# C. H. W. WEBER

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

## Honey and Beeswax

CHICAGO, Aug. 18.—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14c, while No. 1 has sold at 13@13½c. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white, 6@7c; amber, light and dark, 5@6c. Beeswax, 28c.  
**R. A. BURNETT & Co.**

ALBANY, N. Y., July 26.—There is some call for honey, new crop, and if here would probably sell for best prices of season, as the general impression is there will be a large crop. White comb honey will start off at 15c to early buyers.  
**H. R. WRIGHT.**

KANSAS CITY, Aug. 24.—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½c; other grades down to 4½c. Beeswax, 28c.  
**C. C. CLEMONS & Co.**

CINCINNATI, Aug. 18.—The heavy requests for offers on honey recently, have a tendency to lower the prices. We are striving hard to maintain good prices, by giving our friends more than their honey is worth, to hold up the market. So far we have been successful. Still offer extracted honey as follows; Amber in barrels and cans at 5½@6½c, respectively. White clover at 7@8½c. We feel that lower prices will prevail in the near future.

Comb honey is coming in quite freely. We quote fancy white comb honey at 12@15c. The arrival of Western car-load shipments of comb honey is anticipated daily, after which the market will be shattered as to prices. Beeswax, 26c.  
**THE FRED W. MUTH Co.**

DENVER, June 26.—The demand for both comb and extracted honey is light at present, and there is enough of old stock on hand yet to last until the new crop comes in; the same is selling as follows: No. 1 white comb, per case of 24 sections, \$2@2.20; No. 2, \$1.75@2. White extracted, 6½@7½c per pound. Beeswax, 26c.  
**THE COLO. HONEY-PRODUCERS' ASSN.**

NEW YORK, Aug. 18.—No new comb honey on the market as yet, and very few inquiries so far. Extracted is in fairly good demand and we quote: California at from 5½@7c per pound, according to quality and quantity. Southern in barrels from 50@65c per gallon. Beeswax remains steady at 29c per pound.  
**HILDRETH & SBOELKEN**

PHILADELPHIA, Aug. 21.—Some honey arriving, with prospects of a good crop all through the East, but no call for comb honey during the hot weather, so that prices are not as yet established. Extracted honey arriving freely. We quote as follows: Fancy white, 7@8c; amber, 6@7c. Beeswax, 27c.

We are producers of honey and do not handle on commission.  
**W. M. A. SELSER.**

CINCINNATI, O., Aug. 8.—There is no demand for comb honey on account of the warm weather. Extracted is in usual demand for this season of the year. We quote white clover at 7@8c; amber, in barrels, at 5½@5¾c; in caots, 5¾@6c. Beeswax, 28c.  
**C. H. W. WEBER.**

SAN FRANCISCO, Aug. 16.—White comb, 1-lb sections, 9@10 cents; amber, 7@8c. Extracted, water-white, 5@5½c; white, 4¾@5c; light amber, 4@4½ cents; amber, 3¾@4c; dark amber, 2¾@3c. Beeswax, good to choice, light, 27@29c.

Stocks of honey are large and the market weak. Receipts are of fair size and excellent quality. Prices are being maintained at figures quoted despite the fact that there is very little demand at those figures.

## FOR SALE

Until further notice, fine-t quality new crop California Water-White White Sage and Light Amber HONEY in 60-lb. tins, 2 in a case; new cans and new cases. Write for prices and samples, and state quantity you want.

# SEPTEMBER SPECIAL

## Cash Discount for Early Orders

We can not remember a year when we were not crowded with orders through the spring months, and somewhat behind, some years more than others. In order to divert some of this trade to the fall and winter months, we have offered inducements in the way of an early-order cash discount. This year we will be more liberal than ever before in the amount of discount allowed. For some months the price of some of the materials used has been a little lower, and we have stocked up heavily, and propose giving you the advantage of the saving in price. The abundant farm crops throughout the country are stimulating trade in almost all lines, and prices are already stiffening. The discounts which we propose to offer for early cash orders are as follows:

For cash orders before	Oct. 1	10 percent.
"	Nov. 1	9 "
"	Dec. 1	8 "
"	Jan. 1	7 "
"	Feb. 1	6 "
"	March 1	4 "
"	April 1	2 "

You will notice that, after January, the discount drops 2 percent a month; and if we find that advancing prices of materials do not warrant the larger discount, we reserve the right to reduce the amount of discount at any time. Your safest plan is, therefore, to order at once.

This discount is only for cash before the dates named, and is intended to apply to hives, sections, frames, foundation, extractors, smokers, shipping-cases, cartons, and other miscellaneous bee-keepers' supplies. It will not apply on orders for the following articles exclusively; but where these form no more than about 10 percent of the whole orders, the discount may be taken from the entire bill: Tinned wire, paint, Bingham smokers, Porter bee-escape, glass and tin honey-packages, scales, bees and queens, bee books and papers, labels and other printed matter; bushel boxes, seeds, and other specialties not listed in our general catalog.

## Beeswax and Comb Foundation

To compensate for the large early order cash discount we propose to increase the trade price of wax; and until further notice we will pay 26 cts. cash, or 30 cts. in trade, for average wax delivered here or at our branches. When you take trade at 30 cts. a pound you will not be entitled to the early-order discount on the supplies.

The price of comb foundation was reduced Aug. 1 two cents a pound, and the revised price stands as follows:

GRADE.	Size, and sheets per pound.	In lots of				
		1 lb.	5	10	25	50
Medium Brood	7 $\frac{3}{4}$ x 16 $\frac{1}{2}$ 7 to 8	55	53	51	49	48
Light Brood	7 $\frac{3}{4}$ x 16 $\frac{1}{2}$ 9 to 10	57	55	53	51	50
Thin Super	3 $\frac{3}{4}$ x 15 $\frac{1}{2}$ 28	62	60	58	56	55
Extra Thin	3 $\frac{3}{4}$ x 15 $\frac{1}{2}$ 32	65	63	61	59	58

The early-order cash discount applies to the reduced price of foundation, making a total net reduction of 7 to 8 cts. a pound for September orders. We recommend that shipment of foundation be avoided in extreme cold weather, and to that end it would be well to get in your supply in the fall. Use your leisure time in winter to nail and paint your hives, put up sections, and prepare other articles ready for the spring rush.

## Extra-Long Bee-Gloves

Having made arrangements for our supply of gloves from a factory making a specialty of their manufacture, we save enough in the cost to enable us to offer them either with or without fingers at 35 cts. a pair; by mail, 42 cts.

## No-Drip Shipping-Cases

Don't allow your Comb Honey to be sold at low prices on account of poor Shipping-Cases. Put your crop into Root's No-Drip Cases and it will reach the market in perfect condition, thus bringing satisfactory returns. Our Cases are made of selected basswood, with 2 or 3 inch glass front, which shows off the honey to the very best advantage. Below is a condensed price-list. Complete prices and particulars are found in our general catalog.

Shipping-Cases. Name and Size of Case.	Nailed each.			Price complete including 3-in. glass one side, nails and paper, in flat.	With 2 in. glass instead of 3—per 100.	Without the glass, per 100.
	1	10	100			
	12-in. 4-row for 4 $\frac{1}{4}$ section	30	25			
10-in. 4-row	30	25	2 00	17 00	16 00	15 00
12-in. 2-row	20	15	1 30	11 00	10 50	10 00
10-in. 2-row	20	15	1 20	10 50	10 00	9 50
16-in. 2-row	25	18	1 50	12 00	11 50	11 00
8-in. 3-row	20	15	1 30	11 50	10 75	10 00
6 $\frac{1}{4}$ -in. 3-row	20	15	1 20	11 00	10 25	9 50
7 $\frac{3}{8}$ -in. 4-row for 4x5	30	22	1 80	16 00		14 00
7 $\frac{3}{8}$ -in. 3-row	25	20	1 40	12 00		10 50
9 $\frac{1}{4}$ -in. 4-row for 3 $\frac{3}{4}$ x5	30	22	1 80	16 00		14 00
6 $\frac{1}{4}$ -in. 3-row	25	20	1 40	11 50		10 00

## The Simplex Jar

The handsomest glass package on the market. It's a package you need not be ashamed of, and will find its way beside the finest of the grocery shelves. Create a demand for your honey.

This is a new jar with glass screw-top and rubber gasket fitted to the taper screw on jar, which seals absolutely air-tight. Put up in re-shipping cases of 2 dozen jars each, with corrugated protectors.

Price \$1.10 per case; 6 cases @ \$1.05; 20 cases or more @ \$1.00.

## 5-Gallon Square Cans

The above cut shows the favorite package for shipping extracted honey. There is no shrinkage and consequent leaking; no taint to the honey from wood, as is so frequently the case with barrels and kegs. The cans, being made square, economize space, and are easily boxed. They are used exclusively in the far West. Take 4th class freight-rate

PRICE LIST OF SQUARE CANS.

No. in a box.	Capacity of each can in gallons, in honey.	Price of		Wt. of 1 box.	
		1 box.	10 hxs.		
1	5-gal. can boxed	60 lbs.	\$ 55	\$ 5 00	10 lbs.

24	$\frac{1}{4}$ -gal. "	3 "	2 40	23 00	25 "
100	1-gal. "	12 "	11 00	105 00	110 "
100	$\frac{1}{2}$ -gal. "	6 "	9 00	85 00	80 "
100	$\frac{1}{4}$ -gal. "	3 "	7 00	65 00	60 "

## Porter Bee-Escape

The great labor-saver. No well-regulated apiary can afford to be without it more than a smoker.

Price 20c each; \$2.25 per dozen, prepaid.

Price with board, 35c; \$3.20 for 10, not postpaid.

## Editorial Notes and Comments

### Forcing Honey to Granulate

Mr. S. T. Pettit, one of Canada's oldest and foremost bee-keepers, sends us the following on forcing extracted honey to candy or granulate:

DEAR EDITOR YORK:—The time to force the candying of honey will soon be upon us again.

Allow me to say that the two most puissant factors in the process are *change of temperature and agitation*. I am not sure but I would be safe in saying that the former is the stronger factor of the two.

A good many years ago I had an excellent opportunity of taking lessons on this subject. When delivering honey to the trade, it went in groceries, some of which were poor, thin-walled, wooden structures. Others were of substantial, thick brick walls. And invariably the honey in the thin, open, wooden buildings candied first. Observations all along down the years confirm that statement.

In those days most of our honey was marketed in glass, and so the observations were easily made.

I would generally take the start of the grocer, who, in most cases, would be inclined to question the purity of the honey when it began to candy, by saying something like this: "O, your honey is candying beautifully, is it not?" Then a little friendly talk and explanation would follow, and in that way I would win confidence, educate, and do business, always striving to popularize candied honey.

It has been an uphill job, but all who have worked in that line are going to win.

S. T. PETTIT.

Where it is possible to develop a demand for granulated extracted honey we think it is an excellent thing to do. And to be able to compel the granulation of extracted honey is also a fine thing.

Personally, we may say that we have never taken very willingly to the granulated-paper-bag honey, but we may have been wrong about it. If so, it is not the first time we have been mistaken. We believe that some bee-keepers are doing better by working up a demand for granulated or candied honey. Surely it has many advantages. It doesn't leak, nor spill out if the package is tipped over when uncovered. Then there are many people who prefer to eat honey granulated. And those who prefer it liquid can have it so in a few minutes by applying a little heat.

By changing the temperature and shaking

up the honey, Mr. Pettit says its granulation will be hastened. Good thing to know that.

### Food Offered to Queen or Demanded?

The orthodox belief is that the worker-bees are eager to offer food; that iconoclast, Arthur C. Miller, says the queen makes demands. Confirmatory of his view is an article in the Irish Bee-Keeper containing the following passage:

"In 1903 we had some experiments which showed that a queen introduced into a glass-covered box with one strange bee, proceeded to demand refreshment. If obtained, all was serene, but if refused the delinquent worker was immediately killed. This suggested that the battling of queens begins by a general refusal to supply food, and a consequent running amuck by the strange queen."

Further on mention is made of a queen which applied to a worker for food, "and, upon being refused, made a threatening movement which was answered by protrusion of the tongue."

### Rules for Grading Honey

The following letter is from the manager of the St. Croix Valley Honey-Producers' Association:

ST. CROIX CO., WIS., Aug. 4, 1905.  
GEORGE W. YORK & Co.

Dear Sirs:—The last American Bee Journal reminded me that it might interest you to see our rules for honey grading, etc. Out in Colorado the bee-keepers have adopted a set of rules which we believe suits the white clover and basswood localities first rate, and is better than any other grading rules that have come under our observation. All our members (now about 200) are following them. They are simple and easy to follow. Our experience is that the more grades the poorer each grade will be.

Your last issue (Aug. 3) is worth its weight in gold. Honey-production isn't the only thing for the bee-keeper to look upon. Marketing, with us, is the paramount question. If bee-keepers would grade alike, and honestly, how easy it would be to move honey.

Yours truly,

LEO F. HANEGAN, Manager.

The Colorado grading rules referred to are as follows:

#### COMB HONEY RULES.

No. 1.—Sections to be well filled and capped, honey white or slightly amber, comb white

and not projecting beyond the wood, wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, with a minimum weight of not less than 20 pounds for any single case; cases of half-separated honey to average not less than 21<sup>3</sup>/<sub>8</sub> pounds net per case of 24 sections, with a minimum weight of 20<sup>3</sup>/<sub>4</sub> pounds for any single case; cases of unseparated honey to average not less than 22<sup>1</sup>/<sub>2</sub> pounds net per case of 24 sections, with a minimum weight of 21<sup>1</sup>/<sub>2</sub> pounds for any single case.

No. 2.—Includes all amber honey of a pronounced tinge, and all white and amber honey not included in No. 1; to be fairly well sealed, uncapped cells not to exceed 50 in number exclusive of the outside row, wood to be well cleaned; cases of separated honey to average not less than 18 pounds net per case of 24 sections; cases of unseparated honey to average not less than 19 pounds net per case of 24 sections, cases of unseparated honey to average not less than 20 pounds net per case of 24 sections. Cases weighing over 25 pounds go in No. 2 grade.

#### EXTRACTED HONEY RULES.

Extracted honey shall be classified as white and amber, shall weigh 12 pounds per gallon, shall be perfectly free from particles of wax, and shall always be marketed in new cans. All rendered honey, whether obtained by solar heat or otherwise, shall be classed as strained honey, and not as extracted.

#### RECOMMENDATIONS.

It is recommended to sell all cull honey around home as much as possible; to grade only in daylight, near a window.

Pack all sections in stout basswood *no-drip shipping-cases*; to put paper above and below sections; to store honey in a warm, dry room well protected from flies and dust; if the heat of the room causes the wax-moth to become troublesome, treat the honey to the fumes of bisulphide of carbon; to haul carefully, well-protected from dust and rain; *do not nail covers on tight*, as it often becomes necessary to remove them in order to inspect honey or remove a broken section; *do not put any names or marks on cases except grade marks.*

We prefer to pack eight 24-pound cases in a large crate, first putting about 4 inches of straw in it. This will act as a cushion, and prevents breaking down of the combs from jarring or jolting. The glass fronts of the cases should show through the crate so that freight handlers can easily see what it is and handle accordingly. Then there should be two long strips nailed near the top of the sides of the crate (one on each side), and extending out 6 or 8 inches, forming handles by which to carry it. Another good thing is to tack on top a large card having on it in plain letters: "Comb Honey, Handle with Care." When so prepared, comb honey should go almost anywhere by freight in good condition.

The most popular packages for extracted honey are the 2-pound friction-top can, 5 and 10-pound friction-top pail, 60-pound square can boxed, one or two cans in a box, and the 60-pound, round, flat-top can with a veneer

jacket, bail for handle, and a 3-inch screw cap in the top.

Under "Comb Honey Rules," where it says "cases weighing over 25 pounds go in No. 2 grade," Mr. Hanegan adds:

"Unless otherwise fancy. As a rule, heavy cases are non-separated goods, and are heavy because many sections are fat or bulged, and rough more or less, causing leakage."

Also, the paragraph under "Recommendations," Mr. Hanegan would begin with the words, "For local shipping, we prefer," etc.

### A Big Texas Honey-Yarn

A story in the Youth's Companion, telling some things about vast quantities of wild honey down in Texas, causes a member of the American Bee Journal family to write:

"I would like to know whether honey made by wild bees is really produced in the United States in the large quantities stated. If so, it would be an item of great interest to honey-producers."

A river—Double Mountain River—flows through a canyon for 30 miles, according to the story, and—

... "the entire canyon was one vast apiary, where wild bees have existed and gathered sweets for centuries. They are in such numbers as sometimes on certain bright days to resemble clouds high up the crags, and they fill the canyon with a voluminous hum." "There were hundreds of these wild-bee colonies, whose enormous masses of comb and honey were adhering in sheltered chasms and beneath overhangs of the rock. A number of caverns, too, extending far back into the cliff, have been utilized as great storehouses of comb by the bees. Not one swarm alone occupies such a cave, but 50 perhaps, or 100 swarms, each having its own queen, but all using the mouth of the cavern as a common entrance." Two men made a business for years of harvesting the product, and "it was their custom to send a wagon-load of honey and wax down to the railroad station, 30 miles distant, once a fortnight, and sometimes in good weather once a week."

Really, there is nothing new in this; it's the old story that has been going the rounds of the press, only in the present instance it has the redeeming feature that it is given as fiction, not fact; yet it seems a reputable story-writer might come a little nearer to originality of conception.

There is, however, a fresh touch given to the picture in one spot: "But the most copious stores were at greater heights, 200, and even 300 feet above the river-bed. When seen from below, the mass of comb looked no larger than bacon hams, but when reached was found to amount to several barrels of honey." How's that? Think of a ham-shaped mass containing several barrels of honey, and all hanging out exposed to full sight!

As a matter of fact, no bee-keeper has ever found any such bonanza in Texas any more than in New York, and the story could as well be told of New York as Texas, only that parts of Texas are as yet less known.

"The Honey-Money Stories."—This is a 64-page-and-cover booklet, 5 $\frac{3}{4}$  x 8 $\frac{1}{2}$  inches in size, printed on enameled paper, entitled, "The Honey-Money Stories." The cover has a picture of a section of comb honey, 3 $\frac{1}{2}$  inches square, the comb being in gold-bronze, which gives it a very attractive appearance. Then on the gold-bronze comb are printed these words: "From Honey to Health, and from Health to Money."

It is edited by Earl M. Pratt, and contains

a variety of short, bright stories interspersed with facts and interesting items about honey and its use. The manufactured comb honey misrepresentation is contradicted in two items, each occupying a full page, but in different parts of the booklet. It has in all 31 half-tone illustrations, nearly all of them being of apiaries or apiarian scenes. It also contains 3 bee-songs, namely, "The Hum of the Bees in the Apple-Tree Bloom," "Buckwheat Cakes and Honey," and an entirely new one, called, "The Bee-Keeper's Lullaby." This last song has not been published before. The songs alone ought to be worth more than the price of the whole thing.

It is a booklet that should be placed in the hands of everybody not familiar with the

food value of honey, for its main object is to interest people in honey as a daily table article. It is thought that it will be just the thing to sell on railroad passenger trains, on news stands, etc. The stories and items are all so short and helpful, and the pictures so beautiful, that it likely will be kept by any one who is so fortunate as to get a copy of it. Its postpaid price is only 25 cents, but the health-value of its contents would run up into dollars. We mail 5 copies for \$1.00, or club it with the American Bee Journal—both for \$1.10. It would be very nice for a gift to a friend. Send us a six months' new subscription for the American Bee Journal with 50 cents, and we will mail you a copy of "The Honey-Money Stories" free as a premium.

## Miscellaneous News Items

The Bee-Hive is the name of the official organ of the Maccabees of the world. It is published in Michigan. At the head of an advertising circular its publishers are sending out there is a picture of a section of honey 2 $\frac{3}{4}$  inches high by 5 $\frac{1}{2}$  inches wide, on the comb of which are three bees, and the following suspended sign:

"How doth the little busy bee  
Improve each blessed minute,  
He gathers honey all the day  
Because there's money in it."

All right except there isn't much money in the honey gathered by the "he" bees. Like the Indian squaws, the "she's" do the work of the field and the hive.

A Daily Colony-Record.—On the first page appears a picture of a colony of bees on scales, and also a view of comb honey, both belonging to Geo. H. Kirkpatrick, of Kalkaska Co., Mich. He also furnishes the following in reference to them:

The 37 sections of comb honey shown are a little more than one-third of the product of one colony, the colony filling 90 sections. The method of procedure was as follows: June 1, 1904, I placed over a colony in an 8-frame Langstroth hive a super containing 30 sections, 3 $\frac{3}{8}$  x 5 x 1 $\frac{1}{2}$ ; on June 10 I shook the colony into a shallow hive which contained 8 frames, 7 $\frac{3}{8}$  x 16 $\frac{1}{4}$  inches, the same having starters about one inch deep. At the time of the shaking the super was removed from the parent colony and placed on the new hive over a queen-excluder. The brood-chamber of the parent colony was then placed on the new hive above the super where it remained for 8 days, when it was removed and a super added. A few days later a third super was given. The 90 sections averaged 15 $\frac{1}{2}$  ounces.

I have had 22 years' experience in bee-keeping. The method of "shook" swarms is a very good one for comb honey. The present season (1905) I have worked 30 colonies on the O. H. Townsend method of producing both comb and extracted honey in the same super, with very good results. I shall plan to have a goodly number of combs drawn from foundation in shallow frames during the flow this fall, to be used in comb-honey supers next season. This being the first time the dimensions of my brood-frame have appeared in the American Bee Journal, I will not be surprised to see it criticized. For 6 years I have used this shallow frame, and now have more than 200 colonies on it. Having so many good points in its favor, we are discarding the Langstroth frame.

### A DAILY COLONY-RECORD.

For 20 years I have placed on a scale a colony during the harvest of white honey. It

affords me much pleasure to note from day to day the gain in pounds of honey. By placing an average colony on the scales one can easily estimate the amount of honey stored per day in the apiary.

I find here in northern Michigan, where the bees are gathering from red raspberry from 6 to 10 pounds per day, the shrinkage is about one-seventh. This is much less than the shrinkage of basswood or clover. I find basswood shrinks about one-fourth, and clover one-fifth.

The following figures represent my average per colony, spring count, in the home apiary for a period of five years, beginning with 1900:

Year.	No. Cols.	Aver. per Col.
1900,	45	107 lbs.
1901,	56	126 "
1902,	93	103 "
1903,	126	109 "
1904,	130	61 "

The net annual yield per colony for a period of 5 years was 101 1-6 pounds.

A daily colony-record beginning June 4, 1901, and closing July 17, showed the following, the scale being balanced June 4, at 76 $\frac{1}{2}$  pounds:

	Lbs. Gain.		Lbs. Gain.
June 5,	78 $\frac{1}{2}$ ... 2	June 27,	258 ... 7
" 6,	81 ... 2 $\frac{1}{2}$	" 28,	263 ... 5
" 7,	84 $\frac{1}{4}$ ... 3 $\frac{3}{4}$	" 29,	267 $\frac{1}{2}$ ... 4 $\frac{1}{2}$
" 8,	89 $\frac{3}{4}$ ... 5	" 30,	270 ... 2 $\frac{1}{2}$
" 9,	96 ... 6 $\frac{1}{4}$	July 1,	273 $\frac{1}{2}$ ... 3 $\frac{1}{2}$
" 10,	103 ... 7	" 2,	277 $\frac{1}{2}$ ... 4
" 12,	119 $\frac{1}{2}$ ... 16 $\frac{1}{2}$	" 3,	280 ... 2 $\frac{1}{2}$
" 13,	130 ... 10 $\frac{1}{2}$	" 4,	284 ... 4
" 14,	144 ... 14	" 5,	290 ... 6
" 15,	148 ... 4	" 6,	295 ... 5
" 16,	151 ... 3	" 7,	302 ... 7
" 17,	156 ... 5	" 8,	309 $\frac{1}{2}$ ... 7 $\frac{1}{2}$
" 18,	168 $\frac{1}{2}$ ... 12 $\frac{1}{2}$	" 9,	316 ... 6 $\frac{1}{2}$
" 19,	178 ... 9 $\frac{1}{2}$	" 10,	322 $\frac{1}{2}$ ... 6 $\frac{1}{2}$
" 20,	196 $\frac{1}{2}$ ... 18 $\frac{1}{2}$	" 11,	326 ... 3 $\frac{1}{2}$
" 21,	214 ... 17 $\frac{1}{2}$	" 12,	329 $\frac{1}{2}$ ... 3 $\frac{1}{2}$
" 22,	225 ... 11	" 13,	333 ... 3 $\frac{1}{2}$
" 23,	234 ... 9	" 14,	335 ... 2
" 24,	240 ... 6	" 15,	334 $\frac{1}{2}$ ... 1 $\frac{1}{2}$
" 25,	245 ... 5	" 16,	335 ... 1 $\frac{1}{2}$
" 26,	251 ... 6	" 17,	337 $\frac{1}{2}$ ... 2 $\frac{1}{2}$

From the above colony I extracted 244 pounds.  
GEO. H. KIRKPATRICK.

Dividing "Stands."—In one of our exchanges we read of a bee-keeper who "divided 4 stands," and "now has 8 strong stands that are working in the supers." Let's see, a "stand" is the frame or base on which the bee-hive rests, thus keeping it raised from the ground. So a certain bee-keeper divided 4 of such stands and afterward had 8 stands working in the supers. Wonder how he got a "stand" into a "super!" And also how he induced a "stand" to work there! Perhaps some one can explain.

### Importation of Bees by Our Government

BY PROF. A. J. COOK

I AM sure that all the most-enterprising bee-keepers of our country read with a thrill of pleasure that at last our Government had decided to send to the Orient in search of new races and species of bees, in the hope that we might reap advantage from their introduction. There has been for years a desire among our best bee-keepers that something might be done in this line. Mr. Benton, from his wide and successful experience in the past, is probably the best equipped man for this service in the whole world. We may hope that in the introduction of the Macroapis, and very possibly other species or natural races of the genus *Apis*, we shall gain a substantial advantage.

There are two ways that we may hope for improvement. We may reasonably expect an additional amount of honey. This is probably what has influenced those who have been urging for years the introduction of *Macroapis dorsata*. But there is another even more important advantage possibly to be gained in the introduction of new races. We know that we need the common native bumble-bee to aid us in securing a full seed-crop of red clover. We know that the scarcity of bumble-bees in the early season makes the first crop of red clover worthless in the seed-production. But do we know that we ever get a full crop of this valuable seed? Is it not more than probable that with more extensive cross-pollination the red clover might always seed better and give a fuller yield?

In the introduction of new races and species, we will very likely not only secure nectar that now goes to waste, but we will quite likely introduce bees that will work on flowers now unvisited, and in so doing will greatly appreciate production. The farmers of Illinois and Iowa are jubilant over the fact that through the breeding of a better kind of seed-corn, their crop is materially increased the country over, for this means millions of dollars to the country each year. A very slight increase in seed-production of any of our valuable stable crops would have like influence. It is just here that this matter of cross-pollination should appeal to us all, and should make us the ready advocates of just such enterprises as the Government has now undertaken in our behalf.

#### STINGLESS BEES.

It comes to my knowledge that there is some talk of the introduction into our country of species of *Melipona* and *Trigona*—the stingless bees of Mexico, Central and South America. I am greatly in favor of the carrying out of this project. I have very little faith that these bees will ever become a matter of commercial importance in the production of honey. I also am absolutely without faith that these bees will cross with our present bees, and so give us an improved hybrid. They are so absolutely different in anatomy and physiology from *Aphis* that we can hardly hope for a successful cross. Indeed, I have no expectation that this can occur. But the point I made above, that a greater variety of bees will cause more visits to more flowers, I think may safely be depended upon.

There can hardly be a question but what cross-pollination will be more generally effected with every increase of species of bee among us. In our massing of great numbers of plants we have so broken in upon the equilibrium of Nature that we can not be too intent in reaching out to effect in every possible way a greater amount of cross-pollination.

A tremendous gain has been made in the scattering of apiaries throughout the land; may we not hope for a close second in importance in the introduction of new species and varieties of bees now foreign to us? Thus it was that I was pleased to learn from Dr. E. S. Phillips, of the Agricultural Department, that an effort was being made to induce the Government to introduce these stingless bees from the region south of us.

#### GOVERNMENT APIARY AT WASHINGTON.

I am sure our readers will be glad to learn that one of the prominent features on the fine, beautiful lawn of the Department of Agriculture at Washington, is a handsomely arranged

and quite large apiary. Does it not show great good sense on the part of the Department of Agriculture to recognize the importance of the honey-bee, and the value which comes from very numerous apiaries scattered throughout the country? What could the Government do to show more surely its hand in these matters than the putting of this apiary where every visitor of the Department must see it as he approaches the main building? I acknowledge a little more pride, happiness, and patriotism, as I noted this index of broad-mindedness at our capital.

#### DEPARTMENT OF AGRICULTURE.

I greatly doubt if any department of the Government receives more hearty commendation from other countries than does the Department of Agriculture at Washington. I feel equally sure that there is nowhere else in the world a more able body of honest, unselfish, efficient investigators than may be found in this Department of our Government. The research work being carried on is of the very highest order. The results already gained are of tremendous importance in an economic way to our people. This research work is being carried on in a very broad way. Empirical methods are giving way to scientific processes, and the results that are being obtained are in many cases fairly revolutionary. I have rarely ever enjoyed more satisfaction, or experienced better appreciation of genuine service than I have felt the last few days as I have gone through the various departments and noted the magnificent work that is being turned out here.

#### SECRETARY JAMES WILSON.

Not a little of the excellence just referred to comes from the fact that we have a grand type of a man at the head of the Department. Brought up on a farm, Secretary Wilson is thoroughly alive to the obstacles and necessities of the farm. He is thoroughly in sympathy with the man with the plow, and is intensely interested in whatever will make the work of the farm more pleasant and productive. Those who know him best are fully persuaded that his honesty and disinterestedness fully equal his longing to make the Department in the highest degree efficient. He has worked very successfully to get the very best men to be found throughout the world to take charge of this valuable research work. As suggested above, these men have rare qualifications for the difficult tasks which confront them.

It is exceedingly unfortunate that the idea of "graft" in the Agricultural Department has so recently come to the front. It is the general belief of those who are best prepared to judge that the men in this work, and some of those who are under censure, are really philanthropists. It is also believed that they are absolutely innocent in the matter charged against them. We have all been very pleased and grateful for the discovery by Prof. Moore. We have appreciated the fact that the value of this discovery came to us as a free gift. I am glad to report that in my talks with those who know Prof. Moore best, I have found a universal belief that he is absolutely innocent of any intention to wrong the Government.

There is no doubt at all but that these matters will all be probed to the very bottom. Surely, no one in the country can be more interested than Secretary Wilson and the President, that every department of our Government should be absolutely clean. We may rest assured that no guilty man will escape. I feel very certain that the number of such will be found very small. Indeed, the work of the scientist tends to preclude speculation. In the meantime, let us all withhold judgment and do our part to prevent these aspersions which are as mischievous as they are uncalled for.

### "How Bees Build Cells with Exactness"

BY ARTHUR C. MILLER

IN the American Bee Journal for July 6, there appears an article by G. M. Doolittle, which contains the following remarkable statements:

"The question is asked, 'How can so many insects occupied at once on the edge of combs where it is dark, as in a bee-hive, concur in giving them the common curvature from one extremity to the other, as is found in the comb of the honey-bee?' It is supposed that this direct mathematical work is done by actual measurement, as each bee has a square or rule to measure by, in the shape of the antennae. All who have observed the antennae of the honey-bee know that there is a joint in each, out toward its end. In building worker-comb, which is 5 cells to the inch, this joint is closed like a jack-knife, so that when the antennae thus closed are straightened out on each side of the head, the folded joints just touch the walls of the cell, and thus each bee is enabled to work in harmony with every other bee in the hive,

and we have every cell of worker-comb as nearly exact as the average carpenter can make a duplicate of the work of another carpenter.

"In building drone-comb the antennæ are straightened out fully straight, so that they touch the walls of the cell when fully extended at the extreme outside points, and by so doing larger cells are made, or those numbering 4 cells to the inch, which is the size of cells in drone-comb; and these are as uniform as to size as are those of the worker-pattern. In this we see the wisdom of a kind Providence, which placed within the bee an instinctive capacity as great, according to its wants, as is the reasoning capacity in man."

Nothing could be further from the facts. If the bees were dependent upon the two sections of antennæ as described by Mr. D. for the measurement of their work, they would be sorely handicapped, for their are several dimensions to the cells besides distance between parallel walls. Also, there are the accommodation cells which lie between drone and worker comb, and between comb and its supports, cells in curved and crooked combs, all of which vary from any regular comb cells.

These facts should be enough to make any one pause before hazarding the theory of a two-section measure on the bee's head. There is, however, a still more palpable reason for discrediting the statement made, and that is, that the bees do *not* have a folding joint near the outer end of the antennæ. The antenna of a worker consists of 12 sections: the first section called the scape, which is the part next to the head, and is about a third of the length of the whole. The other 11 sections make a slightly flexible rod known as the flagellum. The only place in which the antennæ can be folded, or even bent to an angle of any consequence, is at the junction of the scape and the flagellum. So slight is the movement between the sections composing the flagellum that the ordinary observer considers it a simple straight rod. The antenna is articulated to the head by a sort of ball-and-socket joint which gives it great freedom of movement.

There are also other facts which are at variance with Mr. D.'s statement. The total spread of a worker's antennæ is approximately three-eighths of an inch, while drone-cells are only one-quarter of an inch wide. The total spread between the ends of the scapes—the only place where the antennæ can be folded—approximates but an eighth of an inch, while a worker-cell is one-fifth of an inch wide.

Furthermore, bees when at work do not use their antennæ spread out, but the two tips are brought close to the material the mandibles are working—a fact plain to the most casual observer. Providence Co., R. I.

