N. Y.

HONEY-BOARDS.

Answer to Questions about Section-Cases and Honey-Boards.

Written for the American Bee Journal
BY JAMES HEDDON.

I am requested by the Editor to reply to the following letter from a new subscriber to the AMERICAN BEE JOURNAL, at Davenport, Iowa:

I had 10 colonies of bees last spring, and they increased to 24, partly by natural swarming. I shall have about 800 pounds of nice comb honey from 20 colonies, having sold the other 4. What is the best way to get bees out of crates, after they are taken from the hives? Is it necessary to use honey-boards between supers and brood-frames? If so, will you describe one made of wood, and the one mostly in use? Is it better, at this season, to put a wide frame with sections at the side of the brood-nest, than to put on another crate?

The bee-keeper is away behind the times at present, who does not get the bees all out of his supers *before* he takes them from the hive; but to answer your question precisely as you ask it, I will say, carry the "crate," or more properly, storing-case, to a screen-house, or some place so prepared that bees can exit but cannot or will not enter. (Crates are to ship honey to market in, so let us call them shipping-crates. The storing-cases that are used on the hives, let us call "cases," not racks or crates, but storing-cases, or cases. Let us call brood-frames, brood-frames, and then when we want to use the word "rack" we can use it properly by applying it to that large, coarse frame which holds upon the wagon the hay or straw, upon which we ship 30 or 40 colonies of bees to an out apiary, or some other location, being drawn by horses.) There are two or three different plans which have been described in former issues of this paper, all of which work perfectly.

Yes, the bees will leave your supers even when producing extracted honey, provided there is no brood in them, and there will not be, if you use the queen-excluding honey-board, or if you take them off so late that the brood is all hatched out. With the use of a good honey-board, not excluding, there is little danger of brood in comb-honey cases.

Yes, sir; it is absolutely necessary to use a honey-board between the supers and brood-frames, if you expect your work to pass off pleasantly and smoothly. This board can be either wood or metal, and the wooden one mostly used is known as the bee-space, break-joint honey-board, invented about ten years ago, and made queen-excluding by tacking strips of perforated-zinc on the upper or under side of the slats over the slots, or by putting a saw-kerf in the edges of the slats, and slipping in the strip of perforated-zinc, which is more quickly done, and makes a smoother-looking job.

There is no patent upon this honey-board, and it is undoubtedly the best one ever invented, and is now going into general use. For comb honey it is hardly worth while to go to the expense of having it queen-excluding, but for extracted honey, unless working on the non-swarming plan, where one has a great plenty of combs I prefer to make the honey-board queen-excluding, according to the above method. If you once use a good honey-board, you cannot afford to do without them thereafter.

No, do not use any wide frames in the brood-chamber. The honey will not be nice, as a rule, and it is not a place where it ought to be, if you expect to do your work expeditiously. Put on another storing-case, and again another, as long as the bees need more room. If the last case given them is not finished, during that season, it can be finished up by feeding back extracted honey, or what is already stored can be extracted, saving the combs for the next year.

HINTS.

Soiled Sections, Weeds, How Far Bees Fly, etc.

Written for the Western Plowman

BY C. H. DIBBERN.

The gathering of the fall crop of honey now promises to be both large and of good quality. Of course we want all the honey that can be secured, and we want that in the most attractive shape.

Do Not Use Soiled Sections.

We were lately asked if old combs in soiled sections would not be good enough to use for the late dark honey, as it usually sells cheap, anyway? We most decidedly say, No. If ever we want nice, new, clean sections it is to have the rather dark and less attractive honey stored in. Old comb is not fit to store any kind of honey in, but if such must be used, it would be better to use them for the white honey crop. These old sections and old combs have done more to demoralize prices than anything else.

Bees in Good Condition.

Bees are now in good condition for gathering the fall crop of honey. The hives are all well supplied with good honey, and plenty of brood is constantly hatching out. There is now not that disposition to swarm that interferes so seriously with the early crop. Honey coming in now should nearly all go into the sections, as there is no other place for it. It will not do, however, to put on too many sections, or continue adding cases of sections too late. Remember the gathering of honey will cease entirely with this month, and it is much better to have nearly all the sections finished, than to have a lot of partly finished ones to store and spoil our next season's crop with.

I have opposed using sections and combs held over from the fall crop, for years, and this season's experiments only confirm my previous conclusions. No matter if some bee-keepers think they are very nice to coax bees into the section-cases with, I would not give much for a colony having plenty of bees that would not rush into such cases with foundation in the sections, when honey is plenty in the fields, and the weather is favorable.

Wire-Cloth Separators.

Last season we tried a very few one-fourth-inch mesh galvanized wire-cloth separators, and were rather pleased with them. That being a rather poor year, they seemed to be all right. This year we tried a few more, and find them too uncertain to depend on. The bees can get through them anywhere, and seem to like them—so well that sometimes they use them for the center of their combs. There is also too much brace-comb and attaching comb to it. So far tin suits us the best, but we expect to give thin, planed, wooden separators a trial next year.

After all, the honey crop of the United States does not prove to be nearly as large as we were led to believe. By referring to a late standard report, we find that about a dozen of the Central States have produced a full crop. Michigan and New York, two of the largest honey-producing States, report about one-third of an average crop, and New England States only one-fourth. California, a State that sometimes nearly swamps us, also reports only about one-fourth of a crop. So taking the whole country, there will be quite a shortage, and those bee-keepers in the favored States, who send their product to the right markets, will no doubt meet ready sales and good prices.

How Far Bees Fly.

A good deal has been said about how far bees will fly for honey. Some writers claim that they will only fly two to three miles, while others are just as sure they will go from five to seven miles. Now a bee's wings vibrate, or beat the air, at the rate of 190 strokes in a second. Some claim that this will produce a rate of flight of a mile per minute. In windy weather, when they take advantage of trees and other obstructions near the ground, they fly at a very slow rate, perhaps not more than ten miles per hour. In fair summer weather, however, when there is little wind, and they fly high in the air, they go like a shot, but I am satisfied that they do not go as fast as sixty miles an hour. Thirty miles perhaps is more nearly right. Now if they travel a mile in two minutes, it is fair to suppose they can easily keep this up for twenty minutes. This would take them ten miles from home.

We think that they will often go that distance to a buckwheat field. It can, however, be easily understood that they would gather much more honey when pasturage is nearer, as they could then make more trips. When bees make long trips, as ours are now doing, they return almost exhausted, often dropping at the entrance, and sometimes resting a minute or two before entering the hive.

Clean Out the Weeds.

Many bee-keepers get a little careless towards the last of the season, and allow the grass and weeds to grow up and obstruct the entrances. This is a great mistake, as it makes the apiary look slovenly, and, besides, is a great annoyance to the bees. A bee's wings vibrating at such a wonderful rate are easily injured and worn by beating against the grass. When a bee's wings are worn out, it is of no further use, and is speedily lost, and dies. Keep the apiary trimmed up.

Milan, Ills.

WINTERING.

How to Prepare Bees for Successful Wintering.

Written for the American Bee Journal

BY CHARLES F. MUTH.

It appears that the subject of "Wintering," in my "Practical Hints to Bee-Keepers," does not quite cover the ground. Allow me to publish a letter on the subject, just mailed to a friend;

it may benefit some readers, and save me the writing of a few more letters on the same subject. It is as follows:

Wintering of bees is the easiest and most successful part of my bee-keeping, and I am surprised at the trouble it causes many of our brethren, often to those whose long articles in bee-papers and other periodicals seem to show that they know all about the subject.

I winter my bees on the summer stands, and in single-walled hives. The only extra work caused by my preparation for the winter is, to remove the honey from the second story, cover the brood-chamber with a wooden cover (3 third-covers), place a straw mat on the same, and open the entrance to its full width. Be sure that the colony has plenty of honey, and give the hive a pitch towards the front, of at least 2 inches.

If prepared in this manner, your bees have given you no trouble at all, and will winter more successfully than your neighbor's bees in the cellar, or in their cellar-like chaff hives, even if the mercury ranges between 16° and 22° below zero for thirty days or more. Colonies may starve to death for me in March, April or May, and such has happened, but I shall not lose a colony in wintering.

Your colony must have plenty of honey. Let every one of the 10 combs, or less, according to the size of the colony, be partly filled with honey, and place the heaviest combs towards the middle. Winter passages may not be necessary in mild winters, but may save the colony in a protracted cold; so, cut a winter-passage through the middle of every comb, by putting a pocket-knife blade through and turning it.

The entrance of every hive should be open its entire width, during the winter months. Your bees will feel comfortable if they have honey enough, and I am not very sure that they have consumed more honey than the bees of cellar-winterers, by the time that honey comes in again.

We use 3 third-covers to cover the brood-chamber, and place a straw-mat, or its equivalent, on these wooden covers, to protect them against the cold air, because the bees cluster below, and would chill if this protection were denied them. If on any cold day you want to find the spot under which your bees cluster, raise the straw-mat, and pass your hand over the boards. This will show you the necessity of keeping the boards warm, and it will convince you that "board" next to the bees, is just as practical as the absorbing-cloth, and more so, if your hive has a pitch to the front, of at least 2 inches.

The exhalations of bees condense into water during cold spells, which hangs, in big drops, under the covering-boards, and runs down the combs and the sides of the hive to the bottom. From here it would be absorbed again by the bees, combs and honey, if it could not run out. It would create, thereby, dampness above, and cause the honey to sour under and near the cluster. Diarrhea would be the consequence.

You will be surprised at the amount of water running out in front of the hive, when raised at the back, some mild day following a cold spell. It will convince you that the pitch to the front should be at least 2 inches in winter.

As stated before, I am surprised at the vexation and expense that some of the brethren undergo, when attempting to winter their bees, while they could accomplish their object in so simple a manner, as I have described—at least in this latitude.

Cincinnati, O.

BEES IN WINTER.

Some Hints About Bees in Cellars or Out-of-Doors.

Written for the City and Country

BY A. H. DUFF.

If bees are wintered in cellars or underground repositories of any kind it would be much better if some absorbing material were used over the frames, and directly against them, just over the cluster of bees.

There is a great benefit in keeping the bees dry, by absorbing all dampness that arises therefrom; hence, in cellar as well as out-door wintering, this will be found a great benefit. This can readily be accomplished by leaving the cover off and placing a chaff cushion on the hive instead.

It is almost impossible to winter bees successfully in cellars that are used for other purposes, such as those used under dwellings for keeping vegetables and other commodities for family use. The unceasing interruptions by entering and re-entering will prove an annoyance to the bees to such an extent that trouble is likely to follow. This is against the most important point in successfully wintering bees, and that is perfect quietude during winter, both in and out-of-doors, and our advice is to those who do not have cellars or caves especially for bees, and for no other purpose, to winter out-doors. Cellars, properly arranged, are no doubt ahead of any other method of wintering, but every point in connection must be strictly adhered to.

Bees in underground repositories should remain in them the entire winter, in an undisturbed condition, and, if their condition will allow, they should not be removed therefrom much before the first of May. If they are put out before this, cold snaps are very hard on them, and may result in their destruction. If they are found in such condition as their confinement longer is impossible, they may be put out on a fine day to give them a purifying flight, and placed back in the cellar thereafter. This is the only safe method of handling them. Thus, if bees are in proper condition in the fall when placed into winter quarters, but little work during winter is required, although a few details cannot be dispensed with. They must have an overseer to keep everything in its proper place.

Bees wintered out-doors should have protection from the cold of winter, and as it is now a very uncommon thing to find them in any other way, it is not necessary to say anything on the method of protection. During winter, upon days that they can fly, it is very necessary to have prepared alighting places for them about the entrance, as, on such weather as bees are able to take a flight, it often occurs that the weather suddenly turns cold and chilly, and bees coming in fall at the entrance, and if they cannot travel directly into the hive by means of a sloping bank of some prepared material, or a board, they are lost, being unable to take wing the second time to gain an entrance; hence the necessity of an alighting-place. This may be made by banking up of earth to the entrance of the hive. A covering of sawdust, sand or gravel is very good to cover the surface.

Snow about the hives will do no harm, even if the hives are totally covered. Many are foolish in removing snow from the entrances of hives during winter, thinking that the bees will suffocate. There is no danger of this. It is more of a protection, and should not be meddled with.

Any warm day, when the bees are flying freely, they may be examined by the apiarist, but only on such days. We should not, however, put off until spring to make examinations, but take advantage of the occasion when a warm day comes. If we find that any colony lacks stores during winter, we can furnish them food in the shape of candy, but only in cold weather, when syrup feeding will not answer. Syrup will have a tendency to produce diarrhea; thus candy only should be used. The candy should be made from granulated sugar, and placed over the frames.

Larned, Kans.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Oct. 3.—Progressive, at South Newbury, Ohio.
Miss Dema Bennett, Sec., Bedford, O.

Oct. 11—12.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

SELECTIONS FROM OUR LETTER BOX

Zinc Honey-Boards.—George P. Howell, New Orleans, La., on Aug. 26, 1889, writes:

This has been a remarkable honey season with me. The long drouth we had this spring was the finest honey weather I have known for sometime. I have had remarkable success with the zinc honey-boards I purchased of you. I used about 30 or 35 of them this season, and in not one instance did the queen come through.

Bees Have Done Well.—Mr. F. Councelman, Doylestown, Wis., on Sept. 12, 1889, writes:

Bees have done well for the length of time they have had to work this season. I have taken just about 2,000 pounds from 18 colonies, spring count. I had some trouble with after-swarms. They seem to be inclined to rob somewhat this month, although they are doing well on the smart-weed blossoms, of which there are large quantities within a mile of my yard. I live in the village, and keep my bees there. I have had no trouble about their troubling my neighbors.

Honey-Dew for Winter Stores.—E. J. Smith, Addison, Vt., on Sept. 6, 1889, writes:

I would like to know what to do with my bees. They have been working on honey-dew, gathered from the basswood, elm, and oak leaves, which have been loaded for the past two or three weeks. They have carried in from 10 to 30 pounds, mixed with clover and buckwheat. It smells some like buckwheat, as I go through the yard. I have 180 colonies, and it would be an awful job to extract it and feed back sugar. I am afraid that unless we have a very favorable winter, there will be a very heavy loss of bees all through this part of the country. They have filled the hives so full in some cases as to crowd the queen. The honey is dark, like buckwheat, thick and strong. I would like to hear from some who have had experience in wintering bees with it. I have kept bees for ten years, and have seen some honey-dew now and then, but nothing like it is this year. They have worked as well on it as they would on basswood.

[To extract the honey-dew and give the bees good, ripe honey, is the safest plan. What say those who had similar experience with honey-dew?—Ed.]

Carniolans, Probably.—L. Hammerschmidt, Amana, Iowa, on Sept. 3, 1889, says:

A small swarm of bees came here and clustered on a brush; when hiving them, I found about one-fifth of them like the one enclosed. What is it?

[This is only a very fuzzy black bee—a sort of Albino of the German race. It is much like the Carniolan in appearance. Possibly these are Carniolans. The bee is too crushed to be certainly identified.—A. J. Cook.]

Meadow-Sweet and Asters.—Mr. A. Sherington, Dutton, Mich., has sent us samples, and wrote as follows:

I enclose two flowers, and I would like to know the names of them. No. 1 is a sort of shrub, and grows on low land like the willows, and the bees work on it vigorously. It blooms in August. No. 2 is a plant or weed. It has just commenced to bloom; the bees work on it from daylight until dark, and are just wild after it. The season here has been very good. It is hot and dry, and bees are doing well.

[Prof. C. M. Weed replies thus to the above: "No. 1 is common meadow-sweet, *Spiræa salicifolia, L.* No. 2 is an aster, *Aster ericoides, L.*" All the asters are excellent honey-producers, and no wonder that your bees should be "wild after it."—Ed.]

Report for the Season.—H. B. Winslow, Stockbridge, Mass., on Sept. 3, 1889, writes:

I started last spring with 9 colonies of bees, increased to 16, one swarm having absconded. One colony swarmed three times. It rained nearly every day (except Sundays) through the white clover season. I got only 30 pounds of comb honey up to Aug. 12. The rainy weather ceased about the middle of August. I had to feed 6 colonies to keep them alive, as they did not have an ounce of honey at that time. We have not had any rain for over two weeks, and the bees have done wonders. The hives are full of brood and honey, and the bees are filling the sections fast. There is an abundance of golden-rod and wild asters here, and we have heavy dews, which hold on until nearly noon. I had only one swarm last year; it stored 60 pounds of comb honey by Aug. 1, and 20 pounds this season. That colony has not swarmed for two seasons. I prefer the golden-rod for the national flower. I receive 25 cents per pound for nice comb honey, from the city people at Lenox.

Golden-Rod, etc.—Mr. Chas. W. Dickson, Stellarton, Nova Scotia, on Aug. 19, 1889, writes:

Kindly give through the Bee Journal, the names (botanical) of the plants which I send you; they bloom profusely in this neighborhood, and supply large quantities of honey now to our bees. I put up each flower in a separate package, and designate them by numbers. I am very much pleased with the American Bee Journal, and think that bee-keepers should read it.

[No. 1 is a species of *Senecio*, which cannot be determined specifically without leaves and stem. Nos. 2 and 3 specimens are too fragmentary for determination. No. 4. Lance-leaved golden-rod, *Solidago lanceolata*. No. 5. Common golden-rod, *Solidago altissima*. No. 6. Common self-leaf, *Brunella vulgaris*.—Clarence M. Weed.]

The Season in Nebraska.—Ira N. Lyman, St. Peter, Nebr., on Sept. 9, 1889, writes:

The late frost in the spring killed the early blossoms—early plums and other blossoms—just when the bees were breeding lively, and had most of their honey used up; so they were short of feed to breed fast. Some bee-men here fed their bees, and some let them get along the best they could without feeding, consequently those who fed their bees and kept them in good condition until they could get honey from later flowers, had early swarms, one man having 8 swarms issue from one colony, and his bees kept swarming until he was satisfied. Another poor fellow kept watching his bees, looking for swarming, but they did not swarm; after awhile they be-

gan to kill the drones—a sure sign of a scarcity of forage—and he began to feed some, but still they did not swarm, and away along into August and September his bees began to swarm, and then the crop of honey was cut off again by cool nights, and the bees began to think that winter was coming, so they began to kill drones and ceased swarming again. Some bee-keepers had two or three swarms, some one, and some none. Another bee-man had a lot of bees, and got only a few swarms; he said that he did not want any, and would not let them swarm—as though he could keep them from it, when he has some in the Langstroth hive, some in other hives, and some in box-hives without any frames! But he says that it is a good season for honey, but not good for swarming. The bees had only about three days to gather basswood honey, so Dr. Porter says; he lives in a good place for that kind of honey, and has a great many bees. I live about nine miles from linden timber, but we have an innumerable variety of blossoms along the East Bow creek, that are good honey-producing blossoms. I will report the amount of honey gathered after awhile, when it is taken off of the hives, if I can get the estimate near enough to be worth while to report.

The Stinging-Bug.—R. S. Russell, Zionsville, Ind., on Aug. 26, 1889, writes:

I send you a pair, male and female, of our Indiana bee-catchers. Please give their name in the valuable BEE JOURNAL. They resemble a pair of small bull-stags, under the glass.

We requested Prof. Cook to reply to this, and here is what he says about the insects:

The pair of insects sent by Mr. Russell, are male and female of the stinging-bug, described and illustrated in my book, on page 419. This is *Phymata crosa*. Because of its yellow color, it can hide in yellow flowers, like golden-rod, etc,, and so all unobserved, can easily grasp and hold the luckless bee or other insect that comes within its reach. It sucks its victims bloodless by use of its powerful beak. Its thrust is very painful, and hence the term *stinging-bug*. Its forward or anterior legs are modified into jaw-like claspers; thus it is able to secure its prey. As with most insects, the female is considerably larger than the male. From its hiding habit, its modified legs (see figure in my bee-book), its stinging bite, and its destruction of bees, it is a very interesting insect.—A. J. COOK.

Bee-Keeping in Texas.—W. S. Douglass, Lexington, Texas, on Sept. 4, 1889, writes:

Bees in this section have done poorly so far. There was too much rain during June and July. Some of my Italian colonies worked in the sections, although they did not complete them. Morning-glory is yielding splendidly now, and I expect a few pounds of fine honey yet. This is a splendid honey-plant. Bees accumulate honey very fast from it, and the honey has a beautiful clear color, and is well-flavored. We also have rich-weed, privet-bush, and a few others to come yet. My apiary consists of 80 colonies, being Italians, hybrids, Albinos and blacks. The spring opened very early, and swarms began to issue early in March—one month earlier than I have ever known.

Dry Weather.—Thos. A. Anderson, Gamma, Mo., on Sept. 3, says:

The weather was very dry until yesterday. Spanish-needle is yielding no honey. Yesterday and to-day we had nice showers of rain. There is slow sale for extracted honey, but the demand for comb honey is better.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on **Friday** and **Saturday, Oct. 11th and 12th,** at **9 a.m.** Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be one fare for the round-trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The annual meeting and basket picnic of the Progressive Bee-Keepers' Association will be held at the residence of Mr. F. E. Dutton, near South Newbury, Geauga Co., Ohio, on Thursday, Oct. 3, 1889. All interested are invited to attend.

MISS DEMA BENNETT, *Sec.*

☞ The bee-keepers of Sangamon and adjoining counties are requested to meet in the Supervisors' Room of the Court House in Springfield, Ills., on Wednesday, Sept. 25, 1889, at 10 a.m., for the purpose of organizing a bee-keepers' association. All are invited.—D. D. Cooper, Geo. F. Robbins, C. E. Yocum.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

We Want a Representative at all the Fairs to be held this season. The AMERICAN BEE JOURNAL is the recognized defender of the rights of the bee-keepers, against the attacks of the ignorant and prejudiced. There are thousands who would gladly subscribe to it if it were only brought to their notice, and its claims presented. When making an exhibit, please send for our *Colored Posters* and sample copies, and get up a club. In this way you will not only pay yourself for the trouble, but also aid the pursuit, and its defense all over the country.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

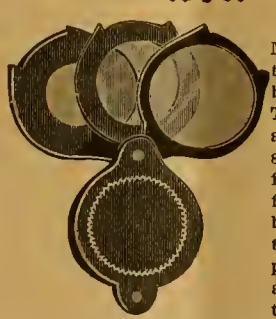
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—It is coming in slowly. We quote: 1-lb. sections of white, 15@16c.; 2-lbs., 14c. Extracted, white, 8@8½c.; dark, 7c.

Aug. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c

BEESWAX.—23½@24½c.

Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: New in 1-lb. sections arriving freely at 16@18c.; extracted, 6@8c.

BEESWAX.—18@20c.

Aug. 10. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, California, 7½@8c.; orange bloom, 7½@8c. White clover and basswood, 7½@8c. Common Southern, 65@75c. per gal. Fancy comb, white 1-lbs., 16c.; fair 1-lbs., 14c.; 2-lbs., 2c. less.—The New York crop being comparatively small, the Western apiarists will find a good outlet here in the East. As prices this season are about 10 per cent. lower than last season, we expect an active demand.

Aug. 21. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—New honey arriving freely, and all the shipments have been promptly closed out so far. We quote: 1-lb. white clover, according to style of package and appearance, 14@16c. Receipts of extracted increasing: demand light, at 8@8c.

BEESWAX.—25c.

Aug. 1. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c.; white clover and basswood, in kegs and barrels, 7c.

BEESWAX.—25c. R. A. BURNETT.

Sep. 10. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.

BEESWAX.—23c.

Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.

BEESWAX.—24c. for prime.

Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—We quote: Fancy white 1-lbs., 16c.; 2-lbs., 14c. Off grades about 2c. per lb. less. Buckwheat 1-lbs., 11@12c.; 2-lbs., 9@10c. Extracted basswood and clover, 8c.; orange bloom, 8c.; California amber, 7@7½c.; buckwheat, 6@6½c.; Southern, 65@70c. per gallon.

HILDRETH BROS. & SEGELKEN,

Sep. 10. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It has arrived quite freely, but owing to warm weather, prices have had to be shaded. Our market to-day is: White 1-lbs., 16@18c.; 2-lbs., 16@18c. Extracted, 8@9c. We look for better prices later, and would not advise bee-keepers to rush honey on the market.

BEESWAX.—None on hand.

Sep. 9. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Comb, 11@16c. Demand fair for all kinds. Arrivals of extracted are good, while good comb honey is scarce in this market.

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.

Sep. 11. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—It is selling very slowly at 14c. for 1-lb. white comb, and the prospects are for lower prices. We have been trying to hold the market to 14@15c., but parties in Iowa and Illinois are offering and selling white 1-lbs. at 12@12½c., delivered here and at other points in Kansas. Receipts are large, and in order to sell we will have to meet these prices.—Extracted, white, steady at 7@8c.; amber, 5@6c.

BEESWAX.—20c.

Sep. 14. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.

BEESWAX.—22@25c.

Sep. 5. A. V. BISHOP, 142 W. Water St.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Sept. 28, 1889. No. 39.

EDITORIAL BUZZINGS.

Honey and Bees at the Maine State Fair will have attention in our next issue, by an article written for the AMERICAN BEE JOURNAL by our friend, Mr. L. F. Abbott, editor of the Lewiston *Journal*.

At the Iowa State Fair, Mr. Geo. W. Penn, of Colfax, Iowa, took three premiums—first premium on fall extracted honey; first on beeswax, and second on fall comb honey. We congratulate him on his exhibit, which must have been a good one to have merited these premiums. Those who took the rest of the ribbons will no doubt report soon.

Prof. C. C. Blake predicts that the year 1890 will be one of very great extremes, both as to temperature and rainfall. He has published an Annual (price $2) for 1890, which he says "points out what the temperature and rainfall will be from July, 1889, to Jan. 1, 1891, in all parts of the United States and most of Canada and Europe; with advice to farmers as to what crops to plant and when, so as to avoid the unfavorable weather, and to raise fair to good crops in spite of fate and hard luck. Without this advance knowledge, it is mathematically certain that very extensive crop failures will occur next year in many parts of the country."

Notable Old Men is the subject on which that enterprising and gossipy paragraphist, Mr. Blakely Hall, wrote for *Frank Leslie's Weekly* last week. Everybody is reading his weekly contributions with peculiar interest, and this is one of the breeziest of all. The American beauty presented this week is Mrs. J. W. Mackay. She makes a handsome picture.

Digested Nectar.—We are very much surprised to find the following from Prof. Cook in *Gleanings in Bee-Culture* for Sept. 1, 1889:

> Our friend Demaree has now a recruit—a doctor. This doctor—see the AMERICAN BEE JOURNAL—makes several assertions that just a little knowledge of chemistry would have prevented. Is it possible that our "M. D.'s" know nothing of chemistry? Such articles may possibly be excused in a lawyer, but from a doctor they are certainly indefensible. Even a lawyer should not attempt to enlighten the public on what he knows nothing about. His ignorance may be excusable; his misrepresentation and pose, as a teacher, are more venial. To say that nectar and honey are the same, or that sugar syrup fed to bees is identical with the honey placed in the comb, is to show entire ignorance of the subject. It is too bad that such men will write.
>
> Now, Mr. Editor, why do not you editors get a little blue litmus paper and a little copper sulphate, or, better, Fehling's solution, and prove for yourselves the truth of this matter? Then when such articles are sent in, throw them into the waste-basket. You would not insert an article about the king-bee. To say that honey and nectar are the same, is as absurd as to say that there is a king-bee.

We are astonished at the above quotation! Our great esteem for the writer will prevent us from returning the compliment. Editors try to advance the interests of the pursuit, and not to play the tyrant. If they were to refuse to publish everything which did not agree with their views, or the theories of those in authority, there could be no advancement, and progressive knowledge would be at a stand-still.

Ridicule is not argument—neither are arrogant assertions and contemptuous epithets conclusive evidence. They rather indicate the lack of evidence, and the weakness of the cause which they are called upon to bolster up. We are therefore very sorry that the Professor should have seemingly invoked their aid.

Dr. McKinney has another article in reply to Prof. Cook, on page 616 of this issue. When professors, doctors and lawyers fail to agree—who shall decide the questions at issue?

To throw such articles into the waste-basket will no more prove their falsity than the thrusting of Galileo into the Inquisition proved that the world did not revolve on its axis! False theories can only be disproved by overwhelming and convincing arguments.

We have a particular relish for debate, but we loathe uncourteous personalities and quarrelsome contention. We enjoy either hearing or reading intellectual conflicts. The more courteous the controversy, the more profound is our admiration for it, and the more penetrating are the arguments, as a general thing.

Our good friend, Prof. Cook, we feel sure must have failed to give his article in *Gleanings*, that mature reflection which he should have done, and will be very glad, no doubt, to modify it when he realizes the peculiar position in which it now places him. He evidently penned it in an unguarded moment.

Fire has destroyed the fine exhibit of friend Emerson T. Abbott, at the St. Joseph, Mo., Exposition. The main building was entirely destroyed on the night of the 15th inst., entailing a loss of a quarter of a million of dollars, and the loss of one life.

All will sympathize with Mr. E. T. Abbott; his loss is a heavy one. He had on exhibition about all in value of what he possessed, and in one hour it was swept out of existence; and as he had no insurance, the loss is a total one. We wonder at his not taking out an insurance policy, especially when we think of his shrewd business qualities! How nice eight hundred or a thousand dollars would be to him now, in the hour of calamity. Let all take a lesson from this disaster, and insure their property against loss by fire.

Mr. Abbott has a determination, and will at once prepare to start again in the world, pay his debts, and resume his business. He is just the man that reverses cannot crush, and we bespeak for him an increased trade next season, as well as that sympathy which should flow from friend to friend.

The St. Joseph *News* of Monday contained a full account of the fire, and from it we take this item about the honey exhibit:

> Crowds began to arrive from the city, which but added to the confusion. Exhibitors paced anxiously up and down the muddy paths, muttering and bemoaning their fates. Others took the matter philosophically. One poor fellow, his hat off and his arms folded, stood watching the burning buildings. "There goes all I have in the world," said he. "The result of five years' labor I placed in that building, and now I haven't fifty cents." It was Emerson T. Abbott, who had a bee and honey exhibit.

The Fall Crop of Honey, like all other crops, has varied in different locations. In some it has been large, in others only of medium size. Mr. C. H. Dibbern, of Milan, Ills., on Sept. 19, 1889, wrote thus concerning his fall crop:

> "We have had frosts during the last two nights, and the honey harvest for 1889 is now over. The fall crop has not come up to our expectations; probably not more than one-half the usual fall crop has been secured. Still, as we had a full crop of white honey, we ought to be content."

Proud of the Volumes.—Dr. J. M. Hicks, of Indianapolis, Ind., thus writes of the pleasure he experiences in reading the numbers of the ILLUSTRATED HOME JOURNAL, and of his intention to bind them for his library. He says:

> Its make-up is certainly of the best, and when the full numbers for the year 1889 are at hand, I intend to have the book well bound worthy of its merits, and add it to my many valuable books, such as Shuckard on the Humble and British Bees, as well as the several volumes of the AMERICAN BEE JOURNAL, *National Bee Journal*, Moon's *Bee World*, and many others I might mention, which are already bound and in my library, all of which I have saved for years, and prize very highly.

Circumstances beyond our control prevented our attending the Detroit Fair.

GLEANS OF NEWS.

Of Real Value to Bee-Keepers.—Mr. C. H. Dibbern writes to the *Western Powman* a *resume* of the Arkadelphia lawsuit, and the decision of the Supreme Court that bee-keeping is not a nuisance *per se*. He then adds:

This decision is of real value to bee-keepers, and is the first case of the kind decided by the Supreme Court and State. Hereafter people having imaginary grievances against bee-keepers will likely think twice before commencing petty suits. Bee-keepers will hereafter be responsible for the real damage that may be caused by their bees, just like any other property. More than that, no bee-keeper ought to ask.

Now while this suit was ostensibly carried on by Mr. Clark, the Bee-Keepers' Union was the "power behind the throne," and it has cost a good deal of money. Mr. Clark, being a poor man, could not have afforded the expense to carry the case to the higher court, and employ first-class legal talent. The management of the Union deserve great credit in this, as in all other cases it has ever taken up, never having lost a case.

The first thing the Union does when a case of any member comes before it, is to determine if the case is a just one. If not, he is advised at once, and a satisfactory settlement is soon made. If he is in the right, he is helped in his defense to the last.

Now is it not very strange that all bee-keepers do not belong to the Union, when all possible assessments amount to but $1 per year? Yet, strange to say, the membership is still less than 500, when it should be at least 10,000.

Some bee-keepers may have been kept out, by being afraid of becoming involved in lawsuits, but are they not much more liable to become involved in such suits by staying out? Then, too, is it not worth something to give our mite to protect a worthy man, like Mr. Clark, in his rights.

Yes, Brother Dibbern, the bee-keepers are standing in their own light in not joining the Union by the thousand. The few who have joined the Union have demonstrated what can be done in defending the pursuit. Now, if the mass of those interested, persist in withholding their influence, the Union will be unable to cope with the enemies of bee-keepers, for lack of funds; and its failure to do so, will be charged rightfully to the apathy of bee-keepers themselves—not to the weakness of the management.

The Chicago Convention will be held on **Friday and Saturday, Oct. 11 and 12, 1889.** The Railroad Traffic Association has made a rate of one fare for the round trip from any point within 200 miles of Chicago, good on Oct. 10, and can be used on any train returning after that until Monday, Oct. 14. The first session will be held at 9 o'clock in the morning of Friday, and an adjournment can be had on Saturday afternoon in time for those who may wish to return on that day. Those who can remain over Sunday will have an opportunity of visiting our magnificent churches and cathedrals in the morning and evening, and of taking a pleasant walk in the parks or riding on the boulevards in the afternoon, as their inclination and tastes may lead them.

Mr. C. Schliesmayer, of Pasadena, Calif., has sent us two large views of his apiaries. One is his home apiary, and the other is one up in the mountains. He has another apiary, the best of all, but these views show that he is an extensive apiarist. In the present poor season he has obtained 6,300 pounds of honey in the comb, and 900 pounds of extracted. The Pasadena *Star* of July 23, makes the following mention of his honey crop:

The most successful honey-producer in the county, C. Schliesmayer, drove past the *Star* office this morning with a thousand pounds of the whitest, purest-looking comb honey that bees are capable of producing, which he had just taken from his hives in the mountains north of town. It is the third load that he has taken to Los Angeles this summer, all of it beautifully put up in boxes with glass ends. Mr. Schliesmayer disproves in the most emphatic way the assertion that bee-keeping cannot be made successful in this vicinity, for a finer article than he produces would be difficult to find in California.

Mr. S. has sold his comb honey at 12½ cents per pound, and expects to sell the extracted to the same firm for 8 cents per pound.

He says: "I owe the AMERICAN BEE JOURNAL for much that I know about bee-keeping, and offer to the Editor my thanks and gratitude. I have been in the business for nearly 20 years; but I have learned more about it in the past few years, since I have read the BEE JOURNAL, than I ever knew before."

The photographs are placed into our BEE JOURNAL Album, with thanks.

The Vermont State Fair was held during the first week of this month, and was a great success. Heretofore the managers have offered no premiums for apiarian products, but this year they have done so, and this is what the Rutland *Herald* says about the exhibit:

An exhibit that attracts much admiration is that of J. H. Larrabee, of Larrabee's Point, who shows a large amount of fancy comb and extracted honey, as well as a colony of bees, including the queen, in a glass hive. A machine for pressing comb foundation is shown in operation, and full descriptions of the methods of his busy honey workers are cheerfully given to all inquiries. All the different publications relating to bee-culture are given to interested parties, as well as samples of the comb foundation. This is the first year that premiums have been offered for bees and honey, and it is hoped that hereafter a large number will compete for them.

Bee and honey shows are the attractions wherever they are suitably encouraged.

Mistakes of Bee-Keepers was the subject matter of the *Bee-Keepers' Review* last spring. Among the mistakes enumerated by the correspondents were—rearing poor queens; overstocking a locality; too much increase; too many irons in the fire; too much confidence in the statements of persons over-enthusiastic on some particular point, etc.

Convention Hand-Book.—As the convention season is just approaching, we want to direct attention to the little book which every bee-keeper needs when attending these gatherings. Here is what Mr. J. E. Pond says about it:

DEAR EDITOR:—Your little "Convention Hand-Book" is really a very handy thing. At two or three different times I have been called on to get up something for special occasions, and I have found the "Hand-Book" just the thing to save me quite an amount of time and labor, as it was a very simple matter to use the "book" as a basis, making only such few changes as were necessary to fit the special time and place.

I can cordially recommend it to any one who may desire not only information, but a *perfect form* for organization of a convention of any kind of a convention, as it will "fill the bill" completely.

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

We make every subscriber this offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Hand-Book for your trouble—by mail, postpaid. Here is a grand chance for all to get a valuable book without costing them a cent!

A New Serial Story, entitled "Heron's Wife," by Etta W. Pierce, is begun in the October number of *Frank Leslie's Popular Monthly*. The color, picturesqueness and dramatic force of this novelist have already given her a reputation as a sort of American Ouida—a reputation which this latest work from her pen will fully sustain. The literary and artistic features of this number of the magazine are even more profuse than usual.

The National Flower.—A vote was taken, as we are informed by Mr. L. F. Abbott, at the Maine State Fair, on Thursday, the third day of the Fair, by Mr. D. H. Knowlton, Secretary of the Maine Pomological Society, and resulted as follows: Golden-rod 155, lily 14, rose 13, sunflower 8, and arbutus 6. "Straws show which way the wind blows."

A correspondent on a farm requests us to record his "vote for the morning-glory, because the golden-rod is not a distinctive flower—only a weed." This reminds us of what a farmer from Jersey county, Ills., wrote to an exchange on this very subject. He says:

When it comes to putting such a detestable vine as the morning-glory ahead of the golden-rod, I think the average farmer will hold up his hands in horror, for if, in this locality, there is a weed more complained of and more hard to eradicate than the morning-glory, I have yet to find out what it may be. Cornfields are ruined by it, and the only way to get rid of it is to change crops. I never knew any one to be damaged by the graceful golden-rod, whose golden plumes nod and sway with a willowy grace unrivaled by any other flower.

The golden-rod is "our choice, first, last and all the time."

A Novel Idea.

A novel attraction in the shape of a palace of black diamonds is to be seen on the Sangamon Fair association grounds at Springfield, Ills. The entire structure is in reality a palace of coal, as it is built of rough blocks of coal dug out of the Sangamon county vein.

THE COAL PALACE.

Owing to the shortness of time at the disposal of the operators who were putting up the palace it is necessarily somewhat limited in its dimensions, but it is big enough to make a very imposing appearance. Bullard & Bullard are the architects of this building, which is certainly a picturesque feature of the Sangamon fair and Springfield's exposition. The original idea was suggested by The Illinois State Journal to Col. Charles F. Mills, secretary of the association, and in two days he had the coal operators of the city thoroughly alive with the novel idea of drawing attention to the coal of their county by erecting a palace of coal on the fair ground. The formal opening of the palace was attended with much ceremony. Senator Shelby M. Cullom delivered an address on "Coal in Commerce" and Pat H. Donnelly, late secretary of the Illinois Miners' Protective association, one on "Coal Miners," and there were also several other addresses.

Senior and Junior.

The use of "Jr." is simply to denote the younger of the same name. In the case of uncles or grandfathers residing in the same community it would be a convenience for all concerned (where the name is the same) to have the nephews or grandsons use "Jr.," while the older persons used "Sr." for senior. The significance of 1, 2 and 3 is simply to denote different persons of the same name. In congress, when two or more members of the same name appear on the list, the name of the state each comes from is printed within parentheses Where there are more than two of the same name in a family 1, 2 and 3 are sometimes used.

Set and Sit.

Discriminate between set and sit. To set means to put, to place, to plant, to fix. To sit means to rest on the haunches, to remain in a state of repose, to perch as a bird, etc. We set apart, set aside, set about and set down (some article), or (in writing). We sit on a chair, on a horse. We sit up and sit down. We set a hen, and a hen sits on eggs We should say, therefore, "as cross as a sitting (not setting) hen."

The Busy, Buzzing Bees.

Words by GEO. W. YORK. German Air.

Allegro.

1. Buzz, buzz, buzz, O - ver fields, oh so fair, Where the bees in la - bor share,
2. Buzz, buzz, buzz, Not a bee has a fear, And no i - dle - ness is here:
3. Buzz, buzz, buzz, Ev-'ry bee till the night is so hap-py in its flight,
4. Buzz, buzz, buzz, In this life we should work, And like bees nev - er shirk,

cres.

Clovers sweet, blossoms rare; There's where nectar's found, Oh, so bus - y
Bus - y they, far and near,—Hon - ey get with care. Bees in sun - ny
Nev - er tires, al-ways bright, Car - ing not for rest. Learn a les - son
For there's no place to lurk—Do our du - ty well; Then at last when

all the day, 'Mong the flow-ers do they stay, Ev-'ry bee ver - y gay,
hours a-mong Fields of flow'rs with joy-ful song. Happy strains they prolong,
from the bee As it toils for you and me. Oh so free and you see,
life is o'er, And of toil we do no more, We shall live on that shore

CHORUS.

Hon - ey all a-round. In this blooming field all day, Flowers grow in
Ring - ing in the air.
Does its ver - y best. *Chorus for 4th stanza.*
Where the an-gels dwell. In that hap-py home above, Where there is naught

bright ar-ray, Bees are there in the air, Hon - ey ev - 'ry - where.
but true love, We shall be free from care, Mu-sic ev - 'ry - where.

The Busy, Buzzing Bees, set to music on this page, is eminently fitted for use at Conventions. The words are excellent, and are just suited to the music. Those who are intending to go to the Conventions this fall will be delighted with this song, and will, no doubt, have the music as well as the words thoroughly committed to memory, so as to make "merry music" wherever they may be.

The Queen Breeders' Journal has been consolidated with the *Western Apiarian*, and the September number of the latter comes out with many additional pages. There is much room for improvement in its typographical appearance, but we hope that time and experience will accomplish that, and make it a credit to the craft. We wish it success, and with that will no doubt come the improvements.

From Two Stand-Points.

To be a woman—direst woe,
The rights of men she ne'er can know.
She cannot cast the mighty vote,
Or sound the ringing campaign note.

To be a woman—happy state,
To govern man and guide his fate,
She takes the middle of the street,
And in the horse-car gets a seat.

She has her say—more than enough—
And has it, too, without rebuff.
Creation's king, a man, is seen
'Most always vanquished by the queen.

QUERIES and REPLIES.

Square or Round Ends in the Zinc-Perforations.

Written for the American Bee Journal

Query 655.—Should the perforations in the metal used for excluding queens have square ends or round ones?—Ills.

Round ones.—A. B. MASON.

I think that it does not matter.—J. P. H. BROWN.

I doubt if it makes any difference.—C. C. MILLER.

I would prefer round ends.—M. MAHIN.

It makes no difference which, in my opinion.—G. M. DOOLITTLE.

I have used only right-angled openings. They work well.—A. J. COOK.

I do not see as it makes any difference. Perhaps round ones.—MRS. L. HARRISON.

I think that it makes very little difference.—C. H. DIBBERN.

The round ones have worked more satisfactorily with me.—W. M. BARNUM.

I think that the difference in results are too insignificant for consideration.—R. L. TAYLOR.

They are oblong with square corners, in what I have.—MAHALA B. CHADDOCK.

I do not know. I have never used any but square-cornered perforations.—EUGENE SECOR.

I will leave this question for others better qualified to answer.—J. M. HAMBAUGH.

Round ones may be an improvement, but I do not find any objection to the square ones.—P. L. VIALLON.

We would prefer long, round-end perforations, if we used queen-excluders.—DADANT & SON.

I prefer the round ends, as in my experience the bees are not so apt to fill them with propolis.—J. E. POND.

I have never seen but one "make" of the perforated-zinc that had round ends to the perforations, and the workmanship of this "make" was so inferior that I would not use it. The square-end slots give perfect satisfaction in my apiary, if the work has been nicely done. I regard the perforated-zinc excluders one of the greatest of our modern helps in the apiary.—G. W. DEMAREE.

Well, I do not know which are best, because I have had perfect success with both. Perhaps there is not enough preference to amount to enough to give it investigation.—JAMES HEDDON.

I should prefer the round corners, especially if I were manufacturing it. The sheets would be stiffer, and less liable to break at the corners. The punches and dies would last longer, with little danger of breaking in hardening and tempering.—H. D. CUTTING.

I do not think that it makes any difference. A more important question is, how to facilitate the passage of bees through perforated-zinc? But that question is fully answered in a properly constructed wood-zinc honey-board.—G. L. TINKER.

I do not think that it makes any difference. The sharp edges left in the metal by the dies, are my objection to perforated metal. Perhaps galvanized iron, punched a trifle large, and then "dipped" again, would be better than the metal now in use.—J. M. SHUCK.

The difference is not worth consideration, if the perforations are smoothly cut, so as not to leave any sharp edges.—THE EDITOR.

Making a Bee-House for Wintering Bees.

Written for the American Bee Journal

Query 656.—Last year I had only 3 colonies, and had them in the cellar, but I have 12½ now, and I cannot keep them in the cellar very well next winter; so I would like to know if a bee-house built like this would do: Say build it 12 feet long and 8 feet wide, and 8 feet high, and boards and battens on the outside, and boards on the inside with 6-inch space between, to be filled with sawdust, and banked up below on the outside. Of course it will have a good floor in it.—H. L. H., Iowa.

The cellar would be much the best, especially for the ½-colony.—G. M. DOOLITTLE.

We do not like bee-houses, unless they are entirely frost-proof.—DADANT & SON.

Yes, sir, I think that a house built as you propose, will do very well.—J. P. H. BROWN.

Your house would do very well if double the amount of space for sawdust was allowed. Also, some plan should be made for ventilating.—WILL M. BARNUM.

The general experience with such repositories has been unsatisfactory. You had better have it under ground.—C. C. MILLER.

I have had no experience in that line, but I should expect to lose that number of colonies in such a house in Michigan.—R. L. TAYLOR.

If you can make it warm enough to keep potatoes from freezing, it may do. If not, they had better be out-doors than in such a place.—EUGENE SECOR.

It will do very well, but must be perfectly dark. Care must be taken to put the hives out before it gets very warm in the spring.—C. H. DIBBERN.

Yes, your plan of house will work, but you must keep watch of the temperature. The house is very much larger than you need for so few colonies.—H. D. CUTTING.

A cave or cellar would be preferable. I do not believe that a house built above ground can be made to retain an even temperature sufficient to insure successful wintering.—J. M. HAMBAUGH.

In your locality I would rather try out-door packing. I would prefer 12 inch walls to those 6 inches thick, in the clear. You have almost too few bees now to keep such a room warm in a cold time, and you do not mention artificial heat.—JAMES HEDDON.

I do not believe that it will do. If the walls were 12 inches instead of 6, it would be better. In this climate (Indiana) I would prefer to leave them on the summer stands, with plenty of ventilation at the bottom, and sawdust or other packing on top.—M. MAHIN.

Yes, this will make a good bee-house, but I would prefer 12 inches of sawdust rather than 6. After all, I would prefer the hives on the summer stands, properly protected. See a short article on the use of straw mats in this issue.—J. M. SHUCK.

I do not think that the 6-inch sawdust space is enough for safe wintering in a bee-house above ground, in Iowa. Such a house, constructed with two feet of dry earth over the bees, and on all sides, would no doubt be a great success.—G. L. TINKER.

Such a house will not do. The wall would need to be 12 or 15 inches thick. Why not dig in the earth, roof over, and so make an out-door cellar? For our severe Northern winters, such a depository is much safer than a house, unless the walls of the latter are double, and enclose a very wide space.—A. J. COOK.

Much will depend. I keep my bees entirely on the summer stands, with even less protection. More depends upon preparation for winter, in the in-

terior of the hive, than the outside. Everything else being all right, I think that your plan will prove a success.—J. E. POND.

Do not build a house to winter bees in. Build a cave on the Doolittle plan, or winter out-doors in chaff hives. But is your cellar really too small for 12½ colonies? If in the old American hive they would of course take up considerable room, but in any modern hive, that will tier up, 12½ colonies will not take up much room.—MAHALA B. CHADDOCK.

I cannot say how such a building would answer for wintering bees further north, but I should think that a 6-inch sawdust wall would hardly keep the temperature above the freezing-point in this (Kentucky) more moderate climate, at all times. I should think that a space of 12 inches of sawdust would be much safer. Somehow or other, a house, if just a little too cold, becomes the worst sort of a place to winter bees safely.—G. W. DEMAREE.

The trouble with such above-ground repositories is that they cannot be kept at an even temperature without considerable trouble and expense. Such buildings have generally been a failure—especially where the walls are so *thin* as you suggest. The walls should be at least double the thickness mentioned, and even then are not to be recommended.—THE EDITOR.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on **Friday** and **Saturday, Oct. 11th and 12th,** at **9 a.m.** Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be one fare for the round-trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."

W. Z. HUTCHINSON, *Sec.*

☞ The annual meeting and basket picnic of the Progressive Bee-Keepers' Association will be held at the residence of Mr. F. E. Dutton, near South Newbury, Geauga Co., Ohio, on Thursday, Oct. 3, 1889. All interested are invited to attend.

MISS DEMA BENNETT, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

STRAW MATS.

How to Make and Use Them on Hives in Winter.

Written for the American Bee Journal

BY J. M. SHUCK.

Bees that are to be wintered out-of-doors, in the latitude of Iowa, need protection. It has been settled that

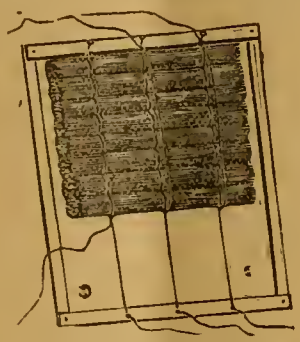

Fig. 1—Making the Straw Mats.

the chaff hive is not sufficiently portable for use where bee-keeping is carried on, on a large scale.

Some of our most successful apiarists, among whom may be mentioned Chas. F. Muth and Dadant & Son, have both recommended and used *straw mats* over the brood-nest in winter, to slowly pass the moisture of the hive and retain its heat. These mats are similar to those used over hot-bed sash, by gardeners, and are quite simple and easily made.

Unbroken rye-straw makes the best mats, but the straw of other grains may be used, and some of the most

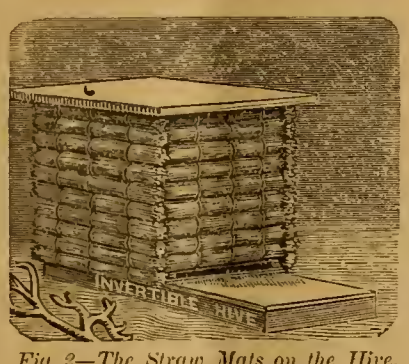

Fig. 2—The Straw Mats on the Hive.

serviceable mats I ever used were made of prairie-slough grass. Stretch a set of tarred twines over a frame (see engraving No. 1), and then fasten another set at the top of the frame for binding the bunches of straw in place. Now take a handful of straw and place it against the nails at the top of the frame, and pass the binding twines over the bunch of straw and under the twines stretched across the frame, and either knot them each time, or carry them back to the nails in the head-board, and secure them until the next handful of straw is laid in, and so on until the mat is completed.

When the proper length of mat is reached, secure each end by tying the two sets of twine securely; then by means of a stiff, straight edge, nailed lightly to the frame, and a broad, sharp chisel, cut the sides of the mat even and smooth, and to the exact size wanted.

I make for winter protection, one mat just the size of the top of the hive, and lay some ⅜-inch strips across the tops of the frames, and then lay on this a piece of wire-screen cloth to keep the mice out, then lay on top of this the mat just described. Then I make two mats just large enough to cover the ends of the hive and ends of the mat on top of the hive, and hang them on top of the hive by twines secured to each, and passing over the mat on top of the hive.

I then make two mats of proper size to cover the two sides of the hive, and the mats at the ends of the hive and on the top of the hive, secured in the same manner as the mats at the end of the hive; then a good board that does not leak, to cover the whole, with a suitable weight to keep it from blowing off; and a piece of twine tied around the whole to prevent the mats blowing out and away from the hive, completes the outfit quite perfectly.

I may add that I use a rim equal to half the depth of the brood-chamber, under the hive—in fact, one-half of an empty brood-nest is devoted to this purpose, and the hive prepared thus, appears as in engraving No. 2. Two sticks laid under the edge of the front mat provides an entrance and exit to the bees.

Des Moines, Iowa.

WOODEN CELLS.

A Hive with Wooden Combs, Said to be a Non-Swarmer.

Written for the American Bee Journal

BY PROF. A. J. COOK.

I have a colony of bees in the Aspinwall wooden-comb hive. They are rapidly storing honey in the wooden cells, and eggs are laid in the cells by the queen. Mr. Aspinwall says that they breed in these wooden cells as well as in wax comb.

The wood is coated with a thin layer of wax. Mr. Aspinwall thinks

that these hives are non-swarming. His theory is that bees never swarm unless they have drones or drone-brood. In this hive the cells are all worker size, and cannot be changed to drone size.

Of course the combs can never break down. The wood in the frames that I have, is basswood, and the bees are tearing it slightly. Mr. Aspinwall says that they will not do this if the wood is pine.

Mr. A. and one of his neighbors have tried this style of comb for two or three years, and are satisfied of its value. Of course the hive is very heavy. If it is a perfect non-swarmer, it will be valuable.

The machinery to make the combs is expensive, but the hives can be cheaply made. Mr. A. has secured a patent on this comb. I think that there is no doubt but he is justly entitled to it, as I believe it is new.

HONEY.

It is Not "Digested," but Concentrated, Nectar.

Written for the American Bee Journal

BY J. W. M'KINNEY, M. D.

The article on page 523, by Prof. Cook, would seem to demand a reply from me. I should have done so sooner, but for business engagements that occupied most of my time.

In this short reply, I shall try to avoid the contemptuous manner that cropped out so plainly in the Professor's article. He accuses me of being ignorant of the matter of which I wrote. He also says, "Nearly every assertion made," in my article, "is untrue, as any doctor ought easily to convince himself." "Cane-sugar fed to bees is changed to a glucose-like sugar, and from a neutral to an acid substance."

In answer to the Professor's contemptuously sounding interrogations, I would say that I know what "litmus paper is"—have been familiar with its use for many years; and Fehling's test for glucose, also. With these means of acquiring knowledge at my command, I fail—sadly fail—to find any evidence that nectar gathered by the honey-bee is "digested" by the insect to "make" it into honey.

From reliable sources, we learn that honey contains crystallizable sugar, and, according to Soubeiran, two other kinds of sugar, one of which is changed by acids, and has the property of turning to the right the plane of polarization, and the other not acted on by acids, and possessed of a strong left-hand rotating power. In addition to these saccharine substances, Guibourt says, "Honey also contains *mannite* and a *vegetable* acid."

It does seem to me that the Professor would recognize the fact that uncrystallizable sugar is *generated* by dissolving cane-sugar in water, and subjecting it to a sufficient heat for 24 to 48 hours, in an open vessel. The length of time necessary for such generation depends, to a great extent, upon the consistency of the syrup. Thin syrup takes on this change more readily than thicker, and occurs as readily outside the hive, and independent of the bees, as when fed to them.

The presence of such uncrystallizable sugar in sugar-cane molasses, is certainly not due to having been *digested* by bees. The presence of this sugar is an *isomeric* form of glucose, exists in honey, and in the juices of fruits, and in nectar.

The Professor has signally failed to prove the proposition, or to show that honey is "nectar digested by the bee." To simply assert it, does not prove it, by any means. His chemical formula for honey ($2\ C_6H_{12}O_6$) is as foreign from proving it "digested nectar," as the formula given by Fownes for gum-arabic (which is $C_{24}H_{22}O$) is foreign from proving that common cane-sugar is the same substance, the formula of which is written precisely the same, ($C_{24}H_{22}O_{22}$).

I did not say in my former article that "nectar and honey were identical;" but I did mean to say, and would here repeat, that whatever the change in nectar while undergoing the process of *concentration*, that change is *not* due to the *digestive function* of the bee. The rational conclusion is, that honey is nectar concentrated by the action of heat and atmospheric conditions. That honey is not always of the same consistency, even when the nectar is gathered from the same source, is due to atmospheric conditions.

Perhaps the Professor would tell us that thin honey, with a tendency to ferment, as is sometimes the case with extracted honey, is in consequence of the bees that gathered it having been troubled with indigestion or dyspepsia.

I agree with the Professor when he says, "We never gain anything by concealing or misrepresenting the truth;" and I would add, neither do we gain by adhering to an error. "*Tell the truth*" is the good motto; and the Professor thinks he would be carrying this motto out by continuing to call honey "digested nectar."

On his suggestion, I will beg the pardon of bee-keepers, and carry out the above motto, calling honey *nectar concentrated* by *heat* and *atmospheric influences*. At the same time I would insist that the physiological function of digestion of the honey-bee, be not perverted from its legitimate office to that of a laboratory for "making" honey. Nectar, digested by the bees, would not be honey, but according to physiological laws it would be chyme.

Camargo, Ills.

[The foregoing article is somewhat caustic, but the Professor's article was of the same nature, and called for a similar reply. We want to learn all that can be said on this subject, and hence have given place to the articles of Prof. Cook, Dr. McKinney and others. See editorial on page 611.—ED.]

APICULTURE.

Modern Salient Features in its Advancement.

Written for the American Bee Journal

BY HENRY K. STALEY.

I notice among a good many bee-keepers of America, that there is a feeling or inclination springing up, which is prejudiced against a man patenting the productions of his brain. And, why should he not? He uses up many hours of valuable time—during each second of which he travels with the earth in its ambit around Old Sol at the rate of 18.38 miles per second; and over which he will never pass again—at least when quick; unless the components or elements of his body, after disintegration have, through various changes, been imbibed, and through assimilation converted into the flesh of other human beings or animals; for it is within the bounds of possibility that the apple which caused the fall of our first parents, may have composed part of the apple by means of which Sir Isaac Newton was able to discover the laws of gravitation, or the force of centripity; and lavishly spends, if he's got it, his money, trying to germinate the embryo of some new invention, as yet incased in its hard-shell covering, not knowing whether he will be able to get back the money expended or not. The above anacoluthon may not be pardonable, but I just wanted to show how valuable time is.

COMPENSATION FOR OUR SERVICES AND WORKS IS IN ACCORDANCE WITH HUMAN NATURE.

Show me the man that is willing to fill a public office without receiving any emoluments therefrom; show me the man that is willing to work day

after day without receiving any compensation for his labors; and I will show you the man that is able to eat his hat. Some people think it more pleasant to receive than give—especially those politicians who are the recipients of public offices from which emanate *pinguis* emoluments *sine magno labore*.

Why, do you think that a person would run for President of the United States, if he has more money than that office pays; or, if money is no object to him, unless he had some object in view, such as praise, honor or glory? In this case he receives the praise and honor with the concomitant pecuniary interests as a secondary object. So, also, with an inventor; he not only wants the prerogative to protect his invention by a patent, but he wants the renown emanating from the article patented itself.

HONOR TO WHOM HONOR IS DUE.

And it is right that his name should go down on the pages of history as a benefactor of mankind, glittering like the diamond—throwing out scintillations of light to future generations as they come and go—among the galaxies of the brilliant names of generals, historians, doctors, astronomers and poets.

Do you think that a person would sit up at night,
While the mopping owl doth to the moon complain
Of such as wander near her sacred bower,

and have his ears made the recipients of other nocturnal noises, even into that arching hour of night—when the Northern bear, tired of prowling around in the fold of the North Star, has slunk into his den—which holds the rest together, thus robbing his brain and limbs of their needed quietude, working on some book or invention—if he did not expect a guerdon? If it is a history into which he has thrown the corruscations of his genius, and made things in tradition to appear to put on the countenance of truth, like Prescott, a man, who although blind apart of his time, wrote histories so wonderful that there was no need of treating them pragmatically, because the imagination could portray and picture the cause and results well enough to suit the mind's eye; and, I repeat it, although blind, yet, like our own Huber, persevered in his studies, rendering true that old aphorism, viz:

For nothing else is history
But pickle of antiquity
Where things are kept in memory
From stinking,

had a right to have his histories copyrighted, so that no one else could steal his writings, and thus wrest from him the emoluments emanating therefrom.

So the inventor of the interchangeable brood-chamber and reversible alveary, thus showed to apiarists that, albeit the Langstroth hive has been the the standard hive for years, yet the time has come, when in the face of terrible drouths, reduced prices and the like, that a better hive was needed.

Some people think that certain inventions cannot be perfected to a greater degree. Such thoughts should be relegated to the mixen of the intellect—the *omnium gatherum* in Pandora's box of useless knowledge. And yet, to show how ridiculous it is to think in the aforesaid manner, let me show it by an example:

Edison, the great inventor, has been making new inventions in the art of telegraphy—inventions, which if put into operation, would facilitate the powers of telegraphy nearly bi-fold. The Western Union Telegraph Company seeing this, and knowing that if these inventions came into the hands of a rival company, that that company would soon be able to surpass and outshine it, has been buying up these inventions at the inventor's price. The formula for buying is like this: "How much?" "Check, $100,000."

When the Rev. L. L. Langstroth, the inventor of the movable-frame hive, and therefore *justly* able to determine the merits of the hive, wrote that vigorous article published on page 294 of the AMERICAN BEE JOURNAL for 1888, the *vox populi* against it, should have held its breath a little longer; but as it did not, the result was quite a war in the columns of our bee-periodicals.

Jealousy in apiculture is a thing not to be overlooked, because it is a worker of evil to our pursuit; therefore it naturally follows, what is the cause of all this "hue and cry" about an invention that is revolutionizing many of the ways of bee-keeping, and at the same time purveying a good to humanity? Is it envy? Then those of our apiarists who are envious concerning certain late inventions, and believe in the Bible, should remember that it says: "Thou shalt not covet thy neighbor's wife, thou shalt not covet thy neighbor's house, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor anything that is thy neighbors." But nevertheless we know that there are some people who cannot master their fickle nature, and let jealousy reign supreme and uncondemned; and, pushed on by hatred or the love of gold, it grasps them much after the following manner:

But gnawing jealousy out of their sight,
Sitting alone, his bitter lips did bite.

Is it that they had the idea in their heads years ago, or fabricated the inventions, and were ashamed to get them patented, but preferred to keep them for their own private use? Then they should remember that he who goes to the trouble of patenting his inventions, and bringing them before the public into practical use, standing all the cavil and calumny besides phlebotomizing on the veins of his pecuniary life-blood, should most rightfully be considered its inventor, as Langstroth was of the movable-frame hive, and Davis of the discovery whereby the worker-larvæ of one race of bees can—with a tiny spoon or goose-quill—be transferred to queen-cells of a different race; thus in time changing the whole colony.

Luck is not the motive whereby inventions or success come, but hand labor. If any one thinks that the Langstroth and later hives came by luck, he is mistaken; for "Luck is *ignis fatuus* (a will-o'-the-wisp); you may follow it to ruin, but never to success." We must reason from what we know, if we desire to avoid a procidence in any profession or experiments. This is the *cause of failure* with a great many uninitiated bee-keepers. They do not reason from what they know, and instead of starting in with one or two colonies, learning the business as they go along, they dash headlong, prone into the waves of bee-keeping, and not being able to swim in apicultural waters, down they go, leaving invectives behind them against our pursuit. Therefore, in order to avoid an apiarian prolapsus, we see that we must reason from what we know, and build up in knowledge as we go along.

The truth of this is quickly seen by reading of some of Langstroth's first inventions. Before he had invented the movable-frame hive, he used what we now call top-bars; the bees starting the combs on the under surface of the bars, and, building them downward, they attached the combs to the sides and bottoms of the hive. Therefore, it will be seen, that he had to cut the combs loose from the sides and bottom of the hive, before he could lift them out. This, of course, was a great improvement over the old box-hive, but still it did not suit Mr. Langstroth.

Then, by reasoning from what he knew and saw, the idea struck him, of nailing uprights to the top-bar and a slat on the bottom connecting them, the uprights. That it was a success, we, apiarists of to-day, know full well.

No, it does not pay to plunge precipitately into bee-keeping — better "prospect," as the speculator says, or according to John Lilly, "Cut thy coat according to thy cloth." Yes, it was days, months and even years of toil linked together with the hope of receiving some reward in the end; a reference to which is given by our

Constitution, where it says, "Congress shall have power to promote the progress of science and useful arts, by securing for limited time to authors or inventors the exclusive right to their respective writings and discoveries."

COPYRIGHT AND PATENT LAWS.

And would we now tear down that defense surrounding book-writing, inventions and the like, which our forefathers built up and fostered, by throwing a wall of protection around nearly a hundred years ago? In 1790 a law was enacted, giving to authors the exclusive right to their writings for 14 years, with the liberty of making a renewal for a like period. In 1831, the term was made 28 years, with the right to renew for 14 years longer, thus making at its extreme limit for a copyright 42 years.

In 1790 Congress made provision for giving to inventors the exclusive right to their inventions or discoveries, and from that time up to the present day, the number of inventions have been accruing annually. Originally 14 years was the time for which a patent was valid, but in 1870, 17 years was made the limit.

Of course, there are some firms who take advantage of the copyright and patent laws, by leaving the patent on their invention run until its time is nearly expired, when, through some new device on the machine, another patent is obtained, giving to them the exclusive right for 17 years longer. Whether this be a manifest injustice to the people at large, absonant or consonant with the Constitution of the United States, it is nevertheless done; and this only shows the immense importance of the patent-right itself.

It is not incongruous here to ask how our country under its copyright and patent laws has prospered; and to that intent I will now apply myself.

Over 600,000 applications have been filed for patents since the year 1836, and about 400,000 patents have been granted, while the books that have been issued are too numerous to mention. Inventiveness seems to have become a national trait, even seen in the small child to the hoary-headed man, and almost every branch of business.

The United States issues four times as many patents as her maternal country, albeit Great Britain started the great wheel of civilization and progress to revolve hundreds of years ago. There was given, some years ago, at the Electrical Exposition in Paris, five gold medals as rewards for the greatest inventions and discoveries of the age. Well, how many do you think Uncle Sam took? *Just five.*

Therefore I ask, should the apiarists of America have that prerogative of patenting—which has built up our pursuit and made it recognized by our Government— taken away because a few persons who are not in favor of adhering to the ways of our forefathers, or else are goaded on by jealousy, or with the thought that the very same idea was in their mind years ago, or that they may have machinated the invention, but did not get it patented? I answer no, most emphatically, no!

If these men let procrastination rule over their ideas, which might have generated an invention, it serves them just right to lose it. Let them remember that,

> The mill will never grind again,
> With the water that has passed.

When they made the invention or discovery which, if patented, would have made them the legal inventors, they desired to be the inventors, but through lack of energy or perseverance, let the goal slip from their fingers; and now, when somebody else has—without the knowledge of any such thing having been made before—made an invention, and after having procured a patent-right for the same, brings it before the public, he kicks up a racket, and lays claim to the inventorship.

COURAGEOUS INVENTORS OF THE PAST.

It is a good thing that the world has some men who dare to bring their inventions before the public gaze; inventions which they know in time will revolutionize certain pursuits, sciences, etc.; as Ericson's iron-clad, the "Monitor," did that of naval warfare. You may remember what Themistocles said to the Greeks, when the Selphian oracle told them to seek safety behind wooden walls; he said, their ship; but in a naval contest hodiernal, there is not the least shadow of a show behind wooden walls, when one bomb, loaded with dynamite, is able at a single explosion to blow a whole ship to mammocks.

Let us take Galileo as another example of those men who dare to bring their discoveries before the public. In the night-time of Jan. 7, 1610, he espied three minute stars in a straight line, and a few evenings following, a fourth around the planet Jupiter. From the first satellite, by means of its eclipse, Roemer was able to solve that great problem—the velocity of light, which was found to be 185,410.33 miles per second, taking the mean distance of the earth from the sun at 91½ millions of miles.

This, of course, gave more confirmation to Galileo in his belief of the heliocentric theory, which recognizes the sun as the centre of the Solar System, around which all the other planets revolve. This, as will be seen, was in accordance with the Copernician theory, both of which were *vis-a-vis* to the geocentric theory, the theory which the church recognized at that time, namely, that the earth was the centre and around it the sun revolved. Picture the earth, by its force of gravitation, making the sun circle around it, when, if you will, mete out four bushels of wheat, and then take out but *one* grain, you have the *relative* size of the earth as compared with that of the sun.

THE ADVANTAGES OF MODERN TIMES.

In those days, how different it was from this land of liberty of ours! The church tried to settle all the great questions of astronomy by the Bible, but we know that book is not the place to go to settle questions of astronomy or apiculture, but religion. Accordingly they accused Galileo of imposture, heresy and blasphemy. They summoned him to appear before the Holy Inquisition, on an accusation of having taught the heliocentric theory; and having commanded him to renounce his belief as a heresy, on pain of incarceration, the church had pretty quiet rest for about 16 years. But in 1632 Galileo published his work, appellated the "System of the World," by which he tried to show the truth of Copernician theory.

On account of this, he was summoned to appear before the Inquisition of Rome, and on his knees commanded to curse his doctrine of the earth moving around the sun; yet, it is related, that when he arose from his knees, he stamped his foot on the earth, and in an undertone said, "E pur si muore"—and yet it moves.

If it had not been for Daniel Boone, in his persistent efforts toward civilization, who, at one time, was the *only* white man in Kentucky, where would our mighty West have been to-day?

If it had not been for Roemer, in discovering the rapidity of light, how would we have been able to tell the length of time it takes the light to travel from the nearest star—a Centauri—to reach us? But having the rapidity of light from Roemer, and the parallax of that star having been determined (from it the distance), we were then able to determine the time, which is 3.6 years; it being 20,832,000 millions of miles from us, or, in other words, twenty trillion, eight hundred thirty-two billions of miles away.

If it had not been for Langstroth, who by his persistent efforts brought into practical use the movable-frame hive, where would our pursuit have been to-day? It would have been as yet in the days of the honey-comb shambles, when comb, larvæ, farina and honey were squeezed together to get that delicious liquid—honey. It

would have been as yet in the slough of fogyism when box-hives reigned supreme, and had bee-moths by the thousands. Thus we see the salient importance of a revolutionizing invention or discovery in being brought before the public.

SUPERSTITIONS OF THE OLDEN TIMES.

Do you think that if the men of this age had to fight like Galileo, in bringing their inventions or discoveries before the public, that the land would be in such a prosperous condition as it now is?

To show how superstitious people were toward the close of the last century, let me quote a little incident:

Lord Campbell made the journey from Edinburg to London in three days and three nights; but judicious friends warned him of the dangers of it, and said to him, that some people who were so *rash* as to attempt it had really died from the *mere* rapidity of the motion. People now-a-days need not be afraid of the telephone, electric street railway, etc., but should remember that many of the arts employed by the Egyptians are lost arts.

The pyramid of Cheops — which covers a surface of nearly eleven acres —and is 487 feet high, stands to-day in gloomy Egypt, the dumfounder of all modern mechanical powers. The art, whereby the human body can be preserved for six thousand years, is unknown to us; hence these things are to us as lost arts, and for any one to be averse to patents in bee-keeping, is simply nonsense. I say *fiat lux*—let the light shine—for our pursuit. And I hope the saying, *ubi apes, iti mel*, will become truer and truer with respect to men, *i. e.*, where brainy men are, there may be inventions that will be patented and not stored away, like the miser does his money, by some gormandizing snouser for his own use, being too lazy to get his inventions patented, and purvey a good to humanity.

DEMONETIZATION OF OLD INVENTIONS.

And, if by their inventions—so long as they render a good to humanity—the demonitization of older inventions is effected to a greater or less degree, by all means let us have them. Who would think of giving up an elegant mansion for an old log-hut, where the hyperborean blasts whistle in and chill you to the marrow; the watch for the sun-dial, the clock for the clepydia, the telegraph or the telephone for the ancient ways of sending news, or the quick short-hand for the slow long-hand writing, when rapidity is wanted. Then why is it, that some people are averse to patenting? It must be their idiosyncracies.

Pleasant Ridge, O.

QUEEN-REARING.

The Rearing of Perfect Queens for Home Use.

Written for the American Bee Journal

BY FRANK COVERDALE.

There has been considerable written on this subject, yet there will perhaps always be room for disenssion. This rearing of perfect queens has always (ever since I have kept bees) been of very much importance to me, for it is my belief that we should have queens reared under the best of circumstances —that means, a plenty of queen-food or royal jelly, even so much so as to have a large amount left after the queen has hatched.

My first experience was to take a frame of brood from one colony and place it in a hive by itself, leaving the few bees that would stay, build there cells and care for them until ready to hatch. These queens were the poorest I ever saw, and their average life was not over one year, and they would be very apt to fail before the next year's honey harvest was gathered.

These queens would lay very small eggs; still I have not noticed any difference as to the working-quality of their offspring. It was the small amount of royal jelly that spoiled my queens.

I next adopted the Alley method, which proved to be much better, but I was not entirely satisfied with this, for the queens were not vigorous enough, or, in other words, they were stinted from the proper amount of royal jelly required to the development of a fine, large queen. So I left this, and went to work rearing queens (whenever I had a chance) under the swarming fever. In this way I got some fine queens to stock my apiary with—good, prolific queens.

This season I have been rearing some queens by the Doolittle method of "Scientific Queen-Rearing," which also gave me good, vigorous queens. One thing I did not like was, that so many of the cups would be respected, and then again the royal jelly placed in the cups would all be sipped up or removed by the bees, even so clean as to leave the larvæ for a time without nourishment. Of course, after this they were fed liberally, and the development went on finely. This being the state of affairs, I began to think over the matter thus:

Why can I not have queenless bees, or bees prepared under the Alley method, to build cells, and just when they get the cells ready to cap over, take out the large larvæ, and place in the same cells small larvæ, not over 30 to 40 hours from the egg? These I found to be well accepted, and the royal jelly was not removed. Here I had a good start in queen-food. This suited me very much.

It soon came to me, that the bees would have double the time to feed the cells, and so they did to almost double the amount of royal jelly, thus causing the bees to build the cells longer, for it is the filling up of the cells at the base, that causes the bees to build long queen-cells; so when the queens hatch, I find in almost every instance, ⅛ to ¼ of the queen-food left in the bottom of the cells.

This plan has not failed in producing queens which are, in my opinion, of the best type in all respects, if bred from good stock. There need be no pains taken as to the stock, when the cells are started. I can get double the number of cells well supplied in this way, and am detained only about three days longer for my queens; so I will have gained time.

Welton, Iowa.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Sept. —.—Maine, at Livermore Falls, Me.
J. F. Fuller, Sec., Oxford, Me.

Oct. 3.—Progressive, at South Newbury, Ohio.
Miss Dema Bennett, Sec., Bedford, O.

Oct. 11—12.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Dec. 4-6.—International, at Brantford, Ont., Canada.
E. F. Holtermann, Sec., Romney, Ont.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Robbing and Carbolic Acid.—P. L. Forgan, Sloan, Iowa, on Sept. 16, 1889, says:

I find it is not generally known, even amongst experienced bee-keepers, that a few drops of carbolic acid, on wet grass or hay, placed in front of a hive that robbing has begun on, very quickly dispels the robbers; and where confusion and riot formerly prevailed, order and quiet reign again.

Well Satisfied with Results.—W. B. Thorne, Glenn, Kans., on Sept. 16, 1889, writes:

I am not willing to give all the credit of a fair honey crop to the AMERICAN BEE JOURNAL, but I will divide the honors. I was advised by the BEE JOURNAL to keep my bees in the cellar as long as danger of cold weather ex-

isted, but they would not hibernate, so out they went, only to test their ability to withstand the coldest of weather of last winter, which came in February. This "hibernated" effectually some entire colonies, and from 1 to 2 quarts of each of the remainder. This reduced my prospects very materially. Considering the poor commencement for the season's work, I cannot complain, having taken an average of 100 pounds of extracted honey per colony, and 2 pounds of comb honey; besides probably an average of 20 pounds yet untaken. I find that the profit of a 160-acre farm lies chiefly in 31 colonies of bees, the honey of which sells readily at 10 cents for extracted.

Taxing Bees in Iowa, etc.—G. B. Olney, Atlantic, Iowa, writes:

I feel very much indebted to the AMERICAN BEE JOURNAL—and why should I not, when the perusal of one article from the pen of a good, practical bee-man, set me to cogitating like unto, "Why can't I do that?" Yes, that old comb, uneven, the cells half-filled with bee-bread, the balance with honey, just put it on a warm stove; no quicker said than done, and the next day I sold that honey for cash in hand, $2.90. Just send that paper right along all the time. That $2.90 will pay for it for about three years.

Our bees are being assessed for taxation at a cash value of $2 per colony. Some owners claim that bees are a perishable article, and not taxable, and thereby refuse to list them. Are bees taxable? Stock over six months old, on the first of January of each year in this State, is subject to taxation. Worker bees are not six months old on Jan. 1. Please answer through the BEE JOURNAL, as there are others that are also in the dark.

[According to that interpretation, the worker bees would not be taxable, but the queens might be. We are not conversant with Iowa laws, and leave the matter to be answered by our Iowa lawyers.—ED.]

Making Frames for Hives, etc. Locke Ferree, Milroy, Ind., on Sept. 12, 1889, writes:

The honey season is about over here, and I have taken about 175 pounds of comb honey. I had 4 colonies in the spring, and increased them to 11. I am going to make some new hives in the winter. I am thinking of making the end-pieces, that connect the top and bottom bars, 1½ inches wide, and the top and bottom bars ⅞ of an inch, setting the frames on a metal-rabbet at the bottom of the hive. 1. Would the bees propolize the ends of the frames so that they would be hard to get out (if the edges of the ends were planed smooth), made in the above way? 2. How close should the ends of the frames come to the ends of the hive?

[1. The closed-end frames have been used for many years. The "Quinby" frame was made in that way, but the end-bars, extending below the bottom-bars, served as "legs" for the frames, and "stood" on the bottom of the hive. If they are planed smoothly, and fit tight, the bees will not think it necessary to propolize them, and they can be manipulated with comparative ease; but if they do not fit tight, there will not be much pleasure in manipulating them.

2. Just leave space enough for raising and lowering them. The passage-ways for the bees should be over the top and bottom bars, if the hives are properly constructed.—ED.]

Good Average Per Colony.—Fayette Lee, Cokato, Minn., on Sept. 12, 1889, says:

I commenced last spring with 41 colonies of bees, and have increased them to 76 colonies, and have taken 5,300 pounds of honey, 900 pounds of it being comb honey, an average of 130 pounds to the colony, spring count. The honey harvest is over for this year.

Hiving Swarms, etc.—Miss Lucy J. Sherman, Hanover, Vt., writes:

I was much amused by the article on page 521, by W. Hood, especially in his account of climbing the tree, while his wife and son stood by and ridiculed him. I never climbed a tree after bees, but I know just how it feels to see them swarm, and not have the slightest notion what to do. If I were in that man's place, the first thing would be some queen-traps, and if there was some mistake about leaving one off, or there was one hive which a trap would not fit without some tinkering, and I had not tinkered it, and the first I knew there was the swarm in the tree—I should say: "Wife, bring me an old sheet. George Washington, climb that tree and tie this rope around the limb that the bees have clustered on." Then I should take hold of the rope, and give the tree a quick jerk, and the bees would fall on the sheet, which I should fold over loosely, and carry to the hive. If this be repeated until the cluster does not return to the tree, you may be sure that you have the queen, and your swarm is safe.

Next year I shall try putting one hive above another, leaving the new swarm on the "1st flat," and the old colony on the "2d flat." That is educating bees to live in "flats." I have never had but one swarm on Sunday, and that was a "bee-atitude" not mentioned in the Sermon on the Mount.

Bees Did Well.—W. H. Fowler, Jennings, Mich., on Sept. 17, 1889, says:

My bees did very well this season. I had 2 colonies, spring count, and increased them to 5. I took 85 pounds of honey from one, and from the other I got the increase. The "Little Wonder" bee-smoker I find is a "daisy" to handle bees with.

Honey and Increase.—Henry Van Tress, Oakland, O., on Sept. 16, 1889, wrote as follows:

I commenced the season with 36 colonies of bees, mostly weak, and have taken about 2,000 pounds of honey from them, and increased to 70 good, strong colonies. I took the premiums at our Fair, on honey and bee-hives. It was not very well attended, on account of there being Fairs around us.

Best Season Ever Known.—Mrs. B. J. Livingston, Center Chain, Minn., on Sept. 16, 1889, writes:

Old bee-keepers say that this has been the best year for honey that this (Martin) county has ever known. The season has been very dry, but linden, white clover, buckwheat, and now golden-rod and Spanish-needles, all seemed to furnish honey already ripened, and all ready to seal up, as fast as gathered. It has been my first season with bees, and I dare say that I have been too much interested in studying them, to make the most of them; yet my 4 colonies have given me over 200 pounds of comb honey, mostly in one-pound sections; and I have increased them to 8, with 8 Simplicity brood-chambers heavy with honey—and surplus still coming in.

A Favorable Word from any of our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	Club
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75

How to Propagate Fruit	1 50	1 25
History of National Society	1 50	1 25

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

We Want a Representative at all the Fairs to be held this season. The AMERICAN BEE JOURNAL is the recognized defender of the rights of the bee-keepers, against the attacks of the ignorant and prejudiced. There are thousands who would gladly subscribe to it if it were only brought to their notice, and its claims presented. When making an exhibit, please send for our *Colored Posters* and sample copies, and get up a club. In this way you will not only pay yourself for the trouble, but also aid the pursuit, and its defense all over the country.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

Many Good Advertisers invite our readers to send for their descriptive Circulars, etc. It will pay to get these, and see what is for sale, by whom, at what prices, and what things are offered. Every one can learn something in this way. Please always tell advertisers *where* you saw their cards; they like to know, and we like to have them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—It is coming in slowly. We quote: 1-lb. sections of white, 15@16c.; 2-lbs., 14c. Extracted, white, 8@8½c.; dark, 7c.
Aug. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.20—@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange bloom and California, 8c.; buckwheat, 6c.; common Southern, 60@70c. per galloo. Comb honey, fancy white 1-lbs., 16c.; fair 1-lbs., 14c.; fancy white 2-lbs., 14c; fair 2-lbs., 11@12c.; buckwheat 1-lbs., 10@11c. Demand is good for fancy white 1-lbs., unglassed or in paper boxes.
BEESWAX.—23@24c.
Sep. 16. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2 lbs., 8@9c. Extracted is in light demand, values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it can not be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c.; white clover and basswood, in kegs and barrels, 7c.
BEESWAX.—25c. R. A. BURNETT.
Sep. 10. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.
BEESWAX.—23c.
Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5½c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—We quote: Fancy white 1-lbs., 16c.; 2-lbs., 14c. Off grades about 2c. per lb. less. Buckwheat 1-lbs., 11@12c.; 2-lbs., 9@10c. Extracted basswood and clover, 8c; orange bloom, 8c.; California amber, 7@7½c.; buckwheat, 6@6½c.; Southern, 65@70c. per gallon
HILDRETH BROS. & SEGELKEN,
Sep. 10. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It has arrived quite freely, but owing to warm weather, prices have had to be abaded. Our market to-day is: White 1-lbs., 16@18c.; 2-lbs., 16@18c. Extracted, 8@8½c. We look for better prices later, and would not advise bee-keepers to rush honey on the market.
BEESWAX.—None on hand.
Sep. 9. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Comb, 11@16c. Demand fair for all kinds. Arrivals of extracted are good, while good comb honey is scarce in this market.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Sep. 11. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—It is selling very slowly at 14c. for 1-lb. white comb, and the prospects are for lower prices. We have been trying to hold the market to 14@15c., but parties in Iowa and Illinois are offering and selling white 1-lbs. at 12@12½c., delivered here and at other points in Kansas. Receipts are large, and in order to sell we will have to meet these prices.—Extracted, white, steady at 7@8c., amber, 5@6c.
BEESWAX.—20c.
Sep. 14. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

Can You Believe It?—The complete works of Charles Dickens in 15 volumes, nicely bound in paper covers, are mailed to our subscribers, postage paid, with one year's subscription—all for $2.10. No one who sees them can understand how they can be produced at that price, including postage!

It pays to be a subscriber to our papers, for none will be sold at that price to any one but subscribers. They cannot be sent to any foreign country at that price. These books will be sent *as a premium*, postage paid, for four subscribers at one dollar each.

As each set will be ordered from and mailed by the publishers, there will be an interval of a week or ten days between the receipt of the money and the mailing. Complaints should be made if not received within twenty days. Complaints must be made within five weeks to secure proper investigation.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

Advertisements.

THE AMERICAN BEE JOURNAL CIRCULATES ALL OVER THE WORLD
PUBLISHED BY THOS. G. NEWMAN & SON, CHICAGO, ILL.

THOMAS G. NEWMAN, EDITOR.

Vol. XXV. Oct. 5, 1889. No. 40.

EDITORIAL BUZZINGS.

Hundreds of Stars in the pretty sky;
Hundreds of shells on the shore together;
Hundreds of birds that go singing by;
Hundreds of bees in the sunny weather.

Hundreds of dewdrops to greet the dawn;
Hundreds of lambs in the purple clover;
Hundreds of butterflies on the lawn;
But only one *mother* the wide world over!

If You are Extracting, beware of extracting the honey too closely. Leave enough for winter stores, or you will repent it.

A Strong Colony of Italian bees are moth-proof. Keep them strong, and they will never be troubled with the moth.

Buffalo is suggested by the *Canadian Bee Journal* as the place for holding the International Bee-Convention in 1890. The suggestion is a wise one, and we second the motion.

The Mother of Mr. S. F. Reed, North Dorchester, N. H., died on Aug. 25, 1889. The BEE JOURNAL offers its condolence. Bro. Reed's bees are also in trouble, for he writes: "We have no honey this season; it has been too cold and wet."

Friend Doolittle has been "on the sick list" for two or three weeks. He is reported to be "around a little," but he can only do *little*—of course! A lack of circulation seems to be the main difficulty. His feet and legs seem to feel like "sticks," more than like flesh and blood; they lack warmth and feeling. The BEE JOURNAL offers its sympathy, and hopes that he will soon resume his usual health and strength.

Against Nature.—A writer in the *Western Apiarian* has a "funny" way of expressing himself on this subject. It will create a laugh, and that will be of some benefit. Here it is:

I satisfied myself years ago, that it was an absolute necessity for queens to have a chance to lay some drone-eggs, and for that reason I put into a hive that I am rearing queens from, a full drone comb, or give them an empty frame and let the bees fill it with drone comb, so that the queen can lay in it; because reason, instinct, and nature's laws and facts in sight, prove that laying drone-eggs is a rest to the spermathetic production; a preventive to rearing those diminutive worker-cell drones, and render the workers and queens of a stronger constitution.

We must not violate nature's laws, to suit our own notions, because old Dame Nature is a stern and set old critter; she carries a positive and powerful sway; and when she says, "So far, and no farther," you had better give in to her, or she will give a yank on the halter, and make your heels break your neck every time.

From such lessons, that have cost me time and money, I have been forced to abide by nature's laws, and look for a place where I can work with her help, and not against her.

I am not smart enough to outwit the old dame; and my belief is, that she has every one living by the nap of the neck.

So much for what we can or cannot do.

The Fools are not all dead yet, says the *Farm, Field and Stockman* of last week, when mentioning the "glucose and paraffine comb" story, which is going the rounds of the press now-a-days. This is its item:

The idea that comb honey is ever manufactured is as absurd as it is false, and has been refuted so many times that further denial seems superfluous, and yet we occasionally see a newspaper with an article on glucose and paraffine, and the American Encyclopedia contains a rehash of the same old slander. The fools aren't all dead yet.

Mrs. L. C. Axtell, of Rossville, Ills., writes to an exchange as follows about her honey crop:

We have had a cooler summer than is usual, but as we had an abundance of rain and a warm winter, white clover was very abundant, and about the time the clover was in the height of bloom, the weather was quite warm and moist, consequently we secured a good yield of honey from the clover, or about 50 pounds per colony in our two apiaries of 207 colonies.

The Honey Crop in England is said to be quite large this year. An exchange thus mentions the honey yield in Yorkshire, England:

It is many years since bees have had such a season for honey-gathering in the valleys as during the present summer. Although a large number of colonies were lost during the winter, with the wet and unfavorable moor season, still what remained to start the spring with have done exceptionally well, and swarmed most prolifically. The long period of bright sunshine which was experienced during the months of June and July, was the saving of the bees in this part of the county. The quality of the honey is excellent, and there is a grand heather bloom on the moors.

A Fishy Story is told about honey and gold, and is as follows:

Clinton A. Snowden, of Tacoma, saw bees going and coming from a hollow tree. He built a fire, smoked out the bees, and cut down the tree to get the honey. He found a great lot of it; but, better still, a large quantity of gold was in the hollow trunk. It had evidently been deposited there by nature, and the wise men out there think that it was "gradually washed up every year by the flow of sap, and in course of time accumulated into a solid mass." Mr. Snowden got over $7,000 for the gold.

It is foolish to say that the gold was washed up into the tree by the sap. The brain which invented the idea merits the cognomen of "sap-head," so often bandied about by urchins on the street. But that item will be copied by thousands of papers, and go the usual rounds of the press, without a thought of questioning its truthfulness.

A Handsome Present.—As the convention season is just approaching, we want to direct attention to the little book which every bee-keeper needs when attending these gatherings. Here is what Mr. J. E. Pond says about it:

DEAR EDITOR:—Your little "Convention Hand-Book" is really a very handy thing. At two or three different times I have been called on to get up something for special occasions, and I have found the "Hand-Book" just the thing to save me quite an amount of time and labor, as it was a very simple matter to use the "book" as a basis, making only such few changes as were necessary to fit the special time and place.

I can cordially recommend it to any one who may desire not only information, but a *perfect form* for organization of a convention of any kind of a convention, as it will "fill the bill" completely. J. E. POND.

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

We make every subscriber this offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Hand-Book for your trouble—by mail, postpaid. Here is a grand chance for all to get a valuable book without costing them a cent!

An Appendix to "Scientific Queen-Rearing," by G. M. Doolittle, is given in the *Second Edition*, which details his further experiments in his methods of Queen-Rearing.

This "Appendix" will be mailed free of cost to all who have the first edition, upon application at this office. It is now ready for delivery.

The "Second Edition" of this interesting book will be mailed to any address, postpaid, for $1.00.

Green's new Fruit Catalogue (Rochester, N. Y.) is on our desk. Pears a specialty.

GLEANINGS OF NEWS.

California Honey Crop.—On page 571, Mr. J. F. Brown, of Virginia, said that the Eastern market reports gave the impression that the California honey crop was "very large," and that this was used as a lever to reduce the price of honey generally. We suggested that the honey-producers of California report the true condition of affairs there, and thus aid in sustaining prices, for the benefit of all honey producers. We have received quite a number of reports from that State, and will here present them to our readers. If any one desires to use an extra copy of this BEE JOURNAL by sending it to their retailer or jobber, they can have another copy to keep "file" complete, by sending for it at once—before our stock is exhausted.

EDITOR OF THE AMERICAN BEE JOURNAL:—At your request (page 571) I send you a report of the honey crop in San Diego county, California. From the best information I can get, it will not exceed three hundred thousand pounds, or less than half the crop of 1888. The largest crop ever raised in this county was in **1878**, when over **three million pounds** was produced, and a total of about seven million pounds in Southern California.

I see an estimate of this year's crop of honey published in a San Francisco report, which is three hundred thousand pounds for Southern California. I believe this can be safely cut in two, and the one-half will exceed the actual product for this year.

The rapid settlement and clearing up of the heretofore wild lands in this county, as well as in adjacent counties, has in a great measure destroyed the bee-keeping industry. It is only in the remote districts that any considerable attention is given to the business.

Fruit-growers generally are clamoring for the removal or destruction of all apiaries in reach of their orchards or vineyards. Their requests are generally being complied with, or the incendiary torch does the work if it is not. I have "killed" and "broken up" over 700 hives of bees within one year, and had about 350 hives set on fire (probably on purpose) within the same period.

The price of honey has not been remunerative for some years, and very little attention, as compared with former years, is now given to the business.

The introduction of bee-keeping in this county in a great measure destroyed the sheep and cattle business, and now in turn the fruit and vineyard industries have destroyed bee-keeping, over a large extent of the county. These changes are in accordance with the eternal fitness of things, and the world at large is the gainer, though many there are who have suffered financially thereby.—J. S. HARBISON, San Diego, Calif.

In reply to your request for a report of the honey crop of California, I enclose a report just received from the *Western Apiarian*, of Ventura county. I think it a fair statement. You will see that the average is very small. There is not an average crop in any county in California. Some report almost an entire failure. I extracted 50 tons last year. My largest average was in 1884, viz: 237 pounds per colony. I have figured up the average since 1880, and I find it to be 70 pounds.

The following report will give the desired information for the whole county, and also present the names of most of the apiarists of this county. I have not had any faith in the honey crop since my return from the East last spring. I extracted from one apiary only. I have left the bees in first-class condition, and plenty of honey in the supers. I did expect to extract 6 tons, but decided to leave it with the bees.—W. T. RICHARDSON, Simi, Ventura Co., Calif.

The following is a Statistical Report of colonies of bees and tons of honey of apiarists of Ventura county, California, tabulated by L. E. Mercer, of the *Western Apiarian*:

In answer to the request on page 571, I will say that from every source that I can gain reliable news, the honey crop in Southern California will not average over one-third of a crop, and in some localities it is a total failure; and when you take the honey crop of Southern California out of the California honey crop, there is *very little* left.

The crop in this locality was for the following prices: Extracted, from 5 to 6 cents; comb, from 9 to 11 cents; the latter in one-pound sections.—A. J. Foss, Fallbrook, San Diego Co., Calif.

In response to the request for honey-producers of California to give an estimate of this year's crop with former years, I would say that it is about equivalent to last year's crop in the counties of Los Angeles, Ventura, Santa Barbara, San Diego, and San Bernardino, which includes the great honey fields of Southern California. Most of the crop has been sold at 6 cents per pound. The crop is about one-half of what it should be in an average season. The hot weather since July 1, precludes the idea of a fall flow of honey in this region, unless the early rains help out.—C. N. WILSON, Los Angeles, Calif.

By request I will state the exact amount of honey in this locality. I have extracted about 13,500 pounds of honey this season from 175 colonies, fall count, while I had 16,000 pounds last year from 152 colonies, fall count. Neighbor B., who keeps a good many black bees, has 12,000 pounds of extracted honey against 25,000 last year. M. has 10,000 pounds this year, against 18,000 pounds last year. F. has 18,000 pounds against 48,000 pounds last year. He lost over 100 colonies last winter. And so it is all over San Bernardino county. Only a few bee-men in the best locality (foot-hills) report about equal to last year. If there is a big honey crop in California, it is not known here. For the last two days a strong north wind has set in, and bush fires are raging all around here, destroying all the sage; so our prospects for next year are not excellent.—WM. RICHTER, San Bernardino, Calif.

The *Rural Californian* for September gives this estimate for this year's crop of honey in California:

This year's crop of California honey is in good demand, two-thirds of it has already changed hands at fair prices to the producer. The yield for the season will not exceed half what was counted on by the bee-keeper in April last, and for the interests of those permanently engaged in the business, it is perhaps best just as it is. A large crop of honey requires a large outlay for help in the handling of bees in the early part of the season, and of late years it is very difficult to get efficient, reliable help for the apiary in Southern California. A big yield of honey requires a large stock of packages in which honey is marketed, and whether one has comb or extracted honey it will cost one cent a pound to pack it for market. Then with a large crop comes low prices, and the honey producer finds large outlay; an immense amount of labor, and small pay. The high price this year, grows out of the fact that we have had three years in succession short or half crops, and the market bare in August.

The honey crop has been almost a failure here—only about 150 tons of honey in the county. That much, 150 tons, or 15 carloads, is a good deal of honey, but we often have in this county 600 tons. Our crop is 32,000 pounds. Honey is selling here in Ventura at 6¼ cents in 60-pound tins.—L.E. MERCER, Ventura, Calif.

The honey crop this year is about 3,000 pounds, while last year, with a less number of colonies of bees, we secured nearly 7,000 pounds of honey. The crop this year has averaged about 30 pounds to the colony of bees.—J. SANDERS, Box Springs, Calif.

The honey season here is very poor. A frost in the beginning of May injured the Alfalfa, I think, so that it did not bloom as well as usual, and has yielded honey very sparingly. My scale hive gains on an average one pound per day. Many colonies have stored nothing in sections. I did not have a single natural swarm. It is the poorest honey season I have known in the county for nine years.—WM. MUTH-RASMUSSEN, Independence, Inyo Co., Calif.

A Tempting Offer for those who are willing to help get new names for our JOURNALS:

Some are desirous of collecting names at once, and we would like them to do so, and thus begin early to get new readers for 1890.

We propose to all who subscribe now for 1890, to *give* them all the rest of the numbers of this year *free*—so the sooner they subscribe, the more they will get for their money.

Now, in order to pay our friends to work for our JOURNALS, we have gotten up special editions of Mr. Doolittle's "Scientific Queen-Rearing," (with Appendix), and Dr. Miller's "Year Among the Bees," bound with nice paper covers, and will *present* a copy of either book to any one who will send us two **new** subscribers for either of our JOURNALS (the BEE JOURNAL, weekly, or the HOME JOURNAL, monthly).

These editions are not for sale, but are gotten up specially for premiums for getting new subscribers. They are nicely printed, and will be sent *free* of postage, as pay for work to be done for our JOURNALS. Clubs need not be located at one post-office, and may contain one "Bee Journal" and one "Home Journal" to the same or different addresses; or both may be for either JOURNAL, as may be desired. Dickens or Waverley may be obtained for each subscriber in this club as offered on the last page of this JOURNAL.

The HOME JOURNAL is needed in every family, and it will be no trouble to get subscribers for it anywhere and among all classes of persons. For larger clubs of it, consult any issue, and our list of premiums.

Call upon your neighboring bee-keepers who are not subscribers to this JOURNAL, and secure the premium mentioned above. We strongly urge you to commence collecting names *at once*.

In sending in new subscriptions, remember to give the full address, with the county, and at the time of sending, state that the names enclosed are for premiums, if the premiums are not then selected.

Third Covers.—Since the publication of the article on "Wintering," by Mr. C. F. Muth, on page 601, there have been many inquiries as to what Mr. Muth meant by "third covers." We asked him to explain, and here is his reply:

Our brood-chambers are 20¼ inches long, outside measure. We cover them with three boards, each one of which is 6⅞ inches wide; as it takes three to cover a brood-chamber, we call them "third covers." They cover also our one and two pound section boxes. It is immaterial for wintering, whether we use third or half covers, or whether one board covers the brood-chamber. But I prefer wood to enameled cloth, for the same reason that I prefer a woolen blanket to a rubber cloth. There is always something damp and uncomfortable under the latter.

Now allow me to add something to my article on wintering, which may prove of interest to some, if it is a repetition of the old story, viz:

If your hives are prepared as described on page 601, then do not be afraid of having the combs filled, or partly filled, with bee-bread; but as bee-bread is of but little value as winter food, hang these combs towards the sides of the hives. They will cause no diarrhea, because the bee-bread will not sour, but they will prove valuable when mild weather begins, and the bees commence to breed.

Do not fear for the welfare of your bees when, in fall, they had access to cider-mills, or laid in for winter stores a stock of honey-dew. They will prosper and thrive on it, and come out healthy in the spring; and if you commence to contract the brood-chambers, to promote breeding about the beginning or middle of March, you will never envy your cellar-wintering neighbors on account of early swarms.

If I differ from the majority of bee-keepers, it does not alter the situation, for I have been as successful a bee-keeper, perhaps, as any of them, and produced as large crops of honey under greater difficulties than the most. CHAS. F. MUTH.

Cincinnati, O., Sept. 24, 1889.

Honey a Staple Article.—In order to make honey a staple article, it is absolutely essential to *create a market* for it. **This can be done** if bee-keepers are willing to undertake the work. All that is necessary is to formulate a *plan*, and then *work it out*. Are honey-producers willing to test the matter? If so, we submit a plan from Mr. H. O. Kruschke, a successful apiarist of Wisconsin, for their consideration; and we commend its careful perusal:

MR. EDITOR:—I want to make a few suggestions. I like your pamphlet on "Honey as Food and Medicine" very much, but I think it would be an improvement if a similar pamphlet was issued like the Medicine Almanacs, to be looked for every year, and be useful at all times. Get them up in large editions, and let them be attractive. The honey-producers can well afford to pay for them, because of the enhanced price of their honey. Put into it reports of what has been done with honey by the different consumers, medicinally and in culinary uses. I could furnish a good report from a neighbor of mine, who had the misfortune to lose an eye. Nothing helped him, until he used honey, though he had the best of doctors to prescribe for it. You can figure out what 100,000 can be gotten up for, how large, attractive, etc. Then how many will subscribe for them. I will take 1,000 annually, if the price does not exceed $20.00. I want to distribute them gratuitously.

They should contain directions for the care of honey; how to liquefy extracted honey when it has granulated; a brief statement that comb honey is not adulterated, etc.

These suggestions, if carried out, will put many dollars into the pockets of honey-producers. They are of more practical importance than anything I have seen brought out at any meeting of bee-keepers in the world. I am ready to pay for anything that has DOLLARS at the end of it.

H. O. KRUSCHKE.

The plan is a practical one! What is it that makes such enormous sales of the patent medicines? The persistent advertising done by their proprietors; and one of the chief methods—we may say the most successful one—is the scattering of millions of Almanacs every year into the *homes* all over the country, where they are consulted and kept for reference "the whole year round."

Mr. Kruschke, noticing the success of the Patent Medicine Almanacs, desires to test the same plan for honey, and we have promised him to put it into immediate operation, if the bee-keepers who have honey to sell will "second the motion."

The "Honey Almanac" will consist of 32 pages, with an illustrated page devoted to each month; the other pages will contain illustrations and matter about the various uses of honey for medicine and food, and a number of recipes for making honey cakes, honey cookies, honey pastry, honey snaps, honey mead and other healthful drinks made with honey; and testimonials from those who have used the various honey medicines, stating its marvelous healing and preserving power, as well as its nutritious and health-giving properties.

We will print the honey-producer's name and address on the first page, free of charge, when ordered in lots of 100 or more—in something of this style:

PRESENTED BY
JOHN DOE, SMITHSBOROUGH, IOWA.
Whose honey may be obtained at
The Grocery and Meat Market of Wm. Johnson.

This will not only tell where the honey can be obtained, but will create a reputation for the honey-producer, which will be lasting and profitable.

They will be delivered at the Express or Freight offices here at the following prices: 100 copies for $2.50; 250 copies for $6.25; 500 copies for $10.00; or, 1,000 copies for $15.00. They ought to be *scattered liberally* in order to create a universal sentiment in favor of honey consumption.

This Honey Annual should be ready for delivery in about a month, and no time, therefore can be lost, if it is to be put to a practical test this season. If sufficient quantities are spoken for *at once* to warrant the outlay, we will publish it. At least from 50,000 to 100,000 should be scattered.

Now, we would ask every one who reads this to consider whether these Almanacs would not do him considerable good in his locality in selling his honey, and giving him good returns for the outlay of the small sum necessary to get them.

If so, please sit down *at once* and write us a Postal Card, stating how many copies you will take. You need not send any money until we decide whether to publish it or not, and that will be announced in the BEE JOURNAL.

Also, we request every one who has tried recipes for making honey cakes, cookies, candy, mead, or anything for consumption where honey is used, to send such to us. Also all recipes for honey used as medicines.

Please do this **at once**, in the interest of the pursuit in general and yourself in particular. If you neglect this matter, it may cost you hundreds of dollars in the decline in price of the honey you have unsold. "*Now is the accepted time.*"

The Chicago Convention will be held on **Friday and Saturday, Oct. 11 and 12, 1889.** The Railroad Traffic Association has made a rate of one fare for the round trip from any point within 200 miles of Chicago, good on Oct. 10, and can be used on any train returning after that until Monday, Oct. 14. The first session will be held at 9 o'clock in the morning of Friday, and an adjournment can be had on Saturday afternoon in time for those who may wish to return on that day.

The Fearful Cyclonic Storm which recently devastated the Atlantic coast is pictured in *Frank Leslie's Illustrated Newspaper* this week, with wonderful accuracy and striking force. In all, ten pictures are shown, forming the leading feature of the paper this week.

THE GOLDEN-ROD.

Sweet flower that by the wayside grows,
And where the noisy brooklet flows,
How far and widespread no one knows—
Sweet Golden-rod.

A nation's suffrage flows to thee
To preside o'er its destiny
And brighten all futurity—
Loved Golden-rod.

Thy thornless stem shall teach us peace,
The arts of war to give release,
And from unholy strife to cease—
Dear Golden-rod.

Yet if war's passion shall arise,
The smoke of conflict dim our eyes,
A rod be thou to enemies—
A Golden-rod.

When peace returns, a symbol be
Of blessing and prosperity,
Which fills the arms of charity—
Bright Golden-rod.

The maiden pins thee to her breast,
By little children e'er caressed,
In love of all forever blessed—
Loved Golden-rod.

OUR GOLDEN ENSIGN.

Flower that glad rays with charm indue,
With conjuring rods evoked in saffron dye,
To vest nude hills in joy of hue,
To paint with cheer each vale's sad view,
And point above to Freedom's sapphire sky,
Our nation's beams now summon thee,
For growth of Liberty aglow to stand,
Her figured strength in bloom to be—
In garlands sun-wrought for the free,
An aureate ensign on her golden land!
—*Union, Brandon, Vt.*

QUERIES and REPLIES.

Drones from Eggs that Would Have Produced Workers.

Written for the American Bee Journal

Query 657.—1. Have the worker-bees the power to remove the fertilizing quality, and rear drones from eggs that otherwise would have produced worker-bees? I made a colony by dividing, to experiment, and did not give them a solitary drone-cell, but gave them combs built entirely on full sheets of foundation; nevertheless, they reared about a dozen drones near each of two or three of the queen-cells. 2. Where did they get the drone-eggs?—Nebraska.

1. I do not know. 2. I do not know.—MAHALA B. CHADDOCK.

1. No. 2. Probably from drone-laying workers.—DADANT & SON.

1. No, the *spermatozoa* are beyond their reach. 2. A worker laid them.—M. MAHIN.

1. I sometimes think that perhaps they have, as I have noticed the same thing.—R. L. TAYLOR.

I do not know, but your experiment would seem to demonstrate it.—C. H. DIBBERN.

1. I think not. 2. They were laid in the cells when you made the division, I presume.—J. M. HAMBAUGH.

1. No. 2. They probably "stole 'em" from some other hive. Bees have been known to do so, under similar circumstances.—WILL M. BARNUM.

1. Bees do many strange things that we do not always understand. 2. They were laid by the queen.—H. D. CUTTING.

I do not know. I have made similar observations, that I could hardly explain any other way; still, it is easy to be mistaken.—C. C. MILLER.

1. I think not. I have seen the same thing a number of times. 2. I think that the worker-bees furnished the drone-eggs.—G. L. TINKER.

They have no such power. The drone-eggs were laid by laying workers, in case they were not already laid in the comb by the queen, before you gave it to them.—J. P. H. BROWN.

I could not say. I have had the same experience that you speak of, but how the change was accomplished, I cannot tell.—G. M. DOOLITTLE.

I cannot guess. I have not paid much attention to this part of bee-culture, as I have been too busy trying to make a living out of the business.—JAMES HEDDON.

I think that they have the power to do so, but I was not aware that they used it. Your statement rather looks as though they do sometimes remove the fertilizing fluid.—EUGENE SECOR.

1. No. 2. The eggs were unfertilized when deposited by the queen, or got so by exposure or other causes. Bees have neither the power to fertilize nor unfertilize the eggs.—P. L. VIALLON.

No! I feel sure that they do not, though some bee-keepers think that they do. I should say that in the case you mention, the comb had some drone-cells, or else drone-eggs, or unimpregnated eggs in the worker-cells.—A. J. COOK.

1. I think not. 2. Queens, especially very old ones about to be superseded, sometimes lay "drone-eggs" in cells of worker size. The "drone-eggs" mentioned might have been deposited by laying-workers.—J. M. SHUCK.

1. You are entering the realms of mystery. Laying-workers might produce the state of things which you describe; in fact, there are several ways in which such a state of things might be brought about. You do not state a very full proposition, but as stated, I do not think that a positive answer can be given.—J. E. POND.

1. No. 2. The eggs had been laid by the queen that laid the worker-eggs from which the queen-cells were reared. I have often noticed that worker-bees will neglect to care for drone-eggs at certain times, when they have a good queen; while if the combs containing such eggs (drone-eggs) happen to be given to a queenless colony, the queenless bees will be careful to nurse the eggs into drones.—G. W. DEMAREE.

1. The *spermatozoa* are not under their control, nor within their reach. 2. In all probability the drone-eggs were from laying-workers.—THE EDITOR.

Bees Building Partially-Completed Queen-Cells.

Written for the American Bee Journal

Query 658.—Why do bees that have no notion of swarming, build what appears to be partially-completed queen-cells, which never contain eggs or larvæ?—L. M.

I do not know.—J. M. HAMBAUGH.

I do not know.—EUGENE SECOR.

Do they not have just a *little* idea of it?—C. C. MILLER.

That is what has often puzzled me.—C. H. DIBBERN.

I have never known them to do so, unless they were preparing to supersede their queen.—M. MAHIN.

In anticipation of the time when they may wish to swarm or supersede their queen.—R. L. TAYLOR.

The bees have an instinct to always have these queen-cell bases ready, whether they afterward conclude to use them or not.—JAMES HEDDON.

Do you know that they had no notion of swarming, when those cells were started?—H. D. CUTTING.

To show the inconsistency which prevails throughout the material kingdom. "Next."—WILL M. BARNUM.

I suppose that it is done in anticipation of a flow of nectar, that fails to come.—G. L. TINKER.

The motto, "In time of peace, prepare for war," seems to be applied to bees, as their instinct makes them always on the alert.—P. L. VIALLON.

I do not know. I do not know that bees have a *reason* for doing *anything* that they do.—J. M. SHUCK.

They build them in anticipation of that great event. They desire to keep busy, and to employ all their spare time.—J. P. H. BROWN.

I do not know what causes them to do this, but I do know that in the past I have taken advantage of this fact, in using these queen-cups for "cradles" in which to rear the best of queens.—G. M. DOOLITTLE.

It is very common to see embryo queen-cells, started by any prosperous colony when gathering honey rapidly, whether they swarm or not. But how does the querist know that the bees have "no notion of swarming," at the

time the cells are started? I have seen cells in different stages in the process of building, even to completion, or capped cells, and yet they would turn up missing, and no swarm would issue; but this proved to me that the bees did have some "notion of swarming," which was afterward abandoned. —G. W. DEMAREE.

Bees never build nor start queen-cells, unless they have some notion that a queen will be needed. Those half-grown queen-cells may have contained eggs at one time.—MAHALA B. CHADDOCK.

Do they? You ask a question, presupposing a state of things that may not exist. In case, however, that your supposed statement is correct, you are asking a question to which the only answer must be a *guess*.—J. E. POND.

How do you know that they had "no notion." The very fact that they commenced to form the cells, indicated some "notion," did it not? Like us of the *genus homo*, bees often commence a work, and from discouraging circumstances, back out. Is not yours such a case?—A. J. Cook.

When the bees commenced to build those "queen-cells" they evidently had a "notion" to swarm—but they might have expected a rich honey-yield, which the elements prevented, in some way, from coming, and, like other beings, "changed their notion," and left their building incomplete, as millions of other buildings have been started but never completed. Insect folly is no worse than man's folly. We have often heard of an unfinished building, when going to decay, called "somebody's folly."—THE EDITOR.

Convention Notices.

☞ The Northwestern Bee-Keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., in Chicago, Ills., on **Friday** and **Saturday, Oct. 11th and 12th**, at **9 a.m.** Arrangements have been made with the Hotel for back room, one bed, two persons, $1.75 per day, each; front room, $2.00 per day for each person. This date occurs during the Exposition, when excursion rates on the railroads will be one fare for the round-trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."
W. Z. HUTCHINSON, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Bomney, Ont., Canada.

☞ The Union Bee-Keepers' Society will meet in Mount Sterling, Brown Co., Ills., on Oct. 23 and 24, 1889. The prospects are very flattering for a grand time, and all who are interested in bees or honey are cordially invited to attend.
J. M. HAMBAUGH, *Sec.*

MAINE FAIR.

Bees and Honey at the Maine State Fair.

Written for the American Bee Journal
BY L. F. ABBOTT.

Maine has to add the present as the third extremely poor season for honey gathering. Three such seasons in succession, with hard winters intervening, is not very inspiring to the apiarist who has just faith enough in the business, under the most favorable conditions, to devote a few spare hours to his bees, and get what honey he can from the least outlay and care.

But there are a few bee-keepers in Maine who, while they know that bees cannot be kept profitably unless climatic and other conditions are favorable, still keep their colonies up to nearly their highest mark, as to numbers, and hope for a change for the better.

Under the depressing condition which the honey interest has been surrounded from the above cause, it was not to be expected that bee-keepers would show much enthusiasm in making an exhibit at the State Fair at Lewiston this year; but when the bee-men focused at the exhibition building on Tuesday, Sept. 10, the opening day of the fair, they shook hands all around, and looked in surprise at the splendid exhibit, both in quality and quantity, of honey displayed, and the comprehensiveness of the exhibit in other directions. In fact, as Mr. Jonathan Pike remarked—to whose activity and faithful management, with that of Mr. J. B. Mason, of the *Bee-Keepers' Advance*, the success of the apiarian exhibit in the past as well as the present season is largely due—"this is the best exhibit of the bee-interest ever made in Maine."

Then, again, to a single exhibitor, Mr. E. H. Greeley, of Clinton, is due the credit of furnishing the back-bone of the exhibit in his grand display of honey in sections, and extracted; for, be it known, while the rest of Maine has been thoroughly under a cloud, as regards the honey interest, Mr. Greeley's bees have gone swimmingly on, producing exceptionally large amounts of honey each year, while the rest of us poor fellows have had to scratch around to devise ways to keep our bees alive. Mr. Greeley attributes his success to the large amount of Alsike clover accessible to his bees, the farmers in that section all sowing it freely for the excellent hay that it produces.

While Mr. Greeley was the main exhibitor, the honey display made by Mr. Pike, of Livermore Falls, was by no means a poor one. The whole of one side of the east wing of the second floor of the large exhibition building was filled with the apiarian exhibit. The honey was mainly arranged in three large pyramids, six or more feet high, built upon the wide table or counter. The base was formed of filled glassed section-cases, and those surmounted by sections tastefully arranged with jars and glass pails of extracted honey, placed at the corners, the whole verging to a point at the top, and surmounted with a single package of some form of extracted honey. Thus arranged, the display was attractive and beautiful.

Mr. Mason, of Mechanic Falls (as also did Messrs. Pike and Greeley), in addition to his honey exhibit, had full colonies of bees, and several small colonies in observatory hives. The Italian, Carniolan and blacks were the prevailing kinds shown.

Mr. S. H. Stockman, of East Auburn, has mainly the Italians, and had a large exhibit of implements for the apiary, besides bees and honey.

Probably the most varied and extensive exhibit of implements and tools necessary to carry on work in the apiary, was made by Mr. Mason.

Mr. Costellow, of York county, had also samples of supplies. Mr. Farr, of Castle Hill, Aroostook county, had fine samples of honey in cases from that famed honey region; but Aroostook, in common with the principal portions of Maine, has experienced an "off year" in its honey products this season.

Lewiston, Maine.

FALL WORK.

The Fall Crop a Failure—Uniting Colonies, etc.

Written for the Prairie Farmer
BY MRS. L. HARRISON.

Many persons rushed off their honey, selling at a low figure, anticipating a big fall flow, as the season was wet. In this they have been disappointed; the bee-police are now marching out the drones. Bloom has been abundant, but the winds did not favor the secretion of nectar. Of course localities differ; there have been some favored spots; but as a whole, the product is not large.

A bee-master can judge intelligently of the inmates of his hives, by watching their entrance. If the colony is

strong, it can be seen readily; and if they are killing drones, he knows that honey is failing in the fields. Where drones are seen in hives after most of the colonies have destroyed them, it will generally be found that they are queenless. It is much pleasanter working with bees before the honey season closes, therefore all colonies that are not storing surplus should be examined and their contents noted.

Where a small colony is found containing a young queen, but few bees and little honey, and another with more bees and honey, but queenless, they should be moved together, and when their locality is established, they can be united. These small colonies are often the best the following season.

If uniting is done sometime before frost, the bees will have time to arrange matters to suit themselves. If the brood is taken from several small colonies, put into a new hive, with the best filled combs, and all queens removed but one, the bees can all be brushed off together, in front of it, when they will enter peaceably, as it belongs to none of them.

Combs containing but little honey can be uncapped and placed in the upper story of the hive, and a little place opened for the bees to come up, when the bees will carry the honey below, and the dry empty combs can be packed away until another season.

Many valuable young queens perish in small after-swarms, and it is the height of folly to suppose that a handful of bees can maintain warmth enough to support life during our winters in this latitude. Better remove an old queen, introduce the young one in her place, and unite enough small colonies to form a good one. The sooner this uniting is done, the better.

Peoria, Ills.

"RICH" LAWSUIT.

According to the Law, Bees Cannot Commit Trespass.

Written for the American Bee Journal
BY C. J. ROBINSON.

It appears that one of the high tribunals of our State (New York) holds that honey-bees do violate the law, and commit *trespass* at common law, if it be proven that such bees go upon lands occupied by any party other than the party who owns or has charge of the bees.

"Trespass," as defined by Blackstone, is an unlawful act, committed with force and violence (*vi et armis*) on the person, property, or relative rights of another. So it is trespass, providing my neighbor proves to the satisfaction of a Court, that my bees stung him *violently*, but I could not be made a party to such trespass—the action could only be maintained against the party who takes part in the wrongful "act."

Such being the facts, there can be no such thing as *trespass*, in law, committed by bees; that is, no act can be committed by bees that Courts can take cognizance of judicially. It is a fact that Courts do adjudicate everything, including dreams, but if not overturned, their judicial *opinions* cannot be practically enforced.

Ex-Justice Douglass Boardman, of Ithaca, who wrote the opinion in the S. W. Rich case, is not well enough versed in matters outside of a city law-office to describe an apiary as "a pig-sty, or a slaughter-house," nor could he identify either one from the other. Here, in the Sixth Judicial District, in which Mr. Boardman was elected Justice of the Supreme Court, the question of competency is ignored, and the best politician, instead of the best lawyer, "gets there."

The venerable ex-Justice, like other men of confined views, fancied that "an apiary" is a pest in a community, else he was swayed by the influence of some "pig-sty" of some sort. For one, I would let the "old gent" down compassionately kind, though he sinned above all others; for while the world's greatest men unanimously have, from time immemorial, lauded *Apis mellifica*, and their life and labors have been a loved theme for great poets and philosophers during all time; and honey-bees are alluded to in the Bible as one of God's gifts to man, especially needful to His elect. Justice Boardman, be it known, in his written judicial opinion, overrules God's written word, and likens bees to pests.

There are narrow-minded people, who fancy that honey-bees are a nuisance, and such minds are too shallow to take in the fact that bees are a real blessing, though to them the blessing is in disguise, by reason of their short-sightedness.

Fruit-Farms Need the Bees.

Some years ago, I read in one of the annual reports emanating from the National Agricultural Bureau, of a case of a lady who expended a large sum in fitting up an extensive fruit-farm. After the trees grew to bearing age, they failed to produce, though they were fruitful of bloom each year. Finally, she consulted a scientific botanist, to learn the cause of her trees' failing to grow fair crops of fruit when they bloomed profusely. The Professor advised her to put an apiary among her fruit-trees, and by acting upon this suggestion, she was made happy in witnessing her trees loaded in due time with fruit. Others might be benefited by the suggestion, for it was so ordained.