## Odors Among Bees—Some Experiments

Translated from "The Bulletin de la Societe Romande D'Apiculture"

BY C. P. DADANT

(Continued from page 567)

ON April 25, my colony No. 11 had already a number of hatched drones, and it was this one which I selected for the first experiment. After having carefully washed my hands two or three times over, so as to remove odor entirely, I caught about 10 drones at the time of their return to the hive. The pulp I made out of them by crushing them was used in rubbing my hands and wrists; then, immediately afterwards, I proceeded to open the hive without smoke and without jar, doing nothing that might stir the bees to an investigation. The result was beyond my expectations; not only I was not stung, but the bees ran over my hands as on their combs, without any hostile demonstrations. The visit lasted half an hour, and it was only towards the end of this time that the bees began to show signs of disquiet and intentions of stinging. I had found there a very good apifuge, and at low cost.

The same experiment, repeated the following day with colony No. 5, gave the same results, only this visit was shorter, for I had another project to put in action. After having closed the hive, and revived the smell of its drones on my hands by crushing a few more, I immediately opened another hive, No. 7—a colony of common bees of remarkable gentleness. What I had foreseen happened: as soon as the hive was opened, and my hands came in contact with the insects, I was assailed and stung about 20 times in the space of a few seconds.

April 29, No. 12 was again visited without stings; then doing as I had done three days previously I opened No. 17, but even though I used a little smoke, as is usually done, I was copiously treated with venom by the irritated insects.

These experiments were repeated the following days on other colonies, and the results, although not always as conclusive, were nevertheless satisfactory. Some trials were, how-

ever, completely negative—a fact which I believed must be attributed to causes which I will mention further.

At several times, after having visited a colony with the greatest success, I moistened my hands (but without having previously washed them) with juice of drones taken from some other colony which I intended to examine also. But whether it was the first odor which irritated the bees, whether it was the mixture of the two odors, or something else still, I do not know, the stings were always numerous. It was only by washing my hands carefully between the visits to each hive, then giving them the odor of the colony to be visited that I could manipulate the insects without being rewarded by a number of stings.

We must conclude from this that the bees, like ants, have a perspiration of a particular nature, also similar to that of ants differing in odor from one colony to another, and that it is this odor which guides them, especially when they try to recognize one another.

When bees are taken from any hive, washed with greatly diluted alcohol (which may be done easily by taking them by the wings), and returned to the alighting-board of their own hive, they are not accepted; several have even been killed, under my eyes. If after having washed them with alcohol they are washed with the juice of drones from another hive, and presented to the bees of that other hive, they are always welcomed there.

I had gone this far with my trials, when an absence of 10 days caused me to interrupt them. It is useless to tell you that, during that time, I was constantly thinking about the experiments made, and the fruits that might be reaped from them. It came to my mind to try whether, in proceeding thus, it would not be possible to introduce into the colonies some fertile queens.

So, May 20, I began again with the determination to sacrifice a few queens, if necessary, in case my trials were unsuccessful. Those queens would, after all, be easily replaced, for in my absence colony No. 2 had swarmed unexpectedly, and had supplied us with three young and beautiful queens, lodged in nuclei while waiting for something better.

Towards 2 p.m. I removed without trouble the 2-year-old queens of Nos. 19 and 25. Then after having washed the queen of 19, and having covered her copiously with drone-juice from No. 25, she was placed at the entrance of that hive. At sight of her, the bees made neither happy nor hostile demonstrations, and she passed among them and entered the hive.

The same operation was made with the other queen, and scarcely any bees noticed her entrance. These 2 queen changes had lasted only about an hour, and the bees did not seem to notice that they had been at any time queenless.

Until then all was well, but what was to be the fate of those 2 queens? I could not make sure of this until the following day. That day, as well as several following days, the weather was bad, so my visit had to be put off till the 25th, that is 5 days after the exchange. But in visiting these 2 hives at that time, I had the satisfaction of noting, *de visu*, the presence of the 2 queens in the hives. They had therefore been accepted without any difficulty—nay, the bees had not noticed the substitution. The laying was not even interrupted, for there were eggs in both hives which could only have been laid by the new queens.

At the time of putting into winter quarters of those 2 colonies, the populations were vigorous, and I have no doubt that they fared well through the winter.

My exchanges of queens were limited to this trial, in spite of my intention of continuing them, for I still had many points to examine. How did the queens and the bees disport themselves, an hour or a few hours after introduction?

I have said that it happened to me to be stung in spite of the drone-juice with which my hands had been rubbed. This happened first on a day when the wind was blowing violently, probably rapidly removing the smell from my hands. The same thing happened in very hot days, when the bees were naturally ill-disposed. There is therefore room for more experiments on this point.

I intend to continue these experiments, as much as my leisure will permit, for I can not hold as absolutely conclusive those made the past summer. But to give them more value, I desire the bee-keepers who may have the leisure, to continue them with me; their co-operation is necessary, for the more numerous the trials will be the better we can recognize their value, and the better we can base our expectations on their utility. If success crowns our efforts, it will be another step towards the successful introduction of queens.

How will the colonies behave that have been drone-laying for a certain lapse of time, or those having had a bad temper? If the method succeeds with one race (my colonies are common

bees, or bees mixed with Italians or Carniolans), will it succeed with others? Thus many points are to be examined with the greatest care by a number of trials.

We must not doubt that there will be some failures, perhaps numerous; we would be very fortunate should it prove otherwise. But experimenters must not be discouraged by failures, but must not fail to repeat their experiments, registering carefully the results obtained, together with the atmospheric conditions, the character and condition of the bees—in a word, all that may have influence upon the experiments. It would be well, at the beginning, to make the experiments on fair days with prosperous and quiet colonies, while the bees are at work. Progressively, the experiments may be extended to the different colonies, whether gentle or cross, and in all sorts of weather.

The results obtained will be the more positive, with mutilated experiments, and I am sure that the friendly and devoted readers of our little Bulletin will gladly welcome the communications that will be made upon the subject.

Moudon, Feb. 18

L. FORESTIER.

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 617.)

### CASH FOR PROOF OF ADULTERATED COMB HONEY

Mr. Dadant—A gentleman over here spoke a while ago. He thought it was not advisable to let people know that there is foundation in combs. The question is only whether we shall allow the people to keep on believing a lie or tell them the plain truth. We do put foundation in our honey. In fact we cannot get straight sections without putting foundation in it. If we explain that we must explain to them we put foundation in the bottom. It is nothing to be ashamed of. Why not tell them that rather than allow them to believe a lie, for fear of telling them that honey-comb is manufactured and sealed over? I have never seen a lady, delicate as she may be, that was not willing to take a piece of that foundation and chew it. If they are willing to do that they are willing to eat the honey that is made on that foundation.

Mr. Horstmann—I think each bee-keeper is responsible for his own neighborhood. I don't agree with Mr. Wheeler. I believe you should explain to them the use of the foundation and why you use it. I will take people right into my bee-house and show them sections before they are bent and put together; show them the strips of foundation before they are put in; show them the machine I use for putting the foundation in, and for fastening it; show them how I fix up the supers; shows them how I put it on the hives; show them the bees working, and then guarantee to everybody that my honey will be absolutely pure. If they find any adulteration I will give them \$100, and also pay for the analysis. I want people to be fully satisfied when they buy honey from me that they are getting it pure. I have never had to take any honey to a wholesale house; I have always been able to sell it at home.

Mr. Wheeler—I am afraid I was misunderstood. I have been selling honey a good many years. I aim to sell as much honey with as little work as possible. It would be a pretty hard job for me to explain to every customer who buys a pound of honey all about it, but I tell you one thing that proved to me very strongly that the idea of foundation went against the people. I have used for ten years a split section that showed the foundation on four sides. I put in four sections in a row, put sheets of foundation through the middle, the sheet of foundation running the full length of the section, and when I got ready to case up those sections I pulled the sections out and scraped the foundation off and went ahead and cased it up. A great many objected to that foundation. All they saw was the foundation sticking out. The grocery men say, "I wish you would let me have sections that are not split; my customers object to those split sections." The consequence was I quit for the present using them. It is a very convenient section the best kind of section in the world to

get filled out, but I had to cater to the trade and I did it just for that reason, no other, simply because people saw that foundation and they said, "Well, that looks as if it was manufactured; I am a little afraid of it."

Mr. Kimmey—I would like to ask some of these practical men when they speak of foundation drawn out what proportion of foundation is used in honey? I speak now of section honey; such as is produced by Dr. Miller's bees.

Dr. Miller—That will depend largely on the foundation itself.

Mr. Kimmey—Take the thin surplus foundation.

Dr. Miller—I should say that the thin foundation is drawn out perhaps an eighth of an inch.

Mr. Kimmey—I will confess I was one of those persons for two years who firmly believed honey was manufactured—comb honey, everything by machinery. I heard it so often. I knew so many things that I firmly believed the comb honey capping and everything was manufactured. I have found out differently since, but I have found out also that the foundation is manufactured. I can't say it is to the detriment of anybody, and I don't believe in trying to deceive or fool anybody.

Mr. Bacon—When you come right down to it, foundation is not manufactured; it is pure beeswax and is merely pressed out; it is originally made by the bees.

Mr. Kimmey—If you can manufacture the full comb and fill it with the pure article, that is absolutely pure; it is just as good as though made by your bees.

Mr. Meredith—I would like to have Mr. Dadant and Mr. Root give their opinion of how much of the medium or light brood can be drawn out in the shape of foundation.

Mr. Dadant—If you give foundation and the bees are not too much in a hurry they will draw it nearly entirely into comb. There is a great difference in the result between when the bees are in a hurry and when they are not. If they are in a hurry and they have plenty of wax they will add to the foundation without drawing it much. They will always work the foundation over. They have changed the shape of it; they have changed it to suit themselves. They always thin it a little if they have plenty. I suppose you understand that clearly. Of course it is according to the grades of foundation, you have thicker or thinner combs both in the midrib and also in the wall. The first is always the best for comb honey. What we call extra-thin we have always considered the best for starters or sheets in the supers. I think very little of that will go into the cell-wall. It will nearly all remain in the midrib because it is so very thin. Therefore, I want to advise people to use the very thinnest for their sections. But when you come to medium and light brood, it is out of the question to furnish that to people for consumption. You will have a heavy midrib in either case. I am afraid too many people use that and create a sentiment against the foundation. But better have a sentiment against the foundation, which we must all know and acknowledge to be there, than to let them believe that your honey is manufactured comb honey, and sealed over with a hot iron, as so many believe. The great trouble is they don't look and don't rely on their palates. The car-loads of honey that come in from the West are largely responsible for that. It is very nice and white, and it looks as if it had never been on a hive, to anybody who does not know. But anybody who will look at the honey, and anybody who can be told that no two sections are alike, will readily understand that it cannot be manufactured. Because, if we were to manufacture them we could not make every comb different from every other comb.

Pres. York—It has been suggested we write for our local papers. I want to say that a few weeks ago my attention was called to a statement about manufactured comb honey in one of the papers that has perhaps several hundred thousand readers. I wrote the editor asking him to make the correction, and he replied that he believed comb honey was manufactured, but if he found otherwise he would correct it. A few weeks later I received another letter from him saying he had discovered it was not true, and he would correct it. I wrote him at once and thanked him for his intention to make the correction. I also said if he wished I would write him an article, and got a letter in a few days saying he would be glad to have me write an article of eight hundred or a thousand words, and I have just written the article. It may have been a little presumption on my part to offer that, but I think it was all right, and I think the rest of us can do the same thing. Whenever you see anything about honey that is wrong, ask for the correction of it, and offer to write an article.

Continued next week

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sts. B. Rural, Toledo, Ohio.

### OLD COMBS FOR WINTERING BEES.

The importance of old comb and long established colony when winter conditions are hard is strongly brought out by Mr. Becker's experience. The old colonies in old hives mostly went through in good order; while of 10 in new hives (presumably new colonies also) only one saw spring, and that perished before spring was over. Between the layers of silk in the bottom of a cell are films of dried stuff that can be used as sort of food. Although honey is the main food in winter, there still seems to be need of a small amount of nitrogenous food different from honey—and the bees get it by chewing up these films. I think that more than half the reason why a new colony and hive is apt to fare poorly when wintering, is because the number of films in a cell is small, and in too many of the cells none at all. Page 490.

### COMB FOUNDATION IN AMERICA AND EUROPE.

Mankind can give bees several laps and yet beat them in the "locality" queerness. Locality Europe and they won't have Weed process foundation. Locality America and they won't have anything else. Perhaps they know more about the Weed process than most of us are allowed to—else know less, and fib against it. Let's see—were we not told once that the Weed process did not work with impure wax? If that is the fact, naturally those European makers, who mostly adulterate, would feel inclined to lie it down. Fifty-seven and a half tons of foundation in one year is certainly a grand record for the Dadants. Page 502.

### OLD AND YOUNG BEES IN THE COLONY.

In his article on page 504, Mr. Doolittle starts ideas that are not as familiar to the most of us as they ought to be. We can take away all the old bees of a colony without destroying it. Younger bees will go the fields in their stead. But will they not bring

smaller loads and fewer of them—and so the damage to the colony be much greater than we thought? We can take away all the young bees and make the field-bees stay at home and nurse brood. But will it not take twice as many of them to digest pollen enough for a given number of young? Presumably they quit breeding and went to the fields partly because their pollen-digesting powers were failing. And it is known to conduce to poor queens to be reared by old bees.

### "SHOOK" SWARMING AND DIVIDING.

The Northwesterners seem to have gotten dreadfully mixed when they tried to discuss "shook" swarming—majority of them talking about some form of *dividing*. *Dividing* is *dividing*; and "shook" swarming is "shook" swarming. Nothing is entitled to the latter name unless it is a tolerably close counterfeit of natural swarming. I guess we shall have to be broad enough to admit that there are two kinds. In the closest imitation we manufacture a cluster in a box or otherwise and then carry it away and hive it just as we would a natural swarm. In the less close imitation we carry away the combs and some of the bees, and let the "shook" continue to occupy the old stand. Page 505.

### TIME OF BABY-BEES' DINING.

There's a laugh hid in Missouri's Ques. 5, on page 505. What the innocent child really wants to know is the meal hours for bee-babies—whether they dine at 12, like working-folks, or at 5 like aristocrats, or at 9 like the public celebration dinner.

### QUEENS LAYING SEVERAL EGGS IN A QUEEN-CELL.

And so a good queen has been known to lay three eggs in a queen-cell—consequently it isn't *always* laying workers that do that sort of thing. Thanks for the evidence, Miss Wilson. Page 507.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bee-Keeping for Women—When Not Advisable—Success and Failure

But while I thus advocate bee-keeping for certain classes of women, as intimated in a preceding article, I do not advocate it for all women under any and all circumstances. The woman whose time is already taken up with other work should not take upon herself in addition the care of an apiary. This is for both her own and her family's sake, for should she do so she will surely overtax her strength and unfit herself for her higher mission, or she will neglect either her family or her bees. Family and home were meant to, and should, occupy the first place in every woman's heart; therefore she is not justified, unless actually compelled by need or lack of health, to undertake anything which will absorb time and strength needed indoors. For these reasons I do not advocate bee-keeping for women with large families, at any rate unless the various members are able and willing to assist materially.

I say "willing," as well as able, for it sometimes happens that a woman who is favorably situated in every other way, and who has an earnest ambition to engage in

bee-keeping, is opposed by husband or some other member of the family because of prejudice against the bees, or for some other reason. Such a woman should not, until she can overcome all opposition by agreeable means, engage in the work. Domestic peace and harmony are worth far more to any woman than anything she would be able to obtain from bee-keeping without them. Besides, much hard work is involved, enough to make it a hard pull alone at the best, and altogether too hard when it must be undertaken in opposition to one's family. In manipulating and cellaring, in extracting and marketing, and at various other times, a woman will find herself hampered by lack of strength or resources; whereas, if the members of her family stand ready to lend her such assistance as they can, both mental and physical burden will be greatly lightened.

But while I have placed a woman's duty to her family and herself above all other things as a barrier to her engaging in bee-keeping, she should also consider that something is due to the enterprise for its own sake, therefore she should not embark in it unless prepared to make it a success as far as she may. But it should first be said that while success or failure affects the standing of any industry, it affects it far less than it does the one re-

sponsible. Any one who has attained any measure of success in any line of work, has gained increased confidence in, and greater respect for, his or her ability, and is therefore better able to cope with the problems of life. On the other hand, those who accept failure are made weaker and less capable. Not only does failure degrade one in one's own estimation, but in that of one's neighbors as well. This is possibly more true of women's efforts than of men's, although the same may be said of both. But women, as money-earners, are more conspicuous figures than men, consequently results are more marked and more strongly commented upon. Knowing these things, then, let every woman who goes into the field take with her energy, enthusiasm, and a determination to succeed.

But as said before, success and failure affect the standing of any industry, especially in the immediate locality where it was made. Where one succeeds more will follow, and bee-keeping is an occupation worthy of the efforts of the most capable. Not only is it productive of health, but is capable of bringing into any community where it may be followed extensively, prosperity and comparative wealth. Women are not less responsible than men; let us therefore give to our industry our best efforts, and endeavor to win for it, as well as for ourselves, the respect and appreciation of all observers.

MRS. MILLIE HONAKER.

Vernon Co., Wis.

### The Yellow and the White Sweet Clover

DEAR MISS WILSON:—I have had a sort of guilty feeling for some time as the American Bee Journal came to hand so regularly, to think that it is so long since I have had a word to say to my confreres. There has been no lack of interest on my part, and many things have called for comment of one kind or another.

I noticed in a recent number that J. A. Green, of Colorado, says that yellow sweet clover blooms 15 days in advance of the white. I am at a loss to account for the difference between his location and mine. Here there is a *month's* difference in the time of their blooming. The yellow comes into bloom early in June, with perhaps a scattering blossom or two late in May. Here it is about the Fourth of July when the white may be said to be in bloom. I would like to hear from some others who have both kinds.

The bees are rushing things here just now, as they always do when the *heartsease* comes. They are losing no time, consequently I am rushed, too.

I have a nice hammock in the shade, but it is empty most of the time. I am glad to see that the editor gets off occasionally so that he can tell us about the "big men," and, incidentally, have "a good time."

(Mrs.) A. L. AMOS.

Custer Co., Nebr., Aug. 16.

### Experiments in Wax-Secretion

Experiments reported in L'Apiculteur showed that a swarm of 20,000 bees builds about 1000 grams of comb in the first 4 days. Estimating that  $\frac{3}{4}$  of the bees at work secreting, that makes each bee secrete .0000376 of a pound of wax in a day. At that rate it would take a bee 26,595 days to secrete a pound, or 26,595 bees to secrete a pound in one day.—[These are interesting figures; but another set of experiments might show quite a wide variation from these, owing to different conditions. Different experimenters have arrived at widely different results as to the number of pounds of honey it requires to make a pound of wax, the highest figures being 20 lbs., and the lowest between 5 and 6. But for all that, the general average of experiments of late has been between 6 and 7 pounds. It would be interesting to know how near the figures you furnish are to the general average. Perhaps the new apicultural department at Washington, with its fine corps of workers, will be able to eliminate many of our guess approximate figures, and substitute therefor those that are reasonably accurate.—Ed.]—Gleanings in Bee Culture.

# Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.  
 Dr. Miller does not answer Questions by mail.

## Treatment of a Weak Colony—Loafing Bees

1. How will it do to set a weak colony on the stand of a strong one, and the strong one on the stand of the weak one? Or, would it be best to give the weak colony brood and bees from the strong one?
2. What makes the bees loaf so much when there is plenty of buckwheat bloom? They hang out and seem to be lazy.

WEST VIRGINIA.

ANSWERS.—I. In making a weak colony take the place of a strong one, there is some danger that the queen may be killed. It is safer to give brood. Bees may also be given with the brood, but the bees added should not be more than about a fourth as many as the bees already in the hive. A nice way is to exchange frames of unsealed brood for frames of sealed brood.

2. It is not because the bees are lazy, but because they are wise enough not to wear themselves out when there is no nectar in the flowers. See answer to Kansas, page 603.

## Swarming Management—Wintering Bees

1. My bees are a quarter of a mile from the house, and I clipped the queens' wings last spring; but being so far away, and not being able to be with them all of the time, I have lost a good many swarms. Another year could I not buy a drone and queen trap for each hive, attend to them every night, and divide what I want for increase, so I would not have to be with them all of the time?
2. Ought I to build a shelter for the bees or will they winter here all right without protection?

COLORADO.

ANSWERS.—1. Yes, it will work. There is danger that some swarms will return to the wrong hives, but that is better than to have them sail off entirely.

2. While it may not be absolutely necessary in your locality, it is well that there be something to break the force of the winds.

## Management of Swarming—Size of Brood-Nest—Hives

I started with 2 colonies (in the spring of 1893) in 8-frame hives. I now have 36 colonies, 6 in Langstroth 10-frame, 4 in 8-frame hives, and all the rest in common store boxes with slats and end-pieces to hold the combs. Is it not possible in using the Heddon system in swarming, with these boxes, to get more money out of it in the end than to buy new hives at \$2 each, since with this system, as I understand it, there is no need to overhaul the bees to cut out cells or anything of the kind?

I never read anything about bees until this season. Of course I now see where I could have prevented so much swarming, but at the same time I wanted to get into the bee-business, therefore the increase was all right for me.

1. In the shook swarm method (or the other method of giving the new swarm on the old stand) why couldn't we place the old hive (with all queen-cells cut out) right under the new swarm until the bees have all hatched, then we have a hive for more bees again? This continual increase means more hives, and there comes a time when we would like to call a halt.

2. What is the matter with closing the hive tight when the swarm commences to issue, keeping it closed until the bees will not take

to wing when released, as described by J. T. Adams in the June 15 issue of Gleanings for 1903?

3. Does the anticipated swarming method of Adrian Getaz, described in the American Bee Journal of June 16, 1904, work out according to schedule?

4. A beginner sees so much in print that seems to be contradictory. For instance: Of course in the early spring we want increase, and lots of it. Some advise a second story to give room for the queen, etc. Then we read what Mr. Dozenbaker has to say in regard to his hive, and one of his strongest claims is just the reverse. He says we need a smaller brood-nest, etc.

Then I read of a lady who keeps down swarming by puffing a little smoke in at the entrance when the swarm commences to issue. This stops the swarming note, she says. Then the next morning she shakes the swarm into a new hive on the old stand and places the old one in tiers 6 or 8 high on a strong colony. Very good. Then I read that should you put even one swarm into an old hive with brood, there would not be enough nurse-bees to take care of all the brood, but if you should put 2 swarms into such a hive there would be enough such bees, and such method was advised. Now comes the question, How many bees would it take to care for the 6 or 8 colonies tiered up over even a strong colony?

5. What would you advise me to do? I am a pharmacist, and therefore can give only a small part of my time to the bees. I can have enough of these store boxes ready for another season without any cost except for paint. Or would it be better for me to buy new hives for another year? I am getting honey, and I have some new colonies which I think will give me 3 supers full, as I have 2 already. I am running for comb honey altogether, and winter the bees in the cellar.

IOWA.

ANSWERS.—1. You'll never reach the point where year after year you'll have just enough hives and all constantly occupied. Some extra hives must always be on hand. But that isn't answering your question. You can easily make a trial of your plan, and one trial will probably satisfy you that poor work will be done in an empty hive over the brood. In one case I had a queen thus placed—over an excluder—and she stayed there 3 weeks without laying an egg.

2. I don't know how it would work in your locality, but I feel almost sure the colony would swarm as soon as the oldest virgin could go with them. Mr. Adams says in his locality he has no afterswarms. But if you could control them till all the virgins but one were killed, you might come out all right.

3. When I see the name of Adrian Getaz attached to a statement, I feel I can rely upon that statement. The system he gives is in good repute across the water, and I wonder that it doesn't make headway here. Exceptions to the working of the plan will no doubt occur, just as exceptions occur in the usual manner of shaking swarms.

4. Different views are entertained as to size of brood-nest, but the difference you speak of may be accounted for by the fact that different times are talked about. When a colony is building up for me in the spring, it is impossible to give too much room for a brood-nest so long as it is fully occupied by the bees; but during the harvest it would be ruinous to have unlimited room in the brood-chamber. It would mean not an ounce of comb honey.

A colony covering 8 or 10 combs in winter will laugh at a temperature 20 degrees below zero, while another covering only a single comb would freeze to death. Same thing in summer. Take a single comb sparsely covered with bees, and the brood will be chilled

in a little while. Take 8 or 10 such combs together, with the same proportion of bees, and the brood will be all right. When you make a shaken swarm, and put the brood in an empty hive, you may put in so few bees that the brood will suffer. It will of course take more bees to take care of two stories of combs than it will to take care of one story; but it will not take twice as many bees. The larger number of such combs you have in a pile, the smaller the proportion of bees needed to keep the brood warm. I don't know for certain, but I think there are enough bees in one strong colony to care for the brood in 6 or 8 hive-bodies tiered up. If necessary, the whole field-force could remain in the hive to keep things warm, and some of them might even lend a hand at feeding babies.

5. In getting ready empty hives for next season, have part of them one kind and part the other, and decide from your own experience which you like the better. I should advise that you try only a small part of the store-box kind, only that the cost is so little that you won't mind throwing them away if they don't suit you. And I have a suspicion that they won't suit you so well as the other kind. But don't grumble at me at the trouble of transferring all from the boxes later on.

## White and Yellow Sweet Clovers

I have read that there are two kinds of sweet clover, white and yellow, and I would like to know which is the better to sow on ground which is not under cultivation; for instance, waysides, fence-corners, etc. Which of the two varieties is to be preferred as a drouth-resister, and are they also used as forage-plants? My intention is to sow it for the bees, especially on waste ground, but I would like to know for what other purpose it could be used.

I have heard that sweet clover grows like weeds and blooms for a long time during the summer. If this is so, I would like to give it a trial, but would like to hear something definite about the plant before I purchase any seed.

INDIANA.

ANSWER.—As to kind of soil and as to resisting drouth, there is probably no difference between white and yellow sweet clover. The chief difference is in the time of blooming, the yellow blooming first. Some say it is two weeks earlier than the white, some say four. As a forage-plant, some esteem it highly, others say it is worthless. It is probably good in all cases where stock have learned to eat it. I have never seen much of the yellow, but from what I have seen I judge it does not grow so luxuriant as the white, and so would not yield so much forage. If you have abundance of white clover, the white sweet clover may be better for you than the yellow, for the white sweet clover comes into bloom before white clover is done.

# Reports and Experiences

## "Raised" Not "Reared"

On page 555, in my letter on "White Honey Almost a Failure," in next to the last paragraph, it should read, "no brood raised" from below to the upper stories instead of "no brood reared," which makes it unintelligible.

B. T. DAVENPORT.

## Hard Winter—Fairly Good Yield

Last winter was a hard one for the bee-keeper. About 50 percent of the bees were lost in this part of the State. But spring opened nice and warm, so the bees built up first-rate. Swarming has not been excessive, the clover yield being rather late, commencing about June 20. Up to date I have something like 75 pounds of honey to the colony, present count. I double up all swarms which

I put on new stands and get the best yield from new colonies. The county report as given by the assessor for 1905 for Nemaha county, was 441 colonies of bees. This was taken in April, but at the present time, I think there are from 1000 to 1200 colonies. A very large percent are poorly kept. Few bee-keepers take a bee-paper, and but few take time to look after the needs of the bees.

Our fall yield is not very large, so that we can not expect much honey from now on.

S. C. MAJORS.

Nemaha Co., Nebr., Aug. 7.

### Too Cold, Wet and Windy

My report so far this year is blank. We have no honey yet. We have had lots of rain, but it has been too cold, wet and windy. The bees seem to be gathering some the last two days, and the prospect for a fall flow is good.

A. J. FREEMAN.

Neosho Co., Kans., Aug. 23.

### Honey Crop a Disappointment

The honey crop here is a disappointment, also basswood. It has been too cool, cloudy and wet during bloom. The fall prospect is not good.

F. A. SNELL.

Carroll Co., Ill., Aug. 31.

### Bees Doing Poorly

Bees are doing very poorly here this year. There is no honey in white clover, and if we do not have a fall honey-flow some of us will have to feed our bees. One man reports plenty for the bees and some surplus honey.

C. W. HOPSECKER.

Skagit Co., Wash., Aug. 8.

### White Clover Yield Light

The white clover season is practically over, and the honey crop from that source has been rather light.

G. GLEYSSTEEN.

Sioux Co., Iowa, Aug. 8.

### Too Much Rain

The honey crop is very light here, as it rained too much during the basswood season, and the bees didn't work much on white clover, although there seemed to be plenty of it.

H. HINRICH.

Jackson Co., Iowa, Aug. 7.

### Bees Doing Fairly Well

The last half of July bees did fairly well. They are now working pretty well, but not doing much in the supers. They must be storing in the brood-nest. I lost a few queens on their wedding-trips this season, and replaced them with queen-cells. It has been fearfully hot and showery the past 2 weeks.

W. IRVINE, SR.

Webster Co., Iowa, Aug. 5.

### Bees Making a Fair Living— Dry Weather

White clover is all gone, sweet clover is more than half through blooming, catnip is dried up, and bees are working on red clover, of which there is plenty, but they are making only a fair living. My little patch of alfalfa is humming with bees almost as loudly as a good bloom of sweet clover would be.

The comb honey is of inferior grade and a very light crop. Two years ago I got 250 pounds per colony; last year, 62½ pounds per colony, and this year only about 25 or 30 pounds per colony. We need rain very badly. It is awfully dry.

J. E. JOHNSON.

Knox Co., Ill., Aug. 5.

### Bees Doing Little Work

Bees have been doing poorly here all the year. I have 6 colonies, 4 spring count, one natural swarm and one shook swarm. They had not gathered enough to live on up to the middle of July. Since that time they have been tolerably busy, and I believe I will be

able to harvest about 25 pounds of section honey to the colony, if we have a favorable fall. There was so much cold rain in the spring that lots of bees starved to death. I fed mine until July. Those that I did not feed lost considerable. I have 2 hybrid colonies, 3 blacks, and one Italian.

I am going to Italianize the hybrids and blacks this fall.

W. P. BURCH.

District 16, Ind. Ter., Aug. 8.

### Bees Doing Very Well—California Honey

My 26 colonies came through the winter in fine condition, and cast 2 swarms this season. The past 3 years they have not swarmed enough to say so, so I have had to make a swarm now and then. The 26 colonies have now 3 hive-stories, with about 100 pounds of surplus honey to spare.

The weather has been rather cold all summer. I got a queen July 25, introduced her the 26th, and she began laying the 29th. She looks fine, but it is too late to get a test of her this year. The progeny of some of the queens I have are pretty cross, but so long as they get the honey I do not care. This is a cold and often windy country, so they may be gentle enough in some other locality.

When speaking about California honey in a former letter, I did not mean that pure California honey was poor, but that the honey sold in some places for California honey was poor.

O. K. RICE.

Wahkiakum Co., Wash., Aug. 1.

### If you want the Bee-Book

That covers the whole Apicultural Field more completely than any other published, send \$1.20 to

Prof. A. J. Cook, Claremont, Cal.,

## Special Offers Until Oct. 1, 1905

# Standard-Bred Untested Queen, 60 cents

2 for \$1.10, or 6 or more at one time, 50 cents each. The Weekly American Bee Journal one year (either new or renewal subscription) with one of these fine Queens—both for \$1.30. Better have one or more of the Queens. They give satisfaction. Remember, the above offers expire Oct. 1, 1905. First come first served.

## An Untested Italian Queen-Bee FREE as a Premium

For Sending One New Subscriber  
for the American Bee Journal for a year with \$1.00.

As has been our custom heretofore we offer to mail a fine Standard-Bred Untested Italian Queen to the person who complies with the following conditions, all of which must be strictly followed:

1. The sender of a new subscriber must have his or her own subscription paid in advance at least to the end of this year.

2. Sending your own name with \$1.00 for the Bee Journal will not entitle you to a Queen as a premium. The sender must be already a paid-in-advance subscriber as above, and the new subscriber must be a NEW subscriber; which means, further, that the new subscriber has never had the Bee Journal regularly, or at least not for a whole year previous to his name being sent in as a new one; and, also, the new subscriber must not be a member of the same family where the Bee Journal is already being taken.

We think we have made the foregoing sufficiently plain so that no error need be made. Our Premium Queens are too valuable to throw away—they must be earned in a legitimate way. They are worth working for.

**CONVENTION NOTICES.**

**National.**—The International Fair is to be held in San Antonio, Tex., Oct. 21 to Nov. 1. When this Fair is in progress there are very low rates in force on the railroads out for 600 or 700 miles. Then there are harvest excursions from the North on the 2d and 4th Tuesdays of the month. The 4th Tuesday in October comes on the 24th. Considering these facts, it has been decided to select Saturday, Oct. 28, as bee-keepers' day at the Fair. This will give ample time for members from the North to reach the city by starting the 24th. The regular sessions of the convention will begin Monday, Oct. 30, and continue three days.

The headquarters of the National Association will be at the Bexar Hotel (pronounced Baer, long sound of a), corner of Houston and Jefferson Sts., and rates are only \$1.00 a day, and up. The convention will be held at Elks' Hall, 125 W. Commerce St., only two blocks from the Bexar Hotel.

Flint, Mich. W. Z. HUTCHINSON, Sec.

**New York.**—The Fulton and Montgomery Counties Bee-Keepers' Society will hold the next meeting on Wednesday, Sept. 20, 1905, at the Central Hotel, Amsterdam, N. Y. The annual election of officers will take place at this meeting, and also two delegates will be appointed to attend the meeting of the State Association at some time during the coming winter, and also any other business which may come up at this meeting. All are invited to come and bring your bee-keeping friends.