Richford, N. Y.

TOBACCO.

The Use of Tobacco Smoke on Bees, etc.

Written for the American Bee Journal
BY W. M. WOODWARD.

I use tobacco smoke with bees very frequently, and see no harm from it, while it serves very important purposes. I use it to double up colonies (in the evening), smoking lightly at first, and then take one hive and place the queen and all, right upon the other, and then smoke pretty heavily, and the job is done.

About one in ten will fight some the next morning, but the tobacco will stop it. When fighting from this cause, I have had to smoke thoroughly as often as three times, before they would give it up entirely. This proves to me that the smoke is not very harmful, at least.

As to Mr. Hill's bees (page 540), the fact that the tobacco did not kill the first swarm when in full strength, is sufficient proof that it did not kill the second, after the hive had been washed again with clean water. But I want to ask, why wash "new" or clean hives at all? It is all nonsense, as I have proved for the last five years.

Bee-hives should be clean and cool, and salt and water or anything else is all useless. Give plenty of fresh air and shade, and let the salt water alone, and the bees will be just as well off, and just as well satisfied. I am confident that the tobacco did not kill the bees, but I cannot tell what did do it.

The Season of 1889.

The honey season is past, with very indifferent results for this locality—indeed I cannot report yet what it will be. There was no clover honey, on account of rain in June, which soaked the low land where only the clover was alive. Fall honey has come very slowly, and some colonies have stored no surplus.

Increase has been large—48 colonies have increased to about 120, but some have been doubled up to keep all strong. I have about 100 colonies now, and may get 1,200 pounds of comb honey, about half nice for the kind, and the rest inferior. It is not all off yet, though I am taking it off as fast as I can.

Bonfield, Ills., Sept. 21, 1889.

WAX.

Melting Combs by the Solar Heat, etc.

Written for the Pacific Rural Press
BY E. H. SCHAEFFLE.

It is an easy matter to melt down a a lot of comb, but quite different to produce a bright, yellow wax that will command the best prices. In the bee-business it is important that everything should be made to realize the highest price, as that is usually very low. Leaving out all of the expensive appliances, there is within the reach of every bee-keeper the home-made solar wax-extractor and the old can or kettle. By the proper use of these inexpensive ways, as fine wax can be produced from the oldest brood-comb as can be obtained through the use of any patented appliance. The best results and least labor attends the

Solar Wax-Extractor.

This is a light V-shaped box into which a V-shaped tin can, with flaring sides and ends projecting above and outward, is placed. Half way down the can a tray is fitted in snugly, and over this is tacked wire-sereen cloth. Above this, far enough to allow space for wax, is the lid with a glass cover. This must be tight to keep out the bees. Place the wax on the sereen, put down the lid, set the extractor in the sunlight, and you will have bright yellow wax from all kinds of comb. Save the white, which will make an article similar to the bleached wax of commerce. In the absence of tinsmith's tools, the following

Home-Made Solar Extractor

will be found to answer every purpose, though not quite as convenient: Tack two boards together, V-shaped, have them half-inch larger than a five-gallon coal-oil can. Across the ends of this V tack boards to act as rests. This is your holder.

With a can-opener cut a coal-oil can from top to bottom, on the corner. From this cut, cut each way at each end to the next corner; bend out the sides and ends for reflectors. Half-way down the V set a snug-fitting tray covered with sereen cloth. Across the top of the V, and below the flaring sides, fit a pane of glass, or several pieces of glass can be laid across, taking care to close all the edges so as to keep the bees out. Drop your can into the V-shaped holder, put in the comb, set the extractor in the sun, and let her go!

Those who perfer to melt their comb over a fire will find that a very bright article of wax can be produced, provided the can or kettle in which the wax is melted, is clean. The wax should not be allowed to boil. Fill the kettle up with water; when the wax is melted, pour into a box set over a pan. Have the bottom of the box covered with screen cloth. Set the strained wax and water out in the hot sun, for which midday will be found the best time. Tie a cloth over the pan to keep out the bees. Allow the pan to sit until the following morning, and then take out your wax and scrape off all the dirt adhering to the under side. If you wish it extra nice, re-melt with water, and set out in the sun as before. Old black wax can in this way be very materially improved in appearance. The secret lies in plenty of water, a clean kettle, not letting the wax boil, and, the most important part, in putting the liquid wax into a hot place and keeping it there, as the slower it cools, or the longer it remains liquid the cleaner it will be, as all the dirt is given a chance to settle before the wax becomes stiff.

Murphys, Calif.

GOLDEN-ROD.

It is a Good Honey-Plant in Wisconsin.

Written for the American Bee Journal
BY PAUL SCHEURING.

Golden-rod is a valuable honey-plant, at least in some localities. Mr. Eugene Secor (page 585) wants to know if golden-rod is not over-estimated as a honey-plant. I, for one, think that it is not. I have 50 colonies 23 miles from my home, in a good golden-rod district, this year, and I got an average of 30 sections per colony of nice golden-rod honey, after Aug. 10; the sections being so well filled, and the honey so heavy, that some of the cases of 30 sections each, weigh as high as 34 pounds. The sections are 4¼x4¼x2, as I use separators. Two years ago I hived 2 swarms of bees together in one hive on Aug. 11, and took 180 pounds of golden-rod honey from them before I put them into winter quarters; but a part of this was in 1¼-pound sections, and the rest in one-pound sections. I wish that Mr. Secor could be in the neighborhood of my apiary in the evening, when the bees are working on golden-rod, and just inhale the air for one minute—it is perfectly delicious!

The wild sun-flowers, of which Mr. S. speaks, are not plentiful here, but the bees work on them also, but the honey is darker than that from golden-rod, and nearly every bee has bee-bread when they work on the sun-flowers, which is not the case with golden-rod.

Once I visited a bee-keeper some 50 miles south of here, where there was plenty of golden-rod; he told me that his bees never got any honey from golden-rod, to amount to anything. I was surprised, but he assured me that it was a fact. Here the bees fairly swarm on the golden-rod, when the weather is just right. I would state that I have never had 5 pounds of buckwheat honey per colony, although there would be several hundreds of acres of it within reach of my bees. They get a little sometimes, as I can smell it, but they use it as fast as they get it.

De Pere, Wis.

BEE-SUPPLIES.

Importance of Ordering Supplies Before the Season Begins, etc.

Written for the American Bee Journal
BY REV. STEPHEN ROESE.

The season of 1889 has been the busiest with bees since I have kept them. Since swarming began, I have had not even time to correspond with friend or relative; from daylight until dark in the harness, and the worst of all was, when swarming began, my long-looked-for and expected supplies did not come—in fact they did not reach me until swarming was all over. I had to rob all old colonies of the upper stories, to put bees in, and even take frames from them to supply new swarms, hoping from one day to another for the goods to come; until finally I was compelled to rip frames out of boards, and at last I put the bees into starch, soap and candy boxes.

Such torment and anxiety of mind I do not wish to return in my future days. From sunrise to sundown, the hum of swarming was kept up—5 and 6 swarms on the wing at the same time; I could not even take time to eat my meals, and I often thought of what Gen. Wellington said at the battle of Waterloo, viz: "I wish it was night, or that Blucher would come;" but I did not wish for Blucher nor the Prussians, for it was hot enough for me without them, and the needle guns and Krupp's cannons.

One day 13 swarms came out, 6 of that number at one time, and they united in one body, clustering after a half hour's stroll all over the yard. At last they settled on the trunk of a dead apple-tree, about 6 feet from the ground, where it began to branch out. After being settled, it was a rare sight, resembling a huge bear sitting on its haunches. But the worst sight came

when I began to divide them, being impossible to hunt out the queens.

For want of time, I divided them as equally as I could, into three parts—two parts stayed, and the other third part just came out to leave. After I had hived 6 swarms before dinner, and feeling hungry as I passed by, and seeing them come out, I just put the hive back on the bottom-board, and left them with their go-away fever, until after dinner, for Mrs. R. will not wait one minute when dinner is ready. When I came out, the whole swarm lay in the bottom of the hive, as if they were cooked (a lesson for me).

I advise every bee-keeper to get his supplies long before the swarming-time, for at that season of the year, the manufacturers are in just as great a trouble and rush as the bee-keepers, and much more so; for those poor fellows, after running night and day to fill their orders, get many complaints and hard words; but I did not practice either.

Our clover honey was a good crop, but basswood did not furnish anything. Bees are busy in the forenoon now (Aug. 10) on buckwheat, and stroll idly about in the afternoon. The honey crop in this section of the county will not be more than half a crop.

Death of John Decker.

Another successful bee-man has gone to his long home. John Decker, of Plum City, Wis., recently received a telegram from his wife's relatives near Milwaukee, that his mother-in-law was dying, and they were requested to come immediately, if they wished to see her alive. Accordingly, they took the train for Milwaukee at Durant, apparently all well, and on arrival there, on Aug. 30, Mr. Decker was taken sick with brain fever, which could not be checked.

In the meantime Mrs. Decker's mother died, the fact of which Mrs. D. communicated to her three sons at home, informing them at the same time, that their father was dangerously ill—not expected to live. While one of the sons was after the mail in town, a telegram had been received at home, informing them of the father's sudden death. While the sons of the deceased prepared to go to Milwaukee, news came also from Washington Territory, that their oldest brother was not expected to live.

After all was over, it was discovered that the funerals of the father, son and mother-in-law had all taken place on the same day and hour. The death of each of them was something remarkable.

Mr. John Decker was a bee-keeper, having kept pace with late improvements, although not able to read English bee-papers in order to be posted, but experience and practice had made him what he was. He possessed a true and generous heart, and there was no place, far or near, where visitors were more welcome than at John Decker's home, and bee-keepers, especially, were gladly received.

On hearing the sad news, I felt deeply impressed with feelings of solemnity and sympathy for the bereaved, who are left to mourn the loss of the kind husband and father. They have the sympathy and best wishes of the community at large.

Maiden Rock, Wis.

HONEY-SECTIONS.

Information About the Origin of the Honey-Section.

Written for the American Bee Journal

BY J. S. HARBISON.

As some interest is being manifested by bee-keepers as to the origin of the section honey-box or "honey-section," as instance the enquiry of Mr. L. C. Whiting, on page 565, I take pleasure in giving the information.

I conceived the idea, and made the first sections of the celebrated California (or Harbison) section honey-box, during the last week of December, 1857, at Sutterville, Sacramento county, Calif.

In September, 1858, I exhibited 500 pounds of section honey, two-pound combs, at the California State Fair, held at Marysville. In 1876, I exhibited section-box honey at the International Exhibit held at Philadelphia, Pa., and was awarded the highest honors therefor.

The first case of section-box honey shipped from California, was shipped by me in the first carload of green fruits that was shipped over the Central & Union Pacific railroad to Chicago, soon after their completion.

In 1873 I shipped the first full carload of section honey that was ever shipped east, part of which I sold to C. O. Perrine, of Chicago, and the balance was sold by Mathew Graff & Co., of the same city. This was followed by a number of carloads to Chicago, and New York, in 1874.

These several shipments gave the Eastern bee-keepers the first knowledge of the invention, and subsequently enabled them to improve on the methods of manufacture, and adopt a size better suited to the wants of their local markets, though not so well suited for long and rough transportation as is required for our California product to reach the cities of the East.

San Diego, Calif., Sept. 10, 1889.

THE CROP.

Hints on Marketing the Honey Crop, etc.

Written for the Western Plowman

BY C. H. DIBBERN.

It is to be regretted that with such a yield of our magnificent white clover honey, the best produced anywhere in the world, so much is still secured in a slovenly, unmarketable shape. The farmers who have only a few colonies are especially careless in securing the honey in the best shape, and generally lack room and facilities to care for it when secured. The result is, they often chuck it into an old box, and hurry it off to town. Probably the sections (for the days of broken combs in pots and kettles are about over) will slap against each other and rattle around so that by the time town is reached, it will be in a very leaky condition.

Of course the dealer takes in the situation at once, and if he takes the honey at all, will pay about half the price that nice honey, in good condition, is worth. He in turn, to beat other store-keepers, will advertise white clover honey at an astonishingly low price. Now, when the bee-keeper who takes great care in having everything as neat and nice as it is possible to have it, comes to market with his honey, he will be asked to compete with this damaged honey in price. Now if he knows his business, and what his product is really worth, he will likely take his load home again, perhaps a sadder if not a wiser man.

Now let us see what is the remedy for this. Is it not in educating the farmer, who will keep bees, in securing and marketing his usually small crop, in a neat and business-like way? It is true the bee and agricultural papers have done much in this direction, but much more is still required to be done. Now we believe the farmer who spoils the market, wishes to get market price for his honey, but he is speedily told that it is very leaky, out of condition, if not that, it is "dirty stuff." Then if he is not satisfied at the first place or two he calls, he is generally ready to sell at what is offered by the time the story is repeated to him.

Bee-keepers cannot well protect themselves against this kind of competition, by buying up their small lots of farmers, as they have their own crops to care for. Then, too, it is often in old soiled sections with crooked, leaky combs, no separators having been used, perhaps partly in old dark comb, so that it would be entirely unsuited to go with his own nice goods.

Taking Care of the Honey.

Now that we have secured so nice a crop of honey, let us see what we had better do with it. With the beginning of August our white honey should all be taken off the hives, or it will be soiled more or less by the bees running over it. Take off all cases where sections are completed, and return such as are not sealed over, to be finished during the fall bloom.

Bee-keepers should have a work-shop and also store-room for honey. The honey, as it is brought in from the apiary, may be temporarily fitted up in the cases, but as soon as there is time, it should be emptied out, and all the sections carefully scraped of propolis, and then piled up on broad shelves around the walls of the honey, room. It is best to pile it loosely, leaving about a half-inch between the sections to allow air to circulate.

When it has been some two weeks off the hives, it should be fumigated with sulphur, to kill the wax-moth, which is sure to appear, especially if there is any pollen in any of the sections. Some bee-keepers claim that this is unnecessary, but I have never had an early crop of honey, that did not need it.

In piling up the sections it is a good plan to put paper that has been prepared with paraffine, to prevent absorbing moisture at the bottom, and between each tier of sections. There will always be some leakage, the best we can do, and this prevents the honey from any upper sections from running over those below. It also saves the honey leaking out, which can be used for bee-feed if nothing else.

Now when you wish to market the honey, get some nice, new shipping-cases with glass on at least one side. Now take a board and saw it off so it will just fit inside of the case. Now take the paraffined parchment paper, and make a pan by folding it over this board, and turning the covers, and you have a nice pan for the bottom of your shipping-case to catch any possible drip. This paper can be had very cheaply, and answers the purpose better than anything I ever saw.

Grade the Honey.

Now when you get an order, or wish to make a shipment, grade the honey, so it will run even in each case, and so that the sections next to the glass will be a fair sample of the whole. If the cases hold two tiers high of sections, put a paper between them, and a few layers of old newspapers on top. Nail on the top with small wire-nails. Cut out a stencil brand, and that parchment paper is just the thing to cut it out of, "This side up. Keep out of wet and sun." Stencil this on top of the case. The kind of honey and your address should be on one end, and the party to whom you wish to send it on the other. Common shoe blacking will do for stenciling. Honey packed in this way will go as safely by freight as by express, at about a quarter of the cost.

A Hive on the Scales.

On June 28 I placed a strong swarm on scales to see how fast honey was coming in, and found they gathered 8 pounds the first day. On July 4, when basswood was in full bloom, they gathered 15 pounds, and on the 5th 18 pounds. From that date they began to drop off, till now they gather but a pound or two per day. What puzzled me at first was, that in the morning I would find that they had lost about a pound, but that was easily accounted for by evaporation.

Then I was surprised to find that up to noon they would gain nothing at all, but this, too, was easily explained by the weight of the bees absent in the fields. These experiments are not only interesting, but valuable, as showing about how much honey is being gathered, and how fast sections and cases must be given. Thus we found that from June 28 to July 8 the bees in our apiary were bringing in more than 1,000 pounds per day. Of course this does not all go into the sections, as a certain amount is consumed by the bees. I am satisfied, however, that many bee-keepers failed in not giving room fast enough.

Milan, Ills.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Oct. 11—12.—Northwestern, at Chicago, Ills.
W. Z. Hutchinson, Sec., Flint, Mich.

Oct. 23, 24.—Union, at Mt. Sterling, Ills.
J. M. Hambaugh, Sec., Spring, Ills.

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa.
H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Beginning in Bee-Keeping.—Mrs. J. M. Null, Miami, Mo., on Sept. 17, 1889, writes:

Since Aug. 10 I have been the happy possessor of an apiary; and could any one know how long and ardently such a state of things have been wished for by myself, then, and then only, could be realized how proud I am; but I shall not remain so very long, unless I can make a success of bee-keeping. My bees are Italians (110 colonies); and have produced 16,000 pounds of extracted white clover honey this season, under the manipulation of Mr. T. A. Anderson, their previous owner, who seemed too modest to report, but I think they deserve praise, even though their manager seeks not fame. The bees have on hand 6,000 pounds of fall honey, and are still working.

I should like to hear the remainder of that man's story, who improvised a Christmas tree (see page 522) on the spur of the moment. It was real amusing. Give us the benefit of another laugh. Mrs. Harrison spoke of a high board-fence as protection to passing teams, etc.; will she please state how high such a fence should be? and what kind would be best? Would it have to be tight?

Bees in Good Condition.—B. F. Pratt, Dixon, Ills., on Sept. 16, says:

Bees have done well here this year. I had 6 colonies in the spring, and I now have 25. I have taken 700 pounds of honey, and all of my bees are in good condition for winter.

Good Average Per Colony.—Arthur F. Brown, Huntington, Fla., on Sept. 19, 1889, says:

Bees are doing well. I expect a good harvest from the fall bloom, which is just opening. My 3 best colonies, up to date, have given 96, 97, and 103 pounds of comb honey; 82 pounds was the average for the whole apiary.

Nameless Bee-Disease.—Alonzo Skinner, Mesa, Ariz., on Sept. 17, 1889, writes:

Mr. Thielmann's article, on page 584, seems to demand further explanation from me. In reply, I would say that some of the colonies that were affected last season, were purchased from other parties, and some of them were here at the time when the first one was affected. I would further state that I do a good deal of work with other people's bees, and I found quite a number of colonies affected last summer, but have only found one colony affected this summer, and that was my own. I feel positive that the so-called "nameless bee-disease" comes from nothing but a lack of salt in their food, and I think that if bee-keepers would place salt where the bees could have access to it, it would do a great deal of good.

Superiority of Florida Honey.—John Craycraft, Altoona, Fla., on Sept. 11, 1889, writes:

The AMERICAN BEE JOURNAL has been with us so long that I do not wish to part company with it. Its words of advice are good and timely, and much of the correspondence is a delight, but some of it is not necessary or applicable to this climate. My crop of honey was fair—8 gallons per colony, and as fair a grade and as good as could be wished for. I have only 20 colonies, but I obtained 160 gallons of honey, and all sold at $1.00 per gallon. I could sell a great deal more of such honey. My bees are along the St. Johns river at St. Francis. The honey gathered along the river is of the very best kind—far superior to the honey out on the pine lands. This I know from experience, by having bees in both places. I do not want to see Florida honey classed as "Southern honey," and sold at a price as such is usually sold. The orange-blossom honey, the wild grape-vine honey, and the palmetto honey, cannot be surpassed by clover or linden.

Susquehanna Co., Convention.—H. M. Seeley, Harford, Pa., on Sept. 16, 1889, writes:

The Susquehanna County Bee-Keepers' Association met at New Milford, Pa., on Sept. 14, 1889, with only a small number present. The following subjects were freely discussed: How to prevent an increase of stock; and how to prepare bees for winter. The honey-crop was reported light, with bees working on honey-dew to some extent. The next meeting will be held at the Exchange Hotel, at Hopbottom, Pa., on Saturday, May 2, 1889.

Foul Brood.—Mr. G. F. Davidson, Fairview, Tex., on Sept. 26, 1889, writes:

I very much fear that foul brood is among my bees, although I cannot tell, as I never saw any bees affected with it. I have about 100 colonies, and have not bought any queens from the North on account of this disease, though there has been considerable foul brood around San Antonio, some 30 miles distant. I will describe, as nearly as I can, the way my bees are affected.

In early spring I had one colony that showed a brown, sticky substance on the alighting-board, and on the ground in front of the hive. The colony soon perished. I gave the combs to other colonies, and about two months ago I noticed the same thing in front of another hive. In the meanwhile, I had read several articles in the BEE JOURNAL on foul brood and its symptoms; I examined the hive, and found dead larvæ in all stages in the cells, though it was perfectly white, and had no offensive smell, and no concave cell-caps, as described in the BEE JOURNAL. I destroyed this colony immediately, and burned the combs and frames. Now I have another colony affected in the same manner; they drag out the larvæ and bees ready to hatch, in front of the hive, clean and white without any smell. I treated them with strong brine, and in about two hours I went to the hive, and the ground in front was black with dead and dying bees. They looked as though they were gorged with honey. Upon mashing them, I found it to be thick, yellow matter, very much like pollen. I will wait until I get information from some one of experience, before doing anything more.

Light Crop of Honey.—C. E. Woodward, Xenia, Ohio, on Sept. 23, 1889, says:

The honey crop in the southern section of Ohio is very light this season, owing to the drouth. Bee-keepers will not realize half a crop. Swarming has been the order of the day. Bees are mostly in good condition. The fall crop amounts to nothing.

Castor-Oil Plant.—Dr. G. W. Bristline, Mount Pleasant, Texas, on Sept. 21, 1889, writes:

Can any of the readers of the BEE JOURNAL give information as to the value of castor-oil plant as a honey-plant? It grows very well here, and the bees work on the bloom from its first appearance in June until frost, and last year they were gathering pollen from it after Christmas. It is not planted here for market, and I have only a limited number, so I cannot tell as to its value for honey, but the bees will not leave it for any other flower; and they work all day, over and over again, crowding each other off the bloom. Will some one living in a locality where it is cultivated for market, please give us this information?

Getting Bees Out of Supers.—J. M. Burtch, Morrison, Ills., on Sept. 19, 1889, writes;

On page 600, James Heddon says: "The bee-keeper is away behind the times at present who does not get the bees all out of his supers before he takes them from the hive." He will confer a favor upon myself and other "away behind" bee-keepers, if he will tell us how to get them out; or, better, give us the most approved method of removing surplus cases. I have tried two methods—one, that of smoking them down, which is not successful, as frequently they will not budge, no matter how hard you smoke them; the other, that of raising the cover or the case, on a cold night, which is more successful, but is too cruel to be practiced.

[We asked Mr. Heddon to reply to the foregoing, but he says that the method of getting the bees out of the supers before they are taken from the hives is not his invention, and the inventor does "not wish to have it published at present, if ever."—ED.]

Flowing with Milk and Honey—Daniel Sheldon, Strawberry Point, Iowa, on Sept. 24, 1889, says:

Bee-keepers in this part of the State are well satisfied with the results of the season. Truly this part of the Iowa dairy-belt is "a land flowing with milk and honey." Bees have swarmed profusely, favoring those who wanted an increase of colonies. They have stored honey in the greatest abundance. Those problems in bee-keeping which looked so hard, look easier now, after reading the AMERICAN BEE JOURNAL for two years. My son shot a king-bird lately; it was crammed with bees.

Golden-Rod as a Honey-Plant.—W. A. Harris, New York, N. Y., on Sept. 23, 1889, writes:

I notice on page 585, an article by Mr. Eugene Secor, relative to the "golden-rod" being over-rated; this has long been my opinion. Would it not be worth while to call for an expression of opinion in the BEE JOURNAL, as to its value as a honey-producer? Mr. Doolittle said to me some years ago, that he "had never obtained a pound of honey from golden-rod, to his knowledge." In this locality the whole country is covered with it, yet we very rarely see a single bee on it, or find any honey being brought into the hives. We have two varieties here only—perhaps some of the other varieties may produce nectar while these may not. I have watched it for many seasons, in the hope of its producing in some year, but I have always been disappointed. I wish it were otherwise, as it is so abundant.

[Yes; let us have a general expression of opinion on the subject. We want the facts.—ED.]

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

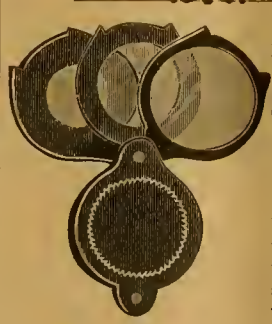
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c.; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs, 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8@c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & MCCORD, 32 & 34 S. Water St.

DENVER

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—24@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange bloom and California, 8c.; buckwheat, 6c.; common Southern, 60@70c. per gallon. Comb honey, fancy white 1-lbs., 16c.; fair 1-lbs., 14c.; fancy white 2-lbs., 14c; fair 2-lbs., 11@12c.; buckwheat 1-lbs., 10@11c. Demand is good for fancy white 1-lbs., unglassed or in paper boxes.
BEESWAX.—23@24c.
Sep. 16. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2-lbs., 8@9c. Extracted is in light demand, values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c.; white clover and basswood, in kegs and barrels, 7c.
BEESWAX.—25c. R. A. BURNETT
Sep. 10. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.
BEESWAX.—23c.
Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—We quote: Fancy white 1-lbs., 16c.; 2-lbs., 14c. Off grades about 2c. per lb. less. Buckwheat 1-lbs., 11@12c.; 2-lbs., 9@10c. Extracted basswood and clover, 8c.; orange bloom, 8c.; California amber, 7@7½c.; buckwheat, 6@6½c.; Southern, 65@70c. per gallon
HILDRETH BROS. & SEGELKEN,
Sep. 10. 28 & 30 W. Broadway, near Duane St.

BOSTON

HONEY.—Receipts have been a little in excess of sales, and there has been a disposition on the part of some to reduce prices. We quote: 1-lbs., 16@18c.; 2-lbs., 16@17c. Extracted is stronger in price, and promises to be even higher, the market being from 8@9c.
BEESWAX.—None on hand.
Sep. 23. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Comb, 11@16c. Demand fair for all kinds. Arrivals of extracted are good, while good comb honey is scarce in this market.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Sep. 11. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—It is selling very slowly at 14c. for 1-lb. white comb, and the prospects are for lower prices. We have been trying to hold the market to 14@15c., but parties in Iowa and Illinois are offering and selling white 1-lbs. at 12@12½c., delivered here and at other points in Kansas. Receipts are large, and in order to sell we will have to meet these prices.—Extracted, white, steady at 7@8c.; amber, 5@6c.
BEESWAX.—20c.
Sep. 14. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

Can You Believe It?—The complete works of Charles Dickens in 15 volumes, or Waverley Novels in 12 volumes, both nicely bound in paper covers, are mailed to our subscribers, postage paid, with one year's subscription—all for $2.10; or both Dickens' Works and Waverley Novels and the AMERICAN BEE JOURNAL till Dec. 31, 1890, for $3.00. No one who sees them can understand how they can be produced at that price, including postage!

It pays to be a subscriber to our papers, for none will be sold at that price to any one but subscribers. They cannot be sent to any foreign country at that price. These books will be sent *as a premium*, postage paid, for four subscribers at one dollar each.

As each set will be ordered from and mailed by the publishers, there will be an interval of a week or ten days between the receipt of the money and the mailing. Complaints should be made if not received within twenty days. Complaints must be made within five weeks to secure proper investigation.

EDITORIAL BUZZINGS.

Please Read the article on page 627 of last week's JOURNAL, on how to make "Honey a Staple Article," and then send us a Postal Card, if you have not already done so.

A Swarm of Bees at the Paris Exposition was the cause of considerable excitement some time ago. Here is the account of it, as given in an exchange:

One morning lately, about eleven o'clock, considerable excitement was caused in the Food-Products and Agricultural Galleries of the Paris Exhibition by the issuing of an immense swarm of bees from one of the observation hives exhibited by Mr. Blow, of Welwyn, Herts. The swarm settled on the top of one of the highest elm-trees, about 60 feet above the roadway. Several ladders were tied together and placed against the tree, but those who climbed into it were unable to reach the bees. Eventually the owner succeeded in approaching the fugitives, and successfully "hived" the swarm.

D. R. Emery, editor of the Apiary Department of the Colorado *Farmer*, thus "goes for" the fellow who wrote that article for the Philadelphia *Record* on "Bogus Comb Honey:"

Why are not persons or papers as quick to state truths as falsehoods? A small "insinuation of evil" or "error" is caught "on the fly," while genuine truth and character must come with a retinue of witnesses and proof!

The writer must have had a contract to fill a half column in his paper, and to show it was simply *talk*, he concludes with a statement that "a Berkshire county bee-rearer lamented that *his bees could not work in the dark*; so he crossed his bees on lightning bugs, and now has bees with lanterns for dark nights. He is now trying to make a cross breed with gum coats and rubber boots for rainy weather."

Why does not the fool make paraffine and glucose honey, if it is such a sure and easy thing made, and not bother with his patent bees?

Friends, do not be alarmed; the occupation of our invaluable friends, the honey-bees, is not yet superseded. Down with the lies.

Well Done.—In these days when the newspapers and periodicals seem bent on publishing falsehoods about manufactured honey, it is refreshing to see the *City and Country*, published at 225 West 23rd St., New York, come out in favor of our pursuit. Its Apiary Department is in charge of A. H. Duff, of Kansas, and its September number devotes three columns to the defense of the purity of comb honey. It starts out with this paragraph:

We are all aware that a certain class of newspapers are very eager for sensational stories, and it seems that they have but little regard for the truth, and the consequences are, falsehoods are sent out broadcast over the country, doing great injury that takes months and years to patch up, and the following, among many other slurs of the kind that have been cast at the bee-keeping fraternity, is now going the rounds of this class of newspapers. From the AMERICAN BEE JOURNAL of recent date, which shows up one of these deliberate lies, we copy the following:

It then copied our editorial entire, from page 436, refuting the calumnies of the Philadelphia *Record*, and other papers, and stating that Bro. Root had offered $1,000 to any one who would take him to the place where comb honey is manufactured by machinery, etc. Then the *City and Country* details the uses of comb foundation, and adds:

This is just how far machinery goes towards manufacturing honey. We broadly assert that all such claims that comb honey is manufactured by machinery, and paraffine used for comb and glucose to fill the comb, etc., are *utter falsehoods in every particular*. It never was done, it can't be done, and it never will be done.

Any and every reader of the *City and Country* is entitled to the above $1,000 reward if they can show up one person or persons, or firms, engaged at this business.

It then quotes another misrepresentation from the Cleveland *Plain Dealer*, giving a rehash of the article from the Philadelphia *Record*. *City and Country* sums up its reply in these words:

Now, we wish to give the Cleveland *Plain Dealer* a pointer: A. I. Root, of Medina, Ohio (and, by the way, it is but a short distance from Cleveland), has a standing reward of $1,000 for such comb honey as you describe. Now is your chance, put up your manufactured honey and take the money. If you cannot do this, then we will expect you to correct the malicious, injurious falsehood that appeared in your paper.

That is just right! The *City and Country* is entitled to our thanks for its manly defense of our industry. If other papers would only be as fair and honorable, we should have nothing to complain of. Mr. W. C. Turner, the Managing Editor, is worthy of our hearty commendation.

Subscribers who do not receive this paper promptly, will please notify us at once.

The Australasian *Bee Journal* for September notices the result of the Arkadelphia bee-lawsuit, and adds:

The Union deserves the hearty support of all America bee-keepers, for had they not persistently fought out these cases in the law courts, without doubt a grievous wrong would have have been inflicted upon American bee-keepers.

We have two cases now on hand, both appeals to higher courts, and we hope that the record of the Union will not be broken in these. So far it has not lost *one* of its suits, a record which is beyond all reasonable expectation, and compares very favorably with any other similar organization in existence.

If its friends, and those who are benefited by its labors, rally around its standard as they should do, the Manager of the Union will do his best to bear off the victory in these suits. But it takes money as well as brains to do that work, and there ought to be ten thousand bee-keepers who would gladly spring to their feet and offer their membership fees *at once*, so that the Union could hire the best law talent in existence, and thereby insure in advance the victory—for our cause is just!

Mr. R. McKnight's exhibit in the Apiary Department at the Toronto Industrial was undoubtedly the attraction of that section of the exhibition. The *Empire* says of it:

In this department Mr. R. McKnight, of the Homewood Apiary, Owen Sound, who has done much to encourage bee-culture in Ontario, has for several seasons past been laboring to make the exhibit an attractive one, and while the large number of prizes he took this year attested the excellence of the various grades of honey shown by him, crowds were attracted around his exhibit from the handsome appearance it presented. It was certainly the finest and most artistically arranged display that has ever been seen in the Apiary Department.

The exhibit was awarded 4 first, 3 second, and 2 third prizes. In addition to these, Mr. McKnight secured a silver medal for the best style of tins for holding extracted honey, and also a bronze medal for the best assortment of glass for the same purpose.—*Owen Sound Times.*

Bee-Disease in California.—L. E. Mercer, of Ventura, Calif., writes to *Gleanings* about a singular disease with which the apiaries in California are affected each succeeding season. He says:

This disease appears every spring and summer in a very few hives in nearly every apiary in the county, but it has caused no serious alarm until recently. The bees usually get over it themselves, but we do not get much honey from the colonies that are so affected. A friend on the Ojai has been experimenting a little with the colonies that were thus diseased. He took the queen out and replaced her with another from a healthy hive. The disease entirely disappeared; and from putting the queen from the diseased colony into a colony that was perfectly healthy, it also became diseased in a very short time.

GLEANS OF NEWS.

Poisoned Honey.—A New Zealand paper gives the following remarkable account of poison existing in honey. It says:

Mr. R. de Thierry has given the *Herald* some important information on the subject. He states that on one occasion he was traveling along the sea-coast with some Maoris, when they fell in with a store of honey accumulated by some wild bees. Mr. de Thierry and one of the natives ate heartily of the honey as they found it. Soon after Mr. de Thierry was affected with giddiness, and fell down, feeling very ill. The native who had eaten with him was similarly affected. The Maoris promptly adopted remedial measures, such as they had probably tried before in similar cases. They kindled a fire, piled some seaweed upon it, and held Mr. de Thierry amongst the fumes until he became so sick that he vomited freely. By and by he got better, and the native, under similar treatment, also recovered. Mr. de Thierry says that the poisoning arises from the bees having access to the karo (*Pittosporum crassifolium*), a tree or shrub which grows all around the coast of New Zealand. At a certain season a kind of gum exudes from the karo, which the bees use for the wax of the combs. The poison is in the wax, not in the honey. This matter is of importance, for bee-keeping is now general, and the karo is being generally planted, as it makes a pretty and useful hedge. It can stand any amount of stormy weather, and also the spray of the sea.

In the *Australasian Bee Journal* for September, just received, we find the following comments on this subject, which will be of interest to our readers. We shall give further particulars as soon as the number for October comes to hand:

We have received from the Rev. Father Madan a full report of all the circumstances connected with the deaths of the two natives who were reported to have died from the effects of eating poisoned honey, and also samples of the honey taken from the same bee-nest from which the natives procured the honey they ate. The latter, immediately on receipt, we handed over to Mr. Pond to analyze, but we have not received his report. No doubt we shall have it in time for next month's issue, when our readers shall be placed in possession of all the facts of the case. We may state that the Rev. Father Madan has been at a deal of trouble in gathering all the facts connected with the accidents to the natives, and procuring the samples of honey, and deserves the thanks of all New Zealand bee-keepers for his labor connected therewith.

Paris Green and the Bees.—In the number of *Insect Life* for September, just at hand, we notice the following very strange article:

The prevailing opinion seems to favor the theory, that if arsenical mixtures are sprayed or dusted upon fruit trees while the latter are in bloom, the bees which frequent them will be destroyed. With this idea in view, fruit-growers have very properly been cautioned not to use these mixtures during the blooming season, and in fact this has been urged as an argument against the use of these substances as insecticides.

The writer, while in Louisiana, was told by planters that dusting Paris green upon the cotton-plants, killed the bees which frequented the blossoms thereon for the purpose of securing the nectar which was contained in them.

There appears, however, to be some good negative evidence bearing upon the problem, which it will be well to consider before forming a decided opinion in this really important matter.

Mr. Edwin Yenowine, a fruit grower near New Albany, Ind., is a very strong advocate of the use of arsenical mixtures, as against both codling moth and plum curculio, and is also, to a limited extent, engaged in apiculture.

Some time ago, while spending a day with Mr. Yenowine, he reminded me that several years ago, he had written me as to the probable effects on bees of the use, during the blooming season, of these arsenical mixtures, and had received a very cautionary reply. It appears that instead of following my advice he sprayed all sorts of fruits freely, both in and out of the blooming season, and instead of destroying his bees, they have increased from 8 to 17 strong, healthy colonies, and have furnished honey of which he and his family have partaken freely. This conversation with Mr. Yenowine took place on June 23, so that the increase shown was practically that of an unfavorable season.—F. M. WEBSTER.

Well! Well!! We are astonished! When bees get fat, strong and healthy on Paris green! Who would have thought it? *Insect Life* is published in Washington. We wonder if Prof. Wiley has not something to do with it. What does Prof. Cook say about it?

Dr. J. J. Owens, of Waterloo, Iowa, gave us a call a few days ago, as he was in Chicago on business. We were pleased to see that he contributed an article for the Waterloo *Courier*, refuting an article which that paper copied from *Harper's Bazar*, asserting that "syrup and paraffine" was taking the place of "wax and honey," in which he says:

Now, as a producer of gilt-edge comb honey, I hereby refute and deny the above in toto, and brand it as a base falsehood and gross slander upon the honey industry of the country. In other words, it is a plain, unvarnished lie, pure and simple. I also protest against the publishing of the same by the local press as facts, as it is doing a hard-working class of men who are considered to be as honest as the general run of mankind—a great injustice and injury. It also has a tendency to prejudice the general public who are not cognizant of the true facts relating thereto, against the honey-producer. I will further state in vindication thereof, that Mr. A. I. Root, of Medina, O., has a standing offer of $1,000 open to the world, to any one who will tell or show him where artificial comb honey is manufactured. Up to the present time no one has come forward to claim the reward.

I assure you, Mr. Editor, and your many readers, in all sincerity and candor, as a fact (and facts are stubborn things), which must and will be admitted by every candid mind, that there is no such thing as artificial comb honey, never has been any made, and I feel safe in saying there never will be.

Poultry and Pets.—The *American Poultry Journal* is one of the best periodicals published in the poultry interest. It is a large quarto monthly, and is illustrated. We club it with the BEE JOURNAL, and send both periodicals for $1.50 a year.

No Sophistry.—"Echoes," a nice monthly published by Will M. and L. S. Young of Nevada, O., gives the following rebuke to papers which have published this contemptible slander of the honey-bees:

The expression, "busy as a bee" is sophistry. That honey-making humbug lives in luxurious idleness nearly two thirds of the year.—*Ex.*

The writer of the above is talking "sophistry." It is not the bees' fault if they are idle part of the year. The flowers furnish nectar about six months of the twelve, over a large territory, and during that time the "honey-making humbug" is out early and late; and during the height of the honey season its life is of but a few weeks' duration, owing to the excessive work done at that time to gather in the extra flow of sweets so lavishly stored by myriads of flowers. We would like to see anything on earth that will equal the bee in its almost ceaseless labor, as long as it finds it to do. There is no "sophistry" about the expression "busy as a bee;" give them twelve months' flow of nectar, and they will put in a full year of labor.

The Southern Exposition will be open from Nov. 5 to 15, 1889, at Montgomery, Ala. It offers $20,000 in cash premiums. For the Apiary Exhibit, Department A, Group 4, the following are the premiums:

Best general exhibit of apiarian implements and products	$20 00
Best 25 pounds extracted honey, to be shown in glass	5 00
Best 25 pounds comb honey, to be shown in sections	5 00
Best colony Italian bees	5 00
Best ten pounds comb foundation	5 00
Best bee-hive for practical use	3 00
Best and largest, most interesting and instructive exhibition in this department by any individual or bee-association	25 00

All articles entered for premiums must belong to the exhibitor, and all honey entered for premiums must be from the exhibitor's apiary. The exhibitor receiving the largest amount of cash premiums is to receive a diploma.

Mr. W. H. Black, of Montgomery, Ala., intends to make a good exhibit, and will get up a club for the BEE JOURNAL.

Capital Bee-keepers' Convention.—Mr. C. E. Yocom, of Sherman, Ills., on Sept. 30, 1889, gives the following account of the organization of a new bee-keepers' association in Illinois:

A number of bee-keepers of Sangamon and adjoining counties met in the Supervisors' Room of the Court House in Springfield, Ills., on Wednesday, Sept. 25, 1889, and organized the "Capital Bee-Keepers' Association." Although the attendance was not large, an enthusiasm was evinced, not often seen in such assemblies. The entire forenoon was spent in organizing. In the afternoon, the subjects of "Fall Bloom," "Wintering," "Prices of Honey," etc., were interestingly discussed. The association will meet semi-annually. Any person interested in bee-culture may become a member of the association, and receive a printed copy of the Constitution and By Laws, by sending his or her name and address, with 50 cents, to the Secretary.

The following officers were elected: President, P. J. England, of Fancy Prairie, Ills.; Vice-Presidents, Alfred Lewis, of Taylorville, and D. D. Cooper, of Sherman; Secretary, C. E. Yocom, of Sherman; and Treasurer, Geo. F. Robbins, of Mechanicsburg. "From the acorn springs the oak."

C. E. YOCOM, *Sec.*

AN EMBLEM-FLOWER.

BY S. BEAUMONT KENNEDY.

'Tis meet a nation's symbol be
One of God's fragrant flowers;
They catch the sunlight of His smile,
And drink His crystal showers.
They bloom in lowly glade and glen,
And on the mountain heights,
And in their prismed petals hold
The rainbow's radiant lights.

The lily tells of sunny France
Corn-flower of "Fatherland;"
The thistle and the heather-bells
For Scotland's glory stand;
While England claims the royal rose,
And wears it on her shield,
And shamrocks, green as emerald,
Fair Erin's meadows yield.

Then choose we from the waste of bloom
That makes our landscape gay
A blossom bright to name us in
The nation's great bouquet.
And seek it not mid close-cut rows
Of fragrant hot-house flowers,
But be its tender tintings known
In mead and rustic bowers.

A flower there is that blooms for all,
For rich man and for poor,
Upon the Western prairie wastes,
And on the Northern moor.
Like Gheber true it greets the sun
Where all the East is red,
And o'er the Southern cotton-fields
It shakes its golden head.

Then be our symbol rich and rare,
This flower so blessed of Heaven,
And let our sweetest songs and thoughts
Henceforth to it be given,
The Golden-rod! the Golden-rod,
Columbia's regal crest,
It lies like sunshine in the land,
And seems with sunshine blessed!

The fairest land on earth is ours,
Christ's blessing o'er it falls,
And ne'er a tyrant's boasting wakes
An echo in our halls.
We brook no despot's iron heel,
No laws save those of God;
Then over us let Freedom wave
Her wand of Golden-rod!

—*Frank Leslie's Monthly.*

Agricultural Colleges.—California looks with emulation upon the State Agricultural College of Michigan. It wants a similar institution in that State, and well it might, for it is a great advantage to farmers' sons in every department of agriculture, including the pursuit of bee-keeping. The *Rural Californian* remarks as follows about the matter:

The demand for reliable, intelligent, honest help in the apiary is increasing every year in Southern California, and under present surroundings is likely to increase. While there seems to be no effort in any direction to supply the demand, the State University at Berkley, has the opportunity to give us a helping hand in this matter, and bee-keepers should urge, yes, insist that the University do its duty in this regard. The State of California can produce $15,000,000 worth of honey per annum, and furnish an article superior to any in the world. The honey and wax product of California is now over $1,000,000 worth; and the University of California, by proper effort, could double this annually until the product has reached its limit. I know of no agricultural pursuit that will allow so great a margin for improvement as may be found in apiculture, in the State of California.

The State of Michigan finds it profitable to have a Professor who gives much of his time to experiment and instruction in this branch of education, and the State reaps annually rich rewards for the money expended upon the apicultural department of the Michigan University. That State has no such territory, no such nectar-yielding flowers, shrubs and trees, as are found in California. Here we count on a perpetual bloom, and in Southern California the bee is on the wing 350 days in the year, and would be every day in the year, but for the rain.

In Michigan the bees are for the most part shut up in cellars for four or five months to prevent their freezing to death, and often cannot work in the spring or summer for a long time on account of cold, cloudy weather. The yield of honey in Michigan does not exceed 70 pounds per hive under the most intelligent management, while in California it averages 250 pounds per hive.

California could well afford a professorship at her University, where the student could be taught everything pertaining to the science of bee-keeping, and thus add to the stream of human knowledge something that would add millions of money to the commerce of the world; give employment to thousands of her citizens, and not detract from the soil one particle of its vitality. Every particle of nectar gathered and sold in the markets of the State is so much gain to the commonwealth, that would be wasted on the desert air, except for the industry of the bee and the bee-keeper.

The American Newspaper Annual for 1889, by N. W. Ayer & Son, Philadelphia, Pa., (price $5) contains a carefully prepared list of all newspapers and periodicals in the United States and Canada, arranged by States and towns in alphabetical order. Under this head is given the name of the paper, the issue, general characteristics, year of establishment, size, subscription price and circulation, also the names of editors and publishers, and the street address (when known) in all cities of about 50,000 population.

Among its exhaustive and interesting tables are those showing the cities, towns, and villages of the United States having a population of 5,000 and upward, arranged in alphabetical order; how many counties there are in each State; in how many of these newspapers are published, etc.

An Appendix to "Scientific Queen-Rearing," by G. M. Doolittle, is given in the *Second Edition*, which details his further experiments in his methods of Queen-Rearing.

This "Appendix" will be mailed free of cost to all who have the first edition, upon application at this office. It is now ready for delivery.

The "Second Edition" of this interesting book will be mailed to any address, postpaid, for $1.00.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

A Tempting Offer for those who are willing to help get new names for our JOURNALS:

Some are desirous of collecting names at once, and we would like them to do so, and thus begin early to get new readers for 1890.

We propose to all who subscribe now for 1890, to *give* them all the rest of the numbers of this year *free*—so the sooner they subscribe, the more they will get for their money.

Now, in order to pay our friends to work for our JOURNALS, we have gotten up special editions of Mr. Doolittle's "Scientific Queen-Rearing," (with Appendix), and Dr. Miller's "Year Among the Bees," bound with nice paper covers, and will *present* a copy of either book to any one who will send us two **new** subscribers for either of our JOURNALS (the BEE JOURNAL, weekly, or the HOME JOURNAL, monthly).

These editions are not for sale, but are gotten up specially for premiums for getting new subscribers. They are nicely printed, and will be sent *free* of postage, as pay for work to be done for our JOURNALS Clubs need not be located at one post-office, and may contain one "Bee Journal" and one "Home Journal" to the same or different addresses; or both may be for either JOURNAL, as may be desired. Dickens or Waverley may be obtained for each subscriber in this club as offered on the last page of this JOURNAL.

The HOME JOURNAL is needed in every family, and it will be no trouble to get subscribers for it anywhere and among all classes of persons. For larger clubs of it, consult any issue, and our list of premiums.

Call upon your neighboring bee-keepers who are not subscribers to this JOURNAL, and secure the premium mentioned above. We strongly urge you to commence collecting names *at once*.

In sending in new subscriptions, remember to give the full address, with the county, and at the time of sending, state that the names enclosed are for premiums, if the premiums are not then selected.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages).....	$1 00
" 100 colonies (220 pages).....	1 25
" 200 colonies (420 pages).....	1 50

Convention Notices.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

☞ The Union Bee-Keepers' Society will meet in Mount Sterling, Brown Co., Ills., on Oct. 23 and 24, 1889. The prospects are very flattering for a grand time, and all who are interested in bees or honey are cordially invited to attend

J. M. HAMBAUGH, *Sec.*

The Mistaken Bee.

A vagrant bee came buzzing round,
And Chloe, frightened at the sound,
Cried, "Mary, help! Go, Lizzie, fetch
A broom and kill the little wretch.

Too late! despite the bustling maids,
The wanton imp at once invades
Poor Chloe's lips—the saucy thing!
And fixes there its ugly sting.

The culprit caught, the maids prepare
To kill the monster then and there;
When trembling for its life, the bee
Makes this extenuating plea:

"Forgive! O beauteous queen, forgive
My sad mistake; for, as I live,
Your mouth (I'm sorry, goodness knows),
I surely took it for a rose!"

"Poor insect!" Chloe sighed; "I vow
'Twere very hard to kill him now—
No harm the little fellow meant;
And, then, he seems so penitent;
Besides, the pain was very small—
I scarcely feel it now at all!"

—*John G. Saxe.*

QUERIES and REPLIES.

Using Old Sections and Combs in the Fall.

Written for the American Bee Journal

Query 659.—I have a lot of old sections, mostly filled with comb from previous years. They are dark, somewhat propolized, and the sections are considerably soiled. I did not like to use them for our nice white honey. Would it not be a good idea to use these for the fall crop, as it usually sells cheap, anyway?—Bee-Keeper.

Yes.—C. C. MILLER.

Yes.—R. L. TAYLOR.

Yes.—MRS. L. HARRISON.

I think that it would.—A. J. COOK.

It would be poor economy.—P. L. VIALLON.

Yes, they are good for fall honey.—G. M. DOOLITTLE.

No. Fall honey sells quite well when put up clean.—DADANT & SON.

Yes, if you wish; but you would have to sell it at a discount.—J. M. HAMBAUGH.

Cut the combs out, melt them into wax, and use the sections for kindling-wood.—EUGENE SECOR.

No; unless you are willing to use it at home. They might be filled with fall honey to be extracted.—M. MAHIN.

Yes, if you can sell the honey. My way would be to use the comb for wax, and clean the sections up nicely for a new crop.—J. E. POND.

Such sections are not fit to store *any kind* of honey in. Melt up the old comb, and use the sections for kindling fires.—C. H. DIBBERN.

Your sections would be better fitted to the fall crop than the early white crop, but whether it would be best to use them for that or not, depends upon how bad they are. What one calls soiled and dirty, another would not describe by that name. I rather think that it would be better to burn up the sections and melt up the combs. I have done that once or twice, and we have a dark fall crop here, too.—JAMES HEDDON.

You can use them as you suggest; but I would first clean off all the propolis; and, with a sharp knife, shave off the outer edge of the cells.—J. P. H. BROWN.

Such combs, if used at any time, should be shaved down until the cells are not more than a half of an inch deep; otherwise the honey will be inferior. It does not pay me to use any but nice, clean combs, for comb honey.—G. W. DEMAREE.

It would be best to cut out all the comb, melt it into wax, and clean up the sections. Put your honey in neat and clean sections, and it will not sell so cheap—H. D. CUTTING.

Melt the combs in all old, dirty, soiled sections, and kindle the fire with the wood. This is the best possible use that I know. Do not regret the losses of the past, but press on to the future and take care of it.—J. M. SHUCK.

Yes; use the old partly-filled sections for the fall crop; then sell it for two cents less per pound than the white clover honey sells for, and see how many of your customers will prefer the dark honey.—MAHALA B. CHADDOCK.

New honey, whether of the early or late crop, does not sell to advantage in old combs. The bee-keeper is sure to lose credit by using such combs. Sections containing nice, white comb can be wrapped in stout paper, and be kept so clean that they can be used another season to advantage. But dark, dusty combs should be melted up.—G. L. TINKER.

The usual answer to such a query is, "Throw them all out-doors, and procure brand-new ones; as your reputation is of far more value than that of the sections." However, I believe the "danger" in this direction is very highly magnified! In fact, too much so! There are many ways in which these sections can be used (without losing your reputation), thereby utilizing sections, and saving the cost of new ones. Your near neighbors, with a little explanation, would just as soon have these as any others. Of course, they should not be sent to a city market. You can also, if anything like myself, dispose of a great many on the home table.—WILL M. BARNUM.

No. Such sections are unfit for comb honey, which is a fancy article, and should be put up in first-class condition—even if it is fall honey. To melt up the combs and use the sections for kindling-wood would be economy. To scrape the sections and fuss with them would be worth more than new ones would cost, if your time is worth anything.—THE EDITOR.

How Long will Bees Live in the Mails?

Written for the American Bee Journal

Query 660.—For how long a time is it supposed that a queen and accompanying bees can bear the confinement of shipping by mail?—Michigan.

Ten days or two weeks. They are now sent across the ocean in the mails.—MAHALA B. CHADDOCK.

For about 15 to 20 days, depending much upon how fine the sugar used is powdered.—G. L. TINKER.

They have been shipped from Europe by mail. I do not know how much more they would stand.—C. C. MILLER.

Probably four weeks, if favorable conditions are present; may be longer. I do not know.—EUGENE SECOR.

I do not know, but I have known them to stand 9 or 10 days in August weather. They should be well ventilated, and have ample room.—J. E. POND.

For an indefinite time. Probably as long as the food and warm weather would last.—C. H. DIBBERN.

That depends wholly upon the packing and the quality and quantity of food. I do not know the outside limit.—M. MAHIN.

Twenty days, without danger of loss; 40 days or even longer, in cases specially prepared.—J. M. SHUCK.

Probably until they starve to death. It is difficult to answer such a question as this, as a correct answer depends upon so many things. In common cases, perhaps three weeks.—WILL M. BARNUM.

I am not certain, for a great deal depends upon the weather, provisions, treatment, etc. I will venture an answer—from 2 to 3 weeks, should they be properly provisioned, and the weather remains propitious.—J. M. HAMBAUGH.

It depends upon many circumstances. I have had them to die in transit in 2 or 3 days, and again perfectly alive after 20 days. I have received queens from Mr. Benton, mailed in Germany, which were 19 to 21 days on the way, and all came lively.—P. L. VIALLON.

When put up right, they can stand confinement 20 days, as I know by experience, and how much longer I do not pretend to say. A few days ago I liberated a queen and some bees that had been confined in a cage provi-

sioned with pure sugar-candy for 20 days; the queen was in good health, but some of the workers were distressed with diarrhea, and discharged as black and filthy-looking matter as I ever saw in the winter season; but perhaps I should beg the pardon of our pollen-theorists, eh?—G. W. DEMAREE.

I do not know, as so much depends upon surrounding conditions. Sometimes it is but a few days, and at other times a month or more, seemingly.—JAMES HEDDON.

That depends somewhat upon the size of the queen-cage, the number of worker-bees with the queen, the care with which they are put up, and the weather. Queen-bees have crossed the ocean, were a month on the way, and arrived safely.—MRS. L. HARRISON.

I sent one to Texas, which then went to Georgia, then to Massachusetts, and then to Kentucky—*en route* about three or four weeks, with the queen and most of the workers all right at the end of the journey. I believe that with good food, they could go much further and a longer distance.—A. J. COOK.

That depends. In very hot, dry weather, they will not bear confinement as long as they will when the temperature is cooler and more pleasant. I have mailed queens successfully when they have been confined in the cage for 30 days.—J. P. H. BROWN.

Several years ago I sent some queens to Scotland, which arrived in perfect order, after a confinement of 16 days. I also sent some to New Zealand, which were *en route* 35 days; all were dead when they arrived but the queen, and she died soon afterward. I prefer not to send queens by mail where it is necessary for them to be confined more than 10 to 14 days.—G. M. DOOLITTLE.

They will stand it from 10 to 15 days, but though they have stood it for a much longer time, it is best not to presume too much upon what might be the result of a longer confinement. We have sent them to Australia, and they were in good condition, but they were specially prepared with extra food, more room than usual, and plenty of ventilation. Some we have received dead, though only confined for 3 or 4 days.—THE EDITOR.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

CORRESPONDENCE.

FACTS.

Further Discussion of the Subject of Digested Nectar.

Written for the American Bee Journal
BY PROF. A. J. COOK.

I am surprised and pained to read the editorial on page 611. I quite agree with the editor, that "Ridicule is not argument—neither are arrogant assertions and contemptuous epithets conclusive evidence." If I have ever, anywhere, used ridicule, arrogance, tyranny, or epithets, I truly beg pardon. I despise all such, and have ever tried to avoid them as I would poison. I did try to express forcibly my displeasure and opposition to the expression of opinions on subjects that writers had not investgated; especially where they taught in opposition to well-settled facts.

Some years ago the great Agassiz talked of bees, and uttered absurdities that made bee-keepers laugh. He merited rebuke, and received it. Prof. Wiley did the same thing, and the editor of the AERICAN BEE JOURNAL fairly "roasted" him. I always felt that the editor was pardonable. When a man writes of what he has not investigated, and so knows not the truth, and essays to teach others, he deserves severe reproof. The editor certainly agrees with me in this, or, he would not have written as he has in the Wiley matter.

Regarding Dr. McKinney's reply: I make no complaint of style; I think he is courteous and fair to me; but not to himself or truth.

I am very glad that the Doctor says that honey and nectar are different. So far, good. But when the Doctor teaches that heat will change cane-sugar to glucose, he is far out of the way. Why! it is heat and evaporation that prepares our cane-sugar from beets, cane, and maple sap. Unless we add acid, such evaporation never changes the sugar. If concentration by heat changed cane-sugar to glucose, then our sugar factories and maple bushes would be glucose factories. This is entirely an error.

I believe that no scientific authority teaches other than that nectar is cane-sugar, and honey, for the most part, reducible sugar. Now there are two ways that the cane-sugar can be changed to honey—either by boiling with an acid, or by animal ferment. Bees certainly work this change. They cannot do it in the first way, therefore they must do it in the second.

Again, bees have four large glands which empty their product right at the base of the tongue. Here, then, is a digestive liquid in rich abundance, that is poured out just where the honey enters. I have not the least doubt but that this is the ferment that digests the nectar. We positively know that the nectar is digested, as is easily tested. Here is the juice, emptying just where it would be needed.

I believe that these facts are demonstrated: Honey is partially, or completely, digested nectar. The bees work this digestion. I have no doubt but that the secretion from the lower head, and thoracic, glands, furnish the ferment that effects this digestion. A diluted solution of any sugar is likely, if kept warm, to ferment or sour. Thus the sap sours in the spring, and the presence of the acid changes the cane-sugar when we boil it, to glucose, and so ruins our syrup or sugar. In the same way diluted honey will sour. It is not that the honey is not digested—"the bees dyspeptic"—but the diluted honey not ripened—is likely, under the right circumstances, to sour. Thus we wish to have thick, heavy honey, so that it may not ferment.

How quickly maple sap sours. It takes only a few hours. This is not true with the syrup. The syrup may be kept for months, and not ferment. This is just the case with honey. Thin honey ferments readily; ripe honey will keep for years.

Agricultural College, Mich.

[To give *pain* to a friend, causes us *sorrow*. Our arguments were only *intended* to show that editors should not exclude courteous discussion, and thereby prevent all advancement—and, also, to prove that putting such articles into the waste-basket, would not disprove the arguments sought to be advanced. We stated that *editors* should not play the "tyrant"—not professors!

We well knew that Prof. Cook went further than he intended, in his article in *Gleanings*, and that is why we depreeated the fact that the Professor should have *seemingly* invoked the aid of ridicule, etc. We surmised rightly that, upon second thought, he would gladly modify the language in some particulars.

The "Wiley matter" bears no comparison to the present discussion. That was a wilful misrepresentation, made in order to cause a *sensation*, and one that has injured the pursuit!

The discussion of the "digested nectar" theory, is a harmless dispute

—doing no injury, and is made only to get at the truth—for which both sides are anxious.

We cannot help thinking that Prof. Cook was particularly unfortunate in the use of the word "digested."—By its use, he certainly cannot mean "food turned into chyme, ready to be converted into blood," as Webster defines that word, and as it is generally understood, in its common use!

Frequently and presistently is it stated that bees do *not* "make honey"—that they simply deposit in the combs what they gather from the flowers! That it undergoes a slight chemical change is true—but it is *not* "digested" in the common acceptation of that word!

Will Prof. Cook, or some one else, please suggest some more appropriate word descriptive of immaculately-pure virgin honey? We do not want to call it *digested*, under any circumstances, if it can be avoided!—ED.]

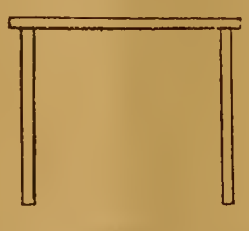
BEES IN WINTER.

Safe Method of Wintering—How to Prepare the Bees.

Written for the American Bee Journal

BY ALLEN LATHAM.

Winter is approaching; even as I write, the wind whistles, and there is a chill in the air suggestive of coming frosts. Now is the time that the average bee-keeper is looking anxiously into the condition of his bees, and he wonders whether they will pass through the winter in safety. Beginners are debating how they shall winter their bees. It is my purpose, in this article,



to give some idea of how the bees can be safely and surely wintered.

I began in 1884 with one swarm, which I captured in the woods. That colony died from the effects of winter. I procured bees the following spring, and the next fall I had 5 colonies, which I safely wintered. Since then I have not lost a colony from the effects of winter. Feeling that I have found a safe way of wintering bees (I do not as yet say that I have solved the "wintering problem"), I desire to present it to the beginners, who, I hope, will accept it with pleasure

The sketches which accompany this article show very clearly how I manage. The outer case, which is about 4 inches larger all around than the hive, and 8 inches higher, is made of clapboards and scantlings an inch square. The top, or cover, is of boards, and is covered with tarred paper, making it perfectly water-proof. The inside

Longitudinal Section, Parallel to Side.

cushions are wide frames covered with burlap and stuffed with fine planer-shavings. The cushions should be of a thickness to make the inner space where the frames are, about 6 inches wide.

A colony is easily packed away. After the frames and cushions are in place (I suppose it is needless to add that the four frames should be half full of sealed honey, and some pollen, if you do not believe in the pollen theory), the case is put over the hive, and then planer-shavings are packed under and at the sides to the top of the hive. Now remove the cover, place two sticks across the frames for a bee-passage, and over the whole lay a piece of carpet or burlap; to fill up the rest of the case, put in a large sack of shavings. The sack should be closed so that the bees can be easily examined without spilling shavings.

Put the outside cover on, and make the entrance about 2 inches by $\frac{3}{8}$ of an inch, and the colony is ready to stand a severe winter, or a mild one. The bees should be packed when all breeding has ceased, and they are ready to quiet down for winter. Here it is about Nov. 1.

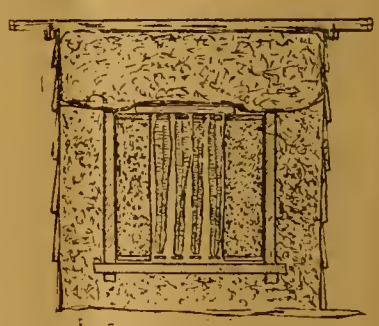
Little care is needed in winter. Snow should be shoveled away from the hives only when there comes a thaw. I usually clear the entrances whenever I happen to be in the apiary. Last winter I was at college, and the bees were let entirely alone, yet they were all right in the spring—all the 27 colonies.

I will here say nothing of spring care of bees, as I expect to write later concerning that. All that remains to be said here are a few words in support of this method.

First, it is a safe way of wintering bees. The bees are in a small space, surrounded on three sides by dry shavings, which carry off all moisture, and retain the heat. They consume very little food—not more than one-fifth as much as an unprotected colony. Thus they come through the winter in a healthy and strong condition. It matters little whether there be a quart or four quarts of bees in the colony, they will winter the same, and breed up nearly as fast in the spring.

I once wintered a quart of bees with no queen. I gave them two frames only. They came through alive, drones and all. In the spring I gave them a queen, and to-day there is a strong colony in that hive. During that winter, there were 21 days in succession when the mercury stood below zero.

Second, it is a cheap method; the whole apparatus for one colony need cost but 50 cents, and will last for years. The sides can be simply tacked



Longitudinal Section, Parallel to End.

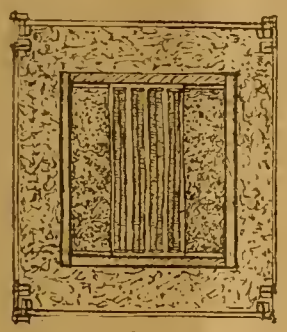
together, and so be easily pulled apart, to be packed away for "next winter."

Third, there is no more work about it than about cellar-wintering. One man can pack 15 hives a day, and unpack 25. The shavings can be kept in a bin, to be used again.

Last, but not least, it is the best thing possible when spring comes. Through it that delicious honey—apple-blossom honey—can be obtained. Last season nearly all of my surplus honey was obtained from apple-blossoms. How this can be done will be told in a future article.

In concluding, I ask the old bee-keepers to try one colony the coming

winter, and see how it works. I am aware that my method is pretty much the same as that used by many other



Horizontal Section.

bee-keepers, but just how it should be done is not clear to the majority.

Cambridge, Mass.

ROBBING.

How to Remove the Surplus Honey.

Written for the Prairie Farmer

BY MRS. L. HARRISON.

"Mamma! Mamma! The bees are on top of the portico, and under it, and trying to go into the parlor, through the shutters; and just look, they are all over the honey-house. Oh, my! oh, my! these is one in my hair! come quick and get it out, mamma. How it buzzes!"

The bees were stinging the chickens and they pitched into me, when I went out. There was a reign of terror for awhile, all produced by robbers attacking a queenless colony. The bees that could not find where the honey was obtained, were trying to enter other hives, and were repulsed with vengeance, which caused all this stinging commotion.

We obtained some cases for holding sections, that were too short, and left an opening at the end of the hives, during the honey-flow. This was no objection, rather to the contrary, as it assisted in ventilation; but now, robbers were trying to enter through these openings, and it appeared as though the whole apiary would soon be demoralized.

I uncovered the queenless colony and let the robbers take possession; and the other bees soon found where the honey came from. I then fastened up the openings made by the short cases, by stuffing in rags; and, to drive off the bees, wet them with kerosene. They dislike the odor of this so much that they soon left on the double-quick.

Removing Surplus.

Surplus honey can now be removed whenever convenient.

In England, in order to drive the bees from the sections, bee-keepers spread on a cloth wet with carbolic acid, which causes the bees to retreat below in the brood-combs; but in this country, smoke is generally used. I go out into the apiary in the early morning, before the bees are flying, and carefully drive the bees below with a bellows smoker, pry up the case, remove it, cover up the hive securely, and put the case into the honey-house.

When the bees get stirred up in that part of the apiary, I go to another part, and do not persist in working a long time each day, as I live in the city and must be careful that persons and horses are not stung. Sometimes in the evening I pry up cases so that I can easily remove them in the morning.

Those that I remove one morning, I scrape off the propolis and store away, and am thus prepared for another lot the succeeding day. Working slowly in this way the bees do not get demoralized, and I can work with them comfortably. If they get very excited, I stop removing surplus for a few days.

As for myself, I do not care how cross they get when I am working with them, as I am protected against their javelins; but at the same time, I must consider the safety of other persons and animals. There is a great difference in the handling of bees, to keep them on their good behavior, as the following will show, taken from the *Western Apiarian*:

"I hired a California man one season to handle my bees; he donned a white linen coat, buttoned up to the chin, put on a bee-hat, gloves with gauntlets up to the elbow, and tied with cords at the elbow, and cords around his pants above his shoes, so that it was impossible for a bee to get at him; then he would pitch right into them, with very little smoke, and the consequence was, in a few days we could scarcely stay on the place for the bees. So I discharged him, and took them in hand myself, and in two days I had them as tame as ever."

When bees get greatly irritated they do not always quiet down in two days, and seem to have good memories. This man had probably worked in California canyons, away from any human habitations, and as they could not sting him, did not care how cross he made them, and they would be in fine condition to drive off bears, and other marauders. Some persons are better adapted by nature to gentle, quiet handling of bees than others, but all who engage in this pursuit should try to improve in this respect.

HONEY.

Digested Nectar or Honey, as Claimed by Prof. Cook.

Written for the American Bee Journal

BY L. A. ASPINWALL.

I have been deeply interested in the above subject; also the gentleman in question. I say gentleman, because I know him, and have met him upon several occasions. I have been highly entertained by him at the Michigan Agricultural College. He is not only a gentleman, but a thorough scholar, not in one particular line or department, but his knowledge is diversified and general.

Now that so much controversy is growing out of the subject of honey being digested nectar, let me beg of our fraternity to discuss the subject with all enthusiasm, but not forget that men who are constantly overworked, often in a burst of enthusiasm forget themselves, and perhaps use an expression which, although harsh, may not have been intended as such. I am quite sure the word "digested" can be distorted and made to mean other than what the Professor intended. We know that to digest is to pass into the chyle stomach, and undergo such a chemical change or assimilation which renders it ready to be appropriated to the system. But when used in a sense that the Professor intended it, we understand it quite differently. When the Psalmist said, "Rivers of water flow down mine eyes because of the sins of my people," he did not mean more than tears.

As yet, I do not quite accept the Professor's theory, although I am much nearer to it than I was a year ago. I have used the litmus paper for certain tests, although not for honey, therefore I cannot speak with much assurance yet. May it not be possible that thoroughly-evaporated nectar leaves an inherent or natural acid so insoluble as not to act upon the paper? Let us hear from our friends on this point.

Perhaps Prof. Cook was a little hasty in requesting Dr. McKinney to ask the brother bee-keepers' pardon, but I can see his burst of energy and enthusiasm more than any feeling that such language would seem to indicate.

Wooden Cells—Non-Swarming.

I want to correct the Professor in his article on page 616, which I know occurred through his multitude of business. He speaks of myself and a neighbor bee-keeper having used it for "two or three years." It should read, "two seasons." I also wish to speak of tearing the comb slightly by

the bees. This would not occur had the bees been introduced during the honey-flow. It was late before completing a successful machine to bore the combs, hence the occurrence. Having discovered it myself, I remedied it at once in substituting a wood which does not leave a furred cell after being bored. The cells being bored endwise to the grain, unless the bit is kept very sharp, a little fiber will be left. The bees naturally remove it, and polish the cells, and during a failure of the honey they continue the work of polishing too long.

I also wish to explain my theory as to non-swarming: I understand the instinct of the honey-bee to guide them in this matter as much as in comb-building; that drones are reared during the approach of the swarming season to impregnate the young queens. They are invariably produced before any preparations are made in the line of queen-cells. I believe that the instinct of the bee is unerring; that they will not attempt to rear a queen and leave her without drones with which to mate. Each colony certainly acts upon the principle of isolation, as in the forest; otherwise, they would not rear drones when other colonies contain them.

WINTERING BEES.

Early Preparation of Bees for Winter—Carniolans, etc.

Written for the American Bee Journal

BY L. W. LIGHTY.

If some one were to put you to bed, and cover you, and command you to lie still, ten to one you would be uncomfortable, with one foot out in the cold, and some corner of the cover not in place, letting in the cold. Give you a little time, and you will make it snug.

So with the bees; put off the winter packing until late, when they have clustered, then you will fix it to your notion, and ten to one the bees are uncomfortable. Get them in good condition, and pack early for winter, and they will be able to "putty up" the little draught-holes that annoy them, and build bridges, and fix things in general to suit their notions, which you will generally find the best.

If bees are to be wintered out-of-doors, they will always winter better if packed and prepared early in the fall, at least before they begin to cluster. At least such has always been my experience.

I have found nice, clean wheat-chaff to be the best material for packing. Top ventilation through a six-inch chaff-cushion is desirable; and *plenty* of good food is very necessary to successful out-door wintering. Let them have a little more than they need, and you generally will not lose anything in the long run.

Carniolan Bees.

I tried the Carniolans this season, and I cannot praise them very much so far. They are very prolific, are not as easily handled as Italians, and will not stick to the comb. They can be handled with very little smoke, if handled *very* quietly; but I do not have any time to "fool away" generally, and want to handle bees hurriedly, as a rule. I think that they do no better in honey-gathering, and on comb-building I can hardly say, as yet.

Report for the Season.

The whole of the white clover season was wet—very wet—and bees got very little honey. Honey seemed to be plentiful, but it rained every day, and bees could not get out. We had a good flow of fall honey, but it is as fall honey generally is—dark, and not very salable. Bees are likely to go into winter quarters in good condition, but will have some honey-dew in the brood-chambers.

The asters are just coming into bloom now, and may give us some honey yet, as it often does. That is usually fine honey.

Mulberry, Pa., Sept. 18, 1889.

MAILING BEES.

Sending Bees by the Pound Through the Mails.

Written for the American Bee Journal

BY E. L. PRATT.

There seems to have sprung up a lively interest in the matter of "sending bees by mail," with no more competition than I expected. Mr. Doolittle is not the man to "rush in where angels fear to tread," and I am sure that I am not. The whole question will bear considerable study on both sides. Mr. E. R. Root, on hearing the news, as given in the AMERICAN BEE JOURNAL, on page 581, wrote to me the following communication:

E. L. PRATT:—In regard to sending bees by mail, we have no doubt but that it is possible to do so, but it is very dangerous to the general queen-traffic, besides it is contrary to the Postal Regulations.

A few years ago one man attempted to send one-half pound of bees through the mails, the package was broken open, the bees escaped and stung the postal-clerks, and the result was, queen-bees and their attendants were excluded from the mails, to pay for the bee keeper's carelessness. It is only through great efforts on the part of the bee-keeping fraternity, especially Prof. Cook, that queen bees and a few attendants were re-admitted to the mails, and then only on conditions that a few bees might accompany the queen. To do so, the Postal laws will have to be modified.

We beg of you not to try the experiment again, if you value the privilege of sending queens by mail. The fact that we have been having trouble with Uncle Sam a number of times in regard to sending queens by mail, shows that we cannot be too cautious.

We had better be content with what we have, and not try to tip beyond the bounds; besides, even if it were permissible and no trouble would come from this source, the postage on a pound of bees would be nearly as much as the express charges, with the average distances to which bees are sent.—E. R. ROOT.

Mr. Alley, and several others, have pitched in and given the scheme a thorough boxing. If we can keep cool long enough, I think that the matter will adjust *itself* very effectually. The time is close at hand when the bulk of the business now done by the hundreds of express companies, will be handled as mail-matter by the Government. Just think of it, reader, to be able to stick a 10-cent stamp on a 5-pound article, and have it delivered at the very door of your customer, one thousand miles, or more, away! The idea is stupendous, and its need unquestionable. The great monopolies and trusts of this country are working out a grand salvation for the people in a slow but sure manner.

The *Nationalist* for August, editorially says: "The use of the mails for transmitting express packages is increasing in popularity. Were it not for the pressure upon Congress by the express companies, which thereby succeed in maintaining the rate upon fourth-class matter, at 1-cent per ounce, and the limit at four pounds, the bulk of the express business would already have gone to the post-office."

One of the improvements which *should* be made in the Postal Service, is the reduction of the rate for express packages. There is a manufacturing concern in Boston now using the mails for the transportation of type-writers to Mexico, that is proving the cheapest and best way, since, by special treaty the international rates for fourth-class matter permits the sending of 12-pound packages.

Perhaps you know that the dealers in liquids and glassware have been preparing for this order of things, by so packing their goods that breakage it next to impossible, even in the generally rough usage of the mails. See also an article in *The Forum*, by Dr. L. W. Bacon.

Look over the field, read up, and give your best ideas to the papers. One blundering failure should not be the means of squelching all other efforts of a progressive nature. If this

world is going to stand still, I want to leave it now; but it is not going to take a stand, yet awhile. Some of us now have pretty hard work keeping abreast of the times. All hail, coming grand events in our national history.

Marlboro, Mass.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Oct. 23, 24.—Union, at Mt. Sterling, Ills. J. M. Humbaugh, Sec., Spring, Ills.

Dec. 4-6.—International at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Stung by Bees, etc.—Aaron Jennings, Medusa, N. Y., on Sept. 30, 1889, writes:

As Mr. Greiner asked (page 584) for the particulars in regard to the West Milton teamster being stung so badly, I would say that it was not one swarm, but bees from quite a number of hives. Mr. Howlet, the teamster, drove his team in the yard where the bees were kept, and the teamster's boy going where the bees were, the bees went for the boy, and the boy went where his father was with the team; the bees stung the horses, and they went among the bees, knocking over six or seven hives. One horse was stung so badly that it died that night; and the other died the next day. A gentleman from the town of Milton visited me last week, and told the particulars. We have not more than one-third of a crop of honey; the hives are well-filled with honey and honey-dew to winter the bees, but I am fearful.

Golden-Rod, Extracting, etc.—J. N. Edsall, Unadilla, Nebr., on Sept. 23, 1889, writes:

I began the season with 14 colonies, increased them to 24, and have taken about 200 pounds of comb honey—rather a poor showing, some will say. Bees started well in the spring, and did nicely until June, but since then the weather has been too cool, and there was little honey in anything; the heart's-ease bloom was light, and golden-rod yielded nothing. 1. From my experience I am inclined to agree with Mr. Eugene Secor, that the golden-rod is "no good" in some localities. I have never seen a bee on it. 2. Would it pay me to buy an extractor, having only fall honey? 3. Can honey be extracted from the brood-chamber before the brood is all sealed in the combs? 4. All my hives are the Langstroth style but one, and that is a tall hive with a frame 12 inches deep; the colony in this hive always gives me the most comb honey. Why? 5. I placed an Alley drone and queen trap on a hive this season, but the swarm left me. Why? When I opened the hive I found three young queens on the combs, and half a dozen queen-cells unhatched. I got no honey from that outfit.

[1. The golden-rod, like many other plants, is much affected by atmospheric conditions, and some years seems not to yield nectar.

2. Yes; an extractor will pay you at all times. It is so handy to extract from partly-filled sections, in preparing for winter, etc.

3. If care is taken not to turn the comb-baskets too fast, the honey can be extracted from combs containing unsealed brood.

4. That state of things is quite unusual. The hives with shallow frames generally give the most comb honey.

5. We give it up. Perhaps Mr. Alley can throw some light on the matter.—ED.]

Best Season for Ten Years.—E. R. Russell, Humboldt, Kans., on Sept. 21, 1889, says:

The honey-flow here has been the best for ten years, and bees are working on golden-rod and heart's-ease.

Ventilation and Foul Brood.—R. E. Parcher, Wausau, Wis., on Sept. 9, 1889, writes:

The AMERICAN BEE JOURNAL is very interesting and instructive to me; in fact too much so; but the object of this is not to compliment, but to find fault with some things that I find in it. This is called forth by reading an article on page 569, on the "Cause and Prevention of Foul Brood." There are a few facts incorporated in that article that are liable to get the whole dose into many. The writer has made a wonderful discovery in his cause of the disease, the "steaming atmosphere" laden with *detritus* (I wonder how many of us would know it, if we should meet it on the street, or in the woods, as Geo. Peck says); but Webster can introduce us, so we know who "detritus" is. Well, it is a great relief to know that all we have to do is to put in a modern fire-brick tile hearth, slate or mahogany month fire-place to each hive, and the disease is headed off. That bees do effectually ventilate, and to a large extent control the temperature of the inside of the hive by their wing-fanning (both outside and inside of the hive), there is no doubt, and I think that at the present day it is generally admitted that the proper place in a room (and I think the same will apply to a hive) to draw the air from, is the *bottom*; then what better or cheaper way of ventilation than to let the bees attend to that themselves. There may be many "theoretical" disregards of correct methods of ventilation, but I think there are few *practical* ones.

[Our friend seems to stumble on the word *detritus*. It is applicable to "a mass of small particles worn off from solid bodies by attrition;" when the portions are larger, the word *debris* is used.—ED.]

Poorest Season for 15 Years.—Edgar Ricard, Canaan Center, N. H., on Sept. 23, 1889, says:

Bees wintered very well in this county last winter, and swarmed early in June, but have not stored any surplus since June 20. Swarms that came out after that time have no honey to winter on. This is the poorest season for honey that I remember of for 15 years.

Bees and Grapes, etc.—Thomas Hoey, Salineville, O., on Sept. 19, 1889, writes:

There are not many bees in this part of Ohio; it is in the Yellow Creek coal hills, where a great amount of the coal is mined, so it is not much of a place to keep bees, as the hills soon dry off, and not much blossoms for bees to work on. After the cold, wet spring was over, the bees did well till about the first of August, then very little was done till about a week ago, when they worked hard on honey-dew; but rain has come, and to-day it is too cold for bees to fly much.

In regard to bees destroying grapes, I would say that I raise a large amount of grapes of the best and sweetest ever eaten, and I have about 60 colonies of bees alongside of the vines; and if bees are so destructive to grapes as some folks say, I do not see how I can raise so many. I have had good, sweet grapes on trees that could not be picked, and were left to stay until the frost froze them, and the bees near

them had very little to eat, yet they never touched them. My bees are Italians, and will go almost any place that they can get anything to eat; but they never touch the grapes, unless the grapes are bursted, or something else has torn them open. The vines over the hives are full of grapes, and the bees have nothing to work on, and yet they do not touch them. A man told me that my bees destroyed his buckwheat, by sucking all the strength out of the blossoms, so that he did not get half a crop! How is that for ignorance?

Premiums at Fairs.—J. W. Bittenbender, Knoxville, Iowa, on Sept. 27, 1889, says:

I had an exhibition of about 8,000 pounds of honey, comb and extracted, and have taken eleven premiums as follows: One of $25.00; 2, $10.00; 2 $5.00; and 6 of $2.00. The $25.00 premium was the largest, and the $2.00 the smallest offered.

Preventing Increase, etc.—O. P. Miner, Taylor Centre, N. Y., on Sept. 21, 1889, writes:

I began with 16 colonies in the spring, and have 19 colonies now, and 800 pounds of comb honey, and 50 pounds of extracted honey from unfinished sections, making 53⅓ pounds per colony, spring count. My bees were never in better condition to gather the harvest than this year; but the weather was too cool and wet during most of the basswood harvest. I worked for honey and not increase, by hiving swarms with others that had recently cast a swarm, by cutting queen-cells, and lastly by removing the queen. I was only successful by the last method in preventing increase, and I believe it to be the only way that it can be done; but it is a question with me whether we get as much honey as by allowing swarms. Our surplus honey in this locality comes principally from clover and basswood. I have never got a pound from buckwheat or fall flowers.

Carniolan Bees Compared.—Judge Laurens Hawn, of Leavenworth, Kans., on Sept. 24, 1889, writes:

I have 80 colonies of bees, and I am preparing to winter them in the cellar. I will say of my Carniolans, that the queens are larger and more prolific than my Italians; the workers are also larger, very gentle, being easily handled without smoke. They stick to their combs so quietly and tenaciously, that a comb covered with bees could be taken to the house, the queen removed, and the comb replaced in the hive, without dislodging a half dozen bees. They are readily distinguished by the white bands, which, when the bees are in the shade, give them a silvery-grey appearance, which at once discloses their identity. They may be distinguished from the blacks at once, without trouble. The queen is larger and stouter than the black queen, and more of a dark-bronze color. With me the Carniolans are better honey-gatherers than the blacks, their combs are whiter, and they use mostly wax in place of propolis. As compared with Italians, I am not prepared to say that they are equal in honey-gathering qualities. I shall watch them carefully next season. In hiving, they are more easily managed than either blacks or Italians; their queens are very fine.

Results of the Season.—A. C. Loomis, Grand Rapids, Wis., on Sept. 27, 1889, writes:

I increased my apiary from 5 colonies to 10—3 colonies giving the increase. Those 3 seemed to do nothing but swarm; the other 2 stored the honey. It took about twice as long as usual to get the new swarms to work in sections. I had an average of 48 pounds per colony, spring count, against 67 pounds last year. I have had seven years' experience with bees, but under the present circumstances I have to keep a small apiary.

Knowing All About Bees.—John Boerstler, Vashon, Wash. Ter., on Sept. 17, 1889, writes:

When I commenced to keep bees, about 25 years ago, I got "log-gums" first, and boxes for some time, and did not know of any bee-paper or bee-books until I spent about $125.00 for humbug moth-proof hives. Just think of it, moth-proof hives! Then I happened to get the AMERCAN BEE JOURNAL, and soon after *Gleanings*, and then I began to see where I missed it by not having any bee-books to read. But those days are gone, and the beginner now can get bee books and papers, and can save many dollars by reading them; for bee-keeping cannot be learned in one year—the bee-keeper can learn all his lifetime. Perhaps some think that they know it all; and those are the kind that will never learn. My advice would be to have only one kind of hives in the apiary, and then read two or three good bee papers or books on bee-culture, and then take good care of the bees, for it will save a good deal of money and time: then by working with the bees it will soon be discovered that bee-keeping cannot be learned in one or two years—it has been a life study for me, for I am learning yet, and expect to do so until I die. The little yellow bees have some funny ways about them very often, that will puzzle any old bee-keeper, for they are full of tricks, and it is hard to learn all of them. I, for one, get puzzled occasionally in swarming-time. Whenever you hear of a man that knows all about bees, please tell him to write a book, and I, for one, will give him $10 for it; but I do not want any more humbug in mine.

Wintering in Box-Hives.—O. R. Hawkins, Bellport, N. Y., on Sept. 24, 1889, writes:

The season here has been very poor so far, on account of the extreme cold and rainy weather. In my apiary I have 7 box-hives containing bees, 2 of which have their hives only partly filled with comb; I have taken no honey from the hives this year, and expect to get very little. Will the two without a full hive live through the winter? I started with 2 colonies, hived 6 swarms, and had one that went to the woods, and another I killed, leaving 2 old colonies and 5 new ones.

[In box-hives it is difficult to tell whether the bees have stores enough for winter, but as you have taken no honey away from them, they probably have enough to carry them through until spring, if you have had any flow of honey at all. *That* you ought to be able to decide, as you are "on the spot."—ED.]

Sugar for Queen-Cages, etc.—J. H. Christie, Dyersburg, Tenn., on Sept. 23, 1889, says:

I have just read Mr. Doolittle's article on page 581, and the idea suggests itself to me, that if he would use coarse-grained sugar (say New Orleans seconds), and fine wire-cloth, the same as is used in milk-strainers, all danger of sifting through into the mail-bags will be obviated. By the way, Mr. Editor, you have gotten me into difficulty, and I want you to get me out of it. It comes in this way: I have been reading the AMERICAN BEE JOURNAL for twenty years, and it has taught me so much that I have nicer honey than any of my neighbors, so that were you to ask them if they were going to take any honey to the fair, they would say, "No. Why, old

man Christie will be there with his, and I cannot compete with his nice honey, so we will not try this year!" So the fun is all spoiled, unless I had some to compete with. Now you must get me out of that difficulty. My bees swarmed but little, and stored about half a crop; but they are doing nicely now, preparing well for winter. I give my vote for the golden-rod as the national flower.

[Oh! that is easy. Just educate your neighbors' sons who keep bees, and bring them up to your standard of excellence.—ED.]

Bees Did Well.—J. F. Eikenberry, Greene, Iowa, on Sept. 28, 1889, says:

The honey season is over. Bees did well in this locality in the forepart of the summer, but the fall honey crop was very poor, on account of dry weather. I got 2,492 pounds of very fine honey—never saw any better. I will sell it all for home consumption. I started last spring with about 30 colonies, and have now 67 in good condition for winter. I like the BEE JOURNAL very much.

Bees in a Boxed Fence-Post, etc.—E. L. Pratt, of Marlboro, Mass., writes:

As I was passing a prominent street-corner in Concord, the other day, I discovered a swarm of bees in a boxed fence-post. They were working like "good fellows." Authority stepped up and ordered them smothered. No words would be taken with regard to removing them in a rational way; so at night-fall the poor little bees were sulphured to death in the heighth of their prosperity. The post could have been removed, bees and all, with little trouble; it was a rotten affair, and a new one would have improved the looks of the corner greatly.

I have read several very generous reports of the "bee-suits" being fought out by the Union, in leading Eastern daily papers.

I have been doing considerable doubling up of colonies for the last two weeks. Fall honey is coming in first-rate. There was none last year at this time (Sept. 1). Buckwheat is yielding in fair quantities, and of good grade. There will be no feeding this season, thank the Powers!

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

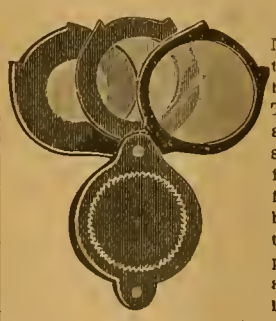
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2 25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c; dark, 12c; the same in 2-lbs., 13@ 4c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs, 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—24@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts; common Southern, 65@70c. per gallon. Demand is good Comb boney, fancy white 1-lbs, 16c.; 2-lbs., 14c. Fair 1-lbs., 14c; 2-lbs., 11@12c. Buckwheat, 1-lbs, 11@12c; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs, according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2 lbs., 8@9c. Extracted is in light demand values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c; white clover and basswood, in kegs and barrels, 7c.
BEESWAX,—25c. R. A. BURNETT,
Sep. 10. 161 South Water St.

DETROIT.

HONEY.—New crop is coming in slowly, and sells at 14@15c. for comb.
BEESWAX.—23c.
Aug. 21. M. H. HUNT, Bell Branch, Mich.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—We quote: Fancy white 1-lbs., 16c.; 2-lbs, 14c. Off grades about 2c. per lb. less. Buckwheat 1-lbs., 11@12c.; 2-lbs., 9@10c. Extracted basswood and clover, 8c; orange bloom, 8c.; California amber, 7@7½c; buckwheat, 6@6½c.; Southern, 65@70c. per gallon
HILDRETH BROS. & SEGELKEN,
Sep. 10. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—Receipts have been a little in excess of sales, and there has been a disposition on the part of some to reduce prices We quote: 1-lbs., 16@18c.; 2-lbs., 16@17c. Extracted is stronger in price, and promises to be even higher, the market being from 8@9c.
BEESWAX.—None on hand.
Sep. 23. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—We quote extracted at 5@8c. per lb. Comb, 11@16c. Demand fair for all kinds. Arrivals of extracted are good, while good comb honey is scarce in this market.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Sep. 11. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—White one-pounds, 13@14c.; rough and white 1-lbs., 12 13c; dark 1-lbs, 10@12c.; white 2-lbs, 12@13c. Extracted, white, 7@8c.; dark, 5@6c.—Demand improving.
BEESWAX.—None in market.
Oct. 4. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 1½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

A Handsome Present.—As the convention season is just approaching, we want to direct attention to the little book which every bee keeper needs when attending these gatherings. Here is what Mr. J. E. Pond says about it:

DEAR EDITOR:—Your little "Convention Hand Book" is really a very handy thing. At two or three different times I have been called on to get up something for special occasions, and I have found the "Hand-Book" just the thing to save me quite an amount of time and labor, as it was a very simple matter to use the "book" as a basis, making only such few changes as were necessary to fit the special time and place.

I can cordially recommend it to any one who may desire not only information, but a *perfect form* for organization of a convention of any kind of a convention, as it will "fill the bill" completely. J. E. POND.

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

We make every subscriber this offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Hand-Book for your trouble—by mail, postpaid. Here is a grand chance for all to get a valuable book without costing them a cent!

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Oct. 19, 1889. No. 42.

EDITORIAL BUZZINGS.

The Loss by Fire sustained by Mr. E. T. Abbott, of St. Joseph, Mo., as mentioned on page 611, makes it necessary for him to sell his bees *at once*, in order to raise necessary funds to meet his obligations. Any one within shipping distance who may want to buy some bees, would do a kind act by buying them of him. It will *help* him over the hill of difficulty that he is now trying to climb.

From Prof. N. W. McLain, Director of the Agricultural Experiment Station, of the University of Minnesota, we have received Bulletin No. 8, which gives reports upon Siloing Clover, Sources of Home-Made Manures, the By-Products of Wheat, the Rocky-Mountain Locusts in Otter-Tail Co., Minn., in 1889, etc. The latter is an exhaustive treatise, and is extensively illustrated, showing these pests in their various stages.

R. McKnight, Esq., Owen Sound, Ont., has sent us a large photograph of his residence, which shows that he believes in taking solid comfort in his home life. The massive residence, beautiful lawn, copious barn, and interesting family, all shows that he enjoys his surroundings, and the name of the place, "Homewood," is expressive and appropriate. He has our best wishes for happiness and prosperity.

He has also sent us a photograph of his honey exhibit at the Industrial Exhibition at Toronto, mentioned last week on page 643. It is no wonder that he carried off so many prizes.

The Autumn Catalogue of Christian Weckesser, of Marshville, O., is on our desk, with offers of queen-bees, small fruits, plants, etc.

The Northwestern Convention met as announced in this city last week. The number in attendance was very creditable—about 80—and all were enthusiastic and entertaining. About 10 lady bee-keepers were present, and some of them took part in the discussion—particularly that veteran, Mrs. Lucinda Harrison. Five sessions were held, and the enthusiasm did not lag at any point.

The proprietors of the Commercial Hotel, where the Convention was held, and where the headquarters were established for all in attendance, endeavored to make all their visitors feel at home, and won golden opinions for their promptness and attention on every hand. Every one, from the proprietors, Messrs. Dabb & Co., to the bell boys, seemed anxious to serve us with the best this popular house affords. Bee-keepers coming to Chicago, could not make a better selection than the Commercial Hotel during their stay in the metropolitan city of the West, which sits like a Queen on the shore of beautiful Lake Michigan.

The Convention had no set programme, but the discussion included everything, in the line of apiculture.

The daily papers, as usual, poked fun at us, and characterized our sessions as "queer, droll meetings of farmers, with long, shaggy beards, and informal to the last degree." Of the discussions, the *Herald* says:

An almost illimitable supply of questions was discussed. They were furnished in a way entirely in keeping with these informal meetings. When any member of the conference desired to be enlightened on any particular point in bee-culture, he wrote the question out on paper, and laid it on the chairman's table. Then it was announced to the meeting, and, after being thumped and kicked around among the delegates till the wind was knocked out of it, it was laid aside for the next one proposed....

They talked straight from the shoulder, and when they came upon a point that needed particular emphasis, walked up before the chairman and fired it straight at him.

After making some more foolish assertions about what was done, the reporter drew on his imagination for the following, for nothing akin to it was enacted:

"What kind of a hive is best adapted to down the swarming fever?" was one of the questions that were raised. It had no sooner been announced than one old fellow in a far corner of the room broke out of a deep sleep, and, springing to the floor, yelled, "Mine!" He then went into a long discussion about divisible brood-chambers, shifting crates, artificial wooden combs, and other things that go to make a bee feel at home in a wooden hive.

Another delegate made some such remarks as, "Hold up the king and discard the queen." The queen of a swarm of bees seems to be the most potent power in the party, and whatever she can be induced to do is readily adopted by the rest as the proper caper. The bee-keeper who cannot manipulate the queen might as well liberate his swarms and seek a new occupation.

The reporter remarked that a member of the Northwestern Society would catch any swarm by simply going up to a tree where it had settled, and "cluck and whistle until the bees settled into a compact ball," etc.

With this starter in Saturday's papers, we need not wonder that Sunday's *Inter Ocean* should contain the following:

Yesterday's session of the Bee-Keepers' Convention was taken up mainly by the discussion of how best to exclude the adulterators and imitators of honey from the legitimate honey market. The methods of testing honey by chemical analysis were reviewed by the scientific members of the body, and it was clearly shown that no house-keeper need lack the knowledge or means of assuring herself regarding the purity or impurity of honey purchased by her....

A committee was appointed for the purpose of bringing the combined influence of the bee-keepers of the country to bear upon their respective congressional representatives, with a view to the enactment of a law analogous to that of protecting dairy butter—whereby all imitations or adulterations of the genuine article shall be marked or branded as such, under suitable penalty in case of neglect.

The Sunday *Times* had a similar announcement, beginning with these words: "The Bee-Keepers' Convention yesterday declared war against the honey-factories"—a pure fabrication.

The session on Saturday began at 9 a.m., and lasted until 1:30 p.m., and up to within ten minutes of adjournment, not a word had been said about "honey-factories" or adulteration. It was then stated that at the Exposition a method for testing honey by chemical analysis was being exhibited, etc., and it was suggested that a committee be appointed to look into the matter. As it was already past the hour of adjournment (1 o'clock), and many had left for home (among them President Miller), and as all remaining were suffering the pangs of hunger, and wanted to go to the dining room, the vote was put—and stood 11 to 12 for a committee. A motion to adjourn was then made, and there was a rush for dinner.

Bee-keepers need no legislation against adulteration, for it has been killed by the low price of honey! When it does not *pay* to adulterate, no one wants to take the trouble to do it, and as a result but very little, if any, adulterated honey can anywhere be found! All the "swash" in the daily papers about adulteration is, therefore, without foundation or excuse.

New York Honey.—Mr. E. L. Pratt writes thus: "Cobb, Aldrich & Co., large retail grocers of Boston, Mass., have on display, in their show-window, 45,000 pounds of New York clover honey in scant-one-pound sections, at 15 cents per section. It attracts a large crowd of people about the show-window." That is a sacrifice.

A. D. Ellingwood, of Milan, N. H., took two prizes at the Lancaster Fair—one being for comb honey. The *Gazette* says: "The show in Floral Hall was very good, and we noticed a fine display of honey by Mr. Ellingwood, of Milan."

The First Engraving on page 648 is an unfinished sketch. It was sent by an oversight of the author, and is meaningless.

GLEANS OF NEWS.

The International Convention.—The Editor of *Gleanings* has sent us advance sheets of the following article, which will appear in the next issue of that periodical :

Where Shall we Hold the Next National Bee-Keepers' Convention?

SHALL IT BE CHANGED FROM BRANTFORD, ONT., TO BUFFALO, N. Y. ?

The *Canadian Bee Journal* for Sept. 18, 1889, contained an editorial touching upon a point that I had been thinking of for some time. It reads as follows :

While at Buffalo, we lost no opportunity of inviting our American friends to be with us at the coming International Convention, to be held at Brantford in December, and we were encouraged by many promises to be present. We hope that our Canadian bee-keepers will not forget to be present, and give our visitors such a welcome as they deserve. By the way, would it not be mere justice to place the holding of the next convention at Buffalo ? The bee-keepers there would like it, and it will give Canadians a good chance of again being present. Besides, the Eastern States are deserving of it in their turn. Think of it, and come prepared to do the matter justice, in the best interest of the association.

This set the ball rolling; and, of course, in view of the foregoing considerations, I could not help giving it another boost by writing the following letter to Dr. Mason, President of the Association, which will explain itself :

FRIEND MASON :—The last leading editorial in the *Canadian Bee Journal* for Sept. 18, strikes upon a point that I have been thinking of for a long time. The reason the next International Convention was located at Brantford, was because its Secretary lived there, and could see to all the necessary business ; but now I am informed he has moved away, and has been away for some time.

Now, the question comes up, what attraction or what reason is there for having the convention in a small town in Canada, with nothing particularly to call it there *now ?* The population of Brantford is only 13,000, and it is but 70 miles from Buffalo by rail. Why would it not be a good scheme to change the convention to Buffalo, on the border of the two countries, in a city of 250,000 population, and in the vicinity where some of the best bee-keepers in the world are located ? We can surely get better rates of travel to Buffalo.

Furthermore, there is a good, live man by the name of O. L. Hershiser, with whom you are acquainted, in that vicinity, and you may be sure he will leave no stone unturned to make the next International a success, so far as accommodations, rates of travel, etc., are concerned. Buffalo, in the winter time, is a place of great resort, on account of the Niagara Falls, and I am satisfied that a much larger attendance can be had by some outside attraction than by bees alone. At New Orleans there was the largest attendance at the International in its history ; and the reason of it was the World's Exposition. We were interrupted a little, it is true, by those coming in and going out; but I would a great deal rather attend a convention where there is a large attendance with some interruptions, than a small, one-horse affair, with an international name, and no interruptions.

Now, my better half and I, and, in fact, the whole of the Roots, want to see Niagara Falls in the winter. For the sake of the women, therefore, and for the sake of securing the presence of the New England and New York bee-keepers, exert your influence in favor of Buffalo, N. Y. The Canadians, according to the *Canadian Bee Journal*, will be just as willing to attend. There is nothing at Brantford now to attract the convention, and there is no reason why it should be held there.

I will write to Prof. Cook, and also to Mr. Newman, and the Secretary, Mr. Holtermann. The latter, under existing circumstances, would, I think, just as soon, have it at Buffalo as at Brantford. We changed our place of meeting last year, and why not change it now ? Times and circumstances alter things very materially, sometimes.

ERNEST R. ROOT.

Medina, Ohio, Sept. 24, 1889.

Hardly deeming it advisable yet to do anything about it in print, I sent press copies of this letter to Prof. Cook, who originally proposed meeting at Brantford, and to the editor of the AMERICAN BEE JOURNAL, Mr. Newman. The following replies were received, all of which seconded the change. The first one is from the President, who writes as follows :

FRIEND ERNEST :—Yes, I am in favor of a change of the place of meeting of the International Convention, *provided* that the Canucks so desire. Come to think about it, though, I do not think that it is any of their business, with the exception of Messrs. Jones and Holtermann. I believe they are the only members in Canada. Why not put it at Niagara Falls, on the Canadian side, then we should be right where we could see the "beauty" without leaving the convention ? I am willing to go anywhere that my friends will allow ; and if I am "short" in December, you will not see me at the convention ; but I *hope* to be there, and Mrs. Mason with me. A. B. MASON.

Auburndale, O., Oct. 1, 1889.

I think I should still prefer Buffalo as the place of meeting, to Niagara Falls itself. Buffalo, besides being centrally located, is so near and accessible to the Falls that those who so desire can visit them *after* the date of the convention. If, on the other hand, it were held at the Falls, there would be more or less interruptions *during* the session. In other words, Buffalo would be just near enough to be an attraction, and yet sufficiently removed from the roar of the great cataract to avoid interruptions.

Prof. A. J. Cook writes in this manner :

Dear Friend :—I think your reasons are good. We all only wish the best interests of the Association. If they would be best served by changing to Buffalo, as seems likely, then I say Buffalo. I see no objection, unless the Secretary or the Canadian bee-keepers object. A. J. COOK.

Agricultural College, Mich., Sept. 30, 1889.

Brother Newman indorses it in this vigorous style :

Friend Root :—Yours is received, with press copy of letter to Dr. Mason, which I have read carefully. If the Canadians do not object seriously, I see no reason why the convention should not be at Buffalo. Our best convention was held at Detroit in 1885, on the border between the United States and Canada. The meeting at New Orleans was not one of the National Conventions. It was an *extra*, but it was good, and just as you say. Count me and the AMERICAN BEE JOURNAL in favor of Buffalo, and send me *advanced proofs* of matter for *Gleanings* about the change, and I will *second your motion*, and support it to the best of my ability. THOMAS G. NEWMAN.

Chicago, Ills., Sept. 30, 1889.

Perhaps I should have sent a press copy to the Secretary, R. F. Holtermann, now of Romney, Ont., Canada, but not then remembering his address, it was overlooked until now. I feel quite sure he will indorse the change.

Now, then, you have the full facts before you. That we may ascertain the pleasure of the members of the Association and others, I suggest that those who favor the change, and also those who do not favor it, write directly to Thomas G. Newman & Son, 925 West Madison St., Chicago, Ills., recording their vote : and Messrs. Newman, after receiving them, can transmit them to the officers of the Society, who will act accordingly.—ERNEST R. ROOT.

In the above article Brother Root asks for opinions of bee-keepers to be sent to us relative to changing the location of the International Convention to Buffalo next December. This was done without consulting us, but we will attend to the matter with pleasure. We favor the change, if it receives the endorsement of Mr. Holtermann, Mr. Jones, and other Canadians. They should have been consulted first.

Later.—Since the above was put into type, we have heard from several Canadians—among them being Messrs. Macpherson and Holtermann—and *as they do seriously object*, there can be no change from Brantford for the next International Convention—but for the sessions of 1890, Buffalo is just the place. The suggestion came too late. Let us now dismiss the subject, and work faithfully to make the Convention at Brantford a successful and interesting occasion.

The Honey Season in Scotland is thus described by a correspondent in the *Record* for this month :

Once more we are within measurable distance of the close of the honey season. Though it has not turned out such a honey-flow as was anticipated in the early summer, nevertheless things look brighter for the bee-keeping industry than has been the case for several years. The crop of honey may be said to be a fair average one. It will be generally conceded that colonies in the spring were in a very backward condition, through scarcity of food and want of bees. The early spring encouraged brood-rearing, however, and, before June closed, reports were current of 100 pounds of surplus being taken from single colonies.

It is some years since the heather looked so promising as it did at the end of July ; but unfortunately bad bee-weather came when the bloom was at its height, consequently the yield of honey from this valued source was not great.

The exhibits of extracted honey shown throughout Scotland this season have been very superior in flavor, color and consistency. Sections have not been first-class ; perhaps this may be attributed to the quantities of *worked-out* sections left from last year to be filled this season, and which in nearly all cases fail to produce good quality sections.

The Carniolan Apiary of E. L. Pratt, of Marlboro, Mass., is shown on this page. Concerning Carniolan bees, Mr. Pratt writes as follows:

I think that the Carniolan bees have the advantage over all other races, because they are almost a *perfect bee* in the rough, as we have them now. With a reasonable amount of good breeding these bees will, without doubt, far exceed the most popular Italian, on account of their extraordinary breeding power, hardiness and prolificness. Carniolans, in their purity, are gentler than any other race I know of. Their honey-gathering qualities are in accordance with their strength.

The only argument against them is their swarming, which I do not find a bad fault with the new management for comb honey. My bees have not swarmed as much as they did when I kept Italians. There is seldom any robbing in a Carniolan yard, and it is with great freedom that one goes about his work with no fear of stings.

In the distance, among the grass, are shown a few of the nuclei hives—one hundred in all.

These hives all take the Cary frame, with ten to the large, and from three to five to the nuclei.

The operator is your humble servant. He is just opening an imported-stock hive, without the use of smoke, during a clover harvest.

During this season, 1889, not a single queen has been lost at mating time, out of the hundreds reared. This is on account of vigor of the young Carniolan queens, keeping all nursery hives a good distance apart, and allowing the grass to grow up about them. All the breeding is done from very fine home-bred queens, and mated with the finest drones from tested imported stock. We are firm believers in breeding from the best drones as well as from the best queens.

Mr. Pratt was the editor of the *Queen-Breeders' Journal*, which has now been consolidated with the *Western Apiarian*.

Raising Alfalfa in Texas.—W. L. Moore, of Denton county, Texas, in the *American Agriculturist* for October, describes his method of raising Alfalfa as follows:

The soil best suited for raising this valuable forage plant is a deep sandy or waxy loam. It grows best in this State on the low lands, and its yield is fine. There are other soils here well adapted to it, which are now planted to cotton, and are not producing as profitable crops as they would in this plant.

To prepare the ground for alfalfa, plow it deep and harrow it thoroughly with a smoothing harrow. This should be done from the 1st to the 20th of October, so that it would give the alfalfa time to take root before winter. If sowed broadcast, it will take from 12 to 20 pounds to the acre, or 12 pounds to the acre sowed in drills. The broadcast method succeeds well in this State, when there is a good season for it to take root. The seed should be covered to the depth of 3 inches, to insure a good stand.

It may be cut at least three times in a good season—once each in June, August and October. If the season is unfavorable, it can be cut only in June and August. If housed as soon as cut, it makes a splendid feed for winter.

The manner of growing alfalfa in Texas, doubtless would work well in the North. This is an excellent honey-yielder, as well as a large producer of good hay, and should be extensively grown in localities where it will thrive. The seed can be obtained at this office at 32 cents per pound, post-paid, or at $3.00 per peck, by express.

The Queen-Rearing Apiary of Mr. E. L. Pratt.

I often show my best colonies to visitors without using smoke at all. To them it is a wonder. A pure Carniolan bee should show no yellow anywhere upon its body. The abdomen should be of a crow-black stripe with wide brown or grey bands. When pure, they are beautiful.

Concerning the engraving, Mr. Pratt sent the following to *Gleanings* as a description of it:

The engraving herewith shows the northeast corner of what is known as the "Pratt Bee-Farm," of Marlboro, Mass. This apiary is wholly made up of the Carniolan race of bees, and is run for queen-rearing exclusively. It is located in the centre of a city of 13,500 population. A small brook is in the background. The large hives in the foreground are stock hives, of the Cary type. The first three or four rows contain imported queens, and they are constantly drawn upon for brood to strengthen nuclei, etc., which keeps them from swarming.

Those hives just to the left of the operator contain the finest breeding queens procurable. These bees will submit to rougher usage without anger, and will endure the severest weather with less risk, than any other bees that we are familiar with.

Uses of Beeswax.—An exchange contains the following paragraphs about the uses of beeswax, which will doubtless be interesting as well as valuable to many of our readers:

Beeswax and salt will make rusty flatirons as clean and smooth as glass. Tie a lump of wax in a rag and keep it for that purpose. When the irons are hot, rub them first with the wax rag, then scour with a paper or cloth sprinkled with salt.

To engrave on iron or steel, first clean the place you wish to mark, and cover it with a thin layer of beeswax, raising the edges so as to form a basin. Then write your name in the wax with a sharp instrument, cutting it through to the steel. When this is done, fill the basin with undiluted nitric acid, or aqua fortis, and let it stand awhile. The longer it stands the deeper it will cut. Then wash with water.

Please Read the article on page 627 of the BEE JOURNAL, on how to make "Honey a Staple Article," and then send us a Postal Card, if you have not already done so.

Bauplane für Bienen-Wirtschaftliche Banten. This is the title of a new book in German by Josef Skach, Boitsberg, Germany, giving directions about building bee-houses, etc. Price, 1 mark. It is nicely illustrated, and is published by C. A. Schwetschke & Son, Braunschweig, Germany.

The Thing that Makes the Buzz.

BY H. D. CASTLE.

"Buzz! buzz! buzz! buzz! you big bumble-bee
Bending down the clover heads—can't you talk to me?
What a funny song you sing—buzz! buzz! buzz!
Should think you'd get your nose all full of dandelion fuzz.

"Don't you have a jolly time! honey every day?
Wearing all your pretty clothes when you go to play—
Nicest kind of velvet coat—yellow satin jacket!
Buzz! buzz! buzz! buzz! How do you *make* that racket?

"Now I've got you, bumble-bee, under my straw hat!
Buzz! buzz! buzz! buzz! I'll find out how you do that!
Pretty little bumble-bee, I won't spoil your jacket—
Oh! oh! oh! oh!"—Here's another kind of racket.

Mamma calls the bumble-bee, "Naughty cross old thing!
Didn't little Freddie know all about his sting?"
"See how big it's swelling up! Oh dear! oh dear suz!
Mamma, is the stinger the thing that makes the buzz?"—*The Housewife.*

QUERIES AND REPLIES.

Raising the Hive from the Bottom-Board in Winter.

Written for the American Bee Journal

Query 661.—1. In putting bees into the cellar for winter, is it advisable to raise the hive from the bottom-board? If so, how much?—C. W.

I have never done so.—J. M. HAMBAUGH.

Yes. I raise it about 2 inches.—G. M. DOOLITTLE.

1. Yes, sir. 2. Two inches or more.—A. B. MASON.

1. It is. 2. A full half-inch will answer.—J. P. H. BROWN.

It is better to raise it, say half an inch, if practicable.—DADANT & SON.

I never have wintered bees in cellars.—J. E. POND.

1. Yes, sir. 2. About 2 inches is about right.—C. H. DIBBERN.

1. Yes. 2. Two or three inches.—MAHALA B. CHADDOCK.

1. Yes, if you use a loose-bottom hive. 2. Half an inch.—MRS. L. HARRISON.

1. Yes, where hives have movable bottom-boards. 2. One inch.—WILL M. BARNUM.

I should like all hives 2 inches above the bottom-boards, were it easy to arrange it so.—A. J. COOK.

1. I suspect that it is quite important. 2. I have planned to have a space of about 2 inches.—C. C. MILLER.

It is advisable to give plenty of ventilation at the bottom. It does not matter how.—M. MAHIN.

I think so. I remove the bottom-board and put inch pieces between the bottom of the hive and what it rests upon.—R. L. TAYLOR.

It will do no harm if the cellar is warm. The warmer the room, the more it can be raised.—EUGENE SECOR.

It in the very nature of the case depends upon the temperature and humidity of the cellar. In a very damp cellar, I should think it essentially necessary to do so.—G. W. DEMAREE.

1. I think that it is. 2. I put a "rim" between the bottom-board and the hive 5 or 6 inches deep, and consider it of great advantage. Those having hundreds of colonies may object to so much trouble.—J. M. SHUCK.

My experience last winter was not favorable to having the hives raised from the bottom-boards. Neither should the bottom-boards be removed unless the temperature is kept as high as 48°. It is better to make the frames 3 inches deep, with stout muslin on one side, and filled with timothy-hay chaff. Place over the frames, and leave the bottom-board as in summer.—G. L. TINKER.

I think not. It is a troublesome maneuver, as it exposes too much entrance for the bees to fly out of and make trouble. I am sure that success or failure in wintering bees depends upon the disease called "bee-diarrhea." You cannot stop it, nor produce it, by dropping bottom-boards, or failing to drop them.—JAMES HEDDON.

If the bottom-boards are loose, the hives may be raised from them from half an inch to 2 or even 3 inches. But its advisability to do so, depends upon the temperature and humidity of the atmosphere in the cellar.—THE EDITOR.

Getting the Greatest Volume of Smoke from Sulphur.

Written for the American Bee Journal

Query 662.—By what means can the greatest volume of fumes be obtained from a given weight of sulphur?—E. & W.

I do not know.—EUGENE SECOR.

I do not know.—J. M. HAMBAUGH.

By burning it, I believe.—A. B. MASON.

I will not try to answer, as I have no use for sulphur, and never have had.—JAMES HEDDON.

I cover it over pretty well, and just let it burn.—C. C. MILLER.

Place it upon coals of fire at a white heat.—G. L. TINKER.

By using an inverted funnel, or hollow cone; placing each super or hive upon a stand directly over it.—WILL M. BARNUM.

If the querist wants to fumigate brood-combs or honey in sections, I will say frankly that I do not know.—J. M. SHUCK.

I should say by burning. By closing a small room, the fumes would be very dense.—A. J. COOK.

By using it in powder, and burning only a small quantity at a time.—J. E. POND.

By thorough combustion. Put the sulphur into an iron vessel, and place a thick piece of red-hot iron upon it.—R. L. TAYLOR.

Burn slowly, and have it shut up in a tightly-closed room or box.—MAHALA B. CHADDOCK.

By filling an iron pot about half full of hard-wood burning coals, and throwing the sulphur on top.—C. H. DIBBERN.

A given weight of sulphur, when burned, will produce the same volume of fumes under all circumstances. They may be more or less diluted with air, according to the space in which the sulphur is burned.—M. MAHIN.

I cannot say. An iron kettle with a little kerosene in it ignited, and sprinkle flour of sulphur over it, does very good work.—MRS. L. HARRISON.

The moment you start the sulphur to burning, it will give you all the smoke you want. Carry the fumes from the furnace by a draft-pipe into the chamber containing the articles to be acted upon by the fumes.—P. L. VIALLON.

I could not say. My method of burning sulphur has been to use a broad-bottomed dish having coals scattered over the whole bottom so that the sulphur was largely spread out. This keeps it, to a certain extent, from running together, thus allowing of greater combustion.—G. M. DOOLITTLE.

I prepare my sulphur for fumigating by drawing strips of paper through a pan of melted brimstone. I then ignite these in an iron pot. The apartment must be tight to *exclude the air*, and should remain closed for 24 hours, otherwise the larvæ of the moth will not be killed.—J. P. H. BROWN.

By burning the sulphur in a room so tight that the fumes cannot escape, and waste in bulk as the burning goes on. If the room is tight enough to hold the fumes, it is not so important as to the rapidity of the consumption by fire. Generally, the best results can be had by causing the sulphur to consume rapidly by fire.—G. W. DEMAREE.

The same "volume of fumes" are "obtained from a given weight of sulphur" when it is ignited. A good way is to have an iron pot half filled with live coals, and then throw the sulphur on it, in a close room.—THE EDITOR.

CORRESPONDENCE.

QUEEN-EXCLUDERS.

Rearing Queens Above a Queen-Excluding Honey-Board.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

From the numerous letters which come to me from those who have tried the plan of queen-rearing as given in my book, all of which speak of their success in using the same, I am led to believe that this plan is to succeed in the hands of all, in every locality, and in every clime. Believing this to be true, I am led to offer a few words for those who think that the plan is a "fussy one" as compared with the Alley plan and others.

Certainly the making of the cells-cups cannot be what is alluded to as "fussy," for these can be made during winter evenings, or at any time, this work being far better than passing away these unoccupied moments in sitting around the store or tavern, listening to the idle gossip there, as some are known to do. As this part of the work is so easily and quickly done, it hardly enters in as to time consumed, but, to be just, we will allow the time as five minutes to make the dozen cups for one colony.

Next we have the getting of the larvæ for the cups, and the two cells which contain the royal jelly, which is to be put into each of the cups. This will consume about five minutes more; while the putting of the same into the cups will take about ten minutes. I have often done it in seven. Then it will take about two minutes to slip this stick of prepared cups into the frame, and place it in the upper story of any hive which has a queen-excluder over it.

The work is now done until about the time the queens are ready to hatch, when it will require but a moment to take the frame of cells out of the hive, and about a minute a piece to put each cell into a nucleus; or into the apartments partitioned off at each side of the upper stories, where they are to hatch and become fertilized; for these cells can be picked off the frames as easily as apples can be picked off a tree, while no combs need ever be cut where the cells are to be inserted. Simply press the hard and the unyielding base of these wax-cells against the side of the comb until it is imbedded into the same, and it it is a fixture. The average number of cells which I secure from each prepared frame is ten, and as it takes but 33 minutes for the whole operation from beginning to end, we have about 3¾ minutes as the time consumed to the apiarist to secure a laying queen, by this "fussy" plan, as Mr. Alley and some others call it.

Well, I do not believe in cheap queens, as all know; but if I did, would not one dollar (the price usually charged for untested queens), pay me pretty well for 3¾ minutes' work? Now let us look at the Alley plan a little, and see how long it will take to get the same number of queens, which is about the number as recommended by Mr. Alley.

Of course you will want a swarming-box to keep the bees in for ten hours, which he recommends to prepare them for cell-building; but as this is easily made, and will last a lifetime, this is not worthy of mention.

Now you have to drum the bees out from a colony, so that they fill themselves with honey, and leave them in this swarming-box for ten hours. This drumming-out process will take ten minutes at least, if the bees have time to fill themselves with honey. Then it will take two minutes to take them to the cellar and get them again, and two minutes more to hive them into the hive where they are to build cells.

Next is the getting of the strip of comb containing the larvæ, the cutting it into strips, the killing of every other larva with the brimstone end of a match; the melting of wax and rosin to stick this strip on the comb, and the fastening of the same in place, which we will place at the very reasonable time of 15 minutes.

After the cells are completed we have to cut the strip of comb from the one to which it was fastened, cut the cells apart, patch up those mutilated in cutting, with a piece of foundation and a hot-knife, when they are ready for the nuclei. This operation will take at least five minutes; then it takes one minute each to put them in the nuclei, and three minutes to put the bees which built the cells back with their brood, or the brood and queen back with them.

By adding all the foregoing minutes together, the same as we did before, we have 47 as the number of minutes required to produce ten queens on the Alley plan, or 4⅝ minutes for each queen. By looking a little further, we find that if the queens are sold at $1 each, as was supposed by the first calculation, we have ten cents as the price which was received for each one-third of a minutes' work; so if we are to have the same price in this latter case, we must sell these queens reared by the Alley plan, at $1.40 each, to receive the same compensation for our labor. Surely, adopting the words found in one of our bee-papers, "So far as I am acquainted with Mr. Alley's method, I must say that if obliged to rear queens by it, or give up queen-rearing, I would accept the latter. The method requires more time and patience than I have to devote to such business."