## Honey and Beeswax

**CHICAGO, Aug. 18**—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14c, while No. 1 has sold at 13@13½c. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white. 6@7c; amber, light and dark, 5@6c. Bee wax, 28c. **R. A. BURNETT & Co.**

**ALBANY, N. Y., July 26**—There is some call for honey, new crop, and if here would probably sell for best prices of season, as the general impression is there will be a large crop. White comb honey will start off at 15c to early buyers. **H. R. WRIGHT.**

**KANSAS CITY, Aug. 24**—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½c; other grades down to 4½c. Beeswax, 28c. **C. C. CLERMONS & Co.**

**CINCINNATI, Aug. 18**—The heavy requests for offers on honey recently, have a tendency to lower the prices. We are striving hard to maintain good prices, by giving our friends more than their honey is worth, to hold up the market. So far we have been successful. Still offer extracted honey as follows; Amber in barrels and cans at 5½@6½c, respectively. White clover at 7@8½c. We feel that lower prices will prevail in the near future.

Comb honey is coming in quite freely. We quote fancy white comb honey at 12@15c. The arrival of Western car-load shipments of comb honey is anticipated daily, after which the market will be shattered as to prices. Beeswax, 26c. **THE FED W. MUTH Co.**

**DENVER, June 26**—The demand for both comb and extracted honey is light at present, and there is enough of old stock on hand yet to last until the new crop comes in; the same is selling as follows: No. 1 white comb, per case of 24 sections, \$2.20; No. 2, \$1.75@2. White extracted, 6½@7½c per pound. Beeswax, 26c. **THE COLO. HONEY-PRODUCERS' ASSN.**

**NEW YORK, Aug. 18**—No new comb honey on the market as yet, and very few inquiries so far. Extracted is in fairly good demand and we quote: California at from 5½@7c per pound, according to quality and quantity. Southern in barrels from 5@6.5c per gallon. Beeswax remains steady at 29c per pound. **HILDRETH & SEGELKEN**

**PHILADELPHIA, Aug. 21**—Some honey arriving, with prospects of a good crop all through the East, but no call for comb honey during the hot weather, so that prices are not as yet established. Extracted honey arriving freely. We quote as follows: Fancy white, 7@8c; amber, 6@7c. Beeswax, 27c.

We are producers of honey and do not handle on commission. **WM. A. SELSER.**

**CINCINNATI, O., Aug. 8**—There is no demand for comb honey on account of the warm weather. Extracted is in usual demand for this season of the year. We quote white clover at 7@8c; amber, in barrels, at 5½@5¾c; in cans, 5½@6c. Beeswax, 28c. **C. H. W. WEBER.**

**SAN FRANCISCO, Aug. 23**—White comb, 1-lb sections, 9@10 cents; amber, 7@8c. Extracted, water-white, 5@5½c; white, 4½@5c; light amber, 4@4½ cents; amber, 3½@4c; dark amber, 2½@3c. Beeswax, good to choice, light, 27@29c.

The market is still very weak, though prices are being well maintained by apiarists, and not without cause, as advices from some of the most important honey-raising districts say that the yield of honey will fall far below the average this year, owing to cool weather during the months of May and June when the wild flowers were in full bloom.

## FOR SALE

Until further notice, finest quality new crop California Water-White White Sage and Light Amber HONEY in 60-lb. tins, 2 in a case; new cans and new cases. Write for prices and samples, and state quantity you want.

## The Bee-Keeper's Lullaby.

EUGENE SECOR.

GEORGE W. YORK.

1. The bees are in the lin - den tops, Bye, ba - by, bye!
2. The ba - by bees are fast a - sleep, Bye, ba - by, bye!
3. The ba - by bees will wake some day, Bye, ba - by, bye!

They'll bring the sun - shine home in drops, Bye, ba - by, bye!  
They nev - er fret, they nev - er weep, Bye, ba - by, bye!  
And go a - mong the flow'rs to play, Bye, ba - by, bye!

And some they'll put in wax - cups neat Just for their cra-dled ones to eat;  
They lie as still at sun - ny noon As stars are still a-round the moon;  
And ba - by mine may have a run Sometime, and chase them, just for fun;

And some they'll keep for ba - by, sweet, Bye, ba - by, bye!  
They nev - er hear their mam - ma croon, "Bye, ba - by, bye!"  
But now lie still and sleep, sweet one, Bye, ba - by, bye!

# GERMAN WAX-PRESS

Save all of your old comb, scraps of wax and slumgum, and instead of allowing them to become scattered or worm-eaten, or rendered in some wasteful method, put them into a German Wax-Extractor and you will be surprised at the amount of wax you can obtain and profits make. With a German Wax-Press you can get every particle of wax out of old combs. Much of the slumgum from solar extractors and other machines contains a very large percentage of wax that can be separated with our machine. Indeed, some bee-keepers buy up all the slumgum they can, and with the use of a German Wax-Press make excellent profits from what otherwise would have been thrown away.

Our Press may also be used as a honey-press. Loose or broken chunks of honey that are too small for an extractor may be extracted in this Press without application of heat, and the honey be as good as though extracted in the ordinary way. With every Wax-Press we furnish an uncapping arm. This arm, with scraping stick, is slipped over the edge of the can with the basket in place. The cappings drop down into this and are drained. This machine, therefore, serves three purposes, and is almost indispensable in any well-regulated apiary.

The machine is made in the best possible manner. The cross arm is of the best selected oak, and will stand any strain. Bolts projecting through the ends of the arm engage with corresponding ears on the can in such a way that a side circular movement instantly releases it.

Before closing I wish to say that Mr. E. R. Root is right when he says, "You can't get over 50 percent of the wax until you use a first-class press for your work." And I want to say when you get a press, buy a German. They are neater, can be used on a kitchen stove, make a fine honey-press and excellent uncapping can, and will be the most satisfactory in the end. I will trade my home-made outfit for one if I ever get a chance.

New York, Aug. 9, 1905.

PERRY ORTON.

I am well pleased with the German Wax-Press. Felt that in one day's work it had more than earned its cost.

W. J. OATES.

I was inclined to believe at first that the German Wax-Press was a failure, but after a thorough trial was well pleased. Secured 30 pounds more wax from one day's use of the machine than I would have secured by the ordinary method of rendering.

Illinois.

B. WALKER.

Wax from old slumgum that had been worked over by another party and declared to be free from wax, I got nearly 50 pounds from only a little over 100 pounds of the stuff.

E. T. FLANAGAN.

Illinois.

## Cash Discount for Early Orders

We can not remember a year when we were not crowded with orders through the spring months, and somewhat behind, some years more than others. In order to divert some of this trade to the fall and winter months, we have offered inducements in the way of an early-order cash discount. This year we will be more liberal than ever before in the amount of discount allowed. For some months the price of some of the materials used has been a little lower, and we have stocked up heavily, and propose giving you the advantage of the saving in price. The abundant farm crops throughout the country are stimulating trade in almost all lines, and prices are already stiffening. The discounts which we propose to offer for early cash orders are as follows:

For cash orders before	Oct. 1.....	10 percent.
"	Nov. 1.....	9 "
"	Dec. 1.....	8 "
"	Jan. 1.....	7 "

For cash orders before	Feb. 1.....	6 percent.
"	March 1.....	4 "
"	April 1.....	2 "

You will notice that, after January, the discount drops 2 percent a month; and if we find that advancing prices of materials do not warrant the larger discount, we reserve the right to reduce the amount of discount at any time. Your safest plan is, therefore, to order at once.

This discount is only for cash before the dates named, and is intended to apply to hives, sections, frames, foundation, extractors, smokers, shipping-cases, cartons, and other miscellaneous bee-keepers-supplies. It will not apply on orders for the following articles exclusively; but where these form no more than about 10 percent of the whole orders, the discount may be taken from the entire bill: Tinned wire, paint, Bingham smokers, Porter bee-escape, glass and tin honey-packages, scales, bees and queens, bee hooks and papers, labels and other printed matter; bushel boxes, seeds, and other specialties not listed in our general catalog.

## Editorial Notes and Comments

### Requeening vs. Shaking Swarms

In an article in the Western Bee Journal (recently discontinued), Adrian Getaz expresses his preference for caging queens or requeening, as against shaking swarms. He says:

In my locality at least there is nothing better than caging the queens or requeening. I have so far used the last process in preference, but I may change definitely to the other after all. With one or several large apiaries and a locality where a considerable proportion of the colonies are likely to swarm, I would cage the queens throughout a little before the swarming-time. The cage should be placed in the cluster of bees. The queens are then well cared for. Furthermore, the bees are likely to work better than when entirely deprived of the queen. In due time the queen-cells are cut out, and the queens are released a few days later. The condition of success is not to release the queens until the colony has been at least 4 days without unsealed brood.

Exactly how it works I could not tell positively. I think it is this way: During these 4 days or more without unsealed brood, the young bees having no brood to feed, take to the field, and become actually field-bees notwithstanding their age, or rather "youthfulness." If we can coin such a word. Later on, when the queen begins to lay again, the excess of nurse-bees has thus ceased to exist, and is not likely to occur until the swarming season, or even the honey-flow, is over, and swarming out of the question. It is immaterial if the same or another queen is given; it does not make a particle of difference. Dr. Miller here, and Gravenhorst in Germany, say that it does. That bees allowed to requeen will not swarm again, but if a strange queen is given them they will. I presume that they gave the strange queens too soon, not knowing the condition mentioned above. I would like Dr. Miller to try again, giving due attention to that condition.

The requeening is done about the same way. The old queen is removed and the bees are allowed to requeen. It is best to do it only when good queen-cells are already present, or when the swarm has already issued and is returned to the parent hive. The cells started only after the queen is removed are liable to give inferior queens. Furthermore, the colony is too long a time without a laying queen, and thereby too much weakened.

My two apiaries are not very large. Furthermore, the locality is not favorable to much swarming. Taking the average of several

years, only 1 colony out of 10 swarms. So I put queen-traps on all, and requeen only those which actually swarm. It is far less work than treating all. And those that do not swarm do much better than if they had been disturbed.

ADRIAN GETAZ.

Knox Co., Tenn.

Dr. Miller offers the following in reply to Mr. Getaz:

It has long been known that the swarming fever could be overcome by having a colony queenless for a certain time, and upon this was based the treatment of swarms given by Mr. Doolittle some years ago, which treatment I used for a time with much satisfaction. When a colony swarmed, the queen was caught, caged, and the cage left in the hive. Five days later all cells were destroyed, and after another five days they were again destroyed, and the queen freed. The plan is an excellent one where there is any one to watch for swarms, and where increase is not desired.

But I think Mr. Getaz is the first one to give so satisfactory a theory as to the why, namely, that the colony is so long a time without unsealed brood that the nurse-bees have pretty much all become fielders. To this he would probably add the theory that the swarming-fever has been induced by the throwing out of balance of the different forces, the nurse-bees having become so numerous in proportion to the amount of brood to be fed that there is a glut in the market of food-material prepared by the nurses.

Mr. Getaz says, "The condition of success is not to release the queens until the colony has been at least 4 days without unsealed brood." In following out the Doolittle plan mentioned, there is a seeming lack of that condition, for the queen is released 10 days after the issuing of the prime swarm. If the queen continued to lay up to the time the swarm issued, that would leave the colony only a day or two, instead of 4 days, without unsealed brood. But it must be remembered that during the last few days before swarming the queen has been tapering off in the matter of laying, so that to all intents and purposes the bees are 4 days without unsealed brood.

After a colony is "treated" by having been kept without unsealed brood a sufficiently long time, Mr. Getaz says it does not make a particle of difference whether its own or another queen is given. He quotes me, in company with such an eminent authority as the lamented Gravenhorst, as holding a different view, and expresses the wish that I would try again, keeping in view the proper conditions. No need to make any further trial, Mr.

Getaz, or, rather, I have tried it many times. You are entirely right.

Gravenhorst was right, too, as far as he went, but he and I were ignorant of the whole truth. He said that if you give to a colony a young queen reared elsewhere, that would not prevent the swarming of the colony, but if a young queen were reared in the colony itself, that colony would not swarm till the following year. He said he didn't know why there was such difference. In the light of the explanation given by Mr. Getaz, the reason is very clear; when the young queen is reared in the colony itself, there is the proper "treatment," the colony being left a certain time without any unsealed brood, whereas when there has been no such treatment I have had a colony swarm when a queen not a month old was given—swarmed, too, in less than a week after the young queen was given.

Long since I have learned that "treating" a colony by keeping it without unsealed brood is an important requisite, and have acted upon it, but without any satisfactory explanation as to the why, and hereby thank Mr. Getaz for such explanation.

McHenry Co., Ill.

C. C. MILLER.

### Mating and Swarming of Virgins

Commenting on an editorial on this subject, Wm. Muth-Rasmussen, of Inyo Co., Calif., writes thus:

In an editorial, page 581, under the head of "Mating and Swarming of Virgins," a very important factor is omitted on which the whole question hinges, viz., that the bees behave in the manner stated, *only when there is no young brood in the hive from which another queen could be reared, if the present virgin should be lost on her mating trip.* When there is suitable brood for this purpose, I have never known a swarm to issue with a virgin queen when she goes out to mate, and for this very reason I am always careful, when I know in advance that a virgin will come out, to see that there are eggs and young larvae in the hive, or to supply them if necessary.

I do not now remember if, in my letter to Mr. Doolittle, I said that bees in such cases "invariably" acted so. If I did, this was perhaps too sweeping a statement. I should rather have used the word "frequently." But I had so many cases of this kind during the swarming-time of the present year, that I could not help thinking and questioning about the matter.

I have since written to Mr. Doolittle, and given him a more detailed statement of facts. Though I feel sure that I have repeatedly seen the same thing mentioned in print during my 35 years of bee-keeping, I could at the time of writing lay my hand on only two quotations, one from Dr. Miller's book, page 165, 1st line from above; and one from "A B C of Bee Culture," 1905 edition, page 257, 2d column, 2d line from above. Dr. Miller says:

"If, by chance, a young queen is in the upper hive, I do not like to put her down until she commences laying and her wing is clipped, for fear of her taking out a swarm. *It seems a foolish operation for them to swarm when there is nothing in the hive from which a queen can be reared, but I have had it happen.*" (Italics mine.)

Mr. Root says: ".....it [a frame of unsealed larvæ] serves as a sort of nucleus to hold the bees together, and to keep them from going out with the queen on her wedding trip, which they are much disposed to do, if in a small nucleus containing no brood."

It seems to me that these eminent authorities corroborate my statement, although my experience was with full colonies with clipped queens, that had already swarmed and been returned to the old hive.

Perhaps Mr. Doolittle will use my last letter for another "Conversation," and I hope that he may be able to shed more light on the subject.

WM. MUTH-RASMUSSEN.

No mention was made on page 581 as to any difference made by the presence of young brood, for the simple reason that in the article of Mr. Doolittle, in *Gleanings*, there was no hint that the presence of unsealed brood would make any difference. Thanks are due Mr. Muth-Rasmussen for bringing out that point. It emphasizes the value of unsealed brood in a colony or nucleus having an unfertilized queen, as urged by Mr. Root. Whether Mr. Doolittle or Mr. Muth-Rasmus-

sen be right, it seems a safe precaution to see that there is unsealed brood in any hive containing a virgin queen.

But there is no need, really, to assume that either one is wrong. Mr. Doolittle merely says he has not had the same experience as Mr. Muth-Rasmussen. That does not say that Mr. Muth-Rasmussen and others may not have had such experience; the interesting point being to find out what is the general experience; or, possibly, to find out what different conditions produce different results in New York, from those quoted by Mr. Muth-Rasmussen in California, Illinois and Ohio.

### Honey Advertising in the Bee-Papers

When we were in the honey-business we bought a great deal of honey from the large producers, and then sold it to smaller bee-keepers who did not have enough to supply their customers. In view of our experience, we do not see why it wouldn't pay those who have large honey crops to offer it to other bee-keepers, as mentioned. Our advertising rates are 10 cents a line, 7 lines to the half inch of space, which is the smallest advertising space we quote a price on. Perhaps a few insertions would sell a crop of honey, provided the price asked for the honey is not too high-

"The Honey-Money Stories."—We have mentioned several times in these columns our new booklet, called "The Honey-Money Stories." We have received the following expressions of opinion concerning it:

DEAR MR. YORK:—I was greatly but agreeably surprised, a couple of days ago, to receive a little booklet published by you, named "The Honey-Money Stories." It is nicely gotten up, the illustrations are fine, and the printing is good. Some one must have done some good editing in the make-up. But I was most surprised to find the little lullaby I sent you a few months ago set to music by yourself. My daughter has tried it on the piano, and says it is very pretty. I am greatly pleased at the setting you have given it.

Yours truly,

EUGENE SECOR.

We are indebted to *Gleanings in Bee Culture* for Sept. 1 for this paragraph:

"The Honey-Money Stories" is the title of a new 64-page pamphlet published by George W. York & Co., Chicago. It is well printed and beautifully illustrated. The subject-matter is prepared in popular style, calculated to interest and attract the attention of the ordinary consumer of honey. The stories are interesting, and from every point of view are calculated to tickle the palate of the person who has never eaten honey, and to stimulate the desire for more on the part of those who are lovers of the sweet. The price of the pamphlet is 25 cents. Bee-keepers can probably procure them of the publishers. Mr. York is to be congratulated on getting out so interesting and attractive a book.

To show how it works to distribute copies of "The Honey-Money Stories," we give the following:

Since reading "The Honey-Money Stories" I am a more firm believer than ever in the food value of good honey, and shall eat more of it.

R. J. H.

Just a little brouching in "The Honey-Money Stories" convinces me that I need four more copies for friends.

A. W. S.

"The Honey-Money Stories" booklet contains 64 pages and cover, with over 30 half-tone illustrations. It is printed on enameled paper, and is a gem in appearance. Single copy, 25 cents postpaid; 5 copies for \$1.00. Or a copy with the *American Bee Journal* one year—both for \$1.10. Send orders to this office.

Uniting Swarms.—A. W. Boss, of Kansas, wishes us to ask for a general discussion in these columns of the practicability and the best method of uniting swarms. Might also have the same thing discussed concerning colonies.

"Getting Even."—Esop's Bear was angry because a Bee stung him, so he madly overturned the hive. Foolish bear, instead of "getting even" he got stung.

The man who grows furious at every little real or fancied insult and tries to "get even," soon finds himself caught in the brambles of annoyance. Remember that "getting even" is a life job that is never completed. If you spend your time "getting even" with people, you will be in the position of the Bear and the Bees—you will have no time for business.

"Getting even" means putting yourself on the same plane as the man whom you despise. Is that worth while? Is it consistent? Don't get the "getting even" habit, unless you wish to see the unpleasant side of people, and spend your life in one long wrangle. Don't think you must defend your dignity at all times. A dignity that needs defense is no dignity at all.

Much that we take offense at arises from misunderstanding. The rest is the escape of the spleen of ignoble souls, and should be given the same attention the lion gives to the braying of the ass.—*The Star Monthly*.

## Miscellaneous News Items

Mr. Huber H. Root, youngest son of Mr. A. I. Root, was married Sept. 6, to Miss Mabel Knisely, of Butler, Ind. Our heartiest congratulations to "Huber," who evidently has done so "Knisely" in a matrimonial way, and also to "Mabel," who now is so well "Root-ed." They will be "At Home" in Medina, Ohio, after Oct. 15.

Mr. Thos. Wm. Cowan, editor of the *British Bee Journal*, was expected to leave for Portland and the North, on Sept. 9. He and Mrs. Cowan have been spending the summer in their California home. They will proceed on their journey homeward, across the Atlantic, after visiting the Portland Exposition and stopping along the way across the Dominion of Canada. May they have a pleasant voyage and a safe arrival home.

Clarence G. Dittmer, second son of Mr. Gus Dittmer, of comb foundation fame, gave us a pleasant call last week. He was on his way back to Baker University, located at Baldwin, Kans., where he spent the last college year. "Clarence" is a veritable "chip of the old block," and knows what he is going to school for. We bespeak for him an honorable career. He reports his father as doing a satisfactory business this year in comb foundation, which must be very gratifying, as the Dittmers have worked hard to build up a good business.

The *Bee-Keeper's Lullaby*, on the first page, is the latest in the apianian music line. As will be noticed, Mr. Eugene Secor is the author of the words, which were published in these columns Nov. 17, 1904. At that

time he suggested that possibly we might be able to set it to music, and the result is thus given. We make not the slightest claims to musical ability, but if "The Bee-Keeper's Lullaby" should be used by just one weary mother in singing her baby to sleep, we will feel well repaid. Should an extra copy of the song be desired, we will mail it on receipt of 10 cents, 2 copies for 15 cents, 3 copies for 20 cents. The extra copies would be printed on a single sheet of stronger paper than that on which the *American Bee Journal* is printed.

The West Michigan State Fair, as previously announced in these columns, is to be held at Grand Rapids, Sept. 18 to 22. Mr. A. G. Woodman, superintendent of the apianian department, is sending out a very neat 4-page circular advertising the Fair and also several things of interest to bee-keepers. On the first page is the excellent picture of last year's exhibit, as shown on the first page of the *American Bee Journal* for Aug. 17. The second page has the apianian premium list in full, and the third page, among other things, gives these further attractions:

The apianian department of the Fair has arranged to have one of the best informed bee-keepers and largest honey-producers in Michigan to talk on bee-topics, answer questions, etc., from 10 a.m. to 12 m. each of the following days:

Tuesday, Sept. 19—W. Z. Hutchinson, editor of the *Bee-Keepers' Review*.

Wednesday, Sept. 20—S. D. Chapman, whose honey crop for 1905 is 17,000 pounds.

Thursday, Sept. 21—E. D. Townsend—1905 crop 25,000 pounds.

Friday, Sept. 22—Geo. H. Kirkpatrick—1905 crop 14,000 pounds.

This is an excellent idea, and Supt. Woodman is to be congratulated upon his enterprising methods and management.

### Injury to Queens in the Mail

BY C. P. DADANT

MY attention has been called to an editorial on page 565. It has always been my opinion that valuable queens were often hurt in the mails, but the mail service is so prompt, and the cost of transportation by this method is so economical, that it is natural for both queen-breeders and bee-keepers to adopt this method of conveyance. But it was a long time after the mailing of queens was adopted that I could persuade myself to use this method.

The transporting of bees was not formerly as successful as it is now, and for years it was thought impossible to ship bees from Europe with safety. The queens sent from Italy were always sent by express, and, in most instances at first, were literally drowned in honey or water, by the mistaken solicitude of the shippers.

In an article lately published in the American Bee Journal, I was made to say that we imported as many as 40 queens a year from Italy. It should have read 400 instead of 40. This was after the importation became successful through repeated trials. These queens were all sent in what would now be called "baby nuclei"—little boxes about 4x6 inches, containing two combs, one with very ripe, white honey or sugar syrup, the other absolutely dry, so that the bees could have room on dry combs. Plenty of ventilation, old bees fresh from the fields or just departing for the fields, and no water. These were the successful conditions needed.

We often found some of the little combs partly filled with eggs, probably laid during the first part of the journey, but which had failed to hatch because of the lack of sufficient warmth. These little "baby nuclei" were bunched in lots of 20 to 24, strengthened with a sheet of tin on the outside, a cushion on the underside of the package, and a handle at the top. These packages were always sent by express at great cost, but the bees came in fine condition, and no better queens could be had than those thus received. Yet they were the Italian bees in their natural conditions, without any select breeding, for the new ideas were just beginning to make their way over there. A great deal of progress has been achieved since.

The damage to the queens sent through the mails is due mainly, in my opinion, to the rough handling of the mail-bags in many places. To be sure, the queen that is heavy with eggs suffers the most from this rough handling, while the young queen that has just begun to lay is harder. We all know how heavy and matronly a mature queen is, how easily she drops from the combs, owing to her enlarged abdomen, and it is very easy to imagine that her condition renders her unfit for rough handling. Perhaps if she were made to fast for a few days there would be more safety in sending her out.

I am not a friend of the express companies, who seem to want to eat up the value of what they transport before giving it up, but until a better method of transporting is devised, I would much prefer to send a valuable queen in a "baby nucleus" by express than to risk her through the mails. It seems to be now out of the question to ship anything even as small as a 2-frame nucleus through the breadth of our land. Bees are too cheap in every State to be sent at the expensive rates that are prevailing, and a queen is just as safely transported with a retinue of 50 worker-bees, in the summer, and probably more safely than if she were left in a populous colony, no matter how carefully the combs might be adjusted for shipment.

Hancock Co., Ill.

### Uniting Weak Colonies with Strong Ones

BY W. T. CARY

I SEE on page 570, Mr. Hasty, in commenting on Edwin Bevins' hard luck in trying to unite a weak colony with a strong one by the use of an excluder, to save both queens, thinks we need more reports. Well, here is another report. It is well remembered I reported a case I had last spring in

answer to Dr. Miller's request, and it was published on page 523. The case I now have to report is this:

How I was about to requeen a colony but didn't. But first I would like to tell how I did requeen 2 colonies in an old-style way. I killed the old queens and set nuclei on top with young queens in shallow extracting supers, one of these nuclei being quite strong and almost filling the super; the other was quite weak, covering about three frames. Result: Two big battles, a lot of dead bees in front of those two hives, queens quit laying, and a lot of cells built. The hardest fighting was done where I placed the weaker nucleus. I found the queens all right, however, with their cliques, and I destroyed the cells where the hard fighting had been done, and so settled the difficulty in that hive, but thinking the other queen was mistress of the situation, I closed the hive without observing the cells, until the young queens began hatching, and precipitated a swarm.

Now for the case in question. I formed a nucleus consisting of 2 shallow extracting combs with a little brood and honey, a handful of bees, and a cell placed in one side of a super with a division-board. The hive to be requeened was provided with a plain flat cover on the edges of which I layed 1/2-inch strips to form a temporary bottom-board with a small entrance at one rear corner, and placed the nucleus up there.

As soon as the young queen had hatched and was laying in good earnest, I filled that super with empty combs, and then removed the temporary bottom-board and replaced it with two wood-zinc honey-boards, retaining the 1/2-inch strips to maintain the rear entrance for the young queen's escort.

Now for results: There was very little quarreling. Perhaps a half dozen dead bees were thrown out to the rear, but in less than two days that super was half full of bees, and that that young queen was perfectly at home among them, and laying "to beat the band." My theory is that the old queen below entertained her own field-workers and other principal forces, and kept them contented and practically isolated from the seat of conspiracy, while the young bees that wandered up there were easily persuaded to follow the band-wagon.

Now they remained in that position for a week, when I locked in the hive below and found the old queen doing so well that my heart failed me, and I did not kill her, but in the meantime I had a swarm issue from another hive and strike for the woods forthwith, while I was fixing to go to Sunday-school. So the next day I destroyed the cells in that other old brood-chamber (hybrid rascals), and placed that nucleus on top of it, and all went merrily on.

Now, there is one point I would emphasize, and that is, the use of two honey-boards. I never tried it with one, but it occurred to me that two queens, both being as free as those two were, would likely raise a row if they got their horns together. Then, also, that rear entrance enabled the young queen's escort to avoid passing through the old brood-chamber below while negotiations were being carried on with the young bees that were drawn up.

### Why Bee-Supplies are High—Home-Made Hives

BY J. E. JOHNSON

THERE has been considerable written in bee-papers, both *pro* and *con*, in regard to high prices for bee-supplies. I have bought 1 1/2-story hives in the flat for 73 cents each, and they were good ones—in fact, the same firm still sells them, but charges \$1.55 each for them in lots of 10.

However, this hive question has two sides. If hives could be bought at 73 cents each at this day, every Tom, Dick and Harry would be in the bee-business. The market already suffers from the fact that there are so many who have only a few colonies of bees and don't take proper care of them, and bring their honey—what they have—to the stores and exchange it for groceries at whatever price the merchant sees fit to pay. And they don't care how much it injures the market, as they do not depend upon bee-keeping for a living, but just consider that the honey they get costs them almost nothing, and they are just that much ahead. They don't pretend to scrape the sections or grade their honey, and I find that some of their sections weigh 18 ounces, others as low as 10 ounces, and some even having contained brood. Now, if the high prices of supplies would drive every bee-keeper of this kind out of business, it would be a blessing to any community.

While I think prices of supplies are too high, I also find customers occasionally who think 15 cents for honey is also too high. I see by Gleanings that for several years their fac-

tory has had to run night and day quite often in order to make the hives as fast as they are called for, and they are often behind with orders. I suppose other factories are also kept pretty busy. Now, if my customers would just be as anxious after my honey as the bee-keepers are after the factory-made hives, so that I would have to work both night and day to supply the demand for honey, I am a little afraid that I should have to raise the price of honey a little—in fact, I would probably charge 18 to 20 cents for the very finest. Fellow bee-keeper, would you condemn me for this? Would it be a very great wrong? Would there be anything wrong in my raising the price of my honey if the demand was so great? Say, fellow bee-keeper, we are in luck that prices are no higher than they are. If the ordinary Wall Street capitalist controlled the hive industry we would probably have to pay \$1.00 for the inside furniture of an empty super.

Several years ago I tried to make a few hives in swarming-time. I had only store-boxes to make them of, and my tools consisted of a hammer, ax, and a cross-cut saw that had not been filed or set for about 10 years, and a square that the horses had stepped on. It is needless to say that my hive-making was not a success. The supers acted as if they were drunk—when one corner came down the other went up, and they persisted in staying in a whin-wah shape. I had to mark the corners to tell how to get the supers back as they were, and if I put the wrong super on a hive I had to introduce it before the body would accept it, and I am sorry to say I sometimes said, "Darn it!"

Well, I quit hive-making, and stayed quit for about 15 years. But I have begun again, and I find it all depends upon knowing how. I now make a good hive that fits, and gives good satisfaction, for about 50 cents for an 8-frame, 1½-story hive, complete except fences. I'll try to tell how I do it.

First, I procured a good cross-cut, fine-tooth saw, a rip-saw, a square, and hammer and plane. I buy a fairly good grade of lumber for \$30 per 1000 feet. I get the boards 10 inches wide, planed on both sides. This lumber contains a few knots, but only small ones. I cut the hive-lengths first. All clear length is used for cover and body, the poorest going for bottoms. One 10-inch board and one ripped in two makes a cover. One 10-inch and one 4-inch makes a bottom. For the body I have to rip off about ½ inch, and this makes a good top-bar for shallow frames.

Now if you will take a factory hive and use it for a pattern, and cut everything not pretty near square, but exactly square, the hive will nail up square, and be as good as any factory-made hive. I use 2-inch strips for cleats for cover and bottom, by ripping a 1x4 in two, so the only kind of lumber I buy is 1x10 inch boards, 12 feet long, and 1x4 inch 12 feet long. I also make shallow extracting supers from 1x6 inch boards, planed on both sides. I make frames in a mitre-box, which is a square trough with a square-cut across for the saw to run in. The bottom of this box is marked in lengths for top-bars, bottom-bars and end-bars. I get store-boxes of soft, fine lumber of proper thickness, and the rip-saw will rip it into strips, like cutting cheese. I run the plane over the edges and then lay in the mitre-box and cut. This insures a square cut, and the frames will be square, and as the marks are on the mitre-box, that saves marking in length. I can make 300 in a day if I have proper material.

There are lots of store-boxes to be had for almost nothing, but don't use anything but good pine or it will warp.

Now, it is not a great job to make 100 hives, and almost any bee-keeper can find time during the winter and on rainy days to make all his hives, if he doesn't want over 100, and they won't cost over 50 cents each, complete, for material. Figure it up yourself: Cover, 2½ feet; body and super 7 1-9 feet; bottom-boards and cleats, 3 feet—total, 12 11-18—say 13 feet. At 3 cents a foot—39 cents. Material for frames, 5 cents; nails, 6 cents—total, 50 cents.

Now, let all who want to do so make their own hives, and all who prefer to buy let them buy and pay their money. As for myself, I will make my own hives and some for my neighbors.

I also have a home-made solar wax-extractor made from a store-box of proper size. A window-pane 16x32 inches, and a sheet of galvanized iron for a bottom, and it works fine. By its use I get from 10 to 20 pounds of wax each year. I have a Rietsche-Getaz press which makes fairly good brood-foundation, and costs only \$1.50 and freight.

So, while bee-supplies are high we don't really have to buy them unless we want to. Some supply dealers deny the existence of a "trust," but they have admitted to me that there is an understanding between them not to compete in prices with each other, and when there is a raise of prices those in the agreement all raise at once, just like the curtain on a stage. Of course, all there is to any trust is an under-

standing between the members of the trust to raise prices. All trusts are an evil, because the most powerful manufacturers compel other manufacturers to sell higher than they would if no trust were in existence, and thus poor and needy people are compelled to pay unjustly more than they ought to pay for goods. The President is after the trusts with a sharp stick, and possibly he will investigate the bee-supply trust.

The argument used by the manufacturer, that expensive machinery is the cause of high prices, is nonsensical. We all know that the reason modern expensive machinery is used is to cheapen the cost of the production by labor-saving machinery, not to make it cost more. If it were not so why use it?

However, we should always remember that the great demand for bee-supplies is the cause of the high prices, as it makes a trust possible, and we are the ones who have been demanding the goods, so, in a measure, the manufacturer is justifiable in raising prices. The rise of prices of raw material is responsible only for a part of the raise in prices of hives. The manufacturer ought to buy lumber much cheaper than the bee-keeper, by buying in large quantities. However, if our honey customers were as eager to buy our honey as the bee-keepers are to buy factory-made hives, and if some bee-keeper in our locality would persist in selling honey real cheap, would we not make it a business of ours to ask that bee-keeper to charge more for his honey? In fact, we would probably all agree to raise the price of honey. Then what would we be? Some people would call it a "trust," others would say there was merely an understanding, and if the demand still continued great, and our customers would take our honey at a good price as fast as we could produce it, we would not, I think, put honey down in price of our own accord, nor could our customers expect it. Neither can we expect lower prices for hives as long as we demand so many of them at present prices.

Knox Co., Ill.

## Convention Proceedings

### Report of the Chicago-Northwestern Bee-keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 633.)  
EVENING SESSION.

At 7:30 o'clock p. m. Pres. York called the convention to order and stated that before proceeding with the business they would be favored with some music and a couple of readings.

Master Ferdinand Moore and Miss Esther Wheeler, favored the convention with instrumental solos; Mrs. Dittmer pleased them with a reading entitled, "A Lullaby," while Dr. Miller convulsed the audience by a reading showing how a certain German was cured of rheumatism by the bee-stings.