Now, dear reader, you may think that I am prejudiced, but if so, it is only in failing to accomplish as much by the Alley and other methods in the same length of time that I desired to, and hence I went to work to see if a more expeditious way could not be found, and one by which the bees could be always left in just that condition which we had them for honey-gathering purposes, where the extractor was used.

By the plan which I have made public we have no *queenless bees* at any time; and have no bees doing *nothing* but *rear queens;* but on the contrary, the colony that is rearing queens is working for honey to the *same advantage* that it would under any other circumstances; while at the same time queens are being reared more expeditiously than by any other plan known to the writer; and that, too, after I have tried nearly every plan that I have ever seen mentioned in print.

If any think otherwise than I do, all that is needed is to try the different plans side by side, and then adopt the one which seems best to them. This is a free country, and I do not wish any one to use anything that I recommend, unless he can see that it is to his advantage to do so.

Borodino, N. Y.

GOLDEN-ROD.

Excellent Fall Honey from the Golden-Rod, etc.

Written for the American Bee Journal

BY G. H. ASHBY.

In answer to the request on page 636, allow me to say that golden-rod is our *best* fall honey-plant in Western New York. The fall honey we depend upon is, buckwheat, golden-rod, asters and Michaelmas daisy (called Micklemas), and they bloom in the order named. Golden-rod always yields the most of any, the weather being favorable. It begins to bloom about Sept. 1, and lasts about four weeks. It always yields well when the weather is favorable, and bees fairly swarm upon it at all times of the day. I think that were the days as long, and the weather as favorable as it usually is in clover or basswood harvest, we would get as much honey from it in the same time. The honey is a nice golden color (also the pollen), and quite heavy, but I think that it

granulates quite easily when uncapped in the cells or extracted. It is our main dependence for winter stores. It is very abundant, and very hardy, yet never troubling cultivated fields.

Getting Bees Out of Cases.

In answer to J. M. Burtch (see page 636), I would say that I think that he does not smoke the cases of honey at the right time. Smoke them in the middle of a day when the bees are working, when the mercury is above 65°, and they will move pretty lively. Take off a case before the bees begin to return, for after that you *surely* "cannot budge them." As the case is removed, quite a cluster may be on the bottom, which can be dislodged by a dextrous shake, and you will have nine-tenths of them out; the rest will leave very shortly, if put where robbers cannot reach them.

Albion, N. Y., Oct. 7, 1889.

THE SEASON.

A Woman's Account of the Work in the Apiary.

Written for the American Bee Journal
BY MRS. W. A. SHAFNIT.

We started with 35 colonies of bees last spring. The spring was very late and cold; apple-bloom came, but it was too cold for bees to work on it. Then came the locust, but the weather still continued cold. In the latter part of May our last year's queens were killed, and dragged out; nearly half of the colonies did this. We never saw anything like it before. The weather then commenced to warm up, and the fields were white with clover, and the air was sweet with perfume; it lasted until the middle of July, and within that time the linden gave a good supply of honey.

During June and July we had our honey-flow, for surely a flow it was, and it kept me busy three days out of the week, taking honey, with what help my husband could give me from his corn and harvest work, working from one to two hours every day at noontime. He cut out queen-cells and introduced new queens. We did not let our colonies swarm more than once.

The honey flow ceased the last of July. The fall crop was promising, but proved too dry. Golden-rod bloomed, but there was no honey in it. We have had no golden-rod honey in this section of the country for three years. Our roadsides and fence-corners are lined with it.

We have 65 colonies now, and we are killing some of our poor ones, which are the blacks. Give us the Italians, and others can take the black ones, as some claim that "they are the best honey-gatherers."

Honey is cheap—only 10 cents per pound; we held ours at 12½ cents for a long time, but finally had to sell with others. Some of our older bee-keepers put the price down.

We are taking the cases off and preparing the bees for winter. We have considerable unfinished comb honey that we are extracting; it sells at 8 cents per pound.

Brighton, Iowa, Oct. 7, 1889.

GERMANY.

Legislative Protection for Apiculture in Germany.

Written for the Australasian Bee Journal
BY T. J. MULVANY.

There are few countries in which the taste for apiculture is more generally spread among the people, or in which the bee-keepers as a class are more intelligent, enthusiastic and energetic in co-operating for the promotion of their mutual interests, than in Germany.

As compared with the United States of America, there is not, perhaps, the same amount of go-ahead enterprise exhibited, and consequently the number of large apiaries kept by people who adopt that as their exclusive calling, is comparatively few. There are, however, a great many people who keep a moderate number of colonies, partly for their own use and gratification, and partly as a means of increasing their modest incomes, and amongst them probably a large majority consists of country clergymen, schoolteachers, and men engaged in other business than that of agriculture.

These are generally thrifty, economical people, accustomed to live comfortably upon small means; and by them a few pounds per annum of additional income is looked upon as a matter of more importance than can easily be realized by people who judge of profits by the standard of "eight hours'" work and "eight shillings a day" for ordinary labor. Such a moderate earning can generally be obtained by the sale of a small quantity of comb honey, and, perhaps, of a few colonies of bees, all at remunerative prices, which can usually be commanded in the immediate neighborhood.

There is scarcely a man amongst those who keep even a few colonies, but belongs to a local bee-keepers' association, and regularly receives, and reads, his copy of the bee-paper selected as the organ of the society to which he belongs. Several of these local societies are affiliated to a provincial association, and these again to a Central National Association, which comprises all the separate States of the "Fatherland," and which holds periodical general assemblies, each year, in a different part of Germany.

This system of holding what they term "Wanderversammlungen," is peculiarly a German one; is universally adopted by men of science, members of the learned professions, artists, architects, engineers, both civil and mechanical, as well as by many of the trades and minor callings, and tends greatly to promote social intercourse and co-operative action between the members of each profession or calling.

The yearly assembly is fixed as a sort of holiday trip, usually in the Easter or Whitsuntide holidays, and occupies two or three days, which are employed in accordance with a well considered programme, in business meetings, social intercourse, and pleasure excursions.

The town or city selected as the place of meeting offers every possible facility and assistance to the executive committee charged with the general arrangements, and the railways usually issue return tickets at reduced rates for the visitors. The whole system is carried out with a strict regard to economy of means, which is rendered practical by the co-operation of large numbers for a common object.

For instance, in the local bee-keepers' societies, the annual subscription does not exceed two or three shillings, *including the price of the bee-paper*, which is supplied to those societies at the rate of one shilling per member, while the price to outsiders is three shillings per annum. This, again, is only possible where so great a number unite for the purpose.

The *Bienenwirtschaftliches Centralblatt*, which is the organ of the German Central Association, is a well-got-up paper of 16 pages, in pamphlet form, with an outer cover, issued twice a month, and has a circulation of 8,000.

To show how municipal, provincial, and central governments assist in promoting the movement, I may mention that in a late number of the *Centralblatt*, the following notice appears:

GERMAN APICULTURAL CENTRAL ASSOCIATION.

For the III Wanderversammlung and Exhibition of the German Central Association, to take place at Stettin, in September, the following grants of money have been made:

1. By the city of Stettin.....1,000 marks.
2. By the Province of Pommern..2,000 marks.
3. By the Royal Minister for Agriculture.....3,000 marks.

Further grants of assistance are in prospect, of which due notices shall be given, etc.

Now here we see £300 already granted as subsidies by the local and central governments, while further assistance is still expected. The railways, which are State property, will, no doubt, issue return tickets to mem-

bers of the societies at greatly reduced rates, and probably carry goods for exhibition free, etc.

I have gone into the foregoing details in order to show that in Germany there is at least as much energy displayed by the bee-keepers, and as much assistance afforded by the Government for the promotion of apiculture, as will be found in any other country. Still, among the general public there is as much of the same kind of ignorance and prejudice to be encountered, which, in the United States, have forced the bee-keepers to form a league for mutual defense in legal prosecutions, and which have already shown themselves in a minor degree in this colony, that it has been found necessary to apply for legislative protection against the wilful destruction of the bees, and against frivolous or malicious attacks upon the property and interests of the bee-keepers.

German Bee-Legislation.

On the 3rd of April last, a Bill was introduced into the Prussian House of Representatives, entitled the "Bee-Protection Act." The member who moved the first reading of the Bill, Herr Letocha, promised a speech of considerable length, by observing that he was not acting upon his own mere motion, but in the name and on behalf of the Central Association for Bee-Culture, and of the 20,000 bee-keepers who were members of the Association.

He then entered into a full explanation of the importance of apiculture in a national point of view, not only on account of the commercial value of the bees' products, but also with regard to the use of these products in medicine, and in many branches of industry—some of which, such as copperplate engraving, lithography, and zincography could not supply their want by any artificial surrogates; and, above all, on account of the services of the bees "in their relation to the bloom and splendor of our native flora, as well as the plenty of our fruits, and also the profitable yield of our harvests, generally speaking." In concluding this portion of his subject, Herr Letocha said:

> I have felt it my duty to go into these details, because, unfortunately, people are still found, even among the agriculturists, who have not the slightest idea of the relation between bees and flowers. Only yesterday I was told by one of our large landed proprietors that the bees caused him great injury, especially in his buckwheat and rape crops, inasmuch as they visited the fields so constantly during the period of the bloom, and sucked the strength out of the plants, so that they could only make a poor growth.
>
> Now, gentlemen, it is a fact, clearly established by experience, that the buckwheat, for instance, on the Luneburg moors, notwithstanding the poor soil of that district, is much richer in corn, or, as the farmer expresses it, gives a better yield, than on good soil in other parts of the country; and this is solely attributable to the fact that the farmers of that district are also bee-keepers who place their bee-hives during the period of bloom, near the buckwheat.
>
> It is also fully established that fields of rape, white clover and seradella, to which bees are brought during the time they are in bloom, afford a much richer harvest than those fields which are not visited by bees; and finally, experiments made by covering small areas of rape, when in bloom, with fine netting so as to exclude the bees, have had the result that the plants so covered yielded but little seed, while the fields immediately adjoining, where the bees had free access to the flowers, yielded a most excellent harvest.

The speaker next proceeded to quote some interesting historical facts to show that the protection of apiculture had been, from the early times, considered worthy of legislative attention. After alluding to the ancient Roman law, which provides that any one who wilfully destroyed his neighbor's bees should pay him compensation for the damage so done, he added:

> In Germany bee-culture was in a flourishing condition in the middle ages, and the bee-keepers were held in high estimation. Those who bred and kept bees were then named "Zeidlers," and possessed many and great privileges. They were, for instance, exempt from tolls in the imperial cities; they had also, under the Golden Bull of 1350, a separate jurisdiction of their own, under their "Zeidel-masters," from which only the most serious crimes were excepted.
>
> In Prussia, specially, bee-culture enjoyed a wise and large degree of legal protection. Thus, for instance, the paragraph 29 of the *Official Gazette* for the police districts in Prussia for the year 1642, ordered, amongst other things, the following:
>
> "And because the moors and forests are becoming few, the villages, however, God be praised, always more numerous, therefore shall the people be called upon to establish bee-gardens, and to pay particular attention to them, so that the wild honey, which would otherwise go to waste on the open fields, may be brought into the gardens.
>
> "Again, in the village regulations of 1702, the peasant farmers and cottiers are specially bound to keep a fixed number of bee-hives. Frederick the Great issued, under date of June 27, 1778, a regulation, *to be read yearly from the pulpits of the churches*, according to which those who should lay down poisonous matter mixed with honey, and thereby cause bees belonging to other people to be poisoned, should be punished, without respect of persons, with imprisonment, with or without hard labor, up to six years." (!)

This last instance shows that there must have been, at that time, a sort of crusade carried on by the misguided enemies of the bees, which called forth such vigorous action on the part of the great Frederick. Or can it be that the Prussians had then a "small bird nuisance" of their own, and that "the poisonous matter mixed with honey" was laid down for the same purpose as the poisoned wheat of our time, which, by the way, requires to be well sweetened to be effective, and which, in the case mentioned at the last meeting of the Otago Bee-Keepers' Association, caused the loss of whole colonies of bees last winter?

What would the farmers of Otago say if the Government were to follow the example of Frederick the Great? In any case it must be admitted that the punishment awarded was out of proportion to the crime, even if we assume that the poison was intended for the bees only.

Herr Letocha then pointed out in what respect the legislation of the present day is defective, and requires revisal in order to protect the property of the bee-keeper, and to forward the interests of apiculture. Amongst the arguments adduced by him in this respect are the following:

> Most of the townspeople, and even many of our great landed proprietors, know nothing of bee-culture but the name; but they look upon the bee as a sort of savage reptile, because it can sting; and because it occasionally finds its way into sugar-factories and confectioners' shops, they believe they have a right to exterminate it by means of fire, poison, or with steam and water. The common land-law, indeed, expressly acknowledges the property of the bee-owner in his hives, and also in the swarms which issue from them. These provisions of the law, however, are only too often paralyzed by one-sided regulations which the police authorities, ignoring the essential nature of the bee, believe themselves called upon to issue in the interests of the public, and in consideration of a stinging mania in the bees.

Here follow instances of such local regulations issued by the police authorities. For example, in Cologne, in December, 1858, a police order whereby it was decreed, under penalties, that "within the city of Cologne not more than 5 colonies of bees should be kept in one house, and the grounds belonging thereto, and then *so that they cannot fly upon strange property.* (From this wise regulation it would almost seem as if the learned authorities thought that bees were kept in cages, like canary birds!)

Then, in Worms, in July, 1879, a local regulation prohibits the keeping of bees or erections of bee-hives "in the southern and southwestern portion of the zemarkung Worms;" and in Bremen, a singular regulation forbids the keeping of bees "*in a portion of the city* and the adjoining zemarkung." But this is not all, Herr Letocha very justly remarks as follows:

> But under the existing laws, even in places where such special regulations have not been issued, the keeping of bees is more or less dependent upon the good-will of one's neighbors. There are, however, such things as malicious neighbors, and under some circumstances even good neighbors will quarrel, so that mutual chicane is brought into play.
>
> Now, should a neighbor, out of chicane or malice, complain that he is troubled by his neighbor's bees, the local authorities, as a rule, order under penalities, the removal of the apiary, even in cases where, owing to the local circumstances, any real damage to the neighbor is clearly out of the question?

The speaker then quoted cases of this sort, of great hardship to the bee-keepers. For instance, a school-teacher who kept a single hive in his garden was ordered to do away with it, because his neighbor complained *that the bees flew upon his crocus flowers* (!); and another person, a professional apiarist in Brunswick, who had made his living thereby "for decades of years," was, after lengthened legal proceedings and appeal to the highest court, compelled to give up his business, and to sacrifice his property, because his neighbors succeeded in proving in court

that, occasionally, swarms had settled on their grounds, and that one or two children had been once stung by a bee. He then adds:

Gentlemen, it is perfectly clear that where such occurrences are possible, apiculture cannot progress. According to the farm-stock census for Prussia in the year 1873, there were then 1,459,415 colonies of bees counted, which, taking the colony at 15 marks, represents a total value of 21,891,225 marks. By the census of 1883, there were only 1,238,040 colonies, or nearly a quarter of a million less. The national wealth invested in these colonies of bees had therefore been reduced in these ten years by nearly three and a quarter million of marks.

In the statistics for 1888, I find the bees were not included at all, and also in the report of the Minister to His Majesty, upon the agricultural matters in Prussia, bee-keeping is not mentioned. This is a proof that apiculture, although a very important side-branch of agriculture, is not valued and appreciated as it deserves to be. The further decline of our bee-culture is unavoidable, and must go on even more rapidly, unless legislative measures be taken better to protect both the bee-keeping and the bee-keepers.

Herr Letocha here referred to the fact that a Bill, such as he now brought in, had been introduced into the Imperial Parliament (Reichstag) in 1883, and had been well received and very influentially supported; but owing to an early close of the session, could not then pass through the later stages. It had been prepared under the advice of thirteen of the highest authorities in bee-culture, including Dr. Dzierzon.

It was not again brought before the Reichstag because it was found in the meantime that the body was not competent to deal with the internal regulations of the different German States, as this Bill would have to do. He finally stated that the Bill he now submitted, contained four sorts of provisions—the first relating to the right of keeping bees, and the property of the the bee-keeper in his colonies and swarms; the second, to police and administrative regulations with regard to the location of apiaries, and of the bee-hives brought out to the fields in the period of bloom, with fixed lines for the contravention of such regulations; thirdly, the imposition of penalties for wilful and improper destruction of strange bees, by means of poison, water, steam, etc.; and fourthly, regulations for the suppression of FOUL BROOD, which he described as a "plague which can destroy whole apiaries, not only in small localities, but in an entire province."

It will now be a matter of interest to see how this Bill fares in the Prussian Parliament; but whatever the fate of the measure may be, we have here a proof that important legislative bodies, such as that of the Kingdom of Prussia and the Imperial German Parliament, the latter representing over sixty millions of people, notwithstanding the weighty matters upon which they have to deliberate, can spare time and attention to consider the whole question of the protection and encouragement due to apiculture upon principles of State policy, while a certain duodecimo parliament sitting "in another place" appears to be so overpowered by the labor of legislating for some half million of colonies, that it cannot afford the necessary time to deliberate upon a short, useful, and, I believe, unopposed measure, intended to save a young country from the damage likely to arise from the spread of foul brood among its bees, although the Bill is so short and so simple that it might well be disposed of by any parish vestry meeting in half-an-hour.

TAXING BEES.

Are Bees Taxable in the State of Iowa?

Written for the American Bee Journal

BY EUGENE SECOR.

The query propounded by G. B. Olney, on page 620, is one which seems to puzzle not only a good many bee-keepers, but also some persons who, by viritue of their office, interpret the Revenue Laws.

The question, "Are bees taxable?" must be decided by the laws of the State where they are kept. They may be taxable in one State, and exempt in another; therefore, what I shall have to say on the subject relates only to Iowa.

If I remember rightly, this question was ably answered in these columns several years ago by Dr. Oren, but as there are undoubtedly many new subscribers, I will give my interpretation of the Iowa law. Indeed, it needs no interpretation, the statute being so plain that any one, it seems to me, ought to be able to understand it. I will quote from the Revenue Laws, and from Section 797, which is the section specifying the exemptions: "The following classes of property *are not to be taxed*, and they may be omitted from the assessments herein required." Paragraph 4 of that section reads, "Animals not hereafter specified."

Taxable property is "specified" under Section 801, and the "Animals" therein named are "horses, cattle, mules, asses, sheep and swine." That is all the law there is treating directly or indirectly on this subject, except the quotation below.

Now, one question that is likely to arise is, "Is a bee an animal?" If not, they may be classed in the "All other property, real and personal," which "is subject to taxation in the manner directed." But if bees are not animals, what are they? Webster defines the word animal thus: "An organized living being, endowed with sensation and the power of voluntary motion; and also characterized by taking its food into an internal cavity or stomach for digestion; by giving carbonic acid to the air and taking oxygen in the process of respiration; by increasing in motive power or active, aggressive force with the progress to maturity."

Bees are animals. Some try to excuse their consciences for wanting to tax bees on the ground that they are property, and ought to share their just burden of taxation. But bees are not only animals exempt, yet we seldom hear of a word of complaint regarding the others. Geese, turkeys, hens, pigeons, guineas, peacocks, *dogs, cats, tame rabbits and fish are all animals, yet the assessor never inquires after the amount of capital that we have invested in them. They are exempt under the Section above quoted.

I may open a poultry farm and invest $5,000 in fine birds, yet the stock would be exempt under the law. I may construct a carp pond and raise fish enough to supply my family, but the carp are exempt. I might start an ostrich farm and the birds would be exempt from taxation under the present law, even though they cost $1,000 apiece. The proper tools of every farmer and mechanic to the amount of $300 are exempt from taxation.

If the Legislature had intended that all the before-mentioned animals should be taxed, they would not have exempted them.

As an instance where visible property wholly escapes taxation with the sanction of law, take poultry. The census report for 1880, shows the number of all kinds in the State on June 1st of that year, to have been 8,539,714. At 20 cents each (not an extravagant estimate), the value was more than a million and a half dollars ($1,707,942). The value of the eggs produced in 1879, at 12 cents per dozen, was $3,870,471.

The number of colonies of bees in the State is not given in the census report for 1880, but the honey produced in 1879 was 1,310,138 pounds. At 12½ cents per pound, the value was $163,767, about one twenty-third part of the value of the product from poultry. We do not hear anything about taxing poultry, and I think that it is about time that they give bee-keepers a rest.

*Under a recent law, dogs are taxed, but it is a sort of a *per capita* tax, and not according to the value of the animal. Its object is to raise a fund with which to pay losses to the owners of sheep or other domestic animals, caused by dogs.

Forest City, Iowa.

LAW.

Sending Bees by Mail is Now Statutory Law.

Written for the American Bee Journal
BY C. J. ROBINSON.

On pages 581 and 582 the subject of shipping bees by mail transit is discussed with pertinency to the bee-business. Mr. A. I. Root expresses fear that the mail "department" will get down on sending queens in the mail, and again exclude them by a ruling of the postal chief. He fears that the "trial package" sent in the mail by Mr. Pratt to Mr. Doolittle "is a direct violation of our present laws." It seems that our active business friend, A. I., has not made himself conversant with "our postal laws."

Referring to our postal law, it will be seen by reference to the statutes relating to mail regulations, that Section 372 of our postal laws, approved by Congress March 3, 1886, provides that certain articles therein mentioned are mailable as "4th class matter." The 8th clause of that Act reads: "Queen-bees and their attendant bees may be sent in the mails when properly put up so as not to injure the persons of those handling the mails, nor soil the mail-bags or their contents."

Please note that it is not left with the Postmaster General in his discretionary jurisdiction to rule that queen-bees and their attendant bees must be excluded as mailable matter, as he did many years ago. Now, it is statutory law that bees are mailable matter.

Our worthy friend, A. I. Root, mentioned that he "would not blame the department for shutting down on us;" none will ever "blame the department" again for "shutting down on us," no, indeed, it *can't* do it; Congress holds the helm of the mails, and have granted "us" the right to send through the mails, queen-bees and attendant bees, without restriction as to the number of attendant bees, and the wording of the law may be construed to include five attendant bees or five million, providing the packages do not exceed 4 pounds.

The 9th clause of the same Section, 372, mentions that "Hard candies or confectionery" may be sent through the mails when properly put up. So go ahead, Messrs. Pratt and Doolittle, and if you fail to push the business, very likely our enterprising friend, Mr. A. I. Root, will dispel his doubts and fears, dry up his mournful tears, and take the lead.

Mr. Root mentioned that "Prof. Cook was instrumental in getting queens through the mails when they were once cut off (?)" I do not like to dispute, nor am I willing to rob one of glory, but when I read the assertion I was a bit surprised that Mr. Root would entertain a superstitious belief that Prof. Cook is to be credited with all the honor and glory as having accomplished what many others, equally as great and good, have done jointly. Is Gen. D. L. Adair, of Hawesville, Ky., who first took the bull (P. M. G.) by the horns, to be ignored? And who had a telling voice in framing the Section, 372? It was not Prof. Cook. Has Mr. Root forgotten that the National Bee-Keepers' Convention took up the subject and appointed a "committee" to influence the chief of the "Department" to rescind his ruling, and permit postmasters to mail bees?

I mailed the first queen and a few attendant worker-bees that ever was sent by mail transit, and I have been cognizant of the rulings and the laws relating to bees by mail. I sent that first queen to Rev. L. L. Langstroth, in the summer of 1863—I suppose he has my letters on file—and naturally I would observe what transpired concerning the business. The idea of sending bees by mail was forced upon me as a necessity. I resided 20 miles distant from an express office.

I had a hand in importing the first Italian queens that landed on this continent, that bred queen progeny. P. J. Mahan, of Philadelphia, went and bought the queens, and bred queens in his apiary, and he sent queens to me by express. I was bothered about getting them, and it occurred to me that they might be sent by mail. I wrote to Mr. Langstroth, asking his opinion in the matter. He answered, saying that he considered it not practical. I ever have a mind that prompts me independently, and I caught a black queen, put her into a cage with a few worker-bees, and put all in the mail-pouch that was borne away on a stage-coach.

A few days later I received a package, per mail, from Mr. Langstroth, containing a fine Italian queen, but she survived only an hour or so. She and the few workers were daubed, and the workers were dead. He had informed me that the bees I mailed to him were in fine condition when received. I informed him that his attempt was a failure; that the bees were daubed, and he sent me another queen which came safely.

Such was the origin of sending bees by mail. At that time Mr. Langstroth wrote me a complimentary letter, mentioning that I was fairly entitled to the credit of the invention—shipping bees by mail; also that he contemplated a new edition of his book, and took pleasure of giving me the honor of being the originator of the plan.

The mailing of bees has proved a great boon to the bee-fraternity, as it did to Mr. Langstroth, yet he has ignored me, even though he promised to do me justice. Of course I do not feel toward him as many others do. A few years ago I wrote, asking him if he remembered the matter, and put the question, whether or not he knew that I was the first who suggested the idea of sending bees by mail, and the first to put it in practice. I suspected that some upstart would claim the credit, and that "Father Langstroth" would forget it, unless I had his acknowledgement in writing. He answered my question (as I took it) rather grudgingly, mentioning, "So far as I know, you were the first to mail queen-becs." I am human, and was feeling unkindly toward him in return for his disrespect to me, so when I received the cold reply, I waxed—well, just as anybody would.

Mr. Langstroth can correct me if I am in error, for it does not depend wholly upon our statements. I feel that I have reason to remember him as treating me unfairly; hence I have criticised him not in a friendly style.

P. S.—In my article on page 586, a slight error occurred. In the second column, and last line but one, it reads, "AMERICAN BEE JOURNAL," instead of "*Q. B. J.*," as I had written in. Editor Pratt commented on one of my articles, and I aimed a joke on him, in answer to his humorous mention of "beauty." The notion is current that "beauty" is—in women and bees—an indication of feebleness, but none attempt to explain or offer logical reasons in support of such a doctrine.

Richfield, N. Y.

[Mr. Robinson misunderstood Mr. A. I. Root's statement. The latter referred to the year 1879, when Prof. Cook, D. A. Jones, and T. G. Newman were appointed a committee to try to get "queen-bees and their attendants re-admitted to the mails," from which they had been excluded when framing a new law.

Mr. Robinson refers to the original time of admitting bees to the mails, in 1863—fifteen years prior to the excellent work done by Prof. Cook, President Willitts, and others, in re-admitting queen-bees to the mails.

We are sorry that Mr. C. J. Robinson should have any unfriendly feelings towards Father Langstroth—than whom no man lives who is more honorable and just, as well as anxious to give every man his just due.—ED.]

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Oct. 23, 24.—Union, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills.

Dec. 4-6.—International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Best Honey from Golden-God.—Chas. E. Dow, Lawrence, Mass., on Oct. 7, 1889, says:

With me the golden-rod is a valuable honey-plant—the best honey that I have taken this year is from it, and was taken in September. It is very thick, and it is hard to extract the combs clean. Let a person take a sprig of the flower, and compare its odor with the flavor of the honey, and he will be surprised at the similarity. I will send you a sample in a few days. Mrs. Dow and I say, let the golden-rod be the national flower.

Bees Did Poorly.—J. M. McDaniel, Peoria, Texas, on Oct. 1, says:

Bees are doing poorly here. We have no basswood or white clover in this part of the country, which are the main honey-plants in many places, and we have nothing to take their places; still I shall keep bees, as I like to work with them. Bees do well here in the spring, and sometimes late in the fall, but often in May and June there is a dearth of honey-plants.

An Opinion of Golden-Rod.—D. C. Leach, Walton, Mich., on Oct. 4, 1889, writes:

I am glad that Mr. Harris (page 636) has asked for an "expression of opinion as to the value of golden-rod as a honey-producer." I also had thought of calling for such an expression. Golden-rod abounds in this vicinity; thousands of acres of pine plains and "stump lands" are covered with it. It blooms in July and lasts, sometimes, until Oct. 1. I have been watching this year, to see how it was treated by the bees; for weeks I did not see a bee on it, although on the watch for them. About Sept. 1, I noticed that my bees were carrying in honey rapidly, and upon examination, I became satisfied that it was gathered from golden-rod. In some localities I found bees quite plentiful on it, and at evening there was about the hives an odor like, but much stronger than, that yielded by the flower of the golden-rod. This continued for about two weeks, and then ceased; since that time no honey has been gathered. Field and forest flowers are good, and the only place that I can find bees at work at all, at this date, is on a small patch of borage in my garden. The borage has been in bloom since early in July, and is still sought by the bees on every pleasant day, as eagerly as ever.

Results of the Season.—G. G. McCoy, Zumbrota, Minn., on Oct. 4, 1889, says:

I started last spring with 3 colonies, and have 11 now—an increase of 8 colonies. I have taken off 280 pounds of comb honey. Our fair was not a great success, on account of the cold weather.

A Worthless Weed is Golden-Rod.—Frank A. Eaton, Bluffton, O., on Oct. 3, 1889, writes:

I notice on page 636 that an expression is desired in regard to golden-rod as a honey-plant. My experience is, that it is one of the most worthless weeds that grows in this part of Ohio. I have never seen a pound of honey from it, and in rare instances I have seen a few single bees at work on it. It grows quite profuse here along the roadsides and in waste-places. I speak of the variety as illustrated in Cook's Manual, and most generally known. It is very pretty, and quite fragrant, which is the most that can be said of it.

Golden-Rod, Hives, etc.—Mr. Daniel E. Robbins, of Payson, Ills., on Oct. 3, 1889, writes:

I have watched golden-rod carefully every year since getting bees in the spring of 1884, and the bees in this locality do not work on it to any great extent; the varieties that we have here are practically worthless as honey-producing plants. Mr. Alley, in his "Handy-Book," page 173, says of golden-rod: "That which yields the honey, grows about 18 inches in height." One sort grows about 4 feet in height. Our honey crop is rather less than an average, the fall flow being very light. I think that much depends upon the location, as to what plants are valuable, what size of hive to use, what system of management is best, and whether the object is to produce comb or extracted honey.

Honey from Golden-Rod.—W. P. Henderson, of Murfeesboro, Tenn., on Oct. 4, 1889, writes:

Yes, the bees get honey from golden-rod in our locality. Since the enquiry of Mr. Secor, I have noticed particularly that my bees do visit this wild flower in our old fields. On Sept. 20, my 100 colonies (nuclei and full colonies) I do not believe had an average of 2 pounds of honey to the hive; now, Oct. 4, they are heavy—hives full—and the queens are restricted to a small space. Golden-rod (which I vote for, for the national flower) and tangle-foot, one of the asters, are the plants that the bees are gathering from. Nothing else is in bloom except cotton, from which they now gather only pollen. Honey from our fall bloom, however, candies long before the clover honey gathered last May, and is a poor winter food for the bees, as they only utilize about half of it.

A Fair Season.—Allen Latham, Cambridge, Mass., on Sept., 25, 1889, says:

This has been a fair season. Little honey was obtained from apple-blossoms, as it was so hot that only four days of bloom were obtained. Clover did not do as well as it should. Buckwheat honey is what filled the hives. I have several colonies, each of which has stored from 50 to 60 pounds of good buckwheat honey. Unless this wet weather stops, little or no fall honey will be obtained. I have sold all my clover honey at 25 cents per pound.

A Splendid Honey-Plant is Golden-Rod.—Benjamin Franklin, Franklinton, N. Y., on Oct. 6, 1889, writes:

I see that some claim that golden-rod is not much of a honey-plant. I cannot say how it is in other sections, but I know by the experience of the past twenty years, that it is a splendid honey-plant here. There used to be a pond covering 100 acres or more, that has grown up to golden-rod; I get a good deal of honey from that after buckwheat is out of bloom. This fall, while the bees were working on buckwheat, any one passing the hives could smell the buckwheat honey; when they commenced working on the golden-rod, one could smell that. It is splendid honey.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40

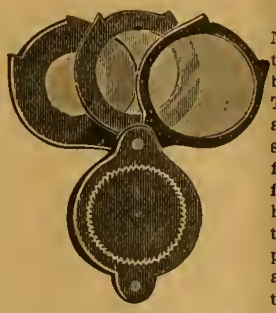
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2 00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

We Propose to all who subscribe now for 1890, to *give* them all the rest of the numbers of this year *free*—so the sooner they subscribe, the more they will get for their money.

Now, in order to pay our friends to work for our JOURNALS, we have gotten up special editions of Mr. Doolittle's "Scientific Queen-Rearing," (with Appendix), and Dr. Miller's "Year Among the Bees," bound with nice paper covers, and will *present* a copy of either book to any one who will send us two **new** subscribers for either of our JOURNALS (the BEE JOURNAL, weekly, or the HOME JOURNAL, monthly).

These editions are not for sale, but are gotten up specially for premiums for getting new subscribers. They are nicely printed, and will be sent *free* of postage, as pay for work to be done for our JOURNALS. Clubs need not be located at one post-office, and may contain one "Bee Journal" and one "Home Journal" to the same or different addresses; or both may be for either JOURNAL, as may be desired. Dickens or Waverley may be obtained for each subscriber in this club as offered on the last page of this JOURNAL.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

New Posters for the AMERICAN BEE JOURNAL, printed in two colors, have just been printed, and will be sent free to all who can use them. They are very handsome, and will "set off" an exhibit at Fairs. It will tell Bee-Keepers how to subscribe, for "Subscriptions Received Here" is quite prominent at the bottom.

We will also send sample copies of the BEE JOURNAL, for use at Fairs, if notified a week or ten days in advance where to send them.

Prang's National Flower is the title of a beautiful pamphlet which contains two colored plates of the two most popular candidates for selection as the National Flower of America. It also has two poems, and a postal card addressed to Messrs. L. Prang & Co., Boston, Mass., with a vote to be filled up for the selection of a National flower. The pamphlet costs 25 cents, and can be obtained at this office.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c.; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy boney.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—20@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2-lbs., 8@9c. Extracted is in light demand, values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c; white clover and basswood, in kegs and barrels, 7c.
BEESWAX.—25c. R. A. BURNETT.
Sep. 10. 161 South Water St.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¼c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—It is in good demand. We quote: Fancy white 1-lbs., 15@16c.; 2-lbs., 13@14c. Fair white 1-lbs., 13@14c.; 2-lbs., 11@12c. Buckwheat 1-lbs 10@11c.; 2-lbs., 9½@10c. Extracted, basswood and clover, 8c.; orange blossom, 8½c.; buckwheat, 6c.; California, 7½c.; Southern, 72½c. per gallon.
HILDRETH BROS. & SEGELKEN,
Oct. 11. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It is moving fairly well at 16@17c., with occasionally an extra fancy lot at 18c. Some large retailers secured quite a quantity of white, averaging about 13@14 ounces to the comb, and are selling it at 15c. per comb, tending to demoralize other retailers, as they want to compete, as the large retailers have filled their windows with the honey, and marked it very prominently. Two-lb. combs are a little scarce at 16@17c. Extracted, 8@9c.
BEESWAX.—None on hand.
Oct. 10. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—There is a quiet but steady demand for choice white comb, at 15@16c. dark is slow sale at 10@12c. Demand from manufacturers is fair for extracted honey, and it is good for best qualities for tables use.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Oct. 12. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs. 13@14c.; dark, 10@12c.; white 2-lbs. 12@13c.; dark. 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

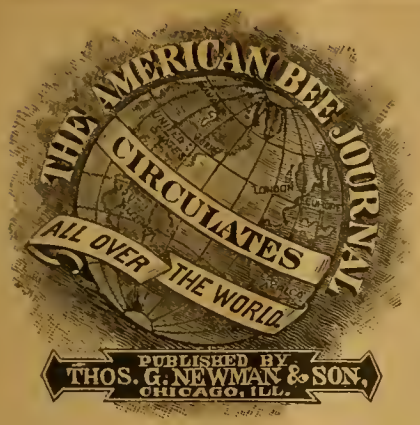
HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 1½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

Convention Notices.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

☞ The Union Bee-Keepers' Society will meet in Mount Sterling, Brown Co., Ills., on Oct. 23 and 24, 1889. The prospects are very flattering for a grand time, and all who are interested in bees or honey are cordially invited to attend.
J. M. HAMBAUGH, *Sec.*

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*



THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Oct. 26, 1889. No. 43.

EDITORIAL BUZZINGS.

About 30 Per Cent. more colonies of bees will be put into winter quarters this year than last. The fall honey crop was about 40 per cent. of an average crop; but the summer crop of honey "hung along" until the end of July—a month later than usual.

Loose Expressions often do harm, as well as cause much annoyance to those who try to "call things by their right names." In an article recently written by an apiarist for a metropolitan weekly we notice the following incorrect expression: "The safest food (for bees) is honey made from cane sugar." The writer well knows that honey is *never* made from cane sugar, nor, indeed, is it *made* at all; it is pure nectar gathered from the flowers! But some smart scribbler may now be found to claim that "honey is made from cane sugar," and to prove his claim he will quote from an article in the *Times* the very words desired to substantiate his assertion. That these words were thoughtlessly written we grant, but the harm done is just the same as though they were deliberate and intentional.

We insist upon "calling things by their right names," and if writers will not do it in their manuscripts, we invariably make the corrections in this office. But when they write to farm and miscellaneous papers, such corrections are not made, and an injury is there done to our pursuit.

A Representative Society Lady whose picture is given in this week's *Frank Leslie's Illustrated Newspaper*, is Mrs. Elliott Roosevelt, and her fair face is most pleasing. Pictures of the Visit of the Veiled Prophet to St. Louis present many grotesque and suggestive sketches.

The Honey Almanac will be published about the first of November, as we have received sufficient responses to warrant us in issuing it. Orders may now be sent in with copy for the Honey-Producers' Card. We will ship them as soon as issued. Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. Please read the announcement on page 629, and see if you do not need some. We are getting an excellent amount of new material for it, in the shape of recipes for cooking and medicinal applications. It will be a very nice and attractive Annual.

Mr. A. F. Randall, of Randalia, Iowa, writes thus about the Honey Almanac:

Now you are on the right track in regard to advertising honey and recipes for using honey. You can count on me now for 100, and if I can use more I will order them later. The recipes for making cakes and drinkables I think will help us all to sell our honey. Please to give H. O. Kruschke thanks for me.

Mr. Allen Pringle made an exhibit at the Lennox County Fair, Ontario, and the Nappanee *Beaver* makes this note concerning it:

Mr. Allen Pringle had erected, in his usual place, a pyramid of honey, which was pronounced by all to be equal to anything seen at the Industrial Exhibition, Toronto. He had several new styles of bottles for extracted honey, which set off his display to excellent advantage. The comb honey was of a superior quality.

Dr. S. P. May, Superintendent of the Mechanics' Institutes and Art Schools of Ontario, who is at present making a tour of inspection, paid Nappanee a visit. He visited the agricultural fair, and expressed himself pleased with the exhibit, especially the display of honey by Mr. Allen Pringle. The Doctor is an experienced man at exhibitions, having represented Ontario at the Centennial, and the Dominion at the Paris Exhibition, so that his commendation is worth something.

The Farm Journal, Philadelphia, Pa., has the largest circulation of any agricultural periodical in the world—150,000. It is now in its 13th volume, and is a good, practical Monthly.

By special contract we have secured terms by which we can offer the *Farm Journal* and either the AMERICAN BEE JOURNAL or the ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20.

Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

This grand offer should bring us thousands of responses at once.

Miss Gertrude Gibbs reported the late Bee-Convention in this city for the *Farmers' Review*. She is a smart young lady.

To Ripen Honey is very essential, either before it is taken from the hives or after it is removed. Which of the methods is the better one, is a question that all are not agreed upon. One of those in attendance at the Ontario Bee-Convention remarks thus:

I have said in conversation and through the press, that if there was any one thing that I knew—if one thing I could cordially recommend—if one item of advice I could give with pleasure, it was: Do not extract honey until it is ripe. And yet, strange as it may seem, there are men who know much more about bees than I do, who say that it is not necessary—that honey can be ripened after it is extracted. I cannot account for this, except on the principle that some men lack ability to judge both flavor and texture.

We hardly think the last sentence is a charitable one. Many of those who advocate the ripening of honey after it is taken from the hives are apiarists of excellent ability, and fully able "to judge both flavor and texture." That honey must be ripened is a fact—the best way to do it is only in dispute.

Bees and Grapes.—A correspondent in the *Indiana Farmer* closed a letter a few week's ago by saying: "Bees are damaging the grapes." Another correspondent replies to it with these unanswerable facts in this week's *Farmer*:

In the summer of 1887 it was quite dry in this section, during the time of ripening of our grapes; so much so that bees were not working any. I had some 40 colonies of bees, mostly setting in the shade of grape vines—all near them, and the grapes matured without a single instance of the bees disturbing them, that was seen. Then in 1888 the same thing was repeated—only the bees were starving for something to eat, the hives being nearly empty—some absolutely so, so far as I could see. I thought I would have to feed or lose all. Again we had a most beautiful crop of grapes; in many instances ripened on the hive, some bunches remaining until the grapes dropped off, and not on a single grape did I see bees working, and I looked carefully.

If bees will not work on grapes at such a time, when will they?

There is one of two things true in my opinion, grapes either crack, or some other insect opens them before the bees will disturb them, just as they do the apple, and some other fruits. After being opened they will likely work on them, but if not opened, I think they will starve first, not because they would not, but because they could not break the skin.

I. R. Good has moved 18 miles, to Vawter Park, Ind., where he intends to start a Carniolan apiary. His son will continue the Italian apiary at Nappanee, his old address.

This is what our friends say about the *Illustrated Home Journal*:

Rev. Stephen Roose, of Maiden Rock, Wis., states his opinion in these words: "The ILLUSTRATED HOME JOURNAL is one of the handsomest and most interesting magazines for the family that I ever saw. 'It is rich and racy.'"

Mrs. J. N. Heater, of Columbus, Nebr., says: "The ILLUSTRATED HOME JOURNAL is just such a magazine as I have been wanting to take for a long time, and I appreciate it. I wish it success."

Two Bee-Periodicals have very strongly condemned the sending of "Bees by the Pound" through the mails, viz: *Gleanings* and the *Apiculturist*. The latter says:

By the time Brother Pratt gets his petition in, requesting the Postmaster General to permit such a thing, other petitions will be sent in strongly protesting against it. I will do my best to upset and defeat it.

The reason given for this opposition is, that though Messrs. Pratt and Doolittle may be careful enough to pack such bees so that they may go safely, many will be so careless in this particular, that some employes of the Postal Department will get stung, and as a result, all queens, and bees, too, will be excluded from the mails.

This "point is well taken," and we hope the matter will be dropped *at once*.

To present petitions and counter petitions on this matter—all from bee-keepers—would be very detrimental to our interest as a body. Whenever we want anything like that, the matter should come with the general endorsement of the craft. The "argument" might bring up points that would not be to the advantage of the pursuit.

Besides, the points to be gained are so very insignificant—only a few dimes would be saved any way, and it would accommodate only a very few individuals.

Mr. Root sells more "bees by the pound" than any one else, and he is opposed to the use of the mails for sending them out. Our advice, therefore, is to let the matter drop, for it is an infringement of the law as it stands, and we ought not to risk any right we now have, by asking for others of a doubtful nature, which are not generally desired.

We Propose to all who subscribe now for 1890, to *give* them all the rest of the numbers of this year *free*—so the sooner they subscribe, the more they will get for their money.

Now, in order to pay our friends to work for our JOURNALS, we have gotten up special editions of Mr. Doolittle's "Scientific Queen-Rearing," (with Appendix), and Dr. Miller's "Year Among the Bees," bound with nice paper covers, and will *present* a copy of either book to any one who will send us two **new** subscribers for either of our JOURNALS (the BEE JOURNAL, weekly, or the HOME JOURNAL, monthly).

These editions are not for sale, but are gotten up specially for premiums for getting new subscribers. They are nicely printed, and will be sent *free* of postage, as pay for work to be done for our JOURNALS. Clubs need not be located at one post-office, and may contain one "Bee Journal" and one "Home Journal" to the same or different addresses; or both may be for either JOURNAL, as may be desired. Dickens or Waverley may be obtained for each subscriber in this club as offered on the last page of this JOURNAL.

Subscribers who do not receive this paper promptly, will please notify us at once.

QUERIES and REPLIES.

Keeping the Bees in the Hive, When Cellaring Them.

Written for the American Bee Journal

Query 663.—What is the best plan to keep the bees in, while moving them into the cellar? I find if I put wire-screen over the entrance, it makes the bees cross; and when I get them in, and arranged, and begin to remove the wire, they rush out, ready for a fuss.—C. W.

A handful of earth, or sawdust, or a wet rag.—R. L. TAYLOR.

Place a wet cloth over the entrance, as Dr. Miller advises in his excellent book.—A. J. COOK.

Move them carefully, when cool or cold, and, if possible, after dark.—A. B. MASON

Put them on a spring wheelbarrow, and move them so carefully that they do not know that they have been disturbed.—G. M. DOOLITTLE.

Put them in during a cool time, handle them carefully, and leave the entrances open.—EUGENE SECOR.

Close the entrance with old cloths, or rags, and at night after the bees become quiet, remove the cloths quietly.—MRS. L. HARRISON.

Wait until a cold snap makes them quiet. You can then get them put to sleep before they wake up!—J. M. SHUCK.

Do not remove the wire-cloth from the entrance until the bees quiet down—say at night—J. P. H. BROWN.

Take them in on a cold day. Have the cellar dark, and use a little smoke, if necessary. Use a lantern when light is needed.—DADANT & SON.

When moving bees about my apiary, I simply put a block of wood against the entrance, and leave it there until the bees get quiet.—G. W. DEMAREE.

Have the cellar dark; put a pine strip over the entrance, and give no jars when carrying. Remove the strip when permanently located.—J. M. HAMBAUGH.

If the weather is cool, and the hives are handled carefully, they do not need to be confined. If wire-screens are used, leave them on until the bees become perfectly quiet.—M. MAHIN.

I find that a piece of board laid over over the entrance is the best thing that I can use. Leave it on for a short time, until they become quiet, and you will have no trouble.—H. D. CUTTING.

I do not shut them in, but take them when they are quiet, and then do not stir them up. If I want to shut any in, I lay at the entrance a rag or cloth *dripping wet*. When this is taken away, in the cellar, they do not rush out, as when fastened in by anything dry. Have the cloth *very* wet.—C. C. MILLER.

Carry the bees in when it is a little cool, or after dark. I never put anything over the entrances, and they do not come out, unless roughly handled.—G. L. TINKER.

The best plan to keep the bees in the hive while carrying them into the cellar, is to carry them *quietly*, not striking them against anything, nor jarring them in any way. Do not try to confine them within the hive with wire-screen, nor anything of the kind.—MAHALA B. CHADDOCK.

Stop up the entrance with a wad of grass, and do not open them for a few hours after they are carried in, when they will quiet down, and the grass can be easily removed.—C.H.DIBBERN.

Put your bees in the cellar when the temperature is such that they are the quietest. Lift the hives carefully so as not to jar them. I once put nearly 40 colonies in the bee-house, and only two or three ever had the least suspicion that they had been removed—I did it so quietly. The bee-house floor was covered with sawdust. The shelves which the hives were placed on, also had a two-inch layer of sawdust. It takes nerve and muscle to do it, but it pays.—JAMES HEDDON.

I have a ½-inch stick, just the length of the entrance, which is used for this purpose. When wishing to imprison the little "rebels," I step up to the front of the hive, and with a faint show of smoke, drive in the outside guards, the entrance-blocks are then removed, and this ½-inch stick quickly slipped in their place. This holds them securely, and can be taken away without causing a single bee to leave the hive. It is far better for this purpose than wire. But, if the bees were to be confined to the hive for any length of time, some arrangement for ventilation should be made.—WILL M. BARNUM.

If the bees are taken into the cellar after the weather becomes *cold*, they will need nothing to keep them in. If such is deemed necessary, however, a *very wet cloth* put over the entrance will not only keep them in, but it will have a soothing effect when it is removed. It is better than sawdust, wire-cloth or grass.—THE EDITOR.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

CORRESPONDENCE.

CUBA.

Golden-Rod — Honey-Extractor for a Large Apiary, etc.

Written for the American Bee Journal
BY O. O. POPPLETON.

On page 585, Mr. Secor asks some questions about golden-rod. I used to think as he does, but longer observations showed me that there were different varieties of it, which varied greatly in their value to the honey-producer; and these again differed greatly in different seasons. Possibly certain varieties yield on some kinds of soils, and others on other soils. This would make an interesting point for botanists to observe.

Mr. S. also speaks of the value of the yellow-ray, or wild sun-flowers, which are so common in some of the Western States. At my old location, some 80 miles east from Mr. Secor's, there were two varieties of these flowers, one of much, the other of no, value. The difference between the two varieties was first pointed out to me by Mr. George Stocks, of Nashua, Iowa.

The valuable kind was very abundant on the Cedar river, a few miles west of my place, but it was very scarce near me. Soil on the Cedar river was drier and sandier than near where I was. It might be well for some one living where they grow, to identify and describe the two species.

While the most of the readers are probably getting their bees ready at this time, for their winter's rest, we, here in Cuba, are nearing the commencement of our annual honey harvest.

Improving the Honey-Extractor.

In replies to Query 560, on page 534, Mr. Heddon says: "So far as I know, we never had a half-way-decent honey-extractor; that is, one at all worthy of the use of a bee-keeper who produces tons of extracted honey. The best of our present machines are just good enough for amateur bee-keepers, who have from 3 to 10 colonies of bees."

This is a strong statement, but not so far from the truth as many might think, at first glance. This apiary yielded fully 25 tons of honey last winter, and the ordinary two or four frame machines would be a nuisance here; but the one that we do use, is probably as far from Mr. Heddon's characterization, as anything yet manufactured.

In ordering the machine from the owner of the Stanley patent, I mentioned certain points that we insisted upon, leaving the details to him. I required a six-frame Stanley reversible extractor, built very strong and substantial, with overhand gearing, the handle being attached to a horizontal rod extending outside of the can, and so geared as to give 1½ revolutions of the baskets to one of the handle; to be furnished with a serviceable brake, and permitting of being oiled without removing any part of the machine.

As this was the first machine of the kind ever made, new patterns had to be made for all the castings. We did not get it set up until almost the close of the season, but judging from the few thousand pounds that we extracted with it, I think that we shall like it much better than I expected we would when ordering it.

It is unquestionably far superior to anything I have ever yet seen or used, but is, so far as I know, the only one of the kind yet manufactured. If any one has any better extractor, let him describe it, as we want the best.

Havana, Cuba.

BAY STATE FAIR.

The Exhibits of Bees and Honey at the Bay State Fair.

Written for the American Bee Journal
BY ALLEN LATHAM.

Yesterday I paid a visit to the Bay State Fair, held in Boston, and the exhibit in the bee and honey department, as a whole, was poor for even an Eastern State, though individual exhibits were creditable. The total amount of honey exhibited would not exceed 300 pounds; of beeswax, not more than 50; and only one full colony of bees. The premiums were fitly awarded. These were sufficiently large to call for a better exhibit.

The first premium on clover honey was taken by Miss M. A. Douglas, of Shoreham, Vt.; the 2nd, by D. W. Clement, who also took the 1st premium on light fall honey. The 1st premium on buckwheat honey was taken by E. N. Fisher, of Ludlow, Mass.; also, the 1st on beeswax and black bees.

Henry Alley took the 1st prize on Italians, and the 2nd on black bees; also 2nd premium on beeswax.

I saw some of the exhibitors, and had considerable talk with them. From all, I heard the cry of "poor season," which will perhaps account for the poor exhibit. One of the exhibitors wished to visit some friends in this part of the State, and so brought on some honey and bees. He took enough prizes to pay his expenses.

Cambridge, Mass.

BEES IN WINTER.

Best Way to Winter Bees—The Different Systems.

Written for the New York Tribune
BY PROF. A. J. COOK.

Bees are natives of a warm climate, where they can fly nearly or quite every week of the year. In nature, bees can retain their fecal matter while in the hive, and never void their intestines except as they fly forth. As with well bred and trained cats and dogs, bees will not soil their domiciles. Thus, in case of long confinement, as is often necessary in our Northern climates, they become diseased.

In their native home, the only provision to insure safe wintering—bating accident—is enough good food. This is true in our Southern States, and in California and Oregon to-day. There, bee-keepers are only watchful that their bees have sufficient good winter stores, and they are without anxiety as to result.

Most insects in our Northern climate pass the winter in a state of profound hibernation; they eat nothing, move not at all, and are seemingly without life, but not so with the honey-bees. They are ever and anon moving about the hive and eating the little that their slight exercise makes necessary. Open a hive in the dead of winter, and even though it rests all unprotected on the summer stand, we will find the bees move and show that they are not dead, nor even sleeping. Thus we easily understand that with the naturally neat habits of bees, with our long, cold winters, and their exceptional habits of activity and feeding, produced doubtless by their long existence in a warm climate, it becomes no easy matter to carry them safely through the winter.

Two things are necessary to this end in our rigorous Northern climate, viz: 25 or 30 pounds of good food per colony, and such protection as will make the severe cold and long confinement endurable.

Honey is a very indefinite term, as bees collect nectar—the source of honey—from many and very widely different locations. That all honey is safe food for winter is not true. The safest food is that made from cane-sugar syrup. Often honey is worth more in the market than is such sugar, at which times it will pay well to extract, and sell the honey, and feed syrup to the bees.

The sugar must be only the best cane-sugar; glucose is not relished by the bees, and, as has been proved often, is fatal as a winter food. Usually, however, honey collected from flowers

is safe to give the bees for winter. Some bee-keepers object to autumn honey for wintering; I have tried such repeatedly, and with the best results. I think that the safe rule is this: Give to bees any honey that you would relish on your table.

Sometimes the bees gather nectar which is secreted by various insects; some of this is rank and unwholesome; it smells and tastes bad. Such honey is fit neither for table nor bees, and if used for wintering, it will almost surely bring disaster. Such honey should always be sold for manufacturing purposes, where it often serves as well as any.

Temperature of Bees in Winter.

The matter of temperature is not so easily provided for. There are three ways to arrange bees so that they may not succumb to our most severe winters. Messrs. Root, Hilton and Poppleton advocate chaff hives. These are double-walled hives with 4 inches of chaff or dry sawdust between the walls. The objections to these are, that they are expensive, heavy to handle, and do not always save the bees. If they would always succeed, as their advocates claim will be the case when rightly managed, they would have much to recommend them.

Messrs. Bingham and Southard have been signally successful by packing. They place a large box about the hive, and fill in with chaff or sawdust, always arranging so that the bees can fly whenever the weather permits. If so successful (and I see no reason why it should not be) I should, on the ground of cheapness and convenience, perfer this to chaff hives. Mr. Bingham places six or eight hives close together, and makes one box do for all.

After trying all the ways, I much prefer cellar wintering. I think that the large majority of Canadian and American bee-keepers in our Northern States agree with me. The only requisites for a good cellar are, that it should be dark, well ventilated, and should preserve a uniform temperature between 38° and 45°, Fahr. It would be best if the temperature could be kept uniformly at 45°. This keeps the bees very quiet, so that they eat and move but little, and so remain in good health even from October to April.

If the cellar becomes too cold or too warm, the bees stir more, eat more, and very likely become diarrhetic, and come out in the spring weak, if alive. It is easier, of course, to keep a cellar at the right temperature if wholly under ground. If found troublesome to preserve the temperature at the proper point, as may be true in very cold or in rather mild regions, we can secure this result by sub-earth ventilation, by artificial heat, or by having a large cistern in the cellar.

I have sub-earth ventilation. A long, 8-inch pipe runs from the bottom of the cellar at least 6 feet underground for many rods before it comes to the surface. A chimney or flue extends from the bottom of the cellar to some feet above the top of the house. By aid of fires in the house above, this flue is kept warm. Thus the cellar is kept warm and well ventilated. The air drawn in through this sub-earth pipe comes into the cellar warmed, and my object is secured. This arrangement is common in this part of the country, and works well. This however, is expensive, and better not be adopted unless found to be absolutely necessary.

I know of several who have wintered bees successfully for years, just in a common cellar. I know of others who control the temperature admirably by means of a large cistern full of water. Dr. C. C. Miller, of Illinois, keeps a small coal-stove in his cellar, by which he keeps the temperature to his liking. I feel certain that with a good cellar and proper care to secure good food, we may winter bees without loss.

Agricultural College, Mich.

GOLDEN-ROD.

The Plant as a Family Yields but Little Honey.

Written for the American Bee Journal

BY R. DART.

The golden-rod family is large, and grows in great quantities in the new States and Territories in the West. It is wild, and stands no cultivation.

Mr. Eugene Secor, of Iowa, tells the truth when he says that there is a yellow aster in bloom at the same time with the golden-rod. On river banks and mud lakes this aster grows 5 feet high; on wet marshes it grows close to the water a few inches above, and is of the dwarf species.

I have been a bee-keeper forty years, and have tried to know what my bees get their honey from during the season. The first twenty years of my life were spent in the wild-oak openings of Wisconsin. I was a bee-hunter, and have taken thousands of pounds of honey from bee-trees. Many of these trees were located close by these large marshes covered with this aster, and when the hollow in the tree was large enough to hold the honey, I have taken large quantities of this yellow honey. The quality is very fine.

Other trees located miles away, and surrounded by golden-rod, when cut, I would find but few pounds of fall honey. My long experience as a bee-keeper and bee-hunter has shown me that the golden-rod family yields but small amounts of honey.

If I were asked to name the flower that was the best friend to the bee-keeper, taking one year with another, for the Northern and Western States, I should say, the "little, white, Dutch clover."

Ripon, Wis.

MIGRATION.

Sending Bees to the South to be Wintered.

Written for the American Bee Journal

BY JOHN CRAYCRAFT.

I have read Mr. Doolittle's article on page 581, concerning the transmission of bees by the pound through the mails, and I am pleased to know that such a thing can be done; but I fear that the Postal Rules may be drawn down on our already especially-favored traffic in queens, although I see no good reason why a pound of bees may not go by mail as safely as a dozen, and no doubt such a permit will be granted; but the fear would be that some of the careless ones would not use that care and caution that would be necessary at all times to prove a safe transportation of them by mail, and if there were to be a few disasters, and loss of mail-matter, then the entire queen-traffic through the mails would be prohibited, I fear.

I do not think that the express charges on bees per pound, put up in suitable cages, carrying from one to three pounds of bees, according to the quantity desired, would be any more expensive than that of the mail—that is as Mr. Doolittle suggests in shipping bees to the North in the spring. Then this brings up this question whether it is profitable, in case of loss of bees during the winter, to send South and get a pound of bees and a queen, and put upon the combs, and soon have a prosperous colony of bees.

This then brings out the shipping idea—say about Sept. 1, the bee-keeper in Michigan puts up all his bees in cages containing one, two or more pounds of bees, that are in each colony with their queen; crates the cages in convenient packages of five or ten, as might be deemed best, and ships them to the South, as far down as the St. John's river, in Florida, to some bee-keeping friend, or partner in the business, who is prepared with hives filled with either comb or foundation, and who will turn them on the combs and care for them (for at this very date, Sept. 21, my bees are busy carrying

in honey and building comb very fast, and the river swamps are full of bloom, and will be yet for more than a month); so that bees will have all they will need for their short winter, from about Nov. 15 to Jan. 15, when the maples, blackberries, and many other wild flowers along the river begin to bloom.

Then the bee-keeper here, that expects to get a full crop of orange-blossom honey, must wake up his bees, and have them breeding as soon as possible, for the orange begins to open the last of February; so that the bees that come from the North, will have March, April and May here, or until they were needed for the clover-fields of the North; and then the old queen, if living, could be returned North with one, two or more pounds of bees, as desired, in the cases that they were sent down, so that there would be no expense for cages, as they could be used a number of times, with proper care; and the Florida man would have left a hive full of brood and eggs that would soon rear for them a queen, and be ready for the palmetto honey through the rest of May, all of June, and often part of July, from the cabbage palmetto.

I can see no reason why such a moving of bees could not be made profitable to both parties—the honey that the North-end man would save, would far more than pay the charges both ways, for I see no reason why a colony of bees (say two pounds and their feed and cage) should weigh over 5 pounds, and a case of ten would weigh 50 pounds, which, at $6.00 per 100 pounds, it would not cost over 30 cents per colony each way; but, to be certain, say 50 cents each way, making $1.00 for the round trip; and $1.00 each to the South-end man, for the care of putting them into hives, and for putting into the cages for return shipment. The extra honey obtained from the bees and the colony left of young brood and eggs, would pay for the honey-care if in the hands of a practical man.

I have no doubt but what some may think that there are many drawbacks to a practical demonstration of this theme, or scheme, and I think so myself, and will continue to do so until I know of a practical test being made; but I feel confident that with a practical man at each end of the line, that there is certainly a fair showing to make a success of it. I am corresponding with parties in the North, with whom I would like to make a practical test of a few colonies, for I have not the hives and combs necessary for only a few, but enough for a test case; and if it was practical, I would prepare to take care of a considerable number another season, and connect with it queen-rearing, from such queens as might be desired to have reared and returned to the owner of the bees, for the summer campaign in the clover-fields of the North.

Altoona, Fla.

REARING QUEENS.

Colonies Rearing their Own Queens after Swarming.

Written for the American Bee Journal

BY BYRON HAMS.

Mr. Doolittle is correct when he says (page 599) that it pays to let colonies rear their own queens after swarming. I would add that if the swarm issues at the beginning, or in the midst of a good honey-flow, and the swarm is a large one, it is a good plan, if we want honey, to place the swarm on the old stand, and remove the parent colony to a new location; then give the new swarm all the surplus combs on the old colony, or a full set of combs, if you have them.

In two or three days, or as soon as the bees get to business, I remove the queen and give a cell as nearly ready to hatch as possible. This colony, not having much brood to care for, will surprise the "natives" with the amount of honey that they will store.

After the honey-flow is over, and the young queen gets to work, we can soon build them up into strong colonies for the next flow, or for winter.

As to the parent colony, fill its surplus room with foundation as soon as it needs it. To keep down increase and secure a large yield of honey, the above plan cannot be excelled.

I place the new swarm on half-sheets of foundation; this insures straight combs, and gives the bees a chance to use their accumulated wax-scales, which would be wasted with full sheets of foundation.

I work for extracted honey, and I cannot say how the above plan would work for comb honey.

On page 619, Frank Coverdale "hits the nail squarely on the head," in rearing perfect queens. I have reared the *finest* queens this season by that variation from the Doolittle method. I select a good, strong colony to start the cells, give to it a few frames of hatching brood, and "crowd them" until they *have to* swarm. I then give a few embryo queen-cups, placed where the queen will find them (I always keep a lot on hand which I carefully save). As soon as I find eggs in the cups or cells, I am ready to remove the queen, and just as I find the proper amount of royal jelly placed in the cells, I remove them, and lift out the larvæ and fix them up, *a la* Doolittle.

Some Excellent Results.

The white clover honey crop was splendid here this season, lasting about nine weeks. Our fall crop was a failure, and as we usually get our largest yield from this source, we can consider our crop about three-fifths of a yield. My bees are in fine condition for winter, very strong in numbers, and with 30 to 40 pounds of the best honey for each colony, and when they are prepared according to Mr. Muth's plan of wintering (see pages 601 and 629), they are *bound* to go through safe and sound.

Now as to my report: Although it is not as good as I expected, I am well satisfied with the results as they are. I commenced the season with 23 good colonies, increased them to 62, by natural swarming, sold 2 swarms for $5.00, and one 3-frame nucleus for $3.00; 4,882 pounds of extracted honey at 8 cents per pound—$390.56; 144 pounds of comb honey at 15 cents—$21.60; and 45 pounds of beeswax at 20 cents—$9.00; making a total of $429.16.

I have 37 extra-good colonies of bees, not counted in the above, which I value at $6.00 each. I owe a good share of my success to the ever-welcome old AMERICAN BEE JOURNAL.

Worcester, Mo., Sept. 30, 1889.

IN COUNCIL.

The Bee-Keepers of the Northwest Meet in Chicago.

Written for the American Bee Journal

BY W. Z. HUTCHINSON.

The Northwestern Bee-Keepers' Society held its convention at the Commercial Hotel, Chicago, Ills., on Friday and Saturday, Oct. 11 and 12, 1889, at 9 a.m., with President C. C. Miller, M. D., in the chair.

That a Society loses by not holding regular meetings is shown by the diminished attendance as compared with former years. It will require a year or two to again awaken interest and bring together the brethren that have been practically disbanded. We have no fears, however, but that the Northwestern will regain its former numbers, and eventually become the best convention there is. It holds its meetings in the railroad centre of the great honey-producing West, and at the season of the year when reduced fares are easily secured. That a convention cannot be a success without low railroad fares, is shown by the fact that but few bee-keepers were present

from east of Chicago, no reduced rates having been given in that direction—why, could not be learned.

President Miller opened the meeting with prayer. The reports of the Secretary and Treasurer were read and approved.

The annual dues were reduced to 50 cents. This was done because there was money remaining in the treasury, and expenses would be light, as there would be no expense for a hall. The following male members paid their dues, the ladies being free :

L. A. Aspinwall, Three Rivers, Mich..
B. T. Baldwin, Marion, Ind.
T. J. Baldwin, Wyoming, Iowa.
John Bird, Nashua, Iowa.
S. N. Black, Clayton, Ills.
John Bradly, Wyanet, Ills.
T. S. Bull, Valparaiso, Ind.
John N. Conger, Wyoming, Ills.
D. D. Cooper, Sherman, Ills.
A. W. Cumins, Woodstock, Ills.
Mark Davis, Lisle, Ills.
James Forncrook, Watertown, Wis.
D. A. Fuller, Cherry Valley, Ills.
Russell Fuller, Richmond, Ills.
A. W. Gardner, Centreville, Mich.
Geo. L. Gast, Le Claire, Iowa.
S. E. Gernon, Waukesha, Wis.
E. P. Gibbs, Lyndon, Ills.
Chas. H. Green, Waukesha, Wis.
J. A. Green, Dayton, Ills.
G. Harseim, Secor, Ills.
A. S. Haskin, M. D., Lawrence, Mich.
James Heddon, Dowagiac, Mich.
William Heddon, Dowagiac, Mich.
S. H. Herrick, Rockford, Ills.
L. Highbarger, Leat River, Ills.
J. Hodgson, Jr., Pewaukee, Wis.
C. W. Hudson, Waukegan, Ills.
J. Hunter, Wyoming, Iowa.
W. Z. Hutchinson, Flint, Mich.
Dr. H. Joseph Jaxon, Chicago, Ills.
B. Kennedy, New Milford, Ills.
A. L. Leach, Dwight, Ills.
W. C. Lyman, Downer's Grove, Ills.
Lot Mason, Auburn, Ills.
C. C. Miller, M. D., Marengo, Ills.
M. S. Morgan, South Elgin, Ills.
Thomas G. Newman, Chicago, Ills.
Howard Ogle, Palona, Ills.
R. Pendergrass, Malta, Ills.
Geo. Poindexter, Kenney, Ills.
G. W. Redmon, Paris, Ills.
G. D. Rogers, Pecatonica, Ills.
A. I. Root, Medina, Ohio.
C. J. Schafer, Eddyville, Iowa.
C. Schrier, Peotone, Ills.
Jas. A. Stone, Bradfordton, Ills.
N. L. Stow, South Evanston, Ills.
G. Ruff, Burlington, Iowa.
M. J. West, Leaf River, Ills.
J. C. Wheeler, Piano, Ills.
C. E. Yocom, Sherman, Ills.

LADIES.

Mrs. John Bird, Nashua, Iowa.
Mrs. C. H. Green, Waukesha, Wis.
Mrs. L. Harrison, Peoria, Ills.
Mrs. D. N. Jones, Marengo, Ills.
Mrs. B. Kennedy, New Milford, Ills.
Mrs. W. T. F. Petty, Pittsfield, Ills.
Miss Gertie Schrier, Peotone, Ills.
Mrs. L. H. Scudder, New Boston, Ills.
Mrs. N. L. Stow, South Evanston, Ills.
Miss Emma Wilson, Marengo, Ills.

The Northwestern is known as the convention that sails in without any essays, or even programme. Whoever "wants to know, you know," writes out his query, and hands it to the President. So long as we can keep Dr. Miller in the chair—and we have succeeded pretty well so far—this plan will work to a charm. He keeps things stirred up and moving. If the folks are slow in talking, or in answering queries, he will call some one right out by name, and *make* him talk, and then the discussion is soon getting red hot.

The opening address, made by Thomas G. Newman, was as follows :

Mr. President and Apiarian Co-Workers :

In 1884, when last this Convention met we little thought that five years would elapse before we should meet again, but such is a fact. One thing and another have prevented the "Northwestern" from convening until this day, and now we hope to have one of those interesting occasions, such as is the delight of bee-keepers to attend.

What have we come here to do ? To talk over the past and learn wisdom from our experiences and those of our co-workers. "Let there be light" was the fiat of the Almighty 6,000 years ago, when darkness covered the earth ; and then the obedient sun gave to this globe of ours the full blaze of its electric fire, and has continued to us that *light* unto the present day, dispelling darkness and warming the earth by its genial rays. Light and knowledge and power have been man's inheritance, as the days come and go. The poet wisely remarks that

> The waves that moan along the shore,
> The winds that sigh in blowing,
> Are sent to teach a mystic lore,
> Which men are wise in knowing.

To this end have we come together, so that the wisdom of each one may be communicated to all, with the magnetic currents of personal contact and hearty fellowship. For in our pursuit, as well as in all others, there is always something to learn, and the one whose ears are always open to learn, and who puts into practice the instruction gained, is the one who succeeds !

The successful bee-keeper is *not born* like the poet, but is *made* by practicing and improving upon his own experiences as well as the knowledge and experiments of others.

Mistakes are made and reverses come, but these do not discourage—they only strengthen the determination to succeed. Patient perseverance, coupled with wise and skilful methods will win at last ! No season should be allowed to pass without adding to our store of bee-knowledge—both practical and theoretical. Then only may we hope to reach the top, and earn the proud distinction of being called "bee-masters !"

The honey season just ended has been a grand success in most of the Northwestern States, but in Michigan, Indiana, and many parts of the East and South, it has been one of the poorest for many years. Our country is so large, with climatic conditions so varied that no regulation will apply to all, and no harvest will result alike in all parts of it !

Is there any avocation in life that has no drawbacks ? Nay, verily. Disasters come in all lines of business, but bee-culture compares favorably with any of them.

While we in the favored Northwest are enjoying the proceeds of a rich honey-harvest, let us try to sympathize with our brethren of the East and South, and encourage them to hope and labor for the years of plenty yet to come to them, as well as to others.

I trust that this Convention will be productive of much good, by diffusing useful knowledge to all present, as well as to those who are anxiously looking for the report of this meeting to bring them something to think about and to practice in their apiaries during the coming year.

Of course we shall differ in our opinions, as do the greatest and best of men, but this should not give rise to any feeling of ill-will. Our thoughts are but the "clothing" of the mind, and we might as well dislike a person for being clothed in white or blue, because our choice is for green or black—as to be provoked at the opinions of others, which do not agree with our own. Diverse opinions lead to wisdom, improvement, progress and knowledge — aye, the "liberties" of which we so often boast, are guaranteed by the diverse thoughts of our fellow men.

We have struck an era of low prices, and as the former days of extravagance will not return, waste and prodigality must cease, and a system of rigid economy be enforced.

New and labor-saving methods are demanded, and while some of you have such, we earnestly request you to describe them, that they may be practiced by all. While we cannot hope to return to the high prices of yore, we can realize some reward for our labors, and that *some* will be determined by our intelligence, industry and improved methods.

Heed the lessons which every season teaches, and you will succeed—if you do not, then you must expect to fail. We have here some level-headed and prosperous apiarists, who go through all times and seasons and prosper. Let us appropriate the light they reflect, and *follow* where we cannot lead. Intelligent and practical methods will always pay.

Let us now enter upon the discussion of practical subjects, and endeavor to do one another good, and thus make this convention one of the most useful and compensating meetings ever held in America. THOMAS G. NEWMAN.

Putting Bees into Cellars.

The first question asked was, "How early shall bees be put in the cellar?"

A. S. Haskins would put them in as soon as they were through storing honey.

James Heddon did not want them put in until they were through breeding and handling pollen, and had had several little flights afterwards. No definite date can be given.

L. A. Aspinwall had put in bees late, leaving them until the last moment, and they wintered well.

A vote was taken to learn at about what time the majority would put bees in the cellar. The greatest number voted Nov. 25. The question gradually drifted into the one of

Wintering Bees.

Mr. Heddon—If there were any system of wintering bees that would always prove successful, we would all have known it long ere this. Having said this, I will still further say that by putting bees on clean combs, feeding them properly-prepared sugar-syrup, and putting them into a warm cellar, I can winter them with less danger of loss than any one can winter a horse or a cow.

E. P. Gibbs—How about dampness?

Mr. Heddon—I am not afraid of dampess in itself. I do fear a low temperature, and dampness is equivalent to a low temperature; but keep the temperature high enough, and dampness will do no harm. Before some one gets to talking about "Nature," let me say that bees are natives of a warm climate, where the opportunities to fly are frequent. In cold climates they are away from their natural environments. For months, the cold confines them to their hives. If they consume a food containing much nitrogenous matter, the intestines become overloaded, and disease is the result.

M. Aspinwall would keep the bees warm by having them in a house-apiary, and warming it with a stove when necessary. He advocated large combs, because they contain more stores, and there is less necessity of the bees shifting from comb to comb in search of stores.

Mr. Gibbs—Did you not lose bees one year, Mr. Heddon, when the stores were sugar?

Mr. Heddon—Not in the cellar, nor by diarrhea. I lost some in the open air, that actually *froze;* but there were no signs of diarrhea.

Mr. Gibbs—I cannot believe that it is pollen that kills bees. I think that it is "cold." I have wintered bees in different cellars, and lost 50 per cent. in a cellar that was very cold, and in the others I lost none. As I now winter my bees, I would not give a man 50 cents to insure them.

Mr. Heddon—I do not care what kind of "fixings" you have, nor how you prepare your bees, if you have some bees from my apiary, with the stores that my bees have, and my bees die, yours will die also. It is a question of food, except that cold induces a greater consumption of stores, and the sooner overloads the intestines. There is no other theory, except the "pollen theory," that explains all winter losses.

President Miller—Well, suppose that we admit that it is pollen that causes the loss, what are we going to do about it? If there is nothing that we can do, except to take our chances, what is the use of discussing it?

Mr. Heddon—When sugar is much cheaper than honey, it will pay to winter bees on sugar; but when honey is worth less than sugar, as it is now, we cannot afford to do it. It will be more profitable to take our chances on honey. But we can have a selection of stores. I can have a case of honey stored in the summer, when but little pollen is stored, and put it aside for winter. After the brood is hatched, we can simply shake out the bees, and allow them to run in and take possession of the reserved case. We can winter the bees in a warm cellar, where there will be the least inducement to consume pollen. We can do the best we can.

Best Size of Sections.

The gist of this discussion was that the pound sections were the most desirable. Less than a pound was preferable to more than a pound, as the dealer would be asked to "throw in" an ounce or two over, while no fault would be found with a little lower price, as the result of a little less honey. All of Mr. Heddon's comb honey for this year had been stored in half-pound sections. He secured as much honey as when larger-sized sections were used, and it enabled him to get ahead of the farmers who brought in honey and sold it at a low price. His half-pound sections sold readily at 10 cents apiece.

Pakages for Extracted Honey.

Mr. Heddon—The pound sections made a success of the marketing of comb honey. The best package for retailing extracted honey is glass. It should hold about one pound. The difficulty is with the price. It ought not to be more than one cent or ten. When honey was high, it did not matter so much. Honey has fallen in price more than glass has.

Supers for Hives.

S. N. Black—I am using something like the old style of Heddon case. It does not exactly suit me, but I have not found anything better.

J. A. Green—No super is advisable that needs taking apart. I use a simple rim with tins nailed to the bottom of the ends to support the "section holders." I think that wide frames without top-bars, are preferable, as the bottom-bars will sag a little, which leaves a crack at the top in which the bees place propolis. There are no advantages in top-bars.

Mr. Heddon—If separators are not used, there is nothing better than my old style of super. With separators, the **T**-super is preferable. So far as working is concerned, I prefer my new style of case with wide frames, but the cost is against it.

Mr. Gibbs—I think that wide frames may cost the most, but they are the cheapest in the end, as I do not break so much honey in removing the sections. I think that separators are a necessity.

Surplus Bees.

Mr. Gibbs wished to know what to do with bees when he had more than he wanted.

President Miller advised uniting, and in the spring making stronger colonies.

Mr. Aspinwall said that the best yield he ever knew was the result of such uniting.

When to Market Honey.

Mr. Gibbs said that most of the honey was sent to market too soon. It becomes soiled and stale from standing about, before the season is fairly open.

Mr. Heddon—People desire honey when the weather is cool—not much before. If sent to the market in large quantities before there is much demand, it aids largely in reducing the price. Small crates have advantages, less likelihood of breakage, and many are sold direct to consumers who would not buy a large crate of honey.

What Hive will Prevent Swarming?

J. A. Green—A large hive.

Mr. Heddon—With my hive and management, I believe that I can produce extracted honey with so little swarming that it will not pay to keep a man in each apiary all the time.

Mr. Aspinwall—I wish to mention the wooden combs in this connection. No bees have swarmed when occupying these combs. No drones can be reared, and I do not believe that the instinct of the bees will allow them to swarm when they can rear no drones to mate with the young queens.

The Unfinished Sections.

J. A. Green — Sections filled with foundation are finished sooner, and look nicer than partly-filled sections kept over from the previous season. One or two such sections in the centre of the super will answer as a "bait" to start the bees to work, but they will never be so fine in appearance; neither does the honey keep so well. It is more likely to "sweat," or ooze from the combs.

J. C. Wheeler—I have seen Mr. Green's honey, and these old sections really look poorer.

Mr. Heddon—A new, naturally-built comb will be finished and capped sooner, when nearly ready to cap, than will one built on foundation.

President Miller—Perhaps Mr. Green does not succeed in having his sections entirely freed from honey the previous season.

J. A. Green—How do you get them cleaned?

President Miller—I pile the supers up out-of-doors, and leave a small opening, large enough for a single bee to enter. The combs will not be injured if only such a small opening is left.

J. A. Green—That is exactly the way I do.

Mr. Heddon—Dr. Miller, do you not teach your bees to become robbers and "snoops," by such management? If I were writing a book on bee-culture, I should lay it down as a principle, that, under no circumstances, should bees be allowed access to honey outside the hives. I would put the sections over a colony.

President Miller—I have never had any trouble in this direction.

Mr. Black—I should think that there would be considerable commotion and quarreling around the entrance to the stack of supers.

President Miller—There is; but I do not know that it causes any trouble.

Chas. H. Green — I secure more honey by using the drawn combs. I extract them in the fall, and just at dusk put a case of them down at the entrance of a hive. The bees come out and clean up the sections.

Mr. Gibbs—I get the honey out, and the combs cleaned up in the same way that Dr. Miller does. In the spring I break off the outside of the combs.

Several spoke of leaving the partly-finished combs until the dark honey harvest.

The Zinc Queen-Excluder.

Mr. A. I. Root said that the first size of perforated zinc that he made was too small; it troubled even the workers to get through. The next size was a little too large, and queens could probably squeeze through it. He now makes a size between the other two, which was probably the correct size. He said that he once had trouble with brace-combs being built to the bottoms of sections. He could not believe that a honey-board would allow him to take off a super, slick and clean, as Mr. Heddon said that it would. He thought that we all ought to be thankful to Mr. Heddon for his persistence in bringing the honey-board before the public.

Mr. Heddon called attention to the discussion that took place last winter at the meeting of the Michigan Bee-Keepers' Association, in regard to the number and size of openings needed in a honey-board. Two rows of perforations had proved sufficient. He believed that *one* row would be sufficient for a strong colony. One row of perforation in each strip of zinc was certainly more passage-way than was needed.

Marketing Honey.

R. A. Burnett—It is a fact that honey is sold only in a small way in warm weather. Honey does not carry so well in hot weather as in moderately cool weather. It leaks more, and soils the cases. October and November appear to be the best months for shipping. It is the privilege of the consignor to limit the price. It certainly relieves the commission man of much responsibility. Sometimes it results in gain, sometimes in loss. The pound sections seem to have driven out about all other sizes. The 60-pound, square tin-can, jacketed with wood, is the best for shipping extracted honey. There is no leakage, and the honey is kept perfectly.

Honey-Boards.

President Miller said that he had experienced some trouble the past season by bees building brace-combs above the slatted honey-boards. He could not say *why* they had done so. He looked upon the honey-board as a great invention, but had hopes that it might yet be discarded.

Mr. Heddon asked upon what he based his hopes.

The President could not say, but thought that more wonderful things than this had occurred.

Mr. Heddon did not believe that, so long as the instinct of the bees remained as at present, the honey-board would be discarded.

W. T. F. Petty reported that he had used thick top-bars, and very few brace-combs were built above them—so few that no honey-board was needed.

J. A. Green had had brace-combs built above all zinc honey-boards, but it was the result of their sagging.

Chas. H. Green had used top-bars ¾ of an inch square. It lessened the number of brace-combs, but not to such an extent that honey-boards could be dispensed with.

Mr. Heddon—When I began using the Langstroth hive, the top-bars were 1⅛ wide, which made the openings between the top-bars a trifle over ¼ of an inch. I had much trouble by the bees building brace-combs and wax *between* the top-bars. I reduced the top-bars in width, and was surprised to see that less combs were built *between* the top-bars, but more above them.

A. I. Root had had the same experience. He reduced the top-bars in width, by cutting them down with a jack-plane.

J. A. Green—I once bought some bees in hives having frames with ⅞ square top-bars. The bees filled the spaces between them with hard wax, and built just as many brace-combs above them, as in the other hives.

Mr. Heddon—I do not see how Dr. Miller can think that the honey-board will ever be abandoned. I would be just as glad as any one to lay it aside, but I do not see how it can be done.

President Miller—The experience of Mr. Petty is a pointer in that direction.

Mr. Heddon—Yes, but the experience of these other men is a pointer in the opposite direction. Then there is this much about it, what he calls a "few" brace-combs, *I* might call a good many.

Mr. Petty—I have 150 colonies, and I will admit that I never used the honey-board, simply because I have seen no necessity for it.

Getting Bees Out of Sections.

Some member said that he had read in the AMERICAN BEE JOURNAL that Mr. Heddon had some method of getting bees out of supers without removing the supers from the hive, and he would be glad if he would disclose this secret.

Mr. Heddon—I decline.

President Miller mentioned the plan of driving out as many bees as possible with smoke, then piling 8 or 10 supers on one hive, and having one person work the smoker vigorously upon the upper super, which will drive the bees down, when a second person snatches it off before the bees have time to return.

Chas. H. Green spoke of leaning the case against the side of the hive, and allowing the bees to crawl back into the hive. This is an excellent plan when robbers do not trouble.

J. A. Green spoke a favorable word for the "Reese escape."

Mr. Heddon was again urged to disclose his plan.

Mr. Heddon—Mr. President, may I speak right out in meeting?

President Miller—Yes.

Mr. Heddon—Well, this invention is partly that of my son, and so thoroughly has he been impressed with the treatment that I have received in regard to my inventions—the disposition of a certain class to steal and claim them—that he declares that he will not suffer in this way—he will neither patent nor make public his discovery. I tell you, friends, the man who steals bread, goaded to the act by the sight of palid lips of starving wife or child, has an excuse; but he who steals the honor that belongs to another, steals something that he cannot successfully use, something that fits him only as the armor of a plumed knight fits a pollywog, and is a thief by nature——

Here Mr. Heddon threw upon the table the handful of voting-blanks with which he had been gesticulating, and strode back to his seat. Later in the day a member said to us: "Mr. Heddon was a little 'riled' once today, wasn't he?" After a moment's thought he added, "But I don't know as I blame him any."

Overstocking a Locality.

All agreed that a locality *could* be overstocked; then followed the question, "How many colonies is it profitable to keep in one locality?"

President Miller said that he was more deeply interested in this question than in any other connected with bee-keeping, unless it might be the prevention of swarming, but it was a question well-nigh impossible to answer definitely, because seasons and localities differed.

Mr. Heddon—I agree with Dr. Miller as regards locality, but not season. If there are blossoms enough to keep the bees busy visiting them, it makes no difference whether the season is good or bad. We must try to get the most money out of our field. Others must be kept out. If we increase the number of colonies until the yield per colony is small, the less opportunity is there for some upstart with a dozen colonies. He can make no profit with his low yield per colony, but I can stand it, because of my large number of colonies. I think that 200 colonies, spring count, will give the best results, and, with the proper hives, tools, and system, one man can manage such an apiary.

Mr. Root gave several instances where large apiaries, notably in California and Wisconsin, had furnished great yields; but he admitted that there was no profit for any one in keeping bees near his large apiary in Medina. Every one who tried it, was obliged to give it up.

Chas. H. Green wished to know if bees right close to basswood did any better that those a little distance away. He had taken bees right into the basswood forest, and they did no better than those a mile and a half away.

Mr. Heddon once had a new swarm that stored 29 pounds and 13 ounces of honey in 24 hours, and the bees flew 2½ miles; some of them 4 miles.

In regard to how many colonies it is profitable to keep in one locality, opinions varied all the way from 75 to 200.

Alsike Clover as a Honey-Plant.

All agreed that Alsike clover is an excellent honey-plant, and for making excellent hay. It is a profitable one for the farmer to grow. It is particularly adapted to low, moist land.

Mr. Root had furnished free all the seed that would be sown within 1½ miles of his apiary; and at half price, that sown beyond 1½ miles, and within 2 miles.

Mr. Wheeler—The trouble is that the farmers cut it too early for it to be of much benefit to bee-keepers.

Mr. Heddon warned bee-keepers against this seed business. To give it away is wrong in principle. The moment that a farmer gets the idea into his head that your bees will get honey from his clover, then he does not wish to sow it. This is human nature. Let me tell you how I managed it. You know that I publish a local paper out at Dowagiac. Well, I sent to Mr. Newman for a cut of Alsike clover. Then I wrote an article on Alsike as a desirable crop for farmers to raise. I spread it on pretty thick, but I guess I did not stretch the truth any. But not a *word* did I say about its honey-producing qualities. Then I went to our seedsman and showed him what I had done, and induced him to put in a stock of seed. I then gave notice where the seed could be obtained. The result is that the farmers have sowed largely of the Alsike. Where a man has no paper to work with, and cannot work with some other fellow's paper, the next best plan is to get some old farmer interested, and let him do the talking.

The Bee-Keepers' Union.

In answer to the question, "Is the Bee-Keepers' Union Desirable?" Mr. Heddon said: Yes, it is. Bee-keeping as a business is new. People have not yet learned to look upon it with respect. There may be a stable on an adjoining lot, and no one complains. A man may build a mill-dam, overflow the country, and cause malaria, and there is no thought of asking for the removal of either. People have become accustomed to these things, and take them as a matter of course. It is not so with bees. We need the Union to *compel* this respect. Jealousy and envy are at the root of much of this trouble. Bee-keepers need a "trust" as much as any other branch of business does.

Mr. Newman was called upon for his views on the subject, and said:

The Bee-Keepers' Union has done much to earn a right to exist. It has gallantly fought many battles in defense of the pursuit of bee-keepers, and in *every case* which has been fully and finally decided, it has *won the victory.* It has now on hand three cases, two of which have been tried in the lower courts, and there a verdict has been obtained against the bees. It will not do to let these cases stand where they are; they must be fought through to a finish, and must also be won, if that is possible.

The only question is a financial one. If money enough can be had to employ the best legal talent, they can be won. If not, then they may be lost. We want to get a lawyer like Judge Williams, af Arkansas, to argue the case before the Court of Appeals in New York, and win the case of S. W. Rich, as we won the case of Z. A. Clark, and thus have a magnificent decision to place upon record, as a precedent in New York. If money enough were in sight, the Manager would employ such a lawyer, but the present half-hearted support will not warrant such an outlay.

The idea of a jury awarding damages of 6 cents, when $1,500 was wanted by the complainant. This shows that he had no case, and had the jury not been tied up to the instructions of a weak and time-serving Judge, they would have non-suited the banker and declared in favor of the bees.

The fight against bee-keeping is rampant, and unless it is checked, no one will be left unmolested. But it must not be allowed to go on in its fight against an honorable pursuit. It must not succeed; the stars in their courses will fight against it, if the bee-keepers will not do their duty. These are not questions of a day or an age, but of all time. They are born of jealousy and hatred, and are a part of the conflict between the rights of a lawful pursuit, and the ignorant and and envious, which in some form is as old as history itself. It must now, in this new world of the West, receive its death-blow by legal tribunal and due process of law; and bee-keeping be declared a lawful and honorable pursuit.

W. Z. Hutchinson—There is this good thing about it to comfort us—the money that we pay to the Union, goes to help some unfortunate brother.

(*Concluded next week.*)

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 4-6.—International, at Brantford, Ont., Canada.
R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa.
H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Working on the Golden-Rod.—F. B. Reynolds, Rossburgh, N. Y., Oct. 7, 1889, writes:

As you want the opinion of bee-keepers in regard to golden-rod as a honey-plant, I will give my observations. I never could find a bee on it until this season, and I must say that I never saw bees work harder on anything of the plant line; it seems as though at times they would devour the whole plant. They did not work on buckwheat; I had a piece of Japanese, not more than ten rods from my apiary, and I saw but very few bees on it.

Bee-Keeping in Minnesota.—H. H. Rosebrock, Owatonna, Minn., on Oct. 8, 1889, writes:

We have had, here in Minnesota, a very curious year for bees. In the spring, bees got some honey from fruit-bloom—enough to increase in numbers—but then we had dry and cold weather, so that in the latter part of May and the first part of June, my bees came nearly starving—they were killing drones. But from July 1 to Sept. 1, we had a continual flow of honey—it was no science to produce comb honey. My yield from 150 colonies, spring count, is 4,500 pounds of extracted, and 2,500 pounds of comb honey. The increase was small. In other years our honey season lasts from June 15 until Aug. 1, and perhaps from Aug. 20 to Sept. 10. We had more buckwheat and golden-rod honey than anything else.

Good Fall Honey-Flow.—E. L. Pratt, Marlboro, Mass., on Sept. 17, 1889, writes:

Before the six days' rain that we are now having, the bees had been getting in an immense amount of honey from fall bloom. It is of light color and good quality. At this time last fall, we were feeding our bees, but now we are taking away full combs of honey, and inserting empty comb or foundation. I have noticed a peculiar fact for the past few seasons: two years ago at this time, the bulk of the flying was toward the north; this season it is all south. I went to a 3-acre buckwheat field 1½ miles north of our yard the other day, for the purpose of seeing that grand sight of bees working on buckwheat; but not a single bee did I see, although the plants were in full bloom. The field is about half and half Japanese and common buckwheat. The fresh and heavily-scented breezes that come from it, seemed heavy with nectar.

Primrose and Aster.—J. M. Pratt, Todd's Point, N. Y., on Sept. 30, 1889, writes:

I enclose three flowers—please give their names as numbered. No. 1, I think, is golden-rod; if so, it is not nearly what it is claimed to be for honey, in other places. No. 2, I saw bees working on strong this morning, at 9 o'clock. No. 3, I think is a wonderful yielder of honey, but not of a pleasant flavor, and can be scented 100 feet from the hives. All three came into bloom in the middle of September, and continue till heavy frost.

[No. 1 is golden-rod.

About No. 2, Prof. C. M. Weed, Entomologist and Botanist of the Ohio Experimental Station at Columbus, O., remarks as follows: "It is evening primrose, *Oenothera biennis*. It is usually fertilized by moths, and I should not suppose it to be much of a honey-plant."

No. 3 is one of the numerous family of asters.—ED.]

Prize Golden-Rod very Highly—H. F. Gressman, Water Valley, N. Y., on Oct. 7, 1889, says:

I find in some localities that golden-rod produces but little if any honey; in this neighborhood it is abundant, and yields a large amount of honey during pleasant weather. Several bees may be found on one stalk, even if it stands alone in the field. Everywhere it is literally covered with bees. We prize golden-rod as a very valuable honey-plant.

This has been a very poor year for bees—far worse than last year. We obtained no honey from white clover. Basswood yielded quite a fair crop of honey, but the weather did not permit the bees to gather nectar only two or three days during the height of the honey-flow.

Experiments with Hives and Frames.—R. B. Woodward, M. D., Somerset, O., on Oct. 9, 1889, writes:

We have had a good season. I began in the spring with 17 colonies, increased to 23, and secured 1,600 pounds of clover honey—one half or more in the comb. I sold my crop on an average of 16 cents per pound. I have discarded all black bees, including the Carniolans, which, with us, are in no way superior to the best strains of Italians or Syrians. I used 3 sizes of frames—11¼x13⅜ inches, 9⅛x17⅝, and 5⅝x17⅝ inches, and saw no difference in the results. My hives are all 18⅛x14⅛ inches. The different depths are made to suit the size of frames. I am much pleased with shallow frames—5⅝x17⅝ inches, and 9 frames to the case—for extracting purposes. Bees are in fine condition for wintering. I winter my bees out-doors, and have never lost any colonies.

Only Half a Crop.—Albert K. Dakin, Tully, N. Y., on Oct. 7, says:

The honey crop in this locality has not been more than one-half of a crop, on account of the wet weather. I have sold my crop so far for 12 and 15 cents per pound.

Not a Large Honey Crop.—A. M. Vannoy, Hedrick, Iowa, on Oct. 14, 1889, writes:

Our fall honey crop in this part of Iowa, is *non est*, on account of too much windy, rainy weather; although we had the finest crop of golden-rod bloom ever known in this part of the country, we got little or no golden-rod honey; so our large honey crop is really not as large as it is supposed to be. Bees, where they have had proper care, are in good condition for winter. There are more bees, and in better condition, in this immediate vicinity, than at any time in the past 20 years.

Good Results.—Robert Schultz, Alma, Wis., on Oct. 8, 1889, says:

My 3 colonies of bees, or what I had left from 7 colonies last winter, did well. I now have 13 colonies. I had the first swarm on May 11, the second on May 22, and the third on May 24. I hived all three, and took from the first swarm, 100 pounds of honey, and it swarmed again on June 18. I hived the swarm, and took off 112 pounds; from the second swarm I took 70 pounds; and from the third swarm, 64 pounds; from the old colony I took 90 pounds. I took off 663 pounds of honey in all. The AMERICAN BEE JOURNAL is a great help.

Afflicted with Carbuncles, etc.—A. J. Duncan, Hartford, Iowa, on Oct. 10, 1889, says:

I am now, and have been for some time, sorely afflicted with carbuncles, first on my knee, that dried up after due time, then one came on my left arm; it has been there about three weeks, and is now getting some better. I now have four on the top of my head; they are not large, but quite sore, and make it quite interesting to me. I think that perhaps I have bad blood, from having so much poison injected into my system from the "business end" of the "blessed bees." I would like to have some opinions from the bee-fraternity on this (to me) important subject. My crop of honey this year has been 75 pounds of extracted honey per colony, spring count, or a little over 2,400 pounds to 32 colonies. I have sold my honey at 10 cents per pound, and do not ask the corner grocer how much *he will give*.

Buckwheat and Golden-Rod.—John K. Rich, Cato, N. Y., on Oct. 9, 1889, writes:

I have just finished taking off my fall crop of honey, and I find that one-third of it is from golden-rod, and very nice it is—very thick, and of good flavor. The balance of the fall crop is buckwheat. My bees worked on buckwheat first, and when the supers were nearly full, I raised them up, and put others under them; the lower one I found contained the golden-rod honey, and but very few were mixed. The hives of some prime swarms contained 24 pounds of buckwheat, and about 20 pounds of golden-rod honey. Last season I got but little golden-rod honey, but two years ago I had a good crop. Buckwheat yields a fair crop every year.

Apiary on a Public Highway.—A. Wortman, of Seafield, Ind., asks the following question:

What distance should a bee-keeper place his apiary from a public highway, to make it safe and lawful, according to the laws of Indiana?

[Will some Indiana apiarist please reply to this question?—ED.]

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now so CHEAP that no one can afford to do without it.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c.; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs. 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—20@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2-lbs., 8@9c. Extracted is in light demand, values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c.; white clover and basswood, in kegs and barrels, 7c.
BEESWAX.—25c. R. A. BURNETT.
Sep. 10. 161 South Water St.

ST. LOUIS.

HONEY.—We quote: Choice white clover comb, 12@12½c.; fair, 10@11c.; dark, 7@8c. Extracted, in barrels, 5@5¾c.; in cans, 6@6½c.
BEESWAX.—24c. for prime.
Aug. 21. D. G. TUTT & CO., Commercial St.

NEW YORK.

HONEY.—It is in good demand. We quote: Fancy white 1-lbs., 15@16c.; 2-lbs., 13@14c. Fair white 1-lbs., 13@14c.; 2-lbs., 11@12c. Buckwheat 1-lbs 10@11c.; 2-lbs., 9½@10c. Extracted, basswood and clover, 8c.; orange blossom, 8½c.; buckwheat, 6c.; California, 7½c.; Southern, 72½c. per gallon.
HILDRETH BROS. & SEGELKEN,
Oct. 11. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It is moving fairly well at 16@17c., with occasionally an extra fancy lot at 18c. Some large retailers secured quite a quantity of white, averaging about 13@14 ounces to the comb, and are selling it at 15c. per comb, tending to demoralize other retailers, as they want to compete, as the large retailers have filled their windows with the honey, and marked it very prominently. Two-lb. combs are a little scarce, at 16@17c. Extracted, 8@9c.
BEESWAX.—None on hand.
Oct. 10. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—There is a quiet but steady demand for choice white comb, at 15@16c. dark is slow sale at 10@12c. Demand from manufacturers is fair for extracted honey, and it is good for best qualities for tables use.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Oct. 12. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs. 13@14c.; dark, 10@12c.; white 2-lbs. 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

Convention Notices.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

Advertisements.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Nov. 2, 1889. No. 44

EDITORIAL BUZZINGS.

☞ A generous correspondent offers to loan $50.00 to the Rev. E. T. Abbott, who lately suffered loss by fire at St. Joseph, Mo., for a year or two without interest, provided others will join him to aggregate $150—and thus place Bro. Abbott on his feet again. Those who are willing to assist in this direction, will please address H. O. Kruschke, Deuster, Juneau Co., Wis.

☞ The Annual Catalogue of the officers and students for 1888-89 of the Michigan Agricultural College is on our desk. This Catalogue is for the 32nd year, and gives much general information concerning the College. The Rev. Oscar Clute is now its President. Among the Faculty are three who are well-known to our readers: Robert C. Kedzie, M.A., Professor of Chemistry; Albert J. Cook, M. S., Professor of Entomology; and William J. Beal, Professor of Botany. We note with pleasure the general prosperity of the College under its able management.

☞ Several improvements in the BEE JOURNAL for next year are in contemplation. We intend to use larger paper, and give more margins to the pages. This week we use new type for the editorial matter and letters. Printing large editions wears out the type very rapidly. We shall spare no pains or expense in keeping the BEE JOURNAL first-class in every respect, and well worthy the patronage of bee-keepers everywhere. We respectfully ask our friends to help extend our circulation—until every bee-keeper in America, who values the pursuit enough to pay a dollar, shall obtain its regular weekly visits.

Father Langstroth.

The Northwestern Bee-Keepers' Society at its last session voted to empty its treasury into the pocket of our venerable friend, Father Langstroth. Accordingly, being the Treasurer, we sent him a check for the amount, $12.25, together with another small amount sent to us by one of our subscribers for that purpose. The following is the response from Mrs. A. L. Cowan, his daughter:

DAYTON, O., Oct. 22, 1889.

MR. THOMAS G. NEWMAN:—My father is deeply grateful to the bee-keepers, for their remembrance of him. He is still sad and feeble, and I appreciate highly every kind act which lightens for a time the clouds which surround him—by the knowledge that his labors are not forgotten.

My father sends his kind greetings to you and to your family. We are grieved to learn of Mrs. Newman's illness. I have suffered so often from the same terrible disease (erysipelas), that I know how to sympathize with her. With best wishes for her speedy recovery, Respectfully,

ANNA L. COWAN.

"Sad and feeble"—how these words send gloom to our hearts! Has that kind face, genial smile and sweet voice given place to sadness, because of the feebleness and natural decline of the physical system? Be not *sad*, noble brother—though "weeping *may* endure for a night, joy cometh in the morning!" *Cheer up*, and remember Him who says, "When thou passest through the waters, I will be with thee." With eyes fixed on Him to guide through the deep waters, and through the pearly-gates, we hope with you soon to be made "living stones in that Temple not made with hands, eternal in the heavens"—where "no discordant voice shall e'er be heard, and all that we experience will be perfect bliss, and all we express will be perfect praise," and where "love divine will ennoble every heart, and hallelujahs exalted employ every tongue."

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

☞ *Frank Leslie's Illustrated Newspaper*, in addition to numerous attractive literary features, last week contained a large number of pictures illustrating the Knights Templar's parade at Washington, the manufacture of bank-notes at Washington, together with a graphic picture of the recent electric-wire horror in New York, and a dozen other pictures of current events.

☞ The sample of golden-rod honey, mentioned on page 668 by Mr. C. E. Dow, is received. It is thick, and excellent in flavor.

Spraying Fruit Trees.

The Green Nursery Company, Rochester, N. Y., in their circular of the Wilder pear, give some very poor advice about spraying plum trees when in bloom. They say:

Ten years ago but few plum trees were grown. Fruit growers supposed that the curculio was unconquerable. But it appears that the curculio is as easily destroyed as any other insect, and now plum growing is a great success, and very profitable. A spray of very weak Paris green water thrown upon the foliage at blossoming time, also again a few weeks later, destroys the curculio.

Mr. C. A. Huff, of Clayton, Mich., wrote them that their advice would do great damage by poisoning bees if the sprinkling be done while the trees are in bloom. We would call their attention to the matter, and present to their notice this fact, that should the bees gather the poisoned honey, and it be eaten, much damage would result in a way that would be very unpleasant for them.

Besides, the insect does not damage the blossom. The fruit is injured; and spraying the blossoms is useless. The time to spray the trees is just after the blossoms fall—then it will kill the insect-pest, and do no damage to bees or honey.

The Green Nursery Company have no doubt innocently fallen into error, and will cheerfully make the correction in the next edition of their Circular, now that their attention is called to the matter.

Honey Instead of Sugar.

The recipes have been sent to us quite freely, as we requested, and have been inserted in the Honey Almanac. Mr. J. W. Stitson, of Otsego, Wis., writes thus about the uses of honey instead of sugar in cooking:

It would take considerable space to write out all the recipes where honey should be used for cooking. White clover honey may be substituted for sugar in the Recipes of any Standard Cook Book, pound for pound, and improve the flavor. Lemons add to its delicate taste.

Honey Misrepresentation.

The editor of the Chicago Daily *Herald*, in the issue of Monday, October 27th, 1889, answers a correspondent thus:

A. and B., Plano, Ill.—There is such a thing as manufactured honey. The comb is made out of paraffine.

We wrote him a letter asking for the proof of his assertion about manufactured comb honey; telling him that there was no such thing in existence; referred to the offer of Mr. Root of $1,000, and told him that it would be very easy to get the money if his "item" was true, etc.

He neither deigned to reply, nor to correct his bold assertion. Honesty would dictate that correction should be made, with an "apology" for hasty assertions about matters concerning which he was entirely ignorant.

GLEANS OF NEWS.

The Honey Almanac for 1890.

By the time this JOURNAL is in the hands of subscribers, the new Honey Almanac will be ready for distribution, and orders on hand will then be filled in rotation.

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Beeswax, its uses, how to render it, and its importance as a commercial product, is described, and 17 useful Recipes are given.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Wisdom would dictate that a million of them be scattered by the first of January.

We will ship them as soon as ordered. Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time.

Mr. H. O. Kruschke writes as follows concerning these useful pamphlets:

Set forth all the merits of *extracted honey*, for that needs it the most. These Almanacs will sell honey, where without them none could be sold.

I had occasion to take some extracted honey to a neighboring town. I could not tarry long there, so I left it in one of the largest stores. I hung up a couple of my large cards, gave the proprietor about 25 of the pamphlets on "Honey as Food and Medicine," and, naming the price the same as comb honey, I threw in the tin pails.

I left 100 pounds. None had been on the market there since the days of Perrine; and that was not pure. The merchant was loth to take it, but said he would see what he could do. I went up to make collection this summer, and the merchant told me that it was hard to get customers to take it, as they were afraid that it was glucose, etc. But he handed to each one a pamphlet, and in a day or two several asked for honey.

If it had all been put up in small pails all would have been sold in a short time. But the laboring people do not like, or cannot buy a large quantity at a time; so hereafter I will put it up in small pails, and furnish it to those who want a large supply, as much as they desire, in their own receptacles. My honey, this year, is quite dark, but my customers do not object to that. I get 10 cents per pound; or in pails, 12½ cents per pound for it. I hope you will get more orders for the Almanacs than a 100,000 edition requires, and make half a million at the start. I know they will be a great aid.

Bee-Keeping in South Africa.

The method of bee-farming, as it is carried on here, says a correspondent to *Gleanings*, is as follows:

A native cuts a circle in the bark of a tree, and about three feet above he cuts another. Then he cuts in a straight line from one circle to another, and strips off the entire bark as cut. While this is still green, he refolds it in the shape of the tree, and carefully sews up the centre seam, and after folding the two ends in a more or less square form, he sews them up, leaving an entrance for the bees. His thread is bark, and his needle is a thorn, and his punch is his spear. This is his bee-hive, and it seems to do excellently for this class of bees.

The forests all about are well provided with these hives, placed in the tree tops, and it seems that the greater number of these hives sooner or later become inhabited with bees. The bees here are not so large as the honey-bees of North America, nor are they much smaller.

Swarms that have alighted about the house from time to time are about the size of a half bushel. Honey here is in abundance, and very cheap. Honey is 10 cents a bucketful (three gallons). Comb honey we never see. The matter of extracting honey is simple with the African; he simply cuts out the combs, and with his hands squeezes out the honey. The honey is of a richer quality, and much thicker than any I ever saw in America. Probably the climate is the chief agency in ripening the honey to so fine a state.

Marking the Bees.

The "funny-man" of the Pittsburgh, Pa., *Bulletin*, has this to say about the late decision of a New York court about the bees becoming trespassers when they visit other lands than those belonging to their owner, when out in search for honey. He says:

The fun will begin when the owner of the land tries to find out just whose bees are standing on their heads in flowers, or taking the honey from his buckwheat field.

There are difficulties in the way of his wife to stitch his initials in the wings of all the bees from his apiary, as she would mark the corner of his handkerchief, or the northern zone of his stockings. Nor would it be a pleasant job to use a rubber stamp and mark each one of his honey insects. The latter would object to this—pointedly.

Cattle may be branded, and sad-eyed sheep can be frescoed with a brush and paint, but the bee is not formed by nature to wear the monogram of its owner. Neither has nature fitted the bee with a safe handle whereby it could be held while undergoing the process of marking. The most amiable boy would decline holding a bee for such or any other purpose—at least would refuse to hold more than one. Even to catch and insert a healthy bee in a device made for the holding process would entail unpleasant results to the catcher.

The tresspassing of honey-bees in New York State will go on in spite of the Supreme Court, and the busy and buzzing trespassers will go unstamped.

☞ Frank Leslie's Popular *Monthly*, for November, is crowded from cover to cover with pictures, stories, decriptive and biographical articles, scientific lore, poems and seasonable literary side-dishes, is a striking illustration of the scope and fullness of the modern magazine.

Preparing Bees for Winter.

Successful wintering of bees depends largely on preparations made before cold weather sets in, such as uniting weak colonies, feeding, etc. The extra food must be given so early that the bees can seal up their stores. Unsealed comb during winter is not healthful food. Whatever variety of food is given them, the moisture that arises from the bees during cold weather enters the unsealed stores, and produces disease.

It is far better to look to this important matter during the honey season, and prepare frames of sealed honey to supply all colonies that need food. But, in our greed for a heavy crop, we are apt to lose sight of this, and when feeding-time comes, we buy sugar, at high prices, to supply these wants.

Uniting bees, and supplying all colonies with fertile queens, is of primary importance. As we have the advantage of movable-frame hives, we should thoroughly arrange the brood-nest in every colony so that the brood shall occupy the center of the hive or combs. If a frame of brood is carelessly set on one side, the bees occupy the other side, and the brood separates.

After properly arranging the hive and providing a good queen, we are ready to feed. The food will be stored around the cluster of bees. Frames of comb filled with pollen near the cluster of bees are considered injurious to bees during winter. This has been our experience, and we take particular pains to either remove such frames from the hive, or place them outside of the brood-nest.

Bees should not cluster on frames filled with pollen during winter. They use too much pollen as food, and it has a tendency to produce diarrhea.—*American Agriculturist for November.*

New Postal Cards.

The new postal cards soon to be issued will vary in size. There will be three sizes when the contracts are finally taken up—one, a fine, delicate card for ladies' use, much smaller than that now in circulation, and much finer quality. Finely calendered paper will be substituted for the old buff blotting-paper. An intermediate card of the same size as the one now in use will be retained, and a new large card will be introduced that can be used for business purposes. It will be large enough to allow a bill-head thereon, besides the other matter.

Subscribers who do not receive this paper promptly, will please notify us at once.

Convention Notices.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

☞ At the request of several bee-keepers, I hereby make a call for a meeting at Higginsville, Mo., on Thursday, Nov. 14, 1889, at 9 a.m., for only one day, for the purpose of organizing a bee-keepers' association. Let all bee-keepers attend, that can do so.
J. W. ROUSE, Santa Fe, Mo.

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

QUERIES and REPLIES.

Keeping the Queen in a Cage After Having Been Mailed.

Written for the American Bee Journal

Query 664.—1. Can a queen received by mail, that cannot be used at once, be kept with safety in a cage by herself, on top of a colony, above the feeder hole, shut up with wire-cloth, with only a paste of honey and sugar for food? 2. How long could a queen be kept safely in such a position, on such paste, strictly by herself, *i. e.*, without any other bees for feeding her?—J. B. W.

1. Yes. 2. I do not know.—H. D. CUTTING.

1. Yes. 2. I do not know. I should not like to risk it very long, if she was worth anything. —A. B. MASON.

1. Yes. 2. If she has plenty to eat, and is warm, she can remain for weeks, or as long as needed.—DADANT & SON.

I should not like to keep her so at all. Why not arrange the cage so that other bees can feed her?—A. J. COOK.

1. I think that she might, if the food is wet enough. 2. Perhaps for weeks, in warm weather.—C. C. MILLER.

The queen-breeders will answer this query to the satisfaction, no doubt, of the enquirer.—EUGENE SECOR.

1. Yes. 2. I have kept them thus for 15 days. The queen, however, should be placed as soon as possible.—J. M. SHUCK.

I lost one in trying to keep her over night, in this way. I do not know—not long, at best.—J. M. HAMBAUGH.

1. Yes. 2. For any length of time, if the conditions are all right. I prefer to put in 1 or 2 bees with her.—P. L. VIALLON.

1. Yes. 2. For a considerable time. It is better to have other bees with her in the cage, if she is to remain confined very long.—C. H. DIBBERN.

1. Not with any certainty, if the weather is very hot or very cold. 2. If the weather were favorable, she could generally be kept a considerable length of time, but much depends upon the colony.—R. L. TAYLOR.

1. Not for any considerable time. 2. I cannot say; if situated so as to receive the heat of the colony, probably two or three days. I have had them die sooner than that.—MRS. L. HARRISON.

Possibly. The more I think over this question, the more I am led to believe that there is "danger" in thus confining a queen—danger of impairing her future usefulness. I should not wish to thus treat a valuable queen. —WILL M. BARNUM.

In warm weather, when honey is being gathered, a fertile queen may be kept in a cage over a colony of bees that have a laying queen, indefinitely, provided that the bees do not close the meshes of the cage with propolis. A good way to feed a queen in a cage, is to cut a thin slice from the outside of a comb of sealed honey, and lay it on the upper side of the cage.—M. MAHIN.

1. Yes. I have kept them for several days in this way. 2. A week at least. I should prefer, however, to let the bees have access to the outside of the cage.—J. E. POND.

1. She can be so kept, but "how long," very much depends. It is always the best not to resort to such plans of preservation, but to give the queen to a nucleus, in case you cannot do better.—J. P. H. BROWN.

If the colony is queenless, a queen can be kept caged on the frames safely for 30 days or more, without any food in the cage. But if the bees of the colony could not reach the queen to feed her, she would live but a few days, even with the food in the cage. —G. L. TINKER.

If you will make the food of granulated sugar and honey, she can be safely kept from two to four weeks. At least I have so kept them for that length of time, but I much prefer to introduce them as speedily as possible. —G. M. DOOLITTLE.

Yes, a queen can be kept in that way for a time—sometimes for several days. Much depends upon minor conditions, which you do not mention. I should not want to risk a very choice queen in that way a great while.—JAMES HEDDON.

1. I do not think it advisable to keep a queen by herself in a cage, except when introducing her; therefore I would say that she cannot be *safely* kept in that way. 2. I cannot answer the question, as I do not know what you mean by, "on top of a colony above the feeder hole"—there are so many sorts of feeders, some having holes, and some not. In fact, I know of no such a place as "on top of a colony above the feeder hole" that would be a fit place to confine a queen in a cage.—G. W. DEMAREE.

1. A caged queen can be kept for some days, laid on the frames above the brood-nest, or hung, with a wire between the frames. If she is a queen that has been sent by mail, she can live for a week, perhaps, on the "Good" candy that the queen-cages are supplied with. 2. Why should she be "strictly by herself?" If she has been shipped, there are always bees with her. If you catch her and cage her yourself, put in some bees. Keeping queens, I have found to be risky business—the ants, or something eat them. If I had a valuable queen, and the colony where I wanted to put her was not ready, I would take a queen that I did not care for, from another colony, and introduce the good, new queen there, and let all the risk be with the common queen.—MAHALA B. CHADDOCK.

A queen can be kept in a cage, and placed over the frames of a hive for several days, if she is accompanied with some bees, and has sufficient food; or better, she may be so placed that the bees of the colony can feed her. Of course, the best way is to make nucleus colony for her, if she is of any particular value.—THE EDITOR.

CORRESPONDENCE.

GOLDEN-ROD.

It Yields Abundance of Honey in Maine.

Written for the American Bee Journal

BY J. F. LATHAM.

In this locality the golden-rod is an excellent honey-plant. Like other species of the melliferous vegetation, it is quite sensitive to atmospheric influences, but it will retain its verdant foliage and brilliant bloom with apparent vigor when herbage of a less hardy nature will wilt and fade from a lack of moisture; although in times of drouth its secretion of nectar is scanty, bees will throng its bloom from "early morn till dewy eve," often increasing their stores, and when not overburdened with brood they will store some surplus in the sections.

When the ground is saturated with moisture, and the nights warm, with copious dews, the secretion of nectar by the golden-rod is quite profuse. On mornings following a good day's work by my bees, I have observed miniature puddles of water on the platforms, in front of the hives, fed by a trickling from the brood-apartments, the result of evaporation.

During the evenings following a good flow of nectar from the golden-rod, the air in the apiary will be fragrant with its odor, as the bees in their "cooking process" force it from the hives. The honey from the golden-rod is thick, heavy, of a light amber color, and were it not for its slightly pungent flavor (a relish agreeable to many who like honey), it would rank second to no other with which I am acquainted.

That honey from the golden-rod is as good as that from any other source for bees' winter food, I have never had reason to disbelieve, although much has been written in the bee-periodicals denouncing its qualities. For eight years I have depended upon the fall bloom for winter supplies for my bees, with the exception of a small quantity, usually, of honey from the raspberry and clover bloom, that might remain in the brood-apartment at the close of the white honey harvest; and I have not, during that time, lost a single colony by the causes attributed to fall honey.

Usually, during the first week of August, the yellow plumes of the golden-rod begin to greet the expectant bees, from the roadsides, rill-banks, meadows, and waste uplands; and from that time, often until the middle of October, they will be found among its bloom. To-day (Oct. 10) I saw a few of my bees come in laden with pollen from the golden-rod and aster, and, judging from their distended appearance, they had honey also from the same source.

Had it not been for the golden-rod and aster, my efforts to procure even a very moderate income from 60 colonies of bees this season, would have resulted in complete failure. As it was, after the golden-rod commenced to bloom the rains ceased, and about four weeks of as delightful honey-weather as one could wish for followed. As a result, my bees filled their poverty-stricken larders to repletion—some to excess.

With what honey I have taken from combs added to the brood-apartment, and what I think may be taken from the same source next spring, I shall receive, by extracting, 500 pounds of golden-rod and aster honey, in addition to 1,000 pounds of white honey in the comb. The above, present and prospective, with an increase of 8 colonies, is the sum total of my bee-keeping for 1889.

West Cumberland, Maine.

IN COUNCIL.

The Bee-Keepers of the Northwest Meet in Chicago.

Written for the American Bee Journal

BY W. Z. HUTCHINSON.

The following is a statistical table of bees, honey and beeswax for 1889, represented by the convention:

The following officers were elected: President, C. C. Miller, of Marengo, Ills.; Vice-President, J. A. Green, of Dayton, Ills.; Secretary, W. Z. Hutchinson, of Flint, Mich.; and Treasurer, Thomas G. Newman, of Chicago, Ills.

Freight Rates on Bees.

The following letter was presented by Thomas G. Newman, and read:

FRIEND NEWMAN:—I intend to be present at the Chicago Convention, held Oct. 11 and 12, but in the meantime should any other business hinder me, will you be so kind as to bring before the convention the subject of the rates charged for sending bees by freight? I think it is of great importance to all bee-keepers in this country.

I would suggest that a committee be appointed by the convention, to consult the railroad authorities, and enlighten them in regard to the unjust ruling and high freight rates on live honey-bees. The tariff and classification as it now is, provides for third-class rate, mimimum weight 20,000 pounds, on bees in hives of any quantity; that is to say, if you wish to ship only 10 colonies, you have to pay for a full carload of 20,000 pounds capacity, and then you are not allowed to load any other stuff, such as supplies, etc., in the same car. Just consider for a moment what an unjust rule, and exorbitant charge this is—for about one-fortieth of a carload they charge for a full carload of 20,000 pounds.

In former years we could ship any number of colonies, and they would charge according to weight; but for the last six months, all railroad companies have combined, and adopted the above rule and tariff classification.

Last week I had some experience in that line with the railroad company, which I will submit. I exchanged with a certain party in Pierce county, Wis., 75 full colonies of bees for 80 acres of land; the bees had to be shipped to Woodville, in St. Croix county, on the Omaha railroad about 40 or 50 miles this side of St. Paul, Minn. The amount of freight that the company charged me was $80, when, in fact, they only charge $40 for household furniture, etc. But I would not have complained about their charges, if they would have allowed me to load other stuff in the car, but they refused to let me do so.

I wrote a letter to the General Freight Department, and explained the matter, and asked to be allowed a special rate so as to permit me to load other stuff in the car. I received an answer from the Superintendent, informing me that they are not permitted to make it less than the published tariff, and he could not set aside their adopted rule, and make it a mixed carload; but referred the matter to the chairman of the classification committee, to see what he could do for me.

In a few days after, I received his answer, stating that he could not do anything for me in regard to the matter, because the rule and classification had been adopted by the combined railroad companies.

After they had charged such an exorbitant price, they would not take any risk whatever. I then asked them what the difference would be, if I load a car with iron ore or bees, if they take no risk for bees: but they left this question unanswered.

The Superintendent admitted that their ruling was unjust, and the rate too high on bees, but he had to carry them out until they are changed. I am of the opinion that if a good committee is appointed by the Chicago convention, to bring the matter before the classification committee, a more favorable tariff for bees could be gained. CHRISTOPHER GRIMM.

Mr. Green said that the Chicago, Burlington & Quincy railroad for a year had such a ruling. Less then a carload was charged as much as a full carload.

It was moved that Mr. Thomas G. Newman be appointed a committee to attend the meetings of the railroad transportation committees, and endeavor to secure a change in the unreasonable ruling.

Mr. Newman thought that it would simply be so much time wasted. These bodies did not live up to their agreements. He cited the instance where members of the Society had failed to secure reduced rates from the east of Chicago, when such rates had been promised.

Mr. Heddon—We must treat with railroads upon *business* principles. To simply go to them with a complaint amounts to nothing. It must be shown to them that such rulings as the one mentioned only throws the business of carrying bees into the hands of the express companies. By express *is* the best way to ship bees, unless sent in large quantities, and the owner with them.

Mr. Root—We have had quite a little to do with railroads, and have found them quite reasonable.

Thomas G. Newman, A. I. Root and James Heddon were finally appointed as a committee to confer with the railroads.

Thirty dollars were voted to the Secretary, and, on motion of Mrs. Harrison, it was voted to pay any balance in the treasury, after all bills were met, to dear Father Langstroth.

A vote of thanks was extended to the proprietors of the Commercial Hotel, for courtesies shown in giving reduced rates, free hall, etc.

Time for Next Meeting.

As there are uncertainties in regard to when the best railroad rates may be secured another fall (the Exposition buildings are to be torn down), it was decided to leave the fixing of the date, for the next meeting, with the officers. A preference was expressed for the latter part of October.

The convention adjourned to meet at the call of the officers, in the fall of 1890. W. Z. HUTCHINSON, *Sec.*

FALL HONEY.

Unfinished Sections—Gathering Honey Rapidly.

Written for the American Bee Journal
BY AARON COPPIN.

I have paid particular attention to golden-rod for three seasons; we have two varieties of it here, and I have never seen bees work on the one shown in "Prang's National Flower." I have seen bees work on the other variety a little, but I do not think that its value is much as a honey-plant. The aster is our very best fall honey-plant.

The honey crop has been very poor here, and bees are not in very good condition for winter. I have just been overhauling some colonies that I was working for extracted honey, thinking that I had lots of honey to extract, but those that had honey in the upper stories, had nothing but empty combs in the brood-nest, so that the bees need all the honey for winter; hence I have nothing to extract this fall.

I am also giving all unfinished sections to the bees to clean out, as I do not think that it pays to extract such small pieces, especially when the bees need feeding.

I was preparing several colonies for winter, from Oct. 1 to Oct. 10, and I found fine-looking queens, but not a bit of brood. I think that it is early in the season for bees to be entirely without brood.

How long it takes bees to find pasture, get a load of nectar and return home again, I do not know; but I took 2 colonies five miles from home, and put them down by a farm-house about one-fourth of a mile from a buckwheat field, to see what difference in the quantity and quality of honey there would be between those two and the home apiary, as I had no buckwheat at home. I released the bees, and I went right to the buckwheat field and back again, which took me about 15 minutes, and I never saw loaded bees come home faster than those did.

Wenona, Ills., Oct. 17, 1889.

HONEY-BOARDS.

Best Material for Brood-Nest Covers in Winter.

Written for the American Bee Journal
BY O. B. BARROWS.

My neighbor, Mr. Pinkerton, usually keeps from 100 to 150 colonies of bees, all of which he winters in his cellar; a part of them he covered the brood-nest with enameled cloth, a part with quilts, and a part with honey-boards made of wood; on these last, which have slots for the bees to pass up through, he uses the two-pound sections, and when the sections are removed in the fall, he covers the slots with a narrow board; on the others he uses one-pound sections. When he put them out in the spring, he saw no difference, but when they came to storing surplus honey he noticed that he was using the two-pound sections much the faster, which would indicate that those under the wooden honey-board had wintered the best.

Now I wish to ask, which is the best material for a honey-board to cover the brood-nest in the winter, where bees are wintered in a cellar? Will some one please reply?

Marshalltown, Iowa, Oct. 12, 1889.

SEASON OF 1889.

Carniolan Bees—Well Pleased with the Results.

Written for the American Bee Journal
BY F. S. JOHNSON.

One week ago I took the last of the sections from my hives. I began the season with one strong colony and one weak one, and I now have 6 colonies, with an average of 10 American frames solid with honey, and have taken 362 well-filled sections from them—362 pounds of honey. The old strong colony gave 137 pounds of surplus honey, and the new colony, taken from the old one, gave 136 pounds.

I purchased a Carniolan queen on June 26, gave her one frame of brood and one empty comb; the colony filled 12 American frames solid with very nice honey, and are very strong and in good condition for winter.

I had one small swarm which I found clustered on one of the rails between the ties on the railroad track, on one windy day, Aug. 25. I scooped them up in my hands, and put them into a box, and by the use of a little smoke, I succeeded in getting them all in. At night I took them home, and gave them foundation, and one frame of honey, partly filled. They now have

8 frames well filled, and are in good condition.

I have 2 colonies of hybrids, which are very cross. I shall take the heads off from the queens in the spring, and give them queen-cells or queens from my best colony. I am not prepared to pass my opinion upon the Carniolans yet, but I think that I shall like them. I shall use them next season to rear queens from.

I did not see a bee on sumac or golden-rod this season; heart's-ease gave us our surplus. I am well pleased with my success with bees.

Campbell, Nebr.

UNITING.

A Simple Method of Uniting Colonies and Nuclei.

Written for the American Bee Journal
BY JOHN CRAYCRAFT.

The ways of uniting weak and queenless colonies of bees, recommended by many correspondents, differ from my method.

I open the hive of the colony to which I wish to give the queenless one, and turn the enameled cloth cover up at one corner furthest from the entrance, sufficient for a small passage for the bees; then about dark, or at any time when all the bees are in, I place the queenless colony over the other that I had prepared, which makes it a two-story hive. If this is not enough, I put on the third colony that I wish to unite, making it then a three-story hive.

The small passage way allows the bees to unite, and in two or three days all the bees will be with the queen, and where the brood is. Then I can arrange the combs to suit the season—if for winter, or for the spring, or for honey work.

I have practiced this method of uniting successfully for several years. I use this all through the queen-rearing season in uniting nuclei when queens are taken out.

My hives are the Simplicity style, only I use a small hive, and 10 frames, each 9⅛x13½ inches, outside measure; also loose bottom-boards. I often use these hives four stories high for extracting, and for comb honey I have light trays that hold 18 one-pound sections, which set inside the hive, and I can place on as many of them as I may desire, or the colony can use.

I have all fixtures about the hives so made that any bottom, roof, hive, tray or frame will fit in any place, so that I can divide, unite, rear queens, or make any change that I may desire—use one story or six of them, if I wish to do so.

The foregoing is my method, and the kind of hive that I find that suits me best; and any hive that will not admit of all these working changes, is not the hive that practical honey-producers are looking for.

Altoona, Florida.

Under the Whispering Leaves.

Written for the Illustrated Home Journal
BY MAHALA B. CHADDOCK.

In my old hammock hanging low,
Near where the golden lilies grow,
I'm swinging, swinging to and fro,
Beneath the Whispering Leaves.
Sweet flowers are blooming all around—
While virgin snowflakes strew the ground;
All life is full of scent and sound,
Of flowers, and birds, and bees.

The scarlet tanager sings in glee
From the swaying bough of the elm-tree,
And then with wing so bright and free,
Seeks his more timid mate.
And far away the lark soars high,
As if he sought his love in the sky,
To woo her to the nest in the rye
Beyond the orchard gate.

The yellow bees hum a gladsome tune—
A song of joy for the royal June,
With a sad note that she dies so soon—
Ah! happy honey-bees.
And as their busy world moves on—
Their tiny world, with its working throng—
I listen to their joyous song,
As I swing beneath the trees.

The swallows fly to the sheltering eaves;
The chittering wren its rough nest weaves,
And overhead are the Whispering Leaves,
That whisper all the day.
I look above at the changeful blue,
With dancing sunlight glancing through,
And wonder if the words are true,
That these still talkers say.

And what they find to talk about,
Week after week, day in, day out;
And if they'd like to laugh and shout—
These restless Whispering Leaves.
The reaper's noise seems far away,
And stiller grows the children's play,
The rain-crow calls his plaintive lay,
Above the Whispering Leaves.

And then I hear them high aloft,
In rustling cadence whispering soft,
Say "Hush," as a loving mother oft
Will soothe the babe at her breast.
And then in tones of tender grief,
They spoke of the sin of unbelief,
In the power of love to bring relief,
To mortals sore depressed.

And in an ardent lover's tone,
They spoke of one who was all our own—
Whose eyes as blue as the heaven's dome
Looked oft at the Whispering Leaves.
The fair maid whom our hearts enshrined,
Whose loving arms around us twined,
And bound us, as only love can bind,
We laid 'neath the Whispering Leaves.

I am swinging again in my hammock old,
And I look away to the hills of gold,
Where the reaper binds with ruthless hold,
And gathers the golden sheaves.
'Tis meet that ripened grain should fall,
And the Heavenly Father watches all;
But o'er our lives there hangs a pall—
She sleeps 'neath the Whispering Leaves.

Vermont, Ills.

WINTERING.

Plan of Preparing Bees to Pass the Winter Safely.

Written for the American Bee Journal
BY A. M. VANNOY.

In the bee-papers and apiarian departments of several agricultural papers, I see enquiries as to the best methods of wintering bees. This depends somewhat upon latitude (or climate); on these wind-swept prairies of Iowa, Northern Illinois and Nebraska, cellaring of some kind is almost indispensable to success. For the last four years I have kept from 10 to 20 colonies as follows:

After selecting a location where water will not rise or stand, I drive four posts into the ground, all in a line, the two outside ones 16 feet apart, and the other two equal distances between. Eight feet from, and exactly parallel with this line, I drive four others in line also; these posts are all stout ones, and are driven in the ground 2 feet or more, leaving 2 feet above the ground. To these posts on the outside of the line, I nail barn-boards, 16 feet long, and 1 foot wide, two to each line, making a solid board fence 2 feet high; the ends are closed by boards of the same width, and half the length, one post being sufficient between the end posts of the sides.

After all is boarded up as before, I dig two spade depths and throw the dirt outside and against the boards, for an embankment. After I have dug all out to within 4 inches of the board wall, and two spades' depth, I lay two poles (fence-rails will do) about 16 inches apart, on each side of the bottom of the pit, and place the hives on them (the poles), as close together as I can get them; of Langstroth hives I can place a double tier on either side.

After all the hives are in, I take 2x6 inch scantling, 8 feet long, and spike the ends fast to the middle posts of the side lines, and parallel with the end wall, and all on a level with the upper edge of the boards in the side and end walls. I cover the whole with 16-foot barn-boards, without breaking joints, being careful to leave no cracks large enough through which mice can enter. Then I cover the whole top with two moderate loads of straw, hay or prairie grass. I use sorghum *bagasse*, as I have plenty of it handy. This gives the required ventilation, and keeps off sudden changes.

I used to think that some kind of a ventilator was a necessity, and last winter, after putting away 16 colonies in the hole, it kept so warm that I tunneled into the hole, and put in 4-inch tile, connected with a 6x6 inch box 4

feet long, and 2 feet above ground (upper end), at each end of the pit or hole, as a ventilator. As I generally watch the bees pretty close for awhile, I went in and examined the hives about three weeks after I put them in, and found that a gopher had utilized the ventilator to store waste dirt; but the ground outside was frozen so hard that I could do nothing for them, so, after seeing that the bees were all right, I just left them until March 25, when I opened the hole, and found them all right, with not over a pint of dead bees in the entire lot. The bees were put in the first week in December, which is about the right time to put them in, in this latitude and climate.

I am satisfied that if these directions are strictly followed, success will attend every effort; and while it requires some manual labor, it has the advantage of scarcely any expenditure of money, as the lumber can be taken out in the spring almost as good as new, and can be used over and over again for the same purpose.

I have never kept over 20 colonies together, but I can see no good reason why 50 may not be kept as well, only requiring the more room. My bees always come out "plump and fat," and apparently vigorous. I always try to select a fine, warm day to open the pit, and if chilly at night, I put the hives in again, with only the boards for a covering, unless bad weather ensues, when I again put on the *bagasse* for a day or two, or until the next warm day, when I put the bees out to stay.

My bees have not been troubled with spring dwindling to amount to anything, and I believe that musty, moldy cellars have more to do with it than damp combs and soured honey.

Hedrick, Iowa.

BLACK HONEY.

A Peculiar Kind of Nectar Gathered by the Bees.

Written for the American Bee Journal

BY WM. S. BARCLAY.

From Sept. 7 for about two weeks, my bees gathered a substance somewhat the color of thin ink. I have no doubt that it was honey-dew, but the source whence it was obtained, is what mystifies me. I have never failed to trace my bees to where they gathered their stores—that is, when they were working freely; but in this instance I failed entirely.

They worked as freely as I have ever known them to do on buckwheat, and brought in fully as large loads as they do from that plant; but the reason they could not be traced was, that when they left their hives, they arose high in the air before they struck their course, and as we have a high hill immediately back of our village, over which they flew, it was impossible for me to again obtain their direction of flight.

This black honey was quite thick, and after standing a short time, it precipitated a black, sandy sediment, which, when shaken up, gave it a grainy appearance that was very repulsive. The taste was sharp and disagreeable, while it gave forth an odor which was anything but pleasing.

While gathering the substance, the bees built the whitest of comb in which to deposit, and I was greatly surprised to find, in eating it, that this comb was as tough as comb that had been bred in three or four times; but what astonished me the most, was that this honey was sealed up almost as rapidly as it was gathered. I think that it was done more rapidly than I have ever known honey to be sealed before. The appearance which it presented when placed in a comb partly filled with sealed white honey, was astonishing, and would have to be seen to be fully realized.

Now the question is, will this honey be safe food on which to winter bees? I know that some of our prominent bee-keepers take the position, "that any fully sealed honey is proper food for winter," but I fear to take the risk. I have left a portion of it with some of my colonies, in their combs in the body of the hive, but I removed all of it that was deposited as surplus, preferring to feed it in the spring when the bees would have daily flights, and when I would apprehend no danger.

I have written to Mr. Chas. F. Muth, of Cincinnati, in relation to this honey, and shall send him a sample of it when I hear from him. I should also like to have Mr. Newman and Prof. Cook see it, and have their opinions of it.

The National Flower.

In relation to our national flower, I would say that my choice most determinedly is the "golden-rod;" and this in the face of the fact that bees in our vicinity do not gather a particle of honey from its beautiful bloom; but this may be stated with equal truth of the spider-plant. For fall honey give me, first, sweet clover, and then the motherwort and catnip.

For its adaptation to all soils and climates; for its beauty, as it waves its golden plumes over hillside and valley; for its tenacity of life; but more, for the beautiful interpretation of its cognomen, give me golden-rod in preference to all other flowers, as emblematic of our now united and glorious nation.

Beaver, Pa.

SECTION-CASES.

Freeing Section-Cases from Bees while on the Hives.

Written for the American Bee Journal

BY FRANK COVERDALE.

On page 636, Mr. J. M. Burtch asks how to get bees out of the section-cases before removing them to the honey-house, or from the hives. Very truly it is quite a task, when it has to be done as Mr. B. says that he has tried, or in the way that well-nigh all of our progressive apiarists are continually practicing, and most especially is it hard to accomplish it with the Italians, for they are so docile, and prone to hang and stick to the comb.

Getting bees out of the surplus cases, has also caused me a great deal of bother and vexation, especially when I have to drive them through a perforated wood-zinc honey-board. I have spent many hours, thinking out a way by which we could prevent this hardship, and the best way I know of at present is this:

Take a board ½ or ⅝ of an inch thick, saw it so as to just fit the section-cases; after which a strip is nailed all the way around it. These strips should, when nailed, project ⅜ of an inch higher than the board, which will leave a bee-space on top, so that the section-cases will fit on this the same as on the hive with the bee-space.

After this is done, bore a ¾-inch auger-hole near the rear, or almost anywhere will do, though it will be better, perhaps, to have the hole over the openings of the sections.

Make a wire-screen cone, about 1½ inches long, with the top to just fit the auger-hole, and the bottom so that a bee can just creep easily down through. Now go to the hive that has one or two cases of capped honey, that you wish to remove, raise up the top cases, and slide in the board; drop the little wire-cloth cone down in the hole that you bored—small end downward; let down the case, and the bees will soon become uneasy, for they have neither queen nor brood, and down through the cone they will go, until every bee is out of the way.

Then how pleasant it is to carry the bee-deserted cases to the honey-room. It scarcely can be imagined how glad I felt the first trial, to return and find a case of honey without a bee on it.

This will save much valuable time, for one can adjust one of these boards very much quicker than to pull and smoke the bees down, blowing fire and ashes on the bees and nice comb honey.

The boards can be made very cheaply, and I should think that a man

could make at least 50 in one day. Place one of these boards on top of the cases, and on top of the board an upper story of brood, and the bees will desert it to such an extent that they will leave it in a starving condition, or, in other words, they will leave the brood to take care of itself. Always leave surplus room below the board while honey is being gathered, when the honey is ready to take off on top of it.

We have just passed through a fair season for the honey-producer in this location. My bees are in good condition for winter quarters. My yield per colony, spring count, is 208⅝ pounds—all comb honey except 600 pounds.

Welton, Iowa.

UNWIRED COMBS.

Securing Good Combs Without Wiring—Empty Combs.

Written for the American Bee Journal

BY G. W. DEMAREE.

My answers to Queries in the AMERICAN BEE JOURNAL have brought me a request to write an article on this subject. To the practical bee-keeper there are a number of objections to wired combs, but the greatest of these is the cost and high order of skill necessary to procure good wired combs. To perforate the frame stuff accurately, and draw the wire in the frames so as to be tight, without springing up the bottom-bar, must be done by one who is capable of doing a nice mechanical job, and this is more than a majority of practical bee-keepers are supposed to be able to do. It is therefore a desideratum on the part of the generality of bee-keepers, to have a simpler and cheaper way to procure good combs for brood and extracting purposes.

Perhaps it is not generally understood what an advantage it is in obtaining a large yield of honey, to have on hand a bountiful supply of good combs, to supply every need of the apiary. I have sometimes remarked that the season must be poor indeed if I fail to get a paying crop of honey, taken with the extractor, when supplied with plenty of empty combs.

The first requisite to success in obtaining good combs without wire, is a good article of foundation, and this I have not failed to find in Dadant's manufacture, five or six sheets to the pound of wax. Let the sheets be well fixed to the top-bars, and hang clear in the frames, with a space of ⅛ of an inch at the ends, and a half inch at the bottom.

My method of fastening the sheets to the top-bars of the frames, is to press the edge of the sheet fast to the top-bar with a putty-knife, and afterward run some melted wax (with a small spoon) on the opposite side from the lap; this prevents the tendency of the sheet to "peel off" when weighted by the bees. I use no mixture for this purpose — as wax can be hardened sufficiently, by pouring it, while hot, in cold water. The bees object to any foreign substance in wax. The frames thus arranged are placed in tiering supers or cases ready for use.

When the honey season opens in the spring, I place a super of empty combs on each hive to be worked for extracting, and as soon as the combs are pretty well filled with new honey, the case is lifted, and a case filled with the prepared sheets of foundation is placed under it. If the season is good, the foundation will be drawn out in a few days, and may be used to hive swarms on. By proceeding in this way, all the combs needed can be obtained.

If there is any loss to the colonies while drawing out the foundation, it is more than made up by the swarms that profit by the ready-drawn combs. If I do not have empty combs to start with, I use the foundation in their place, as the best thing that I can do.

When a crop of comb honey exclusively, is being taken, it does not pay to set the bees at work drawing out foundation, for in every trial I have made in that direction, the bees have neglected the section-cases in their eagerness to fill the sheets with honey as fast as the cells are drawn out. The plan is only practicable when taking honey with the extractor. Still, if I was producing comb honey exclusively, I would employ a number of colonies to draw out all the combs needed for the swarms.

It should be known, however, that full sheets of foundation fastened to the top-bars, as described above, may be placed alternately with drawn combs in the brood-chamber, and large swarms may be hived upon them with perfect safety. I have found, by experimenting with sheets of foundation, that they can be made strong enough to bear large swarms, by simply cutting them into two pieces, and lapping the edges together about ¼ of an inch, and welding them together by pressing a putty-knife on either side, thus forming a rib in the centre of the sheet of sufficient strength to prevent the sheet from sagging.

A piece of fine wire may be inserted between the lapping edges, which will add greatly to the strength of the sheet. I have found that the rib is not in the way of the bees, as they complete the comb right on over it.

How to preserve empty combs when not in use, was once a serious problem with me. The sulphur remedy was never satisfactory in my practice—it is a filthy, disgusting remedy. My plan is this:

In the early spring, the combs having been subjected to winter freezing, I pack them in bales of ten combs each, inserting a strip of wood at the ends between the combs, to hold them apart, to admit the air between them so as to prevent dampness and mold. The bales of combs are bound together with wrapping-twine to facilitate the handling. Each bale of ten combs is slipped into a cotton bag, and the mouth of the bag is securely tied. They are stored away in any dry place where mice cannot get at them. By this plan, empty combs can be kept free from moth depredation for an indefinite time.

It is highly probable that nice, dry combs would have no tendency to mold if only a sheet of paper is placed between them, in place of the strips of wood. The latter, however, is of no consequence to me, as I use the end-pieces of frame-stuff.

Christiansburg, Ky.

PURE HONEY.

It is Rectified, and Not Digested, Nectar.

Written for the American Bee Journal

BY A. H. DUNLAP.

I am now nearly 70 years of age. I well remember watching my bees manipulate their wax, building cells and capping them when full of ripe, digested (or something else) honey. I also noticed that in the evening, a great many cells of the new comb were full, but were empty in the morning; this would be repeated for several nights before the bees capped them over; what they were doing with it, I never so well understood as I think that I do now—they were either "ripening" it, "digesting" it, or doing something else with it. Now this "something else" is what I understand is asked for on page 648.

I never liked the word "ripe," as applied to honey, as its proper use is to express the condition of vegetation after growth and development into its perfected state—it is then "ripe." As for "digested" honey—oo! oo! ough! When I first saw this word applied to honey, how it made my stomach squirm. That just won't do!

Now let us have that "more appropriate word," and call it "rectified" honey; and if any one wants to know what rectified honey is, just say it is "pure honey." If anybody wants to know how it is rectified, say, "I don't know, the bees did it."

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 4-6.—International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

SELECTIONS FROM OUR LETTER BOX

Value of a Good Bee-Paper.

Every bee-keeper in the United States should subscribe for the American Bee Journal. It has been of great help to me. I have taken 1,450 pounds of comb honey from 8 colonies, spring count, and increased them to 20, by natural swarming. I am sure that I could not have done so well if I had not read the American Bee Journal. I try to keep my bees pure Italians, for I believe that they are the best bees to have.

Wm. Elliott.

Plainview, Minn., Oct. 4, 1889.

Digested Nectar Not the Term.

I have been watching with great interest the controversies of late, in regard to honey being "digested nectar." I have so far taken side with the opposition, and I still oppose calling anything in the line of eatables—especially the product of our dear little bees, and fit for the king's table—*digested!* My digestive organs propose to do the digestive work for themselves. I am not a scientist, and I will readily accept Prof. Cook's theory, but I beg the learned Professor (and I think that most of the bee-keepers will join in with me) to give us a more *digestive* name for the "digested nectar." Friedmann Greiner.

Naples, N. Y., Oct. 15, 1889.

Something for Bees to Eat.

On page 108, under the heading of "Wild Bees," Mr. O. C. Becker asks a question. I would like to ask a similar one, viz: Is there anything that can be compounded, that bees will be more greedy for, and eat better, than honey? Will some one please answer?

Joel Flint.

Razorville, Me., Oct. 16, 1889.

Southwestern Michigan Fair.

We had a very busy time in our corner at the Southwestern Michigan fair; it seemed almost like a bee-convention. There were bee-keepers here from every direction, reaching out from 20 to 30 miles. I had no idea that we had so many extensive bee-keepers so near us here. As a general thing they reported only from one-half to two-thirds of a crop of honey, and all felt rather poor. We had a very nice display at the fair. I had a colony of Italian bees on exhibition, a frame containing a few bees with a queen, and also a frame of mostly drone-bees; the last two attracted much attention—the most of the time some one was trying to find the queen. I took the first premium on comb honey, on extracted honey, and also on Italian bees.

Sylvester Pierce.

Three Rivers, Mich., Oct. 14, 1889.

Raising Funds for the "Union."

From 7 colonies I obtained about 550 pounds of about the finest white clover honey that I ever saw. I could have had more if I could have had time to manage my bees to the best advantage. Would it not be just and right to receive say from 3 to 5 cents per colony, as funds for the Bee-Keepers' Union, instead of taxing every member $1.00? I have 9 colonies, and think that it is unjust to ask me for $1.00, while the specialist has his hundreds of colonies, and only pays $1.00. I only speak of this as a matter for consideration, and not as a grumbler.

E. M. Coombs.

Memphis, Ind., Oct. 21, 1889.

[The smallest apiarist can well afford to pay a dollar to sustain an organization which defends the pursuit. The more extensive ones can pay five or ten dollars as donations. We do not favor the method you mention, because it looks too much like a "tax," and would require too much book-keeping. Others may have different views, and we like to have them expressed and discussed.—Ed.]

Cyprians and Golden-Rod.

I am well pleased with the amount of honey that I got this year. I would not give one cent for all the golden-rod in the town of Madison. The Cyprians take the lead in my apiary, and if I had elbow-room, I would keep them altogether. Mine are the "Simon-pure" variety.

Madison, Wis. D. D. Danner.

Few Bees Work on Golden-Rod.

I have been watching the golden-rod here, and have seen but few bees at work on it. The fall crop of honey is a failure in this locality. All the honey I have taken this season, is very dark, while one apiarist within two miles of me, got very nice, light honey. W. H. Martin.

Falls City, Nebr., Oct. 16, 1889.

One of the Asters.

Will you be kind enough to give the proper, or botanical, name of the enclosed plant? It grows in great abundance through all this part of the country, and grows from 3 to 4 feet high. It blooms very profusely, beginning in September, and continues through October. It is one of our best fall honey-plants, and is known here as "iron-weed." It takes this name from the hardiness of the stalks, when dead and dry. E. W. Lyles.

Charlottle, N. C., Oct. 9, 1889.

[It is one of the numerous family of asters (*aster tradescanti*), and is an excellent honey-producer.—Ed.]

Golden-Rod—Wet Season.

In this locality there are two varieties of golden-rod—one growing on high ground, with a long, feathery flower; but this one does not produce honey; the other grows in swamps, and along ditches, with a straight stem, and branches out with flowers in clusters on the top. The latter is the best fall flower we have. My bees are near a swamp of about ten acres of this variety, and about Sept. 1, my 55 colonies did not average 2 pounds apiece; but for about 10 days there was nice, warm weather, and my bees worked on it from sunrise until sunset, averaging about 25 pounds apiece, with 25 colonies of other parties near it, too.

We have passed through the wettest summer and fall ever known in this section of the country. There was abundance of bloom, but too wet for the bees to get out of the hives. I had 1,200 pounds of surplus honey from poplar and clover, nearly all of it being comb honey. There was an abundance of asters, but too wet and cold for bees to work on it. The fall of 1887 the bees gathered the finest crop of aster honey that I ever saw. Golden-rod honey seems to be darker, and has a stronger honey-taste. H. P. Faucett.

Dilworthtown, Pa., Oct. 21, 1889.

Results of the Season.

I prepared 36 colonies last fall for winter, with 5 inches of sawdust over the frames, and all came through, with 2 rather weak ones. They swarmed a great deal, but I doubled up and hived back some, so I now have 70 colonies, all in good condition, with the brood-chambers full of the finest of white clover honey for winter. The average per colony was 70 pounds of honey, spring count, all in one and two pound sections, but mostly in one-pounds. I have no fall honey. There are acres of golden-rod here, and bees worked on it real well for 2 or 3 days, then left it. I have never known bees here to work on golden-rod any better than they have this year. I have kept some bees almost all the time since 1855.

J. E. Walker.

Clarksville, Mo., Oct. 14, 1889.

The Season's Results.

I have 17 colonies of bees, and have taken 500 pounds of honey from them this year. The American Bee Journal has been worth $25 to me the past season.

Albert Mallery.

Portville, N. Y., Oct. 7, 1889.

Robber-Flies and Bees.

I send a sample of something that eats our honey-bees; it resembles a bumble-bee, but it has no sting. They are numerous, and eat an immense amount of bees. Please tell what it is, in the American Bee Journal. J. C. Cooper.

Mt. Pleasant, Tenn., Oct. 16, 1889.

[The insect sent by Mr. Cooper is *Mallophora orcina*. It is fullly illustrated and described in my Manual, on page 417, last edition. This is one of the robber-flies. It is widely distributed in the South, and is a serious enemy of the honey-bee. The illustration in the Manual tells the whole story. It is light yellow in color.—A. J. Cook.]

Profitable Season—Carniolans.

This has not been a very profitable season to bee-keepers in this vicinity. The trouble was too much cold, wet weather. I started in the spring with 5 colonies, and increased them to 16, taking 200 pounds of comb honey. Bees are all in good condition for winter. I obtained a Carniolan queen last May, and my experience with them is that they are "hustlers," when compared with my hybrids. They are not only good workers, but very gentle. J. E. Turner.

Woodington, O., Oct. 22, 1889.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

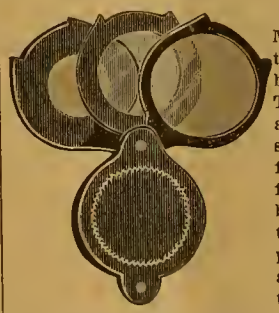
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents: or the AMERICAN BEE JOURNAL for one year. and the Magnifier, for $1.50.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now SO CHEAP that no one can afford to do without it.

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Always Mention your Post Office County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c.; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

PHILADELPHIA.

HONEY.—That in the comb is now arriving and the demand is increasing accordingly. The outlook is still favorable for good prices for fancy honey.—We quote fancy honey in neat crates as follows: 1-lbs., white, 17@18c.; 2-lbs., 14@15c.; buckwheat 1-lbs., 12@13c.; 2-lbs., 10@11c. Off grades of all kinds generally 1 to 2 cts. less. Extracted, white clover, 8½c.; orange blossom, 7½@8c.; off grades, per gal., 60@70c
BEESWAX.—23½@24½c.
Sep. 5. WALKER & McCORD, 32 & 34 S. Water St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—20@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2 lbs., 8@9c. Extracted is in light demand values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

CHICAGO.

HONEY.—It is selling slowly yet, but with colder weather we look for more active trade. Market is well supplied with honey, it being in many hands. In lots it cannot be sold at over 13@14c., and in cases even less, if not in first-class condition. Extracted, 6@8c., white clover and basswood, in kegs and barrels, 7c.
BEESWAX.—25c. R. A. BURNETT.
Sep. 10. 161 South Water St.

NEW YORK.

HONEY.—It is in good demand. We quote: Fancy white 1-lbs., 15@16c.; 2-lbs., 13@14c. Fair white 1-lbs., 13@14c.; 2-lbs., 11@12c. Buckwheat 1-lbs. 10@11c.; 2-lbs., 9½@10c. Extracted, basswood and clover, 8c.; orange blossom, 8½c.; buckwheat, 6c.; California, 7½c.; Southern, 72½c. per gallon.
HILDRETH BROS. & SEGELKEN,
Oct. 11. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Fancy 1-lbs., 16@17c.; fair, 14@15c.; 2-lbs., 15@16c. Extracted, 8@9c. Market is in fairly good condition, but we are getting some of the odd grades from Western New York, Michigan and Wisconsin, and it is not arriving in very good condition, making it hard to sell.
BEESWAX.—None on hand.
Oct. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A quiet but steady demand for choice comb, at 14@16c. Fair demand for extracted at 5@8c
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Oct. 21. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs. 13@14c.; dark, 10@12c.; white 2-lbs. 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

MILWAUKEE.

HONEY.—New crop is coming in and of very fine quality. Demand is fair and values easy. Choice white 1-lbs., 14@15c.; 2nd quality 1-lbs., 12½@14c.; old 1-lbs., 10@12c. Extracted, white, in tins and pails, 8@8½c.; in barrels and kegs, 7@8c.
BEESWAX.—22@25c.
Sep. 5. A. V. BISHOP, 142 W. Water St.

Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

THE AMERICAN BEE JOURNAL
CIRCULATES
ALL OVER THE WORLD
PUBLISHED BY
THOS. G. NEWMAN & SON,
CHICAGO, ILL.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Nov. 9, 1889. No. 45.

EDITORIAL BUZZINGS.

The golden-rod, the golden-rod,
The flower above all others
To wave its plumes from sea to sea,
O'er English-speaking brothers.

This is my vote for the national flower.

EUGENE SECOR.

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excluding honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

By employing these methods, colonies are never queenless, and no queenless bees need be bothered with, by uniting them with other colonies, or otherwise.

If you desire to know how this can be done—how to have Queens fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees cay fly—all about the different races of bees—all about shipping Queens, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.: or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 180 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

Crooked Statistics.

Prof. A. J. Cook gives an experience, in *Gleanings*, showing the carelessness with which many statistics are gathered.

A report from the Department of Agriculture stated that the chinch-bug had done serious damage in five counties in Michigan. Prof. Cook did not believe this, as in all his collecting he had never taken a chinch-bug in the State. So he wrote to the Department and learned the names of the reporters, and immediately addressed a letter to each, as follows:

Do you know the chinch-bug? Do you personally know that it has ever worked in your county? Why did you report ravages from this insect in your county to the Department of Agriculture?

Answers were received from three persons only. They reported that they did not know the insect, that they had no personal knowledge on the subject, and did not know that they had so reported. What are statistics worth if we are to have such reports.—*Rural New Yorker.*

International Bee-Association.

Mr. R. Holtermann, the efficient Secretary, has sent us the following concerning the coming convention:

The programme for the American International Bee-Association, which is to meet at Brantford, Ontario, Canada, Dec. 4 to 6, next, is not yet complete. However from the following it will be seen that every effort has been made to have a good one. The first session will be at 2 p.m. of the 4th.

Bee-Keeping an Occupation for Women—Miss H. F. Buller, Campbellford, Ont.

Cellar *vs.* Out-Door Wintering—R. McKnight, Owen Sound, Ont.

Shipping Queens—F. H. Macpherson, Beeton, Ont.

Disposal of the Honey Crop—Thomas G. Newman, Chicago, Ills.

Cellar Wintering—S. T. Pettit, Belmont, Ont.

Riding Hobby-Horses—Bee-keeping a recreation from other pursuits, and an antidote for disease—E. R. Root, Medina, O.

Alimentary System or Apparatus of the Honey-Bee—Prof. A. J. Cook, Agricultural College, Mich.

S. Corneil, Lindsay, Ont.—Subject not given.

The President will give his annual address which, doubtless, will be amusing and instructive.

Reduced rates, at least one and one-third fare for return trip, may be secured on the Grand Trunk and Canadian Pacific railway; the latter tickets must be purchased to and from Galt or Woodstock. For further particulars, apply to the Secretary.

Remember you must have a certificate when purchasing your ticket for Brantford on the Grand Trunk railway, or Galt or Woodstock on the Canadian Pacific railway.

Reduced hotel rates ($1.50) may be secured at the Kirby House. The Commercial Hotel also, close to the place of meeting, is a good one-dollar house.

The "International" Convention has a strong claim upon every apiarist, and the attendance will be very large, no doubt. The Secretary is doing all he can to make ample arrangements for the meeting, and we hope that it will prove to be one of the most profitable Conventions ever held.

Is Bee-Culture on the Increase?

Mrs. L. Harrison gives her conclusions on the above question in the *Prairie Farmer* of last week, in these words:

This is evident from the number of new faces seen at the convention, and also in the presence of many ladies who appeared to take an interest in the discussions. Father Langstroth, though absent, was not forgotten, as was evident from the many expressions of love and affection for him; as also of appreciation of the great value of his invention, the movable frame.

Drone and Queen Traps.

On page 651, Mr. J. N. Edsall, Unadilla, Nebr., makes this statement and asks:

I placed an Alley drone and queen trap on a hive this season, but the swarm left me. Why? When I opened the hive I found three young queens on the combs, and half a dozen queen-cells unhatched. I got no honey from that outfit.

We referred the matter to Mr. Alley, who replies thus:

The trouble was, without doubt, an imperfection in the metal. In some of our traps the metal was cut just a little too short, and the queen, in some cases, managed to get out. This I know to be a fact, as I had a queen which made her escape in that way, and the bees left for unknown parts right before my eyes. I now make the traps so that such a thing cannot happen. The metal now runs in a saw-kerf at each end of the trap, and it is impossible for a queen to escape. Mr. Edsall should see that the trap is in perfect order before it is placed on the hive.

☞ The Catalogue of the Iowa State College of Agriculture and Mechanic Arts is on our desk. It shows a healthy condition. The Hon. Eugene Secor is one of the Trustees, and is on the committee of "Farm and Farm Buildings." Among the faculty we notice L. H. Pammel, as Professor of Botany. Both of these gentlemen are apiarists. Prof. A. S. Welch, L. L. D., one of the faculty, and an acquaintance of ours for nearly twenty years, died last March. He was the first President of the Iowa Agricultural College, and a former trustee of the Michigan Agricultural College. He was full of years (nearly 70); a ripe scholar—faithful, able, vigilant. May his rest be peaceful, and his rising from it glorious.

☞ The October number of *Insect Life*, issued monthly by the Entomological Division of the United States Department of Agriculture, contains a full report on the horn-fly, which has been the subject of consideration in the Division during the past two years, and of special investigation during the past summer. This horn-fly pest has been a torment to the stockmen and dairymen of the Eastern States.

☞ Jno. C. Swaner, of Salt Lake City, Utah, has sent us his new Catalogue for 1890, and is the earliest comer, Nursery Stock, Flowers, and Bee-Keepers' Supplies.

GLEANINGS OF NEWS.

To Destroy Ants.

A correspondent asks for an efficient remedy for ants in the apiary. The following will give the desired information :

To destroy large ants of the kinds which gnaw holes through corks of molasses jugs, and get into sugar boxes and barrels, and sweets generally, sprinkle a little sugar or molasses where they will find it. When they get well baited, sprinkle a little good insect powder among the sweets—just a light sprinkling—and keep them supplied as long as they will come for it. They will go back to their nest, some of them carrying enough on their feet to destroy them all.

To destroy small red ants, dust a little insect powder for an inch or two around the leg of the table which they crawl up, and the next morning the table will be free of them, if no other way has been used by them. Do not sprinkle so much powder that they cannot crawl through it; their legs are short. A good many of them will be found close to the powder, but some will carry off a little powder on their feet. It is well to sprinkle powder along the road they travel. When on a permanent shelf, find, if possible, the road they use and dust it. If you cannot find their roads, dust the whole shelf lightly, and they will disappear. It sometimes takes four years to entirely destroy these ants.

Bee-Stings for Rheumatism.

Dr. Terc, of Vienna, Austria, has again tried bee-stings on a rheumatic patient. Upon saturating the patient's system with the bee-poison, the rheumatism disappeared —not to return again for a long time. Dr. Terc has applied his remedy in 175 cases, and has inflicted 39,000 stingings, and now keeps a colony of bees on his premises, to be employed in this work. So says en exchange.

☞ A complimentary notice of Mr. I. R. Good appears in the Nappanee *News*, from which we copy the following :

Mr. Good has been one of our most energetic citizens, having built many dwelling houses here during the past two years. As a member of the Town Board, his services were acceptable to our citizens, as rendered by a conscientious worker. The *News* regrets to see him take his dearture.

Artificial Comb Honey.

The old "gag" from the *Herald of Health*, comes up again, and is going the rounds of the press again. Here it is:

Artificial honey, which is more common in the market than consumers know, is made of potato starch and oil of vitriol. Some rash optimists think that they are sure of getting the genuine product of bees and flowers by purchasing honey in the comb. They do not know that the exquisite white comb that pleases them is often made of paraffine wax.

If it is so *common* on the market, why does not some one produce a pound or so of it, and show it as a sample? Not a pound of it has ever yet come to light! No, not an ounce of it!! Gentlemen, either show us a sample, or stop this lying about the matter!

Honey Almanac.

Concerning this helpful annual, Mr. C. Theilmann makes some suggestions. He says :

The Honey Almanac will surely pay honey-producers, and make large returns, if all will take hold of the matter in earnest and distribute them liberally with their honey. The cost is so small (only 1½ cents each, by the thousand) that we can all afford to work together and distribute them—making a rousing advertisement, and selling the whole honey crop; at the same time we are furnishing the best and healthiest of sweets to consumers.

Honey is an exeellent medicine for sore eyes; it is as good as anything that can be had. Apply the honey by dropping it into the eyes before going to bed, or after lying down. If it is too strong, dilute it. It is good for man or beast.

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Beeswax, its uses, how to render it, and its importance as a commercial produet, is described, and 17 useful Recipes are given.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Wisdom would dictate that a million of them be scattered by the first of January.

Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

Wooden Combs.

Mr. L. A. Aspinwall, of Three Rivers, Mich., had on exhibition at the late convention in Chicago, a wooden comb, which had been used by the bees for two seasons. This he had placed in our Museum for the inspection of our visitors.

These combs were mentioned on page 616, by Prof. Cook, who has also a colony of bees working on them.

In order to make such "combs," pieces of wood of the right thickness are sawed from the end of a pine block. In the sides of these pieces of wood, holes like cells are bored by gangs of little "bits," which are not allowed to meet, leaving a "base" for the cells. These "combs" are then dipped in melted wax, and placed in a honey extractor, and the surplus wax thrown off by the extractor being run rapidly.

Mr. Aspinwall claims these advantages for the wooden combs:

1. The combs are absolutely straight, and the cells perfect.
2. They are very durable.
3. They will admit of rough transportation.
4. The bee-moth's larvæ cannot infest them.
5. The honey can be extracted without any possibility of injury to the combs.
6. They admit of permanent queen and winter passages.
7. Drone and worker increase can be controlled, drone-traps being unnecessary.
8. An increased yield of comb honey can be obtained, by reason of a preference for natural comb, queen-excluding honey-boads being necessary.
9. The queen can be found more readily, there being no spaces between the edges of the comb and the frame, in which she can hide.
10. The great advantage to be derived from its use, one of more value than all the others combined, is that the hive furnished with this comb may be used as a swarmer or a *non*-swarmer, as desired.

In addition to this, says Mr. Aspinwall, "should it prove to a be a perfect non-swarmer, the success of bee-keeping will not necessarily depend upon its being conducted as a specialty; but with non-swarming hives, a hundred colonies of bees can quite readily be handled in connection with some other pursuits. Of course I refer to a non-swarmer without manipulation. We can succeed in that direction at present by excessive manipulation, which of course will not pay."

As it is impossible for bees to rear drones in these combs, Mr. Aspinwall reasons that as they will not swarm without drones, they will not swarm at all.

We shall watch this invention with interest, and keep our readers posted as to its progress.

Convention Notices.

☞ At the request of several bee-keepers, I hereby make a call for a meeting at Higginsville, Mo., on Thursday, Nov. 14, 1889, at 9 a.m., for only one day, for the purpose of organizing a bee-keepers' association. Let all bee-keepers attend, that can do so.

J. W. ROUSE, Santa Fe, Mo.

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

The Lindens and the Bees.

Written for the American Bee Journal
BY DAVID HALL.

'Twas a bright, pleasant morn in the month of July,
As the sun came up clear in the East,
And twelve hives of bees that were standing near by
Were awaiting a glorious feast;

For the basswood just then was beginning to bloom,
And each day with its long summer hours—
I knew that the bees would need plenty of room
To store from those beautiful flowers;

For we'd had a warm rain for some days before,
And Nature meantime had distilled
A nectar as sweet as Hymettus' of yore,
With which the cups of those blossoms were filled.

Soon the bees from those large double-hives sallied forth,
And took a bee-line for the wood;
And they loaded themselves up for all they were worth,
As a good strain of bees always should.

And the way they rolled in, tumbled in, 'twas a sight
That would make an enthusiast stare
And hurrah for the linden, with all of his might,
As he waved his hat high in the air.

For more than two weeks worked those bees with a will,
As they worked without favor or fear;
And a hundred pounds each was the size of their bill,
As the basswood closed up for the year.

Then, hurrah for the linden tree! Long may it wave
O'er this beautiful land of ours,
And give us henceforth, as it always gave,
Its honey-producing flowers.

Warsaw, N. Y.

QUERIES AND REPLIES.

Comparison of Italians and Blacks on Red Clover.

Written for the American Bee Journal

Query 665.—Do Italian bees work on red clover more than the black bees do?—P.

Yes.—M. MAHIN.

Yes.—A. B. MASON.

Yes.—J. M. HAMBAUGH.

Yes.—WILL M. BARNUM.

Yes.—MRS. L. HARRISON.

I think so.—R. L. TAYLOR.

Yes, they will.—J. P. H. BROWN.

Yes, decidedly.—C. H. DIBBERN.

It is so reported.—H. D. CUTTING.

Yes, undoubtedly.—DADANT & SON.

Yes. My experience says, five to one.—G. M. DOOLITTLE.

Certainly! There is no doubt about it, in my own mind.—J. M. SHUCK.

We have but very little red clover in Louisiana, but I never could detect that bees ever gathered from it.—P. L. VIALLON.

Yes, more than the black bees; but not more than Syrian or Cyprian bees.—A. J. COOK.

Yes, I think that they do; but neither works on it to any extent.—EUGENE SECOR.

It is so claimed, but I suspect that the difference is not so very great.—C. C. MILLER.

Yes, sir, they do; but they do not work on red clover as much as certain crosses between the two races.—JAMES HEDDON.

All the evidence is in favor of such an idea. As for myself, I have never tested the matter; all that I know is, Italians under the same conditions, give me far better results than blacks.—J. E. POND.

I think that they do. Some years back I had a fine Italian queen (from a noted breeder in New York) whose colony stored 100 pounds of comb honey, all from a 30-acre field of red clover, about ½ mile away. A number of black colonies that I had, failed to store any surplus. I believe, however, that there are strains of brown bees with a trace of Italian "blood," that do good work on red clover.—G. L. TINKER.

In my locality Italians work on red clover more or less every season; and in my experience of over forty years, I have never seen a pure black bee at work on red clover blossoms. Further, I have made inquiry of a number of old men of observation, and I have never met a man who has seen black bees at work on red clover. I am aware, however, that black bees do sometimes work on red clover in the North, where it grows much less luxurious than it does in Kentucky.—G. W. DEMAREE.

It is said that Italian bees have tongues long enough to reach the nectar in red clover. They may get honey from it in a dry time, when the clover heads are small. Once we had a ten-acre field of red clover away out at the back of the farm. Mr. Chaddock told me that the bees were "just roaring" on it. I did not go out to see, but I went to the hives, and everything was quiet. There were partly-filled sections on the hives, but they did not get any fuller, and I watched them day after day. I think that the bees smell the honey in the red clover, and try to get it—perhaps they do get a little, but not enough to put in the sections. The best plan is not to count on honey from red clover, and then if the bees do get any honey from it, consider it an accident, and be thankful.—MAHALA B. CHADDOCK.

Yes, they certainly do; but neither Italian nor black bees work on it, generally, to a very great extent, unless the bloom has been hindered by cold weather, and the stem of the flower is shortened thereby.—THE EDITOR.

The Introduction of Queens in Provisioned Cages.

Written for the American Bee Journal

Query 666.—When introducing a queen, is it thought as safe a plan to provide the queen-cage with a paste of honey and sugar for food, as to place it so that honey is within the queen's reach? (If any readers of this paper have actually made experiments in that respect, I should be glad to hear with what results.)—France.

I have not tried this experiment.—J. M. HAMBAUGH.

Both methods are just as safe, and I speak from actual experience of several years.—P. L. VIALLON.

Yes; but I have had no experience on that line.—C. H. DIBBERN.

I am not sure that one way is better than the other.—EUGENE SECOR.

I do not know, but I would as soon risk the honey.—C. C. MILLER.

Not *just* as safe, but if she has accompanying bees, it will be all right.—A. B. MASON.

I have tried the paste with good results. I prefer a bit of sponge saturated with liquid honey.—M. MAHIN.

I have never been able to notice any particular difference in the result, though it is my practice to use honey.—W. M. BARNUM.

I have many times tried both, and I see no difference. The "paste" is preferred, because it is less trouble.—J. M. SHUCK.

If the colony is otherwise queenless, and have plenty of honey, they will not let the queen die of want.—DADANT & SON.

It is best to place the queen so that she can reach the honey, and the bees have access to the outside of the cage.—H. D. CUTTING.

From experience, I cannot say; from theory, I should expect the queen to suffer, if the bees could not feed her.—A. J. COOK.

In introducing, I prefer a cage with an open side, placed over *uncapped cells of honey*.—J. P. H. BROWN.

Yes, and it is just as safe to give her neither, as in my experience a queenless colony never fails to feed a laying queen.—R. L. TAYLOR.

I always so introduce when working on the old plan, and have kept queens a week in this way. See my answer to Query 664.—J. E. POND.

Place the cage, so that honey is within the queen's reach. I have had queens die in the cage with food, but I think that they never died when placed on a comb.—MRS. L. HARRISON.

Yes, I consider it just as safe to use that plan as the honey, for in either case she will get enough to eat until she will be accepted, if she is ever going to be received. JAMES HEDDON.

I have kept queens for weeks, as described in my answer to Query 664, but all my experience goes to prove that no queen can be thus kept without some injury to the vitality of the queen. In other words, I do not consider a queen that has been kept away from the bees for a month, as good as she would have been, had she been with the bees all the while.—G. M. DOOLITTLE.

The former plan is fully as safe as the latter. My experiments show that there is no plan of caging the queen upon the combs so safe as the plan of allowing the bees to liberate the queen by eating out a plug of the "Good" candy before getting to the queen.—G. L. TINKER.

If a queen is introduced in the Peet cage, there is always "Good" candy enough to last her until the bees liberate her. I have introduced queens in all the ways, and have not lost many in introducing. I think that the "safest" way for a timid bee-keeper is to get a pound of bees with the queen.—MAHALA B. CHADDOCK.

When introducing queens, I provision the cage with soft candy. I would never cage a queen on a comb where I cannot see the actions of the bees toward her; that is simply "going it blind." In all of my experience I never knew of a queen to suffer for food when supplied with a good article of soft candy, made of powdered sugar and honey; or, what is better, a queen candy made by compressing candied honey.—G. W. DEMAREE.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

CORRESPONDENCE.

HONEY-PLANTS.

Golden-Rod—Comparison with Other Honey-Producers.

Written for the American Bee Journal

BY Z. T. HAWK.

I have been greatly interested in reading the reports regarding the value of golden-rod as a honey-plant. In the pleasant evenings of the past summer, a good many informal bee-conventions met on my veranda in Denison, Iowa; and the one absorbing question was, "What are the resources of our range?"

The willows and early spring flowers gave our bees an excellent start in brood-rearing, and fruit-bloom tided them over to the opening of white clover. But day after day our hopes sank lower, for the "off days" of the clover were so many that the bees barely lived. We watched the basswood with great anxiety, and July 1—the date on which the first petals opened—was a greater day with us than the Fourth. My 26 colonies began work in supers enough to give me 500 pounds of honey, had they completed them, but that was not to be.

A large pasture of Alsike clover carried them through the starvation period of two or three weeks that always follows the blooming of basswood, and, during this interval, it became evident to me that the large weed, *Gaura biennis*, is coming to the front in our vicinity as a bountiful yielder of both honey and pollen at a time when it is much needed.

This weed is of comparatively recent introduction in Western Iowa, but it is spreading with great rapidity, and fast monopolizing waste places on rich bottom-lands and favorable situations on uplands. From early morning until 9 or 10 o'clock, it yielded nectar in astonishing quantities, the drops at the base of the stamens being as large as small bird-shot, and a branch suddenly shaken would wet the hand with the sticky liquid.

The earlier sources of surplus having failed us, our discussions turned upon the fall flowers, and their relative value to the bee-keeper. The fact was developed that our "club" had only a wavering faith in the golden-rod, though I am inclined to think that we owe more of our fall surplus to it than is at first apparent. The odor of this flower is not to be mistaken, and I have yet to see the September in Iowa—unless it was this year—that the merest novice, in going among my bees, would not sniff the air and say, "golden-rod."

Our bees are usually busy in the sections until frost comes, and it frequently happens that there are few flowers besides golden-rod in bloom so late in the season; yet I am compelled to acknowledge that it has been on rare occasions only, that I have seen bees at work on it in large numbers. It yielded well in 1886, but in 1887 there were only two days that the bees paid any attention to it—at least so far as I was able to determine. But those were two good days, for the meadows and pastures fairly roared with bees from morning until night, and every yellow head and raceme seemed to have three or four excited little workers contesting possession with the black beetles.

In 1888 I had no opportunity to observe the golden-rod, but this year I noticed the bees quite busy on the tall racemed variety, three days early in September. Possibly they worked some on it later, but I had no opportunity to see them. I only know that it yielded no surplus.

There are four varieties of the plant here, and the bees usually work on all alike. I am inclined to rank heart's-ease as the best of our autumal plants for honey, and golden-rod second, with a large element of uncertainty about it. The asters are very plentiful here, but I am satisfied that they cut absolutely no figure in this locality as honey-plants. After seven years of close observation, I have failed to see a single bee visit them.

Audubon, Iowa.

HONEY.

Some Facts Pertaining to the Production of Honey.

Written for the American Bee Journal

BY DR. J. W. M'KINNEY.

I do not wish to make a "surprise" party of the little "honey discussion" incidentally fallen into with Prof. Cook, but sincerely I am "surprised" at the pertinacity with which the Professor adheres to the dogma of honey being "digested nectar."

On page 647, he says that he "believes no scientific authority teaches other than that nectar is cane-sugar, and honey, for the most part, reducible sugar .....Now there are two ways that the cane-sugar can be changed to honey—either by boiling with acid, or by animal ferment;" and he goes on to say, "As the bees cannot do this in the first way, they must do it in the second."

To avoid a lengthy article, I will just say the eminent chemist, Maumene, has found that cane-sugar undergoes the change into uncrystallizable sugar when kept for a long time in *aqueous solution*, as well as when heated with acids. Saubeiran admits the change of uncrystallizable into grape sugar, but attributes it to a *molecular* transformation of the sugar, independently of the action of an acid; as according to his observation the conversion takes place *only* after rest. In confirmation of his views, this chemist states, "that he found the same to be prodnced by boiling sugar with *water alone*."

For want of a better term, we might be permitted to say that the *acid*, to which the Professor refers in the production of honey, exists *isomerically* in the juices of fruits, in all saccharine juices, and in nectar as well. That is to say, that the acid, or its equivalent, exists in these substances, and it is not at all necessary to call in the aid of the honey-bee, or tax its energies to furnish an acid for the manufacture of honey.

In support of this matter of the pre-existence of acids in saccharine juices, etc., I will simply quote what Prof. Franklin Bache says, when speaking of the manufacture of cane-sugar. He says:

"The acids naturally existing in the saccharine juice, have the effect of converting the cane-sugar into uncrystallizable sugar, by which a loss of the former is sustained." "The lime" (added in manufacturing sugar) "by neutralizing these acids, prevents this result." "The change in sugar which precedes fermentation, namely, the conversion of cane-sugar into the uncrystallizable kind, points to the necessity of operating on the juice before that process sets in; and hence the advantage of grinding the canes immediately after they are cut, and boiling the juice with the least possible delay."

Thus we see that not only this formerly eminent teacher of chemistry, but author as well, recognizes the existing fact of the presence of an acid, or acids, or their equivalents in saccharine juices.

I can hardly believe for a moment, that any one, much less Prof. Cook, would deny the presence of an acid, or its equivalent, in the grape, as well as in the juices of most other fruits. By what process of reasoning, or chemical demonstration, he arrives at the conclusion that nectar, a vegetable juice, secreted by the nectaries of flowers, does not possess the acids, or their equivalents, common to all saccharine juices, is very strange.

If the Professor would take this rational view of the matter, recognizing, as all scientific authority does, the *presence* of *acids* or *their equivalents* in

all saccharine juices, the necessity of invoking the aid of the honey-bee to "make" honey would quite disappear; and in addition to being right, as facts present themselves, it would be a great relief, physiologically, to the idustrious but over-worked honey-bee.

By carefully noticing the Professor's article referred to, it will be seen that he furnishes strong argument in support of the rational fact of honey being *concentrated nectar*. Yes, the Professor is right in saying, "Any sugar in diluted solution, if kept warm, is liable to ferment or sour"—thin honey the same; therefore the necessity of concentration as early as possible, if we wish to prevent thin syrup, or honey, from spoiling by fermentation. In fact, nectar must be *concentrated* before it is entitled to the name "Honey."

Pure honey is "concentrated nectar." "*Digested* nectar" will never, never do.

Camargo, Ills.

BEE-PARADISE.

Remarks on Bee-Keeping for Northern California.

Written for the American Bee Journal

BY D. B. WIER.

This is undoubtedly the best bee-State in the Union, as well as the best for nearly everything else. I came here from Illinois, and looked over every part of the State, both in summer and winter, before choosing a location for a home.

I had had a full sufficiency of bad climate and poor health in Northern Illinois, and wished to find, first of all, a climate in which I could have *comfort* and *health*, and where I could grow pretty nearly in perfection about anything that I wished to plant; where crops were sure without irrigation; and where there were nice people, schools and churches.

All of these things, and about everything that a reasonable person could wish for, I found right here in Sonoma county, 20 to 80 miles north of San Francisco. It is a most beautiful county, with broad, level, and exceedingly rich valleys, and rounded very high hills and mountains, with plenty of the purest water, of fuel, and of lumber; with lands and homes improved and unimproved; and all things considered, they are as cheap as elsewhere on the continent.

I mean just what I say in this, that land may be had, and is, just as cheap here at $100.00 or $150.00 an acre, as it is in Montana, Dakota or Oklahoma at $1.25 per acre, or free to settlers, if one has the money to buy; for one can make a better living off of 10 acres here—make more net profit—than he can there off of 160 acres, and, besides, enjoy this perfect climate for health and comfort, where there are no extremes, fierce storms, never hot, and never cold.

Besides, there is a large amount of free mountain Government land in this county. This mountain land is eminently adapted to fruits and bees. It is mountain land, but very rich, and where plowable, one can grow any crop on it that he may desire to plant, from the potato to the orange, and all is the best for pasturing stock.

The climate of the coast range, 10 to 30 miles from the Pacific Ocean, is the pink of perfection for health and comfort, crops and fruits of all kinds, and for bees. Bees must have three things to thrive, namely, warmth, a long season, and plenty of nectar-producing flowers, with flowers so formed that the bees can reach and gather the honey. These three things are everywhere present in the mountains of Sonoma county, at least ten months in the year. One other requisite is feeding-grounds sheltered from rough winds. This may also be found in the mountains.

Having the above requisites, and a canyon opening to the east or south for several miles, or even a mile in length, with a perennial mountain brook gurgling down it, and we have a perfect paradise for the bee-keeper—the brook fringed with its thousands of flowering shrubs, and the mountain sides carpeted with millions of flowers.

I am not a practical bee-keeper, though I have done something in that line, but I am a practical wild-bee hunter, an expert and specialist in that line, for the sport, skill, exercise and recreation found in it. As the girls say, "I dearly love it;" therefore, when going into a new country, among my first enquiries is the one whether bees do well or not.

I was surprised, on making the enquiry, to learn that scarcely any bees were kept. I also learned that bees did wonderfully well here for many years, and that the moth and bee-diseases came in and destroyed them. Of course they did, and did so everywhere under the old-fashioned hives and management, in the same way that they are now doing in the southern part of this State, and in the Sierras; in these last two regions, moth and diseases have come in, but they can be managed and controlled the same as bee-keepers do it in the East.

The foregoing facts leave Sonoma county virgin soil without competition for the skilled apiarist; any one who can succeed with bees in the East, who understands the science of modern bee-keeping, can succeed ten times better here. Bee-keeping and fruit-culture combined, would be very profitable with light labor here. To those wanting further information of anything in or about this State, I will be pleased to furnish that which is reliable, if stamps are enclosed for reply.

Petaluma, Calif.

FALL WORK.

Uniting Colonies in the Fall for Wintering.

Written for the American Rural Home

BY G. M. DOOLITTLE.

As the season of 1889 has been rather unpropitious for bees in some sections of the country where only white honey is the source of supply, some bee-keepers now find that their colonies have not the necessary number of bees or the necessary amount of stores to give promise of successful wintering; hence they ask what they are to do under such circumstances.

If the colonies were strong in bees, the question might arise whether it would not pay to buy sugar, even at the present high prices, and feed the bees so as to have a greater number next spring, but where colonies are both light in bees and in stores, there is only one correct solution of the problem, which is, to unite the bees till all are strong, and then if stores are still lacking, they may be fed.

There have been many plans given for uniting bees, some of which are too laborious to be tolerated, such as moving colonies little by little each day until they are brought together, carrying them to the cellar for a few days, etc.; the advocates of these plans claiming that by their use none of the bees will return to their former location, yet I find that the more simple plans do just as well where a little precaution is taken by way of removing all signs of the former home from the old stand.

The plan I use, and one which has always worked well with me, so far, is as follows: Having decided that certain colonies are to be united, the first thing to know is, which of the two or three, as the case may be, has the most valuable queen. Having ascertained this, I hunt out the poorest and kill her, then take the hive or hives from which the queen has been killed, to the stand of the one they are to be united with.

I now select from each hive the frames having the most honey in them, to the number I wish to winter them on, and set them in one of the hives,

alternating them as they are set in the hive.

In moving the bees they are jarred by placing the hives on a wheel-barrow in no gentle manner, and wheeling them rapidly to the place they are to stand, first having confined the bees to the hive, and doing the whole on some cloudy day when the bees are not flying, which causes them, in a measure, to forget all about their former home in their anxiety for the present; and also causing them to remain on their combs much better in handling them than would be the case were they not thus disturbed, so that in the process of uniting, very few bees take wing in comparison to what otherwise would, and these few are so bewildered that they immediately go in with the others in the new hive or united colony.

Having the hive full of the combs containing the most honey, I next shake the bees, which are on the remaining frames, off at the entrance, taking one frame from one colony, and the next from another, and so on, so as to mix the bees up as much as possible. When all of the bees are inside of the hive, the work of uniting is done. Remove the hives, bottom-boards and all from the stands occupied by the united colonies previous to this, and no loss of bees will occur.

What few bees go back to the old stands, return after finding their old hives gone; also the mixing-up process spoken of above, causes them to mark their location anew, at their first flight afterward, the same as does a new swarm, or when the bees take their first flight in the spring.

Borodino, N. Y.

VISITING.

An Interesting Account of a Lady Bee-Keeper's Visits.

Written for the American Bee Journal

BY MISS IDA HOUSE.

The basswood flow was immense here the past season, and lasted nearly three weeks. Our bees forgot to swarm after they began to work on the basswood, so we had 160 strong colonies already for work. We (my brother-in-law and I) took off at least 12,000 pounds of honey, the most of which is basswood.

The season was so dry that we did not get any fall honey to speak of. After getting the bees ready for winter, and packing our trunks, we left the bees to the merciful care of my brother-in-law, and started for my old home in the southern part of the State, where we arrived all safe, and sound after spending a most delightful day at the Minneapolis Exposition.

While looking at the grand display of nearly all kinds of industries, and seeing the beautiful castles and palaces made of grain and corn, we could not help wondering where the products of apiculture were, and so we built an air-castle (of magnificent grandeur) out of beautiful honey and beeswax, and furnished it with all the articles necessary for bee-keeping, while near by was the ideal apiary with all its modern improvements.

Since our return home we have been to visit a bee-keeping friend, Mr. Turnbull, who may well feel proud of his beautiful hillside apiary, which consists of 240 colonies of bees, in rows of neatly-painted hives, with shade-trees, honey-house and work-shop, and last, but not least, his beautiful home and loving wife and children.

We wandered into the honey-house, where Mr. Turnbull was busy getting his honey ready for market. He has about 8,000 pounds of what would have been beautiful comb honey, had not a careless bee-keeper ruined nearly 500 pounds of it when removing it from the hives.

The following interesting incident happened while we were there:

Mr. Turnbull was greatly troubled with the bees in his honey-house, and he had spent hours in trying to find where they got in; but, alas, not even a knot-hole could he find for the bees to get through; but on Oct. 11th, in removing a large case of honey, he saw a cluster of bees hanging from the ceiling. He came to the house, got a light, and said that he wished I would go and see what I thought about them; and I found, to my surprise, that they were clustered on pieces of comb fastened to the ceiling.

Mr. T. asked if I thought they had a queen. I did not think that bees would build comb without a queen, or any prospects of one, and he was of the same opinion. So, with Mrs. Turnbull, her sister and my sister, near by, to caution us to be careful, or we would get stung, we put a hive under the bees, took a sharp knife, and cut the comb down, which fell into the hive with the bees.

(About this time our friends were called upon to make a hasty retreat. I saw no more of them until I returned to the house, and then I was not sure but what I had gotten into an apothecary's shop, or hospital; but the evil spirit within me burst forth in peals of merry laughter, in which they all joined, until the walls gave back the echo).

We gave the bees some combs of honey, and left them. The next morning they had a nice queen, and were very quiet—in fact, I think that they were tired of camping out, and felt grateful to us for their new home.

We were sorry when we had to bid our good friends good-bye, but we hope to visit them again in the future.

Hokah, Minn., Oct. 25, 1889.

WINTERING.

Preparing Bees so as to Winter Without Loss.

Written for the Kansas Convention

BY REV. J. D. GEHRING.

In regard to wintering, I can say that I have never lost a colony yet from any cause. I do not think that bees will freeze to death if they have accessible food of a proper kind. If they starve to death, or die on account of bad food or want of ventilation, the bee-keeper (?) ought to be punished for "cruelty to animals."

I believe that the "extractor," together with the effect of penuriousness, are to be blamed for winter losses, more than anything else. My theory is this: Give them plenty of *good* honey—that is, *leave* plenty in the hives, and tuck them up snugly, and then let them defy the hardships of a winter's siege. A solid frame of honey on each side of the brood-nest is, in my judgment, worth more than cushions or blankets.

Hive-Ventilation in Winter.

Another important matter is ventilation, the silly arguments to the contrary notwithstanding. Moisture, which is as inevitable as it is essential in a strong, healthy colony, seeks escape upward—as soon as it goes the other way, it has condensed, and mischief is brewing. Well, superfluous moisture must have vent, and nature says "upward." But, it is just as true that the escape of heat, in the same direction, must be prevented by top-packing.

I think that this theory is supported by philosophy and personal experience. Allow me to illustrate:

If I desire to keep warm in bed, I want the covering just right—not too heavy, and not too light. It does not matter so much what kind of a bed I have under me—so that it is not too short or too narrow; but I want enough warm, soft, and at the same time light, covering. If the covering is heavy and stiff, I perspire, and get colder and colder. I also want the covering close to my body, snugly tucked in. It would not do me any good to put a blanket or two on top of the house that I may be in; nor do I want it under me, or at either side; I want it next to me, on top!

Now, the same philosophy I apply to the packing of my bees for winter, viz.:

1. Have the hive near the ground, and protected from the cold winds.

2. Leave enough of the entrance open for ventilation. This is even more important in winter than in summer, because in warm weather the bees provide air by "fanning," but in cold weather they are semi-dormant.

3. Have an abundance of good honey (not syrup) in the hive—much more than you think they will need, and provide passage-ways from one side to the other of the brood-nest, *on top*. The best thing for this, that I have tried, is the following:

Saw laths in lengths to reach across the brood-nest to within an inch or more on each side; nail the pieces, two by two, together so as to form a trough, and lay three (or more) on top of the brood-nest, equal distances apart; then put on top a piece of good burlap (never enamel-cloth, oil-cloth or heavy duck) cut large enough to be fastened down all around, so that the bees cannot get out into the top packing.

4. Pack with leaves, chaff or fine pine shavings, from about four to ten inches on top, and put on the cover—not forgetting to have at each end of the cover an inch auger-hole covered with wire-cloth, for the escape of moisture.

5. Do not unpack, frequently disturb, or manipulate too early in the spring; but watch them closely, all the same.

6. A good queen in February and March means a good working colony, and surplus when clover blooms. When I say in February and March, I of course mean that the bee-keeper should see to it that each colony has a good queen when packed for winter, or when this, for any reason, cannot be, provide one not later than February or March, by doubling.

When I want to unite or transfer, I take both hives into a warm room, or into the cellar, for the purpose; and after a few days I put the strengthened and queened colony back to its stand.

The foregoing is my "system" of wintering bees. I think that there has been, and is, too much written and said by leading men in the bee-business, about "*cellar wintering*," "*bee-diarrhœa*," "*spring dwindling*," etc., to the confusion and dismay of "green beginners."

Much depends upon the kind of hive used; but more depends upon the kind of management applied.

Lawrence, Kansas.

LIFE'S BUBBLES.

BY EUGENE SECOR.

A golden-haired boy sat alone on the floor,
With a basin of suds beside him;
From a new clay-pipe he tried o'er and o'er
To make fairy worlds o'er-ride him.
With patience and skill
He labored, until
His globe assumed shape on the pipe-rim.

With delicate grace it floats in the air,
In beauty excelling the rainbow;
With bright, eager eyes he follows the fair
Creation before him, when, lo,
A breath from somewhere,
Somehow entered there,
And his fairy-world vanished *in to-to*.

A few fleeting years and this golden-haired boy
Has led to the altar a maiden:
The life that now is, seems his to enjoy;
And with love and sweet duty to aid in
The voyage of bliss,
With what more than this
Doth the "barque of life" need to be laden?

A woman as fair as the daughters of Job,
And as pure as the breath of heaven;
Had a seraph descended in spotless robe,
No holier wife had been given.
But, sudden and soon,
Before her life's noon,
On mortalities rock the barque was driven.

Alone in the world, he in sadness awhile
Doth ponder the problems of sorrow;
But Time, the great healer, doth ever beguile
The heart to think well of to-morrow;
And grief is assuaged
When the mind is engaged,
And hope from the future doth borrow.

The goddess of wealth now allures him to toil,
With the promise of plenty and pleasure,
Assuring the honors from which no recoil
Should come in his moments of leisure.
And riches did come
In generous sum,
When solely intent on earth's treasure.

As apples of Sodom to ashes are turned,
When pressed to the lips of the finder,
So, false and deceptive, at last he has learned
That wealth is a phantom reminder
Of treasures where rust
Corrodes not, nor dust
Shall mar the sweet peace of the finder.

'Tis thus we're reminded, as time and again
Our hopes in things earthly are shattered,
That Solomon said, all things are but vain,
No matter how much they have flattered;
One certain, pure joy,
Content without alloy,
Shall come when ambitions are scattered.

Forest City, Iowa.

BEE-DISEASE.

Results of the Season—Marketing the Honey Crop.

Written for the American Bee Journal

BY C. THEILMANN.

On page 635, Mr. Skinner asks me for further explanation regarding the "nameless bee-disease," but does not say what I should explain, so I am in the dark. I will with pleasure explain anything that I know about this disease, which is not explicit in my article on page 584.

I believe that bees should have access to salt, where creeks and rivers are far away from the apiary; but I do not think it a necessity where they are near, and where lots of cattle and other stock have watering-places, where the bees find all the salt they need to carry on their household. I know that they like this kind of salt better than our common cooking-salt.

In past years I tried to feed my bees salt and water in troughs, but they would never touch it, because they got all they wanted at the watering-places, which apparently suited them better; so now I do not put out salt for them. I cannot believe that the want of salt causes the "nameless bee-disease."

In addition to my article on page 584, I would say, that in *Gleanings*, page 740, the black, hairless shiny-bees are spoken of by "Amateur Expert," who writes that the disease is known as "bacilli depletus." According to my observations, this seems to be nearer right, than that the lack of salt is the cause of the disease, though salt will check the disease; but whether it is "bacilli depletus," or parasites, who knows? The actions of the bees look as if they had the itch or scrofula.

Report for the Season.

I commenced the spring of 1889 with 185 colonies. The weather up to the forepart of June was unfavorable, and I had to feed about 1,500 pounds of honey and sugar to save my bees; but from the middle of June until Sept. 1, we had a continual flow of neetar, with the exception of a few days. Linden was in bloom for 21 days, on account of the cool weather while it was in bloom; this was the longest time I have ever seen linden in bloom. It generally lasts from 6 to 10 days; once only in 20 years it lasted for 14 days.

My crop is 3,000 pounds of extracted, and about 22,000 pounds of comb honey, of excellent quality, one-half of it being white. I have sold about half of the lot at 12½ cents per pound here; that is, I deliver it on board the cars.

Dealing with Commission Men.

A good deal has been written lately about commission men. There are just as good and honest commission men as there are among other classes, and also some bad ones, from whom I have had to learn dear lessons. I like to sell my honey for cash, even if I get a cent or two less for it; but I cannot always do this, and then I do the best I can. Even last year I sold all but about 1,500 pounds, which was sent on commission to a man who was quoted from $40,000 to $50,000 in Dunn's Mercantile Agency; when I got my returns this fall, the statements showed 12½ cents per pound for the same honey that I sold and got my money for last fall at 17 and 18 cents per pound. We should all try to sell our honey for cash.

Theilmanton, Minn.

THE SOUTH.

Wintering Bees in the South and Summering them North.

Written for the American Bee Journal
BY JOHN CRAYCRAFT.

I was greatly pleased with G. M. Doolittle's letter on page 581. It opens another field in the progress of profitable bee-keeping, both for the North and the South, which is certain to become profitable to the bee-keeper in the North and South in about the following manner, as I, at this time, look at it:

About Sept. 1, put up all the bees in colonies that have not an abundance of honey for wintering safely; and ship them to the South to some partner in the trade, and he can turn them on empty combs, or partly drawn foundation, and they will then build up before the fall honey is all gathered along the St. Johns river swamps here, and he could get a full crop of the orange honey in March and April, and such part of May as they might be kept before returning them to the white clover fields of the North. Such a transportation of them could be made with a very small expense. All their winter stores could be saved, or whatever they may have had, and turn the new young bees from the South on the combs.

If in September you send to your partner in the South, say 25 or 50 queens, and an average of 2 or 3 pounds of bees, and have a like amount returned in May, or such time as the season or location permitted, the same cases that they were shipped in would do to return them in again. This seems entirely practical at a glance, as it were.

First, the wintering problem would be solved, for there would be no feeding to carry them through the long, cold winter.

Second, there would be as many, or more, young and vigorous bees ready for the field when the harvest came next May.

Third, is the cost. The cages would be the first and greatest cost at the start, but with care they would last through many seasons. If packages weighing as much as four pounds were sent by mail, the postage would be 64 cents on each; but if such packages were put up in lots of 5 or 10, I think that the express company would carry them at a less cost than by mail, and with greater safety. They could be so put up that 2½ pounds of bees, cages and feed would not weigh to exceed 5 pounds, after they were crated in lots of five or ten, and I think that they would not cost, in expressage, more than 25 or 30 cents per cage in such lots. With that amount of bees, there would be but little trouble of their producing a good gathering of honey, if the season was favorable.

I would put the cost of one cage, with feed, 50 cents; express charges, both ways, per cage, 80 cents; cost of their winter care and putting up again in the spring, per cage, $1.00—making a total of $2.30; and this would mean as many bees returned with the same queen if living, and if not, with a young laying queen.

The expense of $1.00 for their care would not compensate the partner in the South, but he would have the honey that the colony gathered until the 1st or the 20th of May, as the case might be; and with proper care he would have a colony of young bees, brood and eggs, that would soon rear them a queen, if he had not already a young laying queen, or a cell ready for cutting out.

I think that such a change could be made profitable to both parties. The one North would have no wintering trouble to go through, a saving of at least 20 pounds of honey, no labor and care, and have as many bees to turn in the old hive as were taken away, and all young and vigorous, and ready for labor. The one at the South could have a new colony of bees left after replacing as many bees as he received, besides all the honey that they may have gathered. But if the mails will carry bees up to as many as would make a 4-pound package, that would certainly be a very great help to the fraternity.

I have my bees on the St. Johns river, between Lake George and Sanford on Lake Monroe, at St. Francis, a few miles from Deland. I have had my bees on the river for a year, and having studied the flora there tolerably well, I have decided to go into bee-keeping almost exclusively, with my son, who is a thorough, practical bee-keeper for a boy of 17 years; but we have only a small apiary of 40 colonies. We did not desire to increase them until we were certain of our location being a good one, and the honey first-class.

There is no finer honey than the pure orange-blossom; and the wild grape-vine honey, along the river swamps, cannot be excelled by any honey that I have ever seen. I kept bees in Indiana, and one season I had the charge and the management of Dr. N. P. Allen's bees, of Smith's Grove, Ky., in the best white clover fields that I ever saw, and the clover does not excel the wild-grape. I am satisfied with Florida as a honey-producing State, but there are many locations to keep bees that would prove to be complete failures. I would like to have this sending of queens and bees South to be wintered, and returned in the spring, tested, so that the cost, expenses, profits and losses will be established the coming winter, so if it were found to be practicable and profitable to both parties, we would prepare to receive and care for several hundred colonies next year.

Altoona, Fla.

ZINC EXCLUDERS.

The Use of Cell-Cups for Queen-Rearing—Golden-Rod.

Written for the American Bee Journal
BY JOHN S. REESE.

Several items published recently in the bee-papers in regard to perforated zinc, prompts me to give my views.

First, the perforations must be of such size or width as to exclude *all* queens and drones, and give free passage to all workers. This certainly has been accomplished, judging from my experience with at least one "make" of zinc, which I duplicated with my foot-power punch.

The next point to be considered, is getting as many holes ¾ of an inch long in the zinc as possible, and yet retain the necessary strength or rigidity; the object of this being to obtain as little resistance to ventilation through the zinc as possible, therefore the square-cornered hole is a necessity to accomplish the desired end. This is especially desirable when the zinc is to be used in traps and as entrance-guards, so as to give the bees every opportunity of ventilating their hives during warm weather.

The traps that I use have a strip of this zinc (through which the bees pass in and out), about two inches wide and as long as the full width of my hives—15¾ inches; and the traps can be, and are, frequently left on the hives for weeks at a time, during the hottest days in July and August, with no bad results of any kind.

Cell-Cups for Rearing Queens.

The Doolittle cell-cups have proven very satisfactory with me, especially when necessary to remove a cell, in any state of development, from one frame or hive to another. The cups have such a solid base that they can be stuck around anywhere.

I keep a lot of the cups convenient, and when cells are wanted, the royal jelly is transferred from the surplus cells that have been taken from the hives at different times, and laid aside for future use; the grub or young queen was thrown out, and the end of

the cell pinched together to exclude the air and keep the royal jelly from drying up. I have used the food for a number of these cells after keeping them for several weeks—indeed, I have just used some of it to-day (Oct. 19), that has been taken from the hives more than a month, and the jelly was perfectly fresh. Next season I shall try keeping some of this royal jelly in a small bottle.

On one occasion I softened up with water some of this queen-food that was dry and hard, and it answered every purpose in the cell-cup.

The little grubs can be taken in a few moments from the combs of the choice queen, without cutting or injuring the combs. This requires very little practice to enable any one to select the grubs, and transfer them very rapidly, and frequently without removing or disturbing the bees on the comb.

No Honey from Golden Rod.

Golden-Rod in the "blue-grass" region of Kentucky has never furnished any honey, as far as I have been able to learn; but the asters do, and to-day my bees are coming in loaded with honey and lemon-colored pollen from them, and every comb is loaded to the guards with honey and pollen, which insures every colony to winter perfectly on their summer stands, with six inches of sawdust and a water-proof corrugated iron-cover.

Winchester, Ky.

An Open Apple Tart.

Stew some apples till quite soft; take out any hard pieces, beat them to a pulp, and to half a pound of pulp allow six ounces of sugar, five eggs and the grated rind of a lemon. Beat all these well together, then add gradually five ounces of melted butter. Line a dish with puff paste, pour in the mixture and bake it at once.

Chocolate Cakes.

The whites of eight eggs, half a cake of chocolate grated, one pound of sugar, six ounces of flour. Beat the eggs to a stiff froth, add the sugar, then stir in the chocolate and flour. Butter flat tins, and drop the mixture thereon; not too closely, as the cakes will spread. Bake a few minutes in a quick oven.

For Neuralgia.

Boil a handful of lobelia in a half pint of water, strain and add a teaspoonful of fine salt. Wring cloths out of the liquid, very hot, and apply till the pain ceases, changing as fast as cold, then cover with a dry cloth for a while to prevent taking cold. Two large tablespoonfuls of cologne and two teaspoonfuls of fine salt mixed in a bottle makes an excellent inhalent for facial neuralgia. Horse-radish, prepared the same as for the table, applied to the temple or wrist, is recommended.

Europe has 200 unions of men who sew for a living. The members earn about $3 a week and live and dress poorly.

CONVENTION DIRECTORY.

1889.	*Time and Place of Meeting.*
Dec. 4-6.—	International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.
Dec. 16, 17.—	Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.
1890.	
May 2.—	Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER-BOX

Nebraska Fair Premiums.

We have had a splendid fair. I took premiums on fruit, grapes, and bees and honey to the amount of over $100. I had 45 varieties of grapes alone, on exhibition.

WM. STOLLEY.

Grand Island, Nebr., Oct. 28, 1889.

Moving Bees a Long Distance.

It will be seen by my address that I have made quite a move. I shipped 48 colonies of bees from Dubuque, Iowa, to Tacoma, Wash. Ter., sustaining a loss of 8 colonies, being 12 days on the road. This is the longest shipment that I know of, being nearly 2,200 miles. The possibilities of bee-culture here, I think, are great. Here grass and flowers now look like they do in May in Iowa. C. A. PHENICIE.

Tacoma, Wash. Ter., Oct. 26, 1889.

Bees in Box-Hives.

I concluded that two of the 7 colonies in box-hives, mentioned on page 652, did not have stores enough to keep them through the winter, so I destroyed them, leaving only 5 good colonies, 3 of which did not have honey enough to satisfy me. I have fed them some sugar syrup. I propose to leave them on the summer stands all winter, and put corn-stalks around them. Mr. Swezy, a bee-keeper living in Brook Haven, does not give his bees any protection whatever in the winter. He just lets them stay on the summer stands. Out of 6 colonies he has only 2 left; I purchased 2 of them, and 2 died, leaving him only 2.

O. R. HAWKINS.

Bellport, N. Y., Oct. 14, 1889.

First to Ship Bees by Mail.

We have just read the article on page 667, in which Mr. C. J. Robinson accuses Mr. Langstroth of unfairness, and of not giving him (Robinson) the due honor of having been the first to send queens safely by mail.

Mr. Langstroth is human, and consequently has his faults as well as Mr. Robinson, or any of us; but we wish to say publicly, that in this case Mr. Langstroth is *not to be blamed at all*. When we took the revision of the book, "The Hive and Honey-Bee," from the hands of Mr. L., his most emphatic desire was, that we give honor to whom honor is due, and he expressed the opinion that we would try, as hard as any one possibly could, to do this to the fullest extent. The work of revision had hardly begun, when Mr. L. took sick with the disease that has so long prostrated him, and that is even now keeping him from the world. We were, therefore, deprived of his help, and of his counsel. When we took up the subject of mailing queens, we searched the oldest volumes of the AMERICAN BEE JOURNAL for the names of those who had first shipped bees by mail. If Mr. Robinson is there mentioned, we did not see it. Had we found it, we should certainly have given him credit, instead of giving it to Messrs. Townley and Alley. But let Mr. Robinson's ire fall on us, and not on Mr. Langstroth, who has nothing to do with it.

Since Mr. Robinson has a letter from Mr. Langstroth, acknowledging that he was the first man to ship bees safely by mail, we stand ready to give him due credit for this in the next edition of the "Hive and Honey-Bee." CHAS. DADANT & SON.

Hamilton, Ills.

Poor Honey Harvest.

The honey harvest was a poor one again this year in Somerset county, Pa. I would have had to feed, like I did last season, but buckwheat yielded some honey, and golden-rod also yielded well for about three weeks. This was the only honey we have to winter bees on, as almost all the white clover and linden honey was used for breeding.

D. D. JOHNSON.

Summit Mills, Pa., Oct. 25, 1889.

Excellent Results.

The AMERICAN BEE JOURNAL is a very welcome visitor in our family every week. I wintered 26 colonies in the cellar last winter, lost one, and since I have increased to 40, and have taken off 800 pounds of No. 1 comb honey, and 200 lbs. or more of second and third grade honey. The weather has been too wet and cold for good results, so say experienced bee-keepers. With myself, this is the fourth best season thus far.

C. GUILFORD.

Cuba, N. Y., Oct. 28, 1889.

Good Yield of Honey.

I put 15 colonies of bees in the cellar last November, and all came out in good condition in the spring. They did fairly well through April and May, but June was so excessively wet that the first half of the white clover bloom gave but little honey; however, about July 4, the weather cleared up so that the bees did well on the profuse white clover bloom, till the basswood commenced to bloom, which was about July 15, and that lasted the balance of the month, and yielded moderately well. Twelve colonies, which I worked for extracted honey, gave about 1,300 pounds of clover and basswood honey, and 500 pounds of fall honey, which is a good yield for this locality. There is a good demand for honey, on account of the scarcity of fruit, and I have sold nearly all of mine at my own door, at 10 cents for the white honey, and 7 cents for the dark. The yield from buckwheat was light, but I have not known the golden-rod to yield so well in many years.

DAVID HILL.

Warsaw, N. Y., Oct. 28, 1889.

Golden-Rod—Good Season.

As "Golden-Rod" is being tried by a jury of apiarists, suppose we should all give in our testimony. It is very abundant in this vicinity (Waushara county) and, judging by the way the bees work upon it, it is a most excellent honey-plant. I have many times seen several bees upon a single stalk. There are at least two varieties here, both of which yield honey. In my opinion, golden-rod has redeeming qualities enough

to entitle it to become our emblematic flower; it is wide spread, and universally known and admired by every one, and it is so modest that it does not infringe upon space alloted to anything else, but is content with the fence-corners, dry marshes, and other waste-places where it can be seen gracefully lifting its hat, and nodding its golden head to its welcome guests—the busy bees.

This has been quite a good honey season for this section, though not nearly as good as we used to have in days of yore. My bees averaged nearly 60 pounds of comb honey per colony, spring count, and I increased them 40 per cent. All are well supplied with stores for winter.

B. T. DAVENPORT.

Auroraville, Wis., Oct. 27, 1889.

Golden-Rod His Favorite.

In regard to the golden-rod, I would say that when I was living in Illinois, I had 85 colonies of bees, and I must say that the golden-rod honey I got in the fall was the finest of all the fall honey, and I obtained lots of it, too. It was my favorite for my own use, and I would not eat any other as long as the golden-rod lasted. If I had 50 votes to cast, I would give them all for golden-rod as the national flower.

JOHN BOERSTLER.

Vashon, Wash. Ter.

Big Stock Farms and Stakes.

The largest breeding establishment in America for thoroughbred horses is the Belle Mead stock farm, in Sumner county, Tenn. It contains 4,000 acres. The richest stakes ever won in America were the Peyton, run at Nashville in 1843, and the Futurity, run at New York in 1888. Each was worth $41,000 to the winner. The Futurity was for 2-year-olds, and was won by Proctor Knott, owned by Bryant & Scroggins, of Kentucky. This horse won the largest stakes of that season, the sum reaching $69,780, which is the largest amount ever won by a 2-year-old in a season.

Snow Flakes.

The lightness of snow flakes is the result of their surface being so great when compared with their volume, and is accounted for in some degree by the large quantity of air amid their frozen particles. Snow flakes contain about nine times as many volumes of air, entangled, so to speak, among their crystals, as they contain water. Very fine and lightly deposited snow occupies about twenty-four times as much space as water, and is from ten to twelve times lighter than an equal bulk of that fluid.

A Big Valley.

The valley of the Amazon is larger than that of the Mississippi, the former river draining 2,330,000 square miles and the latter 1,244,600 square miles. The Amazon drains a greater area than any other river on the globe.

United States Population.

The present estimated population of the United States is 64,000,000. The annual growth by natural increase and immigration is placed at about a million. The estimated foreign population is not far below 14,000,000.

Be not slow in common and usual acts of devotion and quick at singularities; but, having first done what thou art bound to, proceed to the extraordinaries of religion as you see cause.—Jeremy Taylor.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper

Red Labels for Pails.—We have three sizes of these Labels ranging in size for pails to hold from one to ten pounds of honey. Price, $1 for a hundred, with the name and address of the bee-keeper printed on them. Smaller quantities at one cent each; but we cannot print the name and address on less than 100. Larger quantities according to size, as follows:

	Size A.	Size B.	Size C.
250 Labels	$1.50	$2.00	$2.25
500 Labels	2.00	3.00	3.50
1,000 Labels	3.00	4.00	5.00

☞ Samples mailed free, upon application.

Hastings' Perfection Feeder.—This excellent Feeder will hold a quart, and the letting down of the feed is regulated by a thumb-screw. The cap screws securely on. It is easy to regulate—either a spoonful or a quart—and that amount can be given in an hour or a day, as desired. By it the food can be given where it is most needed—just over the cluster. Not a drop need be lost, and no robber bees can get at it. A single one can be had for 40 cents, or a dozen for $3.50, and it can be obtained at this office. Postage 10 cents extra.

International Bee-Convention.—The Pamphlet Report of the Columbus, Ohio, Bee-Convention can be obtained at this office, by mail, postpaid, for 25 cents. This pamphlet contains the new bee-songs and words, as well as a portrait of the President. Bound up with the history of the International Society, and a full report of the Detroit, Indianapolis and Chicago conventions, for 50 cents, postpaid.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

Always Mention your Post-Office County and State when writing to this office. No matter where you may happen to be for the hour when actually writing—never mention anything but your permanent address. To do otherwise leads to confusion, unless you desire your address changed. In that case state the old as well as the new address.

Having a Few extra sets of the AMERICAN BEE JOURNAL for the years 1887 and 1888, we will supply both these years, and 1889 and 1890, for $3.00, until all are sold. Or we will send 1888, 1889 and 1890 for $2.50, all by mail, postage paid. These are very valuable, and those who have not yet read them should lose no time in securing them.

Yucca Brushes, for removing bees from the combs, are a soft, vegetable fiber, and do not irritate the bees. We supply them at 5 cents each, or 50 cents a dozen; sent by mail, add 1 cent each for postage.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now so CHEAP that no one can afford to do without it.

Honey and Beeswax Market.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.
BEESWAX.—20@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—It is arriving freely and we note some little accumulation, but all will be wanted later on. White clover 1-lbs., according to style of package and appearance, 13@15c. Dark 1-lbs., 10@11c.; 2-lbs., 8@9c. Extracted is in light demand, values ranging from 6@8c., depending upon the style of package, quality, etc.
BEESWAX.—25c.
Sep. 21. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—It is in good demand. We quote: Fancy white 1-lbs., 15@16c.; 2-lbs., 13@14c. Fair white 1-lbs., 13@14c.; 2-lbs., 11@12c. Buckwheat 1-lbs. 10@11c.; 2-lbs., 9½@10c. Extracted, basswood and clover, 8c.; orange blossom, 8½c.; buckwheat, 6c.; California, 7½c.; Southern, 72½c. per gallon.
HILDRETH BROS. & SEGELKEN,
Oct. 11. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Fancy 1-lbs., 16@17c.; fair, 14@15c.; 2-lbs., 15@16c. Extracted, 8@9c. Market is in fairly good condition, but we are getting some of the odd grades from Western New York, Michigan and Wisconsin, and it is not arriving in very good condition, making it hard to sell.
BEESWAX.—None on hand.
Oct. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A quiet but steady demand for choice comb, at 14@16c. Fair demand for extracted at 5@8c
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Oct. 21. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs, 13@14c.; dark, 10@12c.; white 2-lbs, 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

Send Us the Names of bee-keepers in your neighborhood who should take and read the AMERICAN BEE JOURNAL, and we will send them a sample copy. In this way we may obtain many regular subscribers, for thousands have never seen a copy, or even know of its existence. This is one way to help the cause along.

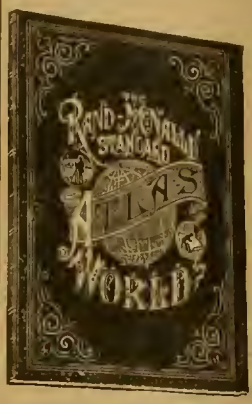
Money in Potatoes, by Mr. Joseph Greiner. Price, **25** cents, postpaid. This is a complete instructor for the practical potato-grower, and explains the author's new system in 40 interesting lessons. It is for sale at this office.

A Favorable Word from any of our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble.

The Date on the wrapper label of your paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to carry the date another year ahead.

Standard Atlas of the World.

To any one sending us, direct to this office, **Five NEW Subscribers** for one year, with $5.00 (renewals not to count), we will *present* this beautiful Atlas, by mail, postpaid:



This ATLAS contains large scale Maps of every country and civil division upon the face of the Globe.

It is beautifully illustrated with colored diagrams, showing the wealth, the debt, the civil condition of the people, chief productions, the manufactures and the commerce, religious sects, etc., and a superb line of engravings of historical interest and value, together with many new and desirable features which are expressly gotten up for this work—among which will be found a concise history of each State.

Price, in best English cloth binding (size, closed, 11x14 inches; opened, 22x14 inches), $4.50.

DORÉ ART PORTFOLIO,

PRICE, 50 CENTS,

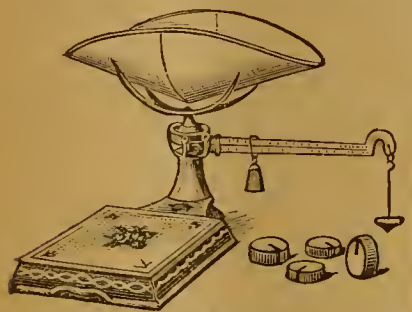
Will be CLUBBED with the AMERICAN BEE JOURNAL, at the low price of $1.25, postpaid.

This magnificent Art Portfolio is in size just 11x14 inches, and besides a picture of Gustav Dore, the great French Artist, it contains the following beautiful engravings: Expulsion from the Garden of Eden—Entering the Ark—Noah Cursing Ham—Samson and Delilah—Ruth and Boaz—Death of Saul—The Judgment of Solomon—Daniel in the Lion's Den—Daniel Confounding the Priests of Baal—The Nativity—Christ Healing the Sick—Sermon on the Mount—The Disciples Plucking Corn on the Sabbath—Jesus Walking on the Water—The Agony in the Garden—Death of the Pale Horse. Seventeen handsome full page plates under one cover.

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

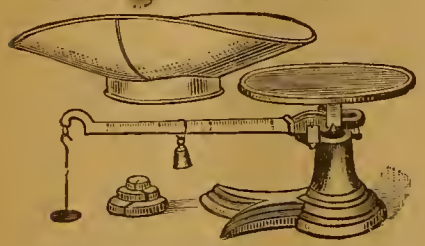
Useful Scales

The Union or Family Scale.



This Scale has steel bearings, and it weighs from ½-ounce to 240 pounds. Price, with a Single Brass Beam, as shown in the illustration, $3.00. With Double Beam for taking the tare, $3.50.

The Little Detective Scale.



This little Scale is made with steel bearings, and a brass Beam, and will weigh accurately ¼-ounce to 25 pounds. It supplies the great demand for a Housekeeper's Scale. Prices:

Single beam,	no scoop	$2.00.
" "	tin "	2.50.
Double "	no scoop	3.00.
" "	tin "	3.50.

☞ All orders filled promptly.

THOS. G. NEWMAN & SON,

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Nov. 16, 1889. No. 46.

EDITORIAL BUZZINGS.

☞ Mr. C. Theilmanun met with an accident lately. His horses ran away, and he was thrown out of his wagon, and broke his collar-bone. It has been "set," and he is recovering.

☞ The *Guardian*, New Castle, Pa., having lately published one of the floating sensational articles about "Bees having been declared a nuisance in New York," Mr. T. S. Sanford sent the editor of that paper an editorial from the BEE JOURNAL on the matter, and it was published in the *Guardian* of Oct. 31, with Mr. Sanford's remarks as follows:

EDITOR GUARDIAN:—The following taken from the AMERICAN BEE JOURNAL refers to an item appearing in your paper a few weeks ago, regarding bees being declared a nuisance in the courts of New York. This case will be carried to the Supreme Court and defended by the Bee-Keepers' Union. The Union has never lost a suit it has defended, and it is worthy the support of all bee-keepers.

It is the duty of bee-keepers everywhere, when they notice in their local papers articles which do injustice to the pursuit, to refute them at once in the papers where they appeared—as Mr. Sanford has so nobly done.

☞ Mr. S. L. Watkins has withdrawn from the *Western Apiarian*, which will hereafter be edited and published by Mr. Frank E. McCallum. It has reached its fifth number, and we hope it will succeed—but it is an up-hill business to establish any new periodical, and requires lots of money to sustain it until the point is reached when it will pay expenses. Its editor promises to publish it for one year, if it takes all the money he has or can raise in the world. He is *plucky*—that is certain.

Honey Almanac.

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Beeswax, its uses, how to render it, and its importance as a commercial product, is described, and 17 useful Recipes are given.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

Here is what is said of it by those who have seen the Honey Almanac:

The Honey Almanac is here. Please allow me to congratulate you, and the bee-keepers as well. This ought to aid every bee-keeper to the easier and better disposal of his honey. You have stowed between these covers very much valuable information—just what we need to scatter broad-cast. I hope they will "go like honey-cakes."—A. J. Cook, Agricultural College, Mich.

The "Honey Almanac" to hand. Allow me to say that I believe it will mark a new era with bee-keepers, as regards the selling of our product, and meets a *long felt want*. Patent medicine men have "got rich" by this way of advertising their wares, and I see no reason why we as apiarists should not take advantage of such "pointers."—G. M. Doolittle, Borodino, N. Y.

The "Honey Almanac" is something unique. It is a fine thing to have so many honey recipes, in such compact form, always ready for reference. It would be a good thing to have such things circulated among customers.—C. C. Miller, Marengo, Ills.

The new "Honey Almanac" should fulfill every object sought by its projectors. It would be difficult to conceive of a better plan to develop and enlarge a home market for our products than the distribution of these Almanacs. The interest you have manifested in bee-half of bee-keepers in this matter, should meet with a hearty response.—G. L. Tinker, New Philadelphia, O.

Your Honey Almanac is just received. My first thought was, "How in the world can they furnish it at the prices quoted?" The recipes, useful suggestions, and valuable information it contains is worth many times its cost, and must be of great value to the public and the bee-keeper, if scattered broad-cast by him. I hope you will sell a million before the first of January.—Geo. E. Hilton, Fremont, Mich.

The "Honey Almanac" is received. Of the many Almanacs published, this is surely the *best* and most *useful* of all. It will assist greatly in creating a demand for the purest and best of sweets—honey.—J. W. Buchanan, Eldora, Iowa.

The "Honey Almanac" for 1890 is received. There is much valuable matter contained in it, interesting alike to the honey-producer as well as the consumer. I believe it would be greatly to the interest of every honey-producer to circulate the "Honey Almanac" freely throughout the community where he lives. I hope every bee-keeper will see to it that this is done.—J. W. McKinney, Camargo, Ills.

I have received the Almanac, and it just fills the bill—something we should have had before.—J. W. LeRoy, Rio, Wis.

I think that the Honey Almanac is the best way of advertising our honey yet thought of.—G. C. Spencer, Panton, Vt.

I have examined the Honey Almanac, and find it a capital hit. If one's home market be lifeless, a liberal distribution of the Almanac cannot fail, it seems to me, to give it life.—R. L. Taylor, Lapeer, Mich.

The Honey Almanac is received, and I consider it a triumph in our line. Its usefulness as a collection of recipes ought to insure its preservation in every home, and thereby increase the demand for honey *immensely*.—J. M. Shuck, Des Moines, Ioa.

The "Honey Almanac" is received. It is very nicely gotten up with many valuable recipes, and the calendar part is very handily and plainly put together, intervened by honey recipes, so that by looking to find the date, any one can hardly fail to notice the honey literature, and thereby do the work that the Almanac is intended to do. Every producer of honey should order some of these helping-means to sell and get good prices for honey—as the money paid for them will surely bring big returns, if distributed over our whole land.—C. Theilmann, Theilmanton, Minn.

The "Honey Almanac" for 1890 is received. I have perused it, and find in it a most apposite work for the dissemination of knowledge pertaining to bees, honey, wax, and other useful information.

I am of the opinion that any household which may possess this Almanac, where there was a paucity of facts concerning honey, its important qualities, and in the matter of the manufacturing of the so-called "artificial comb honey" previous to obtaining it, will, after perusing and digesting its contents, rebuke with a severe and just hand all articles emanating from the reporter's imaginative brains.

The book contains enough of facts aside from bee-keeping to make it doubly valuable, which, together with its neatness, clean printing, etc., makes it worthy of its name as an Almanac.

I hope that the sales of the "Honey Almanac" will be colossal, and that it will produce an immensity of good among the people of our grand and glorious United States, towards the increasing of the consumption of that delicious liquid—honey.—H. K. Staley, Cincinnati, O.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Wisdom would dictate that a million of them be scattered by the first of January.

Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

☞ Whoever before heard of a set of the Waverley Novels being sold for less than $12.00? Just think of our offer of either these or the Works of Dickens, with the BEE JOURNAL until Dec. 31, 1890—all for $2.10! See the last page of this paper.

Misrepresenting Comb Honey.

On page 691 we mentioned the fact that we had written a letter to the editor of the Chicago Daily *Herald*, requesting him to correct his misstatement about "Manufactured Comb Honey." He put this heading to our letter, and added comments as follows:

Adulterated Comb Honey.

Editor of The Herald:—In a recent issue, under the head of "Short Answers," you say: "There is such a thing as manufactured honey. The comb is made out of paraffine." As you ought to know something about the matter you so positively assert, I call for the proof. A member of the National Bee-Keepers' Union offers $1,000 for a sample of the bogus "comb honey"—with combs made of paraffine and filled with glucose by machinery, etc., as the newspapers sensationally affirm. Will you please to either produce the product, give proof of its manufacture by saying where it is done, and by whom, or else make the correction in *The Herald?* I am prepared to prove beyond contradiction that your statement is wholly false and untrue. THOMAS G. NEWMAN.

[*The Herald* very gladly gives this correspondent its authority on the point in question. In a work entitled "Food Adulteration and Its Detection," by Jesse P. Battershall, Chemist in the United States Laboratory, New York city, the author says at page 122: "Occasionally the bees are also supplied with a ready-made comb consisting at least partially of paraffine." He also states that some bee-keepers place vessels of glucose near the hives for the bees to feed on. Other articles of a similar character are used by which the bees themselves are made to adulterate their own honey. This author further says, at page 128, "Eighteen out of thirty-seven samples of strained and comb honey examined in 1885 by the Massachusetts Board of Health, were adulterated with glucose and ordinary syrup." It will thus be seen that the statement of *The Herald*, that comb honey is adulterated, is proved by the highest authority.]—*Editor of The Herald.*

Thereupon we wrote this reply, for which we hope he will soon find room:

Manufactured Comb Honey.

Editor of The Herald:—In your issue of Oct. 27, you made this statement: "There is such a thing as manufactured honey. The comb is made out of paraffine." This I denied, and called for the proof, by your submitting at least a sample of the product (manufactured comb honey), and stating where and by whom it was made.

As an incentive for you to produce a sample of the "manufactured comb honey," I informed you that a member of the "National Bee-Keepers' Union" offers a thousand dollars for a sample of it, *i. e.*, "combs made by machinery, filled with glucose, and sealed over by a machine made for that purpose." Prove your assertion if you can, and claim the money. *It is waiting for you.*

In *The Herald* of Nov. 5, you attempt to cover up the point at issue by heading your reply with the words, "Adulterated Comb Honey," and quoting from a New Yorker's book, entitled "Food Adulteration."

The real point at issue is not the adulteration of honey, but "the manufacture of comb, filling and sealing it over by machinery made for that purpose," (as a certain Professor expressed it) "without the aid of bees." Concerning this I asserted that "I am prepared to prove beyond contradiction that your statement is wholly false and untrue." Please stick to the point, and either "produce a sample of the product, give proof of its manufacture by saying where it is done, and by whom, or else make correction in *The Herald*."

In 1887 there was a failure of the honey crop, and the finest opportunity was presented for the markets to be filled with "manufactured comb honey"—if such existed! I dared those who asserted that such was in existence, to produce a single pound of it. And so far not a single ounce of it has been submitted—even though $1,000 have been offered for a sample of the "stuff," and the information where and by whom it was manufactured.

What a chance was then presented for these mythical manufactories to "run day and night," and supply the demand for honey in the comb! But their failure to do so proves that they do not exist, and exposes the falsity of all the assertions about manufactured comb honey—in the sensational press.

The fact that bees will not touch glucose except on the verge of starvation, is sufficient refutation of the statement of Mr. Battershall, that bee-keepers compel the bees to "adulterate their own honey" by placing "vessels of glucose near the hives," etc. His assertion that "18 out of 37 samples of strained and comb honey, examined in 1885 by the Massachusetts Board of Health, were adulterated with glucose and ordinary syrup," may have some foundation, so far as liquid honey was concerned, *four years ago*, when the price of honey was much higher than glucose—but *now* the tables are turned, and honey can be purchased as low as glucose. *When it does not pay to adulterate, there is no incentive for doing it*, and but little, if any, adulterated liquid honey is now on the market.

The author of the silly story about "the manufacture of comb honey by machinery made for that purpose, without the aid of bees," is Prof. H. W. Wiley, a letter from whom is in my possession, saying that he "wrote it as a scientific pleasantry," never thinking that any one would be silly enough to think that it was a sober fact or truth! On the contrary, your authority from New York, and a lot of other professors, editors, doctors, lawyers, statesmen and ministers have quoted from Wiley's *lie* about "the manufacture of comb honey by machinery," etc., supposing they had some authority to lean upon! But, alas, the original instigator of the falsehood confesses to its untruth, over his own signature.

Now, Brother Editor, (for I am not a stranger to the trials, labors, and courtesies of the craft—having for a quarter of a century held the honorable position of Editor on a daily and weekly paper, as well as a class periodical), I feel sure that you have been deceived by a "wily" falsehood—and will cheerfully make the *amende honorable.* It is but *just* to correct a wrong statement, especially when a failure to do so will injure an honorable pursuit, by casting a reflection and doubt upon its product. Many of its devotees are your constant readers—among them

Yours Respectfully,
THOMAS G. NEWMAN.

A reporter of *The Herald* called upon us last week for an interview, which we hope he will write up and insert in *The Herald* at an early day. We gave him pointers, described modern apiarian inventions, showed him Prof. Wiley's letter, acknowledging that there was no foundation for his silly story about "manufactured comb honey," and asserting that it was simply a "scientific pleasantry," etc.

The reporter expressed much surprise that the Professor should have done such a foolish thing as to write an article misrepresenting an industry, and then take such a long time before even offering an explanation, or making a correction.

What the outcome of this interview will be we know not, but hope *The Herald* will be honest enough to give the real facts in the case to its readers. All we ask is truth and justice—we want nothing else.

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excluding honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

If you desire to know how this can be done—how to have Queens fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees cay fly—all about the different races of bees—all about shipping Queens, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.; or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 170 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

The Queen-Bee's Wedding.

BY WILLIAM H. DONOHO.

There's a wedding among the good people—
The Queen of the Bees is the bride;
She stands in the midst of her maidens,
The fairest of all, and their pride.

Her veil is the mist of the morning,
It sparkles with silvery dew;
Her crown is of fresh orange blossoms,
Her sceptre is yielded to you.

To you she has chosen her consort,
The monarch she'll henceforth obey;
Then rule o'er her happy dominions
With scarcely perceptible sway.

Remember the treasure she brings you
Of innocence, beauty and truth;
It calls for a life of devotion,
To fill out the dreams of her youth.

The katydids chirrup their greeting,
The beetles and bats wheel at play;
The amorous breath of the flowers
Is sweeter than ever in May.

The drowsiest bee in the hamlet
Is buzzing with eager delight;
The veriest drone is awakened,
Resisting his slumbers to-night.

The butterflies come from their bower,
The fireflies flash in the grove;
The turtledoves flutter their pinions
And languidly murmur their love.

The humming-bird whirrs from the jasmine,
The nightingale's off from the rose;
The wood-nymphs and naiads and fairies
Have left all their haunts in repose.

Titania—Queen of the Kingdom—
With Ariel hovers in air;
Luriel, the syren of sea-nymphs,
Is braiding her locks to be there.

Arcadia's wild with commotion,
And Comus and all of his crew,
With Satyrs and Fauns and Bacchantes
Are making the greatest ado.

Above and beneath and around us
Are myriad presences bright;
The spirit of love will evoke them—
They'll be at the wedding to-night.

The Queen of the Bees is to marry,
Her Consort is there in his pride;
She stands in the midst of her maidens,
And fairest of all is the bride.

—*Selected.*

QUERIES and REPLIES.

The Anatomy of Italian and German Bees.

Written for the American Bee Journal

Query 667.—Is there any difference in the anatomy of Italian and German bees?—N.

Yes.—A. B. MASON.

Ask Prof. Cook.—J. M. HAMBAUGH.

I think not.—EUGENE SECOR.

Not that I know of.—G. L. TINKER.

I leave this question to Prof. Cook.—G. M. DOOLITTLE.

I do not understand the question.—R. L. TAYLOR.

I presume not.—M. MAHIN.

See Prof. Cook's answer to this.—J. M. SHUCK.

No. The only difference is in color, and perhaps in size.—C. H. DIBBERN.

It is claimed that the Italians have longer tongues.—C. C. MILLER.

The Italians are slightly larger, but the difference is not great.—DADANT & SON.

That is too deep a question for me. Prof. Cook is the man to answer that.—JAMES HEDDON.

None that I ever saw mentioned. I hope that this question will be fully answered by some of our entomologists.—P. L. VIALLON.

I have never dissected and examined the two races, so I cannot say. I should judge that there is not.—MRS. L. HARRISON.

It is claimed that the Italian bees have longer tongues than the German bees (?). If they have, there is that much difference.—MAHALA B. CHADDOCK.

It is my belief that they are constructed physiologically the same, with perhaps one exception—the Italian tongue is generally conceded the longer.—WILL M. BARNUM.

Yes, in the length of the tongue; possibly in the size of the honey-stomach, etc., though I only know as to the tongue.—A. J. COOK.

While there is no anatomical difference in the two varieties, there is a very marked difference in the external contour of the abdomen. The abdomen of the Italian is more tapering than that of the black or German bee.—J. P. H. BROWN.

No difference discoverable to the common observer, and perhaps to nobody else. A mere difference in length of members of the body, etc., does not constitute a physiological difference. Come to think of it, there may be a difference in "anatomy," for it is vowed by some that they have bees that "make honey" by digestion—mine do not; they gather it from flowers.—G. W. DEMAREE.

There is no more than between a German and an Italian man. The organs are the same; the proof being that they will cross with each other, which would not be the case were they not anatomically and physiologically alike.—J. E. POND.

No. The word "anatomy" is defined to mean "the structure of an organized substance." If there was any difference in this, it would long ago have been learned by dissection. The mere variation in the length of the tongue, or outward appearance of the abdomen, do not constitute an anatomical difference, any more than the length of arms or shape of head would make a difference in the anatomy of men. A difference in the anatomy can only be learned by dissection.—THE EDITOR.

Red Clover as a Honey-Producing Plant.

Written for the American Bee Journal

Query 668.—Is red clover a honey-producing plant, to any appreciable extent?—L.

Yes.—A. B. MASON.

As a rule, no.—M. MAHIN.

Yes, on occasional years.—R. L. TAYLOR.

Not in Louisiana.—P. L. VIALLON.

No, not in my locality (New York).—W. M. BARNUM.

It has not been with me (Illinois).—J. M. HAMBAUGH.

No, but it would be, if bees could work on it at all times.—DADANT & SON.

Yes, but common bees find the tubes too long to readily reach the nectar.—C. H. DIBBERN.

Yes, the best of all the 40 varieties of clover on our continent. All that we need is, the bee that can reach it.—MRS. L. HARRISON.

Yes, but it is often to the bees, like the gold in Nature's great retorts—out of human reach.—J. M. SHUCK.

Yes, undoubtedly. Like all other honey-producing plants, it probably yields better in some seasons than in others.—EUGENE SECOR.

Certainly. You can pull off the little tubes, and suck the nectar out of it.—C. C. MILLER.

It is some years, when the flowrets of the heads are short from a partial drouth.—G. L. TINKER.

Red clover produces a quantity of nectar, but the *Apis mellifica* are able to obtain but very little from it.—H. D. CUTTING.

The second crop, and the mammoth variety, do often give considerable honey; especially to the yellow races of bees.—A. J. COOK.

In some seasons it is, and in some it is not. The humble, or bumble, bee gets a large portion of its stores from this source.—J. E. POND.

Yes. It produces four times the nectar that the white clover does, in this locality. The trouble is that the corolla is so long that the bees cannot reach this nectar, as a general rule.—G. M. DOOLITTLE.

It is a plant that yields large quantities of honey; but the nectaries of the flower are so deeply situated, that it takes a bee with a long proboscis to reach it.—J. P. H. BROWN.

I am glad that you asked that question, for I believe that mankind has been fooled by the idea that there is an ocean of honey in red clover, "if the bees could only reach it." As soon as I had bred up a strain of bees that worked readily on red clover, I demonstrated that it does not contain as much honey as white clover. I think that I am safe in saying that it is not nearly as good a honey-yielder. It sometimes does a fair business, however, when white clover is not yielding much.—JAMES HEDDON.

Yes, it is. It is a splendid honey-producer. Pull off the tubes from a head of clover, and suck them, if you want the proof. All that we lack is a bee with a tongue long enough to reach the nectar.—MAHALA B. CHADDOCK.

Red clover certainly produces nectar, to a liberal extent; but the tubes of the flower are too deep for the tongue of the *Apis mellifica*, except when they are more than usually well filled under favorable conditions. About once in three years, my Italians gather honey to a very appreciable extent, from red clover. The honey from red clover is the lightest in color, of all the grades of honey known to me. I have a sample taken this year, that is literally white. It "candies" more readily than any other honey known to me, but it never "granulates."—G. W. DEMAREE.

Yes; it is one of the best, if not the best of all honey-producing plants. We suppose that the question was intended to be, "Do honey-bees get honey from red clover to any appreciable extent?" To that question the answer is that it is rarely done—when it is "stunted" by drouth, and the "shortened" corolla allows the bees to get at it. The honey is of excellent color, quality and flavor, and generally furnishes the humble-bees with abundant stores.—THE EDITOR.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

CORRESPONDENCE.

WINTERING.

Investigating the Causes of Loss of Bees in Winter.

Written for the American Bee Journal

BY C. J. ROBINSON.

I have written on this subject heretofore, and I trust that it will bear continuation. Much more ought to be said, and some things repeated and examined in the strongest light to be found.

A post mortem investigation usually discloses the immediate cause of the subject's death. It may have been tubercle of the lungs; in such a case, unless the inquiry proceeds further, and finds the cause that produced the tubercles, but little is gained.

When bee-keepers find the cause of death of so many bees to be diarrhea, it behooves us, then, to look further, and, if possible, ascertain the cause or causes of bee-diarrhea. When we are not positive on any subject, we are apt to decide according to the evidence that makes the theory (or some preconceived notion of our own) possible—allowing it to take the place of direct testimony. Now my hope is, by thorough and intelligent investigation, to find the cause, or causes, and so counteract it, or them.

Among the many investigators who have acknowledged diarrhea as the immediate cause, some few have gone further, and hold that the malady is produced by the unhealthful quality of their stores—impure honey, immoderate use of pollen, fermented pollen, and so on; and to prove their conclusion correct, they claim that syrup, of refined sugar, when properly fed, exempts bees from the fatal disease. I have fed the syrup, and feel pleased with the result, but I have no faith in it further than its being a substitute for good honey.

Forty years ago I became satisfied that long terms of severe cold produced diarrhea in colonies other than strong ones that were in the most favorable condition as to food and clustering. Actual experience gave me the idea. Perhaps there are other causes that produce, or tend toward producing, the dire disorder; but it is *cold* that is *the* direct cause.

Father Quinby was authority (none more reliable), that it was periods of intense cold that brought on the dreaded diarrhea. That excessive cold periods are the predominating cause of diarrhea, is proved by the case of Mrs. Tupper many years ago. She took from a row of colonies that gathered their stores from the same field, each alternate one being removed to a cold, bleak situation, while the others were kept warm. The first perished with diarrhea, while the latter wintered well.

I think Mr. Heddon's "pollen theory" has some foundation in fact. While bees are eating much pollen, they are not in a condition to endure continued confinement, and when pinched with cold, digestion does not proceed normally; so, if the two unfavorable conditions (pollen and cold) be present, their food does not digest properly, producing disorder internally, and resulting, inevitably, in fatal disease commonly called diarrhea.

While bees feed on good honey, or purified sugar syrup, of the proper consistency, the whole is duly digested and assimilated; that is, all is converted into blood or juices of the bees, and the waste or impurities of the blood is eliminated through the pores of the external covering and lungs in a gaseous form.

But when bees feed on pollen, or poor honey, their condition is different; the pollen cannot be *all* digested, and the residue cannot be elminated in any way other than through the intestines as fecal matter. Then, in case the bees are kept in confinement for a considerable length of time, their intestines become surcharged with fecal matter, causing irritation, which is followed by virulent disease. For this reason, pollen is dangerous food while bees are passing through the unnatural ordeal consequent upon cold climates.

While bees are active, pollen is, perhaps, necessary as food; but while they are semi-dormant, pollen should be excluded, for the reasons before mentioned; and, because pollen being highly nitrogenous, it excites or stimulates activity at a time when bees should remain quiet, to be safe.

Food consumed by beasts generates heat, and they take it in proportion to the severity of the weather, to keep warm. Bees seem to act on the same principle; but as they are natives of warm climates, their structure is different—not adapted to the vicissitudes of extreme cold climates, and do not burn their food in digesting, to keep up warmth as animals do. It is exemplified when they have worked in the surplus sections until late in the season. Take off the unfinished sections on some cool morning, before all the bees have gathered into the hive; most of them will fill themselves with honey before they can be gotten out of the boxes. The result is, that the honey swallowed is not digested, and warmth is created, but discharged as feces from the bees scattered before they regain the cluster.

When bees are very quiet during severe cold, some must be on the outside of the cluster—and colder than those inside. In ordinary winter weather, it is so mild on many days as to enable them to generate heat enough to enable them to change positions with those inside. But when the weather continues very cold during weeks in succession, the bees on the surface of the cluster are benumbed, and unable to change places and get warm. Then it is that their food is not digested; their bodies become filled with feces, and they must leave to discharge it in and about their hives—the well-known diarrhetic discharges, which, whenever occurring, hope of safety vanishes—the bees are in death's grasp.

If diarrhea does not appear, and the weather continues cold, the colony continues to grow smaller, in proportion to the length of time and size of the colony. Some colonies maintain the proper temperature by having the honey so distributed that they can have empty cells near the centre, into which they may creep for mutual warmth, thus being more compact.

Bees can exist but a short time in cold weather, when between combs of sealed honey. They can, when properly clustered, endure any degree of cold for a time, providing that they have food within their reach. When made warmer, do not consider them safe, unless they are made warm enough, and remain so long enough to enable them to change places with those on the inside; otherwise the result is fatal.

If the foregoing is correct (and I can vouch that it is), it is evidence showing that among those who have housed their bees and lost them, there bees were not warm enough, even though in a cellar or other depository. I am aware that some will say that they have thus successfully wintered bees many times, proving to themselves beyond a doubt that their bees were warm enough, but not considering that the place that was warm enough in some certain winters, is not so every winter, because of the variation of cold terms as to duration of time.