#### ADVERTISING HONEY AS A HEALTH FOOD.

"What can this Association do in the line of advertising that will show the value of honey as a health food in the newspaper press?"

Dr. Miller—I think perhaps the Association will do about as much as it can be expected to do in that direction by the publication of this report, in getting in the things that were said here to-day and encouraging the publication of items in the local press.

#### BREAKING DOWN PRICES OF HONEY.

"What can this Association do along the lines of preventing bee-keepers themselves from breaking down the prices of honey early in the marketing season?"

Mr. Wilcox—That is the most important question we have to consider; at least it has been with me all my life. We have never found a solution, and I don't believe we ever will. I believe that the best advice we ever had on that subject was that given by our late friend, Thomas G. Newman, when he advised us to work the home market, to see it was always supplied with all the honey it could take. The aim should be to increase the consumption. It is quite certain that there is not as much honey consumed as there

can be, and should be, and would be if it were properly presented to all people. It involves an extensive system of advertising, and that has been told over and over again by Mr. Abbott and others, and yourself, Mr. President, and I believe that it is in the right direction. I can't think of anything better to get the world to know it is good, and use it. I propose to try a little scheme of my own of honey and buckwheat cakes, simply because they are two commodities in which I feel interested. I believe the two will work well together, and the consumption of one will help the consumption of the other, for anything that will tend to increase the consumption of one will help the other.

Pres. York—I think the price of honey is lowered by some bee-keepers not knowing what honey is worth starting out with the price too low.

Mr. Wilcox—The remedy for that, so far as my own locality is concerned, has been by some one who does know the value of honey, or can learn it, in the season buying up all the cheaper lots and putting them upon the market at the proper price.

Mr. Whitney—It seems to me that the way to furnish a good market for honey is to produce the very best article you can, and make people believe it. I have known honey to be sold at 15, 16, 18 and 20 cents a section right in a community where much honey was selling for 10 cents, simply because they knew that the honey they were paying the higher price for was all right. I think every bee-keeper ought to do the very best he can, not be slipshod, not have dirty-looking sections, not have one full of holes all around, or perhaps not filled at the bottom of the section at all. Produce the best article you can, and make people believe it is all right, and set your own price.

Dr. Miller—I suppose that nearly all here have been taught to believe by the newspapers that they need a biscuit. Pick up any newspaper and "Uneda biscuit" will stare you in the face. Thousands and thousands of dollars are evidently spent in advertising that one style of biscuit. Those men are not spending money for fun; they are not wasting money, either; they are level-headed men, with a standard article that needs money spent in advertising it. Is there any question that a proper amount of advertising of honey would bring in returns? Is Mr. France here? I was just wondering whether he would agree with my statement or not. Yes, there he is. Mr. France, I want to see if you will agree with me. If the money that has been spent by the National Association helping to settle quarrels were spent in advertising honey in the public press, somewhat in the same way that "Uneda Biscuit" is being advertised, I believe it would do more good, just a little more, at least, towards raising the standard of honey all over the country. Now if you don't believe that, Mr. France, say so.

Mr. France—I endorse it.

Dr. Miller—Good for you. I believe that is a point in the right direction. You ask what can this Association do? If this Association could get enough money into its treasury to help in that same direction that would be a good thing. For at least this Association is helping to make the National what it ought to be, and I am speaking for one only when I say that I believe there is a great work for the National before it to advertise honey, to put a lot of money in. It will take a lot of money. But if the thousands upon thousands of bee-keepers in the country could be got into it there would be money enough to do some good. I know very well some of you will say it will take so much money you need not try it at all. If you can suggest something better I will take that back.

Mr. Moore—There is a thought that occurs to me, different from anything that has been expressed by anybody else. I was one of those who went to the Illinois Legislature and helped them to get a law two years ago for bee-keepers—and an appropriation. In the midst of other things this impressed itself upon my mind: The faith and confidence that the Legislature and the public at large have in associations. There is so much crookedness in the world at large that people are skeptical about anything they don't know anything about. For instance, take this question of manufactured comb honey: The public at large do not know any more about comb honey or foundation than a week-old baby does about arithmetic or the dictionary, until they are taught by the specialist, and they decide the worst possible thing out of their absolute ignorance on the subject. But they look upon our associations, the bee-associations, the dairymen's associations, the fruit men's associations, and anything coming from those associations, and put forth in a formal manner, as the act of those associations, and give full credence. Witness the Dairymen's Association got through the law

establishing a pure food commission. I think I am correct in saying there would be no such law on the statute book to-day unless the dairymen had talked it and worked for it. Another thing, three or four associations were given appropriations by the Legislature two years ago. They give the Illinois State Bee-Keeper's Association \$2,000. They did that because the association asked for it, and they took at one hundred percent all the statements made by the association. Now, let us, along with the National, advertise in such papers as seems best, "Buy your honey of members of the National Bee Keepers' Association," or other associations, according to your judgment, and continue that year after year, not at large perhaps, but somewhere every month in the year for five years. After a while everybody who reads the English language will know that there is honey sold that is guaranteed by the name of the National Bee Keepers' Association, and people will come to inquire for honey under the brand and guarantee of the bee-keepers' association. That has been done for ten years now in Vermont. The Vermont Maple Sugar Makers' Association issues a very fine report every year, and I have had the pleasure of reading two or three of them, and one of their methods was to go to the Legislature and get as stringent a law as they could. Then they have adopted a brand which is issued to all members of the Vermont Maple Sugar Makers' Association. It is a general brand which is copyrighted or trademarked, which ever it is, and there is a blank for each member to put in his own individual name and address, and there is a penalty against any one using this except authorized parties. It seems to me that is perfectly feasible, when you take into consideration the public minds, and advertising would be a way to spend some of our money.

Mr. Becker—Those bee-keepers that are taking the newspapers and are paying annual fees here, claim to get a fair price for their honey. Now, suppose we advertise, you have a certain element to contend with that almost give their honey away. You go through the country, and even in my section of country, I can cite you 25 or 35 that have from 5 to 50 colonies of bees, and one of our own members of the Illinois' Bee-Keepers' Association a few years ago sold her honey at 10 cents a pound, as fine white clover honey as ever was put on the market. The storekeepers themselves said, "We would just as soon give her 12½ cents as 10 cents." The past summer I knew of one case where a man sold 1,000 pounds of honey at 8 cents a pound—fine white clover honey. I was after the honey myself, but happened to be just one day too late, and he wouldn't sell any quantity, but he wanted to sell the entire lot at 8 cents a pound. Last year I bought 1,000 pounds of honey at 9 cents a pound in the same locality. I could have bought 5,000 pounds more at 8 cents. What are you going to do with those that know the price, and hold the better honey at simply a fair price? The past summer, when I wanted to sell my honey, I had to run up against honey sold at 12½ cents a pound and I bought 12 cases myself and gave 13½ for it to the storekeeper. The storekeepers are just about as smart as we are. You come into the city with a thousand pounds of honey on your wagon and you want to sell it. You bring it to a store and they say, "Well, we will give you so much money for it." If you are a stranger in that city you probably can drive all over it and you can't get any more money for it, and you might as well have taken the first bid in order to get rid of your honey. These grocery keepers have an organization that is called the Retail Grocery Association. When a fellow comes in, the first man he strikes makes an offer. If you could stay around you would probably see him go to his telephone and watch the honey man, to see which direction he is going, and then telephone to his next friend, "There is a man in town with so much honey; I made an offer of so much money;" that is when there is an abundance of honey. If the article is scarce then they buy it. But you will always have to contend with the bee-keepers who do not know the prices and do not care. They bring their honey into market early, and you men that have honey and are trying to make a living have to hold on until that honey is out of the way, and is consumed, before you get better prices. You have to contend with these parties that do not take a bee-paper, and don't know the price of honey nor how much honey there is in the country. They sell it for whatever they can get. They go to the store and take it out in other commodities, while you want to get the cash for it; and they always sell it for less money than we can.

The balance of the evening session was in the hands of Ernest R. Root, who delivered a very interesting lecture, copiously illustrated with stereopticon views, also with moving pictures.

(Continued next week)

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### SHOTGUN METHOD OF GETTING DOWN SWARMS.

Actual experiences with the shotgun method of getting down high clusters are very welcome. Frank E. Kellogg's seems to open up new possibilities, in that the limb proved a little too big to shoot off. The impact of two charges of shot at once gave a jar sufficiently violent to drop them pretty clear, not taking off the limb. The sequel was a rather improbable one that I guess must not be expected every time. They didn't do the most probable thing—remain crawling on the ground—neither the next most probable, fly up to the same place again, but took a third and unusually kindly course of alighting in an easier place. I kind o' guess that a swarm that happened to be feeling almost ready to start again would be less frantically persistent in going right back to the identical spot than one that has recently clustered frequently is. But that would be a very risky idea to travel on. Page 524.

### HONEY-TANK CARS FOR BEE-KEEPERS.

There are a few customers that use extracted honey in great quantities. They don't like tin cans. Too petty and fussy. I wonder if the honey-trade will ever grow to having its own tank cars, and so avoid both the pettiness of tins and the everlasting leakage of barrels. The honey-tank car I view as differing from the oil-tank car only in having a bigger man-hole, by means of which a man could go in, and, standing on a big plank, shovel candied honey into a half-barrel bucket. Of course, the honey *should* be used out while still liquid; but Shouldn't Bees are so plenty in this world that I guess they should be provided against in this case. Page 533.

### ONE SWARM OR NO SWARM PER COLONY?

As to whether one swarm or no swarm is to be preferred, 3 of the 29 experts do not meet the question very squarely. Of the remaining 26 only 4 decidedly favor the one swarm. About 19—a very heavy majority—desire a state of things in which there is no swarming. About 11 point out that no swarming is best for a short, early flow with no late surplus, while the colony and its swarm will exceed where there is a good, late harvest. Page 535.

### HIVES NUMBERED AND IN GROUPS.

Yes, sir, in Dr. Miller's apiary No. 25 stands right by the side of No. 26, instead of at the opposite corner of the yard as it's "the way" to have them. We can see this in the picture on page 534. We can also see that he places his hives in the up-to-date 4-hive group. I

admit that my groups of 9 are not as good; but changing is troublesome, and also my style is better in some things; so I keep on in a way that is not up to date. One minor thing in which my style excels is that it is entirely needless to have any visible figures. Each stand has its number, and I can instantly tell it without any numbers posted up to view. This faculty is not any sleight of mine, but any one could quickly learn to do the same thing.

### CYPRIONS AS QUEEN-REARERS.

I still hold fast my view that building an extravagant number of queen-cells is one of the badges of inferiority, and that a disposition to build only three or four represents the highest development. The Cyprians are half-way back to bumble-beeism, in which state every female is more or less a queen. One of my biggest I-don't-knows is I don't know whether it can do any harm to have Cyprians rear queens for more highly developed races. Suspicious. Let the attenuation of the food be carried far enough and the queen wouldn't be a queen at all, but just a worker. I suspect that the same thing carried not quite so far would produce a short-lived queen. Dr. Miller must carefully watch and see whether those Cyp-reared queens live as long as they ought to—and then tell us, "honest Injun." Page 534.

### THE LEAGUE'S SHIPPING-CASE CIRCULAR.

For saying just what ought to be said, and leaving out an immense amount of rubbish that does not need to be said, the Honey Circular on page 536 deserves very high praise indeed. But I wish to plead hard for one little change in future editions. In the fourth paragraph read "enforced" in place of "in force." The latter only means on the books and capable of being enforced. A State which has a pure food law and takes no particular pains to enforce it is no safe place to buy extracted honey on the general market. Don't let The Honey-Producers' League begin by retailing fibs to the profit of the honey-man and the harm of the public. Creating confidence in extracted honey where it is not worthy of confidence is just doing the adulterator's work for them.

Quite likely some will neglect to obey the "N. B.," because they can't imagine *why*. Would it be worth the while to put in between the second sentence and the third, "Honey has a troublesome tendency to absorb moisture?" To be sure, one might guess the why if he would meditate a little on the closing sentence as it is.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bee-Keeping and Most Desirable Apiarian Outfit

DEAR MISS WILSON:—I have not now even a colony of bees, but hope by next spring to have a nice little start in the business. I kept bees for three years in a little village railway town, starting with 2 colonies and increasing to 11 at the end of the third year, and although it was new work for me, and a side-issue, as I was in a little store, and one season was very wet and one very dry, still I think I did very nicely in a financial way, and became very much interested in the work, but I sold out my little store and so left the town, and a

little later I also sold my apiary. I had a very nice and handy outfit.

I wish to begin right when I start in the spring, and want to ask you some questions to help me out. I thought you might have a little more time and patience with a woman, as you are a woman yourself. So I write you, instead of Dr. Miller, who is no doubt too busy to sit down and write answers to my many questions. Some of them may cause you and the good Doctor to smile, but, then, you must remember that I am still somewhat of a "tenderfoot," and I am anxious to learn more of the delightful work.

My mother has at our home 3 colonies of

bees to which this season I have given some attention, and it has renewed my interest in the work, no doubt. Mother had a lot of old comb and old wax, and she could not afford a solar wax-extractor, so, as I had seen one, from memory I took a box and some glass, tin, black paint, etc., and made one which worked nicely, and extracted the wax as nice and clean as we could wish. Mother had 2 colonies, and one swarmed, and that gave her a third, which I hived for her; however, the hives, frames, etc., are not in good shape, but I have done the best I could with them.

Now for the questions:

1. Is there any one particular hive that you and Dr. Miller regard as the *best*, or superior to all others? If so, what is the name of it? Also, what kind do you use? I suppose, of course, that you are using what you regard as *the best*, unless there has been put upon the market a better one since you have bought a supply.
2. Kindly give me the dimensions and number of frames in the brood-chamber, in the extracting-super, and also the size of same.
3. I think that I will do some extracting and run some for comb honey, as I did before. Which would you advise me to do, extract, or run for comb honey, or both?
4. Do you run mostly for comb honey?
5. What size of sections do you use?
6. May I ask how many colonies of bees you keep?
7. How do you increase—by natural swarming?
8. Do you clip your queens? Do you think it injures them?
9. Do you have only the pure Italian strain?
10. What kind of wax-extractor do you use? also honey-extractor?
11. In what direction do you face your hives, and how near side by side and in rows do you place them?
12. Do you have fruit-trees, grapes, sunflowers, or anything of the kind in your backyard? If not, what shade do you have?
13. Do you use boards to protect your bees from the sun or storm on the top and sides of the hives?
14. Do you have a tight board fence on the northwest side of the yard to protect the bees from the cold winds and storms?
15. Do you have alighting-boards?
16. Do you keep all grass and weeds down around the hives?
17. How high is the body of your hives from the ground? FLORA E. PHILLIPS.  
Winnebago Co., Ill.

1. We use the 8-frame dovetailed hive, and know of nothing better, although for some the 10-frame hive may be better, as there is less danger of a colony running short of stores in winter with the larger hive.

2. Eight frames,  $17\frac{3}{8} \times 9\frac{1}{8}$  inches. We do not use extracting supers.

3. I could not advise; that would depend entirely upon conditions. If you have made a success in running for both it may be best to continue that.

4. Yes.

5.  $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ , although we have tried others to a limited extent.

6. The present number (Aug. 28) is 221.

7. Mainly by nuclei.

8. We clip them, and could never see that it injured them.

9. We breed entirely for the honey-gathering qualities, and most of our bees are hybrids.

10. German wax-press. The only honey-extractor we have is the old Peabody extractor, but it is seldom used.

11. Some face east and some west. The first two hives in the row stand as near together as they can without touching, then a space of 3 or 4 feet, then another pair of hives, and so on. Another row is generally placed close up to this row, the hives standing back to back, making 4 hives in a group.

12. Our apiaries are mostly shaded by apple-trees.

13. No.

14. No, although it might be a good thing.

15. Nothing except the projection of the bottom-board—about 3 inches.

16. Not always as well as we might.

17. The bottom-board is about 3 inches from the ground.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

Dr. Miller does *not* answer Questions by mail.

### Keeping the Wax-Worm Out of Sections

How do you handle supers of comb honey so as to keep the wax-worm out of the sections, when you want to keep the supers (or honey) a few weeks after taken off the hive? How long can it be kept so that the worms will not bother it?

MISSOURI.

ANSWER.—I don't pay any attention to anything of the kind, and there is no trouble. But years ago there was trouble. The difference probably is that years ago I had black bees, and now there is much Italian blood. At that time I fumigated the sections with sulphur 2 or 3 weeks after taking off the sections, repeating the dose some 2 weeks later.

### Winter Hive-Protection—Feeding for Winter

1. I am making some boxes to place over the hives to protect the bees through the winter. I would want them weather-tight. Would it be advisable to cover them with tar roofing paper? Or would the odor of tar be offensive to the bees?

2. What size opening must be left for them through the winter?

3. When is the proper time to start feeding for winter?

ILLINOIS.

ANSWERS.—1. The tar on the outside will not trouble the bees.

2. An opening equivalent to 3 or 4 square inches.

3. August, if they can gather nothing later. In general, just as soon as possible after it is known that feeding will be necessary. Generally it ought not to be necessary.

### Judging from Queen-Cells—Wax-Moths—Dead Brood Outside of Hive—Putting on Supers—Feeding Bees in Winter

1. After a queen-cell is sealed or capped, how many days will it be before the queen emerges, and can I tell by the outside of the cell whether she is a good queen or not?

2. Some days ago I discovered wax moths in my only weak colony, so I cleaned out and killed all the worms with the exception of a few which went out of the entrance, down into the grass. Is there any danger of their going back in the hive again? What shall I do if they should?

3. Is it a bad sign to see a few white brood dead out on the grass in front of the hive?

4. As I read in the American Bee Journal that as soon as the bees begin making white wax on top of the frames it is time to put on the supers, I tried it, but they have not started to work in them yet, although the supers have been on over 2 weeks. How can this be?

5. Can I feed bees in winter? With what kind of feeder could I do it the most easy and satisfactory way? How should I do it?

WISCONSIN.

ANSWERS.—1. The queen should emerge something like 7 or 8 days after the cell is sealed. A cell with a good queen in it is likely to be of good size and well pitted over the surface with indentations. A cell with a poor queen is likely to be small, with a smooth surface. But there are exceptions; a good queen coming from a poor-looking cell, and *vice versa*.

2. It is not likely they will re-enter the

hive, and if they do the bees ought to be able to take care of them, as they have now no web to defend them. But it will be no harm to look over the combs again, as others may be there that were too small for you to notice; and worms grow.

3. It is of no great significance so long as they are very few. But if there be any great number, look out for starving.

4. The white wax is a pretty good sign that the bees are getting more than will meet their daily needs, and that it is time to put on supers. But the weather and the yield are fickle affairs, and it may happen that after so good a promise there is no fulfillment. Let us hope, however, that in your case the cessation of storing is only temporary, and that a little later there may be a rushing business.

5. There is no need of it so long as you have the matter in mind this far in advance, and it is very much better to have the bees fully supplied before cold weather comes. Feeding in winter is not a thing to be advised, but if necessary it is better to give sealed combs of honey or candy.

### Colony in a Box—Do Noises Disturb Bees?—Preparing for Winter—Basswood—Management Between Harvests

1. I have a colony of bees in an old box. What would you advise me to do with it?

2. Would the noise made by mowing the bee-yard bother the bees any? Does noise of any kind bother bees?

3. When should they be packed for winter?

4. About when does basswood bloom here?

5. Should the supers be left on between the two harvests? If not, how does one know when to put them on for the second harvest?

IOWA.

ANSWERS.—1. A good way is to leave it where it is till it swarms next year. Put the swarm in a good hive; then 3 weeks later the worker-brood will be all hatched out, when you can cut open the box and dispose of the comb.

2. Noises in general do not trouble bees.

3. Better have the packing done early in November.

4. Probably about the first week in July.

5. Take them off when the first harvest is over, and put on again when you can tell by the flight of the bees that they are again storing. Sometimes there is no distinct break between the two flows, and you must keep something on all the time. In that case, get off all finished work at the close of the first harvest, and leave sections that have been started. If you work for extracted honey, leave the supers on from one flow till the other, only extract all light honey at the close of the first harvest.

### What Ails the Bees?

Early in March I purchased 2 colonies of common bees from a neighbor. We removed them from his apiary to my land, a distance of 600 or 700 feet. They were in old-style box-hives with glass on one side so that the honey and the bees could be seen. The hives were full of honey, and the bees seemed to be plentiful.

It seems strange to me that neither of the colonies cast a swarm this year, nor showed the least inclination to store honey in the supers. The bees of the colonies appeared to decrease in numbers after being located on my land, and although I have had them for 5 months, they do not seem to be any more

populous or have any more honey on hand than when I first bought them.

My neighbor has about 20 colonies. Do you think some of the bees may have returned to their old home and united with the colonies there?

Inasmuch as they have neither increased nor produced honey for me this season, do you think that it would pay me to winter them, especially as they are common bees in old-style hives, and I notice infested with bees-moths?

I have been thinking of destroying my present outfit and trying again next spring with Italian bees in modern hives. What do you advise?

NEW YORK.

ANSWER.—It is practically certain that when, with no precautionary measures, you removed those bees 600 feet, you gave notice to the field-bees that they should return to their old place. If, however, the colonies were what they ought to have been, they should have recovered from the set-back more than they appear to have done. Don't destroy them, however; if they winter satisfactorily they will be good capital to work on next spring. Seeing it's you, let me give you a word of advice. Take some time evenings, after your chickens have all gone to roost, to study up your text-book on bee-keeping, and after you are well informed, decide what you want to do with those bees next spring. If not entirely clear about it, send on any questions that occur, a little while before time for action, and they will be cheerfully answered in this department.

### Bait for "Lining" Bees in the Woods

1. What kind of bait is the best for lining bees in the woods?

2. How can I set it so the bees will scent it?

3. When is the best time to use it?

MICHIGAN.

ANSWERS.—1. Honey diluted with water, perhaps half and half. Some make a smudge by burning, and some flavor the bait with anise. Some make a smudge by burning old combs.

2. Set it out in the open in the woods where the bees are prospecting.

3. After the harvest is over, when there is little or nothing to be had from flowers.

### Apiary Record-Book—Weak Colonies—Outdoor Wintering

1. On the first page for Aug. 3 I see you and your record-book. Now that record-book is just what I want, but I do not know just how to arrange it. I have some 50 colonies. My hives are numbered from 1 up with 2½-inch hand-painted figures. The hives are white and the figures black. Would you give us a sketch of a page?

2. I have 4 colonies that were hived just as the white clover flow was over, and they are rather weak. Each colony has brood. Is that a sure sign that they have a queen?

3. Would you take some frames from strong colonies and give to these weak ones? In this locality there is an abundance of Spanish-needle and goldenrod, which reach their height this month and next.

4. Which is the better for outdoor wintering, to take off the empty supers or to leave them on?

5. Shall I put straw pads over them or not?

MISSOURI.

ANSWER.—1. It is not at all certain that what suits one for a record-book will suit another, but I think you will find advantage in something that will give a permanent record of each colony. You will find it a great advantage to have contractions for the more common entries—and a great many entries will be alike—no matter what the contractions may be, only so you will understand them yourself. Although it may be no model for you to follow, I cheerfully give you a transcript of one colony, the one that I think has done the poorest of any in the home apiary, chiefly due to the fact that it started in

with a poor queen, and further to the fact that its present queen is of the same stock:

"May 3 q cl g l br & b in 4 1 ec 23d in 4 3c 30th soq sv Jun 12 cl OK." That's the whole of the entry for that one colony for the season, and all the entries there will be, unless I kill its queen and give it a better one—a thing that a better bee-keeper would have done before this.

Translated into U. S. language, the record would read:

"On the 3d of May I overhauled the colony and found that the queen was clipped; I gave to the colony 1 frame of brood with the adhering bees, and that made it have brood in 4 frames. I also found present a sealed queen-cell; May 23, I found brood in 4 frames, and 3 sealed queen-cells; May 30 I saw the old queen, and also saw a virgin queen. June 12 I clipped the young queen which I found laying; then marked it 'OK' to indicate that there was no need to go into the hive again."

Here's a record that is more satisfactory, not of the best colony, but one of the best, which, up to Aug. 1, gave 120 sections, with more to be heard from:

"Apr 22 q cl May 2 5br 10th t 2 br & b 4br Jun 22 noc July 12 noc 22d noc Aug 1 noc." And that's all the writing there will be about that colony, probably, except the figures showing the number of sections taken. In fuller language: April 22 I found that the queen was clipped; May 2 that there were 5 frames of brood; May 10 I took away 2 frames of brood with adhering bees, leaving 4 frames of brood; and the "noc" at the four remaining visits means that no queen-cells were started.

2. No, there may be brood in the hive and no queen, the queen having been taken away since she laid the eggs that produced the brood. There may also be brood from laying workers. But as you gain experience you will readily tell by the appearance of eggs and brood whether it be the work of a normal laying queen. If the eggs are evenly distributed, and the cappings of the sealed brood be not raised like so many little marbles, you are pretty safe in saying it is the work of a laying queen.

3. Sometimes it is advisable to take from the strong and give to the weak, and sometimes it is not. It may pay where, as with you, there is a fine late flow.

4. It is better generally to take them off.

5. Not many use straw pads, but they are good things.

## Reports and Experiences

### Honey Crop a Complete Failure

The honey crop has been a complete failure in this State this year. There is not a single pound of surplus that I know of anywhere in the State, and lots of bees starved to death in May and June, the very time we usually get a big surplus. Those that survived are getting in good shape now on cotton.

W. M. BAILEY.

Spartanburg Co., S. C., Aug. 3.

### Distance Bees Fly for Nectar—Light-Weight Sections

There has been considerable discussion the last few years in regard to how far bees will fly and store surplus honey. A few years ago I got over one ton of buckwheat section honey from about 50 colonies, and it was carried 5 miles. The bees in the forenoon flew almost entirely in one direction. There was 2 miles away, 4 acres of buckwheat, and 5 miles away, in the same direction, 60 acres of it. The conditions were favorable for a honey-flow—moist and hot weather. Afternoons they worked on goldrod, and flew in all directions. There was no other buckwheat in that vicinity that I could hear of.

As to light-weight sections, the honey-producer would not know the difference in cost to him, between sections averaging one pound

and lighter sections. The sections, shipping-cases, foundation and work are all the same, and the bees will fill a 24-pound case about as quickly as an 18-pound one in a good flow.

C. M. TARR.

Chippewa Co., Wis., Aug. 19.

### Very Poor Season for the Bees

I put 97 colonies of bees into winter quarters last fall. Some of them winter-killed, and some starved with plenty of stores, and by the time they got through dwindling and robbing I had just 55 left, and they were very weak. By the time they built up and were ready for the supers it was June 10. Then it turned dry, and white clover failed. The first 2 weeks in July were cold and rainy, and the bees have been hanging about the hives more or less ever since. But they have done the best job of gluing I ever saw.

Sangamon Co., Ill., Sept. 1. S. T. CRIM.

### Not a Good Season

The season has not been especially good for the bees so far, but I will have a fair return for my work if the fall flow proves good.

ROBERT B. MCCAIN.

Grundy Co., Ill., Aug. 5.

### Method of Rearing Queens

I am not a baby-nucleus queen-breeder. I use the full-size frame, and regular Langstroth hive, with a solid division-board in the center, with entrance at front for A, and at back for B—opposite corners. Many of my nuclei now have bees enough in them to unite A and B, after removing one queen, and still be strong enough to go through a moderate winter safely.

Instead of distributing queen-cells on the evening of the tenth day, as per Doolittle's instructions, I allow them to remain in the full colony until the next morning, thus getting the benefit of the heat of a full colony all night, and then hatching in a strong nucleus before a cool night comes on them. I claim that by this method, there is no checking in the development of a queen; that this approaches as near to Nature's way as it is practicable to do in commercial queen-rearing.

JOHN M. DAVIS.

Maury Co., Tenn., Aug. 3.

### The Partridge Pea

Is the sample plant which I am sending you honey-producing? M. A. STONE.

Ida Co., Iowa, Aug. 14.

[The plant is the partridge pea, *Cassio chamaecrista*. The yellow flowers are very conspicuous in swampy land, and the bees easily find the nectar hidden at the base.

Prof. Cook, in the Bee-Keepers' Guide, page 429, says, "The partridge pea furnishes abundant nectar and...has extra floral as well as floral glands."—C. L. WALTON.]

### Queen-Excluding Honey-Boards

I used to buy queen-excluding honey-boards, but have found what is for me a cheaper and better way. The wood and zinc-boards interfere too much with ventilation, and come too high. The wood-bound zinc costs too much. The unbound zinc-boards are generally too short and too narrow, and cost more than they would if one buys a large sheet of zinc and cuts it up to suit himself. This is what I do, cutting the zinc up as large as the top of the hive, outside measure. In order to preserve the bee-space below I put a 1/4-inch strip of wood across the center of the brood-frames, and, in order to make a bee-space above the zinc I nail a strip of lath around the outside edges of the zinc, or else nail the lath to the bottom edges of the super. Sometimes the bee-space below the zinc will be preserved by the burr-combs on top of the brood-frames. I do not want any wood between the top of the brood-frames and the super.

EDWIN BEVINS.

Decatur Co., Iowa, Aug. 7.

## CONVENTION NOTICES.

**National.**—The International Fair is to be held in San Antonio, Tex., Oct. 21 to Nov. 1. When this Fair is in progress there are very low rates in force on the railroads out for 600 or 700 miles. Then there are harvest excursions from the North on the 2d and 4th Tuesdays of the month. The 4th Tuesday in October comes on the 24th. Considering these facts, it has been decided to select Saturday, Oct. 28, as bee-keepers' day at the Fair. This will give ample time for members from the North to reach the city by starting the 24th. The regular sessions of the convention will begin Monday, Oct. 30, and continue three days.

The headquarters of the National Association will be at the Bexar Hotel (pronounced Baer, long sound of a), corner of Houston and Jefferson Sts., and rates are only \$1.00 a day, and up. The convention will be held at Elks' Hall, 125 W. Commerce St., only two blocks from the Bexar Hotel.

Flint, Mich. W. Z. HUTCHINSON, Sec.

**Illinois.**—The Western Illinois Bee-Keepers' Association will meet in the County Court Room, in Galesburg, Ill., on Wednesday, Sept. 20, 1905. All are invited to come.

E. D. WOODS, Sec.

**New York.**—The Fulton and Montgomery Counties Bee-Keepers' Society will hold the next meeting on Wednesday, Sept. 20, 1905, at the Central Hotel, Amsterdam, N. Y. The annual election of officers will take place at this meeting, and also two delegates will be appointed to attend the meeting of the State Association at some time during the coming winter, and also any other business which may come up at this meeting. All are invited to come and bring your bee-keeping friends.

West Galway, N. Y. T. I. DUGDALE, Sec.

## ITALIAN

### Bees, Queens and Nuclei

Choice home-bred and imported stock. All queens reared in full colonies.

One untested queen.... \$ .65  
One tested queen..... .90  
One select tested queen... 1.10  
One breeding queen..... 1.65  
One comb nucleus (no queen)..... 1.00

All grades ready to send by return mail.

Safe arrival guaranteed.

For prices on quantities and description of each grade of

Queens, send for free price-list. 100 or 200 lbs. of Brood Foundation. Send for sample and prices.

J. L. STRONG.

204 East Logan Street, CLARINDA, IOWA.

14Atf Please mention the Bee Journal.

## FOR SALE

12 sixty-pound cans white clover EXTRACTED HONEY. This was stored in combs free from pollen and in which no brood had been reared. The honey was practically all sealed when extracted. 8 cts. per pound on cans here.

EDWIN BEVINS,

37A1t

LEON, IOWA.

### Queen-Clipping Device Free!

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. It is used by many beekeepers. Full printed directions sent with each one. ## How the Canadians Like Moore's Strain of Italians

J. L. Byer, Markham, Ont., Can., says:

"I use a very large hive and have been getting Italian stock from different breeders, and yours are the only Italians that fill up my big hives with rousing big colonies. They winter splendidly, out-doors, are hustlers after honey, and not one queen has yet cast a swarm."

Untested Queens.....75c each; six, \$4; dozen, \$7.50  
Select Untested.....\$1 00 each; six, \$5; dozen, \$9.00

Descriptive circular free. I am now filling orders by return mail, and shall probably be able to do so until the close of the season.

We carry a full line of SUPPLIES. Ask for Catalog.

THE MARSHFIELD MANUFACTURING CO., Marshfield, Wis.

## Special Offers Until Oct. 1, 1905

### Standard-Bred Untested Italian.... Queen, 60 cents

2 for \$1.10, or 6 or more at one time, 50 cents each. The Weekly American Bee Journal one year (either new or renewal subscription) with one of these fine Queens—both for \$1.30. Better have one or more of the Queens. They give satisfaction. Remember, the above offers expire Oct. 1, 1905. First come first served.

## An Untested Italian Queen-Bee FREE as a Premium

For Sending One New Subscriber

for the American Bee Journal for a year with \$1.00.

As has been our custom heretofore we offer to mail a fine Standard-Bred Untested Italian Queen to the person who complies with the following conditions, all of which must be strictly followed:

1. The sender of a new subscriber must have his or her own subscription paid in advance at least to the end of this year.
2. Sending your own name with \$1.00 for the Bee Journal will not entitle you to a Queen as a premium. The sender must be already a paid-in-advance subscriber as above, and the new subscriber must be a NEW subscriber; which means, further, that the new subscriber has never had the Bee Journal regularly, or at least not for a whole year previous to his name being sent in as a new one; and, also, the new subscriber must not be a member of the same family where the Bee Journal is already being taken.

We think we have made the foregoing sufficiently plain so that no error need be made. Our Premium Queens are too valuable to throw away—they must be earned in a legitimate way. They are worth working for.

Address all orders to

GEORGE W. YORK & CO.