A degree of temperature suitable for large colonies, is too low for small colonies; that is, large colonies will remain quiet in a temperature so low as to render it unendurable for small colonies.

Forty-five years, ago, before knowing of bees being put into special repositories, cellars or other places during winter, I conceived the idea of putting small colonies into my cellar—such colonies as would not go through

the winter on the summer stands. This I considered no risk of importance, but I feared to experiment in that way with good colonies. After seeing the advantages of wintering small colonies in the cellar, I put large ones in, and adopted that method. Mr. Moses Quinby also practiced cellar-wintering.

Our way of doing it was to turn the hives (boxes) bottom upward, with the top of the hive resting on something up from the cellar bottom, and a quilt or some cloth covered over the lower end of each hive, to keep the bees from leaving the hive. The small colonies—such as had not filled their hives with comb, and needed to be fed, I broke off the dry combs down to, or near, the cluster, and then placed pieces of sealed comb over the cluster, and the bees would move on to the feed. Such is the best practice with bees in box-hives. The cause of loss (often amounting to dreadful calamities) during winwinter seasons, should be understood as far as possible.

Richford, N. Y.

BEE-ESCAPE.

The Reese Bee-Escape for Getting Bees Out of Supers.

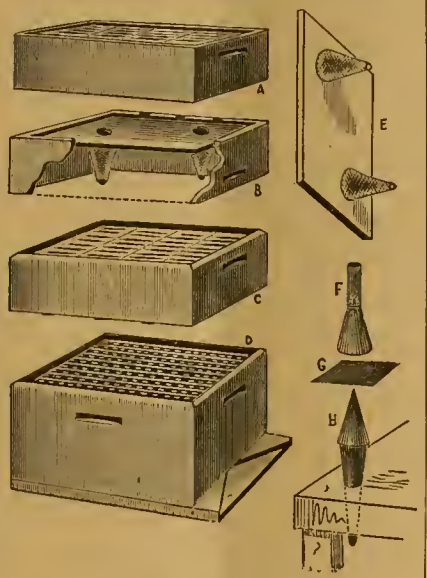
Written for the American Bee Journal
BY F. GREINER.

There seems to be some readers of the AMERICAN BEE JOURNAL who are not familiar with the Reese cone-case bee-escape. For the benefit of those, it might be well to reproduce what Mr. Reese says about it in *Gleanings* for January, 1888;

"The cone-case bee-escape is as follows: Take an empty surplus case that any bee-keeper may be using, for illustration the **T** super. Cut a board that will just fit evenly inside the case; bore two one-inch holes, one near each end; make two small cones of wire-cloth, just large enough to tack over the one-inch holes, and about 1½ inches high. Now make two more larger cones about 3½ inches at the base, and 3½ inches high, and tack over the smaller cones. This will leave a space between the smaller and larger cones; and each cone has a hole in its apex that will admit a bee. Fasten this board with cones near the bottom or top of the empty super, and the cone-case is ready for use. Now raise the filled super, and place between it and the brood-chamber this cone-case, with the cones pointing toward the brood-nest. In a few hours you may expect the full super all clean of bees, and not a cell uncapped."

The wire-cloth cone—the principle feature of the cone-case—can be used in other ways; for instance, when taking off honey from my chaff hives, I leave the full super with bees in the upper department in such a way as to stop all communication between the bees in the super and the bees in the brood-chamber. Through a ½-inch hole in the gable of the cover, and over which a cone is placed temporarily, the bees from the full super will all make their exit in a few hours, and even very young bees will readily find their way back into their parent hive, as the escape-hole is perpendicularly in line above the common entrance.

For convenience, I have a quantity of attachable cones, consisting of a small piece of board 2x3 inches, with



The Reese Bee-Escape.

an inch hole bored through, and a cone nailed over it; this device can easily be fastened with a tack or two, to any part of the hive, and has proved a great help to me in ridding supers of bees.

The most of my wide-frame supers which I use on single-walled hives, have a ½-inch hole bored in one end of them, for common closed by a button; over this hole I place an attachable cone, when the super is filled; I raise it and slip a honey-board (or oil-cloth would probably do as well), between the super and the brood-chamber, and in two hours the bees will usually have left. I have not found it necessary to use the double cone, still it may be safer to.

Now I would like to say that if Mr. Heddon practices a better plan than Mr. Reese has given us, I would like to have him prevail upon the inventor of that plan (see page 636) to describe it, and let his light shine. Thousands of bee-keepers who are working hard to make an honest living, will thank him for it. As far as I know, Mr. Reese has given us the best thing for the purpose, and I make the motion to extend to him our unanimous vote of thanks. Who seconds this motion?

Naples, N. Y., Oct. 8, 1889.

BEE-STINGS.

Results of Bee-Sting Poison in the Human System.

Written for the American Bee Journal
BY C. B. HILLS.

In reply to Mr. Duncan (page 685), I can say from quite an extensive experience, that I believe there are cases where bee-sting poison does in a greater or less degree cause impure-blood eruptions.

A few years ago, while handling a frame thickly covered with bees, I got several stings in the end of my thumb; as quick as I got my hands at liberty I scraped a knife over the end of the thumb—probably broke some stingers off; but whether it was their working into the flesh, or the poison they had injected, this much I am positive of, that from that hour it commenced to be inflamed, and in four days it was very painful.

A doctor examined it, pronounced it a felon, and thought that it would hasten it to lance it, which he did; it only discharged a little very dark-colored blood, and closed up, so I had it lanced again. It laid me up for four weeks, and when it did get well, it left the thumb partly useless for life.

The point that I wish to convey is this: There is no question but that the stings I received in the end of my thumb, were the direct cause of the felon; now may we not reasonably suspect that the poison injected into one's system, by repeated stings, in a measure—especially with some individuals—cause the afflictions, namely, boils, felons, carbuncles, etc.?

One thing in my own case: I have noticed that when I have received numerous stings, soon after I would be afflicted to a greater or less degree. If Mr. Duncan will look at Query No. 634, on page 358, he will see what some of the fraternity have to say on the subject.

I will say right here, to dispel the idea that some might have from reading the answers in that Query, that I do not, nor ever did, use tobacco or strong drink in any form,

Notwithstanding the minor drawbacks in bee-keeping, I take much pleasure, as well as profit, in bee-culture; and am indebted to the AMERICAN BEE JOURNAL for very valuable instructions in the pursuit.

Wellsville, N. Y., Oct. 30, 1889.

LAUGHABLE.

Amus Periwinkle's Kween—Du Beez Maik Hunny?

Written for the American Bee Journal

BY WILYUM SOCKS.

"When doekters disagree hoo shel deside?" Eye hev seen the abuv kwotashun in print nigh onto a 1,000 times, and ez no one seems to be abel tu deside the kwestyun, eye hev konkluded to deside it miself; and ez naybor Amus Periwinkle sez, "with out feer uv sucksessful kontradiekshun."

Amus Periwinkle iz mi neerest naybor. Sumthing over a year ago a swarm uv beez lit onto hiz kotton-wood tree, and he rapt a shawel round hiz hed, and went out and hived them in a empty sope box. In November, he poot them into hiz seller, and kept them thare untill abowt the tyme sugar-sap began to run, when he carryed them owt, and sot them into hiz back yard. But they dident du verry well all spring—the wukers dident eroud the entrans—and Amus began tu git oneesy about them. So wun day he saw Billy Grafton passing, and kalled him in tu look at hiz beez.

Billy Grafton livs about a mile owt on the rode tu Sleepy Holler, and keeps a good menny bea-hives. It dident taik him long tu find thet Amusses beez hed no kween; so he told Amus thet if heed kum out tu hiz playse, he wood sell him a good warrented kween.

In a week or two Amus went out tu git the kween; but it wuz a kold day, and Billy dident like tu open his hives for feer the beez mite stampeed, or sumthing; so he looked around to see if he cood find a kween lofing on the aliting-borde. Pretty soon he picked up a droan, and told Amus she wuz all rite.

Amus hed gon to skule several terms in hiz younger daiz, but his edikashun in entymollygy wuz sumhow negleekted, and he dident no a kween bea from enny uther kind uv a bug.

Thet same afternoon Amus kame to my hous, and invited me over tu hizzen, tu introdoos hiz kween for him. Eye aesepted the invitashun, and when he brot hiz kween out, holding the kaige between hiz hands tu keep hur warm, eye kood hardly keep from lafling az soon ez eye got site uv her. But, sez eye, "Amus jevver see a kween bea befour now?" "No," sez Amus; "this iz the furst wun eye ever sot ies onto. Sheez a buty, aint she?"

"Well," sez eye, "Amus, thet thares a mity helthy looking kween, but its mi beleef she want never lay no aigs nor maik no hunny." "Why?" sez he. "Sheez not thet kind uv a kween," sez eye. "But sheez warrented," sez he, "and eye payed a hull doller for her!" "Kaint help thet," sez eye; "sheez only a setter; sheel set all summer, but she wont never hatch nuthing." But Amus waz surtin she waz all rite, and eye sed no more.

My plan waz tu shoo her in at the entrans, but Amus thot she wood stay on the nest better if she wer left in the kaige; so eye set her thet way and kame home.

The neekst morning eye met Billy Grafton in the rode; he laffed, then eye laffed, then we both laffed; and thets all we sed, exeept thet it waz a fine day for beez. Amusses beez swarmed out one at a time, and gradyully disappeared; but neekst spring he is going to by a hull swarm.

But eye am digressin'. Eye hed in minde the kontrovessy now going on in the bea-paypers konserning hunny. Prof. Kook, uv the Meeshegan Kolledge, a bea-keeper of sevral 100 colloneys, and a gentleman hoo hez heertwofour stood hi in hiz professhun, hez writ a number uv peaces tu pruve thet hunny iz "digested neckter," which he ascertanes by a test with litmus payper.

Now, befour eye went into the beabizness for miself, eye suppozed thet hunny waz "digested neckter;" in faekt eye inklined tu thet opinyun konsidabel more than 45 degrees. Thet is wun of the original idees with a grate menny people. Thay think thet beez maik hunny out uv pawlen and wotter; and the modern idee, thet thay sip the neckter from the poseys and earry it tu thare hives, and bile it down with the heet uv thare boddeys, is sumpthing thet the avrage man or woman never thot ov. It kums to them, howsumever, after a few years pracktickel expeerens with beez. Tharefour eye klame thet Mister Kook is not the original diskuverer of thet hurrysy. "The prufe ov the pooding iz in the eeting ov it." So it iz with hunny, and no litmous payper kood konvins me tu the kontrary.

Take a peace ov litmus payper, or enny uther kind uv payper, and hold it up behind a 2-year-old hoss-kolt, and he will kick up hiz heels just too (2) feet. Tri the same exparement on a mool, and if he iz in hiz prime and feeling well, the result will be jist the same. In nuther kase iz the plane ov polerizashun turned eether tu the rite or left, but strate out, and the formoola is ritten exackly the same, $K1_3 CK_2$.

Now this wood seem tu proov the mool a hors, but it dont. The origin of the mool reeches fur back into the misty heertoofur ov antiekuyty. He iz menshuned bi wun ov the anshent riters, hoo states thet a sertin yung man found hiz mools in the woods (Gen. xxxvi, 24). This proovs hiz grate antiekuyty; and we no posatively, from sertin karackteristics pekular tu the beest, thet he iz a highbrid ov grate strength ov eendoorens and self-kontrole, and not a hors.

The highpothesis thet hunny iz digested neekter iz untenable, bekaws, furst, it iz kontrary tu natur; seekond, it iz not in keeping with thet artistickness in houskeeping for which beez are adepts in an eminent degree; thurd, the droans woodent allow it; forth, it iz an unpossybillyty, bekaws the stumiek ov the bea iz bilt sumpthing like thet ov a hors, so thet the valves wont wurk both wais, and an emetick wood hev no effeekt. It maiks wun feel sort uv flabergasted tu think uv it.

Tharefour, in the lite ov modern reesurch, eye klame—and eye think eye hev suffishently demonstraighted the fackt—thet hunny iz not digested neckter, but neckter gathured by the beez from the bokays of natur; depozited in thare sells, and biled down by the heet ov thare boddeys, into which iz then put a few drops of formiek assid tu keep it from spileing. *Ergo*, hunny iz assidulayted neekter, and thets why it all tastes like hunny.

Skwashtown, Ioa, Oct. 12, 1889.

SEASON'S RESULTS.

G. M. Doolittle's Report—Bees by the Pound in the Mails.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

The season of 1889 has been a very peculiar one. The spring opened unusually fine, continuing so up to May 20, when the bees in this locality were fully as strong as they usually are on June 15, which gave us bright hopes of the future—so much so that I began queen-rearing largely, thinking that for once I would be in the field with queens nearly as soon as some of our Southern brethren. But, alas for human hopes; for with May 21 came on a cold rain-storm, which, with nearly winter weather, continued until June 12. This upset all of my plans at queen-rearing, for nearly all of my nuclei perished, queen-cells were destroyed, and no queens were fertilized during that time.

After getting things in shape again, I found that, after my sales, I had only 26 queens left to commence the season with, the most of which were pretty well supplied with bees, but no brood except in the egg and larval form, for no brood was reared during this cold spell.

From these colonies I drew quite heavily of bees to start in the queen-business again, so that of course they

did not store quite as much honey as they otherwise would have done. When I saw that no brood was being reared at a period when such brood was to become the bees which should be the laborers in the honey harvest, I became convinced that no large crop of honey could be obtained; for it is the bees that hatch from the eggs laid by the queen 37 days before the honey harvest, that become the honey-gatherers during that harvest.

On June 13 the weather became warm again, and the bees poured out of their hives in search of supplies, and brood-rearing then commenced in earnest. White clover was unusually abundant for this section, but as it continued to rain nearly every day, the bees obtained little more from it than enough to sustain the large amount of brood that they were rearing.

Basswood opened on July 4, still very little honey was secreted in the flowers until about a week later, when the bees seemed to obtain honey from it as fast as I ever knew them to do; that is, they came in so heavily loaded, that for several days they dropped short of the entrance, in the same way that they always do when honey is very abundant. To my surprise, I found that although the honey was seemingly coming in very fast, still work in the sections was going on very slow, for the honey brought in was very thin, owing to the rain which still kept up.

Basswood lasted about three weeks in all, the bees getting honey from it only about two weeks. Teasel gave a little honey for a week after the basswood was gone, when the honey season for 1889 was over.

As usual during the past twelve years, buckwheat gave no more honey than was consumed by the bees while they were at work upon it; and as for other fall flowers, we have none, so to speak.

About Aug. 28 the bees began to come in quite heavily loaded, and I was curious to know what they were getting. A search soon revealed that the leaves of the oak and hickory trees were glossy with a sweet, sticky substance, which is known as "honey-dew." The bees worked on this till about Sept. 8, when a rain stopped operations. Of this they stored about 10 pounds per colony, which, with the honey that they had on hand before, gave them enough for winter. I am somewhat fearful regarding the result of their wintering on such honey, but lack of time prevented my extracting it and feeding.

I now have 48 colonies ready for winter, having sold some this fall. The result in honey from the 26 queens is, 651 pounds of comb honey and 103 pounds of extracted, making a total of 754 pounds of honey in all, or an average of 29 pounds for the colony of each queen. This I believe is the poorest yield that I have had since I commenced the business of bee-keeping, except during the year 1869, when there was no surplus obtained from any source, and the bees had to be fed for winter.

Mailing Bees by the Pound.

Since the editor of the AMERICAN BEE JOURNAL published my letter on page 581, telling of the trial package of the ½-pound of bees which were mailed to me by Mr. E. L. Pratt, I have been somewhat amused at the comments thereon in the bee-papers. Especially was I amused by Messrs. Root and Alley "taking us up" so sharply for thus doing, because it was a "VIOLATION OF THE LAW" to send bees in that manner.

Of course it was but natural for me to think back to the time when Mr. Alley boasted of how he was too sharp for the government when queens were not mailable, in getting them through contrary to law in sealed packages; and how Mr. Root sent queens to Canada, and received them from that country contrary to law; as well as how all parties are now receiving queens from Mr. Benton and others across the water, in as open violation of the law, and more so, than is the mailing of "bees by the pound" in our own country.

If these "GREAT LIGHTS" have led the way, was it more than would be expected that *we* lesser ones should follow?

Now they should not be too severe on us because we followed their example. I do not know that the time has arrived yet to *push* the sending of bees by mail, and I think that perhaps it has not; yet I firmly believe that the time will come when they will be thus sent, for their lies a necessity in that direction. None who have censured the plan have seen wherein that necessity lies.

Mr. Alley says that scarcely any one would want to receive bees in that way, or words of like import, if my memory serves me rightly. Now I wish to say, that, according to my best belief, based on the thousands of letters that I have received, two-thirds of those keeping bees do not live within easy reach of any express office—many living from 10 to 30 miles away—which almost practically excludes them from receiving bees by express, without trouble and worry. I am 8 miles from the nearest express office, and I know what I am talking about.

Because every train that "comes in" is met by Messrs. Alley and Root, it does not follow that no one else has different wants from theirs. It was not the saving of cost that I was thinking about when I desired bees by the pound in the mails, but it was that we who live miles from the express office might be equally independent with our more-favored brethren. I think that when Mr. Alley comes to look at it in this light, he will see that he was wrong in thinking of sending in petitions opposed to those of Mr. Pratt.

Borodino, N. Y.

BEES IN WINTER.

Preparing Bees so that they will Winter.

Written for the American Bee Journal

BY DR. J. M. HICKS.

I have received many letters enquiring as to the best method of wintering bees. While I am willing to impart all the knowledge that I can for the benefit of the readers of the AMERICAN BEE JOURNAL, and especially to those who seem anxious to succeed in wintering their bees, I am fully aware that the same process or plan that I might suggest at present, would not prove as successful in some localities as it might in others; hence I will give a plan which, if followed out, will no doubt prove successful in localities where the necessity seems to call into practice a plan that is easiest managed by the greater number, as well as by those who live in localities that are usually most severe on the bees.

I have arranged several bee-houses in the last few years, for many who are interested in the welfare of many colonies of bees, and knowing also how easy it will be to add the extra lumber, as well as some extra labor, in order to save the bees during the approaching winter.

I suggest that the hives be placed on a close-fitting platform or floor, which may be laid temporarily; on this, place the hives about 6 inches apart, leaving about the same amount of space at the front and rear of all the hives, the platform being wide enough, of course, to admit of a back and front wall of plank. The back wall should fit down on the platform, and the front should have 2-inch blocks laid 6 or 8 feet apart, so as to lay a 6-inch board along in front of the hives on the blocks, and the edge of the board to fit close up to all the hives, which will all be in perfect line.

The front wall will also rest on the 2-inch blocks, and form a 6-inch space in front of the hives, and the 6-inch board will form the bottom of the space, leaving an open entrance to all

the hives, which is formed by means of the 2-inch blocks before referred to. This makes a complete, continuous box around all the hives, which are spaced about 6 inches apart.

Now gather forest leaves, and pack them between and around all the hives. (You need not fear getting too many leaves, as the tighter the leaves are packed between and around all the hives, the better.) The back and front walls should be raised high enough above the tops of the hives, to admit of a heavy layer of leaves on top. It will be provided, of course, that the bees have free egress and ingress, the entrances fronting toward the east.

I feel certain that those who take the trouble to provide their bees with such winter quarters, will have no sad faces on account of loss of bees the coming winter. In case any are not favored with a supply of forest leaves, I recommend as the next best article for packing, oat-straw, which should be free from dampness. If the packing is well done, I feel assured that each colony will winter safely on less than ten pounds of honey, which will pay well for all the trouble. Each colony should have at least from 15 to 20 pounds of honey to last them through the winter. I gave directions last spring as to the kind of food, and how to feed to all colonies that are destitute of food. Bees should have at least a good shed over them, and be placed above the ground, out of the reach of mice.

Indianapolis, Ind.

KANSAS.

It is a Good Field for Bees—Report for 1889.

Written for the American Bee Journal
BY REV. J. D. GEHRING.

Is Kansas a good place for bees? A few years ago a negative answer would have been given, even for this region; but now we can say, "Yes, white clover, in great abundance, is here to stay; also Alsike and sweet clover is plentiful along the railroads and public highways."

In the early spring we have the various vine-fruit bloom, and apple, peach, plum, cherry and pear tree blossoms in the greatest profusion. Along the river courses, we have also the linden.

Golden Rod as a Honey-Plant.

As to the golden-rod, I can only say with confident assurance that I am right, that there is plenty of it in this part of Kansas; but I begin to feel a little doubtful as to its honey-producing excellence. I have watched it closely for the last four years, where I had it in sight from my apiary every day during blooming time, and I cannot say that it yielded a good flow of honey. However, I am not sure that this is not owing to conditions of weather and season.

The main trouble with golden-rod seems to be, that it begins to bloom when, as a rule, the weather is very hot and dry; and, just about the time it is at its best, we have cold rains and frost. This was the case here this season.

During the last two days of August, the bees brought in the honey at a furious rate — mostly from white "smart-weed." Since Sept. 1, they have done nothing. I shall probably have to feed some of mine, for when the honey-flow ceased, they had a great quantity of brood, and but a small supply of stores in the brood-nest.

The early part of the season, after fruit-bloom, was just like the latter part—cold and wet; but the frequent rains, keeping the white clover fresh, gave us the "bulge" on white honey, and we can report a good crop of the very best of honey.

I began the season with 18 colonies—nearly all Italians. I desired no increase, and I succeeded in keeping it within 25, all told. I took from 18 colonies, 1,500 pounds of white clover honey, and 200 pounds of yellow honey—all in one-pound sections. I have sold all of it in the home market at from 15 to 20 cents per pound, and could sell another ton of it if I had it.

Two of my Italian colonies gave 140 pounds each, of the finest honey I had.

Getting Swarms with Shot-Gun.

My queens have their wings clipped. I would not try to keep bees, where large shade-trees are as numerous as they are in Lawrence, with queens able to go where they please. I had one queen which I failed to catch, after repeated efforts; she was a "harum-scarum, a tom-boy." I always found her when I looked for her, but when I put my fingers on her to secure her, like the Dutch woman's flea, she wasn't there! But she concluded that she would go to seek a home where she could reign unmolested, and so, one day, she came out with her whole family, drones and all; I do not think that there was a pint of bees in the hive when I examined it—and they were young ones.

I think that the queeen wanted to go off at once, but she finally consented to cluster in the highest top of the highest limb of the highest maple tree in my yard. I could not climb to where they were. I stood and looked at them for some time; of course I was "riled a little." A squirrel or a "possum" I could shoot, but a swarm of bees could not be—"Hold on," I thought; "something must be done. That pesky queen shall not have it all her own way. I'll try my shot-gun on her."

With gun in had, I ascended a ladder to the top of the house; got a good foot-hold, aimed, and fired right into the body of the cluster. The limb dropped, and many of the bees with it; but they soon returned, and took position on another near the place. I shot them down again, and again they came back, but this time lower down, so that I could climb up near them, and saw the limb off. Many bees were killed, but the queen escaped unhurt. I put them back, and clipped the queen's wings. The second day after, they came out again, but returned, and this was repeated several times. They refused to work, and were as cross as hornets. Finally I "kotched" that little "beast," and slaughtered her, and gave the colony a queen-cell.

Another colony persisted in swarming-out with a queen whose wings were clipped, and finally left—I think without a queen; they did not hatch one out, I know. One colony built 26 queen-cells on one frame, and 8 on another.

On the whole, I am well satisfied with my season's work; but I am exceedingly sorry that I cannot continue in the business. On account of my disability, caused by a gun-shot wound of the neck, I am unable to do the necessary work called for in an apiary of from 50 to 100 colonies—and less than that would not pay. My left side is partially paralyzed, and the left hand is too weak to lift heavy frames.

Lawrence, Kansas.

Sublime Thoughts.

There is a way out of every difficulty that meets us in life. It may not be the way we like, or the way that promises great glory, honor, pleasure or reward, but it is the way of deliverance, and we are bound to consider it God's way.—Joseph Owen.

There is a peculiar and appropriate reward for every act, only remember that the reward is not given for the merit of the act, but follows on it inevitably in the spiritual kingdom, as wheat springs from the grain and barley from its grain in the natural world.—F. W. Robertson.

Whenever we yield ourselves to the true law, a higher principle of order enters into our life; we rise out of childish weakness, out of animalism and evil; we are renewed and transformed into children of light; we become conscious of a steady, upward tendency, and of a godlike and immortal quality.—C. G. Ames in Mail and Express.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 4-6.—International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

No Honey from Golden-Rod.

As it is desired to know the opinion of bee-keepers on golden-rod, I have watched to see the golden honey coming in, but it was all disappointment. I have never seen a bee at work on it in this latitude. I think that it is a poor honey-plant. From heart's-ease and smart-weed is where we get our fall honey. I put 28 colonies into winter quarters in 1888, and wintered them without loss till March 15, 1889, and then I lost 10 colonies by fire, which left me 18, and 5 of them got some foul broody honey at one of my neighbor's, and that disabled them for the season; the balance did well on clover and linden, and increased to 28 colonies again. There is no fall honey here. I have fed back about 300 pounds of honey for winter stores. I winter my bees out-doors, packed with leaves, and have lost none in five years from wintering; neither do they spring dwindle, but come out healthy and strong. JERRY SCOTT.

Clarinda, Iowa, Nov. 5, 1889.

Good Yield of Honey.

On page 556, Mr. H. E. Hill reports that in this (Chautauqua) county the honey crop was a complete failure; but were he here now, he could see that his report was incorrect. My bees never did better. I had one colony that began in May, that contained about a quart of bees, and from them I have sold 100 pounds of comb honey, and they yet have plenty of honey to winter on. My bees have more honey than they can use this winter. I put them into the cellar on Oct. 30. It is very wet here now, but we have had no snow yet, though we have had heavy frosts. I expect to start on a trip to the Western States on Nov. 1. C. D. BARBER.

Stockton, N. Y., Oct. 31, 1889.

Paris Green—Golden-Rod.

About the first of last June I noticed in the morning a lot of bees on the grass in the front of some of my hives; they would crawl together in bunches of 4 to 8, and before night they would all be dead. I attributed it to getting poison from Paris green on the potatoes, as it commenced about the time the poison was used here, and ceased when the use of the poison ended, lasting about ten days. It was so last year, and I lost quite a lot of bees. Two other bee-men had the same experience. It affected the Italians, and scarcely any of the blacks. Has any one else had such an experience?

I bought 8 Carniolan queens the last of the season, and as to handling them, I like them very much.

There is but a little golden-rod near here, but I have watched for ten years, and scarcely ever saw a bee on it until this year, when they worked on it very well in the afternoon; but in New York, across the Lake, in the Adirondack Mountains, I have seen them work on it as well as I ever saw them work on clover. I took 40 swarms over there, and found lots of the honey in the hives, of dark color, but fair quality—not such wonderfully nice honey as one writer in the BEE JOURNAL says. As a national flower, I shall not vote for the golden-rod nor the daisy, as they are a pest here, and are so looked upon. I should prefer the sweet-pea, or, what is best for bee-keepers, the clover blossom.

E. J. SMITH.

Addison, Vt., Nov. 4, 1889.

Best Honey-Flow Ever Known.

This season's honey-flow was the largest and finest that I ever saw in this locality. Bees are apparently in good condition for winter. Scarcity of bees prevented a glutted markets, and bee-keepers are happy to sell at "let live" prices—8 to 9 cents for extracted, and 12½ to 15 cents for comb honey. J. W. CLARK.

Clarksburg, Mo., Nov. 4, 1889.

Golden-Rod and Buckwheat.

Golden-rod is a good honey-plant in this locality, and usually furnishes the bees nearly enough honey for wintering. Buckwheat used to furnish considerable honey, but for the past four seasons it has not given much, and this season scarcely any.

A. W. SMITH.

Parksville, N. Y., Nov. 10, 1889.

Pronouncing "Carniolan."

How is C-a-r-n-i-o-l-a-n pronounced? In conversation with a German, who has spent considerable of his time in Austria, I learned to pronounce it Car-*ni'*-o-lan; but Mr. Alley, on hearing me pronounce it so, smiled all over at my poor German. He says that it should be pronounced *Car'*-ni-*o*-lan, with a big O. If there are any Austrian Germans who read the AMERICAN BEE JOURNAL, I would like to have them give the correct pronunciation of the word, so that we may call things by their right names. E. L. PRATT.

Marlboro, Mass.

[We fully agree with Bro. Alley. The accent is on the first syllable, and on the O. If we are not right in this opinion, will some of our Austrian readers please correct us?—ED.]

Digested Nectar—Golden-Rod.

I have been somewhat interested in the reports as to the value of golden-rod as a honey-plant. I used to think as does Mr. Secor, when I lived in Iowa, that as a honey-plant it was of little value; but I find that here in Missouri, it is a valuable honey-producer, usually producing a good surplus of very fine golden-colored honey, that cannot be distinguished from Spanish needle honey, except by the flavor. The same is true of Spanish-needle in Iowa—I never got any honey from it there, but here it yields profusely.

In regard to the digested nectar controversy, although I am no scientist, I cannot accept Prof. Cook's theory; it may be correct, but it does not look reasonable to me. One reason is, that, according to my idea, it takes time to digest any article in the stomach, and where a colony of bees will gather 10, 20, 25, or even 30 pounds of honey in one day (as we have had reports), it does not look reasonable that they could accomplish such an amount of work, or digestion, or whatever you may call it.

Our honey crop here is small, the white honey harvest being light, and the late honey almost a failure; and, to make matters worse, for me, on July 4, I lost my house by fire, and nearly all that we had in it, with some of my bee-supplies.

L. G. PURVIS.

Forest City, Mo., Nov. 4, 1889.

Cause of Foul Brood.

I learned the bee-business in Germany, but I did not understand the different methods of handling bees that we have in this country. I do not find the cause of foul brood in the bee-book that I am reading. Is it not the queen's fault? Will some one please answer? I do believe that if a queen is too old, she causes foul brood. Some keep queens for 3 or 4 years, when they are good ones, but this is altogether too long. I, for one, never had any trouble with the disease among my bees here in America, but I lost all that I had in Germany, in 1871. I have a good recipe that is used in Europe, and if any bee-keepers desire to know it, I shall be glad to publish it.

The honey season has been very poor in this locality, and the increase was small. I have three out-apiaries, but hardly any surplus honey. I shall now try to winter part of my bees on the roof, as I live in the city, and have but little room, and cellar-wintering cannot be practiced, as my cellars are too damp. JOHN H. BLANKEN.

Jersey City, N. J., Oct. 26, 1889.

Some Questions.

1. After the bees have hatched, will there not be a little case left in the cells? Should it be left in? or can it be removed?

2. I have packed my bees with sawdust in a bee-house. Shall I keep the door open, or not? ALBERT MALLERY.

Portville, N. Y.

[1. Yes, a slight cocoon will be left in the cells after the bees are hatched—but it is such a trifle that it takes hundreds of them to make much difference in the size of cells. The only remedy is to melt up the combs and either give the bees comb foundation, or else let them build new comb.

2. The principal point is to keep the cellar at an even temperature—about 45 degrees. If it is necessary to open the door a short time to do this, then open it. If not, let it remain closed.—ED.]

Season's Results—Shade-Boards.

I put 35 colonies into the cellar about Nov. 15, 1888, which was my first experience in cellar-wintering. They wintered very nicely—all except the 5 colonies that starved, and one that came out queenless. The starving was caused by my taking too much stock in reports of bees wintering on so much less stores in the cellar than when packed out-doors. My increase has been small, partly owing to the loss of queens, and uniting queenless colonies with others; so I now have 33 colonies ready for winter quarters. I have not lost so many queens in the five years previous. Bees built up quite rapidly on fruit bloom, and gathered some surplus from raspberry and basswood, but white clover was almost a failure. Up to the close of basswood, I had taken about 650 pounds of extracted honey, with the brood-chambers almost entirely empty.

Then came sweet clover, golden-rod, etc., from which they gathered enough for winter stores—not a starvation amount either—and 850 pounds of very thick, bright yellow extracted honey, which does very well for Michigan this year. Comb honey in this market retails at 15 cents, while I get 12½ cents for my extracted honey in fruit-cans, or $1.00 for a 10 pound pail. So long as I can sell my entire crop at home, at these prices, I do not think that I shall bother with comb honey. My bees have paid me at the rate of $100 per month, for the actual time spent in caring for them this year.

I derive so much benefit from simple suggestions by my brother bee-keepers, that I want to mention a very convenient and cheap shade for hives, made out of old barrel-staves nailed on strips one inch thick by 2 inches wide, and the length you want the width of the shade. Nail the staves on in single cover with a space between, and then another cover over the openings. They are light, and convenient to put as a temporary cover over many things, when not in use on the hives. An old bee-keeper, to whom I showed them, exclaimed, "Just the thing!" J. M. CLARK.

Hillsdale, Mich., Nov. 1, 1889.

Bees in Good Condition.

My crop of honey is almost all sold, at remunerative prices—8½ cents for extracted, and 12½ cents for comb honey. I think that bees are in good condition to winter. I shall put about 150 colonies into the cellar, which is the proper place to winter bees in Minnesota. H. H. ROSEBROCK.

Owatonna, Minn., Nov. 2, 1889.

Report for the Season.

In 1888 I put 29 colonies into winter quarters, and 28 came through the winter. I sold 2 colonies in June for $5.00 each, increased the balance to 55 colonies, by natural swarming, and took 3,000 pounds of honey in one-pound sections—about 2,000 pounds of white honey, and 1,000 pounds of buckwheat. I have over 2,000 pounds on hand yet, over half of which is white honey. A. F. WHEELER.

Rossville, Iowa, Nov. 1, 1889.

How to Rear Queens, etc.

I commenced with 14 colonies of bees in the spring, and increased them to 20, and extracted 3,000 pounds of honey. I call that good for a beginner. I would like to know how to rear queens from an imported mother. PETER EHL.

Sherrill's Mount, Iowa, Oct. 31, 1889.

[Read Doolittle's Queen-Rearing book, and you will learn all about it.—ED.]

Golden-Rod Honey—Bee-Cellar.

Our good old Granite State is not, strictly speaking, a honey-producer; but in the Connecticut and Androscoggin valleys, there is some fine bee-pasturage. The weather here the first of the season was all that one could desire: the bees were breeding rapidly, and gathering honey fast. About July 5, it began to rain, and it rained all through July and August; by Sept. 1 my 80 colonies of bees were almost destitute of honey. About this time the golden-rod began to bloom, sun began to shine, and the bees went to work, and they did work for about four weeks, early and late; so that by Oct. 1, the 80 hives were pretty well filled with a fair quantity of fine comb honey in sections to spare. Golden-rod did it, for we have no other source of fall honey. The honey was a transparent amber, quite thick, and the flavor was very good; crushed in the comb, and put up in glass jars, it attracted a good deal of attention at the county fair this fall.

I have just completed a honey-house 20x30 feet, 12-foot posted, with a cemented bee-cellar beneath, which will winter about 200 colonies of bees. The cost of the building was about $300. Honey (comb or extracted) sells readily for 20 cents per pound here. A. D. ELLINGWOOD.

Milan, N. H., Nov. 4, 1889.

International Bee-Association.

Mr. R. Holtermann, the efficient Secretary, has sent us the following concerning the coming convention:

The programme for the American International Bee-Association, which is to meet at Brantford, Ontario, Canada, Dec. 4 to 6, next, is not yet complete. However from the following it will be seen that every effort has been made to have a good one. The first session will be at 2 p.m. of the 4th.

Bee-Keeping an Occupation for Women—Miss H. F. Buller, Campbellford, Ont.

Cellar *vs.* Out-Door Wintering—R. McKnight, Owen Sound, Ont.

Shipping Queens—F. H. Macpherson, Beeton, Ont.

Disposal of the Honey Crop—Thomas G. Newman, Chicago, Ills.

Cellar Wintering—S. T. Pettit, Belmont, Ont.

Riding Hobby-Horses—Bee-keeping a recreation from other pursuits, and an antidote for disease—E. R. Root, Medina, O.

Alimentary System or Apparatus of the Honey-Bee—Prof. A. J. Cook, Agricultural College, Mich.

S. Corneil, Lindsay, Ont.—Subject not given.

The President will give his annual address which, doubtless, will be amusing and instructive.

Reduced rates, at least one and one-third fare for return trip, may be secured on the Grand Trunk and Canadian Pacific railway; the latter tickets must be purchased to and from Galt or Woodstock. For further particulars, apply to the Secretary.

Remember you must have a certificate when purchasing your ticket for Brantford on the Grand Trunk railway, or Galt or Woodstock on the Canadian Pacific railway.

Reduced hotel rates ($1.50) may be secured at the Kirby House. The Commercial Hotel also, close to the place of meeting, is a good one-dollar house.

The "International" Convention has a strong claim upon every apiarist, and the attendauce will be very large, no doubt. The Secretary is doing all he can to make ample arrangements for the meeting, and we hope that it will prove to be one of the most profitable Conventions ever held.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributiug the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

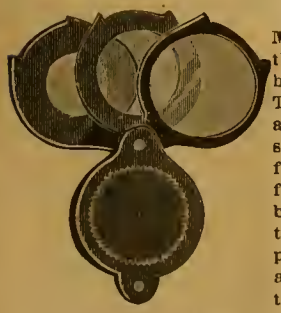
Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.



Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now so CHEAP that no one can afford to do without it.

Honey and Beeswax Market.

CHICAGO.

HONEY.—Receipts of comb are averaging about as they usually do with a fair crop. Prices rule at 13@14c. for choice to fancy 1-lbs., which comprise the bulk of the receipts, very little in sections averaging 1½ @2 lbs., and sells at 10@12c½.; dark, 8@10c. Extracted, 6@8c.

BEESWAX.—25c. R. A. BURNETT.
Nov. 8. 161 South Water St.

KANSAS CITY.

HONEY.—White clover and linden 1-lbs., fancy, 14@15c.; good, 13@14c.; dark, 12c; the same in 2-lbs., 13@14c.; dark, 12c. Extracted, white, 8c.; dark, 7c. Demand is good. Sales large for this time of year.
Sep. 27. HAMBLIN & BEARSS, 514 Walnut St.

DENVER.

HONEY.—We quote: In one-lb. sections, 16@18c.; off colors, 14@16c. Extracted, 7@8c.

BEESWAX.—20@25c.
Sep. 20. J. M. CLARK COM. CO., 1421 15th St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.

BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Demand for white clover 1-lbs. is improving, but price depends upon size and style of package, condition and appearance when received, ranging from 12@13½c.; basswood, 11@11½c.; buckwheat, 8@10c. Extracted, 6½@7½c., depending upon style and size of package.

BEESWAX.—27@28c.
Nov. 9. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Demand fair. Western honey arriving freely, and prices declining. We quote: Fancy white 1-lbs., 14@15c.; 2-lbs, 12@13c.; off grades and mixed 10@12c.; buckwheat 1-lbs., 10@11c.; 2-lbs., 9c. Extracted white clover and basswood, 7½c.; orange bloom, 8½c.; California, 7½c.; buckwheat, 6 cents; Southern 70@75c. per gallon.

HILDRETH BROS. & SEGELKEN,
Nov. 8. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Fancy 1-lbs., 16@17c.; fair, 14@15c.; 2-lbs., 15@16c. Extracted, 8@9c. Market is in fairly good condition, but we are getting some of the odd grades from Western New York, Michigan and Wisconsin, and it is not arriving in very good condition, making it hard to sell.

BEESWAX.—None on hand.
Oct. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A quiet but steady demand for choice comb, at 14@16c. Fair demand for extracted at 5@8c

BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Nov. 9. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs. 13@14c.; dark, 10@12c.; white 2-lbs. 12@13c.; dark. 10@12c. Extracted, white, 7@8c.; dark, 6c.

BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

Convention Notices.

☞ At the request of several bee-keepers, I hereby make a call for a meeting at Higginsville, Mo., on Thursday, Nov. 14, 1889, at 9 a.m., for only one day, for the purpose of organizing a bee-keepers' association. Let all bee-keepers attend, that can do so.
J. W. ROUSE, Santa Fe, Mo.

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

We will Present a Pocket Dictionary for two subscribers with $2.00. It is always useful to have a dictionary at hand to decide the spelling of words, and their meaning.

A New Premium.

The National Purchasing Co. of this city issue a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement with the Manager, Mr. C. L. Seavey, we are enabled to make this remarkable offer: We will forward a Membership Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL for one year with $2.00. This offer is good only until Dec. 31, 1889.

☞ The Harrisburg *Telegram* is preparing a complete history of the Johnstown disaster, which will be published shortly in an elegant volume. It is proposed to make the book a valuable souvenir of the great calamity, excellent alike in matter and illustration. The text will be from the pen of the editor, who is thoroughly acquainted with the subject and with the district, while the most eminent artists will furnish portraits and views engraved from original drawings and photographs. We advise those who desire a superb volume, worthy of a place in any library, to wait for the forthcoming work. Experienced canvassers are desired as local agents to solicit subscriptions, and should write at once for territory.

☞ The *Forum*, for November, 1889, contains the following very interesting articles: American Rights in Behring Sea, by President J. B. Angell; Public Opinion and the Civil Service, by E. L. Godkin; Modern Claims upon the Pulpit, by Archdeacon F. W. Farrar; The Owners of the United States, by Thomas G. Shearman; Industrial Co-operation in England, by Prof. F. G. Peabody; Municipal Control of Gas Works, by Bronson C. Keeler; The Cost of Universities, by President David J. Hill; Wendell Phillips as an Orator, by Carlos Martyn; Requirements for National Defense, by Adj-Gen. J. C. Kelton; The Domain of Romance, by Maurice Thompson; Types of American Women, by Prof. Hjalmar H. Boyesen. For sale by all booksellers.

☞ A remarkable paper on "Financial Panics, their Cause and Cure," is the leading editorial contribution in *Frank Leslie's Illustrated Newspaper* last week. It is from the pen of Gen. Spinner, the veteran former Treasurer of the United States.

Apiary Register.—All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and begin to use it. The prices are as follows:

For 50 colonies (120 pages).....	$1 00
" 100 colonies (220 pages).....	1 25
" 200 colonies (420 pages)	1 50

THE AMERICAN BEE JOURNAL
CIRCULATES
ALL OVER THE WORLD
PUBLISHED BY
THOS. G. NEWMAN & SON,
CHICAGO, ILL.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Nov. 23, 1889. No. 47.

EDITORIAL BUZZINGS.

☞ We are sorry to learn that on account of failing eye-sight, Mr. Willis M. Barnum, of Angelica, N. Y., has to give up all literary work. He is to undergo an operation as soon as possible, which we hope will result favorably.

☞ The bee-keepers of Tuscola county, Mich., expect to organize an association soon. Any one interested may obtain particulars by addressing H. E. Gordon, Unionville, Mich.

☞ Please notice our latest Premiums for getting new Subscribers, on page 751 of this issue. It will pay every reader to endeavor to procure new subscribers for us. We ought to get thousands of new readers during the next two months.

☞ Mrs. Mahala B. Chaddock died on Nov. 12, 1889, at her home in Vermont, Fulton county, Ills., after an illness of six weeks. Pneumonia was the cause. In her latest poem, published on page 696, the last two stanzas were quite prophetic—"She Sleeps 'Neath the Whispering Leaves."

☞ The *Bee-Keepers' Review* for November gives the following "notice" of the Honey Almanac:

Of the many interesting and valuable books and pamphlets gotten out by that indefatigable worker, Thomas G. Newman, the latest is a "Honey Almanac." Recognizing that honey is a luxury, the sale of which must be *pushed*, Bro. Newman has given bee-keepers this lever with which to do the "pushing." Each alternate page is an illustrated calendar, while the remaining pages are filled with interesting facts, figures and suggestions concerning the uses of honey for food, beverages, cooking, medicines, vinegar, cosmetics, etc.

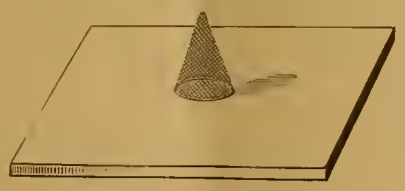
Reese's Bee-Escape.

Mr. Z. T. Hawk, of Audubon, Iowa, writes as follows concerning this useful implement which is described and illustrated on page 727 of our last issue. He says:

On page 697 Frank Coverdale describes a wire-cone escape for cleaning the bees out of the section-cases. The device may be original with Mr. Coverdale, but it is the bee-escape invented by Mr. J. S. Reese, of Winchester, Ky., and illustrated and described in *Gleanings* more than a year ago. There is also an illustration of the improved device in the Nov. 1 issue of that paper. It is an exceedingly useful implement in the apiary, as I have demonstrated by actual use, and I should be very sorry to see any attempt to detract from the credit that is justly Mr. Reese's due.

Here is the description of the simplified bee-escape above referred to:

I am now using with great success and pleasure my bee-escape made wholly of a flat board and a single cone. The board is just the size to cover the T super or surplus case, and may have bee-space or half bee-space above or below, or both, as needed, and the 2-inch hole is put through the board at such a point that the cone will fit down into the lower or unfinished case of sections. When you have taken one section out temporarily, and this point will be determined by the width of section used, this cone may be about 3½ inches long, and is easily made from a piece of wire-cloth 6 inches square, by turning a piece of hard wood to about the shape desired, as a form, and shape the cone over it. The cone may be attached to a piece of thin board with a hole in it instead of the board direct, so the cone may be easily taken off, and all snugly stored away for the next season.



Reese's Simplified Bee-Escape.

Now, to take off the last case of sections at the close of the season, just place an empty super over the brood-chamber; lay the escape board on, with cone down, of course, and set the case of honey on top. The few lurking bees that will remain in the top case will all be old ones, and will not show fight when you remove the cover, but will be glad to fly back home.

In this empty case over the brood-chamber, when no honey is coming in between the spring or early summer flow and the fall flow, you will find the bees will cluster very quietly, and be out of mischief. This last plan will not get the bees out quite so clean as the first plan I wrote you about sometime ago, but it has the advantage of forcing the bees into the empty case of sections at once, and giving them no empty space to cluster and build comb in the case that would contain the cone. I have been rather persistent in presenting to you and the public this discovery; but I know very well its merits, and it is cheap (no patent and no booming). Try them.

J. S. REESE.

Winchester, Ky., July 16, 1889.

☞ Mons. H. Hamet, for 33 years editor of *L'Apiculteur*, at Paris, France, died on Oct. 6, 1889, aged 74 years.

The International Convention.

The following from the President of the International American Bee-Association, is in reference to the coming convention:

I have several times been requested to suggest to those expecting to attend the convention at Brantford, Ont., the desirability of taking with them a sample of both extracted and comb honey (a pound or more), having marked on it the name and location of the producer, the kind of honey, and the wholesale and retail price of the same in their locality. Those not in attendance can send samples, if they wish, in care of the Secretary, Mr. R. F. Holtermann, at Brantford, Ont., charges prepaid; and if thought best, judges could be appointed by the convention to examine and report on the samples, and it would give all an opportunity to see, taste and compare honey from different localities. Any one having anything new, novel and useful in bee-culture, would do all a favor by also having such on exhibition.

A. B. MASON.

We have received the following in regard to reduced railroad fares, etc., from Secretary Holtermann, of Brantford, Ont.:

Applications for reduced railroad certificates are already pouring in. Bee-keepers of the United States must come to our side of the boundary line to get reduced rates. On the Michigan Central railroad no reduced rates can be secured, but they can be had on the Grand Trunk and Canadian Pacific railroads. Railroad certificates can be procured from me; if the applicant travels on the Canadian Pacific road, tickets must be purchased for Woodstock or Galt, and from there get a ticket on the Grand Trunk railroad for Brantford. In this case, you must send for two certificates from me.

The Commercial Hotel at Brantford will board members of the bee-convention for 75 cents per day; at the Kirby House for $1.50. Both hotels are near the place of meeting, the former being a $1.00 house, and the latter $2.00 per day. There is a sample room for the display of hives and other bee-supplies in the Kirby House.

R. F. HOLTERMANN.

Our "Home Journal."

Here is a letter unsolicited and unexpected, which is all the more valuable and welcome, and speaks for itself:

FRIENDS NEWMAN:—I wish to say that we appreciate your ILLUSTRATED HOME JOURNAL *very highly* at our house. Out of some 25 or 30 different papers taken by us, none excel it for *highly intellectual and moral worth*, if any equal it. In these days, when nearly all of the papers of our land are vieing with each other to get hold of something sensational, of the accident, or "blood and thunder" nature, it is a relief to pick up so *clean* a paper as yours, once a month.

Thanks, friend Doolittle. Our aim is to get something for the family which will afford instruction and amusement, and at the same time be unobjectionable, and pure in tone and spirit.

☞ We will send both the BEE JOURNAL and HOME JOURNAL from now until the end of 1890 for $1.75. The Christmas number of the HOME JOURNAL contains Christmas stories, poems and illustrations. Send early and get that number.

Honey Almanac.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

Here is what is said of it by those who have seen the Honey Almanac :

I have just been looking through the "Honey Almanac." Almanac! it is rather a cyclopedia of useful knowledge. It reveals to us the wonderful curative powers of honey. Who would not rather produce it than be a King upon his throne?—Mrs. L. Harrison, Peoria, Ills.

The "Honey Almanac" is a novelty, and I wonder that such a publication has not been thought of before. I am much pleased with it, and think you do not misstate the facts when you say, "Wisdom would distate that a million of them be scattered by the first of January"—only in making the number too small. It is just the thing to keep honey before the people. It is a cheap and permanent way of advertising honey.—A. B. Mason, Auburndale, O.

The "Honey Almanac" is just the thing. If freely distributed it will sell tons of honey, not only for the present, but in the future. It is well gotten up, and the person suggesting it should receive a vote of thanks from all honey-producers.—H. D. Cutting, Clinton, Mich.

The "Honey Almanac" is at hand. The idea is a novel and an excellent one. and I believe it will pay well for bee-keepers to put it into the hands of the people; also to secure places for it in conspicuous positions where it may be read by many.—R. F. Holtermann, Romney, Ont.

The "Honey Almanac" has just come to hand, and I must say that it is just what it was promised, and it is also just what bee-beepers have been long in need of, a strong lever, and instructor to enlighten the people concerning honey for food as well as medicine. It lacks nothing in matter of interest, and is perfection in general.—(Rev.) S. Roese, Maiden Rock, Wis.

The "Honey Almanac" is just received, and carefully examined. It surely will be a powerful "worker" in the hands of the producer of honey, as well as all who contemplate dealing in any way in a pure article. One of the many grand features of the Almanac, and of which every bee-keeper should be proud, is the refutation of the falsehood about so-called "artificial comb honey."—J. M. Hicks, Indianapolis, Ind.

The copy of the "Honey Almanac" is to hand. We believe that it will be a grand educational medium among the masses, regarding the many uses to which honey may be put. Being practical publishers, we may say that the price is very reasonable, and should make large sales; and these, in their turn, should assist in disposing of the crop, if judiciously distributed.—F. H. Macpherson, Publisher *Canadian Bee Journal*, Beeton, Ont.

The "Honey Almanac" is in every respect good. Its recipes for cooking are all truthful to my certain knowledge, and should help to sell the honey crop. To get honey into more general use, and get a remunerative price for it has been the hardest thing to accomplish in my long life as a bee-keeper, and my progress has been slower and less satisfactory than in any other branch of the business of bee-keeping I have tried to master.

To show you that our large crop of this year has all been bought up and shipped to the cities at 10 cents per pound, how many tons of honey must a bee-keeper have to see much money at this price? Our competition is getting to be of the worst kind. My honey crop is mostly in my honey-room, and will remain there until next summer, unless I can get 12½ cents per pound for white clover and basswood, and 8 cents for darker and buckwheat—all of it in small sections. At these prices, bee-keepers can only make one hand wash the other.—R. Dart, Ripon, Wis.

The "Honey Almanac" is received. It is a beautiful piece of work, both typographically and in the "make-up." Containing, as it does, so many valuable recipes, etc., makes it a very convenient piece of literature for every household. Let me congratulate you on your method of handling the different kinds of honey on the last page. It is well done. And the "Wiley *lie*" is refuted in good style. I hope you will be able to place an Almanac into the house of every purchaser of honey during this and the coming year.—E. L. Pratt, Marlboro, Mass.

The neat "Honey Almanac" came to hand. I am surprised to note the many uses enumerated to which honey may be applied in cooking, medicine, etc. The dealer in honey, and the producer, could well afford to supply the Honey Almanac to their customers, and thus help the trade, by spreading a knowledge of the uses to which honey may be put.—L. F. Abbott, Lewiston, Me.

It has been a pleasant task on my part to examine the new "Houey Almanac." It is certainly a very complete exposition of honey, and its useful qualities. A judicious circulation of the Honey Almanac among the people cannot fail to bring the good qualities of honey as a food and a medicine in its most favorable light before the public.—G. W. Demaree, Christiansburg, Ky.

The "Honey Almanac" is received, and its contents are examined. It "fills the bill to the dot." I am only sorry that over 3,000 cases of honey handled this season does not each contain one. No honey dealer should pack or ship a case of honey without the Almanac accompanying the same.—J. W. Bittenbender, Knoxville, Ioa.

The "Honey Almanac" recently received has been read with pleasure and interest. I should judge that its contents are of the right kind to fit it as a missionary in the cause of honey production and consumption. In one house it will be kept at hand for use.—S. B. Ryder, Brandon, Vt.

The "Honey Almanac" is received, and judging from its make-up in general, and the object of its issue in particular, I think that it will be a great help in selling the honey crop when distributed among the consumers. It suits me to a T.—J. F. Latham, West Cumberland, Maine.

I am pleased with the "Honey Almanac." It is a useful, convenient, and interesting pamphlet. I think it will encourage the use of honey, and help to sell it.—Franklyn Howland, Agricultural Editor of *Standard*, New Bedford, Mass.

The "Hone Almanac" is received. We sell all our honey by the barrel. If we were selling at retail we think it would pay to give away a lot of the Almanacs.—E. France & Son, Platteville, Wis.

The "Honey Almanac" is just "a dandy." I must have some of them.—L. W. Lighty, East Berlin. Pa.

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages. Cooking, Medicines, Cosmetics, Vinegar. etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers. and increasing the fruit product. Instead of being an injury to fruit. bees are the fruit-growers' best friends.

Beeswax, its uses, how to render it, and its importance as a commercial product, is described, and 17 useful Recipes are given.

Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

QUERIES and REPLIES.

Ventilation of Bees Wintered in the Cellar.

Written for the American Bee Journal

Query 669.—How can I give my bees ventilation in the cellar, this winter? Would it do to put one thickness of sacking on top of the honey-board, then put on the cap? Last winter I had trouble with dampness in the hives. My cellar is very dry.—Iowa.

I have no experience in cellar wiutering of bees.—M. Mahin.

Leave the cap off entirely. Leave it on the summer stand, and mark the number of the hive on it.—Dadant & Son.

Keep the temperature in the cellar even at 45 to 50 degrees, Fahr., and leave the cap off. Keep the mice out of the cellar.—J. M. Shuck.

I only leave the entrance wide open. I find they do just as well with a board cover as with cloth, etc.—A. J. Cook.

I do not make any provision for ventilation above, but I like a large entrance. Most of my hives have a two-inch space under the bottom-bars.—C. C. Miller.

I do not believe that your bees need any more ventilation than they now have. The "sacking" scheme will work well, just as you propose.—James Heddon.

Give large entrance ventilation, but never give any top ventilation. If you confine all the heat on top, you will not have any dampness to cause trouble.—H. D. Cutting.

Put plenty of absorbents over the brood-frames; raise the body of the hives ⅜ of an inch from the platform, by the use of blocks, and keep the temperature as near 45 degrees as you can.—J. M. Hambaugh.

By removing the bottom-board and leaving the bottom of the hive open. The sacking would do little good. I cannot think that the dampness in your hives did any material injury.—R. L. Taylor.

If you use the sacking in the manner you propose, and raise the hive a full half inch from the bottom-board (in case this is movable), I should think that you would have no trouble with dampness. If the bottom-board is fixed, open the entrance and all ventilating holes to their full capacity.—J. P. H. Brown.

Proper ventilation of the cellar or repository is generally obtained by either surface or sub-earth outlet. I would advise the use of at least two layers of sacking.—Will M. Barnum.

I use no caps on the hives in the cellar. Two or three thicknesses of old carpet, or a bee-quilt, is as good as anything over the frames. I do not use a honey-board while the bees are in the cellar.—G. M. Doolittle.

Your cellar is probably too cold. In my judgment, it is the cold that causes the condensation—the inside of the hive being warmer than the outside. If the outside temperature is 45 to 50 degrees (45 degrees preferred, as the bees are more quiet), and never colder, I hardly think that they will need more ventilation than they have in summer.—Eugene Secor.

No system of ventilation in cellars will prevent dampness in hives, if the cellar is too cold. The temperature should never go below 41 degrees in a dry cellar, and it should range much higher than that in a damp cellar. A light, porous packing over the frames is the best covering. Leave the entrances as in summer time, and take off the caps.—G. L. Tinker.

Leave the entrances open the full width. One or two thicknesses of sacking or carpet will do nicely, but it would be better to leave the "cap" off entirely. A wooden cover with a bee-space between it and the brood-frames is as good as anything, and better than any kind of packing, when wintering bees in the cellar.—C. H. Dibbern.

There are many ways of ventilating; any plan that will allow access of air at the bottom, and allow it to pass out at the top of the hive, will give ventilation; the amount can be judged to suit circumstances or fancy. With a perforated honey-board, the plan that you mention is as good as any.—J. E. Pond.

In my opinion, your cellar needs more ventilation, and not your bees. Before we put in a sub-earth ventilator, honey stored there would get wet, although the cellar is one of the driest. I would not put on the caps, but cover the sacking with a piece of carpet, a "comfort," or something of that kind; put sticks across at each end, and place on another hive above.—Mrs. L. Harrison.

"Iowa" conveys the idea that upward ventilation of his colonies is a necessity in his cellar; I have succeeded just as well in wintering without, as with, upward ventilation. I never winter my bees out-doors—I cannot afford it. I use quilts instead of honey-boards, and leave them on the hives when put into winter quarters, just as the bees fixed them in the fall, *but* the bottom-boards are removed from the hives. If the "sacking" is such as will retain the heat made by the bees, it will be all right. I would leave off the "cap" or cover.—A. B. Mason.

When engaged with my experiments with bees in the cellar, winter before last, I found that a colony of bees could be drenched with condensed water in a week's time, by simply putting enameled cloth over the frames, thus checking all upward ventilation. With a burlap covering they were kept practically dry, the moisture escaping through the porous cloth. After all my experiments that winter, I concluded that no material tended so much to keep the bees dry, as a clean cloth, over the tops of the frames.—G. W. Demaree.

Dampness is generally of no particular detriment to bees wintered in cellars. You can ventilate the cellar, but it will not entirely prevent dampness, if it is naturally damp; but as yours is a "dry cellar," simply take off the caps and leave the entrances open as usual. The sacking will do very well as suggested.—The Editor.

How and When to Move an Apiary a Short Distance.

Written for the American Bee Journal

Query 670.—1. I shall be compelled to move my bees this winter about 50 feet from the present location. How can I best do it? 2. At what time would be best? I practice out-door wintering.—Ohio.

I would move them at any time now. Place some obstruction before the entrances, and they will adjust themselves to the new location.—H. D. Cutting.

Toward spring, or just as late as possible, before they have a general flight. Move them so quietly that they will not know they were touched.—James Heddon.

I would do it on some evening. Place some boards or obstructions in front of the entrance, and it will all be well—no loss to amount to anything.—J. P. H. Brown.

The correct time for moving bees is during the middle of winter. The best way for so short a distance would be to move them by wheelbarrow.—Will M. Barnum.

I would move them after a two or three months' confinement, if possible, and arrange them as nearly as possible as they previously stood on the old stands.—J. M. Hambaugh.

Move them when it is too cool for flight. Put the hives in the new location, in the same order as in the old one, and lean a wide board over the entrance to each hive.—J. M. Shuck.

I would move them while the weather is warm. I moved bees once during cool weather, and after their first flight, I could scoop up the frozen bees. Had they had an all-day flight, they would have found their way back.—Mrs. L. Harrison.

Any time. Face the hives about, and place a board over the front. Nearly all will go to the new home all right. Keep watch the first day they fly, and if some do go back to the old place, put a box on the stand, and return them at night. We moved all of ours twice last year, with no loss.—A. J. Cook.

Within the last week I moved some colonies about 10 feet, and turned the hives completely around. To-day the bees have been flying all day, and I could not see that any got lost.—Eugene Secor.

Move them at any time during the winter, after the bees have been confined to the hive for three or more weeks. Bees always mark their location anew on their first flight in the spring.—G. M. Doolittle.

They may be moved at any time late in the winter, before spring flights occur, with little loss. Two men should be able to carry them the 50 feet, without much disturbance to the colonies.—G. L. Tinker.

1. In your hands, as at that time of the year it is well not to excite the bees. 2. At the beginning of the longest term of unbroken cold weather of the winter, so that the bees will be more likely to re-locate their hives when they at length come out for a flight.—R. L. Taylor.

It is a very unpleasant job at any time, unless you can move them a foot at a time. We would prefer to do it in the spring, although it may do now. Put a slanting board in front of every entrance, when you move them, to show them that there is a change of location.—Dadant & Son.

The moving should have been done during warm weather. As the matter now stands, I should move them all at once after the bees had done flying for the day, and place a board against the entrance of each hive—not, however, so as to close the entrance, but to cover it. Make the old stand as unrecognizable as possible.—J. E. Pond.

I should remove them after they had been confined a long time in their hives, and just before a flight in early spring. Place a wide board in front of each hive, to cause the bees to mark their new locations.—C. H. Dibbern.

Move them in the evening, after it begins to get dark. If practicable, let the hives front towards the old location. Place them as nearly as possible in the order in which they were before; and remove everything from the old location, as far as practicable, with which the bees were familiar. There will be no trouble. I have tried it.—M. Mahin.

1. I do not know, but probably by getting some one to help you carry them. 2. I do not know, but I think that a good time would be, as soon as settled cold weather comes. Have the places fixed to put the hives, and move carefully, without disturbing the bees; and if placed in the same relative positions in the new location, as they now occupy, there would probably be no trouble, especially if a short board be leaned up against the front of each hive, till the bees have re-marked their location.—A. B. Mason.

In the past ten years I have twice moved my entire apiary about 100 feet, and with entire safety to the bees. I selected a day in the winter that was just cold enough to keep the bees quietly in the hives; having first staked off the new site, the hives were borne between two men, and placed on their new stands, as nearly as possible as related to each other, as they were on the old site, which was cleaned up, and changed in appearance as much as possible. As a further precaution, a couple of shingles were leaned up in front of each hive. There was some confusion apparent on the first warm day that followed, but all was soon quieted after a few flights.—G. W. Demaree.

Move them very gently towards spring, and place a board or some obstruction over the entrances, so that the bees will mark their hives anew when they come out for a general flight.—The Editor.

Botanical.

I enclose a specimen of honey-plant of the mint family. It has a jointed root. Please name it for me. Is it very noxious on a farm? Chas. B. Fritts.

[It is wood-sage (*Teucrium Canadense*)—one of the mint family, all of which produce honey of excellent quality. It flourishes on low, wet ground. It is sometimes called "American Germander," and is very common in the wet lands of the Northern States. It is not a noxious weed.—Ed.]

CORRESPONDENCE.

CARNIOLANS.

The Characteristics of this Race of Bees Described.

Written for the American Bee Journal

BY E. F. QUIGLEY.

Since my report on page 268, I have had some inquiry about the Carniolan race of bees. I would say that they are as good honey-gatherers, with me, as the best Italians. They do not crowd the brood-chamber, if given a chance to store above, and a smaller number will enter a surplus case and work. They use very little propolis, their sections are clean, as compared to other bees, and the sealed honey has a fine appearance, the capping being very white. They have not been so bad about swarming for me as the Italians, and they are much gentler than other races.

The Carniolans get out early, and have worked later in the sections—in fact, they were the only ones giving any fall surplus. All swarms were hived in one section of the new Heddon hive, and none of them swarmed again. I believe that they will stand contracting better, and contracting will relieve the surplus of bees that are reared in large hives.

They are quiet in winter, and in summer they are slow about settling. The progeny of the queen introduced to a cross colony, are not so gentle at first as they will be afterwards; this disappointed me for a time, therefore I shall use my best colony as nurse-bees.

They cling to the combs better than black bees, but not so well as the Italians. They defend their homes well, but I have never seen one trying to rob another colony. This fall they found some wet candy that was thrown out by a groceryman within 10 yards of some Italians, and the Carniolan bees had carried it nearly all home before the other bees found it. I noticed them working very busy, when the others were not flying, so I hunted them up, with the results as stated.

It takes but little smoke to subdue them, and some of them can be handled without any. A small swarm of the Carniolans stored 48 pounds of surplus white clover honey in the comb, and still have about 25 pounds in their hive. I shall breed for gentleness and honey-gathering qualities.

Care should be taken that the surplus honey is not taken away too close, as they will store all the honey above, leaving the brood-chamber empty; this is a valuable trait if properly used. My system is, to give them a case of frames of empty comb, placing it below, about the close of the clover harvest, and as the queen goes below to lay, the case above is filled with honey as soon as the bees hatch, and at the close of the season the lower case is removed, crowding the bees into a small space for winter. I shall discard all other bees, for I like the Carniolans, all things considered, better than any other race of bees.

Unionville, Mo., Nov. 1, 1889.

THE SIERRAS.

The Black-Incense Cedar Yields Thick Honey.

Written for the Western Apiarian

BY S. L. WATKINS.

The "black-incense cedar" is one of the best honey and pollen yielding trees of the Upper Sierras. This species of cedar abounds only in certain locations, growing at an elevation of about 4,000 feet above the sea-level.

It is a singularly beautiful tree, with its black, shiny bark, light green foliage, and striking appearance, distinguishing it from its other companions of the forest. These species of cedar sometimes attain a height of from 150 to 200 feet, and frequently 8 feet in diameter. The young trees are generally gathered into family groups, each sapling exquisitely symmetrical, with the primary branches whorling irregularly around the axis of the tree, while each is clothed with its light, green, feathery foliage.

It does not seem to be particular as to the soil it grows on—smooth or rocky, wet or dry; it makes out to live well on all of them.

Old trees of this species are usually dead or broken off at the top, caused by winter snows and winds; trees thus broken off, usually send out young shoots which grow up parallel with the main axis of the tree.

In the fall of the year they are loaded with myriads of beautiful, small yellow cones, producing a golden tinge, which gives the tree a very beautiful appearance. It is about this time of the year that it begins to yield honey, which seems to exude from the bark and the twigs of the tree. Some seasons the trees are just dripping with it. This honey exudes from the trees for about two weeks; at the end of that time it crystallizes, and looks like small drops of granulated sugar on the under side of the limbs; the first rains usually wash it all off.

I have made several experiments to determine whether it was the work of *aphides*, or plant-lice, which usually cause the so-called honey-dew.

This honey cannot be extracted at all, on account of its great density; the combs would be torn to pieces before the honey would start to come out.

The honey gathered from this source has a spicy, cedary taste, not at all unpleasant. Some people prefer this kind of honey to all others, myself among the number. This honey is of a beautiful straw color, weighing between 12 and 13 pounds to the gallon.

The botanical name of the incense cedar is *Libocedrus decurrens*; but this species of black-incense cedar is entirely different from the common kind. I once came across a variegated incense cedar, half of the foliage of which was a dark green, and the other half pure white. Viewed from a distance, the tree looked as if it were covered with white flowers. Whether this is a distinct species of cedar, or only a freak of nature, I am unable to state. I should be pleased to hear the opinions of California botanists on these two varieties of Cedar.

EXTRACTORS.

Description of a Ten-Frame Honey-Extractor.

Written for the American Bee Journal

BY LOUIS C. KOEHLER.

On page 677, Mr. Poppleton says that he is using a honey-extractor which extracts 6 frames at the same time, and he probably believes that he has something good. At the same time he says if any one has any better extractor, let him describe it. All right, I have it.

Last winter I made an extractor, the can of which is made of galvanized iron, 29 inches in diameter, and 26 inches high. It has 3 legs 12 inches long, bringing the can 12 inches from the floor. The central shaft, to which the revolving comb-basket is attached, is a ¾-inch iron rod, connected directly with the gearing above, and resting on a cone at the bottom. The revolving comb-basket is made of ⅛x⅜ inch steel, and is large enough so as to leave a 1½-inch space between the basket and the can.

I can extract ten frames at the same time. My bee-hives are all the 10-frame style, so I can finish the frames of one hive at once. The frames in the surplus apartment are 18x5½ inches.

The principle upon which it works is a very simple one—a band running around small wheels fastened to the shafts of the revolving comb-baskets.

(I can put in ten frames, so it takes 10 wheels.)

When I wish to reverse, I simply take hold of the nearest comb, and turn it, and all of the others will do the same. It takes no time to change sides, and it is a perfectly smooth and noiseless operation.

I am not afraid to assert that nothing so successful has been placed before the bee-keeping public. The perfect facility and great rapidity with which it works, will enable the operator to throw out 200 per cent. more honey in a day than he can with the non-reversible style.

I wish my bee-keeping friends could be on hand during a honey-flow, and see it work, extracting ten frames at once. The handle is attached to a horizontal rod extending outside of the can. The motion of the crank and basket being always in one direction, there is no slamming or banging, as is the case where the reversing of the comb-pockets depends on the sudden reversing of the crank and basket.

Manitowoc Co., Wis.

SURPLUS HONEY.

Preparing the Bees for Winter—Selling the Surplus, etc.

Written for the Western Plowman

BY C. H. DIBBERN.

The bee-season is now entirely over, and all preparations should be completed early this month for the safe wintering of our bees. It will be found very difficult to handle frames now, and if such preparation requires this, it should have been done earlier.

Many bee-keepers contract their hives by taking away the combs, and this can still be done if one goes about it in the right way. I would prefer to do this early in the morning, before the bees begin to fly around the apiary. I would also want to feel reasonably sure that a day warm enough for bees to fly is to follow. Blow a few puffs of smoke in the entrance, then quickly pry the honey-board off with a hatchet or other tool, and blow a little smoke under it, and quickly throw a rubber cloth over the top of the hive. The bees will generally be found clustered near the center, and can be readily removed by pulling the rubber cloth cover to the other side. Insert the division-boards. Blow a little smoke under the cover as it is removed, and replace the honey-board. One wants to be quick about this kind of work now, or the bees will be on the war-path. It is also well to give them a puff or two of smoke at the entrance occasionally, as they have a habit of boiling out and making life miserable.

CELLAR WINTERING.

How shall we best winter our bees? That is a "condition, not a theory, that confronts us." While I am decidedly a cellar winterer, I have no fault to find with those who differ from me. It is all a question which is best, the easiest for us to do, and the safest for the bees. Could I know for certain that each month of our long winters would give us a few warm days, I should feel perfectly safe in leaving them on the summer stands with little protection. But in this section we can never feel sure that we will have such a winter, and the only safe way is to expect a hard, long winter every year. If the bees can have a good flight late in November, just before removing them to winter quarters, I feel reasonably safe that they will come out all right in the spring.

Should bees be packed with chaff or many quilts if wintered in a cellar? I think not. A layer or two of old rag carpet, or some other suitable cover, is all that is necessary. Out-of-doors it is different. Not only every hive should be protected by every means at hand, but the whole apiary should be protected by a tight board fence on the north and west sides. Those who have but few hives can probably go to the trouble of getting dry-goods boxes and packing them around the hives, with chaff, leaves, etc., but what an endless task this would be when one has two to three hundred hives to prepare. It would certainly be much easier, as well as safer, to "pack" them into the cellar. The bees are in excellent condition for winter, as they are generally strong in numbers, and are well supplied with a fine quality of honey—no honey-dew this year, and I feel no anxiety as to their safe wintering.

THE TREMBLING DISEASE.

Some bee-keepers still seem to be greatly troubled by what is known as the trembling or nameless disease. We had a number of colonies affected two years ago. We then gave them a good sprinkling of salt water a few times on top of the frames, and also kept salt water dripping from a barrel where the bees could get all they wanted, and the disease soon entirely disappeared. We believe that this salt-water cure is effective every time, if thoroughly applied.

SELLING THE HONEY.

The market for our surplus is still the main topic with many bee-keepers. Of course, when we have a good crop there is the usual talk of over-production, and that after all bee-keeping "don't pay." Such fellows are apt to compare their hard lot with the rich banker, who, they imagine, has nothing to do but lounge in his luxurious office while his cashier loans somebody else's money, taking iron-clad security and his interest in advance. Well, it is always some one else that seems to have an easy time of it.

But really, is the honey business so bad? Some people do not seem to be able to sell anything. Many bee-keepers belong to this class. They can produce the finest queen, have good hives, implements, work hard and secure fine crops of honey, but when it comes to selling, they are all at sea. Now instead of studying the markets, and looking over our vast country and finding a market there, they will dump it on an over-stocked city near home, or try and work it all off cheap to a few neighbors. Such men lack business capacity.

With me it has been different. I have never yet had a season that I could fill all my orders. This year, since I have had honey off the hives, it has gone like "hot cakes," and I have not had to sell at very low prices, either. Early in the season I made my prices, and have not been obliged to "come down." Of course I have lost some sales by parties claiming that they could buy for less from Tom, Dick or Harry. But I have had orders from first-class customers as fast as I could pack the honey, and my stock will be gone long before Christmas. Now what good would more orders at low prices do me? The trouble is, that there is no business about many, and they do not understand proper distribution. I believe there is a paying market for all the honey that will be produced in this country for many years to come, if the proper market is hunted up and supplied.

WINTER QUARTERS.

The last week in November is the time to be getting the bees into winter quarters. It is a good idea to let them have a flight as late as possible, as the winter will be long enough, anyway. The only danger in waiting very long after or about Nov. 20, is that no warm day will come, and that the hives will become covered with snow and ice. When so covered, and in cold weather, it is not only disagreeable work, but the jarring and cracking in getting the hives loose and removing covers greatly disturbs the bees. Then, too, the combs are apt to be covered with ice, which will melt as soon as put in, thus wetting the bees, and making a bad beginning for wintering the bees safely.

Milan, Ills.

QUEEN-EXCLUDERS.

Rearing Queens Above a Queen-Excluding Honey-Board.

Written for the American Bee Journal
BY HENRY ALLEY.

It may be fair for Mr. Doolittle to describe my oldest method of rearing queens (page 663) in comparisou with what he terms the latest and only practical method of rearing queens; yet the fair-minded will hardly so consider it. On the same principle, if Mr. D. desired to show the good points of the hive he is using, in comparison with the one I am using, he would bring forward the old box-hive that I used 30 years ago.

As Mr. Doolittle made no allusion in his article to my latest method of rearing queens above the queen-excluder (not honey-board), I must think that he is unacquainted with my *very latest* methods for rearing queens. For the sake of Mr. Doolittle's credit for fairness, let us suppose he has read nothing in the bee-papers since August, 1888.

Mr. D. has labored hard, as will be observed by his very thin argument, to make the readers believe that his method is not a "fussy" one. Mr. D. says: "Certainly the making of the cell-cups cannot be what is alluded to as 'fussy,' for these can be made during winter evenings."

Well, if making cell-cups as described by Mr. D. is not a "fussy" job, pray tell what is, properly speaking, "a fussy job." Considering the fact that the comb containing eggs can be used in separate cells, prepared and fastened to the comb, or upon a stick, much quicker and easier than the cell-cups are prepared by Mr. D., is my reason for applying the word "fussy" to Mr. Doolittle's method.

For years I have used single cells, and the eggs in them for cell-cups. This year I have had wonderful success by that method of having queen-cells built. Twenty-five cells can be attached in a row to the bottom of the comb of one Langstroth frame; between each cell there will be a space not less than one-fourth of an inch. Does not Mr. D. think that this method is far more in accordance with nature, than the artificial cell-cups that he makes? The labor can be performed in less than one-half the time required to make the artificial cell-cups.

One other point that should be noticed here, is this: "Next we have the getting of the larvæ for the cups, and the two cells which contain the royal jelly, which is to be put into each of the cups." It seems strange that Mr. D. has ready-made queen-cells on hand at all times, *and never has any queenless colonies.* I stated in the "Handy-Book," that I have no queenless colonies in my apiary. I meant it, and renew the statement here. The only thing we shall differ upon, is as to what constitutes a colony of bees.

When a colony of bees has been deprived of its queen while the combs are full of brood, it is, properly speaking, a queenless colony; but when the bees are taken from the queen and brood, that, then, is not a queenless colony—these are queenless bees, and nothing more. Now a queenless colony is never found in my apiary. I know too well the importance of having a queen in each hive.

Having made that matter plain, let us look again at what Mr. D. says in commendation of his method of rearing queens. Mr. D. produces figures to show with how much less time and expense he can rear queens by his method, than I can by that old-fashioned method of mine.

Does Mr. D. really suppose that it takes me one hour to do the same work that he says he performs in 3½ minutes? What an idea! Let us see: I reared 2,500 queens between May 20 and Sept. 25—that is, that number of cells were started in that time. This made 17 weeks, and I devoted less than one hour each week in the preparation of these cells or cell-cups.

Mr. D. should know that I do not confine bees in a swarm-box ten hours in order to prepare them for cell-building. Then, again, suppose I do—what can be the harm? Is any time lost in the operation? Can there be any objection to keeping kees so confined for any length of time? So far as spending any time in putting bees confined in the swarm-box into the cellar, I will say that I never found it necessary to do that in all my 30 years' experience, any more than I have found it necessary to make artificial cell-cups. I prefer to let the bees do the latter work for me; and the former need not be done unless one chooses to do it.

Mr. Doolittle must find no fault if I express an opinion of the quality of the queens reared by the methods he recommends. With 30 years' experience, wholly devoted to rearing queen-bees, I feel able to give an opinion as to what are the best methods for producing queens. I am sure that queens reared above a queen-excluding "honey-board" when no hatching brood, and but a few young bees, and only those that happen to stray into the chamber are present, are not first-class queens. Does not every man who has had any experience in bee-culture, know that young bees will not leave the brood-nest and take up quarters on cold, dry combs? You might as well expect a small chicken to desert the old hen at night and nestle under a block of ice. If there are no young bees to build the cells and nurse the larvæ, how can good queens be reared? Mr. J. A. Green, one of the best authorities on bee-matters, says this on page 805 of *Gleanings* for 1889:

> A great deal of experimenting has no doubt been done this season with the new methods of having queen-cells built and queens fertilized above perforated metal. So far as my experience goes, it is easy to get cells built while there is a queen in full vigor below, though these cells are by no means of the first quality, except under favorable conditions.

What are those favorable conditions? Why, young bees by the thousands, and stores in abundance. Or, in other words, just the conditions that the colony is in when about ready to cast a swarm, and not dry combs and old bees. I have always made it a practice to put my colonies in the swarming condition before using them for cell-building. The proper way to put a colony in that condition is by liberal feeding when natural forage is not abundant; any other method does not come under the head of queen-rearing.

We all know that there is a demand for queens when bees are not in a condition to swarm; hence we must devise the best means to procure queen-cells. I know of no better way to rear queens than by having the cells built in a hive that is solid full of brood, young bees, and with a laying queen present.

Wenham, Mass., Oct. 21, 1889.

COMB HONEY.

The Proper Way to Produce Honey in the Comb, etc.

Written for the American Bee Journal
BY FRANK COVERDALE.

It often occurs to me how particular we are to secure nice, white sections, and this is right; but what kind of a section-case should be used? We have been in the habit (at least a great many of us) of placing the sections on the hives with the top and bottom exposed to the bees, getting them colored and propolized, and waxy and sticky they are, for a knife will not clean them. Not only is it much more unpleasant to handle them, but it shows a great loss in appearance, which is of so much importance in the grocery store, or our city market; for the eye must be pleased first.

The foregoing state of affairs, along with breaking and leaking of sections, is very detrimental to our comb honey market. As I chanced to be at Clin-

ton, Iowa, I made it my business to inquire as to the condition of the honey market, and as I went from store to store, I found a goodly amount of this sort of honey which was selling at from 8 to 9 cents per pound; of course this honey was dark in color, but if the sections had been nice and clean, it would have been better in appearance, and would, without a doubt, have sold for a higher price; for who is it that has money in his pocket, that can pass by a lot of nice, clean sections full of comb honey, and not be tempted even so much as to buy at least one?

The "Honey Almanac," in my opinion, will prove to be a grand success, and will aid much in consuming our health-giving sweet. I would suggest that where one bee-keeper thinks that he cannot afford to get 1,000 Almanacs, he can get two of his bee-keeping neighbors to send with him. They should then be scattered all through the land, and when we have educated the people of the United States to eat a little over half a pound apiece per annum, our honey market will annually be in a better condition.

Welton, Iowa.

OLD COLONY.

The "Queen of Rosendale,"—a Colony 50 Years Old.

Written for the American Bee Journal

BY J. S. BARB.

On page 316 is a short letter describing an old colony of bees that we have on our place here in Oakfield, O. I thought that this was a pretty old colony—it *is* an old colony, at least for this section of country; but while I was on a visit to Virginia this fall, I saw a colony of bees that is a little older than the colony we have. This colony belongs to Mr. George W. Rosenberger, of Rosendale, Rockingham Co., Va., and is called by him "The Queen of Rosendale"—a name which is quite appropriate.

I will give the history of this "Queen of Rosendale," and will first give a copy of an article in the *Bee-Keepers' Magazine*, of August, 1880, which was written by Mr. Rosenberger, describing the "Queen of Rosendale." The article is headed, "Lessons from an Ancient Bee-Hive," and is as follows:

DEAR SIR:—I thought that it might be some pleasure, as well as some information, to give a short sketch of an old colony of black bees that I own. Just forty years ago this June, there came out of my father's hives at this place, a second swarm, containing about half a gallon of bees; he said to me, then a boy, if I would get a hive and put them into it, I might have the bees. I did so, and put them on a plank on one side of the yard, where they remained until the commencement of the late war. They were then moved to the attic of my dwelling-house at Rosendale, where they remained four years, flying in and out of a window, and storing from 20 to 40 pounds of surplus honey per year.

As soon as the war was over, they were brought down from the attic, and placed on a stand under a pear-tree in the yard, where they are to-day, in an average prosperous condition. I call this old mother of all my bees, hived forty years ago, the "Queen of Rosendale." She and her succeeding daughters down to the present time, have been swarming until they are now the mother of a large number of colonies. How often this old mother has swarmed, I know not, but very frequently, I assure you; and she has always given me from 20 to 40 pounds of nice surplus comb honey annually. I have from her, so far this year, 20 pounds; the second box is nearly full, and will be completed in a few days, which will make 40 pounds for this season.

I have never kept an account of the amount of honey that they have produced; I am sorry now that I did not, but if this could be given, it would afford both pleasure and information that would be worth knowing. I think that I might state, without fear of exaggeration, that this colony of bees has produced 25 pounds of surplus comb honey per annum; this would be in the forty years, 1,000 pounds, and say at 18 cents per pound, it would be worth $180; and if all the surplus honey produced by her daughters, or colonies originating from this old queen, was computed correctly, it should amount to the nice little sum of $1,000. This goes to show what can be done by the keeping of a few bees, requiring no loss of time.

The hive in which the bees have resided for the last forty years, is made of pine lumber, one inch thick; the outside measure of the hive is 12x14 inches, and 19 inches high. There never has been any comb removed from this hive since the bees were first put into it, consequently the combs are as old as the hive. I am unable to see any difference in the size of these bees, as compared with any others in my apiary, although some have been reared in new combs less than one year old.

G. W. ROSENBERGER.

New Market, Va., June 25, 1880.

The above is given just as Mr. Rosenberger had written it. I remember reading it, and knew I had the paper containing it among my bee-papers, but I did not think, when reading the article, that I would ever get to see this old colony, which I did see on Sept. 28. This old colony is still alive, and in good condition, and is yet in the same old hive, and the same comb that was built the first season.

Mr. R. has a very nice home, situated near the grand old Massanutton Mountains, and is in a very good section of the country for keeping bees. When I was there his bees were working on the wild asters, which are quite plenty in that locality.

I will now give you a few items in regard to the "Queen of Rosendale," which were given to me by Mr. R., while I was at his place:

The "Queen of Rosendale" was hived in 1840, put in a common box-hive, and is still in the same hive, and doing as well as any colony in his yard; has stored regularly from 20 to 40 pounds of comb honey yearly, making at least 1,200 pounds in 49 years, which, at 15 cents per pound, would make $180; has swarmed nearly every year, and on one occasion it swarmed three times, and the third swarm had five queens. The comb in the hive is the same made first 49 years ago, and the bees are just as large as they ever were. The queen is black—the common bee of the country. If any one has an older colony, I would be pleased to hear from him.

This year I have 65 colonies, and will have about 1,200 or 1,400 pounds of comb honey, which is worth 16 cents per pound here at home. Several years ago I had 27 colonies, and produced 1,727 pounds of comb honey, which I sold for $12.52 per colony, on an average.

We had a very poor season here this year for bees, especially the forepart, but through September, bees did better than ever before during the fall. I have sold over 100 pounds of fall honey, and still have some left. G. W. ROSENBERGER.

WISCONSIN.

Satisfied with the Results—Golden-Rod Honey.

Written for the American Bee Journal

BY ALBERT H. LIND.

I have no reason to complain about the honey crop this year, as my average is about 125 pounds per colony, spring count. I sold all of my comb honey at home at 14 cents per pound, while grocers at Fond du Lac (our nearest market) were buying good honey for 11 and 12½ cents.

A certain bee-keeper in this vicinity sold his honey at 11 cents per pound to "get rid of it," as he said; and after awhile he came out to my apiary and bought honey for relatives or friends in Chicago, and paid 14 cents, when he had sold his honey for 11 cents. The above shows the folly of rushing honey into market, at ruinous prices.

HONEY FROM GOLDEN-ROD.

On page 636 a general opinion as to the value of golden-rod as a honey-plant, is asked for. With me it has never been a total failure, as bees could always be seen working upon it; but I also think that it is at times overrated as a honey-plant, for the honey is dark, and must be sold at very low figures.

I send a clipping from the New York *Sun* for Sept. 22. It reads thus:

IT IS A BAD YEAR FOR BEES.—New Haven county and the adjoining county of Fairfield, are the two great honey sections of Western Connecticut. Thousands of pounds of honey are shipped from here to the New York market, and New Haven county buck wheat and clover honey are very popular. This year, however, the shipments of this concentrated sweetness will be small. The present season has been the worst for a long time past, and the bee-keepers will barely get enough money to pay them for the bother of taking care of their bees.

The long-continued wet weather has spoiled the honey of the flowers, diluted it,

as it were, until the bees would not touch it. Besides, the weather had a bad effect on the bees themselves. They became lazy and out of sorts. They would not leave their hives for any distant flight, and, when disturbed, they would sting with unusual energy. They accumulated no honey, and, for a living, they used their reserve stock, eating it all, and more than one bee-keeper has had to feed his bees to keep them alive.

With the blooming of the golden-rod came the bright, warm weather, and it seems that now more than ever the bee "improves each shining hour." The golden-rod contains an unusually fine quality of honey, and in every field where it has obtained a foothold, and along every country road, the bees are seen literally covering the bright yellow flower.

This shows that golden-rod yields honey in Connecticut.

The Honey-Bee.

Written for the American Bee Journal

BY MRS. FRED GRAHAM.

Bronze and gold, gauzy wings and merry hum—
Watch them how they go and come,
Extracting honey from every flower,
Working patiently hour by hour.

Do you know they a lesson teach
To all who come within their reach—
Busy, dainty little bees,
That gather honey from flowers and trees?

If we improve the time each day,
In the end, we will find, 'twill pay;
Taking each duty nearest at hand,
We then will be a working band.

Doing a kindness, cheering a friend,
Will pay us always, unto the end.
Let each one strive with all his might,
To do his work well, and cling to the right

Maumee, Ohio.

APIARY WORK.

It is No Child's Play, but Regular Work.

Written for the Prairie Farmer

BY MRS. L. HARRISON.

I would as soon be stung by a bee as be "bored" by an individual who wants to talk bees, and only knows that they "make honey" and have a terrible sting. I have a neighbor, who several years ago, captured a very large swarm of bees, and they have increased considerably since. This woman wants me to tell her what to do; and when I offer her books and papers, refuses them, saying, "I have no time to read them."

Of course she has all the time that there is, and prefers to use it in making fancy articles to adorn her home and person, rather than in studying bee-culture. When her bees swarm, she wants me to hive them. This I cannot do, for while away hiving her bees, I might lose my own; also to take off and put on surplus boxes. She wants the profit derived from keeping bees, but does not want the work of self-denial necessary to it.

"Good morning, Mrs. Harrison; I've come to spend the day with you, and ask your advice about my undertaking to keep bees. I must do something to earn some money, and I've noticed you, as I passed by, working with bees, and thought I might keep them, too. Do you ever get stung?"

"See here, my friend, I'm a busy, practical woman, and no time to sit down. I've a day's work to do in the honey-house, and if you want to learn about the business, I'll loan you a wrapper and an apron, and you can help. I'm not quite ready to go there yet. Suppose you start the fire in the honey-house; you will find the kindling and coal there, already."

"I never could build a fire, and it will spoil my hands, so I cannot crochet this beautiful white phantom. I do love fancy work, but I make so little money at it."

"You may as well know, right now, that bee-keeping is no child's play—plenty of hard work, and, if you choose to make it so, disagreeable. I have lived long enough to learn that every way of earning money has sooner or later its sting. In your fancy work, it's poor pay—you can scarcely earn the water that goes into your soup. You seem to like sitting in an easy chair, with some one to keep fire for you, while you run your fingers through that delicate wool. But the pay, is where the shoe pinches.

"I am now ready to work in the honey-house, and you can come if you choose. The work that I shall do today, is as much a part of running an apiary, as hiving swarms."

"Can I bring my fancy work and watch you?"

"No; you can either help work or stay in the parlor, or go home. It's no place for fancy work. Here is some work that you will be glad to do if you ever keep bees, and that is to remove these sections from this case—glad that you have honey for your work. Take this wide chisel and scrape off the propolis and comb from top to bottom; now with this thin-bladed case-knife, loosen the sections from the case all around; put these two little pieces of pine board on the table for the ends of the case to rest upon, and turn over the case. Take this little piece of board, which I call a 'follower,' and lay it across one row of sections, and tap gently with the hammer.

"Go over every row of sections in this way. Now they are all slipped down into the space made by the little sticks. Lift off the case—see! you was not careful enough; you let the corner of one section dig a hole into the face of that section, and now it cannot be packed as No. 1, for it will run and daub up a case. See, I have made a pan of manilla paper and fitted into the bottom of this shipping-case. If there should be any drip, the pan catches it, and keeps it from running out of the box and making a dauby mess. Put all the perfect sections in it which will be marked No. 1, and the imperfect ones into that pan, and they will be sold to customers who come here.

"This is one of the beauties of a home market; all pieces of comb honey like the section you broke just now, are never allowed to accumulate, but are sold for a less price than No. 1 sections, to persons who call to buy.

"Scrape off the propolis and bits of comb from the table into this all-metal sieve, and set it over this pan; I will pour boiling water over it, and put it into the oven. You will be surprised at the pretty, light-colored wax which will run down into the water from this refuse. We must not forget it, or it will run over, as soon as it boils.

"Here it goes, now. I will remove the seive to another pan, and set this out to cool. As the wax is all melted now, I will scrape the residue into a paper, and keep it to start the fire in the morning; for if I put it into the stove now, it will make a roaring hot fire, and cause that other pan to run over, and the burning wax would soon fill the house with bees, unless the door is kept shut.

"Look at the first pan of wax; how pretty it looks, now it is cool. I will pour the water from under it. Some day I will re-melt the wax, and cool it in tiny cake-pans, which make little cakes, that sell from here to laundry-women for a nickle apiece. The large cakes are sold to druggists who deal in oils and paints. There are sun wax-extractors, which are lined with bright tin, and covered with glass. The product from these sells for a few cents higher than when melted with fire heat. These are used exclusively in California, for both honey and wax. The wax will be in a cake on top, and the honey underneath."

Peoria, Ills.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 4-6.—International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

1890.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Secley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Golden-Rod in Louisana.

The golden-rod, which has been, and is, in full bloom in all the fields around us, for the past few years devoted to the cultivation of rice, has been full of bees for the past month; there seems to be much nectar in it. Heretofore our bees have stored no honey from the plant, that we know of—I have never known the bees to work upon it until this season. There has been a very unusual yield of honey this fall—from two to three gallons to the hive have been stored by good colonies, since the last extracting in June. MRS. I. B. FOX.

Jesuit's Bend, La., Nov. 8, 1889.

Pleased with the Results, etc.

I have always been a lover of bees and honey, and never could get enough of it until this season, which was the best I ever had, both as to honey and increase. I had 20 colonies, spring count, and now have 50 strong colonies, and took 2,000 pounds of comb honey, the best colony storing 130 pounds, and from that down to 5 pounds, and even 2 colonies produced nothing. This proves that bees are just like men—some prosper, while others are drone-like. My experience in wintering bees is, that it is best in the cellar, in a dark corner, with outside ventilation. I do not know anything about golden-rod here, but what we call sweet clover is getting abundant along the roadside, which is good bee-food. The AMERICAN BEE JOURNAL is what every bee-keeper ought to take and read.

H. DIERDORFF.

Franklin Grove, Ills., Nov. 8, 1889.

Drone and Queen Traps.

Mr. Edsall, on page 651, states that he placed an Alley drone-trap on a hive, and that the swarm left, and then he asks "why?"

Mr. Alley's answer (page 707) may be the correct solution, but I suspect not. All drone and queen traps depend for their utility upon perforations in metal plate. These perforations, in order to allow as much room for workers to pass as possible, are so large that a very small queen can pass through them.

Now bees attempt to swarm with the trap on the hive, just the same as if there were none on, and they usually cluster just the same, and return just the same as other swarms without a queen so often return. This will be continued from day to day, until some small queen hatches that can pass through the metal when they swarm, having a queen with them, will go off as they would if no trap were used. The bees do not destroy the young queens under this treatment for some 3 or 4 days or more, and not until they are wholly discouraged about getting away, when they will kill all but one, and settle down for work.

Sometimes several young queens may be seen in a good trap at once, and there is a good opportunity to study their habits with relation to each other, and their treatment by the bees. The largest and best queens usually are the most quiet, and pay but little attention to anything that is going on, save to escape from the trap; but the smaller ones frisk about more, or sometimes hump up their backs and stand there, piping. They are, I think, the only ones which would be likely to attack and kill a rival queen. W. M. WOODWARD.

Bonfield, Ills.

Shipping Queens by Mail.

I have just read, on page 715, Chas. Dadant & Son's response to my article in a former issue. I was not aware that Mr. Dadant had given to other parties the honor due to Rev. L. L. Langstroth and myself. Mr. Langstroth shipped queens by mail before either Mr. Townley or Mr. Alley did—then why did Messrs. Dadant erroneously mention that certain parties were entitled to credit for priority? They charge me with "ire," but I am not conscious of manifesting ire toward Mr. Langstroth; certainly I have not shown ire toward Messrs. Dadant, and their bestowal of it upon me, is strictly gratuitous from a large fund. C. J. ROBINSON.

Richfield, N. Y.

Blue Lettuce as a Honey-Plant.

1. Please give the name of the enclosed flower. It grows very sparingly in the fields around here, and blooms from about Sept. 1 until about the middle of November. Bees work on it in preference to golden-rod. 2. Does it yield honey?

The fall crop of honey was a total failure here, although golden-rod bloomed profusely, also many other fall flowers. Bees do not work on golden-rod much, and I think that it yields but very little honey. We do not have any trouble in wintering our bees, if we leave them plenty of honey, and keep moths and other insects out. The AMERICAN BEE JOURNAL is prized very highly, and is a welcome weekly visitor. I think that all bee-keepers ought to take it.

W. R. TATE.

Durant, Miss., Nov. 6, 1889.

[The plant is a species of blue lettuce (*Mulgedium floridanum*). In all probability it yields honey like the rest of the great composite family to which it belongs. —CLARENCE M. WEED.]

Packing Bees for Winter.

I am very much pleased with the AMERICAN BEE JOURNAL, and I would not do without it as long as my bees help me to make a dollar. Mr. Doolittle's way of introducing queens is a good one; it is done with a great deal less loss than any other.

I got one colony of bees on April 1, 1885, and it gave me 3 swarms the first year; I now have 56 colonies, weighing from 55 to 79 pounds per colony. I took off 1,050 pounds of comb honey, and 54 pounds of extracted. I am selling my comb honey at 16 to 18 cents per pound. I have the pure Italian bees, and know but little about other races of bees. I winter my bees out-of-doors, making boxes over the hives for some, 12 inches wider than the hives, so that I can fill in 6 inches all around the hives with chaff, and a cushion on top. Some I place 6 to 8 or more in a row, drive a few stakes, and board up back and in front of the hives high enough so that I can cover them handily, and fill up with chaff the same as done with the others. So far both methods have proven successful. I prefer clover chaff for packing, and generally pack the bees about Nov. 20, or the last of that month, as the weather and time permits, for I have 115 acres of land, and, with the bees, I am kept hustling, as I do the most of the work myself. I am very careful, however, not to neglect my bees, for I appreciate them highly. I am well pleased with my success in bee-keeping. My bees are not only good workers, but they are very gentle. J. C. BECHTOLD.

Bippus, Ind., Nov. 12, 1889.

Rearing Bees for the Winter.

I have several colonies of bees that hatched out all of their brood by Sept. 20. Will they live through the winter, so as to breed up next spring? Some of my neighbor's bees are in the same condition. The fall honey crop was a failure here, on account of drouth. My crop was 1,400 pounds of comb honey from 15 colonies, spring count, besides increasing to 45 colonies. N. C. ANDERSON.

Knoxville, Ills.

[Oh, yes; it is better to have bees bred later, but if they have enough honey, and are not affected by other detrimental causes, they will be quite likely to winter well.—ED.]

Hiving Bees in California.

I hived a swarm of bees here week before last; they had no place to settle, and were creating a disturbance out in the road. A team drove through them with a terrified driver, but the horses were not stung. I held up a five gallon coal-oil can, and they soon settled. I dumped them into a cheese box, and put them back of the grocery-store, and they are now contributing their daily quota to the throngs of Italians buzzing around the raisin-packers. All the bees that I have seen here, are large, yellow Italians. The stock was introduced years ago by Mr. Harbison.

A friend of mine told me that a swarm settled on a peach-tree last August; and last week, when they plowed the orchard after the rain, one of the boys brought in a pail-ful of comb honey, which he had knocked off the limb. Bees require so little attention that very few bee-keepers here know anything about them. An old rancher looked on in astonishment the other day, while the bees were settling on the coal-oil can. He said that he had kept bees for 20 years, but never had yet been able to find out how to "herd 'em" like that.

J. L. WOOLFOLK.

El Cajon, Calif., Oct. 28, 1889.

Aster and Golden-Rod Honey.

I send you the two varieties of a plant that grows here, and a sample of the honey that they produce. Please to give their name. You will see that about all the difference is in the color of the bloom—the one white, and the other purple. Here they grow in a light, loamy soil, and they would be some of our best honey-plants if they would bloom in July, instead of October and November; but they bloom so late in the season, when bees have but few days that they can leave the hives. The honey from the plants is capped as white as linden honey, and has a beautiful appearance; but there is one great fault about this honey—it candies as soon as stored in the comb, and it is impossible to extract it from unfinished sections.

I think that bee-keepers cannot prize golden-rod too much in this locality. We have five different varieties growing here, and they are our main dependence for winter stores, and in some years they furnish most of our surplus honey. I also send a sample of golden-rod honey. How does this compare with golden-rod honey that has come to your notice?

This season there was no surplus honey stored before Aug. 20, when the best honey-flow commenced that I ever saw, and lasted until Sept. 17. From 43 colonies, my surplus was about 700 pounds of comb honey, and 500 pounds of extracted. Bees in this neighborhood are in good condition for winter. F. J. KRUMM.

Pleasant Bend, O., Nov. 7, 1889.

[The plants sent belong to the numerous family of asters, all of them being excellent honey-producers, and if they bloomed in July instead of in the Fall, they would be of great value for their honey.

The golden-rod honey compares favorably with other samples sent to this office.—ED.]

Fine Rains for White Clover.

We are having fine rains, which are good for the white clover. I will soon send my report in full. I think that I can "show" with any of them, and it is not far from what I thought it would be.

JOHN BLODGET.

Empire, Mo., Nov. 7, 1889.

Bee-Keeping in Iowa.

The past season was a very poor one in this part of Iowa, which includes the whole western portion of the State, but toward the southern line of the State, I think that the yield is better, with large yields in the central and eastern parts of the State. Last spring I put out of the cellar 50 colonies, without any loss in wintering, but several colonies proved to be queenless; I think this was caused mostly after they were put out—possibly I made some mistake in cleaning them out. I sent to the South and procured queens in April, and they did well. I got one queen from Georgia, that did exceedingly well. I think that it pays to get queens, under such circumstances, from our Southern apiarists.

My yield the past season was only about 25 pounds per colony, with an increase of 20 colonies, all in good condition for winter. The weather is warm, and the bees are flying as in summer. Our small yield in this section was not caused for lack of bloom particularly, but more from atmospheric conditions. I have never taken less than 70, or more than 150 pounds, on the average, in six years, until the past season, and I feel a little on the "cheap order" now. I am not an enthusiastic admirer of the golden-rod. EZRA J. CRONKLETON.

Dunlap, Iowa, Nov. 11, 1889.

Poisoning the Bees.

I think that the "Honey Almanac" is a grand thing. I would be pleased to do more for the Bee-Keepers' Defense Fund, but I feel unable to do so, for the following reasons: During the honey harvest my bees were poisoned to such an extent that I did not take one pound of honey. I think that if they had not been poisoned, I would have had a harvest of eight or ten thousand pounds of comb honey, as we had, in this locality, an exceptionally good season. I had only 3 swarms, and these came out early, before the poisoning commenced. My number, spring count, was 91 colonies, all in splendid condition. Others may yet suffer as I have. I do not expect to have the nefarious work repeated on me, for it has been denounced in such strong terms by all parties in this vicinity, that those who did the mischief would rather the circumstantial evidence was not so strong as it is. I have consulted legal authority, but I am advised, as the evidence is only circumstantial, to not undertake to prosecute. There will be no action brought, and the Union will not have any expense in this case; but if they injure me so badly again, I will assume the expense then.

San Jose, Calif. MOSES BRAY.

Experience of the Season.

I started in the spring with 12 colonies of bees, and some were very weak. I increased them to 19 colonies, and prevented swarming as much as possible. I took about 400 pounds of honey, mostly extracted, only about one-half crop, and have rendered about 30 pounds of beeswax. I have reduced my bees to 6 colonies, as I am going to move to Columbus, O., this week.

J. A. RICKENBACHER.

Gahanna, O., Nov. 4, 1889.

International Bee-Association.

The programme for the American International Bee-Association, which is to meet at Brantford, Ontario, Canada, Dec. 4 to 6, next, is not yet complete. However from the following it will be seen that every effort has been made to have a good one. The first session will be at 2 p.m. of the 4th.

Bee-Keeping an Occupation for Women—Miss H. F. Buller, Campbellford, Ont.

Cellar *vs.* Out-Door Wintering—R. McKnight, Owen Sound, Ont.

Shipping Queens—F. H. Macpherson, Beeton, Ont.

Disposal of the Honey Crop—Thomas G. Newman, Chicago, Ills.

Cellar Wintering—S. T. Pettit, Belmont, Ont.

Riding Hobby-Horses—Bee-keeping a recreation from other pursuits, and an antidote for disease—E. R. Root, Medina, O.

Alimentary System or Apparatus of the Honey-Bee—Prof. A. J. Cook, Agricultural College, Mich.

S. Corneil, Lindsay, Ont.—Subject not given.

The President will give his annual address which, doubtless, will be amusing and instructive.

Reduced rates, at least one and one-third fare for return trip, may be secured on the Grand Trunk and Canadian Pacific railway; the latter tickets must be purchased to and from Galt or Woodstock. For further particulars, apply to the Secretary.

Remember you must have a certificate when purchasing your ticket for Brantford on the Grand Trunk railway, or Galt or Woodstock on the Canadian Pacific railway.

Reduced hotel rates ($1.50) may be secured at the Kirby House. The Commercial Hotel also, close to the place of meeting, is a good one-dollar house.

R. F. HOLTERMANN, *Sec.*

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

Your Full Address, plainly written, is very essential in order to avoid mistakes.

If You Live near one post-office and get your mail at another, be sure to give the address that we have on our list.

Give a Copy of "Honey as Food and Medicine" to every one who buys a package of honey. It will sell lots of it.

Dr. Miller's Book, "A Year Among the Bees," and the AMERICAN BEE JOURNAL for one year—we send both for $1.50.

If you Lose Money by carelessly enclosing it in a letter, it is without excuse, when a Money Order, which is perfectly safe, costs but 5 cents.

New Subscribers can obtain the full numbers for 1888 and 1889 for $1.80, if application be made at once, before all the sets of 1888 are gone.

Paper Boxes—to hold a section of honey for retail dealers. We have two sizes on hand to carry sections 4¼x4¼ and 5¼x5¼. Price, $1.00 per 100, or $8.50 per 1,000.

Preserve Your Papers for future reference. If you have no **BINDER** we will mail you one for 60 cents; or you can have one FREE, if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

Please write *American Bee Journal* on the envelope when writing to this office. Several of our letters have already gone to another firm (a commission house), causing vexatious delay and trouble.

Pure Phenol for Foul Brood.—Calvert's No. 1 phenol, mentioned in Cheshire's pamphlet on pages 16 and 17, can be procured at this office at 25 cents per ounce. Not being mailable, it must go by express.

In order to pay you for getting *new subscribers* to send with your renewal, we make you this offer. For each yearly subscriber, with $1.00, you may order 25 cents worth of any books or supplies that we have for sale—as a **premium.**

A Home Market for honey can be made by judiciously distributing the pamphlets, "Honey as Food and Medicine." Such will create a demand in any locality at remunerative prices. See list on the second page of this paper

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Triple-Lense Magnifiers for the inspection of bees, insects, etc. They are invaluable in the conservatory, or if for only a very few plants. For boys and girls, they make very pleasant studies, and arouses in them a laudable enthusiasm for investigation. Price, by mail, 80 cents; or the AMERICAN BEE JOURNAL for one year, and the Magnifier, for $1.50.

A Handsome Present.—As the convention season is now on hand, we will make every subscriber this good offer: Go and call on your neighbor who keeps bees and ought to take the BEE JOURNAL. Get his subscription and one dollar for a year; send it to us, and we will *present* you a copy of the Convention Hand-Book, by mail, postpaid, for your trouble. Here is a grand chance for all to get a valuable book without costing them a cent!

Every Hand-Book contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. They sell at 50 cents each, and are nicely bound in cloth covers.

Please to get your Neighbor, who keeps bees, to also take the AMERICAN BEE JOURNAL. It is now so CHEAP that no one can afford to do without it

Honey and Beeswax Market.

DETROIT.

HONEY.—Demand is fair for comb at 13@15c. per lb. There is more dark honey than light. Extracted, 8@9c.

HONEY.—1-lb. comb, 15@18c. Extracted, 7@8c.
BEESWAX.—20@25c.
Nov. 11. J. M. CLARK COM. CO., 1421 15th St.

MILWAUKEE.

HONEY.—Choice white 1-lbs., 14@15c.; 2nd grade white 1-lbs., 13@14c.; old dark 1-lbs., 10c.; new, 10@11c. Extracted, white, in barrels and kegs, 7@8c.; in tins and pails, 8@8½c.; dark, in barrels, 6@6½c.; in kegs, 6@7c. Demand steady.
BEESWAX.—22@23c.
Nov. 11. A. V. BISHOP, 142 W. Water St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb boney, fancy white 1-lbs, 16c.; 2-lbs., 14c. Fair 1-lbs., 14c; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Demand for white clover 1-lbs. is improving, but price depends upon size and style of package, condition and appearance when received, ranging from 12@13½c.; basswood, 11@11½c.; buckwheat, 8@10c. Extracted, 6½@7½c., depending upon style and size of package.
BEESWAX.—27@28c.
Nov. 9. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Demand fair. Western honey arriving freely, and prices declining. We quote: Fancy white 1-lbs., 14@15c.; 2-lbs., 12@13c.; off grades and mixed 10@12c.; buckwheat 1-lbs., 10@11c.; 2-lbs., 9c. Extracted white clover and basswood, 7½c.; orange bloom, 8½c.; California, 7½c.; buckwheat, 6 cents; Southern, 70@75c. per gallon.
HILDRETH BROS. & SEGELKEN,
Nov. 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Fancy 1-lbs., 16@17c.; fair, 14@15c.; 2-lbs., 15@16c. Extracted, 8@9c. Market is in fairly good condition, but we are getting some of the odd grades from Western New York, Michigan and Wisconsin, and it is not arriving in very good condition, making it hard to sell.
BEESWAX.—None on hand.
Oct. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A quiet but steady demand for choice comb, at 14@16c. Fair demand for extracted at 5@8c
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Nov. 9. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs, 13@14c.; dark, 10@12c.; white 2-lbs, 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

Convention Notices.

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excluding honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

If you desire to know how this can be done—how to have Queens fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees can fly—all about the different races of bees—all about shipping Queens, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.; or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 170 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

A New Premium.

The National Purchasing Co. of this city issue a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement with the Manager, Mr. C. L. Seavey, we are enabled to make this remarkable offer: We will forward a Membership Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL for one year with $2.00. This offer is good only until Dec. 31, 1889.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

☞ We want 8 numbers of the BEE JOURNAL, viz: December, 1875, January to June, 1876, and April 30, 1881. If any one who has them will sell them, he will please write us a postal card and state price. Do not send any numbers until we order them, for we only want one copy of each.

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Nov. 30, 1889. No. 48.

EDITORIAL BUZZINGS.

☞ In going to the International Convention from the United States, the Grand Trunk railway is the best to take, as that runs to Brantford without change.

☞ Our Premium List, consisting of 8 pages of uniform size with this JOURNAL, will be issued and sent with the next number. We have many *new* Premium offers, and hope our readers will prepare in advance to devote a few days in getting up clubs for our Journals. All the Premiums apply alike to both of our periodials, and all clubs may have subscriptions for either or both Journals, as may be desired.

☞ The *Canadian Honey Producer* will cease to exist after issuing the December number. The chief cause is the removal of the editor to another field of labor. His announcement concludes thus:

To the public generally we may say, that the *Canadian Honey Producer* is self-sustaining; and every prospect that its subscription list would increase. Yet, as before stated, there are difficulties in the way which would not be easy to surmount. We trust no one will attempt to publish a new bee-paper. There are enough good ones at the present day, and but little room for more.....

In closing we would here say, we consider we have kept faith with our readers; doubtless we have made mistakes, yet we have made it our aim to publish the *Canadian Honey Producer* in the interest of our readers, therefore any mistakes made we trust will be considered as made unknowingly, and hence all the more readily pardonable. Do not let us be misunderstood—whenever we have seen clearly that we have erred, we have never flinched from correcting the statements made.

Clubs of 5 for $4.00, to any addresses. Ten for $7.50, if all are sent at one time.

Bee and Honey Exhibit.

Some time ago it was suggested that a grand Apiarian Exhibit should be made at the World's Fair in 1892. *Gleanings* suggested that Dr. A. B. Mason should be charged with the work of procuring such an exhibit. The AMERICAN BEE JOURNAL promptly seconded that motion, as did also Prof. Cook. The Doctor's reply through *Gleanings* is as follows:

I have *thought* a good deal in regard to the fizzle of the apiarian exhibit from the United States at Paris, and had come to the conclusion in my own mind that we *must* make the grandest display, or exhibit, of the bee-industry at the World's Exposition in this country in 1892 (wherever it may be held), that was ever made in the world; and to do this we must begin in time. With that in mind, and thinking that, as President of our national association, I might properly be considered the representative of American bee-keepers, I wrote those in charge of the proposed exposition in Chicago, and also to the Mayor of New York, suggesting that, when the proper time arrives for arranging matters, we be given the proper inducements and space to make such an exhibit as will be a credit to us and an honor to the country.

The president of the Chicago organization replied, saying, "The suggestion you make is a good one, and will be laid before the proper authority for such action as may be required, should the fair be located, as we expect, in Chicago."

I have not yet heard from New York, and shall write to Washington as soon as I learn the name of some one engaged in trying to get the exposition located there, so as to be on hand at whichever place it may be located.

I expect to say something about it in the President's annual address at the convention at Brantford. It may, to some, seem a little early to "set the ball rolling;" but if we wait till next year we may be too late; for just as soon as Congress settles the matter of location, the plan of the exposition will at once be laid out; and unless we are on hand, we shall get left out.

Auburndale, O. A. B. MASON.

That is eminently proper, Doctor. You have done just right in "setting the ball rolling" thus early—for when Congress decides upon the location, you will then have driven your stakes.

This work, done as the "President of the International," shows that we have "the right man in the right place," and he should be re-elected, if he will take the *honor* as payment for his very efficient services during 1889. He will then be able to "speak as one having authority," when corresponding with the World's Fair committee.

An Attractive Display.

From an Alabama paper we extract the following concerning an attractive exhibit of honey at the fair:

One of the most attractive displays of the Southern Exhibition was that of the Clovernook Apiary, Judge W. H. Black, proprietor. He showed bees in glass hives, a house built of large sections of comb honey, about 20 varieties of extracted honey. All kinds of fruit put up in honey. Large variety of fruits and vegetables pickled in his honey vinegar. All kinds of apiarian supplies from feeders to extractors.

Honey Jumbles and Lemonade.

The following from the *Canadian Bee Journal* concerning the above, at the late Detroit International Exhibition, will be of interest to our readers:

What our American friends call "Honey Jumbles," sold at an astonishing rate, as many as thirty boxes being disposed of in one day. A pointer which we gave those who sold these jumbles, and which will probably be taken advantage of another year, was to have a supply of honey lemonade as well; the venders would do a thriving business, and, as well as advertise honey in another way, they would make much money.

There were numerous stands through the main building where nothing but lemonade was sold, and a thriving business was carried on.

For ourselves, we lunched on honey jumbles and lemonade, and we do not believe a dozen waiters would be able to attend to the wants of the public, if they knew that they could get a nice, clean lunch with something to wash it down, all at the honey counter.

☞ Here is something rich and racy from the *Western Apiarian* of this month:

The effete stomachs of this generation do not relish honey. In the days when men had physiques, and women were Dianas, honey was an acceptable food. Milk and honey made a concord ordained by Nature. Honey is pure; it is nutritious; it is rich. No perverting cook intervenes to spoil it. Fresh from Nature's hand it comes to us, served in the natural comb which surpasses china in its delicacy, and of a consistency and color unattained by any wiue.

Winter Care of Bees.

There is but little opportunity during the wiuter to give bees attention, and the proper time to put them in shape is during the autumn months. Feeding should all be done before cold weather sets in, and they should be settled in their winter quarters before real winter is at hand. It often occurs that winter overtakes some persons with colonies that lack food. In such cases they cannot possibly use syrup for food, as the weather is too cold for the bees to seal it over, and unsealed stores will not serve properly for winter. The moisture which always arises from the bees in cold weather enters the unsealed honey and dilutes it, making it very unwholesome.

The only resort, therefore, for feeding in cold weather, is to make candy and use it. This is a very good and healthful food if properly made and administered. It is made from granulated sugar by melting it, adding a little water—no more than will thoroughly melt the sugar—when it is boiled a few minutes and poured out into cakes or slates of three or four pounds each. When cool, this becomes very hard, almost like rock candy.

In feeding this it is placed on frames just over the cluster of bees, where they can have access to it at all times. When in this position it recieves the heat arising from the bees, and they remain on it all the time. It is so hard that it will last them a long while. This candy may be given to bees at intervals during the winter, and colonies may be brought through in good condition that would have otherwise perished.

This, or any other work, that is necessary to do with bees wintering on the summer stands, should be done on warm days. It will not do to molest them on a cold day, but it should always be done on days when the bees are flying.—*American Agriculturist for December.*

International Bee-Association.

The programme for the American International Bee-Association, which is to meet at Brantford, Ontario, Canada, Dec. 4 to 6, 1889, at Wycliffe Hall, near Kirby Hotel, is as follows:

First Session, 1:30 p. m., Dec. 4.

Call to order by the President, Dr. A. B. Mason, Auburndale, Ohio.
Calling the Roll of Officers and Members.
Reception of New Members and Collection of Annual Dues.
Secretary's Report.
Treasurer's Report.
Report of Standing Committee.
Question Drawer.

Second Session, 7:30 p.m., Dec. 4.

Addresses of Welcome and Responses.
President's Address.
Election of Officers.
Selection of time and place for holding the next Convention.
Miscellaneous Business.

Third Session, 8:30 a.m., Dec. 5.

Bee-Keeping an Occupation for Women—Miss H. F. Buller, Campbellford, Ont.
Cellar *vs.* Out-Door Wintering—R. McKnight, Owen Sound, Ont.
Question Drawer.

Fourth Session, 1:30 p.m., Dec. 5.

Shipping Queens—F. H. Macpherson, Beeton, Ont.
Disposal of the Honey Crop—Thomas G. Newman, Chicago, Ills.
Question Drawer.

Fifth Session, 7:30 p.m., Dec. 5.

Cellar Wintering—S. T. Pettit, Belmont, Ont.
Riding Hobby-Horses—Bee-keeping a recreation from other pursuits, and an antidote for disease—E. R. Root, Medina, O.
Question Drawer.

Sixth Session, 8:30 a.m., Dec. 6.

Warm Hives—How best Attained—S. Corneil, Lindsay, Ont.
Question Drawer.

Seventh Session, 1:30 p.m., Dec. 6.

Alimentary System or Apparatus of the Honey-Bee—Prof. A. J. Cook, Agricultural College, Mich.
Question Drawer.

Eighth Session, 7:30 p.m., Dec. 6.

Question Drawer.
Installation of Officers.
Adjournment.

Reduced rates, at one-and-one-third fare for the round trip, may be secured on the Grand Trunk and Canadian Pacific Railway, in Canada only. The Canadian Pacific Railway does not run into Brantford, and tickets on that road must be purchased to and from Galt or Woodstock, as these are the nearest points, and for these points only can the round-trip tickets be obtained. Those who intend to go to the Convention should write to me at once. Those from the United States should take the Grand Trunk R'y.

Remember you must have a certificate when purchasing your ticket for Brantford on the Grand Trunk railway, or Galt or Woodstock on the Canadian Pacific R'y.

The Kirby House, $2.00 per day, will take members at $1.50 per day. The Commercial, a $1.00 per day house, will board members for 75 cents per day. Both are close to Wycliffe Hall.

The Executive Committee will take up the Question Drawer, and submit to the Convention such questions as they deem of sufficient general interest and importance. The balance will be submitted to a committee to answer, and questions and replies will be read by the Secretary.

R. F. HOLTERMANN, *Sec.*

Honey Almanac.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

Here is what is said of it by those who have seen the Honey Almanac :

I have just found time to look over the Honey Almanac, and I consider it very valuable, full of good recipes and information. It certainly will be a good medium through which to dispose of a honey crop, as well as a good advertisement for the apiarist.—Frank A. Eaton, Bluffton, O.

The Honey Almanacs are received. They are indeed well gotten up, and I think they will help a great deal in the sale of honey. Our Southern California friends should avail themselves of this opportunity, of advertising honey. The first Almanac I gave away, got me quite an order for extracted honey.—S. L. Watkins, Placerville, Calif.

The Almanacs are received. They will sell tons of honey, if judiciously distributed. If you keep it up a few years, extracted honey will be wanted as much as that in the comb. You may justly be proud of the job, artistically considered. They are chock-full of good things. Now if the bee-keepers will take hold, as they ought, the effort will be crowned with success.—H. O. Kruschke, Deuster, Wis.

Your Honey Almanac is just received. What do I think of it? Why, that it will become our most valuable auxiliary in the disposal of our surplus honey; and especially am I pleased with your last page, and with your perfect and most truthful description of comb and extracted honey. Now, after this, should the wise ones be deceived as to the purity of honey, they deserve to be fed on glucose and patent comb honey (!) for the balance of their lives. —Wm. S. Barclay, Beaver, Pa.

I have just received my quota of the Honey Almanacs. They are nice, indeed. I expected something good, and I am more than satisfied. They are certainly what we have been looking for to build up the honey trade, by increasing the demand for honey. Every bee-man that has honey to sell ought to have some for distribution. My honey crop will be over 9,000 pounds of extracted from 135 colonies, spring count. I have not taken it all away from the bees yet. We had our first killing frost last night.—A. C. Aten, Round Rock, Texas.

I have examined the Honey Almanac. Were I in the business of producing honey for the market, and had the least difficulty in disposing of the product, I do not believe I could find a better plan of advertising the same, than by scattering these Almanacs broadcast in my vicinity. Advertising, as a rule, needs but little more than a statement of the goods for sale. Honey stands on a different basis. The millions do not as yet know its virtue or value, and the "Almanac," it strikes me, would prove a happy medium by which to let the public know it.—J. E. Pond, North Attleboro, Mass.

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Beeswax, its uses, how to render it, and its importance as a commercial product, is described, and 17 useful Recipes are given.

Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

☞ Dr. A. B. Mason gives the National Bee-Keepers' Union the following notice in the *Bee-Keepers' Review:*

At first thought, to some, the Bee-Keepers' Union is an unnecessary organization. I have heard it said by bee-keepers that they didn't propose to give their money to help pay the expenses of some one else's lawsuits. Such certainly do not understand the object of the Union, or else are exceedingly selfish. Its object is not to defend *persons* but *principles*, in which what affects one bee-keeper affects all others, and I believe as at present conducted, the Union ought to have the unanimous support of all bee-keepers.

Yes, "it is not persons but *principles*" which the Union defends. If it were not so, the present Manager would have nothing to do with it.

☞ Frank Leslie's *Popular Monthly* for December, just out, is the Christmas number, and occupies the field in advance of all its contemporaries. It has a special illuminated cover, wreathed in holly-leaves and berries. The table of contents is rich and seasonable, and the magazine is as full of pictures as a pudding of plums. An exquisite colored plate, entitled "Under the the Mistletoe," forms an appropriate frontispiece.

Convention Notices.

☞ The annual meeting of the Vermont State Bee-Keepers' Association will be held at Burlington, Vt., on Jan. 22, 1890. J. H. LARRABEE, *Sec.*

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 16 and 17, 1889. D. A. FULLER, *Sec.*

☞ The 24th annual meeting of the Michigan State Bee-Keepers' Association, will be held at Lansing, Mich., in the Capitol Building, on Dec. 26 and 27, 1889. At that time nearly all railroads sell half fare tickets; a few railroads charge one-and-one-third fare for the round trip. Reduced hotel rates will be given at the Hudson House. All are cordially invited. H. D. CUTTING, *Sec.*

☞ The bee-keepers of Huron and Tuscola Counties will hold a joint meeting on Dec. 16, 1889, in the Union House, Concordia Hall, at Sebewaing, Huron Co., Mich. All interested are cordially invited to attend, and make this, the first meeting, a great success. There will be topics of interest to all discussed. JOHN G. KNUDINGER, *Cor. Sec.*

☞ The International Bee-Keepers' Association will meet in the court-house, at Brantford, Ont., Canada, on December 4, 5, and 6, 1889. All bee-keepers are invited to attend, and State and District bee-keepers' societies are requested to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Anyone desirous of becoming a member, and receiving the last Annual Report bound, may do so by forwarding $1.00 to the Secretary.—R. F. HOLTERMANN, Sec., Romney, Ont., Canada.

Worship in the Woods.

Written for the American Bee Journal

BY E. H. DIEHL.

Long ages since, when Time was young,
Ere prophets spoke or poets sung,
Ere man had used the line or plumb,
Or heard the martial fife and drum,
God's temples were the shaded woods,
Where met the pious multitudes.

A countless age has wheeled its flight,
And brought new stars and worlds to sight;
Primeval man of humble state
Assumes a place now with the great;
Yet God still in the forest moves,
Because His temples are the groves.

How sacred were those vast retreats
Where worshipper his Savior meets!
With tears, and sighs, and heart-felt groans,
Saints from their hovels, and from thrones,
Implored Jehovah from above,
To pity, pardon, save and love.

With folded hands the people stood
In silent prayer—blest attitude!
Or sitting on the verdant ground,
Engaged in solemn thoughts, profound;
Or rendered praises to their King,
In anthems such as angels sing.

Blasphemers entered not that wild!
With oaths its haunts were not defiled;
Low drunkards ne'er enjoyed a breeze
That played among those holy trees;
But humbly every man and youth
Assembled, seeking grace and truth.

Whene'er we see the cooling shade
Of trees in mountain, glen, or glade,
Let all esteem the forests dear—
Their grandeur and their use revere;
Adore them for their memory past—
Adore them, long as time shall last.

Leesburg, Ills.

QUERIES and REPLIES.

Coverings for Brood-Chambers in the Cellar.

Written for the American Bee Journal

Query 671.—What is the best covering for the brood-chamber, when the bees are wintered in a warm cellar, at a temperature of 45° to 50°, Fahr.?—Wis.

A wooden cover.—C. H. DIBBERN.

I would use burlap.—J. P. H. BROWN.

The hive-cover, to be sure.—R. L. TAYLOR.

Some old carpeting, or a bee-quilt.—G. M. DOOLITLTE.

I do not know. I do not winter my bees in a cellar.—M. MAHIN.

A piece of carpet or any porous cloth. See my answer to Query 669.—G. W. DEMAREE.

A straw mat, or a cloth, not close fitting.—DADANT & SON.

A tray of timothy or wheat chaff 2 inches deep, is hard to beat.—G L. TINKER.

I am not sure, but I would prefer hard-maple leaves as an absorbent.—J. M. HAMBAUGH.

A board or porous cloth. I think that the cover is of very little moment; though I do not like oil-cloth.—A. J. COOK.

A *porous* covering of any kind is "the thing needful." My practice is to use common sacking.—WILL M. BARNUM.

Whatever they had out-doors. Most of mine have nothing but the regular hive covers, which are made of ⅞-inch boards.—C. C. MILLER.

I think that the temperature (45 to 50 degrees) is too high; 38 to 40 degrees is warm enough in any cellar. I prefer enameled cloth to anything I have used, but I want it well covered to keep it warm.—H. D. CUTTING.

I would cover first, with Indian-head muslin, kept up with Hill's device, and then with old woolen carpets, worn underwear, or anything else convenient; top the hives with chaff cushions.—MRS. L. HARRISON.

I think that it makes but little difference. I have tried a good many different methods, and I find it just as well to leave the cover on which they had in the summer.—EUGENE SECOR.

I prefer none at all. If mice are bad, use wire-cloth for covers; and if the hives are to be *stacked*, lay the covers on small nails, so that there will be about ⅛ of an inch space between the cover board and the hive.—J. M. SHUCK.

I have tried almost everything conceivable, and found no difference. Now, I leave the cover glued fast, just as the hives come from the yard—because it is the cheapest.—JAMES HEDDON.

I do not think that any covering is needed if the cellar is dark; but any covering handy can be used—either a tight board, or a burlap quilt. I am speaking now of just the temperature you describe. Give ample room at the entrances.—J. E. POND.

I do not know. If the cellar is dry, anything that will keep in the heat will do; if damp, something that will retain the heat, and let the moisture escape, will be best. My bees wintered splendidly last winter in a cellar with the temperature at 50 degrees most of the time, with the same quilts on that were used the previous summer.—A. B. MASON.

There is not much choice. Something porous would be better than oil-cloth. The temperature should not be so high—certainly not over 45 degrees.—THE EDITOR.

The Origin and Cure of Foul Brood.

Written for the American Bee Journal

Query 672.—1. Is foul brood *generally* introduced into a hive from without? 2. Is there any known cure for it, costing less in trouble and expense than the worth of the diseased bees?—Ben Fooled.

1. I do not know. 2. No.—WILL M. BARNUM.

1. Yes. 2. It is very doubtful.—G. M. DOOLITTLE.

1. *Yes, always.* 2. I give it up.—A. J. COOK.

1 and 2. I do not know.—C. H. DIBBERN.

1. Yes. 2. Not where bees are cheap.—DADANT & SON.

1. I presume so. 2. That depends. M. MAHIN.

I do not know. I have not "Ben Fooled" on this question.—J. M. SHUCK.

1. I do not know. 2. In this I am not posted.—J. M. HAMBAUGH.

I do not know anything about it, thank Fortune.—EUGENE SECOR.

1. I think that it is. 2. Yes, the starvation plan, if correctly used, will insure success. It is some work, but the bees and queen are worth it.—H. D. CUTTING.

1. I believe that it is brought from without, like small-pox, but I have had no experience with it.—MRS. L. HARRISON.

1. Wall, Ben, you'll "Ben Fooled" again, ef ye don't *generally* believe it is *always* so introduced. 2. Yes, Ben, and don't yer let any one fool yer agin.—A. B. MASON.

1. Yes. 2. Yes, there is one way, if the colony is not too much depleted. Put the bees into a clean hive with the frames filled with foundation, or with starters (no comb) in the time of a honey-flow. Put no trust in drugs.—R. L. TAYLOR.

There has never been any foul brood near enough to my bees, so that I could have any experience, or even observation with it. From reading, I am persuaded that it usually spreads over the States, from buying bees, queens, etc., from foul broody apiaries; and, once in your apiary, it spreads from hive to hive, through the flight of the bees.—JAMES HEDDON.

1. I think so. 2. If most of my bees were foul broody, I should try some of the cures. If only ten in a hundred were diseased, I think that I should burn up the whole business.—C. C. MILLER.

1. I believe so. 2. The "starvation cure" in connection with a new, clean hive, as first advised by Moses Quinby, is the only reliable cure yet tried. If this costs more than the worth of the bees, they had better be cremated. Most bee-keepers, I notice, are too humane to burn up their bees.—G. L. TINKER.

1. It is so said. 2. Melt or burn all combs, boil the frames in pearline, paint the hives inside and out, put the bees on the "hunger cure" in a ventilated box for 24 or 36 hours, then give them a "shower bath" with the Muth salicylic mixture; place them in a clean hive, on clean combs or foundation, with plenty of syrup of granulated sugar, and "let 'em rip."—J. P. H. BROWN.

1. It is *always* introduced from without; that is to say, it is not generated in the hive. It may be introduced by feeding infected honey; then, of course, the hive would become infected. 2. I do not think that the disease can be eradicated so as to be profitable. I have had experience, and speak therefrom.—J. E. POND.

1. I feel thankful that I know nothing *practically* about "foul brood." There never was a case of foul brood heard of in the blue-grass regions of Kentucky, and we do not want it here. I am well acquainted with what has been written on the subject of foul brood, and I am inclined to think that there is a great deal to be learned about the disease yet; so your question is quite pertinent. 2. D. A. Jones' "starvation cure" is the only remedy that I would have any faith in—if I needed a remedy.—G. W. DEMAREE.

1. Yes. It is not generated within a hive—it is communicated to the colony by using infected honey, or the bees having come in contact with something so infected. 2. The safest remedy is fire, but transferring the bees to a clean hive and comb foundation, will often help the matter.—THE EDITOR.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

Amateur Bee-Keepers' Lament.

Written by Request of Dr. A. B. Mason,
BY MRS. FRED GRAHAM.

I hardly know what is required of me,
When requested to write poetry on the bee;
Surely, Doctor, you must be jesting,
And from all such pranks ought to be resting.

The bees are workers—that I'll allow;
But they sometimes cause a terrible row.
Years ago, I had the bee-fever pretty bad—
Inherited, propably, from my Ma or Dad.

I hived them, and even swarmed them, too,
Till, one day they got mad, and stung me through and through;
My hands and face swelled and swelled, until I thought I'd drop,
And still that swelling did not stop.

I had visions of splendor, and lived at my ease—
All of it to come from those hives of bees;
But they vanished, one by one, away,
And not one of them remains to-day.

Maumee, Ohio.

CORRESPONDENCE.

NOT DIGESTED.

Instances Where Bees did Not Digest What they Gathered.

Written for the American Bee Journal
BY ALEX. ROSE.

I am no scientists, but I will give some experience that I had about eight years ago. That season being a very dry one, my bees had but little honey, and I expected that they would starve during the winter. One of my neighbors commenced grinding cane and making molasses, and my bees commenced working on the stalks of ground cane, and filled many sheets of empty comb full of the juice—as thin as it was ground, or pressed out of the cane.

I talked with some "bee-men" about it, and they said that the juice would sour, or freeze, and the bees would all die. I supposed it would be so. The juice was so thin that when I would take out some of the frames, and give them a quick shake, throwing out the juice on a board, it would evaporate as quickly as that much water thrown on the board. But contrary to my expectations, my bees lived through the winter, came out in fine condition in the spring, increased as usual, and gathered plenty of honey. This juice was not "digested;" that is, there was no honey about it—it was clear cane-juice when the winter set in.

Again, three years ago, my bees gathered honey so rapidly that it soured in the sections. The bees took the sour honey out of the combs, but I do not know what they did with it. Some combs were left empty, while others were refilled with good honey. If bees digest honey, why did they not digest this cane-juice and make some sort of honey out of it?

One year ago last summer the oak and hickory leaves were covered with honey-dew, so-called; the bees filled many of the sections with this honey-dew, and, so far as I could tell, there was no change in it; it tasted the same as that on the leaves. There was an immense amount of it on the leaves, so that it could be tasted without any trouble; and every one of my 29 colonies lived through the winter, and gathered 700 pounds of honey in one-pound sections.

I did not increase my number, as I have formally done, and so I now only have 30 colonies.

MANAGING SWARMS.

I adopted the following plan this year, but I had used the same, to some extent, before:

When colony No. 1 swarmed, I moved it to some other place, took out two or more frames of comb, put them in the center of colony No. 2, or in a new hive placed on the stand where colony No. 1 stood. I took the case off of No. 1, put it on No. 2, and then took the new swarm and put it into the new hive. Then I put the old hive on top of some weak colony.

In a few days No. 3 swarmed, when I drove the bees down out of hive No. 1, and removed any queen-cells that might still be unhatched, and put the new swarm into hive No. 1, having replaced three or more frames, with frames of foundation. I placed this on the old stand of No. 3, taking the cases of sections off of No. 3, and putting them on No. 1, with full frames of comb and some unhatched brood, which the swarm never leaves, or has not for me.

By this plan the honey-gathering hardly ever ceases except for a few minutes, as the field-bees come into the new hive on the old stand, and go directly to the sections, the same as before; and the queen finds plenty of empty cells in which to deposit eggs. By this process I have averaged about 24 pounds of honey per colony, spring count, while my neighbor bee-keepers have no surplus honey—not even for family use.

I had about 80 pounds of honey in partly-filled sections, and some were full, but not capped over. I cut this out, and sold it as broken-up honey, at 15 cents per pound. I have sold all my full sections at 20 cents per pound, except about 200 pounds, which I still have on hand, but I can get the same for it on any day that I desire. I find no trouble to sell all the honey that I can produce, at my home town, when I have the honey in good shape.

My bees have plenty of the best of honey for winter. I winter them on the summer stands, leaving on the honey-boards, and filling the top with dry leaves. I shall try the same plans next year, that I worked this year.

Sullivan, Ills.

SHIPPING BEES.

The Danger in Mailing Bees by the Pound.

Written for the American Bee Journal
BY T. F. BINGHAM.

With solicitude I have read the remarks relating to the shipment in the mail, of bees in quantities of four pounds or less. It is not a question of limitation of attendants with the queen, but a matter that concerns us all as bee-keepers. We can, no doubt, by presuming too much, bring about the repeal of the law allowing the shipment of queen-bees having even a few attendants.

My first reason for not shipping a pound or more of worker bees by mail is, that it is not the meaning of the law that they should so be sent. Next, it is not necessary to so ship them. The express companies can handle them as quickly, as safely, as cheaply, and on such short routes as it would be safe to ship such quantities by mail.

We all understand the value of the privilege of the mail shipment of queens. We wish to send them long distances, as well as short ones, and the mail "fills the bill" perfectly. We should all prize this convenience, and do all in our power to bequeath the same privilege to those who happen to be bee-keepers after us.

No one can question the probability that should an accident occur, and a pound of worker-bees be let loose in the mail cars, or mail pouches, or post-offices anywhere, that the confidence reposed in bee-keepers not to abuse or strain the law, would be at once forfeited, and bees would at once and forever be excluded from the mails.

As a postmaster, I should not accept a bundle of worker-bees as a queen-bee and her attendants; but I should regard it as unsafe and not within the meaning of the law, and should refer the matter to the Postal Department at Washington.

In looking over the labors of the Bee-Keepers' Union, it seems plain that bees are not affectionately regarded except by bee-keepers. The fact that so much has to be said and done, is ample evidence that if we do have any rights, especially for our accommodation and welfare, we cannot regard them to carefully.

I trust that no one will jeopardize our rights and privileges to send queen-bees in the mail, by presuming to send a working colony—even though it does not weigh four pounds—for the purpose of saving a few cents of express charges, or other trifling inconvenience. I hope that the Manager of the Bee-Keepers' Union will not fail to cast his advice in the direction of prudence and judicious management of this matter.

Abronia, Mich.

[We gave our "advice" over a month ago. We fully agree with the position taken by friend Bingham, as will be seen by re-reading our editorial on page 676.—ED.]

HEREDITY.

An Important Discussion on Heredity in Bees.

Read at the British Bee-Keepers' Convention

BY MR. R. A. GRIMSHAW.

Are we to assume that the most social of all insects has developed into its present high condition from ancestors who have had less and less of the social instinct in them as we go back into the remote past, age by age, until we find a seemingly perfect solitary honey-bee, queen and drone, male and female, themselves workers, able to gather their own food, as in the case of the queen humble-bee, able to secrete wax and rear its young until the progeny becoming numerous, take these duties upon themselves? If so, in vast spaces of time, the necessity of honey-gathering and wax-secreting, the part of the queen being removed, the organs and glands used for this purpose would by disuse become aborted and atrophied, the tongue would get shorter by degrees until it became, as we find it to-day, too short altogether for the purpose of gathering nectar from flowers, and the wax-secreting glands would disappear entirely, the pollen-baskets would also for the same reason go by the board, or remain only in a rudimentary form.

The reproductive organs would remain, of course, as perfect as we find them, and by the whole energies of the queen being devoted to egg-laying, the ovaries would be developed into the vast egg-producing organs we know them to be.

On the part of the worker (a female bee), the necessity for its participation in the re-peopling of the hive being removed, the requisite organs would at the same rate become atrophied, as we find them, whilst the constant and increased use of other parts (the tongue and the pollen-baskets), would be gradually developed under the marvellous loss of compensation, into what we see they are in the present stage of their development. The fact of certain varieties of *Apis mellifica* having longer tongues than others, would support the suggestion that our bees are not yet on the apex of perfection, as regards the development of the parts necessary for nectar-gathering. Other varietal differences also strengthen the assumption.

The development of the social idea always brings with it specialization of parts, devotion to special labor, and the division of work. Thus we find the probational nursing-period, and its following honey-and-pollen-gathering life, with the divisions of labor into cell-building, wax-secreting, water-carrying, sentinel works, and so on.

Now the question forces itself upon us—how and by what means are all these specializations handed down to the generations? The queen *per se* has only the re-peopling instinct to transmit, which she does in the worker and drone eggs, the worker-bees having certainly as strong desire to keep up the strength of the huge colony as the queen can have—perhaps more so; but she (the queen) inherits nothing from her parents beyound the faculty of depositing eggs by the thousand. She inherits no instinct for mutual defense, the necessity of seeking food, building cells, etc., neither can she transmit these instincts, for neither the queen nor the drone have the power of handing down to posterity something they do not possess.

The truly wondrous developments of various instincts in the worker-bee are not possessed by the parent bees; and as these developments must have extended over enormous periods of time, in order, little by little, by constant use, to reach their present pitch of perfection, these minute advances of the worker must have been perpetuated by some means for the benefit of her successors in the hives of the future.

The queen-bee is more the daughter of her nurses than the daughter of her mother, for, we know, it is only by the changed treatment of a worker-egg by the worker-bees, that she becomes a queen at all. The queen can only lay queen-eggs and drone-eggs, no worker-eggs, only perfect male or female ova; it is the treatment the female eggs receive at the hands of the workers which decides the future line of usefulness in the female progeny. How, then, can any characteristic developed in the worker be transmitted other than by the food fed to the brood out of the digestive organs of the worker-bee herself—food, perhaps, contaminated by the germs of foul brood, by having passed through the worker's own diseased system, but food as much characteristic of the nurse-bee as is the milk of a nurse-mother—a foster-mother—amongst the mammalia?

We have, then, only this dilemma to face: Peculiarities of the worker-bee not possessed by either of its parents must be handed down somehow by itself; and there seems to be no way of the difficulty other than by assuming that she does this in the manner I suggest. If you insist that these are latent in the worker-egg as soon as laid, quite irrespective of any hereditary tendency handed down in the worker-brood food, then I contend that even in this case the queen-mother inherited these tendencies in the so-called royal jelly, on which she fed when in the grub state, but still a brood food which had passed through the system of workers. The same argument applies also to inheritance through the drone.

Ribot tells us, "In animals the transmission of individual character is a fact so common as scarcely to need illustration;" and Darwin supports him by instancing that "if a horse be trained to certain paces, the colt inherits similar movements; the dog becomes intelligent from associating with man; the retriever is taught to fetch and carry; and these mental endowments and bodily powers are all inherited." He also lays down the axiom that "variability results generally from changed conditions acting during successive generations." Therefore I hold that our worker-bee has gradually developed its social instincts, and the well-known distinctive peculiarities it possesses, through multitudes of generations, adapting themselves to changed conditions of life, inheriting and handing down distinct instincts where fully developed; but where only partially developed, handing down a tendency in a given direction.

It may be doubted that brood food (the sustenance of a foster-mother) is capable of transmitting such tendencies. I think that we only need to reflect a short time and we shall be prepared to admit the theory of heredity by generations of specialized food. Darwin assists us again by telling us, "Each living creature must be looked upon as a microcosm, a little universe, formed of a host of self-propagating organisms, inconceivably minute, and as numerous as the stars in heaven. These organic units, besides having the power, as is generally admitted, of growing by self-division, throw off free and minute atoms of their contents—that is, gemmules....Their development depends on their own union with other nascent cells or units, and they are capable of transmission in a dormant state to successive generations."

Such gemmules are congregated in vast masses—vast by comparison—and these vast masses are themselves so minute that I have heard Dr. Dallinger (that prince of microscopists) say that ten million of them might be contained in a box having the diameter of a human hair. If you rub the seeds of the vanilla plant between the forefinger and thumb, you find them so minute that they become firmly fixed in the beautiful furrows of the skin, yet each of these exceedingly small seeds is composed of a mass of separate cells, having the prepotency of growth and self-division—having the power hidden in itself of reproducing a perfect plant.

Thus, "number and size are only relative difficulties, the eggs or seeds produced by certain animals or plants are so numerous that they cannot be grasped by the intellect" (Darwin); and if "organic units during each stage of development throw off gemmules, which multiplying are transmitted to the offspring," is it an unfair assumption that such gemmules are handed on out of the system of the nurse-bee into the brood of the queen and worker-bee, not by means of the mouth of the brood, and thus running the risk of active chemical change, but into the system of the grub, which seems to absorb the surrounding brood-food by every pore, so to speak?

Let us come to the conclusion of the whole matter: The points of the worker are inherited, and they are also handed down; she cannot very well inherit from ancestors neither of which possess such points, neither can she hand them forward to the generations in the ordinary way. We then have to find some extraordinary manner of accomplishing this task, of overcoming what appears to be an insuperable difficulty.

I hope I have given sufficient reason for coming to the conclusion that countless generations of foster-mothers have been the real highways of heredity in our bees, that as the milk-like secretions of the nurse-bee are fed alike to drone, queen, and worker brood, it is by this means that her wonderful adaptations in structure, etc., are perpetuated.

The following discussion took place after the delivery of the foregoing essay by Mr. Grimshaw:

Mr. Garratt complimented Mr. Grimshaw on his very able and interesting essay, but felt, speaking for himself, quite unprepared to discuss it. He thought it would be an excellent thing if the members could be provided with a syllabus of the topics that Mr. Grimshaw proposed to touch upon in any future essay. They would then be enabled to think over the subjects, and express opinions of more value. He could not but think that Mr. Grimshaw's arguments and conclusions were of a speculative character; for instance, to say that the tongue of one bee is not long enough to secure the honey which is secreted in flowers, is hardly correct. It is certain that the conformation of the flowers varies so much that if honey cannot be obtained from one source, it can from others where it is more accessible. They knew that the common red clover could not be fertilized by the bee under ordinary circumstances, the humble-bee being the chief agent in such work.

Mr. Blow said that his views were on the same line as Mr. Grimshaw's. He was of the opinion that the prominent points were transmitted by means of the workers, and not by means of the queen. There were so many points in the workers which the queen did not possess. The whole subject required a considerable amount of thought.

The chairman (Mr. Graham) quite believed that the young of all animals were physically affected to a great extent by foster-mothers. He remembered an instance of a cat and dog living in the same house, each of which had a litter of young at the same time. The kittens and the puppies were so much together that it was no uncommon thing to see the dog attending to the kittens, and the cat to the puppies. The result of that was, that some of the puppies developed significant feline qualities. Noting those facts in which only one generation was concerned, and bearing in mind what an immense number of generations of bees were evolved in the lifetime of one individual, it was a fair assumption that many changes in bee-life might occur in a thousand years. Possibly the queen might obtain sufficient honey for herself, but she was certainly minus the wax-producing faculty. She had no power in the hive, all the government being under the control of the workers, that could stop brood-rearing whenever they pleased.

Mr. Sambels did not believe in the evolution theory of Darwin, but he thought there was something in the suggestion concerning foster-mothers. Unquestionably the structure of the bee depended on the drone, because they knew what would be the effect if a black bee were fertilized by a yellow drone. With regard to the question of temper, he believed the workers had considerable influence. In the case of a colony of vicious bees, the introduction of a quiet and amiable queen did not effect a change at first, because the young bees were influenced by the propensities of the nurses. He had a friend who made a practice of introducing new races, and all his bees, even the Carniolans, were vicious.

The chairman confirmed, as the result of his experience, Mr. Sambels' views on the question of temper.

Mr. Webster concurred in the views expressed regarding the immense influence of foster-mothers.

Mr. Grimshaw submitted that the long tongue of the worker could not have been derived from the queen, which, if she wished, was unable to gather honey; at least, they had no record of doing so. Even though Mr. Sambels would not support the doctrine of evolution, still if he sanctioned the foster-mother theory of development, he (the speaker) would claim him as a supporter. The queen laid only queen and drone eggs—she could not do otherwise; and it was the workers that determined what should be the ultimate produce of the egg.

Mr. Garratt said Mr. Grimshaw's arguments rested very much upon the assumption that the food supplied to the young bees was prepared by the nurses—an assertion which he did not think had yet been established.

The Chairman, Mr. Grimshaw, and Mr. Sambels, expressed dissent.

The Chairman moved a hearty vote of thanks to Mr. Grimshaw for his kindness in bringing so instructive an essay under their notice, and thereby setting them to thinking. He thought there was a great deal of truth in the "foster-mother theory."

QUEEN-REARING.

Methods of Rearing Queens and Producing Comb Honey.

Read at the Erie Co., N. Y., Convention

BY E. D. KEENEY.

I believe that the American queen-breeders have, by judicious breeding and mating, made a vast improvement upon the imported stock, and a demand is already being made by foreign apiarists for American-bred queens. Perhaps climate has had a hand in this improvement, but this much I know, that for docility, prolificness, beauty and honey-gathering qualities, the American-Italian bees beat the world!

In rearing queens, I find it absolutely necessary to have superior fathers, as well as mothers, to produce superior bees; and I try to have all the drones that mate with my queens, reared in 2 or 3 of my choicest colonies, by keeping in the center of their brood-nest, 3 or 4 frames of all drone-

comb the year round; from all other colonies I keep out all the drone-comb possible.

In early spring I crowd these drone-rearing colonies with worker brood, thereby getting early drones. When I find drones well started, I remove the queen from some populous colony, on the second day remove part of the brood, and the next day the balance, leaving plenty of honey, and giving back about half the number of combs taken from them.

I then take a frame of just-hatching larvæ from my choicest breeding queen, and break down about a half dozen cells on each side, wherein the larvæ are of proper age, and hang this frame in the centre of the colony made queenless. On the second and third days I again break down another dozen cells, which will be as many queens as ought to be reared in any one colony at a time. On the fifth day I destroy all other cells that may have started.

I now work all the brood back into this hive taken from it, and into each frame on the tenth day I fasten one of these cells in a wire-cage, and divide the colony into 9 nucleus colonies, tucked up warmly, and shut up tight; the balance of the cells I fasten in provisioned queen-cages, and place them in colonies from which queens have been sold, or place them in wire cages, and hang in strong colonies to hatch, to be used later in making forced swarms.

Now, to return to the 9 nucleus colonies: On the fourth day after making them, I place on all colonies in my yard (except the 3 or 4 drone-rearing ones), the drone-traps, and keep them on 5 to 7 days, which secures mating as nearly pure as possible. As soon as these young queens are fertile, they are introduced into other colonies from which queens have been sold or sent away direct to customers, and the nucleus again supplied with queen-cells.

Now we will return to the cell in a queen-cage placed in a colony to hatch: On the third to the fifth day after hatching, I place her in a queen-cage the size of a finger, and over the open end I tie a piece of newspaper, as you would a sore thumb; this cage is fastened to a frame of hatching brood, and placed in a hive with a close-fitting division-board. Now from some strong colony shake the bees from two frames into this hive, fastening all up tight for 24 hours; during that time, they release and accept that queen, and in from 3 to 5 days she is fertile, and ready to ship, having mated with the pure drones flying at that time.

PRODUCTION OF COMB HONEY.

I am requested to give a brief outline of my management in securing comb honey. I am not sure that it is better than any other system, but it has worked satisfactorily with me, and if any brother bee-keeper will in any way be benefitted by following or adopting any part of it, I shall feel well repaid.

I winter my bees in a cellar, and place them on the summer stands from April 15 to the 20th. On the first still, warm day after, I shut them on whatever number of combs they can cover well, placing tight-fitting division-boards up to them, and put chaff cushions, or papers and old carpet over the brood-frames, and make them as warm as possible.

They are now allowed only entrance room for one bee at a time, in order to retain the heat in the hive, and protect themselves against robbers. They are left in this condition until dandelions bloom, when I examine them all, and clip the queens' wings, and spread the brood, giving each colony whatever additional room it may need. During apple bloom I spread the brood, usually every three days (in all about three times) equallizing the brood in the hives, and classifying them that all swarming may be *done* within three weeks.

From the close of apple bloom to the first white clover bloom, there is a honey-dearth of ten days, and during that time I feed every colony in my apiary from one-half to a pound of thin honey, to insure continuous brood-rearing. At the beginning of white clover, sections are put on, and I examine and equallize again. All colonies are then of about equal strength.

When a swarm issues, I catch a wing-clipped queen, placing her in a wire-cage, while the swarm is in the air; I remove the old hive to a new stand, placing a hive on the old stand with 2 frames of empty comb and 3 frames of wired foundation in the center, placing a surplus case from the old hive on the new one. By this time the bees are returning, and the queen is allowed to run in, when the work is done.

A just-hatching queen-cell is now given the old colony, and sections are placed on the hive. Honey is taken off as fast as it is completed, and room taken or given to them as I think that they require.

At the close of the honey season, the brood from both hives is placed into one of them, with the young queen, and carried to a new stand. Hive-covers are placed on the old stands to catch all the old bees, which are brimstoned at night, and given a respectable burial.

This plan gives young, vigorous bees for winter and the following spring, and saves boarding from 4 to 12 quarts of bees from 3 to 6 months, which means money.

The hives are now weighed, and if wanting any number of pounds to make 25, actual honey weight, the colonies are fed that amount at once, and left alone until carried into winter quarters, which is about Dec. 1.

Arcade, N. Y.

CALIFORNIA.

Early History of Bees and Honey in Southern California.

Written for the Los Angeles Express

BY S. M. W. EASLEY.

The bee-industry in California dates back to 1854, when a Mr. Appleton brought 2 colonies to Santa Clara county and placed them on the Stockton ranch, near San Jose. Bees from those 2 colonies were often seen six and seven miles from home. They did so well that other importations soon followed, and in two or three years some 200, perhaps more, colonies were introduced. From those colonies the States of California, Oregon, Washington and Arizona have been stocked. In Southern California bees are found everywhere. In this, Ventura county, they are found in the house-tops, in trees, between brick walls, in cliffs of rocks, and for want of a better place, they find shelter in the ground.

The writer of this article bought some of the first bees that were shipped to the State. In 1859 I sold 17 colonies for $1,700. Honey was worth $1 per pound. Two years later they sold for $3 per colony. The price per colony now ranges from 50 cents to $1 in box-hives, to $1.50 to $4 in movable-frame or Langstroth hive, according to quality of hive and condition of colony. I took charge of two apiaries in 1884, located on the Simi Ranch in this county. The two contained 444 colonies, and were located about two and a half miles apart. The total yield of extracted honey from those two apiaries (now three, another having been located in 1885, and their increase in swarms now numbering in all 1,500 colonies) has been 568,000 pounds, or 284 tons.

The largest amount made in any one year was in 1884, when 87½ tons were taken from 552 colonies, and the apiaries increased in number to something over 1,200. The lightest yield in any one year was last year, when only eight tons of honey were taken from 1,500 colonies. The highest price obtained for honey in any year was 7 cents, the lowest 4 cents.

The Italians seem to be the favorite race of bees in this State, though I find the Cyprians to be well suited for our mountain ranges. They seem to have greater wing-power than any other. They are quick to resent an injury, and will give you a warm reception when all are at home on a cold day.

The average number of colonies kept in this county is about 14,500. The average yield of honey to the colony is about 70 pounds. My apiaries of 552 colonies produced about 317 pounds to the colony in one. Some smaller ones gathered 400 pounds to the colony, that of Mr. Wm. Whitaker, of Piru City. Last year some apiaries gathered no honey. One apiary in the county, of 280 colonies, this year gathered 12 tons of honey from the wild hoar-hound. The color of the honey is not as light as our sage honey. It has a little bitter taste, and is equal to hoar-hound candy for colds. It ought to bring a fancy price for medicinal purposes.

Ventura, Calif.

ALBINO BEES.

Are they a Malformation or a Diseased Organism?

Written for the American Bee Journal

BY C. J. ROBINSON.

On page 774 of *Gleanings* for Oct. 1, 1889, Prof. A. J. Cook gives *his opinion* of Albino bees as follows:

It is well known that a true albino is really a diseased or imperfect organism. For some cause, the tissues which usually secrete pigment, or coloring matter, are unable to do so. The hair is white, the exposed skin is pink, as its transparency hides not the blood in the superficial blood-vessels, and for like cause the eyes are pink. Thus the skin in a human albino is tender, and the eyes are so unprotected that they cannot bear the light of day. A hare lip is no more a malformation than is albinoism. The fact that man, by selection, has perpetuated this peculiarity in some animals makes it none the less a diseased condition. All animals tend to reproduce unfavorable as well as useful peculiarities.

I have read that albinos often intermarry, and thus there is unfortunately a tendency to increase and perpetuate this diseased condition among people. Now, I do not think this any argument against the so-called albino bees. Scientifically such bees are not albinos. They are not white. They only show more white than others of their race. Thus, if I am correct, these bees are no worse for their characteristics. They are not physiologically deficient as are true albinos, but only sports, or more properly, varieties. Now, if, as varieties, they have valuable characteristics, as their friends claim, then they are superior. Their lighter color enables us to distinguish them, and, if persistent, marks them as a distinct variety. They are no better or worse for it. While the name albino is not really correct as applied to these bees, yet there is no harm in its use. As yet, I have never seen any true albino bees. Yet I have seen albino crickets and cockroaches.

There is no reason why we may not have one of these pyhsiologically imperfect bees. Even should this occur, it would cause no trouble. We all know that albino bees, as sold in the market, are simply a light variety of the Italian race, and no trouble need occur. True albinos will be very rare, at best, and never can cause any serious misunderstanding. A. J. COOK.

In the above Prof. Cook asserts that "it is well known that a true Albino is really a *diseased* or imperfect organism." His affirmation is *not* so "well known" to learned men (other than himself) that it is admitted as being true in any sense. He offers no evidence, no authority, in support of his claim, and there is valid reason for his default, for none exist; the affirmation is dependent on fiction alone, instead of being based on science.

What would Prof. Cook have understood by his use of the term "disease?" Disease signifies not at *ease*, expressive of an abnormal condition; while *ease* is expressive of normal condition.

Prof. C. says that "a hare lip is no more a malformation that is albinoism." It cannot be "well known" that a hare lip, or malformation, or imperfect organism, bears any relation to disease! A hare lip is a deformity, a malformation, while albinoism is a perfect organism, the structure being complete though differing in certain respects. A creature of variegated color is not thereby deformed. A negro of the darkest type is identical (so far as organism may be considered) with the whitest specimen of the race, and the case is the same with all the shades of color between the two extremes.

Prof. Cook claims that all albinos are constitutionally diseased, and that in the reproduction of albinos, "there is a tendency to increase and perpetuate this diseased condition among people." This "disease" is his assumption. The disease could *not* be perpetuated if it does not exist, and he has not produced corroborating testimony that it ever did exist.

It is well known that albinoism has been perpetuated during all ages, and it continues the same, independent of disease. It is well known that albinoism occurs in the bovine races—albino cows—yet the milk of those cows never proved to be unhealthy. Had it been a fact that albinoism is evidence of constitutional disease, the milk secreted by albino cows would be poisoned by the disease.

The Professor alleges that the "skin in a human albino is tender." This assertion is not susceptible of proof—is not true, so far as my observation extends, and I have investigated the subject—some human albinos reside near by me.

Again, he affirms that the "eyes are so unprotected that they cannot bear the light of day." What are the facts in the case? In albinos the iris of their eyes appear red, from its great vascularity. As the pigment in the coats of the eye serves to diminish the stimulus of the light upon the retina, albinos generally cannot bear a strong light; on the other hand, they are better in the dark than others. Because human albinos do not well bear a strong light, perhaps the Professor fancies that it is occasioned by disease, like a hare lip.

Albinoism in the human species is simply this: The coloring-matter is secreted between the cuticle and the true skin, and whatever may be the color secreted—whether it be white of an uncommon hue, or other color—it is normal and regular, however much it differs from any common order. None have authority to decide that any born color is a "physiological defect."

Learned Buckminister wrote: "The shafts of disease (not hare lips) shoot across our path in such a variety of courses, that the atmosphere of the human life is darkened by their number, and the escape of an individual becomes almost miraculous." He had no reference to "shafts" of hare lips, or malformation, or imperfect organisms.

Shakespeare said: "We are all diseased;" and why may not all bees be a little out of "kilter?"

The so-called albino bees are a type of bees of the family showing more or less yellow, but the hairs on the thorax appear white—hence the name, "albino." The term albino signifies, in Latin, *albus*, white. The scientific name being *leucopathy* or *leucosis*. The Professor declares that the so-called albino bees are not white, and "scientifically such bees are not albinos." However, the distinguishing name is a more valid one than the name "Italian," which he applies to bees more or less yellow. "Scientifically" he never saw any Italian bees. He uses the term "*Italian* bees." Now I will follow him and demur to his calling any known type of bees "Italians." No type of bees are indigenous in Italy, but all are truly exotic in that country, and different types of bees have become natives of Italy, as well as in other countries. Bees, showing more or less yellow, have become natives of several countries. Italian, when applied to bees, is truly a misnomer.

If the learned Professor desires and attempts to educate bee-keepers in the use of scientific terms, and the application thereof technically, why not begin at home? Undoubtedly the so-called Italian and all yellow bees are Egyptian bees, for they had their origin in that country; at least, the first came to notice in Lower Egypt.

BEE-EXHIBITS.

A German Apiarist's Views of the Paris Bee-Exhibits.

Written for the American Bee Journal

BY REV. STEPHEN ROESE.

Tony Kellen is the talented writer for the various bee-periodicals in Germany, Switzerland and France, who closely observed every thing exhibited at the late Exhibition at Paris, France, reported the facts about the exhibits of the various countries and nations of the World, in the German bee-paper, *Der Bienen-Vater aus Boehmen*, page 152. According to his statements, it can be clearly seen which nation takes the lead in apiculture. His remarks concerning our nation and country are as follows:

North America is represented by a grand exhibition of over twenty bee-hive manufacturers, and supply dealers, among them being the well-known names of Dadant, Muth, Root, Heddon, etc. Their exhibition was the most remarkable and practical, and most beautiful of all on exhibition. A description of the various patterns of hives, supplies and products would require many sheets of paper to describe, and whoever would undertake to give a detailed description of each article, would need a hand-book on bee-culture; and this is something in which Europeans fall far short.

England and America have, in apiculture, by far outdone the German nation, to say nothing of the rest of the countries represented. They may in the beginning have learned many things from the Germans—this I will admit—but what they did learn they knew how to put into practice, without standing still, and there is sufficient reason why we find in America the most noted, talented, and most successful bee-keepers in the World; and at this date the Germans and French might well go to the English and Americans, and learn successful and practical bee-keeping.

Concerning bee-literature alone, the Europeans fall far short in coming up to the standard. It will take a long time before we Europeans will be able to present before the public such works as Root's "A B C," or Langstroth's "Hive and Honey-Bee," etc.

The only one who at present, this side of the Atlantic Ocean, attracts public attention, is Master Gravenhorst. We have, aside from his valuable "Imker," a host of other works on bee-culture, and what is most remarkable about the whole thing is, that each work is often reprinted in the second and third editions.

Very remarkable is the way and manner in which Americans establish their apiaries. At the Exhibition I saw a long line of photographs of American apiaries, and in every case the hives stand separate, and free from each other. Nowheres do we find high benches or tables on which the hives stand—not even bee-houses.

There was also a great glass case, full of the nectar sweets, in the most attractive glass honey-pails, in frames and in sections. TONY KELLEN.

BEE-NOTES.

Freaks Among Bees, Golden-Rod, and the Coming Bee.

Written for the American Bee Journal

BY CHARLES A. BUNCH.

I arranged some nucleus hives for queen-rearing, and gave each a ripe queen-cell, and in 3½ days I found one of the queen's laying—just 19½ days from the time the comb was replaced in the hive of the breeding queen. This queen was from this year's rearing, and proved to be a rapid layer.

I found a bee with the head and thorax of a worker, and the abdomen of a drone; and another bee with but one eye, as there was no division at the top of the head like other bees, but "a continuous eye," if that would be the proper expression.

I always expect bees to work on golden-rod, if we have a heavy rain to soak the ground well when in bloom, as it will stand rain better than drouth.

I commenced the season with 24 colonies of bees in good condition; six of this number I divided into two and three frame nuclei for queen-rearing, which left 18 for increase and honey-producing. My crop of honey in one-pound sections was 1,050 pounds, and increased to 43 colonies. I think that the bees would have done considerably better had it not been for so much brood getting chilled and thrown out about May 30—a spell of weather not to be forgotten.

Doubtless some are waiting for the "coming bee," thinking that it will be a new strain of bees, produced by crossing and selection. Such need wait no longer, as the "coming bee" is here, and has been here for sometime. It is produced by crossing the best strains of Ligurian bees with the best Italian bees. This strain of bees is industrious and gentle, and the bee-keeper that admires beauty, will look on such with pleasure.

I cannot help thinking that it will be many a day before the above-named race of bees will allow their banner to be hauled down and stamped in the dust; and if it comes to pass, it will not be without a desperate struggle.

La Paz, Ind.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 4-6.—International, at Brantford, Ont., Canada. R. F. Holtermann, Sec., Romney, Ont.

Dec. 16, 17.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

Dec. 16.—Huron & Tuscola Co's., at Sebewaing, Mich. J. G. Knudinger, Cor. Sec., Kilmanagh, Mich.

Dec. 26, 27.—Michigan State, at Lansing, Mich. H. D. Cutting, Sec., Clinton, Mich.

1890.

Jan. 22.—Vermont State, at Burlington, Vt. J. H. Larrabee, Sec., Larrabee's Point, Vt.

May 2.—Susquehanna Co., at Hopbottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Golden-Rod as a Honey-Plant.

I have been summing up the reports upon golden-rod since Sept. 7, in regard to its value as a honey-plant, and I find the following:

Unfavorable reports: Iowa, 2; New York, 2; Nebraska, 2; Ohio, 1; Illinois, 1; Wisconsin, 2; Kentucky, 1; and Kansas 1—making a total of 12 unfavorable reports.

Favorable reports: Nova Scotia, 1; Wisconsin, 2; Massachusetts, 1; Michigan, 1; Tennessee, 1; New York, 6; Pennsylvania, 1; Washington Territory, 1; Vermont, 1; Missouri, 1; New Hampshire, 1—making a total of 17 favorable reports.

To sum up, there are from the Western States, 4 favorable reports, and 9 unfavorable ones; Eastern States, 11 favorable, and 2 unfavorable; Southern States, 2 favorable, and 1 unfavorable. By this we see that the majority of unfavorable reports are from the Western States, and the majority of favorable ones are from the Eastern States. Now I would like to have Prof. Cook see if he cannot give some pointers that will be of benefit to us, if for nothing else but to satisfy our curiosity. The AMERICAN BEE JOURNAL has been to considerable pains in getting so many reports from so many different parts of the country, and it seems as though we should derive some benefit from it.

G. H. ASHBY.

Albion, N. Y., Nov. 18, 1889.

Getting Bees Out of Sections.

In the well written and finely illustrated article by Mr. F. Greiner, on page 727, I am requested to prevail upon the inventor of any better plan for getting bees out of surplus receptacles than is there illustrated, and to publish the same. He closes by saying that thousands of bee-keepers, who are working hard to make an honest living, will thank me for it.

I have the most kindly feelings towards the class of hard-working bee-keepers to which Mr. Greiner refers, and that is the reason why I have always tried to check the influx into our business to an extent hurtful to this very class.

If Mr. Greiner is familiar with my work during the past twenty years, I would ask, in all candor, if I have not done my share of *gratis* labor. I think so; and when I came to one (and that which I considered my crowning invention), procured a patent upon it, and asked for a partial payment for my labors, it turned out that in the bee-keeping ranks was a class not enumerated

by Mr. Greiner in his sentence, "who are working hard to make an honest living," but who were working in every way to deceive, to the end that some one might not get a dollar, or an honor, more than they have been able to command.

The invention referred to by Mr. Greiner, is that of another, and one who can well be excused for being embittered by the treatment his father has received. There are many kinds of charity, all of which are good, that should *not* be dealt out promiscuously. Every one should deserve what he gets. That would foster a deserving deportment. JAMES HEDDON.

Dowagiac, Mich.

Honey Crop Almost a Failure.

The honey crop of Southern Illinois is almost a failure in some localities, and other places gave ¼ to ½ of a crop. In southwestern localities, among the poplar (tulip) trees, bees did not do so well, on account of the cold spell in May, which is the time that the poplar is in bloom. My bees averaged only 33 pounds per colony this year, and 43 pounds in 1888.

Boyleston, Ills. THOS. C. STANLEY.

Good Yield of Honey—Robbing.

I had 49 colonies in chaff hives last fall, and lost 3 in the spring, one having died (a swarm that came to me), and the other 2 were robbed out, which left me 46, all in good condition except a few weak ones, which finally became all right. Then two weeks of cold, rainy weather came on, and all the bees would have starved, if I had not fed them about 150 pounds of sugar that lasted them until they could get out to gather honey; in a few days the brood-chambers were full, and I had to put on the supers; in a week I extracted 900 pounds and in 3 or 4 days, 1,200 pounds more, and so on till I had extracted nearly 10,000 pounds of honey, besides saving lots of filled combs to put back for winter. I sold all of my honey for 5 and 6 cents per pound, but mostly at 6 cents. Another person and I extracted 2,200 pounds in one day. All of my crop is from 46 colonies of bees. How is that for high? Besides I increased my apiary to 90 colonies, which are now in chaff hives.

To stop bees from robbing, I take a double handful of straw and put it at the entrance against the hive. They cannot, or will not, alight on this, and will soon give up robbing. The bees in the hive will not smother if straw is left there for any length of time. Take it away in the evening. NATHAN MERCER.

Neosho, Wis.

Poor Season for Honey.

I started last spring with 30 colonies, and I now have 51, increased by natural swarming. The drouth held on in the spring until it came nearly killing all the white clover here in Clark county, and it held on for weeks after it had commenced to rain in all the other parts of the State, and we could hear of its being too wet there. The last of May it commenced to rain here, and when it did begin it seemed as if it would never stop; but at last it did cease, and did not rain any more, so that the buckwheat came nearly dying just as it began to bloom. Of course we got no honey from it. Then the cold nights began, so that it was the poorest fall for honey that I have ever known. I got only 500 pounds of honey, of bad quality. The fall honey was better, and I trust that it will winter the bees. I am in hopes that next year's crop will be a good one, for all the earth is a mass of white clover this fall. Some say that they are not discouraged by a failure, but it hurts to have three years of failure, and to see the bees starve to death just when they ought to be thriving and swarming. Still, one thing consoles me, for I can think back to the time when I had honey by the ton—it was when I had to back a wagon to my front door, and haul the honey off by the ton. Then it was, "Where can I sell all the honey?" Now it is, "What will I do for honey for my customers?" The question with me is, How can I produce the honey? Golden-rod is worthless for honey here. Spanish-needle, heart's-ease and white clover are all that we can depend upon for honey.

D. R. ROSEBROUGH.

Casey, Ills., Nov. 15, 1889.

Queen-Cell Knife, etc.

I make a good queen-cell knife as follows: Take an old corset steel, about ¼-inch wide, break it off 3½ inches long, and grind one end in the shape desired for cutting, and sharpen the edge as far back as it will be needed. Then whittle out a handle about the size of a lead-pencil, 3 inches long, and split it half the length and insert the steel; tie a thread around the end in a groove, and it is ready for use. It is thin, and just right for cutting out queen-cells. Make several, and have one always handy.

This has been another year of failure with us here. White clover was abundant, but the bees did not notice it much. From 23 colonies, I got only about 110 pounds of honey, and increased them to 32. This is the fourth year of failure in succession. The fall honey-flow generally fills the brood-chambers. HUGH L. LYNN.

Glenville, Ky.

Gone to Washington.

As Secretary of the Northeastern Ohio, Northwestern Pennsylvania and Western New York Bee-Keepers' Association, I wish to announce through the AMERICAN BEE JOURNAL, that our President, Mr. W. A. McLain, from change of location, has been obliged to resign the presidency of the association. I know that it will be news that all the members of the association will be very sorry to hear, for Mr. McLain was always genial and ready to do all in his power to make our meetings profitable. His hearty hand-shake will be very much missed. Mr. W. A. McLain moved with his family to Seattle, Washington (State), on Nov. 12. Though he has sold his bees, we believe that his interest in them is such that he will secure some of his pets in his new home. H. S. Sutton, of Franklin, Venango Co., Pa., 1st Vice-President, is now the President of the association.

We are having a nice fall, and up to this time we have not had snow enough to cover the ground. Bees generally have plenty of natural stores for winter.

GEO. SPITLER.

Mosiertown, Pa., Nov. 19, 1889.

Varieties of the Clover.

I notice on page 725, that Mrs. L. Harrison, in her answer to Query 668, claims to know of forty different varieties of clover. Will she please to give the names of the forty varieties, and also where they exist? C. E. WOODWARD.

Xenia, O., Nov. 16, 1889.

[At our request, Mrs. Harrison gives the following reply to the above.—ED.]

In the "Herborium" of the Department of Agriculture at Washington, D. C., are specimens of the forty varieties of native clovers (*Trifolium*). The largest number of these belong to the Pacific side of the continent. Of these forty species, only eight (I think) have been experimented with and cultivated, to determine their value for forage and fodder. We have experimented to some extent with six varieties. Then there is the Japan clover (*Lespedeza striata*), that is not a *Trifolium*, but which has been found to be of value in Florida, Southern Alabama, and Georgia, for forage. For pasture in your locality, there is probably nothing better than Alsike clover (*Trifolium hybridum*), which gives great satisfaction with us. The Department of Agriculture has issued several special reports on our native grasses, the principal of these, called the "Agricultural Grasses of the United States," is a pamphlet of 144 pages, with 120 full-page engravings. You can probably obtain it through your Member of Congress; or by writing directly to Hon. Jeremiah Rusk, Secretary of Agriculture, Washington, D.C.

MRS. L. HARRISON.

Peoria, Ills.

Bee-Escapes Further Described.

On page 697, Frank Coverdale attempts to describe a bee-escape to get bees out of sections—a board ⅜ of an inch thick, to just fit the section-case; nail ⅜-inch strip all around; then a ¾-inch hole is bored in the board, and a 1⅜-inch cone made so fit in the hole. This board is slipped between the case of full sections and the brood-frames, or between the top and middle cases, and the cone dropped in the hole in the board, through which the bees will descend into the brood department. Observe, the board is ¾-inch thick, and there will be but a ⅜-inch bee-space below it until the sections or brood-frames are reached—the thickness of board and space under it making in all ¾ of an inch. The wire cone being 1¾ inches long, the point will rest on the tops of sections or frames. How are the bees to get down? E. E. EWING.

Rising Sun, Md.

[At our request, Frank Coverdale replies to the above as follows:—ED.]

Judging from the letters received by me concerning my bee-escape board, it has apparently been quite plain to all, as far as I know, except the above. In answer to Mr. Ewing, as to how to manage the cone, I would say: Bore the ¾-inch hole, as I mentioned on page 697, over the opening of the sections. This is done so that the wire-screen cone will go down between the sections or brood-frames—otherwise of course it would not go down. When used over a wood-zinc honey-board, the cone must be made shorter, so that the lower point will come down between the slats close to the zinc perforations.

FRANK COVERDALE.

Welton, Iowa.

The Honey Crop.

On page 731, Mr. C. D. Barber, Stockton, N. Y., says that I reported the honey crop of Chautauqua county, N. Y., a complete failure, and avers that his bees never did better, and that my report "was incorrect." In justice to myself, I would respectfully say that as I made no such statement, the "incorrect report" applies more fittingly to Mr. Barber's letter, than to any on page 556. The letter would convey the idea that I had positively asserted that which I did not know. In the future, Mr. Barber will please read more carefully, and report more *correctly*. H. E. HILL.

Titusville, Pa., Nov. 19, 1889.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

☞ Read our Book Premium offer on the last page of this JOURNAL.

☞ Money in Potatoes, by Mr. Joseph Greiner. Price, 25 cents, postpaid. For sale at this office.

☞ Send us one **NEW** subscriber, with $1.00, and we will present you with a nice Pocket Dictionary.

☞ Red Labels are nice for Pails which hold from 1 to 10 lbs. of honey. Price $1.00 per hundred, with name and address printed. Sample free.

☞ Calvert's No. 1 Phenol, mentioned in Cheshire's Pamphlet on pages 16 and 17, as a cure for foul brood, can be procured at this office at 25 cents per ounce, by express.

☞ The date on the wrapper-label of this paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to advance that date another year.

☞ Please send us the names of your neighbors who keep bees, and we will send them sample copies of the BEE JOURNAL. Then please call upon them and get them to subscribe with you.

☞ As there is another firm of "Newman & Son" in this city, our letters sometimes get mixed. Please write *American Bee Journal* on the corner of your envelopes to save confusion and delay.

☞ We have some full sets of the BEE JOURNAL for 1889, and *new* subscribers can have the full sets for 1889 and 1890 for $1.80 until all are gone. Or, we will send the full sets for 1887, 1888, 1889 and 1890 for $3.00.

☞ Systematic work in the Apiary will pay. Use the Apiary Register. Its cost is trifling. Prices:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

☞ When talking about Bees to your friend or neighbor, you will oblige us by commending the BEE JOURNAL to him, and taking his subscription to send with your renewal. For this work we will present you with a copy of the Convention Hand Book, by mail, postpaid. It sells at 50 cents.

☞ We offer the Monthly Philadelphia *Farm Journal*, and either the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20. Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excluding honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

If you desire to know how this can be done—how to have Queens fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees cay fly—all about the different races of bees—all about shipping Queens, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.; or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 170 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

A New Premium.

The National Purchasing Co. of this city issue a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement with the Manager, Mr. C. L. Seavey, we are enabled to make this remarkable offer: We will forward a Membership Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL for one year with $2.00. This offer is good only until Dec. 31, 1889.

☞ We want these numbers of the BEE JOURNAL, viz: December, 1875, January to June, 1876, and April 30, 1884. Also No. 18, of 1884: and Nos. 2, 17, 18, 19, 20, 21, 32, 42, 44, and 48, of 1885. If any one desires to sell them—please state price. Do not send any numbers until we order them, for we only want one copy of each.

☞ Please notice our latest Premiums for getting new Subscribers, on page 751 of this issue. It will pay every reader to endeavor to procure new subscribers for us. We ought to get thousands of new readers during the next two months.

☞ W. D. Soper, of Jackson, Mich., has his new Catalogue of Bee-Keepers' Supplies for 1890 on our desk at this early day.

Honey and Beeswax Market.

DETROIT.

HONEY.—Demand is fair for comb at 13@15c. per lb. There is more dark honey than light. Extracted, 8@9c.
BEESWAX.—24@25c.
Nov. 11. M. H. HUNT, Bell Branch, Mich.

CHICAGO.

HONEY.—Receipts of comb are averaging about as they usually do with a fair crop. Prices rule at 13@14c. for choice to fancy 1-lbs., which comprise the bulk of the receipts, very little in sections averaging 1½@2 lbs., and sells at 10@12c½.; dark, 8@10c Extracted, 6@8c.
BEESWAX.—25c. R. A. BURNETT.
Nov. 8. 161 South Water St.

KANSAS CITY.

HONEY.—Fancy white 1-lbs., 14c.; good, 13c.; dark 11c.; white 2-lbs., 13c. Extracted, white, 7c.; dark, 6c Demand good.
Nov. 11. HAMBLIN & BEARSS, 514 Walnut St.

DENVER.

HONEY.—1-lb. comb, 15@18c. Extracted, 7@8c.
BEESWAX.—20@25c.
Nov. 11. J. M. CLARK COM. CO., 1421 15th St.

MILWAUKEE.

HONEY.—Choice white 1-lbs., 14@15c.; 2nd grade white 1-lbs., 13@14c.; old dark 1-lbs., 10c.; new, 10@11c. Extracted, white, in barrels and kegs, 7@8c.; in tins and pails, 8@8½c.; dark, in barrels, 6@6½c.; in kegs, 6@7c. Demand steady.
BEESWAX.—22@23c.
Nov. 11. A. V. BISHOP, 142 W. Water St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Demand for white clover 1-lbs. is improving, but price depends upon size and style of package, condition and appearance when received, ranging from 12@13½c.; baswood, 11@11½c.; buckwheat, 8@10c. Extracted, 6½@7½c., depending upon style and size of package.
BEESWAX.—27@28c.
Nov. 9. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Demand fair. Western honey arriving freely, and prices declining. We quote: Fancy white 1-lbs., 14@15c.; 2-lbs, 12@13c.; off grades and mixed 10@12c.; buckwheat 1-lbs., 10@11c.; 2-lbs., 9c. Extracted white clover and basswood, 7½c.; orange bloom, 8½c.; California, 7½c.; buckwheat, 6 cents; Southern, 70@75c. per gallon.
HILDRETH BROS. & SEGELKEN,
Nov. 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—We quote: Fancy 1-lbs., 16@17c.; fair, 14@15c.; 2-lbs., 15@16c. Extracted, 8@9c. Market is in fairly good condition, but we are getting some of the odd grades from Western New York, Michigan and Wisconsin, and it is not arriving in very good condition, making it hard to sell.
BEESWAX.—None on hand.
Oct. 21. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A large amount of Comb on the mardet at 14@16c for best white. Extracted at 5@8c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Nov. 22. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Receipts are very light, and demand is increasing. We quote: White 1-lbs. 13@14c.; dark, 10@12c.; white 2-lbs. 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 6c.
BEESWAX.—None in market.
Oct. 12. CLEMONS, CLOON & CO., cor 4th & Walnut.

☞ The Works of Scott and Dickens are not like the "novels" of to-day—both are founded on facts—and are well written in excellent English.

☞ We will send both the BEE JOURNAL and HOME JOURNAL from now until the end of 1890 for $1.75. The Christmas number of the HOME JOURNAL contains Christmas stories, poems and illustrations. Send early and get that number.

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*

THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Dec. 7, 1889. No. 49.

EDITORIAL BUZZINGS.

I know that Winter's coming fast,
The shortening day, the early night,
The zephyr chased by colder blast,
The woods adorned with colors bright.

Clubs of 5 for $4.00, to any addresses. Ten for $7.50, if all are sent at one time.

☞ Mrs. G. W. Boynton, La Crescent, Minn., died on Nov. 23, of paralysis of the heart, aged 65. The BEE JOURNAL extends condolence to a brother apiarist.

☞ The December numbers will be sent *free* to all new subscribers as long as our stock lasts—so the sooner you subscribe, the more you will get. Every yearly subscription will run for the full year 1890.

☞ We always extend the term of renewal subscriptions from the date of expiration on our books. Present subscribers whose time may expire one, two, three or six months hence, can safely renew now, without fear of loss thereby.

☞ The Holiday number of the ILLUSTRATED HOME JOURNAL will be beautifully illustrated, and besides the usual inviting matter, will contain much that will be exceedingly interesting during the Holidays. It will be issued about December 20—in good time for the festive season.

☞ The Canadian *Bee Journal* has our thanks for kindly mentioning our name in connection with the management of the interests of apiarists at the World's Fair. We have already indicated our choice—Dr. A. B. Mason—and hope he will accept the responsible position. He is the right man for that place.

A Special Club Rate.

A Magazine of the choice literary character which the ILLUSTRATED HOME JOURNAL sustains, will add many pleasures to any "family circle." Its beautiful illustrations and interesting reading-matter will make it heartily welcomed at every "fireside" in the land.

We desire that every one of our readers should secure its regular visits during the year 1890, and in order to induce them to do so, we will make this tempting offer:

We will Club the AMERICAN BEE JOURNAL and the ILLUSTRATED HOME JOURNAL, and mail both periodicals during the whole year 1890 for **$1.50**, if the order is received at this office before January 1, 1890.

Such a *remarkably low* club rate as the above, should induce every reader of the BEE JOURNAL to accept it without a moment's delay.

As a further inducement, we will mail the superb number for December, 1889, *free* to those who send their subscriptions early; that is, until all the December numbers now on hand are taken.

New subscribers to the above club will have the December numbers of both of the JOURNALS free—as long as the stock lasts. So the sooner they subscribe, the more they will get for their money.

World's Fair Bee-Convention.

Mr. R. F. Holtermann, the Secretary of the International Bee-Association, writes thus:

I should like to see the International American Bee-Association what it should be: and it ought to have, in its treasury, funds to defray the expenses of an International Convention during the World's Fair in 1892. Who knows the grand results which may be secured from a convention of bee-keepers of the World? To do this, we must commence at once; and I propose that every one who can, shall send one dollar as a membership fee to the International for the coming year; and if the surplus be voted to me for the work of the past year, I will turn it over to the treasurer, to remain as funds of the Association. Surely, many will be found who will endorse this scheme, or something like it, and send their dollars. R. F. HOLTERMANN.
Romney, Ont.

We like that, and it would be a fine thing to have a very creditable exhibit of bees and honey at the World's Fair in 1892, and invite the bee-keepers of the World with us.

☞ Dr. J. B. Wilcox, Manistee, Mich., subscribed for the ILLUSTRATED HOME JOURNAL last April, and now, when sending another subscriber, writes: "I intend to keep the HOME JOURNAL in my office for my patrons to read while waiting, but they are so much interested that every number is loaned." That is the unanimous opinion. All who see it want its regular visits.

☞ Clubs for anything in our Premium List may be for either of our JOURNALS, or for any number of either or both of them.

Our Supplement.

Our Premium List is sent as a Supplement to this issue, and we hope that it will be carefully examined by all our readers and that each one will select a Premium, and obtain the necessary number of new subscribers, to procure it.

Books Given Away.

Please notice that magnificent list of Popular Books on the second page of our Premium-List Supplement. We offer any Book in that list, which you may select, as a Premium for getting *one new* subscriber, with $1.00 to pay for the same. The Books are nicely bound in cloth, elegantly gilded, and contain from 300 to 500 pages each. The list comprises over 150 of the most popular Books of the day, and are published at $1.00 each.

This is the most remarkable Premium ever offered for obtaining one subscriber. If you want it sent by mail you must send 10 cents extra for the postage. If sent by express from New York, it is entirely *free*. We will sell any number of them to you at 40 cents each by mail, postpaid.

☞ The *Standard*, of New Bedford, Mass., has this to say about the ILLUSTRATED HOME JOURNAL:

The November number of the ILLUSTRATED HOME JOURNAL is received, and contains very interesting matter of a moral and intellectual character, and its historical and biographical sketches, as well as its stories, etc., are charming. It contains a Young Folks' Department, the Household, and the Family Circle, teeming with entertaining and practical matter, suggestions and hints.

☞ C. Schliesmayer, of Pasadena, Calif., writes thus about the Doolittle book on "Queen-Rearing" we sent him:

I have received the book, "Doolittle on Queen-Rearing," and I am well pleased with it. The printing and binding are fully equal to the reading matter—and all are excellent.

☞ If any of your numbers of the BEE JOURNAL for this year are lost or mislaid, and you desire others to replace them, you should look them over at once and send for them before all our stock is exhausted. They are already getting low on some numbers.

☞ If any one wants a club of two or more weekly or monthly periodicals, besides one or both of our Journals—send us a Postal Card, and we will then quote the lowest possible price, by return mail. The number is too great to enumerate.

☞ Any of the Political Dollar Weekly Newspapers will be clubbed with our JOURNAL at $1.75 for the two; or with both our HOME JOURNAL and BEE JOURNAL for $2.50 for all three papers.

Music at the International.

The words on this and the next page was composed by Mr. Eugene Secor, and the music by Dr. C. C. Miller—and both were made especially for the International Convention. We give them a place in the BEE JOURNAL, so that all can join Yakob in singing about his bees in the spring-time, whether they were at the Convention or not.

Essays at Conventions.

It has been tried at several conventions to dispense with essays, and we think much of the usefulness of such bodies has been lost by their absence. The *Review* for last month, under the caption, "Do we need conventions?" makes some capital points on this subject. We will have to reproduce the article, and commend it to the consideration of all our readers:

It is true that many little things come to light at conventions that would never have been written. Under the stimulus of a face to face debate, when the eyes flash and the cheeks kindle, thoughts come thick and fast; and in this friction of mind against mind, many a spark of wisdom flashes into view. Conventions bring out and diffuse knowledge that would otherwise lie hidden, as it often happens that the possessor of an active brain and a nimble tongue may have fingers to which the pen is a stranger.

We *do* think short, crisp, aggressive essays, as "discussion provokers," are needed at conventions. There should be no attempt to treat the subject exhaustively, but rather to say something that will make men feel like getting up and talking.

The Secretary ought to see to it that such essays, and *none* others, are secured. He should so inform the ones who are asked to write esays. A well-considered programme, with the best men available to lead in the discussions, either by essays or address, is a great step towards success; besides, a published programme is one of the best advertisements that a convention can have. But we cannot for one moment believe that an essay from a man is to be compared to having the man himself present at the meeting—the one is a love letter, the other the lover himself.

We believe it is also true that apicultural literature is largely dependent upon conventions for its brightness, its "newsiness." In the October *Review* for 1888, we said: "We have always noticed that when the editor of a journal attended a convention, the next number of his paper was greatly improved. There would be a freshness and sparkle, indescribable, but nevertheless very apparent." If conventions have such a beneficial effect upon editors, why should they not be a benefit to subscribers?

But, after all is said and done, we feel that it is the social feature that brings us together; it is the enjoyment of this personal magnetism between choice spirits that attracts us.

At the last meeting of the Northwestern, the editors of the AMERICAN BEE JOURNAL, *Gleanings* and the *Review*, together with Dr. Miller and Mr. Heddon, attracted by a sort of affinity, clustered together in a cozy corner one evening as the crowd was dispersing, and talked, and talked, and talked; started once or twice to go to their rooms, only to come back again; and it was only as the small hours approached that Bro. Newman went home, and the others "paired off" and went to bed to "talk some more." Such hours are golden, and

Spring-time Joys.

Words by EUGENE SECOR. Music by Dr. C. C. MILLER.

Den Yakob—dots me—upon der town vent
Ter make vone gollar mit shtraps;
Dot saddle man fix up der ledder zhust nice,
Und drimmed it mit puckles und schnaps.
I harness mineself like vone Mason Grand Knight,
Und cfery vone meets me und sings—
"Now Yakob vats op?" "Vats inside your head?"
I dells dem, "Zhust vaits dell der Shpring."

Ven Aprile vas gome, und dot snn vas got varm,
I put on my mine new-fangled gear,
Und goes down der cellar so happy und shpry.
You dinks I vas married dis year.
You nefer saw anydings vork so like dot,
So handy dose poxes ter pring—
I nefer more preaks Katrina's poor pack
Ter garry dose pees in der Shpring.

I sings like vone jhay pird, so happy I feels,
Und plesses dot awful schmardt man
Vot makes up dot harness all ondt of his headt,
Ter garry dose pees on deir schtand.

Spring-time Joys. Concluded.

Ven oudt mit der cellar ten poxes vas gome
Und Yakob—dots me—haf no shting,
I lafs me all ofer und says to mine vraw,
"I loves eferybody dis Shpring."

Katrina, her sit on der vindow und shmiles,
Und I dinks of dot dime her vas young—
But I don't nefer dinks dot dose innocent pees
Vas grawling mine drowsers among,
Dill I prag oudt vone oder pox zhust poorty soon,
Und shteps zhust as broud as dose kings—

Dunder und blixen—gimlets mit schteel
Vas loose in mine preeches—mit vings.

Ven Yakob—dots me—drys to larrup dot peo,
Ten tousand zhust gome to der fight
From oudt ef dot pox vat I got on mine pack,
Und gif me some music dot night.
"Katrina, Katrina, I'm deadt, dot vos sure,
Und shticking all ofer mit shtings—
Make Yakob let go mit a puteher-knife kvick,
Or your true lofe vill nefer more sing."

will ever linger as bright spots in the memory.

As E. D. Keeney, of Arcade, N. Y., says in a private letter, "We need more play days and rest days, and at the conventions we can drop our business and cares, and can rest and learn, and feel better for it. We can go back to our work with renewed vigor and life."

While it is true that the abundance of cheap and excellent literature has greatly lessened the necessity for conventions—has completely overshadowed them as a disseminator of knowledge—it is equally true that conventions yet have, and always will have, a vast influence. We cannot spare them.

To have a personal acquaintance with the best men engaged in the same occupation as ourselves, is no small advantage; it gives us broader views; by them we can measure ourselves and see where we are lacking; it adds to our enjoyment and to our knowledge. Without conventions our acquaintanceships would be few and far between. Joined with the press, the convention becomes all-powerful—the words of wit and wisdom fall not only upon the ears of the assembled hundreds, but are seen by thousands of readers scattered all over this fair land. The convention and the press—we need them both.

The International.

Our Canadian brethren are intending to do something handsome in the way of entertaining their visitors from this side of the line. The *Canadian Bee Journal* remarks as follows:

Canadians are, in duty bound, to give our American friends a rousing welcome, and show them by our numbers and enthusiasm, that we fully appreciate the holding of the International on Canadian soil. Aside from the social fellowship, think of the information you will gain, and the benefit it will be to you in forming new acquaintances and associations. This chance comes but seldom, and we are sure that none will stay away who can possibly get there.

The Brant Bee-Keepers' Association makes this announcement through its Secretary, Mr. D. Anguish:

We have made arrangements with the City Council for the Wickliffe Hall, an address of welcome from the Mayor, and have secured an instrument, hoping that some of our visitors will enliven the proceedings with a little music.

We admit, Brantford is not as large as Buffalo, nor as attractive as the Falls of Niagara, but never mind, come right along. You may see more than you expect. Be sure and come, everybody that is interested in bee-keeping, and bring your friends. Let us have a large and interesting gathering of bee-men such as we never had. What is the Falls of Niagara, or Buffalo, compared with a large gathering of, I am sure I may safely say, good looking and intelligent bee-keepers?

It is quite uncertain whether we can attend the International Convention, this year, much as we desire to do so. On account of afflictions in our family we cannot plan for any future date. That meeting is of vital importance to the pursuit, and we hope that it will be a very interesting and enthusiastic gathering, and that the interests of the pursuit will receive the closest consideration, and be aided by the wisest measures.

QUERIES AND REPLIES.

Bees Working on Buckwheat When in Bloom.

Written for the American Bee Journal

Query 673.—1. Do bees injure buckwheat when in bloom? 2. If so, how?—Sub.

No.—M. MAHIN.

No.—G. L. TINKER.

No.—H. D. CUTTING.

No.—C. C. MILLER.

No.—WILL M. BARNUM.

No, sir.—EUGENE SECOR.

No.—J. P. H. BROWN.

No.—J. M. HAMBAUGH.

No! No! NO!—G. M. DOOLITTLE.

I think not.—R. L. TAYLOR.

No. They are a benefit to it.—A. B. MASON.

1. No. 2. How? Echo answers, "How?"—DADANT & SON.

No, the bees were created for the purpose of fertilizing plants.—MRS. L. HARRISON.

Not at all, but they are a great help to it, to make it produce abundantly.—C. H. DIBBERN.

1. *No, never.* Bees are valuable to all plants on which they work.—A. J. COOK.

If encouraged, they might harvest the crop and store it. I do not think that they would injure it. They might grind it, and make it into cakes, if allowed to take it as a winter job.—J. M. SHUCK.

1. They do not; they perform a work of value in all cases, in aiding cross-fertilization. In fact, all bloom is aided, instead of being impaired, by the visits of the bees.—J. E. POND.

No. They do it good. Their visits the more perfectly fertilize the blossoms, thus causing more seed-wheat. Who is jealous, envious and ignorant in your locality?—JAMES HEDDON.

No. They are decidedly an advantage to the seeding of the plants. When I was a small boy, my father kept bees in box-hives—lots of them—and every year he would sow about one to three acres of buckwheat for his bees, and to have buckwheat-cakes for his family. Our buckwheat was as fine as ever grew out of the ground.—G. W. DEMAREE.

They not only do *not* injure it, but they are of great value in fertilizing it. It is a false idea that bees injure any bloom. They were created for the very purpose of mingling the pollen-masses, so as to make them fertile.—THE EDITOR.

Effect of Sulphur on Buckwheat Bloom.

Written for the American Bee Journal

Query 674.—Will sulphur sown on buckwheat when in bloom, cause the bees to fight each other?—Vt.

No.—M. MAHIN.

No.—C. C. MILLER.

I guess not.—R. L. TAYLOR.

Never, in my experience.—WILL M. BARNUM.

I do not know anything about it.—H. D. CUTTING.

I never heard of such a thing.—EUGENE SECOR.

I do not know. Try it, and see.—J. M. HAMBAUGH.

I have never tried it, but I should not think that it would.—J. P. H. BROWN.

Oh, dear! there is so much that *I do not know*, and this is a part of it.—A. B. MASON.

I think not. For what do you want to sow the sulphur on the buckwheat?—G. M. DOOLITTLE.

I do not know. I do not use sulphur much—and I do not want to go where they do use it.—J. M. SHUCK.

I never tried the experiment, but I can safely say, no. Bees care nothing for sulphur, as long as they are not subjected to its fumes.—G. W. DEMAREE.

I know nothing about it; but, on general principles, I should say emphatically, *No.*—A. J. COOK.

Buy a bushel of sulphur, and try it, if you have nothing else to do.—DADANT & SON.

I do not know. Who is envious, jealous and malignant in your locality?—JAMES HEDDON.

I should think that they would fight the man who put it on. Is the flour sown on the bloom, to keep away the scratches, from those who eat the cakes?—MRS. L. HARRISON.

What a question! If sulphur should be found to act on bees, as "bug juice" does on man, it may do so.—C. H. DIBBERN.

The man who could believe that bees injure buckwheat when in bloom, might easily believe that sulphur sown on buckwheat would make the bees fight.—G. L. TINKER.

I do not see why it should, but as I have never tried it, I do not know. I do know that sulphur sprinkled in and around hives does not cause fighting.—J. E. POND.

No. The fumes of burning sulphur are disastrous to bees, but we never heard that it caused them "to fight each other." As a matter of fact, it takes the "fight" all out of them, by destroying life itself. But why should sulphur be "*sown* on buckwheat?"—THE EDITOR.

Convention Notices.

☞ The annual meeting of the Vermont State Bee-Keepers' Association will be held at Burlington, Vt., on Jan. 22, 1890. J. H. LARRABEE, *Sec.*

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 17 and 18, 1889. D. A. FULLER, *Sec.*

☞ The Cedar Valley Bee-Keepers' Association will hold its next semi-annual meeting at the office of Jerry Mosher, Waterloo, Iowa, on December 18 and 19, 1889. All interested in bees and honey are cordially invited to be present. J. J. OWENS, *Sec.*

☞ The 24th annual meeting of the Michigan State Bee-Keepers' Association, will be held at Lansing, Mich., in the Capitol Building, on Dec. 26 and 27, 1889. At that time nearly all railroads sell half fare tickets; a few railroads charge one-and-one-third fare for the round trip. Reduced hotel rates will be given at the Hudson House. All are cordially invited. H. D. CUTTING, *Sec.*

☞ The bee-keepers of Huron and Tuscola Counties will hold a joint meeting on Dec. 16, 1889, in the Union House, Concordia Hall, at Sebewaing, Huron Co., Mich. All interested are cordially invited to attend, and make this, the first meeting, a great success. There will be topics of interest to all discussed. JOHN G. KNUDINGER, *Cor. Sec.*

CORRESPONDENCE.

NEW THINGS.

How they are Viewed by One of the Rank and File.

Written for the American Bee Journal

BY DR. C. C. MILLER.

I like to see the announcement of a a new book written by a practical bee-keeper, no matter if the ideas contained in it have been partly or wholly given in print from the same pen in the weekly or monthly page, still it is pleasant to have those ideas collected in book form, ready for easy reference. So I looked eagerly for Doolittle's book, and was not disappointed to find that I was hardly willing to lay it down before I had reached the end. Even the old things in it were dressed up in such pleasant shape, that they seemed like new acquaintances, and among the new things were some intensely interesting.

I think I will be doing a favor to those who have not read the book to urge their getting it. Even for the amateur who never expects to go beyond his half dozen colonies, the book has practical value, and is not intended merely for the professional queen-breeder.

Every bee-keeper should also add the new Langstroth to his library. It has on it the stamp of practicality, as one might expect, coming from such experienced men as the Dadants. If this looks like advertising, all I have to say is, that it is gratuitous, and I think I am doing my readers a favor, just as I would to advise a friend, privately, to do something that I believe would benefit him.

You are not likely to agree to everything in these two books, but you will, in the main, and even if you disagree *in toto*, you might find benefit in knowing the thoughts and plans of good, practical men.

NEW BEE-PAPERS.

I have just received notice of a new paper to be started, having bee-keeping as at least one of its principal provinces. I always rejoice to see the announcement of a new bee-book, but I don't always rejoice at the announcement of a new bee-paper. The book is likely, no matter how poor it may be, to make some addition to my stock of knowledge, and even if it does not, it can do no harm to my already acquired possessions. On the other hand, a new paper may do some harm to that which I already have.

I am pretty sure that the papers already published are none too well sup-

ported, and I am very sure that a good many have not had support enough to keep the breath of life in them, as their deaths attest. Each one that starts up anew, whatever support it may have, is likely to take at least a little support from those already established. I suppose it would be for the interest of any one of the bee-periodicals already published, if all the rest should suspend publication, and leave a clear field for the one. On the other hand, it is for the interest of the bee-keeper to have as many *good* publications as possible. I emphasize the word *good*, and as one of the rank and file, I believe my interests would be best served if a part—perhaps the larger part—of the bee-papers in this country should cease.

I should not like to see the number limited to 1, or even 2, for I think rivalry of the right kind will give us better papers, and even if rivalry made no difference, I would rather have 2 than 1, providing both can have support enough to be good.

As I have already intimated, I would like to have as many *good* bee-papers as possible, the only question being as to how many can be well enough supported to be good. Then it takes something more than support to make a good paper. There must be brains in it, and brains of a special kind.

I wish the next man that meditates starting, might understand that if he were to step right into the place of one of the most successful publishers already established, the chances are 10 to 1 that he wouldn't have the right kind of brains to keep the thing running; and on the other hand, if he could have suddenly given to him the brain equipment of the most successful publisher in the lot, with all the experience of years belonging to it, he would find it very up-hill business to get started, in a new enterprise, and might find, for the first 2 or 3 years, that the most sumptuous fare he could afford would be rye mush and buttermilk.

Marengo, Ill.

SWARMS.

Unsealed Brood to Prevent Swarms from Decamping.

Written for the American Rural Home.

BY G. M. DOOLITTLE.

Will unsealed brood prevent swarms from leaving the hive in which they are placed? is a question I am often asked. This used to be thought a sure preventive, and many even at the present day think that if they put unsealed brood in a hive that is to be immediately occupied by a swarm, that swarm is sure to stay. However, the many reports would seem to indicate that all do not have success with the plan, for, during the past year, I have noticed no less than six different reports where bees had absconded and left such brood when placed in the hive to keep them where hived. My own experience also proves that with first or prime swarms, the placing of brood in the hive they are to be hived in, only enhances the chances of their leaving, rather than proving a preventive.

Previous to 1871 I had never clipped any of my queens' wings, and was often fearful that my new swarms might desert the hives they were placed in. During the spring of that year, I read that a frame of unsealed brood, placed in the hive at the time of hiving, was a sure preventive of the swarm's decamping. This was read with enthusiasm, as here was a plan by which my fears could be entirely removed. Consequently, when my first swarm issued, I hastened to get a frame of brood in all stages, which also contained some honey to start them in house-keeping, as we used to be told was necessary to do. They were hived about 2 o'clock p.m., and I went to bed that night, feeling that my first swarm of the season was well provided for, and would be sure to stay.

The next morning I looked at them, and went to work. At about 9 o'clock, the cry, "Bees are swarming," was heard, and upon reaching the bee-yard, my new swarm was seen going for parts unknown. My lips were bit as I thought of some proper form of sound words to vent my spite on the author of this plan of keeping swarms from absconding, while I resolved that every queen's wings in the yard should be clipped, which was done without delay.

Since that time I have frequently hived swarms, and given them brood by way of experiment, and have had many of them come out, but as their queen could not fly, of course they could not abscond. Still, probably ¾ of the swarms hived in this way stayed and worked all right, while not 1 in 20 hived without any such precaution, bothered me in attempting to leave.

Hence, my experience goes to prove that unsealed brood will not prevent swarms from leaving, but, on the contrary, makes the probability of loss greater, as I said in the start.

But, says one, "Bees ought not to leave unsealed brood." Why not? They do when they leave the parent hive in natural swarming, the brood apparently being an incentive for their leaving, for, if we take the brood away from them at about the time they are ready to swarm, it will stop their doing so.

Upon examining the hive from which this first swarm decamped, I found they had built 2 pieces of comb as large as a hand, and had built queen cells upon the frame of brood, in which the queen had deposited eggs; thus showing that they considered the conditions the same, or nearly so, as they were in the parent hive from which they had issued the previous day.

There were also nearly enough bees left with those returning from the fields, to care for this frame of brood, this also proving that bees were left behind to take care of the old colony, the same as is always done after a prime swarm issues from any hive. I therefore conclude that those who advise the giving of brood to all prime swarms, are laboring under a mistaken notion, and I advise all to go slow in trying any such plan.

Borodino, N. Y.

MISSOURI.

Report of the Recent State Bee-Keepers' Convention.

Written for the American Bee Journal

BY J. W. ROUSE.

A number of bee-keepers assembled at Higginsville, Mo., on Nov. 14, 1889, and after a temporary organization was formed, and a Constitution and By-Laws adopted, they proceeded to elect officers for the ensuing year, as follows: President, R. B. Leahy; Secretary, J. W. Rouse; Treasurer, R. G. Robertson; with five Vice-Presidents, as follows: G. P. Morton, Central Missouri; J. S. Atkins, Northwest Missouri; M. V. B. Page, Southwest Missouri; A. Singer, Southeast Missouri; and P. P. Collier, Northeast Missouri.

An essay on "The production of comb honey," by W. Z. Hutchinson, and another on "Best packages of honey for marketing purposes," from C. C. Clemons, were read and endorsed, and a vote of thanks was extended for the same.

The Mayor of Higginsville gave an appropriate address of welcome, which was appreciated. Several discussions then followed on wintering bees, and on comb and extracted honey.

It was decided that the President appoint a committee of three, to investigate whether there is a law prohibiting the adulteration of honey in this State, and if not, to memorialize the Legislature to pass a law against the manufacture or sale of adulterated extracted honey; or, if allowed to be adulterated, to mark it "adulterated," with a heavy fine, or imprisonment, for violation of the law. Messrs. L. W. Baldwin, P. Baldwin, and Geo.

Boungs were appointed on the committee.

It was voted that the convention continue for an evening session, also for the next day.

The evening session was called to order by the President, and it was decided that the next place of meeting be at Marshall, Saline Co., Mo., and that the semi-annual meeting be held in April, 1890, for two days.

The Secretary was instructed to furnish copies of the minutes to the AMERICAN BEE JOURNAL and to *Gleanings*, for publication. The rest of the sessions were spent in discussions, and interchange of thoughts on the leading topics of bee-culture, after which the convention adjourned to meet at Marshall, Mo., at the call of the executive committee.

J. W. ROUSE, *Sec.*

BEE-KEEPING.

The Importance and Development of Bee-Culture.

Read at the Wisconsin Farmer's Institute

BY JOSHUA BULL.

The honey-bee—and it is a wonderful insect—has been associated with the history of man through all the ages of the past. From time immemorial honey has been used, and highly esteemed as an article of food ; and to the ancients, no higher praise could be spoken of any country, than to say it was "a land flowing with milk and honey."

The habits of the bee have been carefully studied by many learned and scientific men, in ancient as well as modern times, and there is perhaps nothing found in the annals of natural history more interesting and wonderful than may be found in the internal affairs of a bee-hive. There is as much order and system in a bee-hive as can be found in the best regulated governments of the most enlightened and civilized nations ; yet bees are not guided by reason or logic, nor philosophy, but are actuated entirely by that wonderful endowment, "Instinct."

Bees are not given to new notions—they do things to-day just as their ancestors did a thousand years ago, and he who would succeed in bee-keeping must work in harmony with their natural habits, and aid them in every possible way as circumstances may require, and thus encourage them to more vigorous action ; but any attempt to controvert their natural impulse is sure to result in failure, and whether the act be intentional or unintentional, the result will be the same, hence the necessity of being educated for the business.

No set or fixed rules can be given for the management of bees which can be invariably followed under all circumstances to insure the desired results. The right thing to do with one colony at a given time, might not be just the right thing to do with another colony at the same time, owing to the difference in their condition and surrounding circumstances. The variation in the seasons, the changes in the weather, and the condition of the atmosphere—all have an important bearing upon the secretion of nectar in the flowers, and consequently upon the time and manner as to when and how the bees should be manipulated. There are many things involved in bee-keeping, which, to the uninitiated, are impenetrable mysteries.

To be a thorough bee-master, requires as much intelligence, forethought and skill, as to be a good lawyer, physician, or any other professional ; and withal a clear perception of the relation between cause and effect.

Some people seem inclined to believe that anybody can keep bees, thinking that all that is required is, to put them into a hive in some out-of-the-way-place, and then they will "work for nothing and board themselves"—and so they may, but if their owner desires to obtain any surplus for his own table, or for the market, he must give them further care ; and unless he has a heart for the work, so that he finds some degree of pleasure in caring for them, he had better not attempt to keep them at all, as they will only prove a source of annoyance without profit.

In short, to make a successful bee-keeper, requires a sort of special gift, a natural aptness for the business, the faculty of perceiving what needs to be done, and an inclination to do it promptly. The old Spanish adage, "Never do anything to-day which can be put off until to-morrow," does not work well in bee-keeping—it savors too much of slothfulness ; but the Anglo-Saxon maxim, "Never leave until to-morrow, anything which can as well be done to-day," will be found to be much more appropriate, being much more in harmony with the indefatigable activity of the bees. There is always a right time for doing things—not too soon, and not too late.

We are living in a progressive age—no other period in the world's history has ever been signalized by such wonderful developments in science and art as have been brought to light in this Nineteenth Century. The great labyrinth of Nature's mysteries has seemed to be set open unto men, and forces and principles which have lain dormant since the beginning of the creation, have in our days been brought forth and made subservient to the will of man, with astonishing results.

When we take a retrospective view of these things, are we not warrantable in the conclusion that the hand of God is manifested in the development of events according to the world's need ? And whilst such unparalleled progress has been made in other directions, bee-keeping has also received a share of attention ; and I feel quite safe in saying that more progress has been made in the management of bees during the latter part of this century, than during all the thousands of years of previous history.

Bee-keeping in its present stage of development is fully entitled to take rank as one of the arts ; and were it not for the variableness of the season, the changeableness of the weather, and other atmospheric conditions upon which the secretion of nectar in the flowers is so largely dependent, and upon which hinges the turning-point of success or failure, all of which are entirely beyond our control—I say, were it not for these uncertainties, then bee-keeping might very properly be classed as a science ; but inasmuch as the variation of seasons necessitates a variation in the management of the bees, therefore no set rules can be established which will work satisfactorily under all the varied circumstances that may arise ; but the judgment and skill of the apiarist needs to be constantly exercised in order to discover just what needs to be done, and when and how to do it.

There are many other matters to be attended to in a well-ordered apiary, besides taking care of the honey. Every wide-awake apiarist of these days takes as much interest (and I might say, pride) in the rearing of his queen-bees, as a good farmer does in raising fine cattle or horses ; and there are numerous apiarists who do quite an extensive business in rearing queen-bees for sale, and send them all over the country to customers, the prices ranging from one to ten dollars, and upwards, for a single queen-bee, according to her pedigree, purity of blood, etc., and whether she is home-bred or imported.

With many people a bee is a bee, and they know no difference in the breeds ; but with the advanced apiarists it is considered a matter of considerable importance. Each has his favorite breed, the same as with other stockmen. Years ago the brown German bee was the only kind kept in this country, but of late years we have imported Italian bees, Cyprian bees, Syrian bees, Holy Land bees, Carniolan bees, Syrio-Albino bees, and an endless variety of hybrids have arisen by crossing these breeds, some of

which are perhaps superior to any of the "pure-blooded" bees for real business in gathering honey and for comb-building qualities.

Bee-keeping is of late years becoming quite an important industry, the products of which are perhaps ten times greater in this country than it was 25 years ago. The modern facilities for the management of bees has induced many to engage in this pursuit, until it is now claimed that there are in round numbers 300,000 bee-keepers in the United States, and their colonies of bees are numbered by the millions, with an aggregate annual production estimated at 50,000 tons of of honey!

Some are becoming alarmed, fearing that the business is being overdone, because the supply of honey is greater than the market will take at paying prices; but we have this thought to console us, that whatever is lost to the producer in consequence of low prices, will be so much saved to the consumer, and so the account will stand even, and honey is just as sweet now as ever, all the same.

Although the manipulations of an apiary are as widely different from farm work as the practice of medicine is different from the practice of law, yet, nevertheless, a few bees in the neighborhood are a real benefit to every farmer or fruit-grower, because the bees evidently perform a very important part in the fertilization of the blossoms of fruit-bearing trees and seed-bearing plants, by mixing the pollen-dust wtth the stigma of the flowers. when in their search for honey, thereby causing more abundant fruitage. Therefore, let the farmer, the fruit-grower and the bee-keeper live in harmony and good-will, for that which promotes the interest of one, will promote the interest of all. Give the bees a chance.

The bees are busy things you know,
And when there comes a honey-flow
You see them hurry to and fro,
  So quick and fast;
From very early morning light,
They spend each day in busy flight,
And they never sleep by night
  Till the harvest's past.

They do their work with eager haste—
Allow no time to run to waste;
Their honey hath delicious taste,
  As each one knows.
There's a great deal more that might be said,
But if I spin a lengthy thread,
You have not time to hear it read—
  So hear I close.

BEE-WOMEN.

The Duties and Characteristics of a Bee-Keeper's Wife.

Written for the American Bee Journal
BY REV. STEPHEN ROESE.

The following is a translation of an article written for *Der Bienen-Vater aus Bochmen*, by Mrs. Regina Stiller, the wife of a high-school teacher in Monchsdorf, Germany:

It seems daring to me, to appear before the bee-keeping public—however it is nothing strange, for I have read many articles in bee-papers written by a woman's hand, and I have also heard of many prominent and successful lady bee-keepers, from all over the land; not claiming to be talented, or worthy to be numbered among the last-named class, yet I feel a longing desire to become skilled, and thoroughly informed in the art of bee-keeping—for one reason, that the necessary absence of my husband might be substituted in my person, and, for another reason, because I take so great pleasure in the industry and doings of the honey-bee; and as I am a most needed companion and help to my husband in our home apiary, I take liberty in pointing out some of the duties of a bee-keeper's wife; and the reason why I speak of the duties of the wife, and not of the woman, is, that I much prefer to be the wife of my husband, than the woman of a lord.

The beauty and adorning graces of a true wife, especially the help-meet of a bee-keeper, consist chiefly in a consistent life and walk, coupled with a sweet temper, good-will, kindness, and gentleness towards her husband. Bee-keepers' wives, be modest in all your demands on your husband, in regard to dressing; shun all excess of fashion, and vain pride, which so often, and not without reason, are lamentable evils of the female sex, and are not becoming to the wife of a bee-keeper, for very few of the many apiarists in our days, have great riches as their portion in this world.

Be modest in your demands for the kitchen; be content, resigned, and reconciled to your various circumstances of life brought about by your marriage union with your husband; to murmur, complain, and find fault is foolish and unjust, because the circumstances of your husband before marriage were fully known to you: aim rather by careful study in various ways, to make home the sunniest spot on earth, and in so doing, with a soft answer, you will smother many ill words, and bad temper in its very bud of development, and win your husband's confidence and affection for your future days, thus wiping away the wrinkles on your companion's forehead, which life's burdens may have deeply impressed.

On various occasions take him to the apiary; make a comparison of the honey-bee—no matter what calamity, storms, and rough-and-tumble may befall this industrious insect, it will always with renewed energy go to work again, and forget the past; and be assured that the dark clouds on your husband's forehead, and sad look, will disappear, and a silent press of his hand will be a token of his tender feelings, great fulness, and a husband's love towards you; for it is a fact, that by your ready assistance in the apiary, work will move on twice as fast as if one must do all the running and tinkering, and questions put to your husband concerning the various branches in apiculture, will by him be answered with pleasure, for the increase of your knowledge in bee-keeping.

It requires energy and enterprise to work among the bees, but such you will get during practice; and do not fear that you might sacrifice any of your womanly dignities, for the word "womanlike" would never have come into existence, had our sex on all occasions manifested more stability of mind, energy, and ambition.

In leisure hours, which often are spent in reading horrifying and sensational novels, or at the gossiping coffee and tea parties so much in practice by our sex, rather go to the library of your husband, and select a book on bee-keeping, inform yourself, and master this art to perfection. Bring your theories into practice, and surely your husband will present you with a colony of bees as your own, which you may care for yourself, and in due time become master of the situation. How your husband will rejoice, when you will have so far advanced in caring for bees that he can entrust to your care the whole apiary; and how much money then will be saved, which otherwise would have to be spent on hired help; and I will add further, if the words spoken will be heeded, the bee-keeper's home and life will be illuminated with smiles and sunshine to promote joy and peace.

INDIANA.

Awards on Honey and Bees at State Fairs.

Written for the American Bee Journal
BY R. S. RUSSELL.

At our State Fair I received over $40 in premiums on my exhibits, and Mr. Zimmerman, of Wabash, about the same amount. Julius Moesch, of In-

dianapoiis, also had a very fine exhibit of honey-plants, honey, and queens and drones, and gained the 1st premium on honey-plants. Owing to our State Board understanding so little about apiculture, or being so little interested in the industry, only $5 was offered on queens. The 1st premium, $3.00, was awarded to a beautiful golden Italian queen, and the 2nd, $2.00, was given to a very large Carniolan queen, both of my own rearing.

I wonder how many stockmen want to go to a State Fair with fine stock, if the list would read after the style of the apicultural list—in this wise:

Best cow, $5.00, 2nd best, $2.00: best hog, $3.00, 2nd best, $1.50; best sheep, $3.00, 2nd best, $2.00; best goose, $2.00, 2nd best, $1.00; best hen, $2.00, 2nd best, $1.00; best queen, $2.00, 2nd best, $1.00.

My impression is, that they would have plenty of entry pens and but little gate money. But we must pour the "grape and canister" into the hard-shelled State Boards until they learn that there is more than one variety of bees, and that apiculture is as honorable a pursuit as pig-raising, chicken-raising, or horticulture, and demands the same fostering and honors from the State.

I will suggest that the first step to be taken, is to adopt a standard premium-list, such as will give all varieties of bees an equal show, as well as all implements and honey products; but the bee-keepers must first be in line with the list demanded, and then educate these State Boards up to this line. We must send committees from our State bee-keepers' associations, with the prayers of our brethren, demanding reasonable premiums on our products—such as will arouse competition from its slumbers. Then only may we expect to save the 10,000 pounds of nice honey that is annually lost on every square mile of our territory, for want of bees to save it.

Zionsville, Ind.

SOMETHING NEW.

A Queen-Rearing Hive and Frames Described.

Written for the American Bee Journal

BY E. L. PRATT.

I send two engravings which will be used in my little book, entitled, "A New System of Queen-Rearing in Combination with Full Colonies and Standard Hives."

The reader will notice by the engraving that the fertilizing hives are of the small nuclei type, but very different from any other, inasmuch as the frames are entirely exposed when the hive is opened, making quick work in all operation.

The frames are of the standard size, 4¼x4¼, 12 to the foot section-boxes, closed all around. These can be filled into standard-hive frames, as well as with wide frames for comb honey, and drawn upon for bees, brood, honey, etc., at will. One ten-frame hive will contain section frames enough to stock

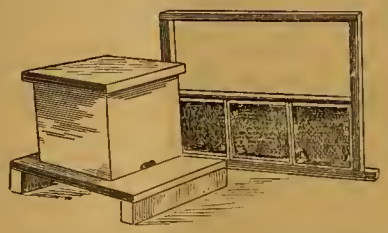

Fig. 1—Hive Closed, and Frame.

20 nuclei—a great saving to a large queen-breeder.

The hive body is a cap (as it were) made very light, yet perfectly tight, thus guarding against robbing, dampness, moldy combs, etc.

Engraving No. 1 represents the small hive closed, with a large frame half filled with small frames standing beside it.

Engraving No. 2 shows the inside paraphernalia, with the cap thrown to one side.

The time required to equip a pair of these hives with bees, brood, honey and cells, is about one minute.

The doubling-up process in the fall does not have any of that drudgery

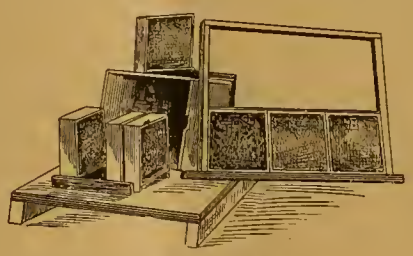

Fig. 2—Hive Paraphernalia.

connected with most nuclei plans; it can be done by single hives or by wholesale. There are no queens or nuclei around to attract robber bees—no waiting for brood to hatch out, and no watching is required.

All will see the advantage of this new plan when they read the book, in which everything is explained very clearly. I give a method for the honey-producer that does not conflict at all with the production of honey. The book will be thoroughly illustrated, and well printed.

A reporter for the Boston *Globe* called on me, and it published a long article from which the following excerpt is taken:

"*The Globe* man yesterday inspected the colonies of bees of Eugene L. Pratt, who is a breeder of queen-bees. He does not keep bees for honey, but is a breeder of fancy stock, to which he gives as much time and attention as if he was breeding blooded and thoroughbred stock of greater dimensions. He is an enthusiastic disciple of apiculture, and from him was gained many points of interest concerning the breeding of these little insects.

"Mr. Pratt winters about 40 colonies, and in the summer increases to about 125, all for queen-rearing. The average price for a queen-bee is $1.00, and the price ranges as high as $10.00. Mr. Pratt has one breeding-queen for which he says he would not take $100. The difference in price is caused by the development of good points, the same as the prices of horses differ for that same reason. This particular queen will have its life prolonged a year or more by keeping her with a small colony. She is capable of depositing about 3,000 eggs per day, but by scientific methods, and by having her reign over but a small colony, she will lay but about 300 eggs *per diem*.

"Mr. Pratt breeds from a race of bees which is comparatively new to this country, and is known as the 'Carniolan race,' which comes from the province of Carniola, Austria. They come from a valley which is surrounded by high mountains. It is very cold there, and there is little vegetation. For centuries this race of bees has been in existence there, and is now considered the most hardy, prolific and gentle in the world.

"For three generations the Pratts have reared bees, and Eugene becomes naturally enough an enthusiast on the bee-question. Of this particular race of bees there are but four breeders in this country, and he is the largest in point of product."

Marlboro, Mass.

FLORIDA.

Bee-Keeping in Florida—Cloth-Base Foundation.

Written for the American Bee Journal

BY JOHN CRAYCRAFT.

I have changed my location to St. Francis, Fla., so that I can be near my bees, and with the help of my son, Fred L., who is a practical bee-keeper, we will make a specialty of bee-keeping, believing and knowing from our observation, that we have one of the best locations in Florida, all things considered, for the production of first-

class honey; and are favorably situated for transportation.

Our bees will be located along the banks of the St. Johns river, opposite Deland, Volusia Co., Fla. We will take the bees to the orange groves along the river, at their blooming, and take them back to their permanent locations, near the hammocks and swamps, where some of the finest honey known is gathered—the wild grape (a sample of which I sent you). We have orange blossom, the grape, and palmetto honey, all of the very best, each of which is very easily separated from other honey, and all can be placed in the markets in the North before their crop is gathered.

Our bees are storing surplus honey yet; and we extracted from the upper stories of many of the hives the past week, getting a very fair honey, gathered from the blue aster, golden-rod, and smart-weed. The river swamps are full of bloom, and will be until we have frost. There has been none here yet, the coldest being 44 degrees above zero, and if the cool weather keeps off much longer, we will not be in much danger of weak colonies to get ready for the orange bloom the last of February.

To have the hives full of bees, ready for the harvest, we will give them a little stimulant of honey, commencing the first week of January, and continuing until we have both stories of the hives full of brood and bees. The secret of success is to have laborers when the harvest is ready.

CLOTH-MADE FOUNDATION.

I think that there will be some new developments made in comb foundation soon, that will make the handling of combs and their shipment safe, with no such things as broken combs—all straight, no sagging, and one can turn in a swarm on the foundation and rest assured that there will be no breaking down, yet all be straight and full at tops, ends, and bottoms of the frames.

How will all this be done? Very easily—use cloth-made comb foundation, which is made as follows:

Take fine, close-cotton unbleached muslin, dip it in the melted wax (the same as is used for foundation) a sufficient number of times to coat it well, so as to make it about the thickness of the plain sheets of wax; then pass it through the mill the same as the wax sheets, and you have a foundation that will be all that could be desired.

The cloth can be cut into long strips, and passed through the wax the same as wire-netting is coated with the metal. I will have this comb practically tested by the bees here in a short time. I know of no reason why it will not work. We will see what the manufacturer will say about it, as he has made me a sample of it to test in the hives here.

I have made application for a patent upon such comb foundation, using any cloth, paper, wire-netting, or any coated material forming a base, and then putting it through the foundation mill. I claim to be the originator of such comb foundation, and would like to have the credit, even if I should never make a great profit from it.

St. Francis, Fla.

[The sample of honey from wild grapes came to hand, and is very pleasant to the taste. It is light amber colored, and of thick body.

In making comb foundation, paper, cloth, straw boards, and thin wood have all been used—but all have been objectionable, and nothing has been so successful as the plain wax sheets put through the mill for configurations. The trouble with the muslin is that the bees will pull out the threads.—ED.]

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 17, 18.—Northern Illinois, at Rockford, Ills. D. A. Fuller, Sec., Cherry Valley, Ills.

Dec. 16.—Huron & Tuscola Co's., at Sebewaing, Mich. J. G. Knudinger, Cor. Sec., Kilmanagh, Mich.

Dec. 26, 27.—Michigan State, at Lansing, Mich. H. D. Cutting, Sec., Clinton, Mich.

1890.

Jan. 22.—Vermont State, at Burlington, Vt. J. H. Larrabee, Sec., Larrabee's Point, Vt.

May 2.—Susquehanna Co., at Hophottom, Pa. H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

But Little Feeding Necessary.

Bees did fairly well in this section the past season. From my 40 colonies, spring count, I took over 2,000 full sections of comb honey. Some colonies were quite weak early, and I strengthened them and increased my apiary to 55 colonies, which are all in good condition now. I have had to feed the least this fall, of any in the six years that I have kept bees. The coldest weather we have experienced in this vicinity this fall occurred on last Friday night, the mercury reaching 12 degrees, Fahr., above zero. I hope for a good season next year. CLARENCE W. WILKINS.

Cortland, N. Y., Nov. 18, 1889.

New View of the Almanac.

The Honey Almanac for 1890 is at hand, and while we are much pleased with it, and think that it will be a great help to many bee-keepers to find a market for their honey, we have no use for more than the copy sent to us. Here we have been working almost night and day, packing and shipping honey, and trying to see daylight through the orders ahead, and more constantly coming in; when here you come with your Almanac to boom our honey trade! Great Scott! Do you want to work us to death? Just think of it, here we are trying to get out an order of 50 cases of honey, with a number more awaiting our immediate attention; and had we sent out a few hundred Honey Almanacs, here would come a great crowd, with pots and pans, for honey in all kinds of shapes. Why, we would be out of stock in just no time, and then we would have to increase our apiary, and hire more help, and build a bigger honey-house, and there is no telling where the end would be. No, sir; we have no use for any Almanacs to boom our honey business. Some extracting bee-keepers may need them, but we don't. Our honey sells at sight. C. H. DIBBERN & SON.

Milan, Ills., Nov. 21, 1889.

[We are glad to hear that there is one bee-keeper who is not looking for a market for his honey; but Messrs. Dibberns' remarks in regard to the Honey Almanac are just as favorable to the necessity of the use of the Almanacs in selling honey, as though they intended to scatter several thousands of them. If we could succeed, through urging the free employment of the Almanacs, in having *all* bee-keepers overworked in filling orders for their honey, we would be very willing to labor day and night, if necessary, in order to bring it about. Let every producer of honey try this means of advertising his honey, and at the same time place in the hands of his customers such knowledge as will lead to the constant use of our delicious and health-giving product. —ED.]

Spraying Fruit Trees Needless.

On page 691 is an article on "Spraying fruit trees," to prevent the curculio from damaging the plum crop. I have a simple, easy and sure remedy to prevent the curculio, without using any poison, or the trouble of the spray. Tell the Green Nursery Company, and the rest of mankind, that all they have to do is to take a yarn string and saturate it well with spirits of turpentine, and tie it around the plum tree, about 2 or 3 feet high, or below the limbs; and as the curculio crawl up the tree, they are stopped by the yarn string, and turn back—they will not cross it. This has been tested to perfection, and never fails. This is valuable information for all fruit-growers. PETER BRICKEY.

Lawrenceburg, Ky.

Fogy Bee-Keepers—Golden-Rod.

I prize the BEE JOURNAL very highly, and think that it should be found upon every one's table, who is at all interested in bee-culture. I have been engaged in the care of bees for about eight years, gradually adding to my stock, as my capacity for taking care of bees increased, until I now have 53 colonies in good condition for the approaching winter. During the season just past I harvested 1,200 pounds of extracted honey, and 100 pounds of comb honey—all from white clover. The comb honey was stored in one and two pound sections. I find that one-pound sections are preferable in market. I have a good local market for my extracted honey, at 12½ cents per pound, though I have some difficulty with a few old fogies who hive bees in soap-

boxes, cracker-boxes, and nail-kegs, and then croak about extracted honey being mixed with sugar! They seem to think that as soon as honey is extracted from the comb by machinery, it ceases to be honey. There is a man living near this place that owns over 100 colonies, who is so full of envy, and so thoroughly impregnated with ignorance, that he will not look at an extractor. This man brought his broken combs to market in buckets, and sold it at 12½ cents per pound, so I was compelled to sell my nice comb honey for the same price.

Our main dependence for honey is white clover and the asters. The golden-rod grows in abundance in this county (Macoupin), but it is of no value as a honey-plant. Bees do not work on it.

LODOWICK D. HENDERSON.

Staunton, Ills., Nov. 26, 1889.

Golden-Rod Honey.

Golden-rod honey is of an amber color, and very thick. There are acres of golden-rod on the bottom lands in Illinois and Missouri, and the bee-keeper that looks after his bees, can discover it the last of August or the middle of September, by the strong smell, but as sweet as honey itself. When bees are getting golden-rod honey, the bee-keeper will not need to watch them ten years, either; but as there are lots of bee-men who keep bees that cannot tell golden-rod honey from basswood, or buckwheat honey from clover, there will always be some difference of opinion in regard to color. For my part, I do not believe that bees gather dark honey from golden-rod, no more than the milkman can get dark milk from a white cow. Let us hear from the bee-keepers of the Illinois and Missouri bottom lands, and see what they have to say on the color of the golden-rod honey.

As for the national flower, I think that the sweet potato would get as many votes as the sweet pea. JOHN BOERSTLER.

Vashon, Wash. Ter., Nov. 20, 1889.

Packing Bees for Winter.

I have been experimenting with bees for ten years, and have always made such a miserable failure on account of wintering them out-doors; so this fall I had a lot of old coal-oil barrels, that had been used for water barrels; also some sugar barrels, which can be bought for 10 cents each at any grocery store. I found that by removing both the hive-cover and honey-board from the Simplicity or the Langstroth hive, they would go into these barrels, some of which I sawed off 2 inches. I used burlap over the frames, slipped the hive into the barrel, packed well with chaff, and tacked four little pieces of boards around the edges of the barrel, to keep out mice. Thus I have a complete chaff hive for 10 cents. I claim no patent on this, but if anybody can construct a better hive for less money, I would be glad to hear of it.

B. G. MCPHERSON.

Clayton, Ills., Nov. 24, 1889.

Alfalfa as a Honey-Plant.

I notice that some bee-keepers say that alfalfa is a great honey-plant. It is a clover, without doubt. I have some growing in my bee-yard; it has been there several years. It grows up early and large, and blossoms freely, as the ground is moist and fertile. All that time I have had no less than 100 colonies of bees (Italians and natives), yet I have never seen a bee working upon the alfalfa blossoms, when at the same time they would be just swarming on the Alsike clover. D. F. LASHIER.

Hooper, N. Y., Nov. 24, 1889.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

☞ Read our Book Premium offer on the last page of this JOURNAL.

☞ Money in Potatoes, by Mr. Joseph Greiner. Price, 25 cents, postpaid. For sale at this office.

☞ Send us one **NEW** subscriber, with $1.00, and we will present you with a nice Pocket Dictionary.

☞ Red Labels are nice for Pails which hold from 1 to 10 lbs. of honey. Price $1.00 per hundred, with name and address printed. Sample free.

☞ Calvert's No. 1 Phenol, mentioned in Cheshire's Pamphlet on pages 16 and 17, as a cure for foul brood, can be procured at this office at 25 cents per ounce, by express.

☞ The date on the wrapper-label of this paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to advance that date another year.

☞ Please send us the names of your neighbors who keep bees, and we will send them sample copies of the BEE JOURNAL. Then please call upon them and get them to subscribe with you.

☞ As there is another firm of "Newman & Son" in this city, our letters sometimes get mixed. Please write *American Bee Journal* on the corner of your envelopes to save confusion and delay.

☞ We have some full sets of the BEE JOURNAL for 1889, and *new* subscribers can have the full sets for 1889 and 1890 for $1.80 until all are gone. Or, we will send the full sets for 1887, 1888, 1889 and 1890 for $3.00.

☞ Systematic work in the Apiary will pay. Use the Apiary Register. Its cost is trifling. Prices:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

☞ When talking about Bees to your friend or neighbor, you will oblige us by commending the BEE JOURNAL to him, and taking his subscription to send with your renewal. For this work we will present you with a copy of the Convention Hand Book, by mail, postpaid. It sells at 50 cents.

☞ We offer the Monthly Philadelphia *Farm Journal*, and either the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20. Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

Honey Almanac.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

Here is what is said of it by those who have seen the Honey Almanac :

The Honey Almanac is received. Have been quite agreeably surprised with its true value, to the producers of honey. Both contents and appearance do credit to its publisher.—W. M. Barnum, Angelica, N. Y.

The Honey Almanac is uniquely tidy, and compact in its general make-up, and replete with useful recipes and valuable information. A copy thereof ought to be placed in every household.—Joshua Bull, Seymour, Wis.

The Honey Almanac is a very good one. Anything that calls attention to the great value of honey must help its consumption. —Emerson T. Abbott, St. Joseph, Mo.

The Honey Almanac is at hand. It is unquestionably the most useful and attractive scheme yet introduced for advertising the sale of honey.—F. A. Huntley, South Omaha, Neb.

The Honey Almanac for 1890 contains 32 pages of facts, figures, and suggestions for honey in its various uses, besides the matter usually contained in Almanacs. A very large number of honey recipes for cooking are compiled. The varied uses of honey as food and medicine are also discussed. The design of this Almanac is to place in the hands of bee-keepers a lever by which they can revolutionize public sentiment, and create a market for honey. Sensational stories in regard to adulterated honey are refuted.—*Gleanings in Bee-Culture.*

The Honey Almanac for 1890 contains the usual calendar, and some 20 extra pages are filled with interesting facts and figures, and suggestions concerning the uses of honey for food, beverages, cooking, medicines, cosmetics, etc. Beeswax, its uses, how to render it, and its importance as a commercial product are described, and many useful recipes are given. If these are distributed plentifully throughout the country, they should assist very much in educating the masses as to the use of honey, and thereby largely increase the sale of this product.—*Canadian Bee Journal.*

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Prices: $2.50 per 100; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 100 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excludiug honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

If you desire to know how this can be done—how to have Queeus fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees can fly—all about the different races of bees—all about shipping Queeus, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.; or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 170 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

A New Premium.

The National Purchasing Agency of this city issues a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement, we can offer a MEMBERSHIP Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL, for one year, with $2.00.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

☞ We want these numbers of the BEE JOURNAL, viz: December, 1875, January to June, 1876, and April 30, 1884. Also No. 18, of 1884: and Nos. 2, 17, 18, 19, 20, 21, 32, 42, 44, and 48, of 1885. If any one desires to sell them—please state price. Do not send any numbers until we order them, for we only want one copy of each.

☞ W. D. Soper, of Jackson, Mich., has his new Catalogue of Bee-Keepers' Supplies for 1890 on our desk at this early day.

Honey and Beeswax Market.

ESTABLISHED IN 1861 — THE AMERICAN — OLDEST BEE-PAPER IN AMERICA

BEE JOURNAL

Premium-List Supplement.

VOL. XXV. CHICAGO, ILLS., DECEMBER 7, 1889. No. 49.

PREMIUMS.

Please Read this Page Carefully.

Preserve this Supplement.—We shall not have room in our JOURNALS to republish much of the contents of this Supplement, so you will please preserve it for future reference. We can furnish every Premium in it, from now until the end of the year 1890.

Premiums are offered as pay for obtaining new subscribers, and will not be given to subscription agents or news-dealers. Each name to apply on a premium, must be accompanied by $1.00 for a year in advance, and all arrearages must be paid up, in addition to the above—only the advance subscription can apply on the premium. Write "*For Premiums*" on every list of names sent for them, if you do not order the premium at the same time, so that we can keep track of them. When ordering Premiums be sure to state how you want them sent, and enclose the postage, if they are to be mailed, unless we have marked them "post-paid."

Now is the Time for Work.—It is important that you commence to work **at once.** Send for sample copies, and then say to all your neighbors and friends, that you want their subscriptions. Show them the JOURNALS—they will all want one or the other—or both.

Every one interested in Bees or Honey needs the BEE JOURNAL, which is the oldest and best bee-periodical in America.

Every person, no matter of what occupation, needs the HOME JOURNAL. It is of inestimable value in every family and home. The quality of the printing, paper and illustrations are attractions. In a year there will be a volume of 432 pages—which will be a valuable addition to any library, and that size and quality of book would cost $5 or more in any book-store.

Good Pay for Good Work.—If you notice in our Premium List any article that you want, it is very easy to obtain it. Just arm yourself with a sample copy, show it to your neighbors, and get their subscriptions. You will be surprised at the result. You will very soon have the names you require to entitle you to the Premium you desire. *Try it.*

All these Premiums are given as payment for work done for us. That work is getting subscriptions. To be entitled to premiums you must send subscriptions direct to the publishers—not to any agency. We furnish Blanks on which to record the names and addresses.

The Articles offered as premiums are all purchased at lowest wholesale rates, and the club raisers get the benefit of the discount. In this way we are able to give premiums of greater value than if we gave them cash.

Premiums are due when the names and money are here, and may be taken at any time. You can have them right along as you earn them, or wait a little and have more together, and save a part of the cost of transportation.

Premium Articles are also sold for money, cash with order. No charge for packing; sent at the receiver's expense and risk.

We Pack with Care and deliver to the Express company or post-office in good condition. That is all we can do. Beyond that, the risk is yours. We register packages going by mail if you send the registry fee, ten cents a package, and insure delivery when registered. We pay postage on everything sent by mail to the United States or Canada, unless otherwise stated. Transportation on all articles sent by freight or express must be paid by the receiver.

Delays.—Wait ten days before you conclude that your letter or our reply has gone astray; then write particulars: date of your sending, how you remitted, and the amount.

Write your Name, Post-Office, County and State plainly, and if your Express or Freight office differs from your Post-office, give that too if you order anything by Express or Freight.

Each Order or Letter must be complete in itself, and not refer to something written a day or a week before, for that letter may be filed away with thousands of others, and very likely the person who reads your second letter never saw your former one.

How to Send Money.—As we do a Cash business only, nothing will be sent until we receive the money. We send nothing C. O. D. Money must be sent by Bank Draft, Post-Office or Express Money Order, or Registered Letter.

Now for earnest work and good pay for it! A nice Gold Watch for every one who will give a few days' work for it!

To Agents.—Send for Samples and Subscription Blanks and then go to work—and do not stop until you have solicited every one in your locality who ought to take our Journals—and have obtained their subscriptions.

Any One may become a Canvassing Agent for our Journals. Send for a Sample Copy Subscription Blank and our Premium List.