334 Dearborn Street, CHICAGO, ILL.

## Capital City Apiary! Fine Italian Queens

Untested, after June 15, 75c; Tested, \$1.00; Breeders—the very best, \$5.00. Terms cash with order. Safe arrival and satisfaction guaranteed. **WALTER S. HOSS.**

ROOT'S GOODS

At Root's Factory Prices

## Honey and Beeswax

CHICAGO, Aug. 18.—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14¢, while No. 1 has sold at 13@13½¢. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white, 6@7¢; amber, light and dark, 5@6¢. Beeswax, 28¢. R. A. BURNETT & Co.

ALBANY, N. Y., July 26.—There is some call for honey, new crop, and if here would probably sell for best prices of season, as the general impression is there will be a large crop. White comb honey will start off at 15¢ to early buyers. H. R. WRIGHT.

KANSAS CITY, Aug. 24.—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½¢; other grades down to 4½¢. Beeswax, 28¢. C. C. CLEMONS & Co.

DENVER, June 26.—The demand for both comb and extracted honey is light at present, and there is enough of old stock on hand yet to last until the new crop comes in; the same is selling as follows: No. 1 white comb, per case of 24 sections, \$2@2.20; No. 2, \$1.75@2. White extracted, 6½@7½¢ per pound. Beeswax, 26¢. THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, O., Sept. 8.—It appears by this time, that comb honey will not be so plentiful. In some parts of the West the crop has been more or less a failure. Prices so far have not changed much yet. Fancy white comb, 13@15¢. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾¢; in cans, ½¢ more; white clover from 7@8¢. Beeswax, 26¢. C. H. W. WEBER.

INDIANAPOLIS, Sept. 2.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 14@15¢; No. 1 in poor demand at 12¢, and amber dull at 10¢. Best grade extracted brings 8@9¢ in 60-lb. cans; amber slow at 5¢. Beeswax, 28@30¢. WALTER S. POWDER.

NEW YORK, Sept. 7.—New crop of comb honey is now arriving in a small way and fancy stock finds ready sale at 14@15¢ per pound; No. 1, at

12@13¢, and amber at 11¢. No buckwheat on the market as yet. Extracted in good demand, and we quote California at 6@7½¢ per pound, according to quality; Southern at from 55@65¢ per gallon; white clover at 6½@7¢ per pound. Beeswax steady at 29¢ per pound. HILDRETH & SEGELKEN

PHILADELPHIA, Aug. 21.—Some honey arriving, with prospects of a good crop all through the East, but no call for comb honey during the hot weather, so that prices are not as yet established. Extracted honey arriving freely. We quote as follows: Fancy white, 7@8¢; amber, 6@7¢. Beeswax, 27¢.

We are producers of honey and do not handle on commission. WM. A. SELSER.

CINCINNATI, Sept. 7.—There is little to report since our quotation two weeks ago. The supply of both comb and extracted honey is fair, and the demand is good. We offer extracted honey as follows: Amber, in barrels and cans, at 5½@6½¢, respectively. White clover at 7@8½¢. Fancy white comb honey at 12@15¢. Beeswax, 29 cents. THE FRED W. MUTH CO.

SAN FRANCISCO, Aug. 30.—White comb, 1-lb. sections, 9@10 cents; amber, 7@8¢. Extracted, water-white, 4½@5¢; white, 4½@4¾¢; light amber, 3½@4 cents; amber, 3@3½¢; dark amber, 2½@3¢. Beeswax, good to choice, light, 26@27¢.

Honey is now a drug on the market and is moving off very slowly. Receipts are coming in freely and are of first-class quality, running very light in color this year. Prices on all varieties show a slight weakening, owing to an extremely sluggish demand, it having been thought that some of the large holdings might be moved at a slightly lower figure.

## FOR SALE

Until further notice, fine-t quality new crop California Water-White White Sage and Light Amber HONEY in 60-lb. tins, 2 in a case; new cans and new cases. Write for prices and samples, and state quantity you want.

HILDRETH & SEGELKEN

# GERMAN WAX-PRESS

Save all of your old comb, scraps of wax and slumgum, and instead of allowing them to become scattered or worm-eaten, or rendered in some wasteful method, put them into a German Wax-Extractor and you will be surprised at the amount of wax you can obtain and profits make. With a German Wax-Press you can get every particle of wax out of old combs. Much of the slumgum from solar extractors and other machines contains a very large percentage of wax that can be separated with our machine. Indeed, some bee-keepers buy up all the slumgum they can, and with the use of a German Wax-Press make excellent profits from what otherwise would have been thrown away.

Our Press may also be used as a honey-press. Loose or broken chunks of honey that are too small for an extractor may be extracted in this Press without application of heat, and the honey be as good as though extracted in the ordinary way. With every Wax-Press we furnish an uncapping arm. This arm, with scraping stick, is slipped over the edge of the can with the basket in place. The cappings drop down into this and are drained. This machine, therefore, serves three purposes, and is almost indispensable in any well-regulated apiary.

The machine is made in the best possible manner. The cross arm is of the best selected oak, and will stand any strain. Bolts projecting through the ends of the arm engage with corresponding ears on the can in such away that a side circular movement instantly releases it.

Before closing I wish to say that Mr. E. R. Root is right when he says, "You can't get over 50 percent of the wax until you use a first-class press for your work." And I want to say when you get a press, buy a German. They are neater, can be used on a kitchen stove, make a fine honey-press and excellent uncapping can, and will be the most satisfactory in the end. I will trade my home-made outfit for one if I ever get a chance.

PERRY ORTON.

New York, Aug. 9, 1905.

I am well pleased with the German Wax-Press. Felt that in one day's work it had more than earned its cost.

W. J. OATES.

California.

I was inclined to believe at first that the German Wax-Press was a failure, but after a thorough trial was well pleased. Secured 50 pounds more wax from one day's use of the machine than I would have secured by the ordinary method of rendering.

Illinois.

B. WALKER.

Wax from old slumgum that had been worked over by another party and declared to be free from wax, I got nearly 50 pounds from only a little over 100 pounds of the stuff.

Illinois.

E. T. FLANAGAN.

## Cash Discount for Early Orders

We can not remember a year when we were not crowded with orders through the spring months, and somewhat behind, some years more than others. In order to divert some of this trade to the fall and winter months, we have offered inducements in the way of an early-order cash discount. This year we will be more liberal than ever before in the amount of discount allowed. For some months the price of some of the materials used has been a little lower, and we have stocked up heavily, and propose giving you the advantage of the saving in price. The abundant farm crops throughout the country are stimulating trade in almost all lines, and prices are already stiffening. The discounts which we propose to offer for early cash orders are as follows:

For cash orders before	Oct. 1	.....10	percent.
"	Nov. 1	.....9	"
"	Dec. 1	.....8	"
"	Jan. 1	.....7	"

For cash orders before Feb. 1.....6 percent.

" " March 1.....4 "

April 1.....2 "

You will notice that, after January, the discount drops 2 percent a month; and if we find that advancing prices of materials do not warrant the larger discount, we reserve the right to reduce the amount of discount at any time. Your safest plan is, therefore, to order at once.

This discount is only for cash before the dates named, and is intended to apply to hives, sections, frames, foundation, extractors, smokers, shipping-cases, cartons, and other miscellaneous bee-keepers-supplies. It will not apply on orders for the following articles exclusively; but where these form no more than about 10 percent of the whole orders, the discount may be taken from the entire bill: Tinned wire, paint, Bingham smokers, Porter bee-escape, glass and tin honey-packages, scales, bees and queens, bee books and papers, labels and other printed matter; bushel boxes, seeds, and other specialties not listed in our general catalog.

## Editorial Notes and Comments

### National Convention in Chicago

We have received the following from Sec. Hutchinson, of the National Bee-Keepers' Association:

THE NATIONAL CONVENTION TO BE HELD IN CHICAGO.

Ever since the breaking out of the yellow fever in the South, have I been receiving letters from different parts of the country, suggesting that the place of meeting for the National convention be changed to some Northern city. To all, for a long time, I returned the same reply: "Let's wait and see how things turn out. If the fever is crushed out of existence, or controlled, then we can go to Texas just as well as ever."

To a certain extent the fever has been controlled, but there seems to be no probability that it will be done with before the time that has been set for holding our convention in San Antonio. The time has come when we can wait no longer. If a change is to be made, it must be made at once, that bee-keepers may be planning accordingly.

Before taking up the matter with the Executive Committee, I wrote to the Directors, the editors of the leading bee-papers, and to several of the most prominent bee-keepers, asking for their views on the subject. The majority was overwhelmingly in favor of a change. The matter was then taken up with the Executive Committee, and every member favored a change to Chicago, during the Fat Stock Show the first week in December. It is possible that some other Northern city has greater claims than Chicago for the holding of the convention, but the meeting must be held where reduced railroad rates will be assured, and the Fat Stock Show furnishes these.

It is possible that there is no real danger from the fever at San Antonio, but the fear of it is real, and would have kept away the Northern people. The bee-keepers of Louisiana and Mississippi would have been shut up in their own States. Texas has had a slim crop of honey this year, and, taken all in all, a convention this fall in San Antonio would have been a pretty slim affair. I think that even the Texans themselves would rather wait another year, when, if all goes well, the convention could be held in San Antonio with every assurance of a big crowd.

Arrangements have been completed for holding the meeting in Chicago, at the Revere House, corner of Michigan and Clark Streets, on the 5th, 6th and 7th of December. This hotel can accommodate at least 300 bee-keepers, and the rates are 75 cents for a room

alone, or 50 cents each where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants.

W. Z. HUTCHINSON, Sec.

We may say that personally we regretted that it seemed best, under the circumstances, not to hold the National convention at San Antonio, as we desired very much to visit the South. But if nothing interferes no doubt the meeting can be held their next year. It is very unfortunate that it was felt the change in place should be made, but "what can't be cured must be endured." And bee-keepers are a very "enduring" class of people, and no doubt all will be glad to bow to the will of the majority who decided the matter.

But now it is "up to" Chicago to do her part in making it a great convention. It comes at the same time as the meeting of the Chicago-Northwestern Bee-Keepers' Association, so in all probability there will be a joint convention. At least the Executive Committee of the Chicago-Northwestern has made such suggestion to the National.

We hope as many bee-keepers as possible will plan to be in Chicago Dec. 5, 6 and 7. Come and help make it a good meeting.

**A GOOD INVESTMENT**  
**16 2-3 Percent Interest**  
**Absolutely Safe**  
**A Chance for Bee-Keepers Only**

That sounds like one of the fake get-rich-quick schemes. When money is loaned by the thousands of dollars at 5, 4, 3 percent interest, or less, it does look as if there must be something rotten in a proposition that promises an annual rate of interest of 16 $\frac{2}{3}$  percent, especially when baited with the specious claim that the chance is "for bee-keepers only."

But there's nothing rotten about it. To say that bee-keepers have a chance to invest money at the rate of 16 $\frac{2}{3}$  percent annually, is only to put in other words the well-known fact that bee-supplies bought before Oct. 1 can be had at 10 percent discount. The ob-

ject of these paragraphs is to call the attention of bee-keepers to what there is in it for them.

Let us see if we can make good.

The discount is "a chance for bee-keepers only," for others do not buy supplies of that kind. The investment is "absolutely safe," for it is just as safe to buy in September as in the following May.

Let us see about the 16 $\frac{2}{3}$  percent annually.

Say a bill of supplies amounting to \$100 is needed. If bought before Oct. 1, \$90 pays the bill. Say the purchase might be deferred till June 1. It would hardly be deferred later. From Oct. 1 to June 1 is eight months. That \$90 invested before Oct. 1 practically gains \$10 in that eight months, which is at the rate of \$15 in a year. That \$15 is 16 $\frac{2}{3}$  percent of \$90—and there you are.

The question may be asked, "How can the manufacturers afford such a discount?" That is their lookout. Yet it is not so very hard to make a fair guess as to the answer. It is the common thing to have a very large number of orders for supplies come all in a jam in the spring, many of them after the season has fairly opened. The amount of these orders can not be foreseen, and the result is that at the last the factories must run day and night, and even then have the unpleasant experience of receiving complaints as to unfilled orders, or else have so big a stock prepared in advance as to run the risk of carrying over to the next year a heavy load of surplus stock. So the manufacturers can afford to pay a good price to stimulate early orders; and the bee-keeper who has the money has the chance to secure the 16 $\frac{2}{3}$  percent interest, and at the same time to avoid the unpleasant predicament of having to wait an unpleasantly long time to have his orders filled if he sends them at a time when the rush is on.

### The National and Advertising Honey

On the next page some of the leading bee-keepers mention several things that the National Bee-Keepers' Association might attempt to accomplish. While there is sufficient variety in the work mentioned, there seems to be a fair unanimity in the suggestions that favor advertising honey.

For several years we have urged the impor-

tance of bee-keepers themselves doing something to popularize the use of honey. Not a tenth part of the honey that should be consumed on the tables of the public is now found there. In order that some definite plan might be inaugurated, several of those most interested originated The Honey-Producers' League. Its objects are all right, and its promoters made a sincere effort to get the bee-keepers and their money together in a way that, had it succeeded better, we believe would have been a great step in attaining the desired result.

But great plans and objects can not be developed and attained in a day—nor in one year. An honest attempt has been made to do just what many of the leaders say should be done, except that the League was organized to do it instead of the National Association.

Now, if it is thought that the National can better do the work undertaken by the League, and also that bee-keepers will rally to the former in larger numbers with their money, then by all means let the National at its next meeting decide to undertake the work. Let it elect an advertising committee of say three, whose duty it will be to manage this part of the work of the National. Perhaps it would be well to have a separate honey advertising fund for the committee's use, which shall be raised by an increase in dues or otherwise. The details can be worked out at the National convention, if it should decide to take up the honey-advertising subject.

It might be possible that the members of the League would be willing to have the dues they have paid into the League treasury turned over to such National advertising committee as mentioned. This we suggest as only a possibility, as we have no right to say that it would be done.

Of this, however, we feel reasonably certain: Something ought to be done to induce the public to eat more honey, both for the benefit of the public's health and for the financial benefit of those who produce honey. The question is, How can it best be accomplished? If The Honey-Producers' League can't do it, perhaps the National Bee-Keepers' Association can.

Which shall it be, if either of them?

### Split-Top Sections

Occasionally something is said in favor of sections made in halves, or at least with the top-bar in two parts. When sections were first introduced, it was common to have a saw-kerf in the top-bar to receive the foundation, but that fell into disuse when other methods of fastening were introduced. There is no denying that foundation is held very firmly when the top-bar is split entirely in two; but it is no more to be denied that the line of wax showing on the top of the finished section is always an eyesore.

Split-top sections have been used in England more than in this country; but if one can judge from the bee-papers over there, they are not growing in favor there.

**Maeterlinck's "Life of the Bee."**—We have a few copies of this book, price, post-paid, \$1.40; or with the American Bee Journal one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

## Some Expert Opinion

### What the National Bee-Keepers' Association Should Attempt

**Ques. 30**—Please name one or more of the most important things for the National Bee-Keepers' Association to attempt to accomplish.

**S. T. PETTIT (Ont.)**—Can not do it.

**DR. C. C. MILLER (Ill.)**—Advertising honey.

**C. DAVENPORT (Minn.)**—To bring before the public the value of honey as a food.

**DR. J. P. H. BROWN (Ga.)**—To secure better prices, better freight-rates, and less adulteration.

**MRS. J. M. NULL (Mo.)**—Advertise honey as though the people had never heard of such a thing before.

**R. L. TAYLOR (Mich.)**—An effective plan to secure a more general distribution and consumption of honey.

**E. E. HASTY (Ohio)**—I have my doubts about the adulteration of honey—let them hold fast what they have already gained.

**MORGAN BROS. (S. Dak.)**—1. The suppression of the adulteration of honey. 2. Aiding its members in the sale of their products.

**O. O. POPPLETON (Fla.)**—Keep on doing what it has done, for one thing. Fight the adulteration of honey at every opportunity.

**L. STACHELHAUSEN (Tex.)**—Fighting the adulteration of honey and the public prejudice against honey. Getting a better market for honey.

**J. M. HAMBAUGH (Calif.)**—Destroy the sale of adulterated honey. Overcome public prejudice against honey. Educate the people to use pure honey.

**E. WHITCOMB (Nebr.)**—Pure-food laws by National legislation; and a National law which will work uniformly to stamp out foul brood in the different States.

**REV. M. MAHIN (Ind.)**—The most important is the suppression of honey adulteration. Next to that, if indeed it should not be placed first, is the eradication of bee-diseases.

**ADRIAN GETAZ (Tenn.)**—Fight the adulteration of honey. Get appropriations from the Government to carry on apicultural experiments in our agricultural institutions.

**N. E. FRANGE (Wis.)**—Advertise honey and its uses. Help to market honey for members. Less defense in neighbors' quarrels. Better methods for nominating candidates for offices.

**EUGENE SECOR (Iowa)**—Advertise the value of honey as a food. Keep before the people the fact that bees are not an injury to flowers or fruit. Assist in procuring and enforcing pure-food laws.

**JAS. A. STONE (Ill.)**—The teaching of the general public how few blossoms bear fruit unless pollinated by bees or other insects. And the uselessness of spraying fruit-trees while in bloom.

**WM. MCEVOY (Ont.)**—To get the bee-keepers to leave the honey with the bees until it is well ripened before they extract it, so that they will be able to sell the public a much better quality of extracted honey.

**C. P. DAPANT (Ill.)**—Do away with the story of manufactured comb honey as far as possible by proper advertising; this is the most important matter to bee-keepers to day. But there are thousands of other things to do.

**J. A. GREEN (Colo.)**—Increase the honey market by educating the people in the use of honey; teach them not to fear the adulteration that does not exist; and check, and, if possible, do away with the adulteration that does exist.

**PROF. A. J. COOK (Calif.)**—A national association for marketing, or a national organization like the Southern California Fruit Exchange. I believe this can be accomplished, and it would be of tremendous value to all bee-keepers.

**E. D. TOWNSEND (Mich.)**—Michigan has a law prohibiting the word "honey" being used except on packages containing pure honey. Help other States to get a similar law, then help put the law in force. I think there is no impure honey on the market in this State.

**C. H. DIBBERN (Ill.)**—1. Stop the sale of all glucose syrup as honey. 2. Run down every lie as to comb honey being "manufactured" and extensively sold. 3. Advertise honey as being far ahead of all sugars and syrups as a wholesome article of food.

**G. W. DEMAREE (Ky.)**—Let the National Bee-Keepers' Association take steps to enlighten the general public, and disabuse their minds of the past and present delusion that bee-culture is necessarily a "little business," and much will be accomplished by its efforts.

**R. C. AIRIN (Colo.)**—Unite all into a cooperative association. Intelligent, united action in distributing products and buying supplies carries with it many other things; eliminates competition, unifies packing, cuts out extra expense, and gives confidence. The United States of America is a "great combine." Who would chop it to pieces, or have 5 or 10 concerns to deliver a letter from ocean to ocean? See?

**E. S. LOVESY (Utah)**—A more thorough organization. It is needed all along the line. The bee-keepers of every State should be organized so as to be in touch with the National. The whole should be organized to such extent that estimates could be made as to the extent of the entire honey crop, its value, also where and when to market the product. Sugar-men do this, and why not the bee-keepers? "In union there is strength."

**P. H. ELWOOD (N. Y.)**—1. To protect the bee-keeper from unjust ordinances, etc. 2. To prevent the sale of adulterated honey. 3. To educate the people to eat more honey, and shun the vile, unhealthy glucose compounds offered under various names. I once bought a can of the best obtainable brand of glucose, and offered it to the bees. They took only a limited quantity and died before spring. I do not believe it possible to winter a colony of bees on pure commercial glucose. Grape-sugar is the natural food of the honey-bee. Then why do they not assimilate the grape-sugar of glucose equally as well as that of honey?

### Depth of Shipping-Cases

Shipping-cases for comb-honey ought to be a little deeper than the height of the sections, when they are piled up a dozen or more high, then the weight of nearly the whole pile will not rest upon the honey in the lowest case, which, in some cases, causes a leak. Mr. Irving Kinyon writes me that he got this hint from P. H. Elwood.—Bee Keepers' Review.

### Comb Honey Guarantee Circulars.

—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before mailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

## Miscellaneous News Items

"What To Eat" is a monthly magazine devoted to the preaching of the gospel of pure food. It is published here in Chicago, by The Pierce Publishing Company. In the September number we are glad to notice the major portion of the Daily News article on "Comb Honey Not Machine-Made." We still have some typewritten copies of it that we will mail on receipt of a 2-cent stamp, for the purpose of having it published in local newspapers. Almost any bee-keeper can get the editor of such paper to use it, we think, if the request is properly made it.

**Wrong Statements About Bees** are constantly appearing in the newspaper press. Lisle J. Schneider, of Delaware Co., Iowa, sends us such clipping, and says he sees about 25 papers, and scarcely a week passes without meeting with some "break" about bees in them. Of course we can't copy all such wrong statements in these columns, and it would do no good if we could do so. What

is needed is their correction in the very papers where the original misstatements appeared. Every bee-keeper who sees such misleading reading matter referring to bees or honey should very promptly write the editor a respectful correction, or something that gives the truth about it, and request its publication. If the bee-keeper himself does not do this, certainly no one else will do it for him.

**The Apiary of J. P. Blunk**, of Webster Co., Iowa, is shown on the first page this week. Here is what he wrote us when sending the photograph, Aug. 8:

I send a picture of a part of my apiary. The grove is so dense that it is a hard thing to get a good picture.

The two outside rows are the hives of the colonies that swarmed. It will be noticed that they are well scattered. This I did to insure the safe return of young queens when on their wedding-trip. It proved my former statement, that young queens miss their own hives when they are placed close together, and are not killed by king-birds, as many believe.

I got every young queen back to her own hive, not one being lost.

This grove is a fine place for bees in hot weather, but a poor place the forepart of the season—too cold—so I put the hives out in the sun up to about swarming time, then I move them backwards by degrees until I get them all in the grove.

Those are my boys at the further end of the apiary, and all are afraid of bees except Dan, the small one at the right of the tall hive. He is my helper in the apiary. I tell them it's no wonder they are all bachelors, for any one who is afraid of a bee surely could not muster up courage to get a wife. So you see I have a poor prospect of ever being called "grandad."

About half of the colonies swarmed, all swarms being regular and in order; no foolishness with the swarms this season.

J. P. BLUNK.

**Comb Honey Not Machine-Made.**—We have a fair supply of the typewritten letter on this subject, which appeared in the Chicago Daily News of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

## Contributed Special Articles

### How Much a Bee Gathers—Strong Colonies

BY G. M. DOOLITTLE

**A** CORRESPONDENT writes me saying, "Will you please tell us through the columns of the American Bee Journal whether the advice which is given me (to keep my colonies *always strong*) is good?"

If every bee reared could have a field of honey placed before it in which to labor, then the motto, "Keep colonies always strong," would be the right one; but inasmuch as this can not be, and as bees at all times must be consumers, no matter whether producing or not, I can not see the philosophy of having a colony strong in bees at such seasons, when of necessity they can be only consumers. That one bee can not gather 50 pounds of honey, nor one-fiftieth part of that, is one of the reasons that more than one bee is required in a hive; and because one bee can not gather that amount is the reason that the apiarist desires a large number of bees in his hives at certain seasons of the year; and as a large number is desired at certain seasons, some have conceived the idea that a large number of bees in a hive at *all* times of the year is a thing of great value.

But right here comes in another side to this "gathering" question. I have just said that one bee could not gather one-fiftieth part of 50 pounds of honey, my reason for so saying being that in this locality we do not have a yield of honey lasting through the length of life allotted to an individual bee, while many bees—yea, usually more than half that are reared under the most skillful management—never add an ounce to the surplus.

Thus, right here comes in another factor to this question, which is the field, or supply of honey. In reality we must begin with the field, or, in other words, place that *first*, for without the field or honey-flow we have no use for the bees. With a continuous and uninterrupted honey-flow within three miles of the hive during the time which a bee lives, I think that a bee might easily gather one ounce of nectar, which would take only 800 bees to gather 50 pounds. Of this amount it would take at least 12 pounds to supply the wants of the colony during the time the bee was living, and unless the

nectar was thicker than it averages here, it would take three pounds of this nectar to make one pound of honey. So, then, we would have from 12 to 13 pounds of actual honey as the product of 800 bees during their life, over and above what was consumed by the colony with an uninterrupted flow of nectar.

While this might be possible, yet there are two things which make it improbable, the first being, as already stated, that the honey-flow does not continue long enough, and the second, that the yield would not be sufficient within three miles of the apiary, where many colonies are kept, so that the bees could work to the best advantage. To illustrate:

One year I had a colony which, on May 25, I estimated to contain 4000 bees. This estimate was made by counting the bees on a given surface of the comb, and then dividing the amount of comb covered with bees by the space counted, when the quotient was multiplied by the number of bees counted on the first surface. The next day was a fine one, and apple-trees were yielding nectar as well as I ever knew them. At 7 a.m. the bees began to go to work, and at 8 a.m. I found that on an average 60 loaded bees were going into the hive each minute. One incoming bee was caused to disgorge the contents of its honey-sac, and a fair-sized drop of nectar was the result. By a careful estimate I found that it would take 3600 such bee-loads to make one pound, so I concluded that 4000 bees were good for the gathering of one pound of nectar per hour, besides caring for the interior of the hive.

Before a bee had left the hive in the morning, I had weighed the same so that I could tell when night came how much the colony had gained. They worked right along at the average rate of 60 bees per minute till 4 p.m., when there came a gradual slackening until 5, when all were in on account of a wind-storm coming up.

At dusk that night I weighed the hive again, thinking to myself as I did so, that if my estimate was correct, it should weigh 8 pounds more than it did in the morning. I found it weighed 8 pounds and 9 ounces, thus showing that my estimate was not far out of the way.

But what was a great surprise to me, was that when weighed the next morning I found that 8 pounds and 9 ounces gain had gone down to 3½ pounds, thus showing that the nectar fresh from the flowers was not all honey, by any means.

After this I became infatuated with the idea that there could be as much honey obtained from apple-bloom as from basswood, if I could only get the population of the hive up to 40,000 instead of 4000; so I began trying to get my colonies strong in bees early in the spring, but after an entire failure of apple honey for the next 4 years—on account of the cold, rainy weather which is usually on when these trees are in bloom—I gave the matter up, only trying to get the colonies

strong so as to take advantage of the generally good weather we have during the clover and basswood bloom.

The point I wish to impress on the reader is: First, we have the field or location we are in, of which we should have a thorough knowledge; next, we have the bees to get in large numbers *just in time* to take advantage of the main honey-flow of the field; and, third, a bee is of little value as a *honey-gatherer*, only as it can be placed in the field of *action* just in the right time. In this way the quantity of nectar which a bee can gather in a lifetime becomes of interest to us, that we may work faithfully and intelligently to have that *lifetime* come when our field is yielding nectar. At all other times we are wise not to work for bees in a greater number than is sufficient so that we can take advantage of their numbers to bring the colony up to this "high water" mark, with the rolling around of the honey-flow of each season.

## A Top and Bottom Frame-Spacer

BY C. W. DAYTON

I HAVE mailed to the office of the American Bee Journal a top and bottom spacer as I use in my hives—the spacer described on page 541. I put them in my hives in 1895. I expect to make 300 new hives between now and another season, using this spacer.

The wire for the bottom is simply woven about headless nails driven in proper positions into a piece of hard wood, and

then soldered to the strip of galvanized iron before it is slipped off the nails.

The top or end spacer is marked out of galvanized iron from a pattern, snipped with the tinner's shears, and then

Fig 2

bent over in a vise having wide jaws. I made a stamping die to cut the notches, but it left the edges too sharp, and, besides, it is so short a job that it is impractical to construct a machine.

Although I never have seen a "St. Joe" hive or spacer, I suspect these notches, when  $\frac{1}{4}$  inch deep, are exactly like it. But my notches are only  $\frac{1}{8}$  inch deep instead of  $\frac{1}{4}$  inch. And bent over instead of being cut out. The only need for deep notches is in moving. When a wagon runs upon a considerable-sized stone, and then slips suddenly off one side, or the stone is a loose one and rolls over, the ends of the frames are apt to jump out of the shallow notches unless bee-glue holds them in place.

Another thing, there should be a half-inch space or more between the side frame and the side-wall of the hive. Mr. Abbott wrote me that wire would not work as a bottom spacer. I would like to know what he uses that is better than wire.

The strips of wood on the top spacer sample are the sequoia (big tree) redwood, which shrinks and swells endwise, never warping or checking sidewise. My hives, constructed of this  $\frac{3}{4}$ -lumber, 1 $\frac{1}{2}$ -story, full of frames, bottom-board, cover and shade-board, average about 16 pounds in weight. I am not well pleased with it. It is too soft, and fades to almost black. It is not so pleasant to look at as white, clean pine.

## Sulphur Treatment of Bee-Paralysis

BY H. S. PHILBROOK

I SEEM to have made a valuable discovery in regard to bee-paralysis, which might well be called the O. O. Poppleton plan modified.

I had moved my bees to the hills, had succeeded in building up most colonies to famous strength, and was just glorying in my prospect of an immense yield of sage honey, when the bees began to show unmistakable signs of bee-paralysis. It first appeared in one colony, and I immediately closed it at

evening, and moved it 2 miles away, but it soon broke out nearly all over the yard. Out of 153 colonies 53 were affected. I was not discouraged, but was ready to fight it, but the question was how to proceed. I disliked the Poppleton plan on account of destroying the brood or else cutting strong colonies up by forming nuclei for the brood. So I tried various other remedies, among the rest a spray of sulphuric acid diluted, which was very effectual, but also had the bad effects of ruining the unsealed brood. Some colonies were so badly affected that they would carry out a full quart of dead bees in a single night.

I reasoned that the disease was a microbe or germ disease, and it must enter the hive at the entrance. If the Poppleton plan worked, sulphur was death to the germ or microbe. I wondered if it were necessary to cover the brood with sulphur, for it does not attack the brood, but only the old or adult bees, and especially the queens. I reasoned that the diseased bees being the adult ones, by covering the entrance-boards with the sulphur and throwing it well back into the hive, the adult bees would come very much in contact with it in trying to keep it up, as the disease seemed to attack them on the tongue, and thence enter their bodies. So I treated every colony in the apiary to a dose of sulphur by throwing it well into the hive-entrance in the evening when all bees were in.

At first the results scared me, for the quantities of dead bees increased, and I drove a distance of 50 miles to Mr. M. H. Mendelson's, to see if he might not suggest a remedy. But my only consolation was this: "Philbrook, you are in a bad fix just at the beginning of the honey-flow, and you will get no honey this year. You have my sympathy, but I can not help you, except to give you my salt-and-water recipe, and it will take the entire season to get it out of your bees."

I was somewhat discouraged, and drove home wondering what I should do, when, presto, change! there were scarcely any dead bees carried out the next morning, and after 4 days I treated the entire yard to another dose of sulphur, and very few dead bees appeared. My yard was free from disease, and all so quickly and easily that it seemed that I had only had a horrid nightmare, and not the real thing.

It appeared later in the season, but I promptly dosed with sulphur, when it vanished once more, and I have seen no further signs of it. My honey crop amounted to a trifle over 15 tons from those 153 colonies.

My first experience in the bee-business was in my father's apiary in the Simi Valley, in California, in 1879. He was in the business for 10 years, and one year took off 47 tons of extracted honey. He shipped this crop to Chicago, New York and Boston, but the experiment proved very disastrous, although he went with it and carried samples in the comb. But people would believe that he had the means of putting it in the combs and sealing it over artificially, thus practicing adulteration  
Ventura Co., Calif., Aug. 20.

## Convention Proceedings

Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill.,  
Nov. 30 and Dec. 1, 1904

(Continued from page 649)

### SECOND DAY—MORNING SESSION.

At 9:50 a. m. Pres. York called the convention to order and requested Dr. Miller to invoke the divine blessing.

Dr. Miller—Our Father, we thank Thee for another night's rest. Prepare us for the work of the day. We pray Thee that the same kind feelings, and the same kind spirit, may prevail here to-day as did on the past day. We thank Thee for the acquaintances of the other bee-keepers, and that we may meet together in a kindly spirit and discuss the things in which we are mutually interested. We pray, O God, for Thy blessing upon us. Wilt Thou care for the dear ones at our respective homes. May we feel that they are safe under Thy care. We pray that Thy blessing may be upon us as bee-keepers, and may we learn something to-day. May we go from here better men and women; better fitted to do the work that our Heavenly Father has for us to do here upon the earth. Bless the President and the other officers. May

the President have just the wisdom he ought to have to direct aright the proceedings of this convention. We pray that Thou wilt bless all the members. Lead us in all we do. Lead us, we pray Thee, through life; lead us up to the time when we shall leave all the things of this world, and may we unitedly come up to enjoy the life beyond through all eternity. We ask it in Christ's name. Amen.

REPORT OF THE INSPECTOR OF APIARIES.

We will call upon Mr. Smith, the State Inspector of Illinois, to open this subject, and tell us about his work.

Mr. Smith—Really, I do not believe that I can add to what has already been so often told the bee-keepers by Mr. France, and by Mr. Moore here in his remarks yesterday. However, I will give an outline of what I have done the past year. The way I do my work is by going to places from which I get invitations to come. I don't go out and hunt up foul brood, only in the neighborhood where I find foul brood; we as a rule go around to the adjoining neighbors that have bees and inspect them. During the last season I visited thirty-two counties in this State, just about one-third of the counties, probably—it would be a good one-third with Mr. Moore's work in Cook County. I find that the bee-keepers are very anxious to know all about foul brood, and how to treat it, and they are very apt to learn also. They are very anxious to inform other bee-keepers how to treat it. Of course there is only one way that I treat foul brood and that is to destroy the comb. I don't try formaldehyde or any other disinfectant; I remove the bees and destroy the comb—that is, the brood-combs. I cleanse the hives out and re-hive the bees again on foundation or empty frames. I think that the work is in fair progress, and another year or two will show that the work that has been commenced will bear good fruit. The diseased locations are found mostly in the north part of the State and along the Mississippi River in the north and south parts of the State, also along the Indiana line. I found foul brood in only one county in the central part of the State. Of course there may be foul brood in every county in the State so far as I know, but I think the bee-keepers, as a rule, are reading up, and that is one way we ought to work—through the press, and the mail, and educate the bee-keepers so that they can take care of their own bees. The bee-keepers as a rule, are very anxious to have the Inspector come, and they are very pleasant people to be with. In fact, I believe that the bee-keepers are intelligent and progressive, and are very friendly. There doesn't seem to be any jealousy existing among them, that one is afraid that his neighbor will produce more honey than he does, or that his bees will do better than his neighbors', but they seem to be anxious to work together. I think that is a very good idea, also. Now if there are any questions that any of the members wish to ask I will be glad to tell them anything they want to know, that they do not know.