Cash Premiums.—Those who prefer Cash Premiums to any articles offered, will please notice that 5 copies will be sent for $4.00, giving a dollar in cash for the trouble of getting up the Club; 10 copies for $7.50. These must all be sent at the same time, but after sending *one Club* of 5 and $4.00, the agent can send the next 5 subscriptions and the balance to make the $7.50 for the 10 names—and any additional names at the same rate may thereafter be sent. They need not be sent all to one post-office, and this applies to both of our Journals.

Agents should read over the samples and make themselves familiar with the reading-matter, so that they can point out its attractive features when getting up Clubs.

Send us the Names and addresses of those of your friends upon whom you desire to call, to get their subscriptions, and we will immediately send them each a sample copy. In this way you can readily get them for a club.

If You Do Not Get Enough Names for your Premium, you can enclose your own subscription for two or more years, to make the number complete.

Please to Look Over Our Premium List.—You will find in it many things that will just fill your eye. These are all to be given away for a little work. Will the reader join the army of Agents, and get up a club for either or both of our JOURNALS? We want to procure at least a thousand agents, who will secure large clubs for our periodicals. Address,

THOMAS G. NEWMAN & SON,
PUBLISHERS
923 & 925 West Madison St., CHICAGO, ILL.

Given for One New Name.

Your choice of either of the following Books will be sent post-paid for one *new* name with $1, for a years' subscription to either Journal;

Dr. Foote's Hand-Book of Health.—It contains hints and information of the utmost importance concerning eating, drinking, dress, sleeping, bathing, working, etc. Price, 25 cts.

Kendall's Horse-Book.—No book is more useful to horse-owners. It has 35 engravings, illustrating positions of sick horses, and it treats all diseases in a plain and comprehensive manner. Price, English or German, 25c.

Scribner's Lumber and Log Book.—Gives measurements of all kinds of lumber, logs and planks; wages, etc. Price, 35 cents.

Fisher's Grain Tables: for casting up the price of grain, produce, hay, wood measurer, ready reckoner, plowing tables, etc. Price, 40c.

Bee-Keepers' Convention Hand-Book.

It contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with subjects for discussion. Price, 50 cents.

THE FARM JOURNAL.

This is a nice 16-page Monthly with 150,000 subscribers—is in its 13th year, and one of the brightest and best Farm papers. It is published at Philadelphia, Pa., at 50 cents a year. We give it one year *free* for one *new* subscriber, with $1.00, or with a renewal for $1.10.

Given for 2 New Names.

Your choice of either of the following Books will be sent postpaid for *three* new names, with $3.00 for a year's subscription to each, of either of our JOURNALS.

Lives of Our Presidents.—This book contains the life of every man who has occupied the Presidential chair, from Washington to the present incumbent—544 pages. Price, $1.

The Every Day Cook Book.—Besides all practical recipes for cooking, it contains a vast amount of information valuable to every housekeeper—320 pages. Price, 50 cents.

Popular History of the Civil War.—A complete history of every battle and naval engagement. It is just such a war-history as every American citizen should possess, and will prove of the utmost interest and value. Price, $1.00.

Cyclopœdia of Useful Knowledge.—This is unquestionably one of the most interesting, entertaining and instructive books ever published. It treats of hundreds of subjects, of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of the people are entirely unlearned. It contains 554 pages, and 273 illustrations. Price, $1.00.

DOOLITTLE'S QUEEN-REARING,

Second Edition, with Appendix—170 Pages; or

Miller's "Year Among the Bees,"

which contains 114 Pages.

These are practical Books, and contain the newest developments in Bee-Culture. They are nicely printed, and strongly bound in manilla paper covers. Either of these Books will be given for 2 subscribers for a year, at $1.00 each. Dickens or Waverly may be obtained for each subscriber, as offered on another page.

Given for 3 New Names.

Dzierzon's Rational Bee-Keeping is an English translation of the latest work by that celebrated German Bee-Master. Price, bound in cloth, $2.00.

SPECIAL CASH PRIZES!

In *addition* to all other Premiums as an inducement for Agents to get up large Clubs in every town, village and city in America, we offer the following Prizes in Cash:

LARGEST CLUB (not less than 100)..	$50
Second largest Club.....	25
Third largest Club.....	20
Fourth largest Club.....	15
Fifth largest Club.....	10
Sixth largest Club.....	5

Competitive Clubs should be sent us with the cash, when 5 or 10 names are obtained. Additions may be made at any time, and as often as desired until March 1, 1890—a strict account of which will be kept at this office.

BUY YOUR GOODS AT WHOLESALE.

The National Purchasing Agency of this city issues a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement, we can offer a MEMBERSHIP Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL, for one year, with $2.00.

Elegant Gold Watch

Given for Fifty Subscribers.

This has an Elgin Movement, Stem-Winder Stem-Setter, and also a finely-engraved Gold-filled case (warranted to wear 15 years), and all of the most modern improvements.

Should you fail to get 50 subscribers, you can send 25 subscribers and $10 extra for the watch; or 10 subscribers and $16 extra.

You cannot fail, in this way, to get the watch, even if you do not complete your club. But with such a valuable and interesting periodical at a dollar a year, fifty subscribers can easily be obtained in every town or village.

FARMER'S ACCOUNT BOOK.

It contains 166 pages, printed on writing paper, and is ruled and bound. Price, $3.00. We will club it and this JOURNAL for a year, for $2.00. It and both Journals for $3.00, the price of the book alone. If you want it sent by mail, add 20 cents for postage.

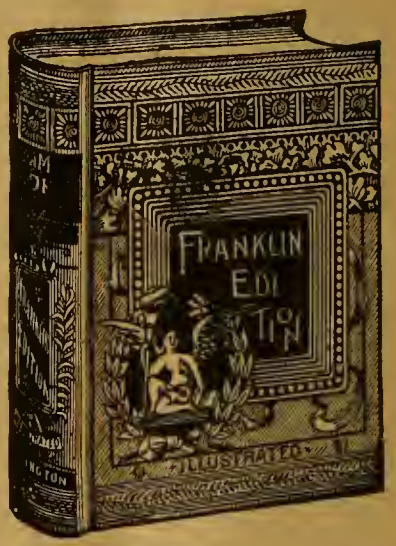
A SERIES OF THE MOST

POPULAR BOOKS

In Fiction, Biography, Poetry, History, Essays, &c., &c.

We will mail any one of the following *DOLLAR BOOKS*, postpaid, for one **New Subscriber** to *THIS JOURNAL*, with $1.00, and 10 cents additional, to pay the postage on the book.

We will sell them, postpaid, for **40** cents each. This is the most remarkable offer ever made for this class of books. They are printed on fine paper, large, clear type, and well bound in cloth, with the title on the cover in black and gold, as shown in the engraving. The usual retail price of these books is $1.00 each.



It will be seen by looking over the following list of the books, that complete sets of Dickens, Scott, and other authors can be selected, and when a number of books are desired, we can send them by express or freight from New York City at **30** cts. each.

When fine, cloth-bound volumes can be secured at such low prices, there is no excuse for any home to be without a good library of standard and popular works. This is a rare opportunity and should be accepted at once. Read the following list over carefully.

ROBINSON CRUSOE. By Daniel Defoe. With 350 illustrations.

ARABIAN NIGHTS ENTERTAINMENTS. New and complete edition.

SWISS FAMILY ROBINSON; the Adventures of a Father, Mother, and Four Sons on a Desert Island. Illustrated.

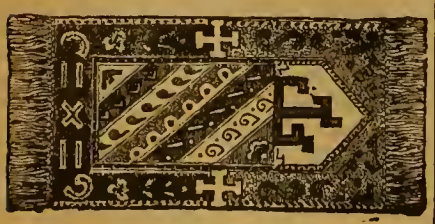
The Pearl Rug Maker.

This new and ingenious little implement is very popular. It can be used on any sewing machine, also by hand, and is so simple that a child can learn to use it. All the old pieces of white, black or colored material from the rag bag can be utilized, and in one day's time a handsome Oriental-looking rug can be made. If Smyrna wool instead of rags is used, the rug will be still softer, with pile half an inch thick, and to knit the same quantity would take fifty times as long. These rugs will take the place of carpet and give a much more elegant appearance to a room, and are cleaner, being easily shaken. They will not draw nor curl up at the edges, and can be made in Persian patterns or floral designs as preferred. You are not obliged to buy stamped patterns, frames, hooks and expensive yarns. Recommended by all the leading sewing machine companies. Full instructions and six different patterns with the rug maker. **$1.00** postage paid.



Given for 3 New Subscribers, at $1 each.

Ladies' Aluminum-Gold Watch.

Given for Fifteen Subscribers.

This is a Ladies' Aluminum-Gold Hunting Watch, with fine imported full-jeweled movement. Price, $5.00, by mail.

Singer Style Sewing Machine.

Given for Fifty Subscribers.

Each machine is THOROUGHLY TESTED to see that it is perfect before leaving the Factory, and the manufacturers GUARANTEE EACH MACHINE FOR FIVE YEARS.

ALL THE MATERIAL entering into the construction of these machines is of the very best, and all the parts are nicely fitted. The wood work is of Black Walnut, Oil Polished. The iron work is nicely ornamented and Japanned, and they are an ornament in any lady's room. With each machine we include a **full set of attachments** which have formerly sold for as much as we now offer the machine, attachments and all.

These attachments include one Johnson's Foot Ruffler, one set of Hemmers, one Tucker, one Foot Hemmer or Friller, one Package of Needles, six Bobbins, one Screw Driver, one Oil Can, extra Check Spring, one Gauge, one Gauge Screw, one Wrench, and an Instruction Book, which will enable one not accustomed to running a machine, to soon learn.

Each machine is crated and delivered at the Express office or Freight depot in Chicago, and will go safely to any part of the country. The weight is about 100 pounds, and the cost of shipping within 500 miles of Chicago is from 50 cents to $1.00; to the Atlantic Coast, the Gulf or about the same distance West, about $1.50; and about double this to the Pacific Coast.

Price, $15.00; or given for 35 subscribers, with $5.00 extra; or for 20 subscribers, with $10.00 extra.

Gold Charm for Watch Chain.

Given for Four Subscribers.

This shows a Gents' fine rolled-plate gold watch-charm for chain. Price, $1.25, postpaid.

FIGHTING PHIL.

LIFE AND MILITARY CAREER OF GEN. PHILIP H. SHERIDEN.

BY P. C. HEADLEY.

380 PAGES. SIZE, 5x7 1-2 INCHES.
CLOTH. PRICE, $1.50.

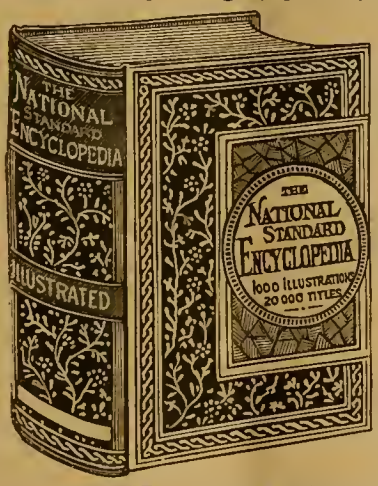
The career of Gen. Philip H. Sheriden, rising as he did from an exceedingly humble position to the highest rank in military honor, is replete with interesting incidents, and in this volume the most important of these incidents are cleverly woven into a fascinating narrative, amply illustrated. This book also contains considerable information about the West Point Military Academy, and a brief history of the United States cavalry service is added. In this stirring history of Gen. Philip H. Sheriden, with his brilliant successes, won by unaided genius,

WE FIND FACTS THAT AMAZE US.

Some person has written that when a people are capable of appreciating a fine thought, a man is born who can present it to them; and this life history of General Sheriden seems to be the history of a man born to be the admiration of a people, and to teach the lesson of what can be accomplished by the humblest through perseverance and pluck. We find here a brief history of our cavalry, which did not deserve the name of cavalry at the opening of the war. Southern gentlemen always rode, and it was small wonder that they found cause for much amusement in their Northern brothers' style of horsemanship. But under such a leader as Sheriden all things were possible, and the record of the splendid achievements of our cavalry is unsurpassed in history. The requirements at West Point in regard to scholarship, the numerous rules and regulations as to conduct, the daily work required, the whole life, in fact, of the cadet, make up an intensely interesting chapter in this volume. While this is called a history for young people, it is one that every man and woman in the United States should read, in order that they may realize what a genius and a general we had in "Fighting Phil."

☞ *Given for FIVE New Subscribers for one year at $1.00 each.*

A Volume for Universal Reference!



HANDSOME CLOTH BINDING.

The National Standard Encyclopedia is a valuable book for popular use, compiled by competent editors, after consultation of the best authorities, printed from new, large, clear type, and handsomely bound in cloth. This is the justly popular "Little Detective" Scale, and weighs from ¼ ounce to 25 pounds. Price, $2.50 by express.

THE NOVELTY POCKET KNIFE

A plain, practical, common-sense and serviceable knife of this kind has long been needed by travellers, fishermen, hunters, mechanics, ladies, boys, and all who carry or use a pocket knife. It is operated entirely with one hand, is simple, safe and convenient, and is instantly opened or closed. A pull of the thumb, in the ordinary position in which the knife is held for use, upon the thumb piece, opens the blade slot, and drops out and securely locks the blade. The blade can also be set at various distances, for use as an eraser, pencil sharpener, nail cleaner, etc., etc., in which positions it is held by the pressure of the spring thumb-catch. By reversing the movement of opening, the blade drops back into the handle, and the blade slot is securely closed against entrance of dirt, etc., by the lip of the thumb-catch, which closes over and covers it. The frame of the knife is made of extra hard brass casting, the sides of ebony, the blade of excellent tool steel, and the whole is beautifully finished. Extra blades can be furnished if desired, and are easily inserted by any one. The knife is strong, durable, and well-made in all its parts. Length, when opened, 5 1-2 inches. Price, **50 cents** each.

FOR ONLY THREE DOLLARS,

we will send you either of our Journals **for one year,** and both Dickens' Works and the Waverley Novels (24 Volumes)—all 4 for $3.75.

Every One Should Have

The National Standard History of the United States. By Everit Brown. *In this most interesting book, our country's history is told from the discovery of America down to the election of Grover Cleveland as President of the United States. This book contains Sixty-seven Chapters—about 600 Pages—giving full and authentic accounts of the Norsemen, the Discoveries and Explorations of Columbus and the Cabots, Spanish, French, English and Dutch Explorations, the Landing of the Pilgrim Fathers, the Indians and their Wars, the Colonies, their Settlement and Growth, the States and their Settlement, the French and Indian Wars, the Revolution and its Battles, the Administration of each President from Washington to Grover Cleveland, the Civil War, the Record of its Battles and the Gallant Officers of the Army and Navy, the Emancipation of 4,000,000 Slaves, Reconstruction and Peace. Bound in HANDSOME CLOTH BINDING, WITH OVER*

60 Illustrations.

In preparing this history of our past, no pains have been spared to gather the best material from every source. The most reliable authorities have been consulted and the ripest fruits of historical research have been carefully gathered.

Four centuries ago North America was then a wilderness and its inhabitants were savages. The story of its marvelous development is now open before us. It is told in THE NATIONAL STANDARD HISTORY with somewhat of the earnestness of the men who cut down the primeval forest, and the fire of the pioneers and soldiers who first subdued the Indian possessor and at last drove out the British invader. The reader will find every hard fact to be brightened with the romance of real life, than which nothing is more stirring, and every era of our history is full of patriotic devotion and heroic endeavor.

A narrative so full of picturesque incident and romantic adventure should sweep the reader along as by a charm and a fascination. A history so pregnant with pure thought and high endeavor should awaken the sympathy and arouse the ambition of the most sluggish. A freedom which has cost so much sweat of brain and blood, so much treasure of money and life, should grow inexpressibly precious.

This book contains 600 pages and is bound in handsome cloth binding.

☞ *Price, $1.00; or given for THREE New Subscribers for one year at $1.00 each.*

Ladies' Gold Brooch.

Given for Four Subscribers.

Cyclopedia of Natural History.

Comprising descriptions of Animal Life: Mammals, Birds, Reptiles, Batrachians and Fishes. Their Structure, Habits and Distribution. For Popular Use.

BY CHARLES C. ABBOTT, M. D.

OVER 500 ILLUSTRATIONS.

This work presents the subject of Natural History in a manner suited to interest and instruct the general mass of readers. It combines accuracy of information and systematic arrangement with brevity and simplicity of treatment. The descriptive portions in the various branches of Natural History are marked by vividness and simplicity; numerous original anecdotes are introduced, illustrative of animal habits and peculiarities, in connection with scientific details, and over 500 illustrations give a life-like aspect to the whole volume and a clear idea of what each creature is where nature placed it. It possesses equal interest for juvenile and for mature readers.

Over 600 Pages. Handsome Cloth Binding.

☞ *Price, $1.00; or given for THREE New Subscribers for one year at $1 each.*

DING-DONG BELL BANK.

This Bank is made of sheet metal, and represents the well-known Nursery tale,

"Ding-Dong Bell, Cat's in the Well," Etc.

And contains clock-work, main-spring, and Fan Regulator, so arranged that the instant a penny or nickel is pushed through the slot in the Bank, the clock-work causes the small boy to **Ring the Bell**, while **Johnnie Green** on the fence **Waves His Hat**, and at the same time

Jacky Stout Takes the Cat from the Well,

The whole performance lasting one-half minute.

A Bank That Will Earn Money,

Because the bottom part is a coin safe, into which the pennies drop after having started the performers. It has a metal door, with post-office lock and key, so all money put in is in safe keeping for its owner. It is **not** a single quick motion like that of the common trick banks, but is a very comical performance, lasting half a minute. It is excellent for use at fairs and other entertainments to catch pennies. Each bank is carefully packed in a wooden box, with full directions.

☞ *Price, $1.50; or given for FIVE New Subscribers for one year at $1 each.*

Each set contains ewer or pitcher basin, covered chamber, brush vase, covered soap-dish with drainer, handled drinking mug and pitcher. Price, $7.50 by express or freight; or given for 10 subscribers with $2.50 extra.

Crown Fountain Pen.

Given for 8 Subscribers.

This has a best Para Rubber Holder, with No. 3 long nib, 16 Karat Gold Pen, box, filler and directions. Price, $3 00.

Silver Knives, Forks and Spoons.

These are Rogers' celebrated extra-plated ware, and are offered thus by mail, postpaid:

6 tea-spoons given for 4 Subscribers
6 forks " 8 "
6 knives given for 6 Subscribers.
2 table-spoons " 3 "

Or, ALL of the above (20 pieces) given for **20** subscribers.

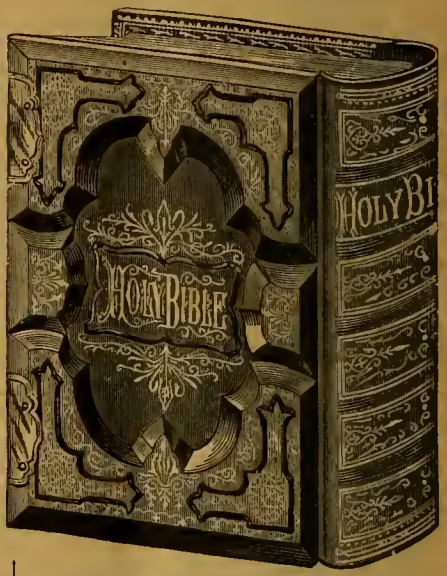
Carving Knife, Fork and Steel.

Given for Eight Subscribers.

The Knife is 9 inches long, stag handle, and Spanish blade. Price, $4.00 for the set; by mail, $4.15

Beautiful Family Bible.

Given for Fifteen Subscribers.



It contains besides the Books of the Old and New Testaments, Maps of the Holy Land, a variety of Tables, and a Household Directory, illustrated with a thousand or more interesting Engravings; also, a Chronological Index, a complete Concordance, Family Record, etc. Price, $7.50 by express.

Gold Ear Drops.

Given for Four Subscribers.

Cut white stone, with solid gold mountings. Price, $2.00, postpaid.

Men's Nickel Swiss Watch.

Given for 8 Subscribers.

This Watch has a solid-nickel open-face case, with Swiss stem-wind movement. Price, $3.00, complete, by mail. Address,

EDITORIAL BUZZINGS.

The Bee went a courting
My Lady, the fly;
Said the Bee to my Lady,
"For you I would die."

Said sweet Lady Fly,
As she blushed 'neath her wing,
"I love your soft words,
But I hear that you sting."

☞ The *Canadian Honey Producer* bows itself out of existence with the December number—having existed three years. It was well conducted, and leaves many pleasant memories.

☞ The International Convention was held in Brantford last week. We were unable to be present, but our representative, Mr. W. Z. Hutchinson, took a stenographic report for us, and will write it out in time for our next issue. The new officers are :

President—R. L. Taylor, Lapeer, Mich.
First Vice Pres.—Eugene Secor, Forest City, Iowa.
Secretary—C. P. Dadant, Hamilton, Ills.
Treasurer—Dr. C. C. Miller, Marengo, Ills.
The next meeting will be at Keokuk, Iowa.

☞ The Third Congress of the Central Society of apiarists of Germany was held at Stettin, last September. There was a magnificent exhibition of honey, and a *fete*, which had more than 700 visitors—as we see by the *Bienen Zuechter*.

☞ Dr. Dzierzon, who is now 79 years of age, attended the late Congress of German and Austrian bee-keepers at Ratisboune, in Bavaria. The Baroness of Berlepsch, Carl Gatter, Prof. Kunnen, of Luxembourg, Baron Ambrozy, and many other distinguished apiarists were also in attendance. This was the 34th annual meeting.

Not the "National."

In the last issue of the *Apiculturist* we find this item:

We see it hinted in some of our exchanges that a National Bee-Keepers' Convention has been held somewhere in the Western States. It must have been a very quiet affair, it seems to us, or more noise would result from it. The AMERICAN BEE JOURNAL, which, we believe, is the *official organ* of the National Convention, has said very little about the meeting, and what it did say was in reference to the fun the local papers made over the whole affair.

Well, who objects to those worthy gentlemen, though few in numbers, meeting in convention once a year to discuss the great problems connected with bee-keeping? No real injury can come from it, and some good may be accomplished. Whether they continue or not to meet, we believe the seasons will be alternately favorable and unfavorable, just the same, during the honey harvest.

Surely, the editor of the *Apiculturist* has been asleep for some months. The Convention he mentions, of which the "local papers made fun," was the "Northwestern," held at Chicago last October, and a full report of it may be read in the AMERICAN BEE JOURNAL for Oct. 26, 1889. It is a pity Bro. Alley missed the the reading of that report. We have now mailed an extra copy, marked, for his perusal. It was *not* a "very quiet affair," but a really lively, old-fashioned meeting.

Bro. Alley errs also in his statement that the AMERICAN BEE JOURNAL is the "official organ of the National Convention." It is not, and never has been an "official organ" of any Society. It is an *independent* Journal—independent of persons or cliques!

The *irony* of the last paragraph is harmless—a mere "pleasantry"—for no one else ever thought of such a thing as "the National Bee-Keepers' Convention" (or any other National or International Convention) being a "real injury" to bee-keeping. No one who attends them, or reads their reports, so regards them. Wake up, Bro. Alley, and keep posted.

☞ Some have requested us to print a card on a less number than 100 Honey Almanacs, and we have concluded to accommodate them. We will furnish 25 copies with card printed on the first page, **postpaid**, for $1.10; 50 copies for $1.70; 75 copies for $2.30. President Mason, in his address at Brantford, said:

At least one copy of the Honey Almanac should be in the house of every family in Canada and the United States, and it rests with bee-keepers to see that such is the case.

See prices for more on the next page.

☞ A neat programme of the 20th annual convention of the "International American Bee-Association," at Brantford, was gotten up by Secretary Holtermann. It is a credit to the Society.

Clubs of 5 for $4.00, to any addresses. Ten for $7.50, if all are sent at one time.

A Full Crop—Percentages.

Much confusion prevails on account of those who report their crops of honey, misapprehending what constitutes a full crop, or percentages. The Indiana *Farmer* makes these remarks on the subject:

Bee-keepers are interested in knowing what a full yield of honey is. Statistics are usually made up in percentage of a full yield. But confusion always happens when people make statements calculated from different bases.

The common basis is 100 per cent., and this should mean a full yield of whatever the crop may be. One hundred pounds of honey per hive is generally accepted as a full yield, and if this is taken as a standard, then every one interested knows what a 50 or 60 per cent. yield will be.

A number of prominent bee-keepers who have reported the yields for the past season, give them as follows: 32,000 pounds per 300 colonies, or 107 to the average; 20,000 pounds per 350 colonies, average 57 pounds; 5,000 pounds per 68 colonies, average 73½ pounds; 35,000 pounds per 400 colonies, average 87½ pounds; 2,000 pounds per 200 colonies, average 10 pounds; other averages are 10, 26½, 75 and 28 pounds per colony.

☞ We call particular attention to the Fifth Annual Report of the National Bee-Keepers' Union, published in this issue, and invite every bee-keeper to become a member. Send to this office for a Blank and vote for officers. Those now in the office have been re-elected so often that we know they would all like a change. Let us have a *new deal* all around, and perhaps that will put *new life* into the organization. Select those you prefer in the list of members, which will be sent with the Voting Blank; fill it up, and return it to the Manager, with a dollar, and that will make you a member, and pay all dues for the year 1890. The result of the election will be announced in the BEE JOURNAL for the second week in February. If you get more than one Voting Blank, please hand one to your neighboring bee-keeper, and get him to join the Union, too.

☞ The Chicago *Herald* published the principal part of our denial of its assertion that comb honey was being manufactured (as found on page 724) without comment! This virtually admitted its error in making the foolish statement—though it had not the manhood to apologize for the blunder.

☞ If any of your numbers of the BEE JOURNAL for this year are lost or mislaid, and you desire others to replace them, you should look them over at once and send for them before all our stock is exhausted. They are already getting low on some numbers.

☞ Any of the Political Dollar Weekly Newspapers will be clubbed with our JOURNAL at $1.75 for the two; or with both our HOME JOURNAL and BEE JOURNAL for $2.50 for all three papers.

GLEANS OF NEWS.

Death of Mons. H. Hamet.

We have already given a short notice of the death of this distinguished French apiarist, author and editor. The following was written by Mons. G. de Layens, for the *Revue Internationale d'Apiculteur*, published by our friend, Mons. Ed. Bertrand, and is translated for the AMERICAN BEE JOURNAL by friend Chas. Dadant:

The Central Society of bee-culture of France has experienced a great loss. Its Secretary, Mr. Hamet, died on Oct. 6, at the age of 74.

In his youth, Mr. Hamet was a schoolteacher who spent his leisure hours with bees. His first teacher, in bee-culture, was Lombard, the well known professor of beeculture of Paris. Toward 1855 Mr. Hamet settled in Paris, and soon after founded a society under the name of *Societe Economique d'Apiculture*. At about the same time, he began to publish the journal *L'Apiculteur*, and to lecture on bee-culture in the elegant school-apiary of the Luxembourg, a building which was unhappily destroyed later, in consequence of improvements undergone by this public garden. There remains yet, in the Luxembourg, a few hives surrounded by trees; and it is there that Mr. Hamet continued his lecturing to his last days.

In 1856 he published a small treatise on bee-culture, and soon after a pamphlet on the amesthesis or asphyxy of bees, and a book on bee-culture.

His *Cours Pratique d'Apiculture*, the first edition of which was printed in 1861, is just published for the sixth time. His *Calendier Apicole et Almanac der Cultivateurs d'abeilles* was the extent of his works; of his last pamphlet a second edition was published.

The first French exhibition of bee-culture took place in Paris in 1859, and since that, thanks to the initiative of Mr. Hamet, it has been followed by a great many others.

A large number of medals were distributed in these exhibitions, the men composing the Board were always selected among the most enlightened practitioners. Such gatherings contributed to spread bee-culture in France.

Mr. Hamet being prejudiced in favor of the hives having fixed combs for rural beekeeping, drew to himself a large number of bee-keepers of the country, who were, on that account, more numerous than other bee-keepers in the meetings. In spite of such drawbacks, movable-comb hives have at last been adopted by bee-keepers in France, and at the "*Concours Regional of Chartres*," in 1885, Mr. Hamet yielded to the evidence given by Mr. Joly, who is a clever bee-keeper, and owner of 200 colonies.

Mr. Joly, who was a *fixist* (favored immovable combs), is now a *mobilist* (uses movable-comb hives), acknowledges that he was backward; that, when growing old, he has recognized the merits of the movable-comb hive; that he obtains from this hive larger profits; and that, in his opinion, it ought to be preferred....Mr. Hamet, resuming what was said, closed his speech by saying that we should work to get strong population in the hives, and adopt the movable-comb hive, which seems to give the best results, for he, too, like Mr. Joly, rallies to this method, etc. *Bulletin de la Societe d'Enres Loir*, 1885.

Mr. Hamet was a little rough in his manners, and we could notice it occasionally in his journal; but I cannot forget that he was my first teacher; that, but for him, I would never, probably, have engaged in bee-culture, and that, during an intercourse of 20 years (or more) he acted kindly and obligingly by lending me the books, in his large library, on bee-culture. It was in his apiary of Mendon that I hived my first swarm. All these reminiscences cause me to regret not to have shaken hands with him for the last time.—G. DE LAYENS.

Hoarseness and Chilblains.

Among the many uses to which honey may be effectively applied, are the following, which doubtless will be very acceptable at this season of the year, in many families where the BEE JOURNAL is a regular weekly visitor:

HOARSENESS.—Wrap a large lemon in a piece of wet, raw cotton, cover with hot ashes and roast; when done, squeeze out the juice and mix with honey. Dose, one table-spoonful every hour.

CHILBLAINS.—Make an ointment of tincture of catechu, 2 fluid ounces; honey, 1½ ounces; water, 7 ounces. Mix well and apply at night.

Langstroth Revised.

The following notice of this book is translated from *L'Apicoltore*, an Italian monthly published at Milan, Italy, and edited by our friend, Alphonso Visconti de Saliceto, with whom we had an interesting visit ten years ago. He says:

I owe to the kindness of my dear friend, Chas. Dadant, the worthy present of the above work.

The old edition of "The Hive and Honey-Bee," which I own, and of which I gave, some years ago, a summary, in the *Apicoltore*, was written in 1859. Mr. Langstroth, being unable to revise it, on account of old age and sickness, intrusted the revision of this classic work to Messrs. Dadant.

The book is now at the altitude of the most recent knowledge in bee-culture. It contains 521 pages of text; the old edition had but 387 pages. It is illustrated with 199 very fine engravings, and maguificent pictures of Messrs. Langstroth, Huber, Dzierzon, Cheshire, Root, Cowau, Mehring, Hruschka, Bertrand, Cook, Newman and Swammerdam.

Messrs. Dadant having manifested the desire to use some of the engravings which have been published, from time to time, in our journals, our society willingly granted their request.

Messrs. Dadant give us the hope that they will soon write for the world, in the French language, this valuable book, which will then be read and easily and fully understood by all our fellow bee-keepers.

We will publish, in the *Apicoltore*, a summary of what will seem, to us, new, or confirming the experience of others on facts already known, but not yet accepted as truth by all. DR. ANGELO DUBINI.

Cassano Magnano, Italy.

☞ Every one who has read of the disastrous fire at Lynn, Mass., will scrutinize with interest the pictures in *Frank Leslie's Weekly*. The strong, manly face of Henry M. Stanley, which is represented, speaks of the energy that has accomplished so much, while that of Mrs. Charles Albert Stevens is most attractive in its beauty. Other subjects give the paper its usual interest.

Honey Almanac.

This Honey Almanac places in the hands of bee-keepers a powerful lever to revolutionize public sentiment, and create a market for honey, by making a demand for it in every locality in America.

Each alternate page is an illustrated calendar for the month—making a complete Almanac for the year 1890.

Here is what is said of it by those who have seen the Honey Almanac:

The Honey Almanac is an excellent aid, a novel idea....We can recommend the Almanac to our friends.—*Canadian Honey Producer.*

The author has really done a good thing for bee-keepers in publishing a work giving so much information of value to the general public concerning the various uses of honey. We know of no better way to get up a home market for the sale of honey than can be done by purchasing at least 100 copies of the Honey Almanac and distributing them gratis as far as they will go in the neighborhood, where one desires to find a sale for his honey. It is not possible for the bee-keeper to find a cheaper way to advertise his goods. The price of the Almanac is so low that every bee-keeper in the land can afford to purchase a thousand or more copies and scatter them far and wide. Take hold, friends, help Brother Newman out, and at the same time help yourselves.—*American Apiculturist.*

Its 32 pages are filled with interesting facts, figures and suggestions concerning the uses of Honey for Food, Beverages, Cooking, Medicines, Cosmetics, Vinegar, etc. Also, its effects on the human system are tersely noted; a brief refutation is given of the Wiley lie about manufactured comb honey; a short dissertation sets forth the mission of bees in fertilizing the flowers, and increasing the fruit product. Instead of being an injury to fruit, bees are the fruit-growers' best friends.

Prices:—25 copies for $1.00; 50 copies for $1.50; 100 for $2.50; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 25 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

Convention Notices.

☞ The annual meeting of the Vermont State Bee-Keepers' Association will be held at Burlington, Vt., on Jan. 22, 1890. J. H. LABARBE, *Sec.*

☞ The Northern Illinois Bee-Keepers' Association will hold its annual meeting in the Supervisors' Room of the Court House, at Rockford, Ills., on Dec. 17 and 18, 1889. D. A. FULLER, *Sec.*

☞ The Cedar Valley Bee-Keepers' Association will hold its next semi-annual meeting at the office of Jerry Mosher, Waterloo, Iowa, on December 18 and 19, 1889. All interested in bees and honey are cordially invited to be present. J. J. OWENS, *Sec.*

☞ The 24th annual meeting of the Michigan State Bee-Keepers' Association, will be held at Lansing, Mich., in the Capitol Building, on Dec. 26 and 27, 1889. At that time nearly all railroads sell half fare tickets; a few railroads charge one-and-one-third fare for the round trip. Reduced hotel rates will be given at the Hudson House. All are cordially invited. H. D. CUTTING, *Sec.*

☞ The bee-keepers of Huron and Tuscola Counties will hold a joint meeting on Dec. 16, 1889, in the Union House, Concordia Hall, at Sebewaing, Huron Co., Mich. All interested are cordially invited to attend, and make this, the first meeting, a great success. There will be topics of interest to all discussed. JOHN G. KNUDINGER, *Cor. Sec.*

QUERIES AND REPLIES.

Proper Width and Material for Separators.

Written for the American Bee Journal

Query 675.—1. What width of separators would you advise for sections 4¼x4¼x2 inches? 2. Of what material should they be made?—Iowa.

I do not use separators.—M. MAHIN.

1. Three and ⅜ inches. 2. Wood.—J. M. HAMBAUGH.

1. Three and ½ inches. 2. I prefer tin.—G. M. DOOLITTLE.

1. Three and ½ inches. 2. Of wood.—J. M. SHUCK.

1. Three and ½ inches. 2. I prefer tin.—R. L. TAYLOR.

1. Three and ¼ inches. 2. Some prefer wood; I prefer tin.—A. B. MASON.

1. About 3½ inches. 2. Wood has worked very satisfactorily with me.—J. P. H. BROWN.

1. As wide as the sections, viz: 4¼ inches. 2. Wood, planed smooth.—C. H. DIBBERN.

1. Three inches. 2. Basswood or poplar—very white wood.—A. J. COOK.

1. About 3½ inches. 2. If nailed on, tin; if loose, wood.—C. C. MILLER.

I never used separators, for my local trade does not demand them. If I did, I should prefer tin.—MRS. L. HARRISON.

1. Three and ½ to 3⅝ inches. 2. Wood or tin, plain, no holes through them, nor corners, angles, or other costly theories, that are of no practical use.—JAS. HEDDON.

1. I use 3½-inch tin separators. 2. I have seen them made of wood, which worked nicely. The kind would depend, with me, largely upon the price.—EUGENE SECOR.

1. There should be room both at the top and bottom of the separator for the free ingress of the bees—say ½ inch. 2. White poplar makes a good separator; but tin is perhaps the cheapest in the end.—WILL M. BARNUM.

1. Allow about ⅛ inch at the top and at the bottom of each separator. 2. I have used both tin and wood, but I find tin the easiest to manipulate, and so I use it. I do not think that any difference in results will be found, whichever is used.—J. E. POND.

1. Three and ½ inches. 2. I have used many tin separators, and they work well; but wood is so much cheaper, and works just as well, that I prefer the wood. I prefer some hard wood to basswood. I have had basswood separators eaten ¾ of an inch down from the edge.—H. D. CUTTING.

1. Separators should be made as wide as the section is high. There is not space here to give the reason, but it will be forthcoming. 2. I believe that wood makes by far the best separator. Yellow poplar is the best wood, and should be sawed, not sliced, into separators.—G. L. TINKER.

The separators that I use in my section-cases are made of Coke tin, and are cut 3⅜ inches wide; this leaves ample openings at the tops and bottoms of the sections for the bees to pass freely, and yet it is close enough to prevent the combs from being bulged. I prefer tin, because it is thin, and takes up less room than any other material fit for separators.—G. W. DEMAREE.

1. About 3½ inches. 2. Tin is generally preferred, but wood has some advantages; and some apiarists like it as well as tin—others prefer it.—THE EDITOR.

Having Combs Built, or Buying Foundation.

Written for the American Bee Journal

Query 676.—In changing from the producing of comb to extracted honey, is it best to have the bees (weak colonies) build their combs, or buy foundation?—Ark.

Buy comb foundation.—M. MAHIN.

Buy foundation.—G. M. DOOLITTLE.

I would use foundation.—J. P. H. BROWN.

I should use foundation.—EUGENE SECOR.

Buy foundation.—J. M. HAMBAUGH.

I think that I should buy foundation.—C. C. MILLER.

I should prefer to buy foundation.—H. D. CUTTING.

I should prefer to use foundation—R. L. TAYLOR.

I would advise the use of full sheets of foundation. It is the cheapest in the end.—WILL M. BARNUM.

I would buy foundation; then I would have light combs, that would not color white honey.—MRS. L. HARRISON.

Buy combs, if you can, and if not, get foundation, by all means.—JAMES HEDDON.

I would buy foundation, every time, even if I had to borrow the money to do so.—C. H. DIBBERN.

I prefer foundation; though in some cases it pays to have bees build combs. For extracting, wired combs are very excellent. To obtain these, we must have foundation.—A. J. COOK.

I would not try to produce comb honey with weak colonies. The bee-keeper's golden rule, "Keep all colonies strong," is especially valuable in producing comb honey.—A. B. MASON.

If the bee-keeper is prompt, diligent, painstaking, persevering, accurate, skillful and level headed, buy foundation. If he is not all these things, he would better not have the bees.—J. M. SHUCK.

Accordiug as the bee-keeper could afford. I would prefer the frames half filled with foundation, but full sheets may be used to great advantage between old brood-combs, if straight.—G. L. TINKER.

Use comb foundation, by all means. In my locality, to set the bees to building their combs in the surplus cases, with a view to obtain combs for extracting, would be the worst sort of management. The foundation will pay 200 per cent. on the investment, the first season.—G. W. DEMAREE.

I find the best results from the use of foundation; and then again, complete control is had by its use, both in the matter of getting straight combs, and all-worker cells if desired. There is a difference of opinion, however, on the subject, and localities may be the cause.—J. E. POND.

By all means give them comb foundation. Weak colonies are very poor to depend on for building comb.—THE EDITOR.

Essays on Extracted Honey.

We offer Cash PRIZES for the best essays on "Extracted Honey," each essay not to exceed 2,000 words in length, and must be received at this office before Jan. 1, 1890. The first prize is $5.00; the second, $3.00; and the third, $2.00. All essays received on this offer will become the property of the AMERICAN BEE JOURNAL, and is open for competition to its subscribers only.

CORRESPONDENCE.

BEE-ESCAPE.

Description of a Simple and Effective Bee-Escape.

Written for the American Bee Journal

BY C. H. DIBBERN.

The engraving is that of the underside of a solid honey-board, with bee-spaces to match the hive and supers. The illustration tells the story, and any intelligent bee-keeper could make it without further explanation. The cones are double, and fit in the *bee-space* on the underside, presumably ⅜ of an inch, though I have them for a ¼-inch space.

They are easily made of green wire-cloth, by shaping them with the fingers over a wooden form. It is surprising how nicely a piece of green wire-cloth can be shaped over a block!

A little explanation may be necessary to enable any one to make it. The dots are holes ¾-inch through the board, and the board itself may be of any thickness. The outside cone is just enough larger to easily admit of a bee running around it. Now when this escape board is placed with the cones fitting nicely in the bee-space under it, above the hive or case of sections, and the full case of sections and full of bees is placed on it, they will at once find themselves comparatively cut off from the queen and brood-combs, and become greatly excited. Of course they readily find the holes, and down they go, and out at the escape into the hive.

Should any try to return after passing out of the inner cone, they will be very likely to run around it, and out of the outer one. The exit from these cones is just large enough to nicely allow a bee to pass out, but as the wire in the edge of the cone points outward, it is not so easy for a bee to return; but should one occasionally get into the outer cone, it would very likely take the passage *around* the inner cone, and out again into the hive.

Suppose, however, that a very few bees should regain the super—they would soon find themselves rather lonesome, and be glad to rejoin the great company below.

Of course the form of this escape can be varied; for instance, the holes may be cut in the middle, or any other part of the board. The form of the wire-cloth cones can also be changed, to make two or more outlets. It could also be changed to the form of a star, and placed over one hole in the center,

with the escapes at the points of the star, and it could be made double or triple. The principle however remains the same, viz: a horizontal escape in the bee-space under the board. I know that this escape will *work perfectly*, and it would be difficult to get up anything cheaper.

The cones can be made for a cent each, and I do not figure the boards anything, as they are worth all they cost, for an inner cover. The cones are tacked on with a few 2-ounce tacks, and can readily be removed in a moment. I have another use for this board, however, when the cones are removed. I use just such a board with one or two ¾-inch holes to place under supers of finished sections. This allows some bees to remain with the honey, to protect it from moth, and care for it, till it is thoroughly ripened on the hive. This board is to protect the honey from getting soiled from the bees below, that constantly travel over the dark brood-combs.

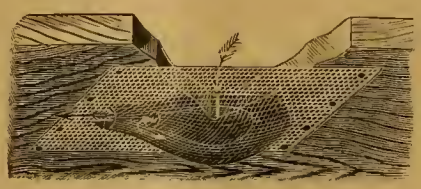
I have been working with bee-escapes of various kinds during the last season. Mr. John S. Reese, of Winchester, Ky., first called my attention to his bee-escape, and I was greatly pleased with the idea.

Now I want to say right here, that to Mr. Reese belongs the honor of inventing the first practical bee-escape, and but for his invention mine would never have been thought of. I would not detract one iota from the credit so justly due him, for bringing out, and donating, his invention to the public.

I soon discovered, however, that his escape was not perfect, on account of bees clustering and building comb in the space required for the tube under the board. Mr. Reese has obviated this in a measure, by removing a section from the super of empty sections under it, and running the cone into it temporarily. Of course, it must be removed before much comb is built, and the empty section returned, which is not so easily done when the super is full of bees; and the **T** supports have a disagreeable way of *not* letting the section slip below the upper ridge of the **T**. Then, too, when the last case is removed, Mr. R. again uses the rim of a super only under the escape-board. This, even in cool weather, after honey has ceased coming in, does not prevent the bees clustering there, as found out this fall.

While I was trying to overcome the foregoing objections in Mr. R.'s bee-escape, I became convinced that in order to make a perfect escape, I must abandon the vertical principle, and adopt a horizontal one. I tried to use a common slatted honey-board, by covering partly with rubber-cloth, but I soon abandoned it. I next made a wire-cloth arrangement the size and thickness of a honey-board, with **V**-shaped escapes between the cloth. This worked all right, but was expensive, and objectionable in many ways.

Somehow I knew that I had the right (horizontal) principle, and that there must be no space under the escape. Lately I wrote to Mr. Reese, who made some well-grounded objections to this wire-cloth escape, but thought it would work. I was not satisfied with it myself, and felt that something more simple could be invented. With these thoughts on my mind, I went to bed, and after a short sleep, I awoke, and again commenced thinking of bee-escapes. Then thinking



The Dibbern Bee-Escape.

of my honey-protector, and my horizontal cones, I put the two together, and instantly almost exclaimed "Eureka!" I had found it. The next morning I hastily made the wire-cloth cones, and attached them to the honey-protector board, and I had a *perfect bee-escape*—just the thing I wanted!

There is no patent on this bee-escape, and I now give it to the bee-keepers of the world. If Mr. Heddon has as good one, he can keep it as a great secret. The one here described is all that can be desired. I want bee-keepers to give it a fair trial, and if it is not the simplest, best and cheapest thing out, they are at liberty to invent a better one. I consider this the best thing that I ever invented. If it will lessen the cares, and labor, of our favorite pursuit—bee-keeping—I will feel well repaid.

Milan, Ills.

Hints to Beginners.

☞ The truth which every beginner should learn, and one that should stand out with great prominence is, that a large force of bees will do a large amount of work, and that said force should be on hand just when the labor or honey harvest is on hand. Failing to have the workers on hand at this time, means a failure to secure very much of a harvest of honey. Therefore every effort should be made to secure a large stock of working bees at the time, or times, when the flowers yield the most honey, or when the plants are in bloom, which usually gives the surplus crop.—*American Rural Home.*

ILLINOIS.

Report of the Union Bee-Keepers' Convention.

Written for the American Bee Journal

BY J. M. HAMBAUGH.

The Union Bee-Keepers' Association met at the Court House in Mt. Sterling, Ills., at 10 o'clock a.m., on Thursday, Oct. 23, 1889, and quite a number of prominent bee-keepers were present, and lent much eclat to the occasion.

In the absence of President Ogle, ex-President S. N. Black, of Clayton, was persuaded to officiate. The first half day's meeting was somewhat informal, and social discourse upon sundry topics was freely indulged in. The Secretary read an essay from W. J. Cullinan, of Quincy, entitled, "Increase and Its Control," which was discussed as follows:

Mr. C. P. Dadant said that increase will never be fully under control. It was somewhat against nature.

Mr. Black—By introducing a queen to a parent colony, immediately after a swarm is cast, would prevent further increase.

Mr. Hambaugh asked for a remedy, to cause bees to work in the sections.

Mr. Smith puts on supers at the very first indications of a honey-flow, before the cells are drawn and become white.

Mr. Dadant does not advocate restricting the queen, but should have unrestrained privileges to either sections or combs.

Mr. Smith said that there was some features not thoroughly understood with regard to bees being in a normal condition. They should have plenty of nurse-bees, comb-builders, and honey-gatherers.

Mr. Dadant said that comb-building was under the control of the bees, and that bees would become gatherers much sooner in life than 21 days, as asserted by Mr. Smith.

Treasurer J. G. Smith reported $7.25 in the treasury, and it being sufficient to meet contingent expenses, no extra charges will be made against the members. The old roll of members having been misplaced, a new list was ordered made. As there was no further business, the "Query-Box" was opened.

ITALIAN BEES VS. BLACKS.

"How do Italian bees surpass the blacks?"

Mr. Dadant—Black bees will starve at times when Italians will prosper, and the latter are superior in every way.

Mr. Smith corroborated Mr. Dadant's statement, and also stated that the

Italians will supersede their imperfect queens more readily than the blacks.

Mr. Black's choice would be pure Italians, but said that hybrids are better to work in the sections than the blacks.

Mr. Wallace had been breeding Italians for 18 years, and would not have blacks as a gift. He never had any trouble with moth, except in queenless colonies.

Mr. Dunbar sent for an Italian queen; she was beautiful in appearance, but her progeny were lazy and not satisfactory. Some of the hybrids reared from her were good, but not equal to some of his blacks.

Mr. Dadant—There is nothing perfect in this world, and this is an exception, and, as a rule, they are otherwise.

The Secretary said that blacks were more disposed to rob and fight than Italians; he has kept a book record of his home apiary for a number of years, where he has had pure Italians, blacks, and their crosses, and finds by actual observation, that the Italians and hybrids produce from ⅛ to ½ more honey than the blacks, and the pure Italians lead both. They will defend against robbers much better, and supersede their imperfect queens much more readily.

SPACE BETWEEN THE SUPER AND HIVE.

"What space, if any, is best between the super and the hive?"

Mr. Smith said ⅜ of an inch. He uses a wedge to hold sections to place against the outer case.

Mr. Dadant—For comb honey, I would use the Foster case, with clamp.

The Secretary uses ⅜ of an inch space between the supers and brood-frames.

SOWING ALSIKE CLOVER SEED.

"Will it pay to sow Alsike clover seed?"

Mr. Wallace sowed some last year, and is much pleased with it. His bees just swarmed on it—he found 20 on it, to one of red clover. The honey granulates sooner than other honey. The hay is good, but the yield is not so large as red clover. The seed yield is equal to that of the red.

The Secretary said that it will pay to sow it; the hay is fine, and less inclined to chaff and dust. His experience was that it is hard to cut with a mower.

Mr. Dadant tried it 18 years ago; sowed it alone, and it fell down badly. He has not tried it since, but believes it to be meritorious.

Mr. Black sowed some two years ago, and got a good stand. He cut it with wheat stubble. Cattle ate it splendidly. Off of 20 acres he sold $150 worth of baled hay. The yield of seed was good.

SECTIONS WITH FOUR BEE-SPACES.

"Are sections with bee-spaces on all four sides an advantage?"

Mr. Dadant had tried them and found that the bees take to them more readily. They are more in accordance with nature, and more accessible in cold weather. They are better ventilated, and bees are not separated so much.

The Secretary had never tried them, but said that they are certainly more in accordance with nature. We should cater to the bees' nature and habits as nearly as we can.

Mr. Smith had not tried them, but doubted if the bees would attach the honey so well to the sides of the sections.

Mr. Dadant—They attach the honey to the sides of the sections better than in the closed-side sections, but they cannot be glassed so well.

INTRODUCING QUEENS.

"Which is the best method of introducing queens?"

Mr. Wallace, after removing the old queen, puts the queen to be introduced into a wire cage, usually allowing her to remain caged for 48 hours in the old hive, before releasing. He also drops honey on the queen before releasing her.

Mr. Dadant cages the queen 48 hours, and lets the bees release her by gnawing the comb with which he closes one end of the cage. He has also used advantageously sweet water scented with peppermint, to sprinkle them.

COMB HONEY VS. EXTRACTED.

"Is there any logical reason why comb honey should receive a preference over extracted honey, as regards taste, desirability, etc.? If so, what is it?"

Mr. Wallace said that it was more in looks than taste.

Mr. Dadant—Extracting may cause it to lose its essential oils to some extent, and it will granulate sooner than that in the comb. It is prejudice more than any logical cause. We must cultivate more of a demand for it.

Mr. Black said that the question was intended for him personally, as he claims to detect a material difference in taste. He also claims that looks go far towards governing the taste, and also that the comb is good for the digestive organs.

The Secretary said that the question was his, but nothing personal was intended. He simply wished to know the cause of so many objections to extracted honey. He has had much experience in selling extracted honey, and knows many of the objections to be groundless. He takes exceptions to Mr. Black's ideas that the wax in comb honey is health-giving, but held that, on the contrary, it was detrimental to the health. He believed that when bees are disturbed, they are liable to emit some of the venom from the sting upon the combs, which probably explains why so many realize griping pains after eating comb honey. This is avoided in extracted honey. He thinks that one cause of prejudice is due to the old methods of "straining" honey through a sack, in connection with dead bees, old, dirty combs, pollen, etc., giving the honey a very unpleasant, rank taste, and which is still confounded with our wholesome extracted honey.

Mr. Black—That does not tally with my methods. We did not get *our* strained honey that way. We excluded the pollen and dead bees.

Mr. Frank said that it made no difference to him, so that he got the honey. He gave the preference to the extracted, as he could put it on both sides of his bread.

WEIGHT AND MIXING OF HONEY.

"Does all honey that is pure, weigh the same, and will it mix?"

The Secretary said that Spanish-needle honey will weigh one pound more per gallon than clover honey.

Mr. Dadant—I cannot mix thick honey, except by warming. Fall honey will weigh more than spring honey. Any good, cured honey will weigh 11 pounds per gallon, and none over 12 pounds. Linden honey is not so readily cured as other honey.

The Secretary had some experience in mixing honey, and it can only be done by heating it quite hot. He had mixed some rank linden honey with fall honey, and it made a very salable honey.

GETTING THE BEST RESULTS.

"How shall we get the best results from our bees in a financial point of view?"

Mr. Smith—Work the queen for strong colonies. Early feeding should be practiced to start the queen to laying, in order to be ready for the first honey-flow.

Mr. Dadant—I would avoid rearing drones as much as possible, as they are consumers, and not producers. I would rear drones from such colonies as would be suitable crosses for queens, and prevent others. One colony properly supplied with drone-comb will rear sufficient drones for an apiary.

The Secretary—No man can prevent bees from rearing drones, entirely. I have frequently noticed drone-brood in worker-cells.

Mr. Dadant—If Mr. Hambaugh had measured the cells of foundation, that had a streak of drone-brood, he would find that they had been stretched to drone size, and that these stretched cells were always near the top of the comb.

Mr. Wallace—Drones in worker-cells are much smaller than normal drones, and I would dispense with them, if possible.

Mr. James—An average of from 50 to 100 drones per colony is sufficient.

The Secretary—The prime factors in honey-production is a good queen, and a hive that you can expand or contract to suit her requirements. We must be able to give the queen room, that no time may be lost in egg-laying; and we must also have all the surplus cases at hand, that we may give the bees plenty of room before they are seized with the swarming fever; we must be able to expand the size of the surplus apartment to the requirements of the large army of workers, to keep the bees at home and at work. We must also be ready to quickly remove all honey from the surplus receptacles, as soon as we know that the honey is cured and ready, and not allow the hives to become glutted with honey, as this is liable to bring about the swarming fever. I use alcohol barrels in which to store honey, and a dry room. I never put honey in a cellar.

Mr. Dadant—Sell in a local market, and keep up fair prices. Sell by sample, but do not begin too early in the season. We must not crowd the market. When shipping comb honey, put heavy paper in the bottom of the crates. For extracted honey, use tin cans, neatly labeled, and make every package as inviting and presentable as possible.

Mr. Thornton—When country stores refuse to buy, leave your honey on commission.

Mr. Black—Each bee-keeper must adapt his business to his surroundings; study his local market, and by all means drive a good local trade. The amount of business done depends upon the ability of the man to sell.

LAYING IN QUEEN-CELLS.

"Does a queen ever lay eggs in queen-cells?"

Mr. Dadant—I think not; their antipathy against other queens leads to that conclusion.

Mr. Wallace—I think that they do.

Mr. Smith had seen eggs in old queen-cells, and their position would indicate that the queen had laid them there.

The Secretary has doubts as to the queen ever laying the egg in the queen-cell, owing to their antagonism toward each other.

Mr. Dadant thought it probable that the eggs had been placed there by the workers.

Mr. Thornton—I think that the queen lays in the queen-cells, the same as in other cells.

Mr. Black was of the opinion that the queen sometimes lays the egg in the queen-cell, and at other times the cell is built around the egg by the workers.

Mr. Wallace said that the queen lays the egg in the queen-cell.

Mr. Dadant—If we admit that the queen lays the egg in a queen-cell, and knows the sex of the egg, then she is different from anything in the animal kingdom. If she does not know the sex (and size of cell governs the sex), then the egg would hatch a drone.

DIFFERENCE IN YIELDS OF HONEY.

"What is the difference in the yields between comb and extracted honey, when the apiarist furnishes foundation for comb honey, and dry combs for extracted honey?"

The answers were as follows: The Secretary—Double the amount; Mr. Wallace—A trifle more; Mr. Thornton—Twenty per cent. more; Mr. Williams—No more; Mr. Dunbar—Fifty per cent. more; and Messrs. Smith and Black—A trifle more.

QUESTIONS ON DRONES.

"Will bees admit drones from other hives, when they are not queenless?"

The prevailing opinion was that they would during a honey-flow, but not during a dearth.

"Are drones from virgin queens of the same value as from fertile queens? Are drones from laying workers capable of fertilizing queens?"

Mr. Dadant—According to Mr. Cheshire, their organs are fully developed, though they be from an unfertile queen, or laying worker.

Mr. Wallace—They are "no good," in my estimation.

WHAT IS ROYAL JELLY?

"What is the food, or in other words, the royal jelly upon which young queens are fed during the larval state?"

Mr. Dadant then read from Mr. Cheshire's writings upon this subject.

Mr. Wallace once cut out a section of comb with eggs, and put it into a hive with a swarm of bees, and shut them up for three days, at the end of which he found queen-cells filled with royal jelly, and he knew that they had no possible chance to gather it from the outside.

SPRAYING FRUIT-TREES.

At Mr. Smith's suggestion, it was decided that the association be authorized to petition the State Horticultural Society, to prevent as far as it is in their power, the spraying of fruit-trees with Paris green or other deadly poisons, when they are in bloom. Mr. Dadant said that it should become a legislative topic.

The annual election of officers next being in order, the following was the result:

President, S. N. Black, of Clayton, Ills.; Vice-President, C. P. Dadant, of Hamilton; Secretary, Daniel Shank, of Clayton; and Treasurer, G. W. Williams, of Buckhorn.

It was decided that the next meeting be called at the option of the executive committee, in October or November, 1890, and that the Secretary be instructed to secure badges to be worn at the next meeting.

Messrs. Dadant and Hambaugh were appointed as delegates to the International Convention at Brantford, Ont., Canada, on Dec. 4 to 6, 1889.

At the suggestion of the President, the members gave their report for the season of 1889, as follows, the last three names being visitors:

	No. colonies.	Lbs. honey.
J. A. Thornton	250	14,000
J. M. Hambaugh	240	15,000
T. S. Wallace	130	3,500
Chas. Dadant & Son	450	45,000
J. G. Smith	13	300
Jos. Dunbar	34	1,200
G. W. James	18	200
G. W. Williams	19	800
Daniel Shank	19	500
S. N. Black	60	1,200
John H. Hambaugh	20	600
E. S. Frank	9	125
D. W. Miller	4	100
Total	1,266	82,525

The convention then adjourned *sine die*. J. M. HAMBAUGH, *Sec.*

CAGES.

A Queen-Cage for Shipping and Introducing.

Written for the American Bee Journal

BY E. L. PRATT.

I have sent away quite a number of samples of the queen-cage that I am trying to make perfect. All who have received them commend it very highly. Mr. G. M. Doolittle calls it the "perfection cage."

It is a simple block, 1¼x4 inches, containing three one-inch holes ¾ inch from each other, and from the edges of the block. These are connected with a ⅝-inch hole, so as to form a passage-way through the one-inch holes, and make an exit for the queen and attendants, while introducing; when, by simply removing a small cork, the deed is done, as the bees will soon remove the candy in the en-

trance of the cage, and the queen is introdueed without any fussing or trouble.

The first inch hole is the air space which is covered with a small piece of wire-cloth ; the second hole is closed tight, so as to give the confined bees a place in which to huddle together in cool weather; and the third hole, which is at the exit end, is filled with candy enough to last a queen and her attendants 20 days or more. The whole thing is then covered with a thin board, and tacked fast, making a neat and perfectly safe little package, in which queens can be sent anywhere with safety in cool or warm weather.

No wrapping or tying is necessary, and the address can be written directly on the smooth surface of the wood. All the cost of the cage and the postage on a queen in it, is about 1½ cents.

I want to get help on perfecting this cage, and will send a sample to any who are interested, with pleasure. Suggestions are solicited from all.

Marlboro, Mass.

[The sample cage sent with the above article is light in weight, commodious and yet substantial. It is desirable that it be criticised freely, and the offer of Bro. Pratt to send a cage to any one interested, for suggestions looking to an improvement, should be accepted.—Ed.]

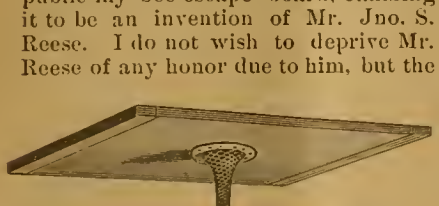
BEES IN CASES.

The Bee-Escape Board and Its Practical Use.

Written for the American Bee Journal

BY FRANK COVERDALE.

On page 739, Mr. Z. T. Hawk rather accuses me of being "fast" in making public my bee-escape board, claiming it to be an invention of Mr. Jno. S. Reese. I do not wish to deprive Mr. Reese of any honor due to him, but the



The Coverdale Bee-Escape.

bee-escape board which I mentioned on page 697, is the fruits of my own study, as I never heard of any way of getting bees out of section-cases while on the hive, nor of any cone for the purpose.

I was not a reader of *Gleanings*, and even if I had been, the cone-case described on page 727, would not have been satisfactory to me, for, as I unstand it, there must always be an empty surplus case with each board, to have the thing right, otherwise, in an ordinary bee-hive, these long screen cones would be very hard to keep in shape ; or, in other words, many of them would be mashed out of shape.

In making the cones for my board, cut strips of wire-cloth 1⅛ inches wide, and as long as the piece you cut it from ; on the forming stick mark one side, placing the mark made, even with the end of the screen strip cut out; roll it just once around or over (the large end of it), and cut it just about ½-inch longer, and in the shape of the letter V—not too pointed at the bottom, just so that it will go nicely around the small end of the forming stick, and a little wider.

Now wrap the top end of the screen around the large end of the stick snugly, take a wire thread long enough to go 4 or 5 times around, and wrap tightly. Take the two ends of the thread between your finger and thumb, and with the other hand twirl the whole thing over and over, until you have it sufficiently tight. Cut off the rough ends, then press it around the middle and lower point, and then bring around the further side of the screen, which will be too much ; then with the shears clip off the spare cloth, leaving it wrapped over about (in the center) two meshes, and just a little more than to meet at the point.

Now wrap another wire thread 4 or 5 times around just where the forming stick begins to spread the screen, or a little over one-half inch up from the point, and fasten as you did the first. The base of the cone when finished, should be just large enough so as not to go through the ⅜ inch auger hole. In order to make the cone go down nicely, with a sharp knife round out the top edge of the board—it is of importance to have the cones go down level and smooth. One of these cones is all that I have been using in a single board, as I think it sufficient ; but if I were to use two, they would not be over one inch apart, and go down between the same to the sections. I think that it is best to have one of these boards for every strong colony in the apiary, as their cost is slight, in comparison with their usefulness and endurance.

As soon as the honey is capped, the board is placed beneath the case, and so on all over the apiary, so it will be seen that I do not have to remove my honey the same day, nor the next—I can take it off at my leisure, even if I should not get at it for a week, when cases fit as they should.

When I wish to remove the boards, the cones are taken out and put into a basket for the purpose, and the boards put away until again needed. My board will not warp out of shape, for the strips nailed against its outer edge, with a ⅜-inch bee-space projecting above the top surface of it, holds it to its place, and it will last as long as will the hives ; and it is about the same with the cones, if properly cared for, which is easily done.

This bee-escape board is a very useful implement. I will hereafter describe how I control increase with it, while producing comb honey.

Welton, Iowa.

THE UNION.

The Fifth Report of Its Work, by the General Manager.

It becomes my duty for the fifth time to make a report to the members of the National Bee-Keepers' Union, of the work done.

The past year has been a glorious one for the Union—one in which its work has been carried to the highest authority in a State (the Supreme Court of Arkansas), and there, by the eloquent arguments of its very able counsel, Judge Williams, of Little Rock, Ark., it has drawn forth a decision in favor of the bees, declaring that the pursuit of bee-keeping is legitimate and honorable—that *bees are not a nuisance !*

We now warn all the "ignorant" and "prejudiced" to keep their hands off—and inform them that *bee-keepers have rights* guaranteed by the Constitution of the United States, that all are bound to respect.

The decision of that Supreme Court is a document that will become of great use as *a precedent*. It will be a guide for the rulings of judges—for the information of juries—and for the regulation of those who may dare to interfere with a respectable pursuit by law or otherwise !

The National Bee-Keepers' Union, in this one instance alone, has been of *great benefit to bee-culture*, even though it has received but very poor encouragement and support from bee-keepers in general !

HOW IT APPEARS TO OTHERS.

Speaking of the argument of Judge Williams, Mr. Eugene Secor, a lawyer of Iowa, remarks thus :

The argument of the counsel for the "Bee-Keepers' Union" in the Arkadelphia bee-lawsuit, will be a valuable contribution to the legal literature of bee-keeping.....

Town councils—ignoraut sometimes of matters pressed upon their attention by interested aud unscrupulous persons—do some very unwise, as well as unlawful, acts; hence the need of just such a precedent as this case will furnish, for the protection of bee-keepers in the future.

Had it not been for the National Bee-Keepers' Union, that furnished the "sinews of war," this case might have gone against us by default.

A case so wisely managed, and so sucessfully terminated, ought to inspire confidence enough in the Union, that its treasury shall never lack "the needful" to defend every worthy case.

Mr. J. E. Pond, a lawyer of North Attleboro, Mass., gives his opinion of the case in these words:

I have read the exhaustive argument of Judge S. W. Williams with pleasure, and *as a lawyer*, I wish to say that no court can honestly differ from it or decide against it. When I say "exhaustive," I mean just what I say. It covers the whole ground; the decision in the Clark case must be for the defendant on constitutional law, and local law cannot avoid the Constitution.

Mr. R. McKnight, of Owen Sound, Ont., records his opinion of the Arkadelphia case thus:

That defense is worth a dollar to every bee-keeper in the land. The judgment that followed it, established a precedent of great importance to bee-keepers, and will probably be quoted in the courts, through generations to come.

Mr. C. H. Dibbern philosophizes after this manner:

This decision is of real value to bee-keepers, and is the first case of the kind decided by the Supreme Court of any State. Hereafter people having imaginary grievances against bee-keepers will likely think twice before commencing petty suits. Bee-keepers will hereafter be responsible for the real damage that may be caused by their bees, just like any other property. More than that, no bee-keeper ought to ask.

Mr. Clark, being a poor man, could not have afforded the expense to carry the case to the higher court, and employ first-class legal talent. The management of the Union deserve great credit in this, as in all other cases it has ever taken up—never having lost a case.

The first thing the Union does when a case of any member comes before it, is to determine if the case is a just one. If not, he is advised at once, and a satisfactory settlement is soon made. If he is in the right, he is helped in his defense to the last.

Mr. A. I. Root, editor of *Gleanings in Bee-Culture*, remarks thus about the Arkadelphia case:

We are not in favor of trades-unions in general, but the Bee-Keepers' Union, under its present able management, we are sure has been productive of good. After we have a few more precedents established like the Arkadelphia case, outside parties will be slow to declare bees a nuisance.

The National Bee-Keepers' Union is unlike "trades-unions." It simply sets up a *defense* when its members are unjustly attacked! It will not defend even a member, unless his cause is *just;* and attacks growing out of ignorance, jealousy, prejudice, and the like, which threaten the pursuit in general, should always be repulsed vigorously!

The "Union" orders no strikes, and makes no attacks—it simply *defends* the pursuit of bee-keeping, and fights in a moral and legal way, for right, justice and truth!

OUR CONSTITUTIONAL RIGHTS.

Judge Williams argued in a masterly manner, and was sustained by the court, that the power is not given by the Constitution of the United States to prohibit bees by Statute. We have a Constitutional right to keep bees.

Many persons are frightened by the fact that the bees possess a weapon of defense, and thereupon declare them a nuisance. They never stopped to think that the "sting" was provided by Nature for its defense, and to insure the perpetuation of its kind! If an attack is made upon its home, the sting is its only defense—but it is an effective one! When away from its home, it seldom volunteers an attack!

It was asserted by the prosecution, that bees were a nuisance because they were liable to sting children. Judge Williams met it with this unanswerable argument: "It is not true; unless children molest them at their hives, or catch them. But because a domestic insect may sting or hurt under some circumstances, no more makes it a nuisance—*per se*—and liable to prohibition, than the fact that a horse may kick, may run away in the harness and kill a child; or an ox may gore persons with its horns, would make these animals nuisances *per se*."

Cases are numerous where children have been injured, and even killed, by the kick of a horse, by being run over by a cow, the bite of a dog, or the scratching of a cat. The Judge asks, "Shall the keeping of horses and cows be forbidden by an ordinance?" Certainly not! No one would think of such a thing for a moment! Domesticated bees must have an equal chance with all domesticated animals!

ADVANTAGES OF THE DECISION.

A condensed history of this case, together with the argument of the counsel for the Union, and the decision of the Supreme Court, has been printed by the Union, and a copy thereof will be sent to each member for perusal.

These pamphlets have already saved much trouble, and prevented several law-suits. A case in point, and one which illustrates the moral effect of being a member of the National Bee-Keepers' Union, is as follows:

Rev. Robt. Carver, of Manton, Mich., a member of the Union, wrote to the Manager that he was sued by a jealous neighbor to appear before a prejudiced Justice of the Peace, for maintaining a nuisance. The damage was placed at $100 for trespassing bees, and threats were made to drive him and his bees out of the village.

The Manager of the National Bee-Keepers' Union counseled him as to what to do, and how to proceed; told him to hire a good lawyer, and assured him that the Union would stand by him as long as he was in the right, and defend his rights in a moral as well as a financial way.

The case was called, and an adjournment was made, Mr. Carver retained a lawyer, showed him the letter and documents of the "Union." He read the latter carefully, then went and talked with the opposite attorney, and some of those incensed against the bees. The result was that they were quite willing to compromise the affair. By mutual agreement the suit was dropped, leaving the parties who brought suit to pay all costs.

Mr. Carver writes as follows: "A friend of mine happened in, when several of them were talking about the matter, and he heard the Village Marshal say, that if they went on with the case, they would have all the bee-fraternity to fight, and would have their hands full."

ITS MORAL EFFECT.

This is another triumph for the Union. The moral effect of being a member of an organization for the defense of the pursuit, was that the prosecuting party withdrew from the field and paid all the costs!

Several other cases, similar to the above, might be cited, all serving to illustrate the fact, that belonging to such an organization is of itself not only an honor, but also a power in the defensive! If a jealous or prejudiced neighbor finds that a bee-keeper belongs to a "Union" for the defense of the pursuit, he will think twice before rushing into a lawsuit.

The decision in the Supreme Court of Arkansas will do more to guarantee bee-keepers their *rights*, than anything that has ever been done in America. If the Union never does another thing, and goes out of existence *at once*, that decision will be its "crown of glory," and its generous benediction.

THE "S. W. RICH" LAWSUIT.

This is quite another thing from the Arkadelphia case. Mr. Olmsted sued S. W. Rich for $1,200 damages for injuries (?) inflicted by the bees upon his person and property, but the jury (from which every person having bees was excluded) gave him but six cents to cover wounded feelings and damaged property!!

This has been appealed to the Supreme Court, and the decision of the lower court affirmed. Whether to carry this case up to the Court of Appeals is the question. If that Court should pass upon the merits of the case, it will be worth the money it will cost, which will be about $500.

HOW TO BECOME MEMBERS.

As this Report will be sent to many not now members, but who should become such, it may be well to say that the entrance fee is $1.00, and that pays for the dues of any portion of the unexpired current year, ending Dec. 31. Then it costs only $1.00 for annual dues, which are payable every New Year's day, and must be paid within 6 months, in order to retain membership.

If membership ceases, all claims against former members also cease; and all claims to the protection of the Union are dissolved.

Financial Statement for 1889.

Balance as per last Report	$279.38
Fees from 315 members for 1889	315.00
Donations	3.70
	$598.08
DISBURSEMENTS	$236.40
Balance, Dec. 2, 1889	$361.68

LIABILITIES.—Bonds are given for the costs in the Rich lawsuit. These, with the amount necessary to carry up the appeal, if it is passed upon by the "Court of Appeals," will probably amount to $600.00, or more.

The Union has also engaged attorneys for the defense of several other cases, the costs for which will have to be paid when they come up for trial—so we shall have use for all the money on hand and the dues for the next year—as the cases come up for trial.

DUES AND ELECTION OF OFFICERS.

It now becomes my duty to call for $1.00 for the coming year, as dues from each member. A Blank will be sent to be used for that purpose; and also a Voting Blank. Fill up all the blanks, and send to the Manager with a postal note or money order for $1.00 in the enclosed envelope. It must be received by Feb. 1, 1890, or the vote will be lost.

CONCLUDING REMARKS.

If the Union is to continue its good work, it must be supported both by the financial as well as moral influence of all the apiarists of America.

The General Manager has labored incessantly, without the hope of reward, except such as comes from a consciousness of having done his full duty, and now is fully prepared to welcome his successor, when elected. His energies have been given in unstinted measure for the defense of the pursuit, and it is a pleasure to know that his labors are appreciated so far as words go—but it takes money to obtain "decisions of law," and lift up a standard in defense of the pursuit.

THOMAS G. NEWMAN, *Manager.*

925 West Madison Street, - - CHICAGO, ILL.

A GOOD TEST.

The Honey Almanac Creating a Market for Honey.

Written for the American Bee Journal

BY REV. STEPHEN ROESE.

To bee-keepers the Honey Almanac is well worth all that it costs them, and I think that all who live to see another honey season, will feel the need of a double portion of those grand little helps in honey sales. I, for one, will want a full 1,000, I think, to sow broadcast over the land. They will accomplish the object in view—the ready sale of our honey; and, besides, inform the public in regard to its various uses in the kitchen as food, and in the nursery as medicine; and, what is more, it will remove a prejudice which has hitherto planted itself as a monstrous battery to keep at a distance from mankind, their family friend and God-given blessing—honey.

It is very strange that the want of such a "leader" among the many thousands of bees-keepers of the land has not been felt before. With my small lot of Honey Almanacs, I have begun experimenting. Wherever I intend to sell honey, I send them out as an "advance guard," to open the way, and this "advance guard" is marching on unmolested; and good reason and judgment will not suffer it to be ordered to turn about.

One year ago I went to St. Paul with some comb honey, and 200 pounds of extracted. The comb honey I sold, but the extracted no one wanted, so I left it with commission men until last May, when I had it shipped back again, without selling one pound, and used it in feeding bees. Of late, since I got the Honey Almanacs, I went to that city again, with some comb honey and only one gallon can of extracted, which I begged the groceryman to purchase on time. Seeing he had jelly tumblers for sale, I told him to fill them with honey, and put them on the counter, and if they were not sold when I returned, I would take the honey back, and pay for the tumblers—which he agreed to.

I left a Honey Almanac, and in less than a week he wrote to me, saying that the honey was all sold, and to send more at once—a case of 2 tin cans (60 pounds each), and some Honey Almanacs also, which I did, and sent him three cases instead of one, prepaying the freight, and stating that he need not purchase the two cases not ordered, but to please store them for safe keeping until I went to St. Paul.

To my daughter residing in another town, I sent one copy of the Honey Almanac, and after letting a neighbor read it, she ordered 100 pounds of extracted honey, and I had hardly received her letter, acknowledging the receipt of the honey, when she wrote back, "The honey goes like hot-cakes. It is all gone, but don't send me any more honey in 60-pound tin cans, as it is too much trouble to weigh it out. Send me 200 pounds more, immediately, in 12-pound tin cans. Nearly every family wants at least that much. The people are coming with horses and buggies from far off, to my door, and call for honey."

Those "little, big levers" (Almanacs) have helped me wonderfully in the almost discouraging work before me, of selling my honey.

Although times are hard, money is scarce, and bee-keepers should economize and save expenses in directions uncalled for, yet a few dollars invested in Honey Almanacs, will bring its interest annually in gold. What brought the riches to the patent-medicine institutions, such as Drs. Payne, Ayer, Schenk, World's Dispensary, and others? Advertising! If their advertising mediums—their Almanacs—were able to accomplish such ends, what may be looked for in the near future from the Honey Almanac, having such a broad field, and sure foundation to work upon?

Patent-medicine almanacs have only here and there a few feeble testimonies to work with, but the Honey Almanac has truth for its basis and foundation, and the most learned and scientific men of the nation to bear testimony in its favor, and back it, too, wherever it goes. The Bee-Keepers' Union stands ready, as a protecting friend, for all who will seek shelter under the shadow of its wings, to ward off the fiery darts of all enemies of this honest industry, and the dollar spent in this direction is equally well invested as in the Honey Almanac, and only old-fogy bee-keepers will sit with their hands folded, growling about hard times, and wishing and praying for better prices, and more ready sale of their honey; but wishing and praying, without a manly act, and a disposition to keep pace with the bee-keeping body, is like a locomotive without the moving power. Life is motion, and nature, in its onward course, teaches mankind the great lesson that a Stand-still has corruption in store, and decay in its bosom.

Maiden Rock, Wis.

☞ We always extend the term of renewal subscriptions from the date of expiration on our books. Present subscribers whose time may expire one, two, three or six months hence, can safely renew now, without fear of loss thereby.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 17, 18.—Northern Illinois, at Rockford, Ills.
D. A. Fuller, Sec., Cherry Valley, Ills.

Dec. 16.—Huron & Tuscola Co's., at Sebewaing, Mich.
J. G. Knudinger, Cor. Sec., Kilmanagh, Mich.

Dec. 26, 27.—Michigan State, at Lansing, Mich.
H. D. Cutting, Sec., Clinton, Mich.

1890.

Jan. 22.—Vermont State, at Burlington, Vt.
J. H. Larrabee, Sec., Larrabee's Point, Vt.

May 2.—Susquehanna Co., at Hopbottom, Pa.
H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

SELECTIONS FROM OUR LETTER BOX

Benefits of Bee-Papers.

I am very much pleased with the AMERICAN BEE JOURNAL. I secured about 500 pounds of comb honey this year. Two swarms went off, and I now have 20 colonies in good condition for winter. My bee-keeping friends sold their honey at 12½ cents per pound, but I sold mine at 15 cents at my house. I have sold about 400 pounds, and have only 100 pounds left. I have three neighbors that have bees, and every time they have a little dab of honey to take off, they come to me. They said that they would not be stung for all the honey. I told them that if they would send for the AMERICAN BEE JOURNAL, it would help them a great deal with their bees.

GEO. F. TIBBETTS.

Ocheltree, Kans., Nov. 30, 1889.

White Clover Crop.

Bees wintered nicely last winter. I had 30 colonies, spring count. They were inclined to swarm some, but I prevented them as best I could. I returned some, and increased my apiary to 40 colonies. We had a wonderful crop of white clover, but rain and cold nights in June cut the nectar short, or rather the clover season was larger than usual, but the surplus was gathered slowly. I obtained 270 pounds of good honey. J. E. BOYLES.

Nelsonville, O.

Good Increase and Little Honey.

The season of 1889, with me, was good for increase, but poor for honey. I began with 52 colonies, and now have 93, and took 3,000 pounds of honey, about one-half comb, which is all sold except about 200 pounds. I received 12½ cents in cash for nearly all; for extracted I get 10 cents per pound. I consider that the swarming fever cost me at least 3,000 pounds of honey. The fall crop was little better than a failure here—it seemed to be too dry. I do not think that I ever saw 100 bees on golden-rod in my life. It is a very poor reliance for honey in this section. What is there against adopting clover as our national flower? I am just preparing to place a part of my bees in the cellar, where I have always had very good results. I usually winter a part in the cellar, and the rest on the summer stands. They had a nice flight last Monday. It had been a very pleasant fall up to last Tuesday, when we had a cold wave and some snow. The mercury is 2 degrees above zero this morning.

W. H. GRAVES.

Duncan, Ills., Dec. 2, 1889.

Cold and Wet Weather.

The first really cold wave for this winter is hovering over this locality, and the mercury is now 10 degrees below zero, while the ground is covered with about 4 inches of snow, and full one inch of ice on top of that, which gives us fine sleighing. On Thanksgiving day we had a heavy rain, which froze as fast as it fell, loading everything with ice, which has done a great amount of damage. I send a drawing of what accumulated on a small stalk of timothy hay, no larger than a knitting-needle.

The honey season here was a small affair for white honey, for the reason that it rained nearly all the time white clover was in bloom. Basswood was of no account. The bugs put in their appearance early in August, on every swamp elm in this locality, and from that time to Sept. 10, the bees put in their time in bringing in "bug-juice," and storing it in their hives, until many of them filled nearly every inch of space in the brood-nest, and it is there now, for them to live on, if they can, through the winter. What the result will be, I will tell next spring. I put my bees into the cellar on Nov. 15 and 16th, in fine condition, being the heaviest lot that I ever put away for the winter. IRA BARBER.

De Kalb Junction, N. Y., Dec. 4, 1889.

[The average width of the ice on the stalk of timothy hay, was 1½ inches. The rain and mud this fall in the West, has been very disagreeable. We hope for colder weather here soon.—ED.]

Poor Honey Crop in Virginia.

I was awarded a diploma for the best display of apiarian supplies, and the 1st premium on bee-hives, honey and beeswax, at the Agricultural Fair at Woodstock, Va. last month. The honey crop was very poor here this year, owing to wet, cool weather. The crop was only about half what it was last year. Nice comb honey in sections is worth 20 cents per pound.

JOSEPH E. SHAVER.

Friedens, Va., Nov. 21, 1889.

Results of the Season.

My report for 1889 is as follows: Number of colonies, spring count, 29—increased to 51. Number of pounds of extracted honey, 2,716; amount in one-pound sections, 1,700 pounds. I think that this does pretty well when we got a very poor fall flow of honey, as the average is about 150 pounds per colony. We had plenty of aster bloom, but from some cause, the bees got no honey from it. There is some golden-rod, but I have never seen the honey-bee at work on it. The greater part of my honey is already sold. R. J. MATHEWS.

Riverton, Miss.

Books Given Away.

Please notice that magnificent list of Popular Books on the second page of our Premium-List Supplement. We offer any Book in that list, which you may select, as a Premium for getting *one new* subscriber, with $1.00 to pay for the same. The Books are nicely bound in cloth, elegantly gilded, and contain from 300 to 500 pages each. The list comprises over 150 of the most popular Books of the day, and are published at $1.00 each.

This is the most remarkable Premium ever offered for obtaining one subscriber. If you want it sent by mail you must send 10 cents extra for the postage. If sent by express from New York, it is entirely *free*. We will sell any number of them to you at 40 cents each by mail, postpaid.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

☞ Read our Book Premium offer on the last page of this JOURNAL.

☞ Money in Potatoes, by Mr. Joseph Greiner. Price, 25 cents, postpaid. For sale at this office.

☞ Send us one **NEW** subscriber, with $1.00, and we will present you with a nice Pocket Dictionary.

☞ Red Labels are nice for Pails which hold from 1 to 10 lbs. of honey. Price $1.00 per hundred, with name and address printed. Sample free.

☞ Calvert's No. 1 Phenol, mentioned in Cheshire's Pamphlet on pages 16 and 17, as a cure for foul brood, can be procured at this office at 25 cents per ounce, by express.

☞ The date on the wrapper-label of this paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to advance that date another year.

☞ Please send us the names of your neighbors who keep bees, and we will send them sample copies of the BEE JOURNAL. Then please call upon them and get them to subscribe with you.

☞ As there is another firm of "Newman & Son" in this city, our letters sometimes get mixed. Please write *American Bee Journal* on the corner of your envelopes to save confusion and delay.

☞ We have some full sets of the BEE JOURNAL for 1889, and *new* subscribers can have the full sets for 1889 and 1890 for $1.80 until all are gone. Or, we will send the full sets for 1887, 1888, 1889 and 1890 for $3.00.

☞ Systematic work in the Apiary will pay. Use the Apiary Register. Its cost is trifling. Prices:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

☞ When talking about Bees to your friend or neighbor, you will oblige us by commending the BEE JOURNAL to him, and taking his subscription to send with your renewal. For this work we will present you with a copy of the Convention Hand Book, by mail, postpaid. It sells at 50 cents.

☞ We offer the Monthly Philadelphia *Farm Journal*, and either the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20. Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

	Price of both.	*Club*
The American Bee Journal	1 00	
and Gleanings in Bee-Culture	2 00	1 75
Bee-Keepers' Guide	1 50	1 40
Bee-Keepers' Review	1 50	1 40

American Poultry Journal	2 25	1 50

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

Doolittle on Queen-Rearing.

Queens can be reared in the upper stories of hives used for extracted honey, where a queen-excluding honey-board is used, which are as good, if not superior, to Queens reared by any other process; and that, too, while the old Queen is doing duty below, just the same as though Queens were not being reared above. This is a fact, though it is not generally known.

If you desire to know how this can be done—how to have Queens fertilized in upper stories, while the old Queen is laying below—how you may *safely introduce* any Queen, at any time of the year when bees cay fly—all about the different races of bees—all about shipping Queens, queen-cages, candy for queen-cages, etc.—all about forming nuclei, multiplying or uniting bees, or weak colonies, etc.; or, in fact everything about the queen-business which you may want to know, send for "Doolittle's Scientific Queen-Rearing;" a book of 170 pages, which is nicely bound in cloth, and as interesting as any story. Price, $1.00.

An edition in strong paper covers is issued for premiums. It will be mailed as a present to any one who will send us *two* new subscribers to either of our JOURNALS.

☞ We want these numbers of the BEE JOURNAL, viz: December, 1875, January to June, 1876, and April 30, 1884. Also No. 18, of 1884: and Nos. 2, 17, 18, 19, 20, 21, 32, 42, 44, and 48, of 1885. If any one desires to sell them—please state price. Do not send any numbers until we order them, for we only want one copy of each.

CATARRH.

CATARRHAL DEAFNESS—HAY FEVER.

A New Home Treatment.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been formulated whereby catarrh, catarrhal deafness and hay fever are permanently cured in from one to three simple applications made at home by the patient once in two weeks.

N. B.—This treatment is not a snuff or an ointment; both have been discarded by reputable physicians as injurious. A pamphlet explaining this new treatment is sent free on receipt of stamp to pay postage, by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.—*Christian Advocate.*

Sufferers from Catarrhal troubles should carefully read the above.

50E26t Imly.

A Special Club Rate.

A Magazine of the choice literary character which the ILLUSTRATED HOME JOURNAL sustains, will add many pleasures to any "family circle." Its beautiful illustrations and interesting reading-matter will make it heartily welcomed at every "fireside" in the land.

We desire that every one of our readers should secure its regular visits during the year 1890, and in order to induce them to do so, we will make this tempting offer:

We will Club the AMERICAN BEE JOURNAL and the ILLUSTRATED HOME JOURNAL, and mail both periodicals during the whole year 1890 for **$1.50**, if the order is received at this office before January 1, 1890.

Such a *remarkably low* club rate as the above, should induce every reader of the BEE JOURNAL to accept it without a moment's delay.

As a further inducement, we will mail the superb number for December, 1889, *free* to those who send their subscriptions early; that is, until all the December numbers now on hand are taken.

New subscribers to the above club will have the December numbers of both of the JOURNALS free—as long as the stock lasts. So the sooner they subscribe, the more they will get for their money.

A New Premium.

The National Purchasing Agency of this city issues a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement, we can offer a MEMBERSHIP Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL, for one year, with $2.00.

Honey and Beeswax Market.

DETROIT.

HONEY.—Demand is fair for comb at 13@15c. per lb. There is more dark honey than light. Extracted, 8@9c.
BEESWAX.—24@25c.
Nov. 11. M. H. HUNT, Bell Branch, Mich.

CHICAGO.

HONEY.—Receipts of comb are averaging about as they usually do with a fair crop. Prices rule at 13@14c. for choice to fancy 1-lbs., which comprise the bulk of the receipts, very little in sections averaging 1½@2 lbs., and sells at 10@12½c.; dark, 8@10c Extracted, 6@8c.
BEESWAX.—25c. R. A. BURNETT.
Nov. 8. 161 South Water St.

KANSAS CITY.

HONEY.—Fancy white 1-lbs., 14c.; good, 13c.; dark 11c.; white 2-lbs., 13c. Extracted, white, 7c.; dark, 6c Demand good.
Nov. 11. HAMBLIN & BEARSS, 514 Walnut St.

DENVER.

HONEY.—1-lb. comb, 15@18c. Extracted, 7@8c.
BEESWAX.—20@25c.
Nov. 11. J. M. CLARK COM. CO., 1421 15th St.

MILWAUKEE.

HONEY.—Choice white 1-lbs., 14@15c.; 2nd grade white 1-lbs., 13@14c.; old dark 1-lbs., 10c.; new, 10@11c. Extracted, white, in barrels and kegs, 7@8c.; in tins and pails, 8@8½c.; dark, in barrels, 6@6½c.; in kegs, 6@7c. Demand steady.
BEESWAX.—22@23c.
Nov. 11. A. V. BISHOP, 142 W. Water St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb honey, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Demand for white clover 1-lbs. is improving, but price depends upon size and style of package, condition and appearance when received, ranging from 12@13½c.; basswood, 11@11½c.; buckwheat, 8@10c. Extracted, 6½@7½c., depending upon style and size of package.
BEESWAX.—27@28c.
Nov. 9. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Demand fair. Western honey arriving freely, and prices declining. We quote: Fancy white 1-lbs., 14@15c.; 2-lbs., 12@13c.; off grades and mixed 10@12c.; buckwheat 1-lbs., 10@11c.; 2-lbs., 9c. Extracted white clover and basswood, 7½c.; orange bloom, 8½c.; California, 7½c.; buckwheat, 6 cents; Southern, 70@75c. per gallon.
HILDRETH BROS. & SEGELKEN,
Nov. 6. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It is selling a little slow. Fancy white 1-lbs., 16@17c.; common, 15@16c. Extracted, 8@9c.
BEESWAX.—24c.
Nov. 27. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A large amount of Comb on the mardet at 14@16c for best white. Extracted at 5@8c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yellow, on arrival.
Nov. 22. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

HONEY.—Selling slowly, especially extracted, on account of mild weather. White 1-lbs., 13@14c.; dark 10@12c.; white 2-lbs, 12@13c.; dark, 10@12c. Extracted, white, 7@8c.; dark, 5@6c.
BEESWAX.—22c.
Nov. 22. CLEMONS, CLOON & CO., cor 4th & Walnut.

EDITOR.

Vol. XXV. Dec. 21, 1889. No. 51.

EDITORIAL BUZZINGS.

CHRISTMAS.

"So now is come our joyfulest feast,
Let every one be jolly;
Each room with ivy leaves is dressed,
And every post with holly."

☞ Dr. C. C. Miller was not at the International, and his genial face was sadly missed.

☞ At the Paris Exposition, the awards to Americans were very numerous. Among them we notice a Silver Medal to Chas. Dadant & Son, for "Appliances in Bee-Culture," and a Bronze Medal for "Honey." Honorable mention is made upon boney exhibits to E. R. Newcomb and Mary E. Ross.

☞ The new officers of the "International" are men of extensive experience in honey-production and practical management of the apiary. We may reasonably expect that the next Convention will eclipse all former gatherings of American apiarists.

☞ We understand that the members of the "International" were photographed, and that an engraving of it is to appear in *Gleanings* soon. The "Life Members" being absent, will lose their places in the engraving.

Presents are now in order. Can you think of anything more welcome to your friend, than a year's subscription to the ILLUSTRATED HOME JOURNAL? It would be hard to find any better present for the money—or one that would bring more pleasure throughout a whole year.

To Our Friends.—This is the subscription season, when people generally select their periodicals for the coming year. May we ask you, dear reader, to exert your influence among your friends, in order to induce them to take one or both of our JOURNALS? They aim to benefit all who read them—they are practical, and their tone pure. In price they are so low that none can say they are too poor to subscribe for them. We desire to place the ILLUSTRATED HOME JOURNAL in the home of every person in America, and the BEE JOURNAL in the hands of every one interested in bee-keeping. We ask our friends to help us in this endeavor, and in return we will help you. If sent this month, $1.50 will pay for both JOURNALS for 1890. Now is the time to get your full money's worth.

☞ Dr. A. B. Mason, ex-President of the "International," has been selected to have charge of the Bee and Honey Exhibit for the United States at the World's Fair of 1892, and Mr. R. McKnight is to superintend the Canadian apiarian exhibit. These appointments are excellent ones—in fact we do not believe better selections could have been made. Both men are experienced in that line of business, and we may look for something creditable for North American bee-keepers.

☞ The *Canadian Bee Journal* has our thanks for kind mention and regrets at our enforced absence. Just at that time Mrs. N. was much worse, but now she has rallied again. It is a very treacherous and fitful disease. We should have enjoyed the rare treat of meeting our Canadian brethren, and much regret that we could not have done so.

Our Premium-List Supplement describes many articles of great merit, and that are useful in every family. We have carefully selected them to offer as premiums for getting up clubs for our JOURNALS. We do this to *induce* our friends to devote a few hours of labor for us. Our JOURNALS are first-class in their lines, and are needed everywhere. We do not want any one's labor without remuneration, and the articles offered will pay for the labor of getting up clubs, and thus the arrangement will prove to be for our mutual advantage.

☞ The BEE JOURNAL gives 52 dividends in a year on an investment of one dollar. Can any one desire a better investment, or richer returns?

Postal Notes are no safer to use in letters than bank bills. Any one can get the money on them. A Money Order can be obtained at the post-office or at the express office for 5 cents (only 2 cents more than a Postal Note), and is perfectly safe; if lost it can be re-issued.

The Report of the International Convention occupies nearly all our space this week. It is the *newest news* extant, and as such will be read with great interest. The essays are excellent, and the discussions "are timely and good." We shall shortly publish the Report in pamphlet form, with the new songs and music, and also portraits of the new and retiring officers. It will make quite a complete and useful book for reference. Price 25 cents. Or with a brief History and Report of all the 19 previous sessions, 50 cents, postpaid.

Christmas Presents.

A novel and pretty way of distributing Christmas gifts is to set your dining-table as you would for a meal. Put on your choicest cloth, and at each one's accustomed place set a soup-dish. The center of the table may have some pretty decorations arranged to suit the fancy; a pot of tall ferns would be lovely. Festoons of evergreens and holly may hang from the chandelier or lamps, as the case may be. All the small gifts can be put into the dishes, while others may be neatly arranged in front. Such gifts as sleds, rocking horses, etc., should be placed where the chair usually stands. Let some one have special charge of the arrangements. When all is ready, the bell may be rung, as at dinner time, and the household called together. In this way the older folks may share the surprises and pleasures.

Let me whisper a word or two more to my young readers, before I lay down my pen. Perhaps you are happy; perhaps you have all that you can wish to make your cup of joy run over; but stop and think a moment. Do you not know some one who may be less fortunate; whose Christmas will be empty and dreary, unless some one else (which may be *you*) brightens it? Remember, even in your gladness, that "it is more blessed to give than to receive." The giving of one little token to some poor child will bring you much additional joy. —*American Agriculturist for December.*

The Union.—Here is what Brother Heddon says when sending his Vote and Dues for 1890:

I know the value of promptness. The Union has done so well that I vote for all the old officers except James. When you want more money than these dues amount to, I trust every man of us is willing to be drawn on for another assessment. Is it not strange that we have so small a membership? What can our brother bee-keepers be thinking of? Is it any wonder that so many fail? We have a rule declaring that the Union will defend no member against a storm whose clouds were gathering *before* he joined. This is as it should be, I feel sure. I consider this the main point to induce apiarists to become members.

JAMES HEDDON.

☞ The Works of Scott and Dickens are not like the "novels" of to-day—both are founded on facts—and are well written in excellent English.

CORRESPONDENCE.

QUEENS.

Several Criticisms Answered on Rearing Queens.

Written for the American Bee Journal

BY G. M. DOOLITTLE.

I notice by the bee-papers, that Dr. G. L. Tinker and others claim that the plan I gave in my book, of having queens fertilized above a queen-excluding honey-board, is not practical. In regard to this, all I have to say is, that it proves a success with me when used as I have given in the Appendix to the book, and I consider it entirely practical in this locality.

In order that the reader may judge whether I know what "practical" work is or not, along this line, I will give the working of the plan with one colony, which is only a sample of numbers worked in the same way:

When the colony was strong enough to occupy a second story, the brood in the lower story was contracted by taking out two frames in the egg and larval form, and the other combs of honey and pollen, and putting in two division-boards, or dummies, one on either side, in place of the so taken out combs, thus leaving 7 frames of brood below. The upper story was then put on, after putting on the queen-excluder, and contracted to six combs, two of which were those containing the eggs and larvæ taken from below, and the others were the combs partly or entirely filled with honey, together with one empty comb taken from the shop. This gave the colony 13 combs instead of the 12 occupied before.

The next day they were given a frame of prepared queen-cells between these two frames of brood, and as the honey was coming in quite freely, more combs were given at each side as was needed, so that when it was time for the queen-cells to hatch, the upper story contained all the combs that it would hold, all of which had more or less honey in them, and were well covered with bees.

At this time, one comb of honey was taken out, so as to make room for the two queen-excluding division-boards, which were slipped down in the grooves made for them. The two combs containing the now sealed brood were placed over behind the excluders, one on either side, with one of the nearly-mature queen-cells on each, while a frame of honey still remained in this apartment. At this time the other mature queen-cells were used, two more frames of eggs and larvæ put in the place of two frames of honey taken away, and another lot of prepared cells placed between them, as at first, and thus the colony was kept rearing queens all the season in this central apartment.

The next day there was a queen in each end of the hive where the cells had been placed, while in three or four days more the holes in the side of the hive through which these virgin queens were to pass out to meet the drones, were opened, and left so till the tenth day, when an examination showed two laying queens. These were then taken out and sent off, and two more nearly-mature cells put in their places. Meantime the queen below was keeping every available cell occupied with brood, and as I took the two frames of eggs and larvæ from the other hives to use above after the first, the colony was rapidly getting stronger.

About the time the third lot of queens hatched, the colony swarmed, sending out a very large swarm, which was hived in a separate hive.

The operations with the old hive was continued right along just the same as before, except that for about two weeks I did not place any prepared frames of queen-cells above, on account of there being too few bees in the hive to rear the best of queens. In due time the young queen which hatched from cells left below after swarming, became fertilized, and filled the lower hive with brood, just the same as she would have done had there not been any virgin or laying queens above, as the case might be. If my memory serves me rightly, I sold 14 queens from the upper story of this hive, took much extracted honey, or honey in the frames, and in the fall had 2 good colonies for winter.

I relate this, not only to show that the thing is practical, but also to contradict the statement which has gone out, that young queens can only be so fertilized where there is an old or failing queen below. The queen that went out with the swarm was one of my best queens, reared the season before, while no one will say that the last one was an old or failing queen. I said in the start, that this one was only a sample of others, but I will modify it by saying that none of the others worked for queens in the above way swarmed, otherwise the others were the same, and none of them had their queens superseded, thus showing that none were "failing."

Mr. Pratt, and others, seem to think that they must make colonies queenless or use queenless bees to start queen-cells for good queens to be reared. After the cells have been in these queenless colonies two or three days, the partly-finished queen-cells are then given to the bees in the upper stories to finish. After carefully testing this matter for several years, I consider this a waste of time, and, worse still, for queenless bees will not rear as good queens as will those that rear queens while the old queen is still present in the hive.

The claim is made that the larvæ are neglected when placed above, which may be so when no precaution is used by way of contracting the brood-chamber below, or having too much room for the size of the colony, but when fixed as I have given above, there are as many young bees above, around the the queen-cells, as in any part of the hive. I say "young bees,"—by this I mean such bees as feed the larvæ, build comb, etc., and not the white, fuzzy ones which are just hatched, and perform no part of these operations, no matter where they are. When honey is not coming in, the colony rearing queens is always fed, for bees do not rear really good queens, under any circumstances, where no sweets are to be carried from fields or feeder.

Lastly, I have read Mr. Alley's article, on page 744, and care to notice only two items in it, being perfectly willing to leave the matter to the readers for decision, and for them to adopt whatever plan they desire for rearing queens.

The items alluded to, are, first, where he refers to the making of the cell-cups as being "fussy," and says that the labor of using his method "can be performed in less than one-half the time required to make the artificial cell-cups." While no one that has used the two methods will believe any such statement (but for the sake of argument, let that be admitted), yet no one of reasonable mind would throw away the cell-cups on that account, for by their use the cells can be handled, after they are built, with perfect safety by the most inexperienced; and can be taken from where they are built, and placed in nuclei, *in less than one-half the time* than those built out from comb. Thus we gain all the time lost, and handle the cells with a safety which secures success every time, even in the hands of those who have only a few bees, and little or no experience; the latter being the class for whom my book was intended, as well as for the professional queen-breeder.

The second item is where Mr. Alley seeks to convey the impression that I rear, or recommend rearing, queens in an upper story where there is "no brood," but where there are "dry combs and old bees."

On page 62 of my book, these words are found: "I raised two frames of brood (mostly in the larval form) above, so as to get as large a force of nurse-bees about the prepared cells as possible, to properly feed the queen-

larvæ. The prepared frame was placed between the two with brood in them."

Again, on page 64 are these words: "The cells are better supplied with queen-food, where unsealed brood is placed in the upper story every 10 days—enough better, in my opinion, to pay for the extra work."

Elsewhere in the book I explain how feeding is always resorted to when honey is not coming in plentifully from the fields, so that there is never any "dry combs" in the upper story; and by trying to carry this idea of "no brood, dry combs, and old bees," Mr. A. shows that he has never read my book on queen-rearing, so that he knows nothing of what he is talking, or else he wilfully misrepresents for the sake of carrying out his argument. No matter which "horn of the dilemma" he may take, the reader can clearly see what his intention was by so writing.

No one has ever recommended the rearing of queens with only old bees and dry combs, of late years, that I know of, and surely the foregoing, which is substantially the plan as given in my book (only in outline), does not convey any such impression. As I have said before, the book was not written to harm any one, but, on the contrary, to add my mite to the fund of knowledge already in the world. For this reason I feel willing to accord to every one the privilege, which I consider my own, viz: After hearing a matter, to decide upon that which I think best adapted to my wants.

I have faithfully given in the book all that I considered of value, which resulted from six years of hard labor and experimenting along the line of queen-rearing, and if it benefits no one, I still have the consolation left me, of having tried, to the best of my ability, to be of use in the world, and of having cleared $500 each of those years, to put into my own pocket.

P. S.—Since writing the above I have received a letter from Mr. Alley, saying:

"I must acknowledge, however, that had you given the plan of placing brood in the upper hive with the cell-cups, you would have had a point a long distance ahead of the world."

This shows that Mr. Alley had not read my book when he wrote his article for the AMERICAN BEE JOURNAL, and I gladly take back what I said about his "wilfully misrepresenting." Ignorance is preferable to being wrong intentionally, at all times; although criticising that with which one is not familiar, so as to give a wrong impression, is hardly excusable. In the above quoted paragraph, Mr. Alley pays high tribute to the plan of rearing queens as given in my book, and places the method "*a long distance ahead of the world.*" G. M. D.

BEE-TALK.

International Convention at Brantford, Ont.

Written for the American Bee Journal

BY W. Z. HUTCHINSON.

The International American Bee-Association, held its 20th annual conventions on December 4, 5 and 6, 1889, at Wickliffe Hall, in Brantford, Ontario, Canada.

The Convention was called to order at 1:30 p.m., with President A. B. Mason in the chair. The following members then paid their dues:

J. Alpaugh, St. Thomas, Ont.
D. Anguish, Brantford, Ont.
Jos. Armstrong, Cheapside, Ont.
George H. Ashby, Albion, N. Y.
J. S. Barb, Oakfield, O.
R. Aull, Warwick, Ont.
G. W. Barber, Harford, Ont.
T. Barkett, Brantford, Ont.
H. J. Beam, Cheapside, Ont.
J. R. Bellamy, Blackbank, Ont.
Chas. Brown, Drumgrain, Ont.
Ira Burrows, Drayton, Ont.
J. C. Calvert, Medina, Ohio.
Rev. W. F. Clarke, Guelph, Ont.
Thos. Conway, Eramosa, Ont.
Prof. A. J. Cook, Agricultural Cottege, Mich.
W. A. Crysler, Chatham, Ont.
C. P. Dadant, Hamilton, Ill.
J. Y. Detwiler, New Smyrna, Fla.
S. A. Dickie, Brantford, Ont.
Martin Emigh, Holbrook, Ont.
A. R. Fierheller, Mt. Elgin, Ont.
C. Flanders, Boston, Ont.
J. A. Foster, Tilbury Centre, Ont.
F. A. Gemmell, Stratford, Ont.
Wm. Goodyear, Woodstock, Ont.
Wm. Granger, Wanstead, Ont.
J. B. Hall, Woodstock, Ont.
A. E. Hoshal, Beamsville, Ont.
Dr. A. E. Harvey, Wyoming, Ont.
O. L. Hershiser, Buffalo, N. Y.
William Hill, St. Thomas, Ont.
Geo. E. Hilton, Fremont, Mich.
J. Hislop, Strathburn, Ont.
M. B. Holmes, Delta, Ont.
R. F. Holtermann, Romney, Ont.
J. R. Howell, Brantford, Ont.
W. Z. Hutchinson, Flint, Mich.
Andrew Johnston, Stratford, Ont.
E. D. Keeney, Arcade, N. Y.
Wm. Knowles, Carholme, Ont.
Arthur Laing, Acton, Ont.
Robert Langtry, Benton, Ont.
Dr. A. B. Mason, Auburndale, Ohio.
Fergus McMasters, St. Marys, Ont.
R. McKnight, Owen Sound, Ont.
C. McNally, Simcoe, Ont.
F. H. Macpherson, Beeton, Ont.
R. L. Mead, Nassagaweya, Ont.
Thos. Moore, Carholme, Ont.
G. H. Morris, Hatchley, Ont.
Elias Mott, Norwich, Ont.
L. L. Mullock, Binbrook, Ont.
John Newton, Woodstock, Ont.
R. L. Patterson, Lynden, Ont.
A. Pickett, Nassagaweya, Ont.
E. R. Root, Medina, Ohio.
F. A. Rose, Balmoral, Ont.
E. Rosebrugh, Branchton, Ont.
T. Ruddle, Oustic, Ont.
Eugene Secor, Forest City, Iowa.
R. E. Smith, Tilbury Centre, Ont.
Wm. Spedding, Clifford, Mich.
J. Sturgeon, Kincardine, Ont.
E. W. Tanton, Stratford, Ont.
R. L. Taylor, Lapeer, Mich.
Mark Tovell, Guelph, Ont.
Thos. Waken, Glenoak, Ont.
John Yoder, Springfield, Ont.

Mrs. J. C. Calvert, Medina, Ohio.
Mrs. C. P. Dadant, Hamilton, Ill.
Mrs. Dr. A. B. Mason, Auburndale, Ohio.
Mrs. F. H. Macpherson, Beeton, Ont.
Mrs. E. R. Root, Medina, Ohio.
Mrs. J. Sturgeon, Kincardine, Ont.
Mrs. John Yoder, Springfield, Ont.

LIFE MEMBERS—*Not present.*

D. A. Jones, Beeton, Ontario.
Thomas G. Newman, Chicago, Illinois.

This was one of the most successful meetings that this International society has held for several years, both in point of numbers, and in the character of its discussions.

The first essay read was from Thomas G. Newman, Chicago, Ills., upon

Disposing of the Honey Crop.

Mr. President, Ladies and Gentlemen:

A Yankee, down East, who has given the subject allotted to me briefly to discuss, a thorough study, got up a placard for his salable honey, which read like this: "Hot Rolls and Honey will Draw Human Flies." This he placed up over an attractive display of honey, where it was kept for sale. It was put up in the nicest shape, each package was done up in white tissue paper, and put in "cartons," having nice labels printed in two colors, and little string handles, all ready to be purchased and taken home safely as well as conveniently.

It is no wonder that he never had a surplus crop of honey left on his hands! The cry always was for **more**—no matter how much was produced.

We have in North America nearly a a hundred millions to feed. If we divide the honey crop evenly among those, in the United States and Canada, who are hungering for a pure sweet, it will give them but a small taste indeed. If it was placed within reach of all, the whole crop would not last over 20 days. All that is needed is even distribution, an attractive article, and a diffusion of knowledge concerning its consumption and value as a food and for medicinal purposes, and recipes for its use.

To place 100 "Honey Almanacs" with the honey-producers' name and address on them in any town, would sell all that can be produced near it, if the article be put up in attractive packages.

Quite lately we witnessed a little scene which ought to teach a good lesson. A lady went into a store and asked to see some honey in the comb. She was shown some, but turned away quickly in disgust, saying that she did not want that kind!

Do you ask what kind it was? Well, I will tell you. It was of rather a dark color, put up in one-pound sections. The sections were covered with propolis, which had not been scraped off, nor had there been any attempt at it! There had been no separators used in the surplus arrangement, and consequently the combs were very unevenly built, and, as they had been packed in the crates, some combs had rubbed against the protrusions in others, and it was a dripping, sticky, and unsightly affair.

Such work as that would ruin any honey market, and if an apiarist will not learn better, and work in accordance with the advanced ideas in the sunshine of the present, he had better quit the business, and leave it to others more worthy to share in the newer ideas and advancement of this progressive age. THOMAS G. NEWMAN.

The subject introduced by Mr. Newman was then discussed in the following manner:

R. L. Meade found his greatest trouble to be from farmers and small bee-keepers, who rushed their crop of honey on the market as soon as they got it off, and who sold it at a very low figure. He had received 2 and 3 cents more per pound for his honey than they did, right in the face of the opposition, and it was because the customers who bought of him were willing to pay that much more for it, because they knew that his product was clean and good, and well cared for. He had sold his entire season's crop at 12½ cents, wholesale, and 15 cents retail. In his section, however, fruit was a complete failure.

F. A. Gemmell kept up his name by furnishing only the very best article of honey.

J. B. Hall sold his honey "on his name." He put his name and address on every section, and he had known such method to bring him orders from points a thousand miles from home. If he had any honey that did not come up to his standard of perfection, he sold it at a less price, and he was particular not to put his name on it.

Prof. Cook here asked how amateurs were to get their names up, as those who had previously spoken were all old hands at the business.

G. Sturgeon kept bees, and had worked up his reputation by keeping his honey clean and in tempting shape. He never fed his bees sugar-syrup, and consequently no one could charge him with adulteration of any kind.

Prof. Cook could not see that feeding sugar-syrup for wintering purposes was going to hurt a man's reputation, if he exercised reasonable care.

Mr. Sturgeon—How will it be prevented?

Prof. Cook—Use other combs, and extract only from the upper and second story.

"Does it make any difference in disposal, as to whether the honey is liquefied or granulated?"

R. F. Holtermann—It makes a great difference. The great bulk of my customers want it in a liquid state, and I sell the great bulk of mine in gem jars.

J. B. Aches' market also demanded liquid honey.

A. Pickett considered it the most natural to have honey in the liquid state, and found it best suited to his trade.

How Can Propolis be Reduced to a Minimum?

J. B. Hall—Go some place where there is no propolis, or take the crop of honey off by July 20, before which there is very little propolis in my district.

G. Ashby—Make everything a proper bee-space—5-16 of an inch.

Mr. Holtermann—The bee-space will, of course, help materially, but to get off the honey early is the best remedy.

R. L. Taylor took his honey off as soon as possible before there was much propolis.

J. Alpaugh coincided with the views of those who took honey off early.

W. F. Clarke wished to know when there was lots of honey, if the amount of propolis would be in proportion.

Prof. Cook was of the opinion that there would be. He expected to have heard somebody say that the double bee-space helped to reduce the propolis very largely.

Dr. A. B. Mason used double bee-spaces, and found that they were helpful.

R. L. Taylor always uses double bee-spaces.

F. A. Gemmell uses both double and single bee-spaces, and finds more propolis on the sections above single than double bee-spaced honey-boards.

What Size of Sections is Best?

The consensus of opinion was in favor of sections holding one pound, and the size was to be either 4¼x4¼ and 7 to the foot, or 4¼x4¼x1½ inches.

EVENING SESSION.

The meeting was called to order at the appointed time by President Mason, who then called upon Mayor C. B. Heyd. The Mayor promptly responded. The following is a short synopsis of the

Mayor's Address of Welcome:

The very pleasing duty devolved upon him of welcoming the Association to the city of Brantford. Brantford had a name for extending hospitality. It was an attractive and pretty city, and he had much pleasure in extending a hearty welcome. He was happy to see so many Canadians present, but he was likewise happy to see such a large number from across the lines. He was glad of the feeling of amity which existed between the two countries. The objects and aims of the people were apparently one and the same. He would not say anything about the little animal that had brought them together. He did not know whether it was an animal or an insect. He was very fond of the product of the bee, but did not want any closer acquaintance with it. He had, when a boy, become acquainted with it, and the remembrance would undoubtedly remain with him as long as he lived. Since that time he had preferred not to renew the acquaintance.

We have many beautiful buildings and also an hospital, which would be well worth a visit, as well as the House of Refuge, where our aged and infirm are taken care of. Then we have the Blind Institute, where the unfortunate blind were taught and educated to earn their own living. He would, on behalf of Principal Dymond, extend a hearty invitation to members of the Bee-Association, to visit the Institute, also to visit the works of A. Harris, Son & Co., which was one of the largest manufactories in the country, and a hearty welcome would be given. He would not trespass on their time, but would give way to those who would speak on the bee-question. He would particularly welcome the ladies, who had graced the Convention with their presence. He hoped that the Association would have a most prosperous meeting.

Ald. S. G. Read seconded the Mayor in his address of welcome.

Mr. Clarke, President of the Ontario Association, extended the welcome of all Ontario, of which Brantford was but a small part. If they had been going to choose a model city to show the American delegation, Brantford would be that city.

A quartette, composed of Messrs. Liddell, Pickles, Shapley and Blasdell, with Miss Eva Waters presiding at the piano, rendered two excellent songs.

Prof. Cook was called upon to respond to the addresses of welcome which had been given. He was quite at a loss to know why he had been called upon. But he was sure that a glad welcome always awaited the Americans who attended the conventions in Canada. He had been to Ontario before, and the Americans said they never had anything like the welcome they had received at Toronto, and he was prepared for the reception they had received to-night. They had read some things about fishing. He was glad they had come, as this welcome had assured them of more than a 7-mile limit. There was no section in the world which could compare with Ontario as a honey-producing district. He would not take up any further time, but say they had had a royal greeting, and would go away thinking more of the brothers on this side of the line, and hoped the feelings extended on both sides.

Dr. A. B. Mason then read the following, as the

President's Annual Address.

Ladies and Gentlemen of the International American Bee-Association:

Some one has very truthfully said that this age of civilization is not without its false gods and their worshippers. No evil of the Nineteenth century is more universal. There is one shrine at which almost every one bows with a devotion scarcely excelled by paganism—it is at the shrine of fashon; and we, as bee-keepers, are not an exception to the rule. Bee-keepers' conventions are fashionable, and I doubt not nearly all who can afford the time and money to do so, and, as in the fashionable world, probably some who cannot, are present with us to-night.

It gives me pleasure to meet you all at this annual gathering, but especially those who have been so long and favorably known by their excellent contributions to our bee-literature; and added pleasure comes to me in the opportunity it gives of meeting, face to face, so many of my Canadian relatives (cousins, I believe), who have so freely given me the credit of having an acrimonious feeling towards everything Canadian or English. It is not the first time I have received credit for more than I have deserved, and it is somewhat comforting to know that in this I have plenty of good company.

If you all knew, as some of you do, what a corporeal infliction has been threatened me, evidently by a Canadian, in case I "dared to put foot on Canadian soil," you might wonder how I dared to "beard the 'lion' in his den," and be in attendance at this convention. But when I tell you that a prominent member of this Association (also a Canadian), recently wrote me that if I *was not here*, "a vote of censure will be passed," you will readily see that I was "in a strait betwixt two," and I at once decided to run the risk of getting the first, rather than to suffer the last.

There is a fascination about courage, that human nature worships. No matter how uncouth, every one finds admirers the moment it is authentically announced that he is brave; and so, from this first and best of animated nature, the characteristic of unfailing courage is universally adored. In this instance, I lay no claim to this adorable quality, for in a letter received a few days since, from one of Canada's noted bee-keepers, he says: "Now don't let your fears get the better of you. I shall try hard to be there, and won't let anybody hurt you." So, as you see, I am here. But another thing confronts me, for on a postal, written with type-writer, some friend, who is very anxious about how I conduct myself, says: "Do try to overcome your surly manner at the convention. At least don't be cross *all* the time."

I can assure you that the anticipated pleasure in meeting with Canadian bee-keepers has had more to do with my being here than any other one influence, although I am grateful for the privilege of being, if only for a few days, in a country where "honey drops from the trees." How eagerly we scan the pages of the bee-papers for something from the pen of our favorite writers, but how much more pleasure in meeting such face to face in a gathing like this. As so fitly expressed in the last *Review*, "The one is a love letter; the other, the lover himself."

Things that address the ear are lost and die in one short hour; but that which strikes the eye, lives long upon the mind; the faithful sight engraves the knowledge with a beam of light.

I doubt not the most, if not all of you, have come here with the hope and expectation that this would be one of the most enjoyable and profitable meetings ever held by this Association, and such as bee-keepers delight in attending. That such may be the case is doubtless the wish of all present. To make this wish a veritable reality, can best be accomplished by each one taking part in the discussions, and so contribute their portion of information for the general good.

Soil, air, sun and moisture are requisites to vigorous vegetable growth, but not the only requisites, for the house-plant has these; but in order to reach its most perfect development, it must be removed from its root-bound condition to its native soil, and the open air where root and branch may appropriate the nourishment that is all about it. In the domain of thought the same is true, and any one wishing to reach the highest attitude of attainment must have fellowship and communion with other minds; "establish a commerce for his thoughts." He must *give* as well as *receive*.

Good sense will stagnate. Thoughts shut up want air.
And spoil, like bales unopened to the sun.
Thoughts, too, delivered is the more possessed;
Teaching we learn, and giving we retain.
'Tis thoughts, exchange, which, like the alternate
Rush of waves conflicting, breaks the learned scum,
And defecates the student's standing pool.

Without this and kindred organizations, each bee-keeper would have to depend largely upon his own resources and experiments; struggling on without adequated knowledge; by slow and tedious process, gathering important facts to be used for a brief period, and then, with the possessor, be buried forever out of sight.

Men thus acting for themselves follow in a beaten path, or become selfish and reticent of their knowledge; "wise in their own conceits," and jealous of their dearly-acquired wisdom. If such an one gets into a gathering of this kind, he seems to feel that there is nothing for him to learn, and we rejoice when the scales fall from his eyes.

We have met here for the very same purpose for which other bee-keepers' conventions are held, which was so appropriately and beautifully told by the editor of the AMERICAN BEE JOURNAL, in his address at the recent meeting of the Northwestern Bee-Keepers' Society, at Chicago.

"We have come here," he said, "to talk over the past and learn wisdom from our experiences, and those of our co-workers. .....Light and knowledge, and power have been man's inheritance as the days have come and gone. The poet wisely remarks that—

"The waves that moan along the shore,
The winds that sigh in blowing,
Are sent to teach a mystic lore
Which men are wise in knowing.

"To this end have we come together, so that the wisdom of each one may be communicated to all, with the magnetic currents of personal contact and hearty fellowship.....

"Mistakes are made, and reverses come, but these do not discourage, they only strengthen the determination to succeed. .....Of couse we shall differ in our opinions, as do the greatest and best of men, but this should not give rise to any feeling of ill-will."

With this introduction, allow me to call your attention to some things in our specialty that have been, and are, attracting our attention and eliciting discussion in the bee-periodicals.

Within a few months, a new "disease" has made its appearance among some of the bees of Michigan, commonly recognized by its name, "digested nectar," and if our Canadian bee-keepers are not very careful, it will cross the line and get mixed with their "pure crystal linden" honey. I sincerely hope that the "Wolverines" will, if possible, confine it to "its native heath." It might not be unwise for this convention to pass resolutions of sympathy for such bee-keepers as have the malady in their apiary, and appoint a committee to fully investigate and report upon the matter, giving them full power to send for persons and papers.