Dr. Miller—You say that you destroy the comb and put the bees upon foundation or empty frames. Is that all? Do you let them stay?

Mr. Smith—No, in about two weeks or ten days remove them and put them on full sheets of foundation, after they have exhausted the honey they carried with them from infected colonies.

Dr. Miller—Isn't two weeks longer than has been the custom?

Mr. Smith—That is long enough. Some I have given as short a time as four or five days, but I think the best plan is to be sure that the honey is all exhausted; and if it is in a time when there is no honey-flow the bees want to be fed.

Mr. Kimmey—How about the young that have been started in two weeks, or would they start?

Mr. Smith—You cut that comb out and melt it up into wax.

Mr. Kimmey—Suppose that the disease is carried by the honey that the bees have at the time they make the first change, won't the disease go on with the next brood?

Mr. Smith—You will find very little brood in the new comb. Of course it would be in the very young larval stage. The disease never attacks the young bees until they get in the state called the grub state. After the bees become in the nymph state the disease never attacks them. I have never found any that were killed after taking the form of the nymph, with legs and wings.

Mr. Kimmey—Before that time won't the bees that have become infected with the honey carry that infection to the brood that is started in two weeks?

Mr. Smith—I think not. I don't think that the disease

can be developed in two weeks. At least I have never found any disease. I have had some parties that didn't change their bees back into the second frames until they had capped brood, and I found no disease there.

Mr. Kimmey—Won't it then be better to put them on empty frames the first time?

Mr. Smith—I think it would, because it has a tendency for them to exhaust their honey in building new comb.

Mr. Kimmey—And afterwards destroy them and put them on full foundation.

Mr. Smith—Put them on full foundation the second change.

Pres. York—I would like to ask in how many apiaries Mr. Smith found disease, and what percent he visited?

Mr. Smith—The percent I visited was probably 90.

Pres. York—Do you know how many apiaries you visited?

Mr. Smith—I have a record of that, but I didn't bring it with me.

Pres. York—How many colonies did you examine?

Mr. Smith—Over 2,000.

Mr. Swift—Is the disease exterminated by melting the wax? Does heat destroy it?

Mr. Smith—Yes. Mr. Dadant can tell that. He gets thousands of pounds of wax sent in, extracted from diseased colonies, and he has never had any complaint against it.

Mr. Pease—Will you give us a plan by which the person who never saw foul brood will recognize it?

Mr. Smith—Did you ever smell a carpenter's glue-pot? It puts me in mind of the young man who went to the medical college. When he returned home they wanted to know all about it. He says, "Now I will tell you, if you had seen what I have seen, and felt what I have felt, and smelt what I have smelt, you would know all about it." [Laughter.] If you smell that foul brood once you will never forget it. It smells as nearly like a carpenter's glue-pot as anything you can get.

Mr. Wilcox—Don't you find foul brood sometimes without smell?

Mr. Smith—Where it is not fully developed all over the hive and it is just the first inoculation, you may sometimes find a comb of beautifully sealed brood and just three or four cells that are affected, but it doesn't take long for it to spread.

Mr. Wheeler—I would like to go back a little bit. In regard to this treatment that you speak of, the bees are first shaken out at the beginning of the honey-flow, or "shook out," and they are put on empty frames. Our bees gathered the whole year's crop in two weeks' time. Now, there is a very tender point right there, whether you leave those bees in the hive two weeks and then take them off those combs they have built in those two weeks and melt those combs up. If it is not necessary to do that it would be a great loss of money to the bee-keeper. If two days or 48 hours would do, that would be a great deal better than two weeks.

Mr. Smith—Two days or 48 hours would not suffice—four days at least. I wouldn't make the change under that time. While it is a fact that they do not always carry the disease with them—I have known swarms to come out of the infected hives, and I have hived them on foundation and they didn't carry the disease with them at all. It seems they exhaust the honey before the young brood gets large enough to take the disease; especially if it is a second swarm and the young queen doesn't get to laying for a few days, the brood is later than the laying queen would be.

Mr. Wheeler—Some of the money that is used ought to be used to experiment along that line. It makes a great difference to us bee-keepers, if we know just how much time there should be. I have had a little experience, and I have shaken them out on combs, that is, just one comb with a little brood in and fresh-laid eggs, and those bees showed no signs of the disease for a year or two, no more than bees shaken out on empty frames; why that was I can't tell. They were no more affected than bees that were shaken out on empty combs and given new comb. The object was to save all the bees possible.

Mr. Smith—In making my trips I cannot go back to every man's yards in four or five days afterward and change his bees, I only leave my orders with him. I have gone back on several occasions where my trip was near there, and found some of them had not transferred them at all. They got busy, it was haying time, and the oats had to be hauled in, and with one thing and another they didn't have time, and they didn't like to bother with them; they were afraid of being stung, and they didn't transfer them back at all.

(Continued next week.)

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### THE HONEY-EATERS' LEAGUE.

Yes, "Illinois," hurrah for the Honey-Eaters' League to keep the Honey-Producers' League straight, and to see to it that honey, genuine but poor, is duly fed out to the bees, and not eaten by man. Page 537.

### NO HARM TO EAT WAX IN HONEY.

Dr. Bohrer says some good things on page 538; but I can't second his advice to fritter away advertising to tell the public that wax is not digestible. Though not digestible it doesn't do a bit of harm—and is suitable for the eating even of a risen Christ. Bran is on the borders of indigestibility, and yet most doctors would like us to have it left in our food instead of bolted out. And bran is capable of irritating some delicate stomachs, as wax seems not to be.

### STACKING UP SECTIONS OF HONEY FOR FURTHER RIPENING.

So Doolittle, in stacking sections, puts strips between the courses to help the inter-circulation of air. Undoubtedly good—and not so much trouble as it looks to be, after one has once gotten the strips. With some persons the strips would be spoiled, or half spoiled, when wanted for a second using; but probably those persons would better do something else than keep bees. Page 539.

### BEES SUPERSEDING QUEENS.

And here's a good idea of C. P. Dadant's: If a queen is very prolific the workers will quickly notice it when she begins to fail, and rear another to supersede her. But if she has been a poor one all her life they may not pay attention when she becomes somewhat poorer. Page 540.

### COLOR OF HAIR AND A DAY'S WORK.

Is that strange assertion a fact, Dr. Miller? Can't tell by the color of a man's hair how big a day's work he can do? Say, now, I'm quite sure I could do a bigger day's work before my hair got to be white. Page 543.

### "HONEY-BUTTER."

So "honey-butter" is what it is, eh? I think that is a very good name for it—if it takes. Likely to make some people think it is a mixture of honey with something else—but I don't know as the error is likely to do any great harm. Page 547.

### MANAGING A BALLED QUEEN.

Excepting the folks "born with a silver spoon in the mouth" we mostly don't have a tablespoon at hand to use when we suddenly find a queen in jeopardy in a ball of angry bees. I should rather suggest a couple of chips or section-sides to lift the ball with. And I should say, Don't risk your bare hand. Dumping the ball into water seems to be the standard way. Alas, water is very often not at hand. Thanks to Dr. Miller for the information that *very careful* smoking with cool smoke does not endanger the queen much more than water does. It's a dire situation, and one must not expect to save her every time by any tactics. Page 549.

### DON'T EXTRACT HONEY FROM COMBS WITH BROOD.

From the Northwestern folks I would have liked to see a little more square-up-and-down condemnation of the abominable practice of extracting honey from combs with brood in them. The general drift was against it—but we don't want to drift against cannibalism and such things if we find them still extant. Page 552.

### DO BEES MOVE EGGS?

Evidence of bees carrying eggs from one place to another is of interest (if we could get it), but to find an egg in a queen-cell above an excluder is hardly positive evidence. More likely that a laying worker did it. Laying workers are not to be expected in a super where a queen is laying below, but there *might* be an exception. When an egg is being laid in sticks automatically wherever it is touched against the cell. But to make it stick in a new place after it gets dry once—that's a rub that I guess bees never overcome. To move the minute larva after the egg hatches is easier—and the evidence is more plenty that they occasionally do it. Page 555.

### MAILING LAYING QUEENS.

I would offer this improvement on the preparation of a heavy and long laying queen for journey by mail. First make a nucleus of the frame she is found on, and keep her there for a day or two. Then put the nucleus back where it came from and cage the queen. Keep her 24 hours and then send. This will be gradual cessation of laying. It may be that sudden cessation is capable of doing some harm without any jolting. Page 565.

vested your fruit before you arose by the light of the moon.

We tried keeping a bulldog, and various other ways to save the fruit. But the dog was poisoned, and the other ways proved worthless after a trial. All at once one day my eye came upon an article about bees, in the newspaper, and being always interested in bees through being so fond of the honey, I read the article. It was on the habits of bees, and other things that to a bee-keeper are so common. But being an uninitiated one at that time the article looked so wonderful that, on thinking it over, the thought occurred to me, Why would not the bees keep away the troublesome boys? That was the beginning, in the late summer of 1903. I sent for "A B C of Bee Culture," and studied all winter, and engaged bees for the spring.

The result is we have not been bothered at all with boys since one small crowd of boys meddled with the hives by throwing apples at them and were stung. One boy tells all the rest, and they "stay off." I wonder if any one else has ever kept bees for this purpose, and if they have been as successful.

Only yesterday the boys were attempting to steal the ripe peaches from our finest tree. It is loaded with fine fruit, and away from the bees somewhat. I had a couple of empty hives, and we set those empty hives right under the peach-tree, with harmless but good results. For our own home, at least, I seemingly have solved the extremely hard *boy* problem to my satisfaction.

I have a colony under each tree of the choicest fruit, and the common fear and terror of bees makes other people (as well as boys) keep a safe distance away.

Since keeping bees the last 2 summers, and finding out some of their habits, and the ways to handle them, I often wonder why so many people are so mortally afraid of bees that they can not go into a most pleasant and profitable (after learning the ins and outs) business.

I am a young business woman, and bees and music are my only recreations. My music I study early in the morning, and my bees every evening when I get home from the office.

I also had the experience of catching a strange (the first one I ever handled alone) swarm of bees last summer. They were hanging from a limb of an oak-tree about 10 feet from the ground. I have the bees still. All the neighbors (for it is thickly settled around us) were so terrified at the swarm of bees they dared not open the screen door, and sent for the street inspector to remove them. He came and "dared not do it," and went away. For 2 days this swarm hung before I found it out. I was out in the garden when a passing teamster told me about the swarm of bees, and seeing the hives asked if they were mine. I told him they were not.

"You can get that swarm if you know how," he said.

I told him I did not want to steal even a swarm of bees.

"You need not be afraid. The whole neighborhood is scared to death, and willing to pay to have them removed."

So I went over, with the above result. I found out about the inspector after capturing the bees, and he was greatly relieved, as he "dast not," and could not, or did not care to find any one who "dast." I had lots of fun and an experience that don't come often to one who has always lived in a city.

Last year was a very poor honey-year, and this year worse yet. There were quantities of clover blossoms, but so much rain and such cold weather the bees could not work. I think I will average about 25 pounds of honey per colony, and considering the weather and my inexperience, coupled with having to transfer 3 out of 5 colonies last spring, I have done as well as I could expect for one who makes bee-keeping a secondary occupation. And I have had all kinds of good times among them, and many a good laugh, as people that knew nothing of bees made a remark or asked questions.

The American Bee Journal is a paper which is as necessary in bee-keeping as a dishpan to housekeeping. I have been on the point of bothering you several times, and I'd say to myself, "I'll wait till the Journal comes, and perhaps I can help myself out," and, sure

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Not All the Sections Needed

When Mr. York was at Marengo, July 4, he thought the whole of the 26,000 sections might be needed; not that all would be filled, for always more sections are put on than are filled. But the bees balked 2 or 3 weeks later, leaving a big lot of sections that were never put on the hives. Fuller report later.

### Outwitting Sneak-Thief Boys with Bee-Hives

DEAR MISS WILSON:—I have read so many interesting reports and experiences, and had a number of great helps through the American Bee Journal and you, that it really seems

as if you and I were acquainted. However, I scarcely think we would recognize each other on the street should we happen to meet, do you?

This time I am not going to ask any questions, but have had several experiences that I thought possibly you might like to hear.

We live in the heart of the best residence district of a city of about 105,000 people. We have the largest grounds around, with one exception, and the place has a great deal of fruit of all kinds on it, especially apples. It has been the conundrum of years to keep boys away from apple-trees in the city. Nearly every one has given up in despair, and let the boys have the apples to save the annoyance and bother of being up at 3 a. m. and keeping an uninterrupted vigil all day, only to get up the next morning and find some one has har-

enough, the very thing I'd want, and at the time I'd want it, would be in the very next paper.

I have laughed at some of my remarks in a previous letter printed in the Journal, and torn to pieces in a good-natured way by some critic, and really I am learning lots, and thank you very much. MISS MICHIGAN.

It took a woman's wit to solve the sneak-thief question. I want to congratulate you on your success. It was a very bright idea, putting those empty hives under your luscious peach-tree. I could just see those boys skulking away from the empty hives, and you enjoying the sport; but it would be hardly advisable to publish in the local papers that said hives contained nothing but emptiness!

### Honey Tooth-Paste

Four ounces of precipitated chalk, 2 ounces of powdered castile soap, 2 ounces of powdered orris root, 20 drops of oil of sassafras, 40 drops of oil of bay, sufficient honey to form into a paste.—M<sup>RS</sup>. QUI VIVE, in Chicago Record-Herald.

### Honey in the Heart of London

Over 50 pounds of comb honey of excellent quality have recently been gathered in the very heart of London. The bees belonged to a woman apiarist.—The Farmers' Review.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

### Remedy for Bee-Moth

Is there no preventive against what is known as the bee-moth? Out of 20 strong colonies we have had 4 literally ruined by this infamous pest. It appears that when the moth gets into a hive the bees give up to their fate, which very soon is entire destruction. If there is a remedy why not publish it in every bee-paper in the land? MISSOURI.

ANSWER.—Every bee-paper in the land has repeatedly published the remedy, and it may also be found in the text-books. In a word, the remedy is strong colonies and Italian blood.

It is hardly the right thing to say that the moth overcomes a colony; rather, the moth comes in to finish up the work when a colony has given up. No one ever heard of a strong colony of Italian bees with a good laying queen being overcome by the wax-moth. True, the wax-moth may get in some of its work, but the bees of such a colony will always keep the upper hand without any interference on the part of the bee-keeper. Don't allow weak colonies; don't allow queenless colonies. Even a very weak colony, however, will keep the moth at bay, if the bees be of Italian blood and have a good queen.

### The "Stinging-Bug" and Bees

I am sending you a new enemy of the honey-bees. These bugs stay right among the blossoms of sweet clover, and when a honey-bee alights on it in quest of nectar they will fasten their front feet or claws to the honey-bee's leg and about the stem of the blossom, holding the bee fast, and rob it of its nectar, as all bees have had their tongues out when I have found them dead, with one or two of these bugs holding fast to them. What are the bugs? Will they be a source of annoyance, that is, if they become very plentiful? ILLINOIS.

ANSWER.—The culprit is *Phymata erosa*, which you will find described in Cook's Manual, where Prof. Cook says: "I have received it from Maryland to Missouri on the South, and from Michigan to Minnesota on the North. The insect will lie concealed among the flowers, and upon occasion will grasp a bee, hold it off at arm's length, and suck out its blood and life. . . . It is also called the 'stinging-bug,' in reference to its habit of repelling intrusion by a painful thrust with its sharp, strong beak."

It is about  $\frac{3}{8}$  of an inch long, looking a good bit like a squash-bug on a small scale, a special characteristic being its very heavy, awkward-looking front legs, which are, however, admirably adapted to seize and hold its prey. It is not wholly bad, for it destroys caterpillars and other vegetable-feeding insects. Although known for many years, it

has never seemed to become a very important foe, which is fortunate, as it would be a hopeless task to try to conquer it.

### Queer Experience in Introducing Queens

I took the old queen from colony No. 1 Friday morning, Aug. 11, and put in a cage and queen on Saturday, the 12th. I took the old queen from colony No. 2 on Monday, the 14th, and put in a cage and queen the same evening, about 5:30. On the same day colony No. 1 swarmed out and united with colony No. 2 without much fighting. What became of queen No. 1, and why did the bees swarm out and unite with No. 2? I am sure No. 1 was dequeened, and, further, they came clear across the whole row of hives. I have introduced a great many queens, but never before had such an experience. KANSAS.

ANSWER.—Bees are queer critters, and there's no telling why they do some things. In the present case, No. 1 may have swarmed because in proper condition for swarming, for when a colony has the swarming fever the change of queens doesn't count. But why the swarm should enter No. 2 I don't know—possibly because there was some excitement there caused by the introducing. I have known cases where a swarm has issued and after some delay has entered a hive other than its own. As to what became of the queen of No. 1, it very likely went with the swarm and entered No. 2.

### Questions on Management

I have in my apiary 4 colonies of bees which have made me much trouble. I shall call them Nos. 1, 2, 3 and 4.

No. 1 had a queen that was not a good one. The bees dwindled away until the colony became very weak. The first part of August I introduced a new queen, which was accepted, but the young queen was not much better.

Colony No. 2 was queenless. I introduced a queen that was killed; later I united No. 2 with No. 1. But still No. 1 remains weak.

To No. 3, which was a strong colony, after removing the old queen, I introduced a young queen, which was killed in the cage and thrown out. I then introduced a second queen which, I believe, was accepted. The bees are very cross.

Colony No. 4, which was also queenless, was strong with eggs and brood in many cells of all stages. I thought the eggs were laid by a worker-bee. I therefore took the colony about 50 rods away from the old stand, and brushed all the bees from the combs in the grass, before introducing the young queen, but the bees did not accept the queen. The colony is medium strong, and still has some

brood, but the wax-worm took possession of it. This was one of my best colonies.

1. Why did not colony No. 1 improve after uniting with No. 2?

2. What was the reason No. 3 killed the queen first introduced? and what makes them so very cross?

3. Did I do right in uniting No. 2 with No. 1?

4. How can I save colony No. 4, or how can I improve No. 1? Should I unite, or should I put in a frame of all kinds of brood from a strong colony? PENNSYLVANIA.

ANSWERS.—1. Old age of the bees was probably the basic trouble with No. 1 at the last. Its two queens being poor, there was little addition to the strength of the colony, and the bees were dying off faster than the young bees were coming on. Colony No. 2 was added to it but No. 2 had been queenless for some time, and its bees were getting old, so that they died off in a short time, leaving the colony no stronger than before. Indeed, it is possible that some of the bees of No. 2 may have returned to some colony near its old place, so that there was little help from No. 2 even at the time of uniting. It would have helped more to build up the colony if you had given it frames of very young brood from other colonies. It does not weaken a strong colony very much to draw from it a frame of brood if that brood consists of eggs and very young larvae, for that frame can soon be replaced, and the queenless colony can just as well be taking care of brood as not.

2. The manner of introducing may have had something to do with it, but sometimes bees will kill a queen when no reason for it can be seen. Bees are freaky.

3. There was no harm in uniting two queenless colonies, and very little good, as explained in answer to Quees 1.

4. Giving young brood, as already explained, will be a help, the trouble being that at this time of the year it is not so easy to find plenty of full frames of brood. If you have two or more strong colonies with young queens, you may get one or more such frames from each; at any rate you can take the youngest brood you can find, and a week later you ought to find those frames replaced so you could make another haul. Don't understand that young brood will build up a colony faster than sealed brood, only it does not cost so much to the colony drawn on.

## Reports and Experiences

### Bees Did Well

My bees did very well this summer. I will have about a ton of nice white comb honey. I have been getting 10 and 12 $\frac{1}{2}$  cents a pound for all that I have sold. I started last spring with 20 colonies and increased to 31.

WM. MILLER.

Yakima Co., Wash., Sept. 2.

### Season of 1905—Queens

Another honey season is about closed, and while we got a fair amount of honey, the season was not an ideal one. We had an abundant bloom of fruit, dandelion, alsike and white clover, and basswood, but the weather was too cool and wet while the bulk of the bloom was out. On many days the bees could not fly, and on many fair days the bloom seemed to yield no nectar. Clover seemed to yield but little for at least 2 weeks after it came into bloom; basswood yielded nothing, and has not for several years. While I have as much honey as I had last year, the yield per colony is not nearly as much.

We had abundant rains all summer, and there still is much white, alsike and sweet clover bloom out, also plenty of heartsease, but the latter seldom yields much in this locality; but the bees are getting enough to live

on and keep up brood-rearing, and most of them are in fair shape for winter.

Swarming was not excessive. I increased from 42, spring count, to 66, but some of the increase was made artificially. I had only about 18 natural swarms.

We are often told that many queens are lost on their wedding flight, either by being caught by birds or entering the wrong hive on their return. Doubtless it is true; in fact, I have lost a few by their entering the wrong hive, having found the queens either balled or dead at the entrances of the hives, while a colony near by, having a virgin queen, was minus its queen. But from observation I am inclined to think that as many, or more, queens are lost in other ways.

Six or 7 days after swarming I usually cut off all queen-cells but one, to prevent after-swarms, but this season the weather did not always admit of doing the work soon enough, so one day, after several days of rainy, cool weather, when the work should have been done, I opened the hive of a colony that had cast a swarm 8 or 9 days previously. On the first comb I lifted I saw queen-cells torn down; on the next I found a cell from which a queen had hatched, and on the same comb a young queen as lively as a cricket, but with the merest rudiments of wings. I promptly killed her, and, fortunately, found cells not yet torn down, from which they soon had a perfect queen.

On another occasion I saw quite a commotion in front of another hive that had previously cast a swarm, and on examination I found a virgin queen with defective wings, floundering on the ground with a handful of bees with her. She had evidently started on her wedding-trip, and, not being able to fly, fell in front of the hive. In both of these instances, had I not discovered the defective queens when I did, I would later on have had queenless colonies, and probably would have concluded that the queens were caught by birds or had entered wrong hives.

At another time I cut all cells from the combs of a colony except one very fine one, and, later on, when I made an examination as to whether or not they had a laying queen, I found them queenless, and the fine, large cell still on the comb with a dead queen in it. Here, again, had the cell not been there to tell the tale, I might have said the queen was lost in mating.

Taking all these circumstances into consideration, I am inclined to think that as many, or more, queens are lost from other causes than by being caught by birds or entering wrong hives on their mating flight.

Many colonies that cast swarms and turned up queenless when too late to remedy the matter, could be saved if bee-keepers would make prompt examinations—as soon as young queens ordinarily should be laying.

A. H. SNOWBERGER.

Huntington Co., Ind., Sept. 7.

### Common Motherwort

I enclose a plant that has made its appearance in this section in small quantities. It began blooming about May 1, and has continued to do so until now. There has not been a single day, unless hard rain, that the bees have not been on it in great numbers. I am sure it is a great honey-yielder. I have asked many people if they knew anything of the plant, and have not been able to find anyone who did. It is usually found about old barns, stables, and any old, deserted houses.

L. H. SUDDITH.

Cabell Co., W. Va., Sept. 5.

[The plant is the common motherwort—Leonurus Cardiacus—and, as you suspect, is a great honey-plant.—C. L. WALTON.]

### Shaken Swarms—Swarms Deserting—Home-Made vs. Factory-Made Hives

On page 501 it speaks of giving brood to shaken swarms. In handling such swarms I found it best to put the old queens and 9-10 of the bees in a new hive, with strips of foundation for guides in the frames, one frame of brood being given if there was no honey in

the fields, but if honey was plenty in the fields the bees would generally stay without any brood being given.

On the same page it speaks of swarms deserting. I use Father Langstroth's plan: Put the bees into boxes with wire-cloth covers, and set the boxes and bees in the shade for 5 hours or more, until the swarming-fever is over, then put the bees into a cool hive.

A great deal is said about hives, and for and against the factory-made hive. After having hauled hives for 30 years, and making my own hives, I wish to say that very few men can make their own hives so that they will be as cheap or as good, or will last so well, as those made by any good, honest manufacturer—and I do not know of any dishonest ones. I make my own hives, and I think I have the best hives that I have ever seen or heard of—certainly the best for those who wish to keep only 50 colonies of bees or less, and keep them on the same stands summer and winter; the best for ease of handling, and for safety in wintering, but they cost a trifle more than ordinary hives. They are well made, but not as well as some I have seen from the factory. W. M. H. K. EAGERTY.

Republic Co., Kans., July 31.

### One of the Asters

What is the name of the flower I send? The bees work on it first-rate here in the fall, and it grows all over in old burnings. It is in full bloom now, and will last till frost comes. Is there much honey in it, or is it pollen the bees are after? V. A. GOODNOW.

Lincoln Co., Wis.

[The flower is one of the asters, and, along with the other members of the same class, it furnishes a large and excellent supply of nectar for the bees.—C. L. WALTON.]

### Poor Season—No Honey

We have had a very bad season. During clover-bloom it was very wet, then when white clover came it turned very dry, so much so that the clover was dried up entirely. Then we had the corn-tassel, but this hardly kept the bees alive. Now we have the Spanish-needle and a few late flowers. We have had no honey yet. J. K. BOYD & SON.

Boone Co., Mo., Aug. 26.

### Crop Practically a Failure

Our crop of honey from 650 colonies of bees is only 4000 pounds. No comb honey from our 3 comb yards. There is a shortage of at least 80,000 pounds of honey in this valley.

Ada Co., Ida., Sept. 9. E. F. ATWATER.

### Most Excellent Honey Crop

I have 20 colonies of bees now. I thought to write about the entire honey season, as it is nearly over with us, but I was afraid that if I gave the amount of honey or the number of sections of honey gathered by a single colony, there might be plenty that would doubt it, if it were published. So I'll only say that the honey crop here was excellent—most excellent—in every respect.

EMANUEL B. KAUFFMAN.

Lebanon Co., Pa., Sept. 6.

### He Will Be a Bee-Keeper

My father is a subscriber to the American Bee Journal, and I enjoy reading it very much. I am 10 years old.

We have 3 colonies of bees. One of them is in an observation hive. I sit with it open for hours at a time, and watch the bees. I enjoy watching them, and when I grow older I mean to have some myself.

Linn Co., Mo., Sept. 8. DAMON MURPHY.

### BEE-KEEPERS' SUPPLIES.

We are now able to quote lower prices than ever before. Highest quality guaranteed. We handle the G. B. Lewis Co's goods—Italian Bees for sale in dovetailed hives. Send for my 88-page Catalog, and leaflet for beginners. They are free.

44E1f W. J. MCCARTY, Emmetsburg, Iowa

# BEE=BOOKS

SENT POSTPAID BY

GEORGE W. YORK & CO.,

CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

Please mention Bee Journal when writing advertisers.

**Capital City Apiary!**  
**Fine Italian Queens**

Untested, after June 15, 75c; Tested, \$1.00; Breeders—the very best, \$5.00. Terms cash with order. Safe arrival and satisfaction guaranteed. **WALTER S. HOSS,** 1123 Blaine Ave., INDIANAPOLIS, IND. 27A13t Please mention the Bee Journal.

**Tennessee Queens**

Owing to the great demand for my TENNESSEE QUEENS for several seasons, and the quantity of standing orders from old customers, I decided not to advertise until my books were cleared of orders, and thus avoid disappointing customers. I am now ready to fill orders by RETURN MAIL. Breeders used: Imported dark leather-colored Italian; my selections from light imported Italian; Moore's long-tongue; golden; Carniolan (mated to Carniolan droes in distant yard, and to Italian droes); imported Caucasian (lately received, mated for the present to Carniolan and Italian droes).

PEDEVILLE, NEAR BELLINZONA,  
ITALIAN SWITZERLAND

This country is politically the Switzerland Republic, but lies geographically in Italy, and possesses the best kind of bees known. In writing mention the American Bee Journal.

**Select Tested Breeders**

Golden Yellow Breeding Queens, \$1. Every young queen from them yellow as gold. Non-swarmling, non-stingers and hustlers for honey. 8-page leaflet on Queen-Rearing free to all.

**HENRY ALLEY, Wenham, Mass.**  
Please mention Bee Journal when writing.

When planning a business or pleasure trip from Chicago to Buffalo, New York, Boston, or any Eastern point, you should investigate the satisfactory service afforded by any of the 3 Express Trains operated by the Nickel Plate Road. Colored porters are in charge of coaches, whose duties are to look after the comfort of passengers while enroute. Special attention shown ladies and children, as well as elderly people, traveling alone. No excess fare charged on any train on the Nickel Plate Road. American Club Meals, from 35 cents to \$1.00, served in Nickel Plate dining-cars. One trial will result to your satisfaction. All trains leave from La Salle Street Station, only depot in Chicago on the Elevated Railroad Loop. Call on or address John Y. Calahan, General Agent, 113 Adams St., room 298, Chicago. 34—36A4t

Please mention Bee Journal when writing advertisers.

**Special Offers Until Oct. 1, 1905**

**Standard-Bred Untested Italian... Queen, 60 cents**

2 for \$1.10, or 6 or more at one time, 50 cents each. The Weekly American Bee Journal one year (either new or renewal subscription) with one of these fine Queens—both for \$1.30. Better have one or more of the Queens. They give satisfaction. Remember, the above offers expire Oct. 1, 1905. First come first served.

**An Untested Italian Queen-Bee FREE as a Premium**

**For Sending One New Subscriber**

for the American Bee Journal for a year with \$1.00.

As has been our custom heretofore we offer to mail a fine Standard-Bred Untested Italian Queen to the person who complies with the following conditions, all of which must be strictly followed:

1. The sender of a new subscriber must have his or her own subscription paid in advance at least to the end of this year.
2. Sending your own name with \$1.00 for the Bee Journal will not entitle you to a Queen as a premium. The sender must be already a paid-in-advance subscriber as above, and the new subscriber must be a NEW subscriber; which means, further, that the new subscriber has never had the Bee Journal regularly, or at least not for a whole year previous to his name being sent in as a new one; and, also, the new subscriber must not be a member of the same family where the Bee Journal is already being taken.

We think we have made the foregoing sufficiently plain so that no error need be made. Our Premium Queens are too valuable to throw away—they must be earned in a legitimate way. They are worth working for.

## C. H. W. WEBER CINCINNATI OHIO

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

## Honey and Beeswax

**CHICAGO, Aug. 18**—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14c, while No. 1 has sold at 13@13½c. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white, 6@7c; amber, light and dark, 5@6c. Beeswax, 28c. **R. A. BURNETT & Co.**

**KANSAS CITY, Aug. 24**—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½ cents; other grades down to 4½c. Beeswax, 28c. **C. C. CLEMONS & Co.**

**CINCINNATI, O., Sept. 8**—It appears by this time, that comb honey will not be so plentiful. In some parts of the West the crop has been more or less a failure. Prices so far have not changed much yet. Fancy white comb, 13@15c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, ½c more; white clover from 7@8c. Beeswax, 26c. **C. H. W. WEBER.**

**INDIANAPOLIS, Sept. 2**—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 14@15c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c. **WALTER S. POWDER.**

**NEW YORK, Sept. 7**—New crop of comb honey is now arriving in a small way and fancy stock finds ready sale at 14@15c per pound; No. 1, at 12@13c, and amber at 11c. No buckwheat on the market as yet. Extracted in good demand, and we quote California at 6@7½c per pound, according to quality; Southern at from 55@65c per gallon; white clover at 6½@7c per pound. Beeswax steady at 29c per pound. **HILDRETH & SEGELKEN**

**TOLEDO, Aug. 18**—The market on comb honey at this writing is practically the same as last; however, honey is being offered quite freely, and this has a tendency to decline the price. On account of the heavy receipts of fruit there is no great demand for either comb or extracted at present. Fancy white clover in a retail way brings 15c; No. 1, 14c; little demand for amber.

Extracted, white clover, in barrels, 6@6½c; in cans, 7@7½c; amber in barrels, 5@5½c; in cans, 6@6½c. Beeswax, 28@30c. **GRIGGS BROS.**

**PHILADELPHIA, Sept. 9**—Some honey arriving, with prospects of a good crop all through the East; but no call for comb honey, so that prices are not as yet established. Extracted honey is arriving freely and is selling as follows: Fancy white, 7@8c; amber, 6@7c. Beeswax, 27c.

We are producers of honey and do not handle on commission. **WM. A. SELSER.**

**CINCINNATI, Sept. 7**—There is little to report since our quotation two weeks ago. The supply of both comb and extracted honey is fair, and the demand is good. We offer extracted honey as follows: Amber, in barrels and cans, at 5½@6½c, respectively. White clover at 7@8½c. Fancy white comb honey at 12@15c. Beeswax, 29 cents. **THE FRAD W. MUTH CO.**

**ALBANY, N. Y., Sept. 8**—Honey market is opening up in good shape here, with increasing demand for new crop. Comb, fancy white, 15@16 cents; good white, 14@15c; No. 2, 13@14c; buckwheat, 12½@13c. Extracted, white, 7@7½c; mixed, 6½@7c; buckwheat or dark, 6@6½c. Beeswax, 28@30c. **H. R. WRIGHT.**

**SAN FRANCISCO, Sept. 4**—White comb, 1-lb. sections, 9@10 cents; amber, 7@8c. Extracted, water-white, 4¼@5c; white, 4¼@4¾c; light amber, 3¾@4 cents; amber, 3@3½c; dark amber, 2¼@3c. Beeswax, good to choice, light, 26@27c.

The market continues very weak, but prices are being maintained as quoted. Stocks have a tendency to accumulate under normal receipts and a still further reduction in price may be necessary before the honey in first hands can be moved. Receipts are of good quality, the average being much lighter in color than usual.

# AMERICAN BEE JOURNAL

WEEKLY—\$1.00 A YEAR

Published by GEORGE W. YORK & CO., 334 Dearborn Street

45th Year

CHICAGO, ILL., SEPTEMBER 28, 1905

No. 39

Conrads' Improved Bee-Smoker.

No. 2.—Mr. Kilgore and His No. 1 Comb Honey.

No. 3.—One of Mr. Kilgore's Tiered-Up Hives.

No. 1.—Apiary of S. G. Kilgore, of Madison Co., Ohio.

Apiary of W. D. Ball, of St. Joseph Co., Ind.

(See page 678)

PUBLISHED WEEKLY BY  
**GEORGE W. YORK & COMPANY**  
 334 Dearborn Street, Chicago, Ill.

**IMPORTANT NOTICES**

**THE SUBSCRIPTION PRICE** of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

**THE WRAPPER-LABEL DATE** indicates the end of the month to which your subscription is paid. For instance, "dec05" on your label shows that it is paid to the end of December, 1904.

**SUBSCRIPTION RECEIPTS**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

**ADVERTISING RATES** will be given upon application.

**National Bee-Keepers' Association**  
 Objects of the Association

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

**Annual Membership Dues, \$1.00**  
 General Manager and Treasurer—  
 N. E. FRANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

**The Honey-Producers' League**  
 (INCORPORATED)

**OBJECTS:**

- 1. To create a larger demand for honey through advertising.
- 2. To publish facts about honey, and counteract misrepresentations of the same.

**MEMBERSHIP DUES**

- 1. Any bee-keeper may become a member by paying to the Manager an annual fee of \$1.00 for each 20 (or fraction of 20) colonies of bees (spring count) he owns or operates.
- 2. Any honey dealer, bee-supply dealer, bee-supply manufacturer, bee-paper publisher, or any other firm or individual, may become a member on the annual payment of a fee of \$10, increased by one-fifth of one (1) percent of his or its capital used in the allied interests of bee-keeping.

GEORGE W YORK, Manager,  
 334 Dearborn St., CHICAGO, ILL.

**Italian Queen-Bee Free as a Premium**

To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us ONE NEW subscription with \$1.00 for the Bee Journal a year. Now is the time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

**IN THE HEART OF MICHIGAN**

Within a hundred miles of me are over 3/4 of the bee-keepers of Michigan. I am on the Pere Marquette R.R., which completely covers this region. Root's Goods, Factory Prices, Prompt Service, Low Freight. Send for Catalog.

# WINTER IS COMING

Are Your Bees In Good Condition ?

Outdoor Wintering is the Safest for the Majority of Bee-Keepers

**Dovetailed Chaff Hive**

This is one of the very best hives we sell; and for wintering bees, or for the production of comb honey, we do not know of anything better.

A good many suppose that double-walled hives are useful only for winter; but in localities subject to cool nights and a very hot burning sun during the middle of the day, they are none too warm for comb honey. Some of the best bee-keepers of the country are beginning to learn that such a hive, having well-protected supers, produces not only more, but a better-filled comb honey. Our dovetailed chaff has 2 inches between the walls, and when packed with chaff, sawdust, planer-shavings, or any loose material, makes a very warm brood-nest. The water-table, or picture-frame-like rim, covering the inner and outer walls, permits the use of the same supers that are used in the single-walled hives. When these supers are put on this hive and then covered with its warm, telescopic cover, the bees are in position to store comb honey as they can not do in supers not so protected.

**Dovetailed Winter Case**

There are those who, having single-walled hives desire something which, at a slight additional expense, will convert their hives into double-walled abodes for bees during the winter. Again, some others who winter in-doors wish something cheap and serviceable in the way of a protection to put over the hives after they are set out in the spring. To supply such we are prepared to furnish an outside case having the same cover and the same outside shell as go with the chaff hive described here. These are set over the 8-frame hive, and the opening at the bottom of the case (that is, the space between the hive inside and the case) is stopped up with the padded sticks. Packing material is poured in the space, after which a cushion or tray is put on top of the frames, and the cover set over the whole. This arrangement as a whole has given the best of results.

These are large enough to go over 10-frame Dovetailed and Simplicity hives, allowing only 3/8-inch space on each side.

See prices of both 8 and 10 frame sizes in bottom line of table below.

**Table of Prices of Dovetailed Chaff Hives**

## Editorial Notes and Comments

### Why Do the Bees Get No Honey?

An experienced bee-keeper wrote thus to a honey-dealer:

"Why did I not get a crop of honey? I don't know; it was not too wet nor too dry; all I know is that I don't know."

The dealer sent the card to Dr. Miller, presumably for reply. Dr. Miller has forwarded the card to this office without even the formality of saying, "I don't know;" and from the date of the card he must have held it a sufficient time to do some wrestling over the question.

Why is it that there are times when plenty of bloom is in sight, rain falls seasonably, and all conditions point to a big harvest, and yet the harvest is lacking? This year, in northern Illinois, white clover was abundant, at least in parts; the bees did good work on it up to the latter part of July, and then the flow seemed to cease rather abruptly, although clover continued to bloom as abundantly as before, and the weather was all that could be desired. Why was the nectar lacking?

If any one has the right answer to the question, he will confer a favor by forwarding it without delay to this office.

### Black Bees Championed

According to D. M. M., in the British Bee Journal, black bees excel in 17 specific points, some of which are: They begin brood-rearing earlier than foreign races, and keep it up later; take more readily to supers, and stay in them later; produce more heat than a like number of other races; can breed early with a smaller force of bees; store surplus with a smaller force; send more foragers abroad out of every thousand bees.

D. M. M. is a prominent writer of good reputation, and it would be interesting to know whether others have come to the same conclusions, or whether Scotch prejudice may have something to do in the case. One statement may at least be questioned:

"A large proportion of Canadian bees, as well as those of a great part of the United

States, are blacks, or have black blood in their veins, while many large apiarists even there claim still that they are the best bees."

Can any one give the names of five large apiarists in the United States who claim that blacks are best? Can any one give the name of one such?

### National Convention Program

We have received the following from the Secretary:

#### PROGRAM FOR THE NATIONAL CONVENTION.

The National Bee-Keepers' Association will hold its annual convention at the Revere House, corner of Clark and Michigan streets, in Chicago, during the Fat Stock Show, when exceedingly low rates may be secured on the railroads. The dates for the meeting are Dec. 5, 6 and 7. Rates at the hotel are 75 cents for a room alone, or 50 cents each, where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants. The program is as follows:

#### FIRST DAY—TUESDAY.

##### EVENING SESSION—7:30 P.M.

Wax-Rendering Methods and their Faults—O. L. Hershiser, Buffalo, N. Y.

Can the Tariff on Comb Honey be Tinkered to the Advantage of the United States Bee-keeper?—Hildreth & Segelken, New York.

#### SECOND DAY—WEDNESDAY.

##### MORNING SESSION—9:30 A.M.

How Many Bees Shall a Man Keep?—E. D. Townsend, Remus, Mich.

Short Cuts in Bee-Keeping—M. A. Gill, Longmont, Colo.  
Question-Box.

##### AFTERNOON SESSION—2:00 P.M.

The Control of Increase—L. Stachelhausen, Converse, Tex.

Migratory Bee-Keeping—R. F. Holtermann, Brantford, Canada.  
Question-Box.

##### EVENING SESSION—7:30 P.M.

Contagious Diseases Among Bees and How to Distinguish Them—Dr. Wm. R. Howard, Ft. Worth, Tex.

Experimental Apiculture—Dr. E. F. Phillips, Washington, D. C.

#### THIRD DAY—THURSDAY.

##### MORNING SESSION—9:30 A.M.

The Honey-Producers' League—Can it Help Bee-keepers?—R. L. Taylor, Lapeer, Mich.

The Business End of Bee-Keeping—N. E. France, Platteville, Wis.  
Question-Box.

##### AFTERNOON SESSION—2:00 P.M.

In What Way Can Bee-keepers Secure their Supplies at Lower Prices?—W. H. Putnam, River Falls, Wis.

How the Producer and Dealer May Advance their Mutual Interests—Fred W. Muth, Cincinnati, Ohio.  
Question-Box.

##### EVENING SESSION—7:30 P.M.

What Have We to Hope for from the Non-Swarming Hive?—L. A. Aspinwall, Jackson, Mich.

Poultry Keeping for the Bee-keeper—Emerson T. Abbott, St. Joseph, Mo.  
W. Z. HUTCHINSON, Sec.

It is none too early for bee-keepers to begin to prepare now for attending the National convention the first week in December.

### Profits of Sugar-Feeding?

The following paragraph appears in the American Bee-keeper:

In reviewing the report of the last meeting of the National Bee-keepers' Association, attention was arrested by comments on the feeding of sugar for producing honey. Some earnest men in their efforts to show that the possibilities were overdrawn compared with the prices of sugar and of honey, saying that with sugar at 6 cents and honey at 5 cents obviously there could be no profit to induce the practice. In their zeal they quite overlooked the fact that the 6 cents' worth of sugar makes 3 pounds of feeding syrup and 2 pounds when stored and thickened. Sixty-six percent gross profit is quite a temptation to a good many men, and when a 3-cent-per-pound stored syrup can be sold for 15 cents, there is temptation enough to warrant a lot of strong preaching against the feeding of any syrup for any purpose except prevention of absolute starvation.

The fight against the feeding of sugar for any purpose except prevention of absolute starvation is a commendable one. And if "a 3-cent-per-pound stored syrup can be sold for 15 cents" (would there not in that case be 400 percent gross profit instead of 66?), there is certainly warrant for strong preaching, and perhaps something besides preaching, to discourage any such practice.

But is not the picture of what can be done

with a pound of sugar somewhat overdrawn? Is it a "fact" that a pound of sugar makes 3 pounds of feeding syrup and 2 pounds when stored and thickened? It is only of late years that it is advised to use sugar and water equal parts for feeding, and then only when the feeding is done early. Does any one ever feed two parts water to one of sugar? For late feeding, so that the syrup shall be something like the consistency of honey, Root's "A B C of Bee Culture" gives a gallon of water to 20 pounds of sugar. Counting 8 pounds to the gallon of water, that would make 28 pounds of syrup from 20 pounds of sugar. So instead of a pound of sugar making 2 pounds of stored syrup, as claimed, making an increase of 100 percent, the increase would be only 40 percent—quite a different thing. But in actual practice it would fall much below 40 percent. For in the act of storing, a goodly portion is consumed by the bees for their own sustenance, and a notable portion for making

the wax; for of course only comb honey can be under consideration at 15 cents a pound. Indeed, the difference between the amount fed and the amount of the finished product, whether extracted honey be used to feed for section honey, or whether sugar syrup be used to fill combs for feeding, according to reports made, seems to be greater than can well be accounted for. Some of the feed seems to go, without one's knowing where it goes.

This is not said with any intention to encourage or to excuse sugar-feeding, but rather to show any one dishonestly inclined that there is not in trying to make honey out of sugar the bonanza he might suppose.

### Ridding Hives of Ants

W. C. H. says this in the British Bee Journal:  
"I tie a little greasy cloth around each leg of the hive-stand, and have no trouble with ants."

snout, and you have a smoker possessing the features of both smokers combined in one.  
WALDO C. CONRADS.

**Not Candidates for Re-election.**—We have received the following notices, with the request that they be published in these columns:

Please say in the American Bee Journal that I am most positively not to be considered as a candidate for re-election as Director.

C. C. MILLER.  
McHenry Co., Ill., Sept. 16.

EDITOR YORK:—Won't you kindly say through the columns of the American Bee Journal that I am not a candidate for re-election to the office of Director of the National Bee-Keepers' Association? I most sincerely thank the members of that organization for the honor they have conferred upon me in the past, and wishing them every success and prosperity for the future, I do my hat and make my exit. J. M. HAMBAUGH.  
San Diego Co., Calif., Sept. 13.

Both Dr. Miller and Mr. Hambaugh deserve the gratitude of bee-keepers everywhere for their many years of faithful devotion to the interests of bee-keeping, as directed through the National Association. While their loss as directors will be felt, still it is hardly fair to impose on a few good men the work of the National Association when there are others who need to be trained in the service. And those others will never be trained unless they are given the opportunity of gaining experience.

All honor to the loyal and true men who have given so freely and unselfishly of their time and wisdom for the progress and advancement of practical apiculture! And all hail to the new and eager-to-do-and-to-dare ones who are willing and able to grapple with the duties and problems that confront the industry of bee-keeping to-day!

**"The Honey-Money Stories."**—This is a 64-page-and-cover booklet, 5 $\frac{1}{4}$ x8 $\frac{1}{2}$  inches in size, printed on enameled paper, entitled, "The Honey-Money Stories." The cover has a picture of a section of comb honey, 3 $\frac{1}{2}$  inches square, the comb being in gold-bronze, which gives it a very attractive appearance. Then on the gold-bronze comb are printed these words: "From Honey to Health, and from Health to Money."

It is edited by Earl M. Pratt, and contains a variety of short, bright stories interspersed with facts and interesting items about honey and its use. The manufactured comb honey misrepresentation is contradicted in two items, each occupying a full page, but in different parts of the booklet. It has in all 31 half-tone illustrations, nearly all of them being of apiaries or apiarian scenes. It also contains 3 bee-songs, namely, "The Hum of the Bees in the Apple-Tree Bloom," "Buckwheat Cakes and Honey," and an entirely new one, called, "The Bee-Keeper's Lullaby." This last song has not been published before. The songs alone ought to be worth more than the price of the whole thing.

It is a booklet that should by placed in the hands of everybody not familiar with the food value of honey, for its main object is to interest people in honey as a daily table article. It is thought that it will be just the thing to sell on railroad passenger trains, on news stands, etc. The stories and items are all so short and helpful, and the pictures so beautiful, that it likely will be kept by any one who is so fortunate as to get a copy of it. Its postpaid price is only 25 cents, but the health-value of its contents would run up into dollars. We mail 5 copies for \$1.00, or club it with the American Bee Journal—both for \$1.10. It would be very nice for a gift to a friend. Send us a six months' new subscription for the American Bee Journal with 50 cents, and we will mail you a copy of "The Honey-Money Stories" free as a premium.

## Miscellaneous News Items

**Mr. Chas. Mondeng**, of the Mondeng Mfg. Co., Minneapolis, Minn., dropped in to see us last week. He is making a trip among some of the leading bee-supply manufacturers. He reports a fair business the past season. Mr. Mondeng is an expert machinist and inventor. He will be heard from later on.

**Apiary of W. D. Ball.**—When sending the photograph of his apiary, Mr. Ball wrote thus:

I enclose a photograph of my apiary of 13 colonies, located in a central portion of a busy city of 50,000 inhabitants. The shrubbery shown in front of the hives is mostly sweet pea vines, with a few tomato plants. The hives face west, and the shrubbery hides the hives at the lower end.

The strong sun was too much for my eyes, which accounts for the squinting look of my face.

W. D. BALL.  
St. Joseph Co., Ind.

**Apiary of S. G. Kilgore.**—When forwarding the pictures shown on the first page, Mr. Kilgore had this to say:

EDITOR YORK:—I send some kodack views, and as I am a novice in the photograph business, they are nothing extra.

No. 1 is a partial view of my apiary of 40 colonies after I had taken off about half the supers. I have been keeping bees about 15 years, and produce only comb honey. I try to keep down increase to one prime swarm to each colony, as from 40 to 50 colonies is all I am able to take care of, being a cripple with rheumatism, and have poor health. This business gives me plenty of fresh air and sunshine, and I delight to work with bees.

I sell only fancy and No. 1 comb honey, and find a ready sale for all I have, at 17 and 18 cents per pound. I stamp my name, address and telephone number on each section I sell. I have never yet produced enough to supply all my home trade. I sell from 12 to 50 pounds to each family for winter use, and let them keep it in nice, clean shipping-cases. When I call for an empty case I leave a full one in its place.

No. 2 is some of my No. 1 honey, with myself at the left with a bee-veil on. The honey is in 4 $\frac{1}{4}$ x4 $\frac{1}{4}$  plain and bee-way sections. This year's production will be 75 percent of a full crop.

No. 3 is one of my dovetailed hives with 5

supers on; also a Dibbern queen-trap. This colony gave me over 100 pounds of No. 1 comb honey, and it has a remarkably thrifty queen.

I requeen my apiary about every two years, and buy all queens from a practical breeder. I think it is cheaper to buy queens of a reliable breeder than to go to the trouble of rearing them. I clip all queens, and my way of introducing them is as follows:

I place each new queen, when it arrives, on top of the frames of the colony to which I wish to introduce it. I leave it there for two days, so the new queen will acquire the scent of the colony. At the end of two days I open the hive, when the old queen is generally found clinging to the cage, for she will always hunt up a rival queen to give battle, but the old queen and bees can not harm the new queen inside the cage. I remove the old queen, and at the same time expose the plug of candy in the cage, and then close the hive, and the job is done. I never lose a queen by this method, and it saves hunting all over the hive to find the old queen.

According to your request, I had an article of a column published in our county newspaper, in regard to so-called manufactured comb honey, and the offer of \$1000 reward. If every bee-keeper would enlighten the people with an article in his county paper there would soon be a big demand for honey, and at good prices. S. G. KILGORE.

**Conrads' Improved Bee-Smoker.**—Wald. C. Conrads, of Comal Co., Tex., writes as follows about his double-end lighting smoker:

I have noticed in the American Bee Journal (pages 571 and 619) that other bee-keepers also feel the need of a smoker that opens at both ends. I send herewith a photograph of my improved smoker. Here is what I claim for it:

It gives the advantage of filling from either end, and one can always light it from the breech, while it can be refilled from the muzzle, which brings down the fire again to the breech, so necessary to prevent the smoker from throwing out sparks. After having refilled the smoker several times from the muzzle, ashes having accumulated, all that is necessary to do is to open the breech, which will then allow the ashes to fall out, yet leaving back enough fire to refill the smoker again from the muzzle after having replaced the breech.

All that is needed is a nozzle from a Corneil smoker; remove the snout from the Vesuvius smoker so that you may put on the Corneil

### Work in the Apiary for October

BY C. P. DADANT

THE honey crop is now entirely over, and all supers on the hives should be removed. Those combs that have been run through the extractor and returned to the hives for cleaning and repair would best be taken off before the end of the month. Cool mornings, when the bees have congregated in the brood-chamber, are best for this end. In warm days we would find those supers full of bees, and there would be quite a task to remove them. But it is better to delay the removal until late in the month, as we avoid the possible development of moth-eggs among the combs that are deprived of bees during the remaining warm days of fall.

The weak colonies must be again examined. If they have been helped during September with combs of brood and honey, they will be found quite populous. But such colonies as have not succeeded in getting a sufficient surplus, or those that are queenless or too weak in bees to go well through the winter, should be united either with stronger colonies, or added to one another.

It is sometimes possible to make one good colony out of two or three poor ones; one of them furnishing combs of honey, another bees, another a good queen. But there is always more or less danger of their fighting when united, unless it is done late, and the bees smoked very thoroughly before putting them together. We have often united colonies by bringing them slowly together, moving each hive a few inches every day, so they may not lose their bearings, and then uniting them some very cool morning by transferring the combs loaded with bees from one hive to the other. It is well to remove all combs but two or three, previous to this uniting, so that the bees may all be gathered in a bunch, and those combs may be removed in one handful and inserted in the other hive.

We always aim to remove from their hives those colonies that are queenless in preference to those that have a queen. A few puffs of smoke, and perhaps a little spraying with sweet-scented water, will help them to agree, if we are careful not to overdo this. Drone-laying workers, if there are any, are usually killed by the bees of the colony that has a queen.

At this time also we remove all dry combs from the body of the hives, and examine each colony to make sure of its winter stores. Feeding may be done to supply those that are short, but the very best way of supplying winter stores is by securing heavy combs from fat colonies that have something to spare, and inserting them in hives that are likely to be short. Care must be taken to place those combs where they will be easily accessible for the cluster. A comb heavy with honey, which is placed behind two or three dry combs and away from the cluster, will be rather a detriment than a help, as outside bees may find it and discover that it is not defended. As a rule, however, it is not advisable to feed and try to winter a colony that is not strong enough to defend its door.

The entrance is, of course, reduced to suit the needs of the colony. Some apiarists seem to consider this a needless precaution, because in a state of nature the bees have the same entrance to their "gum" in hot weather as in cold weather. But the bee-business is a business of details—we can expect more from our bees under domestication than in the natural state, simply because we aid them in small things, and if we did not do more for them than Nature does, many colonies would be allowed to starve that would give us good results the following year. Nature provides for all beings in a general way, but she gives us foresight that we may provide that in which she is lacking.

Sometimes, though rarely, hives are found which are so thoroughly filled with honey in the brood-chamber that there is no room for the queen to lay or for the bees to cluster. These hives will gain by the removal of some of their heaviest combs, and the replacing of them by combs that are filled only down to about a half to one-third of their depth with honey, these combs to be inserted in the middle of the cluster.

Although the bees must have honey in easy reach, a colony will not winter well on combs that are entirely filled. A col-

ony in an ideal position has about half of each comb dry (the lower half), and the bees occupy this part. When you open a hive in the latter part of October, and the bees come to the entrance at once, but do not show at the tops of the combs, you may be sure that they are in good shape for winter. Yet there are populous colonies that cover every comb from top to bottom, and have a plentiful supply of honey. These are in exceptional circumstances. But a colony that does not occupy at least five spaces between combs may usually be considered as in danger of suffering if the winter is severe. Such colonies, if it is necessary to risk them, would better be wintered in the cellar. Nothing is done, however, towards winter-packing or cellar-wintering before November, in this latitude.

### Giant Bees of India—Stingless Bees—Wax-Moth

BY DR. E. F. PHILLIPS,

Acting in charge of Apiculture, Washington, D. C.

I HAVE read with interest the article by Prof. A. J. Cook, on page 631, on "Importation of Bees by Our Government." I quite agree with Prof. Cook in most that he says, but there are one or two things that I would like to correct.

In the first place, the scientific name of the giant bee of India is *Megapis dorsata*, and not *Macroapis*. The two words mean the same thing, but it is necessary to use the correct one. Since there is now considerable interest in this genus of bees, due to the fact that the Bureau of Entomology is trying to import them I thought that you would be glad to have your attention called to this error.

In the fourth paragraph of the same article the generic name of our common bee is given as *Aphis*. This should, of course, be *Apis*, and it is evidently but a misprint. Some of your readers might wonder how a cross between stingless bees and plant-lice would help them.

#### STINGLESS BEES OF SOUTH AMERICA.

I may also be pardoned if I say that the Department of Agriculture is not expecting to try to import the stingless bees of South America. In a very delightful talk which I had with Prof. Cook, I told him that there was a movement on foot on the part of some private individuals to get these bees, and evidently I did not make myself clear. I would be glad to see these bees tried in this country, for we can not try too many things for the good of apiculture, but I think I am safe in saying that the Department of Agriculture will not be the one to do this.

The Department Apiary, concerning which Prof. Cook writes so kindly, is always open for inspection, and it will be a pleasure for any of the force to show any of the readers of the American Bee Journal what we have here.

#### THE LESSER WAX MOTH.

It has come to my notice that the lesser wax-moth—*Achroia grisella*—has been found in this country, and I am anxious to learn how widely it is distributed. I will appreciate it very much if any of the readers of the American Bee Journal who have any specimens of this moth in their apiaries will notify me of that fact, and send samples of either larva or adults. I will be glad to send on request a return frank to any person wishing to mail any specimens to me, which will make it unnecessary to pay postage. In order that this moth may be distinguished from the common wax-moth—*Galleria mellonella*—I will give a brief description:

The adult moths are little more than half the size of the common moth, and with wings spread measure about  $\frac{5}{8}$  inch. The fore wings are considerably darker than the hind, and a very characteristic feature is the swiftness of movement of the insects. The tunnels are similar to those of the common moth, but smaller in diameter, and the cocoon, at the end in which the pupa is found, is considerably smaller. Wherever found in America they are due to importations, since this is a European species.

Bee-keepers need not fear this moth any more than the larger one, for it is well known that there is one sure preventive for moths, and the rule of every bee-keeper, whether troubled by moths or not, should be, "Keep all colonies strong." This will of course not keep the moths away from stored combs.

There is an excellent illustration of both bee-moths in the "A B C of Bee Culture," page 54, but the name is misspelled in the text.  
Washington, D. C.

## Cleaning Up Unfinished Sections, Etc.

BY EDWIN BEVINS

THAT colony of strenuous bees I wrote about early in the season had completed about 120 sections of honey at the end of our short white honey-flow. At that time I removed all supers from the hive except the one next the brood-chamber. This had a few partly-filled sections in it. And thereby hangs a tale, or tail. Take your choice. The tale (or tail) is as follows:

When, a few days ago, I wanted some sections of sealed honey to fill up the last case needed to fill up a crate for shipment, I went to this super and thought I saw enough sealed sections to fill the case. I put a Porter bee-escape under and waited awhile for the bees to get out. When I went again the bees were not out, but the honey was. The bees had found a hole in one rear upper corner large enough for the passage of one or two bees at a time, and they had traveled out and in, and in and out, till they had put about all of the honey below. My first thought was that I must be one of the fool bee-keepers which Dr. Miller had occasion to mention not long ago. But there had been no robbing of the super by bees that did not belong to the hive.

I had in the honey-house a large number of supers filled with unfinished sections in all stages of development. I filled a super with the sections nearest completion, and put it on the hive with nothing between it and the brood-frames. Then I filled the robbed-out super with sections less complete, and put it on above the bee-escape, the passage to which was closed. A solid piece of board would have been just as good. Then the bees went on with their robbing. The work goes on so quietly that the other bees in the yard are not attracted. I get one, and sometimes two, supers cleaned out every 24 hours. I have added supers of sections below the escape till now there are three. The brood-chamber was, of course, filled in the early stages of the work, and the honey must now of necessity go into the supers.

Whether the sealing of the honey below the escape will come up to expectations I can not at present say, but as a means of getting unfinished sections cleaned out for future use, the experiment is a howling success. This one colony has cleaned out 12 or 15 supers full already.

Now don't all jump at once. If you do, somebody will get his foot in it. The situation with me was like this:

At the time when the early honey-flow came to a premature end I had three supers on most of the hives run for comb honey. Then I went to work and reduced the number to one super on each hive. I left this one for the comfort of the bees, and for them to fill with the fall flow. But I had a large number of incomplete sections on hand, which I knew I could not get completed this season. They were very much in the way. Attempts at robbing were frequent. I dared not put them out when the weather was so warm, and the dearth of honey in the flowers so great that the bees would not leave the hives. Then a short time ago there was a sudden change. The bees began to go freely to the fields, and gave but little attention to things around home. This change has afforded me an opportunity to dispose of my unfinished sections in the way indicated.

The foregoing is a sample of what the comb-honey producer is frequently called upon to do. At the prices which have prevailed for quite a while the work necessary to make a salable product has been done at a loss. I have long had a suspicion that bee-keepers generally are barking up a tree that has a very small-sized 'coon hidden in its foliage. But, notwithstanding the unremunerativeness of his pursuit, the pursuit is not likely to be abandoned. Bee-keeping is a part of the world's work, and somebody will be doing it. Those who are in can not lightly get out—and there will be recruits. When one's thoughts get to roaring seaward, the work of his hands will inevitably take the direction of the bee, just as, when the thoughts of Tennyson got to "roaring seaward," his footsteps took the direction of the sea.

There will, most likely, be some comb honey found in the markets when most of us are dead; but many of us in the meantime will not realize much more for the work of producing it beyond the satisfaction of contemplating the beauty and perfection of the product. I think that Mr. Heddon's idea is quite correct, that more persons have been beguiled into the pursuit than is for the welfare of the pursuit. I thought when writing the next above sentence that I would underscore the word "beguiled," but will leave that for the reader to do or not, as suits him. Decatur Co., Iowa.

Why Not send in some new subscriptions for the American Bee Journal? Samples free for the asking.

## Convention Proceedings

### Report of the Chicago-Northwestern Bee-keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 665.)

REPORT OF THE INSPECTOR OF APIARIES.

Mr. Hutchinson—In all my experience with foul brood I have never cut the combs out, as you speak of. I either shake them on starters or full sheets of foundation, and I never had another case of foul brood come on. In other words, I haven't found it necessary to make that second shake.

Mr. Smith—That is according to the rules that are laid down by Mr. McEvoy. My experience has been the same as Mr. Hutchinson's.

Mr. Hutchinson—I wouldn't like to say it was never necessary, but I say in my experience I have not found it necessary.

Mr. Smith—I have not found any to develop the second time, unless it was taken from other infected colonies.

Mr. Kimmey—From your experience with infected brood, is it your opinion that you would find after the first transfer that that colony would be saved, whatever way it was treated?

Mr. Smith—Oh, yes, where it is done in the early part of the season; and it depends a good deal on the fall flow; but a great many of them have done well.

Mr. Kimmey—Would there be much loss in the first two weeks?

Mr. Smith—I believe you can gain by making the change and putting them on full sheets of foundation because the bees draw it out and you have a full sheet of workers and the queen will fill those new combs. They are not clogged with honey or pollen; and I have had a great many swarm within four weeks after being transferred.

Mr. Wheeler—I think there would be a great loss there right along this line. You people ought to be pretty careful when you go to work. We bee-keepers who are interested financially, and have all our money in the business, do not want to have the inspector come along that is careless in regard to our financial welfare, as well as the bees. Now if it is not absolutely necessary to allow those bees two weeks' time before you cut out the combs, we don't want to have to do it. In regard to this man asking if that colony is of any value, it certainly is of value. The colonies in the spring may show a little of that disease, and they want shaking out and may gather hundreds of pounds of comb honey in that season. And right there is where you people ought to be a little careful. We ought to have scientific investigation; we ought to have some definite knowledge to go by, and not be haphazard about it, and have a man come along and say two or three days or two weeks, it doesn't matter. We must understand what we are doing. It is a matter of thousands of dollars of importance to us.

Mr. Smith—I said two weeks. I said that is as long a period as I have known parties to let their bees remain and change them. But about four days is what I tell them. Leave those in till they have exhausted the honey, about four days, and then change them back onto other frames or foundation.

Mr. Wilcox—Wouldn't it be better to put them on empty frames than foundation?

Mr. Smith—I do, as a rule, but a great many men have starters of foundation in their frames, and they don't want to take the starters out.

Mr. Whitney—You said you found foul brood in this region along the west part of the State, and along the Indiana line. Do you conclude from that that foul brood is prevalent along water courses, or in damp, low locations, rather than dry?

Mr. Smith—I can't say as to that.

Mr. Whitney—It seems to me that it would be an index if you found it in that locality and not in the dry ones.

Mr. Smith—I found some counties along the Illinois

River from Peoria south until we get down to Pike county, where I have not heard of any foul brood. When you get down to Pike county there seems to be considerable of it.

Mr. Dadant—I think I have an answer to that question, whether foul brood will be produced in damp places. Colorado is about as dry a State as there is, and, I believe there is more foul brood to the thousand colonies there than there is in Illinois. California is a very dry State, and they have considerable foul brood. I think a great many colonies has more to do with foul brood than temperature or moisture. We find when things are congregated in large numbers there is more chance of disease; that cities have more disease than farms. In the production of crops a small vineyard will have very little of the black rot, but put them together and it will start somewhere and spread through the vineyard; and I believe you will find the same thing where large vineyards are, and where a number of bees are kept together. I believe that is the main secret of all the diseases. I would like to add with regard to foul brood, it is very difficult to say some things positively in regard to the treatment, as I believe there are different degrees of foul brood, as there are different diseases of the throat. Some foul brood is more malignant than others. Therefore you need more care, in which case the inspector has to judge as to how much care he should use. In regard to beeswax, I have never had foul brood at home. We have bees in the apiary where we have our comb foundation making. We get beeswax from all parts of the Union and foreign countries; our bees have access to the beeswax before it is melted. We find it difficult when we take in materials to have very close-fitting doors, so they are opened most of the time in the summer, and we have the bees in there a good part of the time; we have never had any foul brood from it. Therefore I conclude it is impossible for beeswax to give foul brood, and the reason is this: When beeswax is melted it soaks into whatever it touches. If you dip your finger in hot beeswax you find it very difficult to work it out, although the moisture in the body would be apt to throw it out. Take one of those foul-brood germs and soak it in beeswax, and you deaden it and render it absolutely harmless, and it surely could not reproduce itself.

Mr. Reynolds—Mr. Smith states that a swarm hived on foundation with a young queen is not as likely to have foul brood as the swarm shaken from a colony would be. Would it not answer the purpose, instead of keeping those bees so long on foundation, to catch the queen and prevent her from laying, as Mr. Smith says, and close the entrance for four days and they would consume the honey, no matter what the honey-flow would be?

Mr. Smith—That would be a very good idea, I think, to catch the old queen to keep her from laying. It takes a brood or an egg to develop, I think it is nine days until it comes into a fully-developed pupa—as we call it when it fills the cell ready to cap; that is the time that foul brood attacks the larva; and after the bees cap it, then it goes into the nymph state. I have never yet found any bees in that stage of growth or development that were affected with foul brood. It seems that the tissue of it gets so tough that the spores do not enter it.

Mr. Moore—One gentleman has raised the question as to the great damage that is likely to be done to a bee-keeper by the inspector. I want to ask these people who have had experience in this matter, what is the probable profit from a colony of bees that has foul brood during the season, supposing they are run for honey? Never mind the question of getting rid of the disease, but what profit will you have from those diseased colonies through the season? And what is the damage to the honey crop by the legitimate treatment?