Perhaps the thing most desired by leading apiarists is the prevention of swarming. If what has recently been brought to our notice, in the invention of wooden brood-combs, by Mr. Aspinwall, of Michigan, proves to be what is claimed for it, that desire will, ere long, be satisfied. But

How seldom do our dreams come true—
The very thing our fancy lets
Us hope in time will be our own,
Some other fellow always gets.

We fall in love; the mind's diseased,
The brain is in a foolish whirl;
And while we worship from afar,
Some other fellow gets the girl.

Ah! what a torment life would be
If we were of all hope bereft,
That in some fairer world than this
That other fellow would get left!

During the present year there has been added to our bee-literature G. M. Doolittle's book on "Scientific Queen-Rearing;" and the Dadants have done the bee-keeping world a lasting favor in their splendid revision of "Langstroth on the Honey-Bee." Its division into numbered sections, and the frequent references from one to another, with its copious index and superb engravings make it *one* of the most, if not the *most* desirable work ever published on bee-culture, and it should be in every bee-keeper's library. These, with Prof. Cook's "Manual of the Apiary," "Quinby's Bee-Keeping" revised, and the "A B C of Bee-Culture," with a few of the many valuable and interesting books and pamphlets that have been written and published by the editor of the AMERICAN BEE JOURNAL, supplemented by the reading of half a dozen, more or less, of our leading bee-papers, will put the average bee-keeper in pretty good shape to get both pleasure and profit in attending and taking part in bee-conventions, whether there be "an axe to grind" or not.

But the "latest thing out" is a Honey Almanac for 1890, issued by the publishers of the AMERICAN BEE JOURNAL, and to my narrow vision it has entirely demolished the saying that "there is nothing new under the sun." At least one copy of it should be in the house of every family in Canada and the United States, and it rests with bee-keepers to see that such is the case.

The sending of bees by the pound through the mails has recently come under discussion. As is usual, such a course has its advocates and opponents, and would it not be well for this convention to consider the matter, and take some action in regard to it?

The queen of wild-flowers and honey-plants, the golden-rod, as a national flower for the Yankees, whose praises of late have been so frequently, fervently and eloquently sung, might not be averse to receiving some amorous attentions from the members of this association, without blushing. When in the field nodding to the breezes, or as a bouquet on the breast of a lovely woman, it possesses a beauty unequalled and unsurpassed by any other flower.

The honey crop in 1887 and 1888, to many of us, was a total failure, and to some even worse. For others, there was a partial crop, and to but few was there the usual yield, but a fairly good crop the past season, revived the failing spirits of many, if not the most of us, and I am quite confident that some who are here would not have been, had the honey yield been as light in 1889 as it was the two previous years. Owing to the meagre yield in 1887 and 1888, the price at some points was materially greater than it has been this year.

Taking the highest quotations of the market on the first of each of the last six months of each year, the price for comb and extracted honey was as follows:

1887.		1888.		1889.	
Comb.	Ext.	Comb.	Ext.	Comb.	Ext.
		San Francisco.			
15½c,	5c to 8c,	12c,	5½c to 6¾c,		
		St Louis.			
14c,	4¼c to 6c,	15c,	4½c to 6c,	12½c,	5c to 6¾c
		Chicago.			
18c,	8 4-5c.	17c,	8c.	13c,	8c,
		Cincinnati.			
16½c,		15½c,		15½c,	
		Detroit.			
16¼c,		16¼c,		6c,	
		New York.			
16¾c,	15c to 9c,	17½, 7½c to 9c,		15c,	7c to 8½c

In Detroit, but four quotations are given for extracted honey—in December, 1887, and October, 1888, ten cents; in December, 1888 and 1889, nine cents.

In Cincinnati in July, August and September, 1887, 3 to 7 cents; October and November, 3½ to 7 cents; December, 3½ to 8 cents; in 1888 it was 5 to 8 cents except October and November, when it was 4½ to 8 cents; in 1889 the constant quotations have been 5 to 8 cents.

There are said to be over 300,000 bee-keepers in the United States and Canada, and if each apiary contained but 15 colonies, the number reaches 4,500,000; and if these produced but an average of 30 pounds, the total honey production would be the enormous amount of 135,000,000 pounds, which at 10 cents per pound would amount to the snug sum of $13,500,000. If each colony produced an average of one pound of beeswax, and it was worth 20 cents per pound, it would amount to $900,000.

The Wiley liars, in their statements about manufactured honey, have found their *more* than match in Thomas G. Newman, who gives them no peace or comfort, but pounces upon them with a vigor that is worthy of the cause, and has made this portion of the Ananias family either drop dead at his feet, or has so weakened their voices as to make them almost inaudible. The other bee-papers have also done good service in this line, and the editor of *Gleanings* has a standing offer of $1,000 to the person who will prove that the "wily" *lie* is the *truth*—a pretty good premium for one whose word is valueless.

Apis dorsata, and the "coming bee" have been sought for by our Mr. D. A. Jones with a push, energy, and perseverance that would not have dishonored a Yankee, and as yet without success. Well might he with the poet Secor say:

'Tis thus we're reminded, as time and again
Our hopes in things earthly are shattered,
That Solomon said, all things are but vain,
No matter how much they have flattered;
One certain, pure joy,
Content without alloy,
Shall come when ambitions are scattered.

But to the editor of one of Canada's bee-papers belongs the honor of recommending the most feasible plan yet suggested for securing *Apis dorsata*. He says: "Owing to the difficulty of transporting bees alive, we would suggest that the next enterprising individual take a package of.... egg-preservative with him and secure drone and worker eggs and preserve and ship them to America, where they might be put in strong colonies, the drone eggs first, and the fertilized ones later, and *Apis dorsata* shall be ours."

The editor of the AMERICAN BEE JOURNAL thought so well of the scheme, that he suggested the name of a party who would take a half-interest in the enterprise. Who knows but that ere another gathering of this association, some enterprising Canadian or zealous Yankee will have acted upon the suggestion of the wide-awake editor, and have secured and introduced the "coming bee?"

Last year, through the efforts of your presiding officer, America's bee-keepers' poet laureate, the Hon. Eugene Secor, of Iowa, was induced to write two bee-songs, and our sweet singer, Dr. C. C. Miller, of Illinois, put "wings" to them in the shape of music, and the editor of *Gleanings* put them in print, and furnished a hundred copes of each, free of charge, for use at the Columbus Convention; and this year. there has emanated from that hive of industry, the office of the AMERICAN BEE JOURNAL, another bee-song, the music of which is familiar to many, if not to all of you, a hundred copies of which Mr. Newman has furnished in the nice shape you see, for use at this meeting.

Last winter, I again tried to press Mr. Secor into service, and get more of "that which cheers, but does not inebriate." A portion of his reply was, "We have had a little 'old-fashioned' weather out here this winter—about 40 feet below zero," and adding, "Don't you pity us poor heathens who live—

'Way out upon the prairie, where
No Sabbath bell is heard.
No music but the sand-hill cranes,
And breezes, blizzard stirred?"

But keeping in mind the injunction, "be not weary in well-doing," and through the kindness of Dr. Miller, in writing the music, and the publishers of the AMERICAN BEE JOURNAL in printing it, we have another song that we can claim as our own; and all this gathered-grandeur without cost to the association or the bee-keeping fraternity. I hope that during the coming year there will be more added to this gathering sweetness, so that in the near future the songs sung at our conventions, both amusing and ennobling, may be such as are just fitted for the occasion, and enjoyable also in the family circle.

Upon the frst mention of a World's Fair and Exposition to be held in the United States, in 1892, it occurred to me, as it doubtless did to many of you, that as bee-keepers we should prepare for and make the grandest exhibit of the products of, and appliances used in, the apiary that was ever made anywhere. Canada's bee-keepers did themselves honor, and it was a credit to their good sense and energy, to make the grand exhibit they did at the Colonial Exposition in England, in 1886; but the bee-keepers of the United States ought to beat them so badly that they will be anxious for another opportunity to "show off."

In a letter received a week ago to-day, from a successful bee-keeper of New York, he says: "We ought to have a 'lay out' at the Exposition that will astonish the world." With this idea in view, and knowing that it is well to begin to move in fair and exposition matters in good time, I wrote to the mangers of the enterprise in regard to the desirability of having such an exhibit, and received gratifying responses. The United States Government's Apiarian Exhibit at Paris last summer was not much of a success, and could not be expected to be when it is known that bee-keepers had nothing to do with it, except to sell to its representatives, Prof. McLain and others, such things as they wished to put on exhibition. Is it not sincerely to be desired that the coming opportunity to make a display of the magnitude of our industry be improved to its fullest extent?

The changes that I would suggest to be made in the Constitution and By-Laws of the association are given on page 214 of the AMERICAN BEE JOURNAL for this year—a copy of which I have with me, so I will not take time here to mention them, but will mention them at the proper time. Is it not desirable that some plan be devised by which the Bee-Keepers' Union, the Honey Producers' Exchange and this association shall be combined?

The Union, under its efficient management, has accomplished much for our fraternity, and as "In union there is strength," ought not something to be done to make the Union stronger? Under the able leadership of its Manager, assisted by the Board of Directors, it has carried to a successful termination six cases in which bee-keepers have been brought before the Courts on account of damages claimed to have been done by their bees, and settled scores of disputes looking to lawsuits. I believe one case is still in Court, and funds are very much needed to carry it to a termiuation favorable to the cause of justice. "Money talks," and out loud, too.

The Supreme (supremely ridiculous) Court of New York has made itself the object of ridicule by its recent decision in such a case, and it is hoped and expected that when the case comes before the Court of Appeals, the utterances of the Lower Court will be so thoroughly "snowed under" that no summer's sun will ever be able to reach them. Is it not the height of folly for any one who has an apiary, or even keeps a few colonies, to ignore the fact that there is a constant danger of their being the next victim of "miss-placed confidence," and perhaps have on hand a fair-sized suit for damages, etc? Should not each give a helping hand towards furnishing the needed funds with which to defend the right, for it is *principles*, not men, that are being defended? But few Canadians belong to the Union, and not having an organization of this kind, would it not be well for them to give it their hearty support?

Up to the present time this Associaton, and so far as I know, all other bee-keepers' associations, have been accustomed to allow any one present to take part in and enjoy to the full, all benefits arising from asking questions and discussing subjects under consideration, whether members of the association or not. To me this course seems open to serious objections. At our homes, when those not members of our family come to see us, we show them the utmost consideration, and provide for them the very best we have, and wish them to occupy the best and most luxurious seats we possess, if it be nothing better than a hard-bottom chair. Would it not be to our credit as an association, to provide equally well for our bee-keeping visitors, by furnishing them with reserved seats, and hope that, like the visitors at our homes, they will not "wear their welcome out?"

To those who are at an expense of from ten to one hundred dollars, or even more, besides several days of valuable time, for the sake of reaping benefits that come from association and contact with kindred minds, should be granted the privilege of occupying the floor and doing the pleasant, satisfying and solid work of the convention. A fit name for such people as object to becoming members by the payment of the small fee, and yet wish to reap its benefits, I first heard used by the staid editor of the *Review*, and those of you who are so fortunate as to have the pleasure of his acquaintace, can readily imagine how his lips appeared when he called them "absorbers." Appropriate name! Grand title! To such visitors as are not, and do not expect to become bee-keepers, we extend a most cordial welome at all times, and shall be glad to have such occupy seats at our table, and participate in and enjoy our social chat.

Since writing the above, the *Review* for November has come to hand, and on this subject, among other things in regard to this matter, Dr. Miller says: "Here is one man coming hundreds of miles at the expense of $50 or $100, who promptly pays his membership fee with no feeling that there is any hardship about it, and right by his side sits a man who lives hard by; sits

through a part of all the sessions, imbibing all he can (why didn't the Doctor say absorbing) that is to be learned, but is suddenly struck with paralysis, when those present are asked to walk up and pay their dollars. If anything is said to him he may reply: 'I just dropped in awhile to see what is going on; I don't know that I can be here after this session, so it's hardly worth while to become a member'."

Since the last meeting of the Association the sleepless destroyer, Death, has invaded the ranks of our fraternity, and quietly and noiselessly removed many loved ones, adding their names to the long list of those who have passed from this sphere of labor, and enjoyment, as well as disappointment, to try the realities of "the beyond." Many of these were to us unknown, but, without doubt, you will all remember the name of Mrs. Mahala B. Chaddock, whom we expected to have met here, and who so recently passed away, while, we may almost say, the ink from the pen that wrote for our entertainment was scarcely dry. The last verse of a poem written by her for the Nov. number of the *Illustrated Home Journal* seems now to have been written for herself. She says:

I am swinging in my hammock old,
And I look away to the hills of gold,
Where the reaper binds with ruthless hold,
And gathers the golden sheaves.
'Tis meet that ripened grain should fall,
And the Heavenly Father watches all;
But o'er our lives there hangs a pall—
She sleeps 'neath the whispering leaves.

E. C. Jordan, of Virginia, who has frequently contributed to our bee-literature, has passed away, and none of us knows who will be the next.

It has been truthfully said that in the course of human events we all have our joys and our sorrows, which are deep and abiding. It becomes us then to accept these joys, and, as best we may, modify our griefs by a more thorough devotion to the duties before us, ever thankful to the Great Power which controls all for the manifold blessings received.

Mr. John Little, of this Province, Ont., in an after-dinner speech at a meeting of the American Horticultural Society, said that he put horticulture and religion together, and was sorry he had not commenced earlier in life.

We can substitute bee-keeping for horticulture, or what would be better still, add it to the others, for horticulture, bee-culture and religion make a trio that go well hand in hand, and if any of us are laggards in either respect, let us rectify the mistake at the earliest possible moment, for,

This life to toil is given,
And he improves it best,
Who seeks by patient labor
To enter into rest;
Then pilgrim, worn and weary,
Press on, the goal is high;
The prize is straight before thee—
There's resting by and by.

In closing, I wish to tender this association my profound and sincere thanks for the confidence reposed in me, as shown by your having twice chosen me as your presiding officer.

I accepted this evidence of your esteem, with an earnest desire to discharge the duties of the office acceptably, but with no idea of doing it as acceptably as have the ably, illustrious, scholarly, eloquent and noted men who have preceded me; but I shall ever remember with gratitude this unexpected evidence of your esteem.

With the most earnest and sincere desire for the success and happiness of you all in your chosen vocations, as the years go by, I wish you all God-speed.

A. B. Mason.

The address of the President was referred to a business committee as follows: Prof. A. J. Cook, Chairman; E. R. Root, F. H. Macpherson, M. Emigh, Wm. Couse, J. R. Howell, Wm. Hislop.

After the reading of the President's address, the meeting adjourned until 8:30 a.m.

SECOND DAY.

MORNING SESSION.

President Mason called the meeting to order at 8:30 a.m., and the convention listened to the reading of an essay written by Miss H. F. Buller, of Campbellford, Ont., on

Bee-Keeping as an Occupation for Women.

The question may be, and no doubt often has been asked, "Is bee-keeping a suitable or desirable occupation for women?" and after having given it a pretty fair trial for the last eight years, I am of the opinion that there is no reason why any woman of moderate strength and intelligence, should not be able to take charge of an apiary of from 30 to 50 colonies, with very little assistance, and derive both pleasure and profit from the employment; at the same time, I doubt whether there are many who would succeed very well in carrying on the business alone, though of course there are a few who would.

In reading the numerous bee-papers that are published now-a-days, one frequently meets with articles on the subject of, whether it is best to make a specialty of bee-keeping, or combine it with some other occupation. Now I do not believe that the farmer can carry on both farming and bee-keeping successfully himself, but if he has either daughters or sons, who will make a specialty of this department, bee-keeping, it may very advantageously be combined with farming; and I do not know of any reason why girls might not make as great a success of the business, as boys.

The wife is supposed to have her hands quite full enough with household work, and, I may say, her head, too, and for any one, either boy or girl, man or woman, to do any good with bees, they must give them their individual attention, and be really interested, and enthusiastic over their work.

"Eternal vigilance is the price of success" in any business, and in none more than in bee-keeping. It is not only labor, but a science, and will make constant demands, not only on the patience, but on the bodily strength and intelligence of those who engage in it; at the same time there is a fascination about the business which relieves it of all tediousness. A woman will think of her bees, study about them, and become so interested as to be almost paid for her work by the love of it.

I believe it would be well worth while for any one who has not been in the way of having the management of an apiary, to spend one season with a skillful bee-keeper before embarking in the business on his own account, as he would then find out not only the best methods of working, but also whether the kind of work suited him. However, even with this preparation, all will not succeed, for I know a lady who took this course, and afterwards failed entirely when she was working for herself; while others, who have only learned what they could from books and papers, besides the suggestions and instructions given them by more experienced bee-keeping friends, have done very well.

In conclusion, I may say that a great deal of the work in the apiary is quite as well adapted for women as for men, and also in the care of the honey, and in preparing it for market.

Where they are most likely to feel their deficiency, is in the lack of skill to do the various carpentering jobs that seem to be inseparably connected with bee-keeping. I imagine that it is the exception, rather than the rule, to find a woman who knows how to handle carpenter's tools, though even this they may acquire enough of to answer the purpose, where there is a necessity for doing so.

Henrietta F. Buller.

Miss Buller's essay was then discussed as follows:

Prof. A. J. Cook—The key to the situation is just this: Give the children some bees of their *own*. Do not give them the bees and then take the honey and sell it, and pocket the money.

R. L. Taylor—Bee-keeping is as good as anything to furnish ladies a healthful, out-door occupation; but the question is, whether it is the best thing for them as a *business*. For some ladies it is all right. Some women can lift a barrel of flour; I have seen them do it. Some *men* are not strong enough, physically, to make a business of bee-keeping. We must look at this as a *business*. All kinds of business *can* be carried on with but little demand for physical strength—sections *can* be put on and taken off one at a time—but the question is, does it pay?

O. L. Hershiser mentioned that two girls had done most of the required work with his bees the past season, and, as their part of the proceeds, they now had $75.00 in the bank.

R. McKnight thought that perhaps 75 per cent. of women would succeed as well as men at keeping bees.

Wm. Sawyer said that a woman was not capable of managing a *large* apiary.

Geo. H. Ashby—Some of you speak about the healthfulness of bee-keeping, and that it is on this account that ladies take up the pursuit. Now, I would like to have you show me the woman that thinks that bee-keeping is healthful, unless she also finds it *profitable*.

C. P. Dadant—There is much connected with bee-keeping that ladies cannot do, but they can have it done.

R. McKnight, of Owen Sound, Ont., followed with an essay on

Cellar vs. Out-Door Wintering of Bees.

I have been assigned the duty of saying a few words on the subject of wintering bees, with the view, I suppose, of opening up a discussion on this important matter.

Safe wintering is of prime importance to success in bee-keeping, in high latitudes, hence the best method of accomplishing this cannot secure too much attention, for upon it depends, in a large measure, the result of the season's work.

I am not expected to treat the subject exhaustively—this is clear, from the fact that I am limited to eight minutes in discussing it.

Successful wintering, either in-doors or out, depends not so much upon where bees spend their quietude and repose, as how

they are treated during the time of their activity.

Preparation for winter should begin when the first notes of our sylvan songsters fall upon the ear, as they return from their temporary stay in the Sunny South—

"When through the neighboring fields the sower stalks,
With measured tread, and liberal throws the grain
Into the faithful bosom of the ground."

It should continue while the floral world fills the air with its balmy odors, and nectar is being distilled in plenty. It should go on

"While the mower, sinking, heaps o'er him
The humid hay, with flowers perfumed;"

and only cease when on the last mellow autumn day

"The insects swarm from their dark nooks
To sport through one day of existence more."

It is only then that the bee-keeper's work of preparation should cease, and that of "gathering in one group his pets" be entered upon, that in peace and safety they may pass the time when

"The sky saddens with the gathering clouds,
And through the hushed air the whitening storm deepens."

If only proper treatment be accorded bees throughout the successive stages of their active life, it is not a matter of vital importance whether they spend their season of repose in the cellar, or out-of-doors, provided that they be properly protected.

Preparation is not my theme, however. My text has been furnished me, and I must stick to it—"Cellar vs. Out-Door Wintering of Bees." "That's the question." As it stands, I suppose I am expected to put in a strong plea for the cellar, but I am somewhat at a loss to know just what "cellar" means in my text. Usually it is an elastic term that may mean anything from a damp and dismal hole in the ground, to a well-built, well-ventilated, and well-appointed apartment.

If I am to understand "cellar" to mean the underground room of a dwelling-house, well-built and well-ventilated, then it will be a safe enough place in which to winter bees. However safe it may be, if this be the cellar of my text, I must at once declare myself in favor of the out-door system, for I am entirely opposed to the use of the house-cellar as a winter storing-place for bees, to any great extent.

I am opposed to it, not on the bees' account, but on sanitary principles. When a cellar is so used, it cannot be other than disagreeable to those that live over it. The exhalations thrown off by the bees, floating up, as it will, and diffusing itself through the atmosphere of the rooms above, must be the reverse of agreeable to people who inhale it. It may be worse than disagreeable—it may be positively injurious to health. I incline to the belief that it is so.

If there be such a disease as "bee-asthma," and if it is so contracted by inhaling the odors arising from an open hive in the open air, how much more likely is it to manifest itself when its inhalation continues for months at a time. For these reasons, I cannot advocate cellar-wintering in the literal sense of the phrase.

An underground, or partially underground, structure is, however, in my judgment, the best wintering place—best because most convenient and economic, both of which are important considerations. Speaking as I do from years of experience in various plans of wintering bees, carried on simultaneously, I know whereof I affirm.

During these years I have had two bee-yards—some years three. At home I winter my bees in a bee-house. At the out-apiaries I pack them on the summer stands, or in clamps, and my experience convinces me that the in-door plan has the advantage of the out-door one, in these two important matters—convenience and economy.

The convenience consists in the ease and rapidity with which the hives may be put in and taken out; the economy consists in conserving heat and saving honey.

I shall not enter into the consideration of which is the safer, for I believe safety may be insured by either plan; but content myself with showing that convenience and economy both range themselves on the side of indoor wintering.

Admitting one has on hand the cases and clamps of former years, the work of packing for winter outside is still a labor of some magnitude. The cases must be placed in position, the hives moved into them, sawdust or other suitable material procured; and the packing done. All this consumes time, and recurs with every returning winter. Compare this work with the simple labor of transferring from the yard to the bee-house, and it is a mere bagatelle.

The economy of the indoor, as compared with the out-door method, must be apparent to every one who has given the matter any thought at all. In the former, the heat generated by the bees when together, may be employed in maintaining a uniform and suitable temperature, resulting in a continued state of quiescence and comfort, which state reduces the consumption of stores to a minimum.

My own experience goes to show that one-half the amount of honey per hive will serve to winter in the house, required to bring them through outside. This saving is of great importance to the bee-keeper in more respects than one. It often enables him to winter his bees without fall feeding, when otherwise it would be necessary for him to do so. If the stores be ample, it is no less advantageous, for it saves honey, which means money.

Let us take, for example, a bee-keeper who has 200 colonies. Five months will be the average time of confinement in winter quarters. Say it requires 1½ pounds per colony per month inside, and 3 pounds outside; there will be a saving of nearly 8 pounds of honey per colony in favor of the bee-house, or 1,600 pounds for 200 colonies; 1,600 pounds at 9 cents per pound, is $144.

But it may be urged that the extra cost of the building will more than counterbalance the saving in honey. This I am not prepared to admit. Three hundred dollars, at most, will serve to construct a bee-house, where labor and lumber are not excessively high. The expenditure once incurred, no further outlay will be necessary for a lifetime; while the building may be made to serve the purpose of a first-class extracting room, or a store-house in summer.

On the other hand, no satisfactory plan of out-door wintering can be adopted without considerable outlay in labor and money. If the single-clamp plan be practiced (and I hold this to be the best plan of out-door wintering), it will require 50 feet of lumber, at least, for each outer case, or 10,000 feet for 200 colonies. This, at $9.00 per thousand feet, represents $90.00; for labor and nails, say 15 cents per colony, $30.00; sawdust or other packing material, 5 cents each, $10.00—or $130.00 in all. This will cover half the cost of a permanent structure, in every way preferable. To this we must add twice the consumption of honey annually.

It is easy, therefore, to determine which plan in the long run is most economical, to the man who keeps from 100 to 200 colonies; and it is to such that my remarks more immediately apply.

Bee-keepers having a less working-force, should regulate their practice by the circumstances in which they find themselves.

R. McKNIGHT.

The following discussion of Mr. McKnight's essay then took place:

Prof. Cook—Have you found cellar-wintering of bees equally safe with out-door wintering?

Mr. McKnight—So far as my experience has gone, the greater safety has been with the in-door plan.

Dr. A. E. Harvey—If the dead bees are kept properly cleaned up, and the cellar ventilated, there will be no danger to health, by having bees under the living-rooms.

J. Sturgeon had 200 colonies, and out-door wintering had been the most successful with him. Locality, the hive, and food, made all the difference in wintering, in his opinion. He used chaff hives, and had high board wind-breaks. Late disturbance is an injury. Possibly he did not understand the plan of in-door wintering.

R. L. Taylor—At what temperature did you keep the cellar?

J. Sturgeon—40° to 45°, as nearly as possible.

R. L. Taylor—Well, *how* near?

J. Sturgeon—Well, within 10° to 15°.

Rev. W. F. Clarke preferred out-door wintering, but wished to have the hives raised a foot from the earth. Whether in-doors or out-doors, *hibernation* is what is needed.

R. L. Taylor—How are we to make them hibernate?

W. F. Clarke—It is mainly a matter of temperature, but not wholly. We cannot always induce this condition.

Geo. H. Ashby—One trouble is, that experiments are not decisive. One man puts all his bees into the cellar; another leaves them all out. Part of mine are left out, and part put into the cellar. Those in-doors consumed 9½ pounds per colony, in 5 months; those out-doors consumed 13 pounds. Those wintered in the cellar swarmed earlier, and stored the most surplus. The trouble with cellar-wintering is, that the bees are put out too early in the spring. Hives last longer when they are in the cellar during the winter.

S. Corneil—In weighing colonies, did you take into consideration the weight of the brood?

Geo. H. Ashby—There is so little brood, that it is of no account.

S. Corneil—The object of putting bees into a cellar, is to aid them in keeping up the proper temperature inside the hive. If they are properly protected, the out-door plan is equally as good.

E. R. Root—In our locality (Medina, Ohio), the consumption of stores is about 13 to 15 pounds per colony in out-door wintering. We have wintered but few bees in the cellar, but we have put in about 40 colonies this winter, and were surprised to see with how little labor they were put into the cellar.

Prof. Cook—We need have no fears of ill-health from having bees in the cellar, if the cellar is ventilated as all cellars ought to be. I think that sub-earth ventilation is not needed, unless it be used to control the temperature. I know of many who have wintered hundreds of colonies with no sub-earth ventilation.

S. Corneil—The only advantage of sub-earth ventilation, is that it may be used in tempering the air by bringing it in under the earth. I venture to say that I can winter bees in a temperature of 25 , by having the walls of the hive thick.

J. B. Hall—Where is the man who winters his bees out-of-doors? You all talk about out-door wintering, but when it comes right down to it, if you do not put your bees into a cellar, you build a little cellar around each colony. Why not put them all into one big cellar?

R. L. Taylor—It has been urged that bees should not be taken out of the cellar too early. My experience is, that it is better to take them out early. If they have wintered well, there is no danger of spring dwindling.

The convention then adjourned until 1:30 p.m.

AFTERNOON SESSION.

President Mason called the meeting to order at 1:30 p.m., and the convention then proceeded to select the place for holding the next meeting. Keokuk, Iowa, was chosen, and the election of officers was then held, which resulted as follows:

President—R. L. Taylor, Lapeer, Mich.
First Vice Pres.—Eugene Secor, Forest City, Iowa.
Secretary—C. P. Dadant, Hamilton, Ills.
Treasurer—Dr. C. C. Miller, Marengo, Ills.

The other Vice-Presidents are to be chosen by the executive committee.

REPORT OF COMMITTEE ON RESOLUTIONS.

The report of the Committee on Resolutions was read and adopted. It is as follows:

Resolved, That the cordial thanks of this Association are due, and are hereby tendered to the Brant Bee-Keepers' Association, for its kind invitation (extended at its last session) to meet at Brantford, and for the generous and efficient manner in which it has received and entertained this convention.

Resolved, That our thanks are also tendered to the Mayor and City Council of Brantford, who have so kindly carried out the evident wish of the city, in granting us the free use of this hall, and in giving us a generous welcome.

Resolved, That the thanks of this Association are due, and hereby extended to such bee-periodicals as have given us the gratuitous use of their columns for notices of meetings, and in other ways given their assistance to make this meeting a success. And to the city and other papers who have kindly published our proceedings, and for the correct manner in which they have reported our meetings.

Resolved, That the thanks of this Association are due and hereby tendered to the quartette who so kindly assisted in enlivening our session by the singing of our bee-keepers' songs.

Resolved, That the thanks of our Association are due and hereby tendered to the hotels and railroads for reduced rates and accommodations.

Resolved, That having been informed by a communication from ex-President Thomas G. Newman (read by the President), of the severe illness of his wife, and of his regret at not being able to be with us in this convention, we hereby tender him our most cordial sympathy, and express our sincere regrets that he is not permitted to be with us.

To the Rev. L. L. Langstroth, the acknowledged father of modern apiculture, who is with us in thought but absent on account of failing health, we send most cordial greeting, and wish him a restoration to health and strength, and express our regrets that he is not here to cheer us by his presence, and enlighten us by his counsel and wisdom.

To S. T. Pettit, of Belmont, Ont., and E. D. Keeney, of Arcade, N. Y., who send regrets for their inability to be with us on account of ill health.

To J. V. Detwiler, of New Smyrna, Fla., who came so far as Toledo, O., and was prevented from attending this convention because of the death of his father, we also send words of cheer and our regrets at their enforced absence. R. F. HOLTERMANN, } *Com.*
R. L. TAYLOR. }

The following telegram was sent to Father Langstoth: "The International bee-keepers send affectionate greeting, and wish you were here."

Next came an essay from S. Corneil, of Lindsay, Ont., upon

Heat-Retaining Hive—How it is Best Obtained.

Regarding the protection of bees against cold in winter, and during the time of rapid brood-rearing in spring, I take the ground that warm air inside the hive is of the first importance, and that the temperature of the air outside the hive is only a secondary matter, provided the hive walls are composed of good heat-retaining materials. In a hive of bees we have, as it were, a self-acting furnace, keeping up a constant temperature of 65 degrees in the centre, and at least 50 degrees in the atmosphere immediately surrounding it, when the bees are the most quiescent.

As with live stock during our winters, so with bees, the better the heat is retained in the air in contact with them, the less food they consume, and the less vital work is required to keep up the standard temperature. That much of the heat generated may be retained by the selection of the best materials for the hive, is evident from the following account given by Prof. Pepper, in his work on "Heat:"

"One of the most interestiug novelties displayed in the department devoted to Norway, in the French Exhibition of 1867, was the self-acting Norwegian cooking-apparatus, constructed in the most simple manner, of a wooden box lined with four inches of felt, in which the sauce-pans containing the food, previously boiled and maintained at the boiling-point for five or ten minutes, according to the nature of the food to be cooked, are placed. The heated sauce-pans are covered with a thick felt cover, and, the lid of the box being fastened down, the rest of the cooking is done by slow digestion, no more heat being added.

"The heated vessels containing the food will retain a high temperatnre for several hours, so that a dinner put into the apparatus at 8 in the morning, would be quite hot and ready by 5 in the afternoon, and would keep hot up to 10 or 12 at night, because the felt clothing so completely prevents the escape of the heat; and as the whole is enclosed in a box, there are no currents of air to carry off any other heat by convection.

"The principle on which this cooking-apparatus acts, is that of retaining the heat; and it consists of a heat-retainer or isolating apparatus, shaped something like a refrigerator, and one or more sauce-pans to fit into it."

In selecting the materials for hives, with a view to the greatest warmth, it should be remembered that air conducts nearly twice as much heat as cork, the ratio being as 49 to 29. Carded wool and wool-felt conduct about four times as much as cork. Blotting-paper conducts about as much as wool. Sawdust conducts about seven times as much as cork. Wood generally conducts seventeen times as much heat as cork, "more than four times as much as wool, and more than ten times as much as air."

Cheshire says, "If a hive side of ⅝-inch zinc have its protective power represented by 1, that of a double side with dead (!) air space would equal 4, while the same wooden sides packed tightly with chaff would equal 10." "Further experiments proved that the cork-dust in lieu of the chaff-packing, gave a non-conductivity to be represented by 14."

My own experiments have satisfied me that straw is a much better heat-retaining material than wood. Each straw has a dead-air chamber between the joints, and and when the straws are pressed together, the air lying between them is comparatively "dead."

I made some experimeuts last winter with an old-style Jones' hive made of straw, and a single-walled eight-framed Langstroth hive. I found that the same quantity of hot water cooled much more quickly in the Langstroth. For covering hives on top, there is nothing available as good as quilts filled with sheep's wool. There is a kind of batting used by upholsterers which I think would answer nearly as well. It is made of old woolen rags, and costs, at wholesale, less than half the price of wool.

Cork-dust at wholesale costs about five or six cents per pound. A cubic foot well packed weighs about eight pounds. About three pounds will be required to give 1¼ inches of filling for the walls of ordinary hives. I use picture-backing and three thicknesses of carpet felt-paper for the inner skin of my hives, and ⅞-inch pine for the outer skin. Hives with walls thus filled will measure about 2½ inches larger each way. They will weigh abont five or six pounds more, and will cost about as much more as single-walled hives of the same capacity.

The question which every bee-keeper will ask before incurring the extra expense is, Will it pay to use these double-walled hives? I think it will be admitted that their advantages for early spring brood-rearing are as great as for wintering; but leaving the former out of the question, if, during the time one of these hives lasts, it should be the means of saving in good condition a colony of bees, which in a single-walled hive would have died, it will pay to use hives with packed walls.

S. CORNEIL.

Mr. Sturgeon used and preferred the chaff hive.

J. B. Hall—Yes, but there are really a lot of little cellars, with a tube from each, through which the bees may fly. Mine are in one large cellar, with no tube for them to fly out.

Mr. Sturgeon—Yes, but I have tried putting bees in a cellar in chaff hives.

J. B. Hall—Yes, yes; but you protected them *too* much. When I go into a warm room, I take off my overcoat.

J. B. Aches—Does Mr. Sturgeon give upward ventilation to his hives in the cellar?

Mr. Sturgeon—No, sir.

S. Corneil—A covering of enameled cloth amounts to nothing, in the way of retaining heat. Such covers must be covered with some non-conductor of heat.

Geo. H. Ashby said it made no difference if the cellar were damp, if the temperature were high enough.

R. L. Taylor had several times tried wintering bees out-of-doors, and they had never wintered so well as in a cellar. He had bees in two cellars. One cellar is made under his house. There is a furnace in it, and the cellar is dry. The other is under the barn, and has a cistern in it, and is damp. He could see no difference in the wintering of the bees in the two cellars. There is just this much about it: In a damp cellar, the temperature must be kept higher.

Adjourned to meet at 7:30 p.m.

EVENING SESSION.

The meeting was called to order at 7:30, with President Mason in the chair. This session was opened very pleasantly by the singing of the several bee-keepers' songs. The last one sung was the one that appears on page 772 of the AMERICAN BEE JOURNAL. This was new, and "brought down the house." It did us good to see the staid and sober President Mason, so far forget himself as to slap his knees, tip back his head and shake his sides with laughter.

Should Bee-Keeping be Combined with some other Business?

R. L. Taylor—No. We find life none too long to perfect one occupation. If there is added to this regular money-making occupation, some other money-making occupation, there can never be so great a success. I think I can make more money by choosing some one business, and putting my whole soul and life into it. But my nature rebels at such a course; there are some other things that I like to do as well as bee-keeping; so I have sacrificed my love of money for the pleasure of having more than one pursuit. In the summer the bees require close attention, and any pursuit to combine with bee-keeping, must be one that will require but little attention at that time. Small-fruit growing, that has been so often mentioned, is a very poor one. In many places, grape-growing, or the raising of pears or plums would work well with bee-keeping. But the question always comes back to me: "If bee-keeping is so profitable, why not keep more bees? Or, if it is not profitable, why follow it at all?" If a man does his work in the winter as he ought to, he can care for 300 colonies of bees.

Mr. F. H. Macpherson, of Beeton, Ont., then read the following essay:

Shipping Queens.

The most that I can say on this subject will probably not be new to the majority of you, but as I shall detail the system practiced in our own apiary, there may be some points which may interest even the older heads who have perhaps had a great deal more experience than myself.

I take it that the point in the queen-breeder's work—where my subject shall properly commence—is when he has his queens mated and ready to forward in fulfilment of the various orders received or expected.

The three principal items for consideration are: 1. The cage. 2. The food. 3. The mode of caging. I shall discuss these in the order in which I have named them, as it appears to be their natural sequence.

THE CAGE.—It requires to be light, strong and free from absorbent qualities. We have made them from pine, cedar, balsam, spruce and basswood, and like them in the order named. Pine seems to conform to all the requirements named, better than any of the others; cedar is light, but not so strong; balsam is light, soft, not liable to split, and a good non-absorbent, but with us it is not easily obtainable; basswood is strong and less liable to split, but it has the disadvantage of absorbing moisture, and will soon become sour, unless kept in a dry atmosphere; spruce is light, but it is usually hard and flinty, and is very liable to crack.

The shape of the cage has not so much to do with successful shipping, as has the ventilation; and I am of the opinion that a good many queens are lost through *over*-ventilation. It is surprising to notice how little air will suffice.

Another fruitful source of loss is from the sudden change of temperature when in the mails. This may, to a great extent, be overcome by wrapping the cage in a single thickness of ordinary manilla-paper.

The immediate requirements of every cage are—a sufficient space in which to place the queen and the attendants, and another space in which to put the food, so connected with the first that the queen and her retinue may get at it as they require, and yet not become fastened in it, or daubed by it.

THE FOOD.—This is probably the most important item connected with the whole business of shipping queens—the "weal or woe" of more queens depends upon this than upon all other things combined. There are, perhaps, as many different kinds of foods made and recommended as there are different methods of curing bee-stings, but, as in the latter case, what proves of service to one is of no account with another.

We have tried many different mixtures with varying results. The "Good" candy seems to be generally recognized as having merit, and our success with it has been fair. We have also obtained uniformly good results from the use of a food made after the following formula:

Take absolutely-pure granulated sugar and pulverize it. Put it in a granite dish and pour over it enough pure honey (first having heated the honey to a little below the boiling-point), to thoroughly saturate it, and stir the mass until the sugar and honey are well mixed. Then place the vessel in hot water, in which it should be allowed to stand (keeping the water about the boiling-point) until the sugar and honey become thoroughly incorporated. When cool it will be found quite waxy. It will not melt and run easily, and the bees take it very kindly.

During the past season we have sent out many hundreds of virgin queens, and the work of preparing the food as given above, was more than we cared to undertake for such a large number. We also desired a less costly food. We received in the spring, from Mr. W. P. Henderson, of Tennessee, a half-dozen young queens which reached us in a fine, healthy condition, and which appeared to be fed on pure honey, and we felt that Mr. H. was practicing the plan we wanted.

We ascertained from him that he used short-staple raw cotton, just from the gin, after being separated from the seed, which he saturated with the ripest and thickest honey that he could get, and which he then placed tightly in the trough of the cage, to keep it from leaking and bedaubing the bees.

One pound of the raw cotton holds sufficient honey for a thousand cages, at a cost of ten cents for the cotton. During the season we shipped nearly all our queens on food prepared in this way, and we found that in the majority of instances they reached their destination in splendid condition.

I wish to particularly emphasize the idea that nothing but the purest of sugar should be used—adulterations of this article have cost us the lives of a good many queens.

MODE OF CAGING.—Complaints are sometimes heard, of queens which do not lay on introduction after arrival at their destination, even though they may have been good layers before being shipped. The treatment of queens before shipment, and the mode of handling when caging, has a good deal to do with this trouble. If a queen be taken out of the hive when she is actively engaged in egg-laying, there is considerable danger of injury, through close confinement and through the jarring and shaking which she will receive in the transportation by mail, and we have known such queens to cease laying almost entirely after a long journey. The remedy for this is, to allow them to rest a day or two before shipment.

We have seen students, in catching queens, take hold of them by the abdomen or the head. This is detrimental in many cases to the egg-laying qualities of the queen, especially if any pressure is exerted. She should always be caught by the wings, and held only as short a time as possible.

They should be handled very carefully and gently, so that they may not become excited, and on being taken from the hive, they should at once be transferred to a dark spot as near the temperature of the inside of the hive as possible. If allowed to remain in the hot sun, they receive what we might call a sort of sunstroke, and their egg-laying qualities seem to be impaired.

We generally ship queens by a mail, which leaves late in the day, and, if possible, we always like to have the queens caged, and placed in a dark room for two or three hours before they are sent off. They are thus less excited, and stand the journey better. F. H. MACPHERSON.

E. R. Root showed and described the Benton shipping-cage. One trouble, he said, with the Peet cage, is that the space is too large, and one side is of tin. This allows the bees to slip about too much. They had been using the Benton cage, with the best of success, the past season. After much experience, they had found 20 bees were about the right number to put in the cage. They had arranged the Benton cage so that it might also be used as an introducing-cage. He had watched the matter closely, but had seen no proof that queens are injured by shipping immediately after caging.

Adjourned to meet at 8:30 a.m.

AMERICAN BEE JOURNAL
ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

☞ Read our Book Premium offer on the last page of this JOURNAL.

☞ Money in Potatoes, by Mr. Joseph Greiner. Price, 25 cents, postpaid. For sale at this office.

☞ Send us one **NEW** subscriber, with $1.00, and we will present you with a nice Pocket Dictionary.

☞ Red Labels are nice for Pails which hold from 1 to 10 lbs. of honey. Price $1.00 per hundred, with name and address printed. Sample free.

☞ Calvert's No. 1 Phenol, mentioned in Cheshire's Pamphlet on pages 16 and 17, as a cure for foul brood, can be procured at this office at 25 cents per ounce, by express.

☞ The date on the wrapper-label of this paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to advance that date another year.

☞ Please send us the names of your neighbors who keep bees, and we will send them sample copies of the BEE JOURNAL. Then please call upon them and get them to subscribe with you.

☞ As there is another firm of "Newman & Son" in this city, our letters sometimes get mixed. Please write *American Bee Journal* on the corner of your envelopes to save confusion and delay.

☞ We have some full sets of the BEE JOURNAL for 1889, and *new* subscribers can have the full sets for 1889 and 1890 for $1.80 until all are gone. Or, we will send the full sets for 1887, 1888, 1889 and 1890 for $3.00.

☞ Systematic work in the Apiary will pay. Use the Apiary Register. Its cost is trifling. Prices:

For 50 colonies (120 pages) $1 00
" 100 colonies (220 pages) 1 25
" 200 colonies (420 pages) 1 50

☞ When talking about Bees to your friend or neighbor, you will oblige us by commending the BEE JOURNAL to him, and taking his subscription to send with your renewal. For this work we will present you with a copy of the Convention Hand Book, by mail, postpaid. It sells at 50 cents.

☞ We offer the Monthly Philadelphia *Farm Journal*, and either the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20. Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

A New Method of Treating Disease.

HOSPITAL REMEDIES.

What are they? There is a new departure in the treatment of disease. It consists in the collection of the specifics used by noted specialists of Europe and America, and bringing them within the reach of all. For instance, the treatment pursued by special physicians who treat indigestion, stomach and liver troubles only, was obtained and prepared. The treatment of other physicians, celebrated for curing catarrh, was procured, and so on till these incomparable cures now include disease of the lungs, kidneys, female weakness, rheumatism and nervous debility.

This new method of "one remedy for one disease" must appeal to the common-sense of all sufferers, many of whom have experienced the ill effects, and thoroughly realize the absurdity of the claims of Patent Medicines which are guaranteed to cure every ill out of a single bottle, and the use of which, as statistics prove, *has ruined more stomachs than alcohol.* A circular describing these new remedies is sent free on receipt of stamp to pay postage, by Hospital Remedy Company, Toronto, Canada, sole proprietors.

51D26t Imly.

A Special Club Rate.

A Magazine of the choice literary character which the ILLUSTRATED HOME JOURNAL sustains, will add many pleasures to any "family circle." Its beautiful illustrations and interesting reading-matter will make it heartily welcomed at every "fireside" in the land.

We desire that every one of our readers should secure its regular visits during the year 1890, and in order to induce them to do so, we will make this tempting offer:

We will Club the AMERICAN BEE JOURNAL and the ILLUSTRATED HOME JOURNAL, and mail both periodicals during the whole year 1890 for **$1.50**, if the order is received at this office before January 1, 1890.

Such a *remarkably low* club rate as the above, should induce every reader of the BEE JOURNAL to accept it without a moment's delay.

As a further inducement, we will mail the superb number for December, 1889, *free* to those who send their subscriptions early; that is, until all the December numbers now on hand are taken.

New subscribers to the above club will have the December numbers of both of the JOURNALS free—as long as the stock lasts. So the sooner they subscribe, the more they will get for their money.

☞ Some have requested us to print a card on a less number than 100 Honey Almanacs, and we have concluded to accommodate them. We will furnish 25 copies with card printed on the first page, **postpaid,** for $1.10; 50 copies for $1.70; 75 copies for $2.30. See prices for more on the page 822.

Subscribers who do not receive this paper promptly, will please notify us at once.

Honey and Beeswax Market.

DETROIT.

HONEY.—Demand is fair for comb at 13@15c. per lb. There is more dark honey than light. Extracted, 8@9c.
BEESWAX.—24@25c.
Nov. 11. M. H. HUNT, Bell Branch, Mich.

CHICAGO.

HONEY.—Receipts of comb are averaging about as they usually do with a fair crop. Prices rule at 13@14c. for choice to fancy 1-lbs., which comprise the bulk of the receipts, very little in sections averaging 1½@2 lbs., and sells at 10@12c¼.; dark, 8@10c Extracted, 6@8c.
BEESWAX.—25c. R. A. BURNETT.
Nov. 8. 161 South Water St.

KANSAS CITY.

HONEY.—Fancy white 1-lbs., 14c.; good, 13c.; dark 11c.; white 2-lbs., 13c. Extracted, white, 7c.; dark,6c Demand good.
Nov. 11. HAMBLIN & BEARSS, 514 Walnut St.

DENVER.

HONEY.—1-lb. comb, 13@15c. Extracted, 6@7c.
BEESWAX.—20@25c.
Dec. 9. J. M. CLARK COM. CO., 1421 15th St.

MILWAUKEE.

HONEY.—Choice white 1-lbs., 14@15c.; 2nd grade white 1-lbs., 13@14c.; old dark 1-lbs., 10c.; new, 10@11c. Extracted, white, in barrels and kegs, 7@8c.; in tins and pails, 8@8½c.; dark, in barrels, 6@6½c.; in kegs, 6@7c. Demand steady.
BEESWAX.—22@23c.
Nov. 11. A. V. BISHOP, 142 W. Watar St.

NEW YORK.

HONEY.—Extracted, white clover, basswood, orange blossom and California, 8c.; buckwheat, 6 cts.; common Southern, 65@70c. per gallon. Demand is good. Comb boney, fancy white 1-lbs., 16c.; 2-lbs., 14c. Fair 1-lbs., 14c.; 2-lbs., 11@12c. Buckwheat, 1-lbs., 11@12c.; 2-lbs., 10@11c. Demand very good for fancy white 1-lbs., and buckwheat 1-lbs.
BEESWAX.—22c.
Oct. 2. F. G. STROHMEYER & CO., 122 Water St.

CHICAGO.

HONEY.—Demand for white clover 1-lbs. is improving, but price depends upon size and style of package, condition and appearance when received, ranging from 12@13½c.; basswood, 11@11½c.; buckwheat, 8@10c. Extracted, 6½@7½c., depending upon style and size of package.
BEESWAX.—27@28c.
Nov. 9. S. T. FISH & CO., 189 S. Water St.

NEW YORK.

HONEY.—Market is inactive, and prices declining. Fancy white 1-lbs. 13@15c., 2-lbs. 12c. Off grade 1-lbs. 11@12c., 2-lbs. 10@11c. Buckwheat 1-lbs., 10@11c.; 2-lbs., 9c. Extracted in good demand. Basswood, 7½c.; California, 7½c.; orange bloom, 8@8½c.; buckwheat 6 cents; Southern, 70@75c. per gallon.
HILDRETH BROS. & SEGELKEN,
Dec. 9. 28 & 30 W. Broadway, near Duane St.

BOSTON.

HONEY.—It is selling a little slow. Fancy white clover 1-lbs., 16@17c.; fair to good, 15@16c.; 2-lbs., 15@16c.
BEESWAX.—24c.
Dec. 9. BLAKE & RIPLEY, 57 Chatham Street.

CINCINNATI.

HONEY.—A large amount of Comb on the mardet at 14@16c for best white. Extracted at 5@8c.
BEESWAX.—Demand is good—20@22c. per lb. for good to choice yallow, on arrival.
Nov. 22. C. F. MUTH & SON, Freeman & Central Av.

KANSAS CITY.

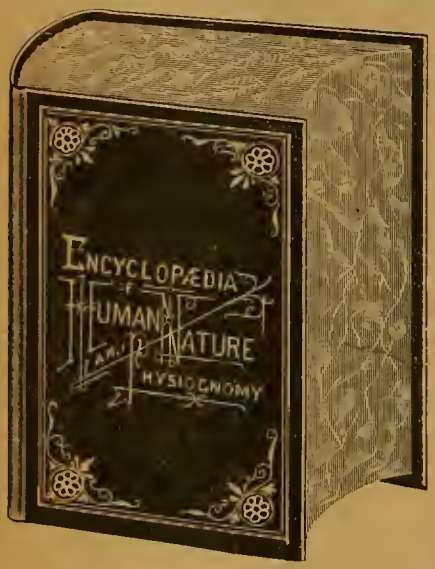
HONEY.—Selling slowly, especially extracted, on account of mild weather. White 1-lbs., 13@14c.; dark 10@12c.; white 2-lbs. 12@13c.; dark. 10@12c. Extracted, white, 7@8c.; dark, 5@6c.
BEESWAX.—22c.
Nov. 22. CLEMONS, CLOON & CO., cor 4th & Walnut.

A New Premium.

The National Purchasing Agency of this city issues a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement, we can offer a MEMBERSHIP Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL, for one year, with $2.00.

$5.00 Encyclopedia.—The work is almost as large as Webster's Dictionary, 4 inches thick, weighs over 5 pounds, and occupies over 300 cubic inches of space. It is handsomely bound in English cloth, double spring back, gilt side and back stamp, marble edges, beveled boards, and contains over 100 illustrations. It is published at $5.00 per volume, which is very low in comparison with standard current prices on other works.



It treats of every characteristic, both the good and the bad, of the various types of man and woman, and proposes to tell most people more about their fellow-men than they ever dreamed it possible to find out.

We will club it with either of our JOURNALS for $2.10, postpaid. Or both the BEE JOURNAL, HOME JOURNAL and Encyclopedia for $3.00, all postpaid.

Or we will present it as a Premium for 5 new subscribers to either JOURNAL, with $5.00 to pay for the subscriptions.

This is an opportunity of a lifetime—a rare chance to get a very valuable book free. The postage alone costs 30 cents.

Clubs of 5 for $4.00, to any addresses. Ten for $7.50, if all are sent at one time.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

OLDEST BEE-PAPER IN AMERICA

VOL. XXV. CHICAGO, ILLS., DECEMBER 28, 1889. No. 52.

Issued Weekly at

Nos. 923 and 925 West Madison Street,

At One Dollar a Year.

New Subscriptions can commence at any time. Single Copies Five Cents Each.

George Neighbour & Sons, 127 High Holborn, W. C., London, England, are our authorized Agents for Europe.

Entered at P.O. as Second-class matter.

Topics Presented in This Number.

Convention Notices.

☞ The next annual meeting of the Ontario Bee-Keepers' Association will be held in Belleville, Ont., in the City Hall, on Jan. 8 and 9, 1890.
W. COUSE, *Sec.*

☞ The Indiana State Bee-Keepers' Association, will hold its tenth annual meeting at Indianapolis, Ind., on Wednesday, Jan. 15, 1890, at 1 p.m. All bee-keepers are cordially invited.
GEO. C. THOMPSON, *Sec.*, Southport, Ind.

☞ The annual meeting of the Colorado State Bee-Keepers' Association, will be held in the Chamber of Commerce building, in Denver, Colo., on the third Monday in January, 1890, for the election of officers and other business. Everybody is invited to attend. E. MILLESON, *Pres.*

☞ The 24th annual meeting of the Michigan State Bee-Keepers' Association, will be held at Lansing, Mich., in the Capitol Building, on Dec. 26 and 27, 1889. At that time nearly all railroads sell half fare tickets; a few railroads charge one-and-one-third fare for the round trip. Reduced hotel rates will be given at the Hudson House. All are cordially invited. H. D. CUTTING, *Sec.*

☞ The 21st annual meeting of the New York State Bee-Keepers' Association will be held in the Court House at Rochester, N. Y., on Feb. 5, 6, and 7, 1890. Reduced rates will be given at hotels and on all principal railroads. The programme and full particulars will appear in due time. Each county association is requested to send two or more delegates. G. H. KNICKERBOCKER, *Sec.*

☞ The annual meeting of the Vermont State Bee-Keepers' Association, will be held at Burlington, Vt., on Jan. 21 and 22, 1890. Excellent hall accommodations have been secured at the VanNess house. The Central Vermont Railroad has granted round-trip tickets from the following places: Rutland, White River Junction, Cambridge Junction, Richford via St. Albans, Ticonderoga, and all intermediate points, to Burlington and return for fare one way. A good meeting is expected, and all are invited. For further information and programmes, apply to the Secretary,
J. H. LARRABEE, Larrabee's Point, Vt.

To Correspondents.

Our Club Rates are: $1.90 for two copies (to the same or different post-offices); and for THREE or more copies, **90 cents** each.

The Bee Journal is sent to subscribers until an explicit order is received by the publishers for its discontinuance, and the payment of all arrearages is made.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one getting up a club, can have Sample Copies sent to those they desire to interview, by sending the names to this office; or we we will send them all to the agent.

Foreign Postage.—To all countries in the Universal Postal Union, 50 cents extra. To all countries NOT in the Universal Postal Union, $1.00 more than the subscription price.

How to Send Money.—Remit by Express, Post-Office Money Order, or Bank Draft on New York or Chicago. If none of these can be had Register your Letter, affixing stamps both for postage and registry, and take a receipt for it. Money sent thus, IS AT OUR RISK; otherwise it is not. Do not send Checks on Local Banks, for they cost us 25 cents each, at the Banks here, to get them cashed.

Make all Money Orders Payable at Chicago, Ills.— Some postmasters in the country insist on making such payable at some sub-station of Chicago, but we want them drawn on the *main office*.

Postage Stamps of any denomination may be sent for any fraction of a dollar; or where Money Orders cannot be obtained, stamps for any amount may be sent.

Subscription Credits.—The receipt for money sent us will be given on the address-label of every paper. If not given within two weeks after sending the money, write to us, for there must be something wrong. Do not wait months or years, and then claim a mistake. The subscription is paid to the END OF THE MONTH indicated on the wrapper-label. This is a continual statement of account.

We will take Canadian paper money for subscription or books; and Canadian postage stamps may be sent for fractions of a dollar.

Do not Write anything for publication on the same sheet of paper with business matters, unless it can be torn apart without interfering with either part of the letter. Both may be sent in one envelope, but must be on separate pieces of paper.

Never Send Silver in letters. It will wear holes in the envelope, or may be stolen.

Emerson Binders, made especially for the AMERICAN BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, postpaid, for 60 cents each. They cannot be sent by mail to Canada.

Lost Numbers.—We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails, we will cheerfully replace them if notified before all the edition is exhausted.

Always Give the Name of the Post-Office to which your paper is addressed. Your name cannot be found on our List, unless this is done.

We will Present a Binder for the BEE JOURNAL, to any one sending three subscriptions to the BEE JOURNAL—with $3.00—direct to us.

Advertisements for the next BEE JOURNAL must reach this office by the Saturday of the previous week.

BEE BOOKS

Sent by mail on receipt of price by

Thomas G. Newman & Son

925 West Madison St.,
CHICAGO, ILLINOIS.

Rates to Dealers.—On 10 or more copies, 25 per cent. discount, including postage; or if the dealer pays the transportation, 40 per cent. discount will be given.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by THOMAS G. NEWMAN—220 profusely-illustrated pages, bound in cloth. Price, single copy, **$1.00.** 2 copies, **$1.80.** 3 copies, **$2.55.** 5 copies, **$4.00.** 10 copies, **$7.50.**

Bienen Kultur;—oder Erfolgreiche Behandlung der Bienen, by THOS. G. NEWMAN.—This is a German translation of the principal portion of the book called "Bees and Honey." 100 pages. Price, **40 cts.** Per dozen, **$3.00.**

The Apiary Register, by THOMAS G. NEWMAN.—A Record and Account Book for the Apiary, devoting 2 pages to each colony, and so arranged that a mere glance will give its complete history. It is strongly bound in full leather. Price, for 50 colonies, **$1.00.** For 100 colonies, **$1.25**; 200 colonies, **$1.50.**

The Bee-Keepers' Convention Hand-Book, by THOMAS G. NEWMAN.—It contains a simple Manual of Parliamentary Law and Rules of Order for Local Bee-Conventions; Constitution and By-Laws for a Local Society; Programme for a Convention, with Subjects for Discussion. Price, cloth binding, **50 cts.** Leather binding, **60 cts.**

Bee-Keepers' Guide, or Manual of the Apiary, by PROF. A. J. COOK.—The edition of 1888 is entirely rewritten, and is not only instructive, but interesting and thoroughly practical. It comprises a full delineation of the anatomy and physiology of Bees. Price, bound in cloth, **$1.50.**

☞ A few copies of the old edition can be supplied at **$1.25** per copy.

Honey as Food and Medicine, by THOMAS G. NEWMAN.—It gives the various uses of Honey as Food; Recipes for making Honey Cakes, Cookies, Puddings, Foam, Mead, etc. Also Honey as Medicine, with many valuable recipes. This pamphlet is intended for consumers, and it should be liberally scattered, to create a demand for honey.—Price, for either the English or the German edition, 5 cts.; one dozen, 40 cts.; 100 for $2.50; 500 for $10.00; 1,000 for $15.00.

☞ If 100 or more are ordered, we will print the bee-keeper's card (free) on the cover.

Why Eat Honey? (Leaflet No. 1), by THOMAS G. NEWMAN.—This leaflet is intended for distribution in the bee-keeper's own locality, in order to create a Local Market.—Price, 100 copies, 50 cts.; for 500, $2.00; for 1,000, $3.25.

☞ If 200 or more are ordered at one time, we will print on them the honey-producer's name and address FREE.

Alsike Clover, (Leaflet No. 2). This is intended to scatter among farmers, to induce them to plant Alsike Clover for Pasturage and Hay, and thereby improve the neighborhood for bee-forage. Price, 100 for 50 cts.; 500 for $2.00; 1,000 for $3.25.

How to Keep Honey, (Leaflet No. 3), by THOMAS G. NEWMAN.—This leaflet is designed to inform producers, dealers and consumers How to Keep Honey, so as to preserve its richness and flavor, and prevent deterioration by being stored in damp and unclean places.—Price, 100 for 50 cts.; 500 for $2.00; 1,000 for $3.25.

The Preparation of Honey for the Market, including the production and care of both Comb and Extracted Honey, and instructions on the Exhibition of Bees and Honey at Fairs, etc., by THOMAS G. NEWMAN. A chapter from "Bees and Honey."—Price, 10 cts.

Bee-Pasturage a Necessity, by THOS. G. NEWMAN.—Progressive views, suggesting what and how to plant. It is a chapter from "Bees and Honey."—Price, 10 cts.

Swarming, Dividing and Feeding.—Hints to Beginners, by THOMAS G. NEWMAN. A chapter from "Bees and Honey."—Price, 5 cts.

Bees in Winter, by THOS. G. NEWMAN.—Chaff-Packing, Bee Houses and Cellars. This is a chapter from "Bees and Honey."—Price, 5 cts.

Scientific Queen-Rearing, as Practically Applied, by G. M. DOOLITTLE. The author details the results of his Experiments in the Rearing of Queen-Bees for the past four or five years, and is the first to present his great discoveries to the world. Price, $1.00.

Foul Brood—Its Cause and Cure, by FRANK R. CHESHIRE, of London, England. It describes his experiments with the use of Phenol for the cure of the diseases of Bees. Price, 10 cents.

Honey as Food and Medicine.—This is a French edition of the pamphlet in English bearing the above name, by THOS. G. NEWMAN. It is printed in large type, and contains 20 pages. Price, 5 cents.

Revised Langstroth Book, by CHARLES DADANT & SON; edition of 1889. It is entirely re-written and fully illustrated. Price, **$2.00.**

Convention Reports.—A brief history of the North American Bee-Keepers' Society, with a digest of all its previous Conventions, and full Reports of the Proceedings of the Conventions held at Detroit, Mich., in 1885; at Indianapolis, Indiana, in 1886; at Chicago, Ills., in 1887; and at Columbus, Ohio, in 1888. Price, **50 cents.**

☞ Report of either Convention, **25 cts.**

A B C of Carp-Culture, by MILTON P. PIERCE.—It explains the simplest, cheapest and most effective system of carp-culture, and being written by the Secretary of the American Carp-Cultural Association, it cannot fail to be of inestimable value to all interested in the fascinating avocation of carp-culture. 100 pages. Price, 40 cents.

A B C of Potato-Culture, by T. B. TERRY.—It tells how to grow potatoes in the largest quantity, and of the finest quality, with the least expenditure of time and labor. It is not only valuable to potato-growers, but a great part of it applies to the management of almost any crop on the farm, especially to the preparation of the soil, manures, etc. Price, 40 cents.

Kendall's Horse-Book.—No book can be more useful to horse-owners. It has 35 engravings, illustrating positions of sick horses, and it treats all diseases in a plain and comprehensive manner. It has many good recipes, etc. Price, in either English or German, 25 cents.

Western World Guide and Hand-Book.—It contains 288 pages of useful information for home-seekers or tourists, capitalists or laborers. A vast amount of information not to be found elsewhere. Price, 50 cents.

Practical Turkey Rearing, by FANNY FIELD, the most experienced turkey-rearer in America. Written expressly for those who are interested in making the business profitable. All turkey-rearers should get it. Price, 25 cents.

How to Raise Comb Honey, by OLIVER FOSTER.—16 pages. Price, **5 cts.**

Foul Brood, by A. R. KOHNKE.—Origin, development and cure, as taught by the most noted apiarists of Germany. Price, **25 cts.**

Scribner's Lumber and Log Book.—Gives measurements of all kinds of lumber, logs and planks; wages, etc. Price, **35 cts.**

Emerson Binders.—Made especially for the AMERICAN BEE JOURNAL, and lettered in gold. They cannot be mailed to Canada. Price, **60 cts.**

Constitution and By-Laws.—For local associations, with name of the organization printed. Price, **$2.00** per 100.

Ribbon Badges for Bee-Keepers, upon which is printed a large bee in gold. Price, **10 cts.** each. Large and elegant Badges, with rosette, **50 cts.** each.

Photographs of Dzierzon, Langstroth, or Baron of Berlepsch. Price, **25 cts.** each.

Comb Honey—How I produce it. By GEO. E. HILTON. Price, **5 cts.**

Simmins' Modern Bee-Farm, and Its Economic Management—200 pages. Price, **$1.**

Dr. Foote's Hand-Book of Health.—It contains hints and information of the utmost importance concerning eating, drinking dressing, sleeping, bathing, working, etc.

It tells how to cure boils, burns, chilblains, corns, coughs, cholera, diarrhea, dysentery, diphtheria, dyspepsia, ear-ache, felons, headache, hiccough, hoarseness, itching, pimples, piles, rheumatism, ringworm, sore eyes, sore mouth, sore throat, sunstroke, stings and insect bites, toothache, ulcers, whooping cough, worms, etc. Price, 25 cents.

Pocket Dictionary, containing 32,000 words and phrases, illustrated with 670 engravings. 320 pages. Always useful and often indispensable. Price, 50 cents. Mailed free, as a premium for two subscriptions to the AMERICAN BEE JOURNAL with $2.00.

Farmer's Account Book.—It contains 186 pages, printed on writing paper, and is ruled and bound. Price, $3.00. We will club it and the AMERICAN BEE JOURNAL for a year, for $2.00.

☞ If you want it sent by mail, add 20 cents for postage.

Fisher's Grain Tables; For casting up the price of grain, produce, hay; wood measurer, ready reckoner, tables for plowing, etc. Useful to every farmer. Price, 40 cents.

Poulterer's Guide, by C. J. WARD.—It tell how to treat diseases of poultry, etc. Every poultry-producer should have it. Price, 25 cents.

Quinby's New Bee-Keeping, by L. C. ROOT.—This is a new edition of Mr. M. Quinby's "Mysteries of Bee-Keeping," entirely re-written by his son-in-law. It is interesting and covers the entire field of bee-keeping and honey-production. Its style is plain and forcible, making its readers realize the fact that the author is master of the subject. Price, bound in cloth, $1.50.

A B C of Bee-Culture, by A. I. ROOT.—This is a cyclopædia of everything pertaining to the care of the Honey-bee, and is valuable to the more advanced bee-keeper, as well as to the beginner. It contains facts gleaned from the experience of thousands of bee-keepers, all over America. Price, cloth binding, $1.25; paper, $1.

Success in Bee-Culture, as practiced and advised by JAMES HEDDON.—It contains 128 pages, well printed on good paper, and illustrated. It covers the whole field of practical apiculture, and is intended for specialists and those who keep bees for the profits of the business. Price, 50 cts.

A Year among the Bees, by DR. C. C. MILLER.—This is a Talk about some of the implements, plans and practices of a bee-keeper of 25 years' experience, who has for 8 years made the production of honey his exclusive business. Price, in cloth binding, 75 cents.

The Bee-Keeper's Handy-Book, by HENRY ALLEY.—This book contains 270 pages, and is a complete manual of bee-keeping. It gives his methods of Queen-Rearing practiced for 22 years. Price, bound in cloth, $1.10.

Dzierzon's Rational Bee-Keeping.—A translation of the master-piece of that most celebrated German authority. Price, bound in cloth, $2.00; in paper covers, $1.50.

Blessed Bees, by JOHN ALLEN.—This is a romance of bee-keeping, full of practical information and enthusiasm. Price, 75 cents.

The Production of Comb Honey, by W. Z. HUTCHINSON.—It discusses the use of Comb Foundation—when, where and how to use it, etc. Price, 25 cents.

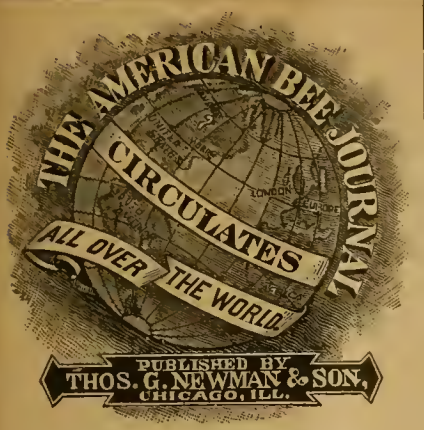
Moore's Universal Assistant, and Complete Mechanic.—This book contains 1,016 pages of over a million industrial facts, calculations, processes, trade secrets, legal forms, items of business, etc., of vast utility to every farmer, mechanic and business man. This is a veritable treasury of useful knowledge, and well "worth its weight in gold" to any mechanic, business man, and farmer. Price, bound in cloth, $2.50.

Dictionary of Practical Apiculture, by PROF. JOHN PHIN.—This book gives the correct meaning of nearly 500 apicultural terms. Price, bound in cloth, 50 cents.

Practical Hints to Bee-Keepers, by CHAS. F. MUTH.—It gives his views on the management of Bees, and details his method for the cure of Foul Brood. Price, 10 cents.

Dzierzon Theory.—The fundamental principles of Dzierzon's system of apiculture as set forth by Berlepsch. It was translated by the Samuel Wagner. Price, 15 cents.

The Hive I Use, by G. M. DOOLITTLE.—It details his management of Bees, and minutely describes his methods for the production and care of comb Honey; management of weak colonies; how to control swarming; how to get the largest yield of honey, etc. Price, 5 cents.



THOMAS G. NEWMAN,
EDITOR.

Vol. XXV. Dec. 28, 1889. No. 52.

EDITORIAL BUZZINGS.

We Wish all our readers and patrons
"A MERRY CHRISTMAS,
and a prosperous and
HAPPY NEW YEAR."

☞ This number completes the Twenty-Fifth year of the AMERICAN BEE JOURNAL—a full quarter of a century. It is old and tried, and ever faithful to its trust.

☞ The full and complete Index in this number will be very valuable to all who keep the numbers for reference, or who use Binders. It covers not only the subjects, but the illustrations, and the names of the correspondents.

☞ Much interesting matter is crowded out of this issue, by the Report of the International Convention and the copious Index. It will appear, however, in the first number of the New Year.

☞ The bees that are left on the summer stands have "had a picnic" this fall. The weather has been so mild—in fact quite "warm"—so that they have been "on the wing" considerable of the time. Winter holds off, and so far we have had no cold weather in this latitude. We hope that Old Winter will not "dally in the lap of spring" to pay for it.

☞ The Eastern New York bee-keepers will hold a Convention at Albany, N. Y., on Jan. 20 and 21, 1890.

Clubs of 5 for $4.00, to any addresses. Ten for $7.50, if all are sent at one time.

Queen-Bees are now mailable to foreign countries. In accordance with our request, and the letters of apiarists who have written to him, the Superintendent of Foreign mails has succeeded in getting bees admitted to the mails of countries of the Universal Union. The Postmaster General has just issued the following circular relative to the matter:

OFFICE OF FOREIGN MAILS,
Washington, D. C., Nov. 23, 1889.

The International Bureau of the Universal Postal Union, at Berne, Switz., having advised this Department that certain countries of the Postal Union have consented to admit to the mails they exchange with other countries, packages containing QUEEN-BEES; provided the bees are packed in wooden boxes, not exceeding 5x2x1½ inches in size, closed with a wire screen protected by a movable wooden lid, and that postage thereon is prepaid, either at the rate applicable to letters or to "samples of merchandise" in Postal Union mails:

IT IS HEREBY ORDERED: that on and after the 1st of December next, Queen-Bees, in boxes which would entitle them to transmission in the domestic mails of the United States, and not exceeding the dimensions above named, shall be admitted to the mails that are exchanged between the United States and the Argentine Republic, Belgium, Bulgaria, Chili, Columbia, Congo, Dutch West Indies (Curacoa, etc.), Egypt, Guatamala, Hayti, Hawaii, India (British), Italy, Liberia, Mexico, Paraguay, Portugal and the Portuguese Colonies, Roumania, Siam, and Spain and Switzerland, at the postage rate applicable to "*samples of merchandise*"; and to the mails exchanged between the United States and Austro-Hungary, France, Germany, Greece, Luxemburg, The Netherlands and Dutch Guiana, provided postage thereon is *fully prepaid* at the rate applicable to *letters*, viz: five cents per half-ounce, or fraction of half-ounce.

JOHN WANAMAKER,
Postmaster General.

Postmasters will cause due notice of the foregoing to be taken at their offices, and issue the necessary instructions for carrying it into effect.

N. M. BROOKS,
Acting Superintendent of Foreign Mails.

Candy for Winter Feeding.—We are requested to give a recipe for making candy for feeding bees over the frames in winter. Here it is:

Use four parts of coffee A sugar, and one part of water; simmer until it becomes quite hard, on being cooled; mould it into frames of one-inch thickness, and lay it on the top of the frames, using sticks underneath ½-inch square, to give the bees free access to it, and the heat of the hive will keep it warm, and soften it.

☞ The Rev. W. F. Clarke writes thus: "The ILLUSTRATED HOME JOURNAL is a welcome monthly visitor to our house. With wife and daughters, it is 'who's who' to get the first read of it. I have to come last, because I am obliged to take it as a relief and relaxation from sterner studies. But I enjoy it very much when I can get to it. We all like it, and so do our grandchildren, cousins and aunts. It is a truly family magazine, containing something for all, whether old or young, that cannot fail to be interesting and instructive."

☞ The BEE JOURNAL gives 52 dividends in a year on an investment of one dollar. Can any one desire a better investment, or richer returns?

Color of Honey.—Mr. J. C. Lee, of Brooklyn, Pa., asks this question:

I heard two bee-men express different opinions about basswood and white clover honey. One claimed that basswood honey was the whitest honey gathered, and that white clover honey was not colorless, but of a yellowish tinge. The other claimed just the reverse of this. Will you please state the color of the two kinds of honey, in the BEE JOURNAL?

White clover honey varies in tint from pure white to amber, according to the location where it is gathered. That from the hill sides varies in color from that in the valleys. Atmospheric conditions, soil, and climate have much to do with its tint. Basswood honey is white, invariably.

Bees and Honey in Indiana.—We have received the Biennial Report of Statistics for Indiana. The total number of pounds of honey reported are 1,624,683 for 1887, an increase of 566,800 pounds over the product of 1886. The average to each colony is about 16 pounds. In 1888 the honey crop had decreased to 923,922 pounds—only a little over one-half of what it was in 1887. The average per colony in 1888 was only about 7 pounds.

Honey Almanac.

Here is what is said of it by those who have seen the Honey Almanac:

It is to every bee-keeper's interest to get the Honey Almanacs well scattered about in his immediate vicinity, especially if he has not got as large a trade as he wishes to have. As for me, I can sell more than I can produce, to do my best, and there is upward of 400 colonies kept within a radius of one mile of my own apiary—all within the limits of the city. I have on hand now 70 colonies.—B. E. Rice, Boscobel, Wis.

We have received the Honey Almanac, and are greatly pleased with it. The book is brimful of choice recipes for cooking, thus commending itself to the housewife; while it contains directions for the use of honey and beeswax in combination with other ingredients, valuable in case of sickness and accident. It also clearly demonstrates the fact that comb honey cannot be "manufactured;" and, altogether, it is one of the best advertisements a bee-keeper can have for the sale of his products. A number of these Almanacs distributed in a town, ought materially to increase the demand for both comb and extracted honey. —*Bee-Keepers' Guide.*

Prices:—25 copies for $1.00; 50 copies for $1.50; 100 for $2.50; 500 copies for $10.00; 1,000 copies for $15.00, delivered at the freight or express office here. The bee-keeper's Card will be printed upon the first page, without extra cost, when 25 or more are ordered at one time. Postage, 40 cents per 100 extra. All orders can now be filled as soon as received.

☞ Whoever before heard of a set of the Waverley Novels being sold for less than $12.00? Just think of our offer of either these or the Works of Dickens, with this JOURNAL until Dec. 31, 1890—all for $2.10! See the last page of this paper.

The Language of Clover.

Written for the American Bee Journal
BY EUGENE SECOR.

Tell me, little winged rover,
That art happy in the clover,
Playing hide-and-seek all day,
While I mow and rake the hay—
Tell me, dainty, restless bee,
What you in those flower-cups see,
As you roam the fields among,
Gleaning treasures with your tongue.

Thus the sprightly miss replied,
As from flower to flower she hied:

"Whenever I journey o'er field or glen,
In search of the nectar in clover,
And peep in the red and white blossoms, then
I think of a maiden with lover.
The *red* are the blushes on modesty's cheek—
Tho' white is the bride's favorite color—
So I a sip from the former do seek,
But am wedded to white, tho' duller."

Further quoth her busy sister,
That well had spoke, or I had missed her:

"This fact I observe in my travels:
Not the brightest are the sweetest,
Not the largest are completest;
The knowledge of *worth* unravels
The mystery why we often
Pass the showy gardens over,
Seeking modest, sweet white clover,
Hidden in the meadow corners."

Then up spoke a cousin we call *Americana*,
A bee "at home," North, or in Louisana:

"But the red and the white with the blue sky above,
Make the colors which all Americans love;
And the stars and the stripes in triumph wave over
The land where we find nearly all kinds of clover."

A queen bumble-bee came buzzing that way,
And this is what I heard her say:

"Those distant relatives spoke quite well,
But have not told it all;
There's more in clover yet to tell,
So I'll some facts recall.
The threefold leaf suggests to me
Its triune virtues rare;
Where clover grows, the mighty three—
Beef, milk and honey are.
And where this last, *best* gift is found,
To bees and clover due,
What flocks are there! What fruits abound!
What wealth the wide world through!
The world itself, too, is a gem—
It's always running 'over.'
With 'love' and 'lover'—sweetest words
Because they're found in *clover*."

Forest City, Iowa.

HISTORICAL.

Some Facts About Mailing Bees 27 Years Ago.

Written for the American Bee Journal
BY C. J. ROBINSON.

I submit a few historical notes relating to the origin of shipping queens per mail. In Dadants' revision of Langstroth's book, it is recorded (as new matter) that Mr. Townley and Mr. Alley were the first shippers. Such record has no foundation in fact, and is erroneous, as I know from personal knowledge.

The Rev. L. L. Langstroth was the first queen-breeder who shipped Italian queens by mail. The history of the matter is: In 1860, L. L. Langstroth & Son bred queens from the Italian queens imported by S. B. Parsons. J. P. Mahan bred from queens imported by himself. His queens and those for Mr. Parsons came into New York harbor on the same ship, and arrived in September, 1859. Later, our lamented Samuel Wagner and Richard Colvin imported queens, from which Mr. Colvin bred queens for sale. Still later (in 1861) William Rose, of New York, imported Italian bees.

In the season of 1861 there was a lively competition in the queen-trade. All of the queen-breeders sent queens by express. Mr. Langstroth bred or furnished his queens in boxes or frames 5 or 6 inches square, and he sent queens with a hundred or more workers on one frame by express. Mr. Mahan, who was joint owner with Mr. Langstroth of the Langstroth patent, used comb frames running from side to side of Langstroth hives, instead of running from end to end of the hive.

In sending queens ordered, he placed one of the comb frames, on which were a queen and a few workers, in a box suitable, as for a cage, and forwarded all by express.

I received queens from Mr. Mahan by express, and one queen from Mr. Langstroth. I was distant 20 miles from the express office, and was bothered to get queens from the office when they arrived.

In the summer of 1863 (it may have been in 1862) I was inspired with the idea of shipping queens by mail. Then I wrote to Mr. Langstroth, stating that I conceived the idea of sending by mail instead of express. He promptly answered me, giving it as in his opinion that the plan of mailing queens was not practical. On reading his answer I determined to experiment, and I got a paper-box about the size of a Peet cage, but thicker, put in one end a piece of old comb with honey in it; fastened it with a needle and thread; punched holes in the box with an ilet punch; caught a common queen; let a few of her workers on to the honey in the cage; dropped in the queen and closed the box; wrapped paper around the cage, making holes to correspond with the air-holes in the box; addressed the package to L. L. Langstroth & Son, Oxford, O., and put it in the mail-pouch.

A few days later, I received a letter from Mr. Langstroth, informing me that the bees came all right, and that he began to believe that they might be transported through the mail. He, at the same time, sent me an Italian queen in a very small cage—a pine stick one inch square, corners dressed off, and a $\frac{5}{8}$-inch hole bored in one end about $2\frac{1}{2}$ inches deep, a bit of honey (in comb) put in the bottom, the queen and some six workers put in the hole, wire-cloth nailed on the open end, and a paper having on it my address was glued on the stick.

The package came all right in the mail, but the bees were dead, and the queen (a fine Italian) was just dying when I received it. The cause of their dying was because they were daubed with honey.

I reported the arrival of the bees and his ill-success, whereupon he mailed to me another queen. The cage was like the first, only a little larger. Both queens were fine, beautiful Italians, and he sent them gratis.

Such was the origin of mailing queens. Messrs. Langstroth & Son at once adopted the plan of sending out queens to their patrons by mail, and were the first to do so, and others followed Mr. Langstroth's way of shipping.

As for myself, I never sold a queen, and do not make any claim other than that of the original thought, and executed the plan, set the example first, and then Mr. Langstroth put it into practice. I wish to have given to Mr. Langstroth that which is his due, and I want what is due me. I know that Mr. Langstroth has priority over all others in the business of sending out to patrons Italians queens by mail transit. I feel that it is unjust for other parties to be credited with the honor, and that, too, in his famed book.

I am aware that I am looked upon as being inimical to Father Langstroth. Such has, I presume, been prompted by reason of some of my criticisms, but I want to do justice. He was greatly benefited by my suggestion and experiment, and he so acknowledged at the time. At that period I was one of his few disciples. Mr. Langstroth was being driven to the wall during the period from 1860, and later years. See his answer in June, 1861, which was published in the *Country Gentleman*, and copied into the AMERICAN BEE JOURNAL, in the June issue for 1861. I then esteemed Mr. Langstroth about the same as do his latter-day disciples. Herewith I enclose for your perusal a leaf from the *Country Gentleman*, on which is an article I wrote. What prompted me to write it, was the circumstances of the case. Mr. Langstroth is a very modest man—a clever soul—not actively brilliant—his aspirations were only for mutual good—he was no financier, and he could not cope with such brainy, active men as were his opponents. I saw how it was in the

race for patronage, and it excited my sympathy for friend Langstroth, and I aimed at his rescue.

I wrote to Messrs. Dadant after reading their response to my article in the AMERICAN BEE JOURNAL, and referred them to Mr. Langstroth to corroborate my statement as being first to mail queens. They answered by saying that Mr. Langstroth is not in a condition to answer inquiries. Certain it is he has been able to answer as to the origin of mailing since they (Dadants) commenced the revision. If they wished to record that history, they ought to have sought the information from reliable sources, and if they were unable, as they confess, to obtain reliable information, not record any history relating to the origin of the plan.

The AMERICAN BEE JOURNAL was discontinued during a period of some three years. I well remember its being discontinued because the war absorbed the attention of our whole country to that extent that infant enterprises were neglected—could not weather the storm. If I am not mistaken, the AMERICAN BEE JOURNAL was not issued in the summer of 1863, the time of mailing the first queens thus sent out.

On page 276 of the AMERICAN BEE JOURNAL for 1881, appears an article written by myself, under the heading, "Origin of sending queens by mail." Prior to that date, the editor mentions my claim, copied it, I think, from the *Bee-Keepers' Magazine*. In a letter received from Mr. Frank Benton a short time ago, he said that he was cognizant of the fact that I was the first to send a queen in the mails, and that *he* was the first who succeeded in sending safely queens per mail across the seas. I propose giving Mr. Langstroth the honor of being the first who shipped queens by mail to purchasers.

[The AMERICAN BEE JOURNAL was suspended during the war, from January, 1862, to June, 1866, and that accounts for the lack of history of the passing events during that time. Our friends, Messrs. Dadant, we feel sure, will make the necessary correction in the next edition, which will be issued at no distant day. Meanwhile, the AMERICAN BEE JOURNAL most cheerfully records the interesting bit of history, and gives credit and honor to whom honor is due. This, we think, will satisfy all reasonable beings. The copy of the *Country Gentleman* for July 28, 1864, which Mr. Robinson sends, fully corroborates his assertions about bees being then sent in the mails by Mr. Langstroth.—ED.]

VISITING.

Description of a Visit to a Connecticut Apiary.

Written for the American Bee Journal
BY LUCY JANE SHERMAN.

I have recently visited an apiary situated about five miles from here, and I will give a short account of it.

It is called the "Riverside Apiary," and is in West Norwalk, Conn. To one "not to the manor born," the drives between the Norwalks, Noroton, Rowayton, and New Canaan, are all interesting. Everywhere we see very old houses with gable-roofs and stone chimneys, and shingles in place of clap-boards. Stone-walls abound, and in every direction the land looks "rock-ribbed and ancient as the sun."

Riverside Apiary belongs to a Mr. Johnson. He is preparing to winter 28 colonies. His hives are almost exactly like the Cary chaff-hive. His specialty is rearing queens, though he sells both comb and extracted honey. He has sold 1½ tons of honey the past summer, 1,200 pounds of which was from white clover, and sold in July for 25 cents per pound. The rest has brought 20 cents—even for the extracted honey. He considers this one-third of a crop. He has two extractors in the honey-house.

A SUN WAX-EXTRACTOR.

He has one machine which I have never seen before, and which he claims is his own invention. I think that he called it a wax separator. Its object is to melt the wax and separate it from the impurities. It consists of a wooden box lined with tin, which contains water about one inch deep. The cover is lined with some highly-polished metal, and is fastened to the box with hinges. Within the box is a tin-pan made to fit the box, only not so deep, with a depression in the bottom, and something like an inverted tea-strainer inserted.

The scrapings of the wax are put into this pan, and covered with a tightly-fitting glass cover. The outside cover is left up, at right angles with the box. The sun strikes the highly-polished lining, is reflected on the glass cover below, causing heat sufficient to melt the wax, which runs through the inverted tea-strainer, into the water below, while the refuse remains in the pan.

There are no trees in this apiary—it is a sort of "five-acre lot" behind the house. On one side, full 50 feet below, is Five Mile river, which, at this point, is only a respectable brook in size.

DECOY FOR SECURING SWARMS.

Mr. Johnson does not use a drone and queen trap; to secure swarms, he clips the wings of every queen, and when a swarm issues, he uses a *decoy*. I had never seen a decoy, and for the benefit of those equally ignorant, I will try to describe this:

Two pieces of wire-cloth of equal size are fastened to frames, perhaps six inches square, connected by hinges, and fastened to a pole 4 or 5 feet long. This pole is fastened to two other poles shorter than the first, but equal to each other. These three poles are set in the ground in front of the hive which is casting a swarm.

The wire-cloth frames open like a book, and some part of the swarm is likely to settle underneath them. Meanwhile the bee-keeper takes what he calls a "queen-bottle"—that is, a piece of wire-cloth joined so as to form a cylinder, with a cork at each end—picks up the queen (she will be found in front of the hive, as her wings are clipped), puts her into the bottle, puts in the cork, and hangs the bottle on the decoy. Of course, all the other bees join those on the decoy, and the swarm may be hived easily.

I visited another apiary the same morning, but it was no larger than the first-mentioned, and apparently had no distinctive features.

Rowayton, Conn., Nov. 19, 1889.

BEE-TALK.

International Convention at Brantford, Ont.

Written for the American Bee Journal
BY W. Z. HUTCHINSON.

THIRD DAY.
MORNING SESSION.

The convention was called to order at 8:30 a.m., with President Mason in the chair. The exercises were opened with prayer, by President-elect R. L. Taylor.

It was voted that Thomas G. Newman & Son be paid $15.00 towards printing in pamphlet form the Report of the proceedings of this Convention, and to furnish a copy for each of the members, by mail.

Contradicting Reports Injurious to Bee-Keeping.

E. R. Root called attention to the Chicago *Herald* affair. It had published false and misleading stories regarding "manufactured honey," and failed to retract until numerous letters from subscribers came pouring in. A large number of letters from *subscribers* seems to have a wonderful effect upon an editor. Mr. Root urged all bee-

keepers to write *at once, themselves*, to any paper in which they saw false statements regarding their industry, and its products, and contradict them. This would do more good than anything else that could be done. Mr. Root then read an essay upon,

Riding Hobby-Horses.

Bee-Keeping as a Recreation from Other Pursuits, and an Antidote for Disease.

A hobbyist, or one who rides hobby-horses, is, according to Webster, one who pursues anything unduly, or to the weariness of others. I am not one who would advocate riding hobby-horses to such an extent; but I am one who would, by all legitimate means, encourage healthy enthusiasm in bee-keeping, or, in any other pastime or pursuit.

Riding hobby-horses has been a characteristic of the Medina "Roots." In harmony with such characteristics, perhaps I have inherited my due share. I am going to talk to you to-day on the benefit of having a mild hobby—not one that will make its rider get so crazy as to neglect his legitimate business, but one that will help in its pursuit.

Coming down to the subject, the first question I ask is, "What do we keep bees for?" You answer, "For the production of honey and wax—that is, for the *money* that there is in them." But is this the only reason? Nay, verily. We not only keep them for the *money* that there is in them, but for the real fun that we can get out of them—a sort of fun that is akin to a healthy enthusiasm; a fun that lightens the burden of our daily toil, gives zest to life, and a new lease to it.

In a late number of that excellent periodical, the *Bee-Keepers' Review*, Prof. Cook Cook says:

> In every business, one can do better work if some variety comes into the life. This rests the mind, brightens the hopes, and makes the success better in both lines. Thus the minister, the lawyer, and the teacher, think and speak to better purposes from their work and experience in the apiary. The bee-keeper has clearer thought and better success from his rest periods, when he wrestles with the problems of how he may save souls, save property, or educate his fellows.

The Professor is in a position to know whereof he speaks, and he hits the point exactly. "All work and no play makes Jack a dull boy." Close application to work of the every-day sort, year in and year out, wears on the constitution; but if one has a hobby-horse to release the tension during his odd hours, he will not only enjoy the work more, but live more and better, as Prof. Cook aptly puts it. Several instances come to my mind, viz:

A business man of my acquaintance gave such close attention to his business as to become morbid, even despondent. When he arose in the morning, it was his *business;* when he ate his meals, it was his *business;* when he went to bed, it was his *business;* and in his dreams it was his *business;* and the result was, melancholia came upon him, and the end was suicide. A mutual friend, in speaking of this sad event (who was considerable of a horseman, and who enjoys breaking colts, and whose hobby, by the way, is horses), said: "If that man (Mr. W.) had had a fine colt, and had gone out mornings to take a little drive, breathe in the fresh air, and watch the development of this noblest of animals, he might have been alive now, and such a thing as despondency might have been unknown to him."

Another friend of mine, a teacher of music—and most musicians are more or less nervous — confessed one day that thoughts of suicide continually entered his mind; and, as a confidential friend, he asked my advice. Said I, "You lack variety in work. You need recreation in the shape of a hobby, to interest you, aside from your duties." Of course, I advised him to keep bees. But he had such a natural aversion to them that the thought was utterly out of the question. I next suggested poultry. He embarked in the business, and now his health is not only much improved, but that dreadful thing that sometimes afflicts humanity—melancholia—is gone. He has obtained a new lease of life, and enjoys the work of his profession; and when he goes home from his work, he works with a keen zest among his poultry.

I might take one more example, and a very familiar one, I doubt not, to many of you. My father once was, as you know, a jeweler by trade. Close application to business, however, brought on paralysis. The doctor advised him to get out-doors and work with his bees. The result was, that the jewelry business was in time abandoned, and bee-keeping as a pursuit was adopted. His health returned, and a new lease of life was added. Again, editorial work, together with general business, broke down his health. The green-house and garden hobby was next taken up, and health has again been restored. Instead of dying worn out, he is in possession of almost his full vigor.

Once more, if you will pardon the allusion, I will refer to my own experience. At a comparatively early age in life I had hobbies, not because my health demanded it, but because I inherited these tendencies. First it was electricity; then that most interesting of pastimes, the study of the microscope. Later on in life, when I began to assume responsibilities in the work in which I am now engaged—namely, bee-journalism and bee-keeping—I felt constantly the need of a change. Amateur photography attracted my odd spells, and very soon it became a most enjoyable pastime; and at the supper-table I was ever and anon talking about "that last photograph I took," "instantaneous exposures," and "flash-light negatives," until my hobby-horse was indeed a weariness of flesh to my better-half.

The result of the hobby was, that it gradually incorporated itself into my general work, and the consequence was, that many of the articles in *Gleanings* were illustrated which would not otherwise have been.

Later, out-apiaries began to attract my attention; and feeling the need of a good horse—one that could get over the ground pretty lively—I was soon in possession of a fine colt—an animal that was intelligent, and one that reciprocated in many ways the little attentions that I gave him. He was a *hobby-horse* in very fact. I read up all I could find on the subject of horses; I enjoyed driving him; and when I got back to my regular work, I hardly know why, but everything possessed a joy that it had not before. *Gleanings* was made better, perhaps, and some of my long, prosy articles were made more concise.

While these hobbies did not build up a broken-down constitution, as in the other instances, they served admirably to preserve a general good health, on the principle "that a stitch in time saves nine." They did another thing: They kept me in my younger years away from the street-corners, and from contracting bad habits at that age in life when boys are easily led astray.

It is to be observed, that I have had several hobbies. I have looked the field all over. I know something of the attractions in raising fine poultry; I have experienced the passion of studying and working with electricity; I have seen a little of the hidden beauties revealed under the lens of the microscope; I know what it is to appreciate and enjoy a good photograph; I believe I can tell when I see a good horse—whether he has got a good action; whether he is sound; whether he can travel a mile in 4 minutes, or whether he can make that distance in 3 minutes, or in 2:10; but not one of these hobby-horses presents half the attractions that the study of bees does.

Bee-keeping is eminently well-fitted as a pursuit, and as an amusement for the busy man who spends long hours in the office. There is nothing of the kind that stimulates study, that fires up enthusiasm, that rests the mind, and so gives a new lease of life, as does bee-keeping. To ministers, there is an unlimited field of illustration in the bee-hive. D. A. Jones once said to me, that he did all he could to induce ministers to take up bee-keeping, not only because it gave them another means of livelihood, but because it opened up to them a world of illustrations, and at the same time gave them one of the most delightful of pastimes.

And now let me glance briefly at the latter end of my long-tailed subject—"Bee-keeping as an antidote for disease." Many of the minds of those present will recur to Mrs. Sarah J. Axtell, of Roseville, Ills., an invalid who is confined to her couch during the greater part of the year. When the bees begin to work in the fields, little by little she gets out into the apiary, and finally she is able to accomplish the work of most strong men. Her husband, likewise, has poor health, and yet they both experience better health while at work among the bees. In a single season, from 180 colonies they once obtained 39,000 pounds of honey, and sold the whole for cash. If my time was not so limited, I might mention scores of similar instances.

I think it is safe to say, that a very large percentage—perhaps a half—of those who keep bees were attracted to that business, not because of the money there might be in it, but because of the delightfulness of the occupation, and because of its influence upon the health. Dr. C. C. Miller, as a musician, has had offers of large salaries that would dazzle the eyes of most of us; but, no, he prefers God's pure air, and out-door work with the bees.

But, you say, "You are going to get everybody to go into the bee-business, and so break down prices." Oh, no, not at all. Intelligent, reading people who *need* recreation or diversion in the garb of a hobby, are not the ones who would break down prices. We get from the ranks of such people such scholarly men as Prof. Cook, Dr. C. C. Miller, P. H. Elwood, S. Corneil, and scores of others whom I might name.

My object in writing this, is not to point out how bee-keepers can *earn* more money, but to call the attention of professional and business men, and overworked men in general, to something that will lighten their daily toils, give them a new lease of life, and open their hearts to a new world.

ERNEST R. ROOT.

S. Corneil thought that there was danger of riding hobby-horses too hard. If the interest in the hobby becomes too great, it is injurious.

R. McKnight agreed with Mr. Corneil. He (McKnight) began keeping bees as a pastime, and became so interested that he sat upon a stool, under an apple-tree, four days, waiting to see the first swarm issue (laughter). He now prosecuted the business for the money there is in it.

R. L. Taylor began keeping bees as a pastime, and became so interested that he could not let it alone. He said

that business men ought to be careful how they take up bee-keeping as a recreation. If they become so interested that they neglect their other business, it is then "all day with them." This is really a more serious affair than one would suppose. "*I*," said Mr. Taylor, "got upon the hobby-horse of bee-keeping, *and couldn't get off*, and *now* I don't want to get off."

President Mason—I think that Mr. Taylor is right. I have often thought, although I have never before said it, that I would have been better off if I had never kept a bee. I think that the warning of Mr. Taylor is appropriate.

Bottles for Honey.

R. McKnight showed some samples of bottles for honey. They were imported; none like them are made in this country. One style is called the "tie-over," because a parchment is tied on the cork. Some of them had screw tops. They varied in size from one-half pound to 3 pounds. They were almost unbreakable, as was shown by the manner in which Mr. McKnight kicked them about the platform, and allowed them to be tumbled from the table. He showed bottles filled with honey in 1888 that had never granulated. The honey was heated to near the boiling-point, then sealed up while hot. He admitted that the flavor was slightly affected by the heat.

Swarming Without Drones.

"Do bees ever swarm before the queen has laid any drone-eggs?" was asked.

President Mason said "Yes;" and gave this as a reason why he thought that the use of wooden combs would not prevent swarming.

Combined Supers and Shipping-Crates.

"Can honey be produced in the same receptacle in which it is to be shipped?"

E. R. Root—It can, but it is scarcely advisable.

R. L. Taylor—I have two brothers (farmers) who produce honey in this manner, and secure nearly as much in price as those who clean and crate their honey.

The convention then adjourned until 1:30 p.m.

AFTERNOON SESSION.

The convention was called to order at 1:30 p.m.

Mr. Ivar S. Young, of Christiana, Norway, sent a sample case of honey to be shown at the convention. If the sample sent is a fair production of the honey of that country, the inhabitants have no need to be ashamed of it. It is very light in quality, and very elegant in flavor. Considerable time was taken up in inspecting this honey, after which the thanks of the association were tendered Mr. Young for the honor he conferred upon them in sending the samples of honey to the convention, and that the Secretary forward a copy of the resolutions to Mr. Young.

The Convention then listened with delight to the reading of an essay by Prof. A. J. Cook, illustrated with colored charts, upon the

Alimentary Apparatus of Bees.

If there be truth in the doctrine of organic inertia, and if modification of organs and organisms has risen wholly, or in part, through impringement upon their surroundings, then for the maximum of differentiation, we should look to organs and organisms most used, or those most important in the organic economy.

Nutrition is the great function of animal life. To secure and prepare the food is the chief work, at least of all the lower forms of animal life. We should expect them to find differentiation most marked in such organs as are useful in procuring the daily bread. Among insects, the legs, wings and alimentary organs are the real weapons in this important work of "bread winning." In bees, where the habits are so marvellously varied, we should expect a marvellous variation or modification in these organs—nor would we be disappointed. I think we would hardly except man himself, in the remark that nowhere in the whole animal kingdom, do we find more interesting and startling structural developments than are to be found in our study of the honey-bee.

Two years ago, at the Chicago meeting of this association, I showed how vividly this is illustrated in the modification of the legs. The modified-hairs, antennæ-cleaner, wax-jaws, pollen baskets, and pulvilli are marvels of structural modification, for the attainment of specific purposes. The functional complexity of the legs of these insects, is only equalled by their marvellous development and structural differentiation.

In this essay, I wish to explain the anatomy and physiology of the alimentary system of the bee. In the tongue, and digestive system of this insect, we find a structural modification even more surprising than that of the legs, equally, if not more, marvelous than is to be found in any other organic structures.

In this essay I shall confine myself to a discussion of the tongue, the glands, the stomach, mouth, honey-stomach, and true stomach.

It is a curious fact that long and familiarly as the bee has been known, yet in all the descriptions no one has rightly understood the bee's tongue. I know not a single discription that is entirely accurate. Many of our latest writers are not as correct as was the grand old master Swammerdam. Even the last editor of the admirable Encyclopedia, Brittanica, is wholly wrong. It says (Vol. III, page 485), "It is not tubular, as Swammerdam had supposed, but solid throughout, and the minute depression at the extremity is not the aperture of any canal through which liquid can be absorbed. It performs strictly the office of a tongue, and not a tube for suction." Every statement in this paragraph is entirely untrue.

The bee's tongue is a double tube. The inner or central tube of the tongue is perforated at the end, and through this, nectar is drawn from tubular flowers. This tube is slitted, too, near the end, on the under side, and the edges of this rigid slit are united with the corresponding edges of the outer tube by a somewhat folded membrane. The length of the tongue varies from .23 to .26 of an inch. It is longer in the yellow than in the black races.

At the base of this double cylinder, just anterior to where the ligula joins the mentum, the central tube opens by a short slit on its upper side. By holding bees by the wings, and permitting them to sip colored liquids, and then by cutting off their heads while still sipping, it is easy to learn just how they sip. When they have access to a large drop of nectar, they not only draw the liquid through the central tube, but also through a much larger extemporized tube, formed by approximating their maxillæ. This is the way they suck the honey from such bountiful sources as the linden, where a single colony of bees may store 15 pounds in a day.

In case the nectar is at the bottom of long corolla-tubes, then the bee can only use the small central tube, and must sip very slowly. Again, in case the nectar is spread out thin on any surface, the bee can throw the central tube out by tightening the folded membrane, and, by parting the slit, can draw in and lap up the spread-out liquid. This is also a slow process.

The outer tube is imperforate at the end, and by filling this with blood the tongue is speedily elongated. Thus the tongue is extended by the action of the muscles, aided by this protrusive force of the nutritive fluid which is also forced into the tongue by muscular action.

Connected with the digestive apparatus, are three pairs of glands. The upper head-glands are high up in the head cavity, and in structure, resemble a compound leaf, or the meibomian glands in our own eye-lids; that is, a central tube receives the ducts from numerous follicles. These main ducts empty one on each side at the base of the mouth.

Below the glands just mentioned are the lower head-glands. These are compound, racemose glands, and empty into a long duct, which also receives the ducts from a second pair of similar glands located in the thorax. The common duct from these four glands empties just at the position of the slit at the base of the ligula, just where any secretion could be best poured into and mixed with the stream of nectar that might be drawn through the tongue in any of the three ways already mentioned.

The function of these glands has, I think, been misunderstood in part, by even such authorities as Leuckart and Schiemenz. They think that the upper head-glands secrete the larval food. I feel sure that this is wrong. I believe they secrete the saliva of bees, a substance analogous to our own saliva, in that it is mixed with the pollen or bee-bread, and renders it soft and plastic. More than this, I think the secretion from the glands doubtless furnish the ferment which aids to digest the pollen or albuminous food of the bees. The fact that the nurse or young bees furnish chyle or digested food to nourish the thousands of larvæ of each hive, and also to feed the queen and the drones, explains why these glands are so large in the nurse-bees.

My reasons for this view are, that the mouths of the ducts on the bee's mouth are just where they should be; the large size of the glands in the nurse-bees is also in harmony with this view, and except for this secretion we cannot explain the deglutition of the pollen.

The function of the secretion from the other four glands is without doubt to digest nectar of flowers. As is well known, this nectar is neutral, and contains cane sugar. Honey is acid, and contains reducible sugar. Thus honey is digested nectar, and the secretion from the large racemose glands of the bee is the agent which effects this transformation. The common duct from these glands empties just where the

stream of honey from the tongue enters the mouth. This honey must be digested while in transit from flower to hive.

The fact that a colony of bees may gather 20 pounds of honey in a day, explains the necessity of the great size and number of these glands. The fact that all honey is not equally reduced, and that some honey has even a right-handed rotation, is also explained. When honey is collected very rapidly, as is often true in the linden season, it is not fully digested. This makes the analysis of honey a difficult matter. I much question whether any chemist can certainly determine whether or not honey is pure. I positively know that some of our best chemists have pronounced honey of undoubted purity, to be adulterated. To one acquainted with the physiology and habits of bees, this is not surprising.

The honey-stomach is a strongly muscular organ, richly lined with epithelial cells, and in no wise peculiar, except for the interesting and complex stomach mouth at its lower end. This is a slightly oblong, nearly spherical organ, with a central passage. The four segments which comprise the anterior end are jaw-like, slightly movable, and have a peculiarly snapping motion, as is easily seen by viewing a fresh specimen under a low power objective.—Short bristle-like hairs form a thick lining to the central cavity. These hairs point downward.

The function of this unique organ is as interesting as its structure. The fine pollen-grains of flowers, as you all know, are light and airy, and so float in every breeze. As they fall from the overhanging anthers, they often lodge in the same nectar that attracts the bees. Thus as the bee sucks the nectar from the flowers, it secures at the same time more or less of this rich nitrogenous pollen. The pollen and nectar pass together into the honey-stomach. When the bee reaches its brood-nest, it desires to pass the honey—for by this time the nectar has been digested—into the cells, where it is stored for the future needs of the bees. But while we find a small amount of pollen in the honey, we find much less than is found in the nectar. But how can the bees separate this pollen from the nectar? It is done by this stomach-mouth, the jaws of which are constantly opening and shutting as the bee is gathering from flower to flower, and is bearing its full load to the hive. Thus the mixed nectar and pollen are drawn into the central cavity of the stomach-mouth, when the jaws close, pressing the nectar back into the honey-stomach, while the pollen is retained by the bristles, and passed into the true stomach. This constant motion also mixes thoroughly the nectar and saliva, thus promoting the digestion of the nectar or the formation of the honey.

We see, then, that the stomach-mouth is a sort of screen, whose purpose is to separate the nitrogenous from the carbonaceous food. The former is in small quantities, just sufficient for the daily needs, while the honey comes in large quantities, and is stored up for times of scarcity.

Where the stomach-mouth enters the true stomach, the central opening is continued in a free membranous tube which hangs in the true stomach. This, of course, serves as a valve, and prevents the digested material (as it is pressed by the muscular action of the stomach), from returning through the stomach-mouth into the honey-stomach.

It is now a well-known fact that the nurse-bees digest the food for the larvæ, the queen, and the drones. It is probably true that all the albuminous food of both queen and drone is prepared by the nurse-bees.

The upper head-glands are not found in the drones, and are very rudimentary in the queen. Thus these bees are not able to take and digest pollen. They can take the honey, and so have the racemose glands, which, in case the nectar was not fully digested by the worker-bees, enables the queen and drone to complete the digestion. Thus the queen, during the active season, while she is often laying 2,000 or 3,000 eggs daily, receives her food all prepared for absorption, and so we understand how it is that the queen may lay nearly twice her weight of eggs daily. I have weighed laying queens several times, and find them to weigh about .23 of a gramm, or about 35 grains. I have found that 3,000 eggs weigh about .4 of a gramm, or about 60 grains. This wondrous performance is only possible, in that the queen's food is wholly digested for her by the nurse-bees.

The nature of the food given by the nurse-bees to the brood, and to the queen and drones, has been much discussed. Dufour thought that it was chyle, or food fully digested and ready for absorption. Schiemenz argues that it is the secretion from the upper head-glands. Schonfeld believes that Dufour was correct—digested pollen with additions of honey.

Schiemenz thinks that the valve that reaches from the stomach-mouth into the true stomach, would make it impossible for the bee to regurgitate any food which had really entered the true stomach, and so argues, despite the location of the mouths of these ducts, and the necessity of saliva for the liquification of the pollen, that the jelly or larval food is really the product of the upper head-glands. From several experiments which I have tried, I believe Schonfeld and Dufour are correct, and Schiemenz in error. One experiment which in itself seems crucial, I will explain:

I removed from a small colony of bees all the honey, gave them a frame of brood, and shut them in their hive. I then mixed some finely-pulverized charcoal with some diluted sugar syrup, and fed it to these bees. As the charcoal is insoluble and indigestible, of course it cannot and does not pass through the walls of the stomach into the blood, and so cannot ever pass to the glands. Even if it were in the blood, it could not enter into secretion, as it is in non-osmotic, and so could not appear in the saliva. Yet this charcoal appears in the food given to the larvæ. This food then cannot be a secretion, but must be the chyle or digested food of the nurse-bees.

That the strongly muscular structure of the alimentary tract, may draw the stomach-mouth up to the œsophagus, and thus draw the valve up so that its valuvlar nature is destroyed, is the view of Schonfeld, and is, I believe, correct. This is then a sort of adjustable valve, and may prevent regurgitation or not, as the function of the bees require. Thus we have in the stomach-mouth, as well as in the tongue of the honey-bee, examples of differentiation which are not surpassed anywhere in the organic world. A. J. COOK.

Prof. Cook's essay was discussed as follows:

S. Corneil—Have you ever examined wax to see the amount of pollen which it contained?

Prof. Cook—Yes, I know it contains pollen.

S. Corneil—You say that you are wintering bees on wooden-combs, as an experiment, to prove that they can winter without pollen. You know that combs have been dipped in wax, and wax contains pollen, hence your experiment will be imperfect, even though the amount of pollen be infinitesimal.

Prof. Cook—That is true. I tell you that we must be very careful, I see.

S. Corneil—I have had the eggs of the bee-moth's larvæ hatch in comb foundation, and bore tunnels between the sheets. There must be pollen in the wax, or this could never have happened.

C. P. Dadant—I think that there is little pollen wax. It is true that there is a residue every time wax is melted, but this residue is usually wax reduced to this peculiar condition by the action of the hot water.

S. Corneil—This residue comes about as the action of hard water. When soft water is used, such trouble is avoided.

C. P. Dadant—We have rendered wax with steam, yet we had the same trouble.

R. McKnight asked how long a bee could subsist upon its sacful of honey.

Prof. Cook said that circumstances were so varied that it would be impossible to give a definite answer.

C. P. Dadant objected to the use of the term "digested nectar," or "partially-digested nectar," as applied to honey, because the honey is not really assimilated.

Prof Cook maintained, and was supported by S. Corneil, that honey is in *reality* "digested nectar;" that it is in a condition to be assimilated without undergoing any change, or at least but slight change, in the true stomach. There are foods that are really "digested," or nearly so, that is, they are ready for assimilation. Honey is one of the foods; it is largely absorbed directly from the stomach into the system.

Dr. Harvey said that, in this matter, people were confounding *digestion* with *assimilation*. There is primary digestion, and secondary digestion. The first is the *preparation* of the food for assimilation, and the second is *assimilation*. The process that nectar undergoes is that of primary digestion,

R. McKnight said that, if honey undergoes any further change in the true stomach, then it is "partially-digested nectar;" if it undergoes *no* change, then it is "digested nectar." He looked upon the whole matter as unimportant, and one that would soon be forgotten.

It was voted that, inasmuch as it has come to the knowledge of the Association that a member sold a crate of honey to a hotel in Brantford, during the meeting, the outside sections of which were good white honey, and the inner sections inferior, dark, buckwheat honey, the whole being sold as a prime article, the Association desires to place on record its condemnation of all such transactions as essentially dishonest, and calculated to bring bee-keeping into disrepute.

REPORT OF THE SECRETARY.

The following is the report of the Secretary, which was referred to the committee mentioned on page 817 :

Upon referring to the By-Laws, it will be noticed amongst the duties of the Secretary, is that of making a report. I must confess that this is a very difficult task. No time or money has been spared to make the present meeting a success.

It is the pleasant duty of your Secretary to report that the International American Bee-Association is very much indebted to the Brant Bee-Keepers' Association for the kind assistance it has given in making arrangements for the convention, and to the majority of the bee-papers for the gratuitous notices, etc., given by them of the meetings, and the co-operation of a number of individuals in a quiet way. Whilst it is pleasant to reflect upon this, it is also the duty of your Secretary to report that the interest in the Association is not nearly general enough throughout America. What a vast amount of work could be done by co-operation !

It is desirable to reach the great mass of bee-keepers in a more direct and certain way than through your Secretary, and the State and Provincial associations should labor more in union with the International, and this could doubtless be done by the secretaries of each.

Whenever such a local association meets, they should appoint two, or even one delegate, to the annual convention of the International, and this delegate should feel it his duty to reach and urge every bee-keeper in the province at all likely to attend the gathering of the International.

It is not necessary to point out the much greater interest which could be awakened in this way, nor the increased usefulness of our association, to say nothing of the financial grain.

As Secretary, and knowing the sentiments of some of its members, let me urge that the funds of the Association be husbanded as far as practicable, and spent only for absolute necessities, looking forward to a grand International Convention, at which nations will be represented, at no distant date.

Your obedient servant,
R. F. HOLTERMANN.

The question-drawer was taken up, and a number of questions answered by Dr. Mason.

It was decided that R. McKnight be the Canadian representative, and Dr. A. B. Mason the United States representative of the honey and bee interests at the coming International Fair of 1892.

On motion, a vote of thanks was given to the President, Secretary and Treasurer of the International Association, also to the President and Secretary of the Ontario Association.

It was decided that the Association pay $25 to Secretary Holtermann for services as Secretary.

Mr. Holtermann said that he would donate $15 to the Association, as $10 would cover his expenses.

The convention then closed with the Doxology, followed by prayer, by Mr. J. C. Calvert.

Peace and Good-Will to Men.

I heard the bells on Christmas Day
Their old familiar carols play,
And wild and sweet
The words repeat
Of peace on earth, good-will to men!

And thought how, as the day had come,
The belfries of all Christendom
Had rolled along
The unbroken song
Of peace on earth, good-will to men!

Till ringing, singing on its way,
The world revolved from night to day,
A voice, a chime,
A chant sublime,
Of peace on earth, good-will to men!

But in despair I bowed my head—
"There is no peace on earth," I said;
"For hate is strong,
And mocks the song
Of peace on earth, good-will to men."

Then pealed the bells more loud and deep,
"God is not dead, nor doth he sleep!
The wrong shall fail,
The right prevail,
With peace on earth, good-will to men!"
—HENRY W. LONGFELLOW.

A New Premium.

The National Purchasing Agency of this city issues a Membership Ticket good for the year 1890, for the sum of one dollar. This Ticket is not transferable, and entitles the holder to all discounts that the Agency can secure on goods that may be ordered, and they are in a position to obtain more or less discount on every order received.

By a special arrangement, we can offer a MEMBERSHIP Ticket for 1890 to any one sending us two new subscribers for the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL, for one year, with $2.00.

CORRESPONDENTS.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 — OLDEST BEE PAPER IN AMERICA

ALFRED H. NEWMAN,
BUSINESS MANAGER.

Business Notices.

☞ Read our Book Premium offer on the last page of last JOURNAL.

☞ Money in Potatoes, by Mr. Joseph Greiner. Price, 25 cents, postpaid. For sale at this office.

☞ Send us one **NEW** subscriber, with $1.00, and we will present you with a nice Pocket Dictionary.

☞ Red Labels are nice for Pails which hold from 1 to 10 lbs. of honey. Price $1.00 per hundred, with name and address printed. Sample free.

☞ Calvert's No. 1 Phenol, mentioned in Cheshire's Pamphlet on pages 16 and 17, as a cure for foul brood, can be procured at this office at 25 cents per ounce, by express.

☞ The date on the wrapper-label of this paper indicates the end of the month to which you have paid. If that is past, please send us a dollar to advance that date another year.

☞ Please send us the names of your neighbors who keep bees, and we will send them sample copies of the BEE JOURNAL. Then please call upon them and get them to subscribe with you.

☞ As there is another firm of "Newman & Son" in this city, our letters sometimes get mixed. Please write *American Bee Journal* on the corner of your envelopes to save confusion and delay.

☞ We have some full sets of the BEE JOURNAL for 1889, and *new* subscribers can have the full sets for 1889 and 1890 for $1.80 until all are gone. Or, we will send the full sets for 1887, 1888, 1889 and 1890 for $3.00.

☞ Systematic work in the Apiary will pay. Use the Apiary Register. Its cost is trifling. Prices:

For 50 colonies (120 pages)	$1 00
" 100 colonies (220 pages)	1 25
" 200 colonies (420 pages)	1 50

☞ When talking about Bees to your friend or neighbor, you will oblige us by commending the BEE JOURNAL to him, and taking his subscription to send with your renewal. For this work we will present you with a copy of the Convention Hand Book, by mail, postpaid. It sells at 50 cents.

☞ We offer the Monthly Philadelphia *Farm Journal*, and either the AMERICAN BEE JOURNAL or ILLUSTRATED HOME JOURNAL from now until Dec. 31, 1890, for $1.20. Or, we will *give it free* for one year to any one who will send us *one new* subscriber for either of our Journals with $1.00 (the subscription price).

CLUBBING LIST.

We Club the *American Bee Journal* for a year, with any of the following papers or books, at the prices quoted in the **LAST** column. The regular price of both is given in the first column. One year's subscription for the American Bee Journal must be sent with each order for another paper or book:

Do not send to us for sample copies of any other papers. Send for such to the publishers of the papers you want.

CATARRH.

CATARRHAL DEAFNESS—HAY FEVER.

A New Home Treatment.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been formulated whereby catarrh, catarrhal deafness and hay fever are permanently cured in from one to three simple applications made at home by the patient once in two weeks.

N. B.—This treatment is not a snuff or an ointment; both have been discarded by reputable physicians as injurious. A pamphlet explaining this new treatment is sent free on receipt of stamp to pay postage, by A. H. Dixon & Son, 337 and 339 West King Street, Toronto, Canada.—*Christian Advocate.*

Sufferers from Catarrhal troubles should carefully read the above.
50E26t 1m1y.

☞ Frank Leslie' Popular Monthly for January, 1890, is a "Holiday Number," as befits the season. It has a new typographical dress throughout, and is, pictorially, probably the most elegant number of Frank Leslie's Popular Monthly ever issued. The colored frontispiece is "A Fair Masquerader." There are numerous articles of literary, romantic or practical interest, while the serial and short steries, poems and various departments are unusually full and varied.

Subscribers who do not receive this paper promptly, will please notify us at once.

CONVENTION DIRECTORY.

1889. *Time and Place of Meeting.*

Dec. 26, 27.—Michigan State, at Lansing, Mich.
H. D. Cutting, Sec., Clinton, Mich.

1890.

Jan. 8, 9.—Ontario, at Belleville, Ont.
W. Couse, Sec., Streetsville, Ont.

Jan. 15.—Indiana State, at Indianapolis, Ind.
Geo. C. Thompson, Sec., Southport, Ind.

Jan. 20.—Colorado State, at Denver, Colo.
E. Milleson, Pres., Denver, Colo.

Jan. 22.—Vermont State, at Burlington, Vt.
J. H. Larrabee, Sec., Larrabee's Point, Vt.

Feb. 5-7.—New York State, at Rochester, N. Y.
G. H. Knickerbocker, Sec., Pine Plains, N. Y.

May 3.—Susquehanna Co., at Hopbottom, Pa.
H. M. Seeley, Sec., Harford, Pa.

☞ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

WINGER'S IMPROVED FEED GRINDER

is a novel and ingeniously arranged Grinding Mill, made to attach to 10 or 12 foot Pumping Wind-Mills, operated by an elbow attached to main pumping rod in such a manner that it can be attached or detached in a minute, so that you can either pump or grind, or do both at the same time. It works with a reciprocating lever, so arranged that it grinds on the up-motion of the Wind-Mill. The Grinder consists of a double-metal case and 3 burrs, two remaining stationary and one revolving in the center, producing a double-grinding surface, two-fold greater than any other known to the world, and will grind more than the ordinary farmer needs. It can be changed from grinding coarse to fine by simply turning one nut.

Price, **$20.** We will present one of these Feed Grinders to any one who will send us 75 subscribers to our Journals, at $1.00 each.

Certificate to Get Wholesale Prices.

We can furnish ANY THING YOU MAY WANT at absolutely wholesale prices. Why pay exorbitant prices in your own town when you can buy in Chicago, through us, at wholesale prices? We can save you from 8 to 50 per cent. on all different kinds of goods manufactured. You can only obtain the foregoing advantage by becoming a subscriber to either the Illustrated Home Journal or the American Bee Journal; OTHERWISE, a Membership ALONE will cost you $1.00 per year.

For $2.00, we send one copy of either, **Crime of the Century (Dr. Cronin's Murder), Little Giant Encyclopedia,** or **Ideal Cookery Book**—Illustrated and bound, price, $1.50 each—One year's subscription to American Bee Journal, or Illustrated Home Journal, price, $1.00 per year—Membership Certificate for 1 year from date of issue, price, $1.00 per year—total, $3.50.

If you will order **Clothing, Furniture, Dress Goods, Stoves, Silverware, &c.,** to the amount of $25.00, send money with the order. We will send you BETTER goods than you can buy at retail for $25.00, together with the above Book, Paper and Certificate, and in many cases return you money besides.

Send by Money Order or Registered Letter. Address all orders for goods and mail to the

NATIONAL PURCHASING AGENCY,
323-325 Dearborn St., Suite 18-20, CHICAGO