Mr. Root—If I might answer that question, from my own experience I would say, generally speaking, there would be no profit. If the colony could hold its own, if I allowed the disease to run and didn't do anything with it, it would be not a case of profit, but a case of profit and loss, with particular emphasis on the word "loss," with the chance of infecting the other colonies.

Mr. Reynolds—Some inspectors might be a little more partial with some than others. There is a point there to look at.

Mr. Snell—I would like to ask Mr. Smith if he has found any foul brood in the northwestern part of the State?

Mr. Smith—Yes, sir; in Whiteside county there is a good deal of it.

Mr. Wilcox—I want to get this clear to my own mind. I have never found foul brood in my apiary, and I hope I

never will. I understand from all I have read of it that the disease is transmitted only through honey. Is that correct?

Mr. Dadant—I believe that is a mistake. Cheshire described foul brood as *Bacillus alvei*, and he found it even in the body of the queens. Now, of course, I couldn't answer for what Cheshire said, but he is one of the best authors on bee-culture. Cheshire was a scientific man, but he was not practical; he was not a man who produced honey. He found germs of foul brood in all parts of the hive. In cases where you cure it so readily I don't believe you have the true, dangerous foul brood. Therefore I think we should be very particular. I don't think we can go any too far. Where you cure it by simply transferring the bees, that is well. I don't think you should expect to do it in every instance. I believe there are dangerous cases where you will have to transfer the bees and destroy the combs, over and over again. I don't believe you should stand to the statement that foul brood is only in honey.

Mr. Root—Prof. Harrison gave a paper on that in the Canadian report in which he stated he had found the *Bacillus alvei* in the ovaries of the queen, as Cheshire has said. But I wish to say, in opposition to that, I have personally introduced queens from the worst colonies we have had, into healthy ones, time and time again, and never saw the disease carried in that way. I don't mean to say it cannot be done, though. But the experience so far as I know over the country has been to the effect that queens may be taken out of these diseased colonies and put into others, and the disease was not transmitted. Why that is so I don't know, but that is the practical result of it.

Mr. Dadant—Perhaps in this matter the scientific men are deceived by some circumstances. Now, where a man dissects a queen he evidently has to kill her, and those germs of *Bacillus alvei* are very difficult to produce. It may be a colony partly infected. When he examined the queen the germs have developed since the death of the queen, or in such a way that if the queen had been alive and well she would not have had any germs. At the same time, we must be very cautious and not assert. In this disease it is better to be over-cautious than insufficiently cautious. Therefore, I believe we should be very careful. In regard to boiling, I believe it is a mistake to say it will take three hours of boiling to destroy the germs. At the same time there are men who have found germs after three hours of boiling. It may be they got those germs in a short time after the boiling, before they made the examination, and I am inclined to believe that, because I think anything that is boiled in the matter of life will die. But in such a dangerous disease we must be very careful in asserting the danger does not exist under such and such circumstances. We may say it is not probable. As Mr. Root says he has not found it, therefore I would be inclined to think he is right, but at the same time we must be very careful not to assert the disease does not exist in all parts of the hive.

Dr. Miller—Calling attention to a point that might be misunderstood in what Mr. Dadant has said, the fact that the germs of foul brood may be found in the body of the queen, does it necessarily follow that the disease will be conveyed by that? It may be there without being conveyed. But going back to the point before: Will foul brood be carried in any other way than by the honey of the hive? If the germs be carried from a diseased colony, no matter what from, the disease may be conveyed to another hive. The germs are in the brood. Isn't it possible that that might be carried, sometimes, as well as the honey? I suppose it is true that the honey is the principal medium, and the usual medium, through which the disease is conveyed, but surely it is not the only medium. If the diseased part itself of the brood be in any way carried from one colony to another, that would surely carry the disease.

Mr. Wheeler—That is a good point the Doctor makes, and one that is very important. The bees are continually taking out that dead brood. I believe when the disease first starts they keep it all clean. I believe the hive for months is perfectly free of any signs of foul brood, and yet they have it and we don't know it. They keep carrying out every bit of foul matter and finally they have to give up in despair. All this time that foul brood has been carried on the bottom-board and after a while some of it is left. Now, the question is, Is the foul matter that is carried out infectious? That is something worth inquiring into. The question is whether we had better fumigate our hives and burn them out or not. Some say yes, and some say no. It is an important question.

(Continued next week.)

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### WHEN HONEY HAD THE FIELD.

The days that never will come back—and we don't want 'em to come back. But somehow we lick our lips at them still—the days when there was no sugar, and honey had the whole field to itself. Page 566.

### EXPERIMENTS AS TO ODORS AND BEES.

L. Forestier's verification of previous experiments as applied to bees is of interest. If not quite positive evidence that recognition is by smell, it weighs in that direction very decidedly. A bee wet in dilute alcohol and allowed to enter home at once is stopped by guards. Kept till the scent of alcohol is completely evaporated, it is recognized as a fellow citizen again. As one bee might die of loneliness and worry, take a dozen if you wish to repeat this. Page 567.

### TESTS FOR PARAFFIN IN BEESWAX.

So strong, hot lye eats up beeswax and makes a soap of it; but paraffin resists and remains paraffin still. I suppose a good-sized piece of the suspected foundation should be put in—kept hot for awhile—well stirred—then cooled. Then if anything solid or semi-solid appears, warm water will tell whether it is soap or paraffin. Manifestly this will not detect the tallow or rosin sometimes used by non-manufacturing rogues. If foundation was three-quarters beeswax and one-quarter paraffin, I wonder how a slip of it would look if bathed for awhile in lye at 135 degrees. Should expect it to look different from a slip of pure foundation. Page 568.

### THE FRENCH WAX-KETTLE METHOD.

The French kettle, on page 583, may very likely be a good one; but when they back it to extract entirely all the wax from old combs they are asking us to believe rather too much. The essential operation, after all, differs but little, I should say, from that of other kettles. And possibly also the contents of a wax-kettle might be stirred properly in some more simple way than putting in the machinery of a flying machine to do it. The salt-water idea is probably very good. Just the salt, in and of itself, I don't know whether it would help or hinder the separation of wax. But it raises the boiling point of the fluid from 212 degrees to 230, and that is likely to be a decided advantage. But (there it is again!)

those who scold gently about it injuring wax to boil at 212 degrees will howl at 230.

### FINGER-NAIL TEST FOR TALLOW IN BEESWAX.

The finger-nail test for tallow in beeswax seems to be an excellent one. We never have to puzzle over the question what we did with our finger-nails when we used 'em last. Always on hand—in both senses of the term. The elasticity of the nail, and the stubbornness of pure wax combine to give a rippled appearance to the furrow we plow with a finger-nail. A smooth, unrippled furrow results when we plow in tallow wax. Page 584.

### DECLINE AND RISE OF BEE-PASTURAGE.

As to the decline of bee-pasturage, I think there is a slow movement of the flora to meet the bees half way. Once got along entirely without the honey-bee, now (in blind, groping way) recognizing the benefit of bee-visits, and preparing to pay for them. If the more desirable mints, and lupines, and veronicas are gradually exterminated, and the asters meantime gradually learn to yield honey, the net result may be in our favor. Page 587.

### GOOD AND POOR BEE-COUNTRIES.

Good bee-country, eh? And \$50 of loss at one lick from melting in shaded hives. Thermometer 115 degrees—bappy are they in poor bee-countries! Page 588.

### DIFFICULTIES IN DEFINITE DESCRIPTIONS OF BEE-RACES.

Dr. Bohrer seems to be making a reasonable demand about new races of bees—that they be described in definite terms as to general appearance. I suppose the main trouble is that the definite description of one colony fails to fit another colony whose claim to purity is just as good as the first. Worse than that, might you not describe a Caucasian colony definitely, and then somebody hunt up a pure Carniolan colony to fit the description quite well? Page 588.

### HONEY FROM BASSWOOD LEAVES.

The question about honey from basswood leaves brought out a decided negative. Only about 5 of the 29 experts ever saw bees work on basswood leaves at all; and none ever saw them get much at it. Page 598.

from one colony and given to another at any time of year, and there will be no fighting. If one weak colony is united with another, unless special precautions are taken, there will be fighting and slaughter. The fighting in the latter case will be all the worse if the uniting is done late.

With these principles in mind, the few cases of uniting that were needed among our bees were undertaken early, and they were made on the instalment plan. To-day, as it might be, a queenless colony, instead of being united as a whole with another colony, is parceled around among two or several colonies, a single frame with its bees being given to a weak colony, and two or more to one stronger. To-morrow another queenless colony will be broken up, distributed in the same manner, and as the weak colonies with good queens are thus becoming stronger each day, and thus competent to take care of larger accessions, only a few days are needed thus to distribute all the faulty colonies, and without the danger of any fighting.

### Sweet, "Hivey" Mary

Mary had a swarm of bees,  
And they, to save their lives,  
Must go wherever Mary went—  
'Cause Mary had the hives.

—Selected.

The above bright stanza was sent in by Miss Sadie A. Butts, a city bee-keeper in Cook Co., Ill., who has been very successful with her little back-yard apiary.

### A City Office-Roof Apiary

Miss Emma V. Haggerty, who will be remembered as the lady who was so successful in passing the examination for the position of care-taker of the bees of the city of New York, but failed for lack of a political pull to get the place, might do good service just now in that city, in a case mentioned as follows in a daily newspaper:

### BEE-FARM IN HEART OF BUSINESS DISTRICT.

"If one were asked what is the thing he would be least likely to find in the heart of the business center of New York and replied that it would be a bee-farm, he would consider himself absolutely safe. But on the roof of an office building in Vesey street there was discovered to-day a full-fledged apiary. Not only are many thousands of bees contentedly swarming in their unusual surroundings, but they are storing away many pounds of honey stolen from several candy factories in the vicinity. The bees' happiness, however, may be short-lived. Complaint has been made of them as a public nuisance by the proprietor of one of the candy factories."

Miss Haggerty would no doubt suggest that it would be a simple thing to screen out the bees. Indeed, were no bees within a thousand miles, the screens would be needed to keep out the flies, for New York is by no means a flyless city. Consumers of candy would no doubt prefer to eat confections that had been visited by the cleanly bees to using that which had been swarmed over by the filthy flies.

If the candy-makers have a grievance against the bee-keepers, the bee-keepers have equally a grievance against the candy-makers for exposing their sweets, especially if as poisonous as some candies are said to be.

### Comb Honey Not Machine-Made.—

We have a fair supply of the typewritten letter on this subject, which appeared in the Chicago Daily News of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Uniting Weak and Queenless Colonies

However the sentiment of the sisters might incline them to the nursing along of a weak and queenless colony in the spring, when it might be better economy to break it up, there can be little question about such things in the fall. Yet one doesn't learn in a year, nor in several years, to steel one's heart ruthlessly to break up the family ties of a colony that has been tenderly watched over, thus making just one less the number of colonies in one's apiary. But if one would be a successful bee-keeper, the lesson must be learned, first or last, that it is not the number of hives with bees in that counts, so much as the number of bees that are in the hives.

Facilities for building up and strengthening are not the same in the fall as in spring. Brood does not abound in September or Octo-

ber as it does in May or June. In early summer it is an easy thing to find in populous colonies frames of well-matured brood which will produce 5000 bees or more. Two or three such frames of brood properly taken care of will of themselves make quite a little colony. But if you have never given the matter much attention, you will be surprised to find how scarce such frames of brood are at this time of the year. A search through a hundred colonies may not reveal one, whereas in the early part of the season more than one could have been found in every hive. So if you have a queenless weakling at this time of the year, throw sentiment to the winds, steel your heart against all tender emotions, and resolutely increase the chances of a larger number of bees next spring by lessening the number of tenanted hives now.

A frame of brood, or even a frame of honey, with its adhering bees, may be taken

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.  
 Dr. Miller does not answer Questions by mail.

## Cleaning Out Partly-Filled Sections—Hive-Covers in Winter

I have a number of sections with a little honey in them that I want to use next year for bait sections. I can not very well follow your plan without my neighbors' bees getting most of the honey. Can I put the sections over the frames and let the bees clean them out, without danger of starting robbing?

2. Do you leave the hive-covers on when wintering in the cellar, or use canvas or something of that nature?  
 MINNESOTA.

ANSWERS.—1. Yes, not a bit of danger from robbing unless some crack is left so the bees can get in to the supers from the outside. The only trouble is that it is hard to get the bees to make a clean job of it. Sometimes, especially if they have plenty of stores in the brood-chamber, they seem to think the honey couldn't be in any better place than in the sections, and utterly refuse to move it. Exchanging full frames in the brood-chamber for empty ones may make them change their minds. Some say they succeed by having a burlap or other cover over the brood-frames, with one corner turned back so the bees have only a small passage; but that has not succeeded very well with me. In any case it will be well for you to allow the bees a chance at the sections off the hives, after they are mainly emptied.

2. They are carried into the cellar, covers and all, just as they were on the summer stands.

## Weight of Colony for Wintering

1. What should a 10-frame colony of bees weigh, ready for wintering?

2. If it has full frames of honey should they be placed in the center of the hive? The frames in the center are only partly full of honey.  
 NEW YORK.

ANSWERS.—That depends. The kind of hive makes a difference, some being heavier than others; covers and bottoms also differing. Find out as nearly as you can what a hive filled with empty combs weighs. Then try to have each hive with its bees and other contents weigh 40 pounds more than the empty hive and combs. Understand that doesn't mean that there will be 40 pounds of stores present, for the weight of the bees and pollen is counted in. For cellaring, 5 or 10 pounds less will do; but you're more likely to do harm by too little than by too much.

2. The bees know better than you how to arrange their stores, and you can safely leave that matter in their hands, your part being to make sure that they have not only plenty of stores, but abundant stores.

## Is It Foul Brood?

What is the matter with my bees? Soon after the white honey-flow the young brood began to turn a light brown and to die. They went in all stages of the brood until they were capped over. A few died after being capped, and would have a sunken appearance, but no greasy appearance around the small hole. Some of the brood would turn up Chinaman-shoe fashion, but would never stick to the walls of the cell. Nor could I get it to be ropy by sticking a pin or toothpick in it.

Our honey harvest has been a failure. So after I saw the brood in the fix it was, I began to feed, then the young larvae did not die, till I could see the eyes; then the bees would build out over it as though they were going to start queen-cells. They would build the

cell about  $\frac{1}{2}$  of an inch and leave it open. I sent a sample to the State bee-inspector, who pronounced it foul brood, but it will not cure by the Baldrige plan nor by the McEvoy plan, as I took one of my worst colonies, shook it out on starters, left it for 48 hours, then shook it on full sheets of foundation, and as soon as the brood got so I could see the eyes it turned brown and died.

I tried one colony with the Baldrige plan, then after it began to rear brood I shook it out on full sheets of foundation. After I began to feed the trouble decreased considerably. Whatever it is, it is general all over this locality.

How would it do to extract all the honey and feed sugar syrup with naphthol beta in it?  
 ILLINOIS.

ANSWER.—I should have more faith in the inspector's judgment than my own, for he has seen hundreds of cases to my one, and is familiar with the disease; but it might be no harm to send a sample to N. E. France, Platteville, Wis., General Manager of the National Bee-Keepers' Association, if you are a member of that organization, and if you are not, send him a dollar to make you a member.

The symptoms of the disease may not always be exactly alike, and neither is it proof that foul brood is not present because the usual treatment has not proved successful. If the trouble is general all over your locality, there is a chance for a colony to get the disease afresh, even during treatment.

It might not be a bad thing to try the syrup with naphthol beta, but in any case the disease will be at a stand-still through the winter, and it might be about as well to wait till next year and then vigorously apply the McEvoy treatment. Even if the disease is not foul brood, that same treatment is all right for those diseases that somewhat resemble foul brood.

## Queenless Colony and Drone-Killing

Will a colony of bees kill the drones in the fall if they are queenless?  
 MAINE.

ANSWER.—I think not.

## Building for Wintering Bees—Bee-Feed for Winter

1. I think of building a place to winter my bees in the coming winter, and would like to have your opinion on my idea. As I am going to put it along the side of my honey-house, I will have to make it high enough to accommodate two tiers of hives. After putting the first tier on the bottom, I will put a super on each hive filled with chaff. The next tier will set on top of these supers, and will also be supplied with supers filled with chaff. Over all of this I will put chaff, also behind and in front, but will arrange some way to keep the chaff from blocking the entrance and preventing the bees from flying. Do you think, if each 8-frame hive weighs 45 pounds, that this method will be successful?

2. I made a nucleus this summer. It is in a shallow extracting super (8-frame). If this is full of honey should it winter all right, or would it be better to put on another story and feed it full of syrup? The nucleus seems very strong and completely fills the shallow hive.

3. I made some syrup for feeding by mixing sugar with cold water, equal parts by measure. Will this be all right?  
 ONTARIO.

ANSWERS.—1. Something depends upon the weight of the hives, bottom-boards, etc. If of the same weight as mine, 50 pounds would be safer.

2. If the shallow frames are of the usual

depth, something like 6 inches, and the combs are solid with honey, there ought to be no need of further feeding. But with combs solid with honey there should be plenty of room for the bees to cluster below the bottom-bars. This you can give by putting under the hive a frame perhaps 2 inches deep.

3. That's all right for early feeding, so that the bees have plenty of time to evaporate and ripen it. But the later it grows the heavier the syrup should be; and when fed so late that bees are not expected to evaporate it, there should be about 5 pounds of sugar to each quart of water.

## Keeping Drawn Sections Over—Hiving Swarms on Full Drawn Combs or on Foundation

1. Is it possible to keep the combs built in sections this year and not filled so that they will be as good as new for use next year? If so, how? I have trouble about their turning a straw color.

2. Is it best to hive a swarm on full-drawn empty combs, or would you cut them out and put in foundation or starters when running for comb honey? I have used the full combs the past two years, and the result has been that in many cases the bees filled up the brood-nest pretty soon, and then swarmed again.  
 OHIO.

ANSWERS.—1. I've studied over your question quite a little, and am not entirely sure whether you mean the sections turn a straw color while on the hive or after you take them off. If while on the hive, then it is probably because the bees varnish them with propolis, which they do increasingly as the season advances, and the less honey they are storing the more propolis they seem to put on the sections. The remedy is to take off sections when the bees are storing nothing; even if you put them on for a later flow, and especially not to keep sections on after the last flow is over. If you mean that the combs turn straw color after you take them off the hive, then I don't know what the trouble is. I never knew change in the color of foundation or comb in sections, unless it were a slight bleaching out to a lighter color. All I do with mine is to keep them in a dry place, and I have no trouble.

Possibly I haven't understood your question aright, and if not I'll be glad to try again.

2. I think I should generally prefer the drawn combs, but I doubt about it in the case you mention. If it leads to swarming again in a short time, or even in a rather long time, and if such swarming does not take place with foundation, then I should prefer the foundation. Before swinging clear over, however, it may be worth while for you to do some experimenting. Under conditions as nearly alike as you can make them, try a number of colonies with full combs, a like number with foundation only, and to another like number give hives half filled with foundation, and tilled up 10 days or so later with full-drawn combs. By this last is meant that a 10-frame hive would receive 5 frames of foundation at the time of hiving swarm, and 10 days or so later 5 frames of combs. Then you can see which lot works best.

## Comb Honey Guarantee Circulars.

—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before nailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

Maeterlinck's "Life of the Bee."—We have a few copies of this book, price, post-paid, \$1.40; or with the American Bee Journal one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

## Reports and Experiences

### Early Honey-Flow Good

About 6 weeks ago I got an Italian queen, introduced her according to directions, and now I notice about one-half the colony is as fine a colored lot of bees as I have ever seen. In June we had a couple weeks of good honey-flow, but since that time there hasn't been any honey coming in—not enough for wintering. The light colonies will have to be fed for winter. W. H. ELLIS.  
Calhoun Co., Iowa, Sept. 18.

### Colony Killing Off Bees

A year ago I lost 8 colonies out of 10, and last winter I lost 4 colonies out of 6. I was so discouraged I wanted to give up. I have 3 now, but something is wrong with one of them. It is a strong colony, but the bees are killing about a quart of bees a day. As soon as they are dead they turn black. What can be the cause of this? Are they robbers, or is it some disease? I closed the entrance to about 2 inches, and they are working now. A swarm that issued June 18 has filled a 10x14-inch frame hive and 63 sections. How is that for a wet summer? A. A. WHITTON.  
Lycoming Co., Pa., Aug. 31.

[It may be robbers, or it may be that a weak swarm has entered and the bees of the colony are killing the intruders.

The work of that swarm of June 18 is not bad for any summer.—EDITOR.]

### Season Hard on Bee-Keepers

This has been the most injurious season to bee-keeping that I can remember. Beginning with a cold, rainy spring, and heavy rains continuing in June, July and August, with but few intervals, it was difficult for the bees to gather much surplus honey.

Last year at this time I had extracted 10,500 pounds, and now up to this date I have extracted only 3300 pounds.

Often the bees were compelled to eat instead of gathering honey, and in many instances, especially with nuclei, I was compelled to feed with comb honey from extra-strong colonies, and extracted honey in Doolittle feeders.

The last 10 days have been clear, with the exception of one shower, and the bees are beginning to store surplus honey. Two-pound sections put on June 15 are just being filled, but none are capped over. A neighbor was anxious in regard to his bees, as he found some of the larvae dying, and on examination I found it the result of starvation. He immediately resorted to feeding, and averted any further loss. O. M. BLANTON.  
Washington Co., Miss., Sept. 5.

### Honey Crop in Southern California

I saw the statement recently (in the American Bee Journal) I think, made by those who make it a business to know that the honey crop of Southern California this year would be only about 1/2. In this section that estimate will hold good, not because we did not have the honey, but because we did not have the bees to gather it.

Last year's drouth was the most disastrous to bees of any season for many years. Last spring it was my business to see every resident in a territory that would average 20 miles square, in which there were many bee-keepers. I found only 2 bee-keepers whose losses were as low as 20 percent. If I remember correctly the next lowest was about 40 percent. Most of the losses were around 75 percent, and some 90 and 95 percent. Those bee-keepers having less than 10 or 12 colonies and who allowed their bees to provide

for themselves, I did not count where all were lost.

Like a good many others, I did not begin to feed soon enough, but another time under like circumstances I think I could feed more effectively, although I saved 19 out of about 70 colonies, all healthy, but not strong.

Our season opened about 6 weeks late, and while I tried to get a few days at home each week to look after the bees, when I did all I could to control swarming, I lost 15 or 16 of the first swarms, which, at that stage, was a serious loss.

The bees did not get strong enough to do effective storing until the black sage—from which we get our nicest and best honey—was well past its best. About June 1, however, they were over their swarming fever, and I began to have bushels of bees. The way they scooped in the honey would make a man's eyes stick out. I could not always keep ahead of them in filling frames with foundation. This kept up until about the last of July on white sage, wild buckwheat, sumac, and towards the last tar-weed. This last does not make very nice honey, but it feeds the bees.

I have now 100 colonies, all in fine condition (except one through an accident). I think they have plenty of honey to carry them through until next year. Some of the later colonies I may have to even up a little, but there is plenty of honey elsewhere to do it. Besides, I have put away over 200 good, fat frames of honey to use wherever they will do me the most good. If there is any honey in the fields next year I hope to have the bees to gather it.

The bees are still gathering a little honey from the very last of wild buckwheat, a species of goldenrod and sugar-gum. I wish I had thousands of these trees where I have one now. I think they must equal your basswood, not in quality, perhaps, but in quantity. The bees keep up a perfect roar on them, and if they are close to the house you would have to be a most uncommonly sound sleeper if their noise did not arouse you before it was fairly light. Near the trees the air is filled with the odor from the blossoms, and the white blossoms are fairly black with bees, and the bloom keeping up for weeks.

Three years ago this fall the greater part of the pasture upon which I depend (several square miles 75 percent black sage, 20 percent white sage and sumac) was burned off as bare as a street, since when we have had only one really good growing year, so that the black sage, a naturally slow grower, has been more than usually slow. I have just discovered, however, that if given favorable conditions it grows quite rapidly. Black sage must be several years old before it blooms much. An abundance of rain next winter would give me considerable pasture in this burned district. A. J. BURNS.  
San Diego Co., Calif., Sept. 1.

### Poor Season for Honey

This has been a very poor season for honey in this locality. The prospects were good in early spring, but the drouth during June killed the white clover and cut the crop short. We have but very little basswood in this locality, consequently the crop does not amount to much from that source. We have had so much rain since the drouth was broken that we will get very little, if any, fall honey. We can only hope for a better crop next season. H. M. GARNER.  
Miller Co., Mo., Sept. 2.

### Two Good Seasons—Briar-Berry

We have had two very good honey-years. I had 52 colonies last year and secured 2600 pounds of honey, and this year with the same number of colonies I secured 1700 pounds.

We have had some trouble here with the bees sucking briar-berries. They come into bloom just as the gallberry bloom gives out, and the bees put the briar-berry juice around the edges of the white honey, which makes the sections look as though they were in mourning—the black juice around the white honey.

Last year was the best honey season we have ever had in this country. One trouble

with us is that we have too much rain in the honey season. S. B. SINGLETARY.  
Thomas Co., Ga., Sept. 4.

### White Clover a Failure

The white clover honey was a complete failure in this locality, and I think in Missouri—lots of bloom but no nectar. Buckwheat and Spanish-needle are in bloom, but it rains almost daily, so we will get no fall crop. My customers are after me for honey. A. E. PATTEN.  
Lawrence Co., Mo., Sept. 15.

## FOR SALE HONEY-JARS

When planning a business or pleasure trip from Chicago to Buffalo, New York, Boston, or any Eastern point, you should investigate the satisfactory service afforded by any of the 3 Express Trains operated by the Nickel Plate Road. Colored porters are in charge of coaches, whose duties are to look after the comfort of passengers while enroute. Special attention shown ladies and children, as well as elderly people, traveling alone. No excess fare charged on any train on the Nickel Plate Road. American Club Meals, from 35 cents to \$1.00, served in Nickel Plate dining-cars. One trial will result to your satisfaction. All trains leave from La Salle Street Station, only depot in Chicago on the Elevated Railroad Loop. Call on or address John Y. Calahan, General Agent, 113 Adams St., room 298, Chicago. 34-36A.t

**Tennessee Queens**

Owing to the great demand for my TENNESSEE QUEENS for several seasons, and the quantity of standing orders from old customers, I decided not to advertise until my books were cleared of orders, and thus avoid disappointing customers.

I am now ready to fill orders by **RETURN MAIL**. Breeders used: Imported dark leather-colored Italian; my selections from light imported Italian; Moore's long-tongue; golden; Carniolan (mated to Carniolan drones in distant yard, and to Italian drones); imported Caucasian (lately received, mated for the present to Carniolan and Italian drones).

**Standard-Bred Untested Italian.... Queen, 75 cents**

2 for \$1.40, or 4 or more at one time, 60 cents each for balance of season. The Weekly American Bee Journal one year (either new or renewal subscription) with one of these fine Queens—both for \$1.50 Better have one or more of these Queens. They give satisfaction. First come, first served.

**An Untested Italian Queen-Bee FREE as a Premium**

**For Sending One New Subscriber**

for the American Bee Journal for a year with \$1.00.

As has been our custom heretofore we offer to mail a fine Standard-Bred Untested Italian Queen to the person who complies with the following conditions, all of which must be strictly followed:

1. The sender of a new subscriber must have his or her own subscription **paid in advance** at least to the end of this year.

2. Sending your own name with \$1.00 for the Bee Journal will not entitle you to a Queen as a premium. The sender must be already a paid-in-advance subscriber as above, and the new subscriber must be a **NEW** subscriber; which means, further, that the new subscriber has never had the Bee Journal regularly, or at least not for a whole year previous to his name being sent in as a new one; and, also, the new subscriber must not be a member of the same family where the Bee Journal is already being taken.

We think we have made the foregoing sufficiently plain so that no error need be made. Our Premium Queens are too valuable to throw away—they must be **earned** in a legitimate way. They are worth working for.

Address all orders to

ROOT'S GOODS

AT ROOT'S FACTORY PRICES

## Honey and Beeswax

**CHICAGO, Aug. 13**—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14c, while No. 1 has sold at 13@13½c. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white, 6@7c; amber, light and dark, 5@6c. Beeswax, 28c.  
**R. A. BURNETT & Co.**

**KANSAS CITY, Aug. 24**—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½c; other grades down to 4½c. Beeswax, 28c.  
**C. C. CLEMONS & Co.**

**CINCINNATI, O., Sept. 8**—It appears by this time, that comb honey will not be so plentiful. In some parts of the West the crop has been more or less a failure. Prices so far have not changed much yet. Fancy white comb, 13@15c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, ½c more; white clover from 7@8c. Beeswax, 26c.  
**C. H. W. WEBER.**

**INDIANAPOLIS, Sept. 2**—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 14@15c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.  
**WALTER S. POWDER.**

**NEW YORK, Sept. 7**—New crop of comb honey is now arriving in a small way and fancy stock finds ready sale at 14@15c per pound; No. 1, at 12@13c, and amber at 11c. No buckwheat on the market as yet. Extracted in good demand, and we quote California at 6@7½c per pound, a c. rd. to quality; Southern at from 55@65c per gallon; white clover at 6½@7c per pound. Beeswax steady at 29c per pound.  
**HILDRETH & SEGELKEN**

**TOLEDO, Aug. 13**—The market on comb honey at this writing is practically the same as last; however, honey is being offered quite freely, and this has a tendency to decline the price. On account of the heavy receipts of fruit there is no great demand for either comb or extracted at present. Fancy white clover in retail way brings 15c; No. 1, 14c; little demand for amber.

Extracted, white clover, in barrels, 6@6½c; in cans, 7@7½c; amber in barrels, 5@5½c; in cans, 6@6½c. Beeswax, 28@30c. **GRIGGS BROS.**

**CINCINNATI, Sept. 7**—There is little to report since our quotation two weeks ago. The supply of both comb and extracted honey is fair, and the demand is good. We offer extracted honey as follows: Amber, in barrels and cans, at 5¾@6½c, respectively. White clover at 7@8½c. Fancy white comb honey at 12@15c. Beeswax, 29 cents.  
**THE FRED W. MUTH CO.**

**PHILADELPHIA, Sept. 21**—There seems to be an unusually large quantity of comb honey offered in the market at this time and prices for new goods are somewhat weak. We find small lots of bee-keepers in the vicinity offering it at almost any price, regardless of the actual value. Honey has been sold in Philadelphia at the following prices during the week: Fancy, 13@16c; No. 1, 11@14c. Extracted, amber, 5½@6½c; white clover, 6½@8c. Beeswax, firm, 28c.  
We are producers of honey and do not handle on commission. **WM. A. SELSER.**

**ALBANY, N. Y., Sept. 18**—Honey demand sharpening some as cooler weather prevails. We quote fancy white, 15 cents; A No. 1 white, 14@15c; No. 1 white, 14c; mixed, 13c. Buckwheat, extra, 13c; fair, 12@13c. Extracted, buckwheat, 6@6½c; amber, 6@6½c; white-7@7½c. Beeswax, 28@32c. **H. R. WRIGHT.**

**SAN FRANCISCO, Sept. 13**—White comb, 1-lb. sections, 9@10 cents; amber, 7 8c. Extracted, water-white, 4½@5c; white, 4½@4¾c; light amber, 3¾@4 cents; amber, 3@3¾c; dark amber, 2¾@3c. Beeswax, good to choice, light, 25@26c.  
San Francisco jobbers say that there is no material improvement in the honey market here owing to the fact that apiarists are still asking above the figure at which business can be done here. The quotations above represent the prices which San Francisco dealers are willing to pay for the various grades delivered. It is reported that Colorado will produce about ½ of the average yield of honey this year, and that Colorado buyers are already in the southern part of California buying several carloads of comb honey for shipment into the Middle West. An estimate of the yield for southern California for this year, emanating from the California National Honey Producers' Association, says that the output will approximate 175 carloads. Last year's crop was practically nothing and the prospects are for higher prices.

# WINTER IS COMING

Are Your Bees in Good Condition ?

Outdoor Wintering is the Safest for the Majority of Bee-Keepers

Dovetailed Chaff Hive

This is one of the very best hives we sell; and for wintering bees, or for the production of comb honey, we do not know of anything better.

A good many suppose that double-walled hives are useful only for winter; but in localities subject to cool nights and a very hot burning sun during the middle of the day, they are none too warm for comb honey. Some of the best bee-keepers of the country are beginning to learn that such a hive, having well-protected supers, produces not only more, but a better-filled comb honey. Our dovetailed chaff has 2 inches between the walls, and when packed with chaff, sawdust, planer-shavings, or any loose material, makes a very warm brood-nest. The water-table, or picture-frame-like rim, covering the inner and outer walls, permits the use of the same supers that are used in the single-walled hives. When these supers are put on this hive and then covered with its warm, telescopic cover, the bees are in position to store comb honey as they can not do in supers not so protected.

Dovetailed Winter Case

There are those who, having single-walled hives desire something which, at a slight additional expense, will convert their hives into double-walled abodes for bees during the winter. Again, some others who winter in-doors wish something cheap and serviceable in the way of a protection to put over the hives after they are set out in the spring. To supply such we are prepared to furnish an outside case having the same cover and the same outside shell as go with the chaff hive described here. These are set over the 8-frame hive, and the opening at the bottom of the case (that is, the space between the hive inside and the case) is stopped up with the padded sticks. Packing material is poured in the space, after which a cushion or tray is put on top of the frames, and the cover set over the whole. This arrangement as a whole has given the best of results.

These are large enough to go over 10-frame Dovetailed and Simplicity hives, allowing only 3/8-inch space on each side.

See prices of both 8 and 10 frame sizes in bottom line of table below.

Table of Prices of Dovetailed Chaff Hives	Designating Letter	EIGHT-FRAME KD IN FLAT PRICE IN LOTS OF				Weight of Ten	TEN FRAME KD IN FLAT PRICE IN LOTS OF				Weight of Ten

Vol. XLV—No. 40

## Editorial Notes and Comments

### Carloads of Convention Bee-Keepers

Had everything been clear sailing for holding the National convention of bee-keepers at San Antonio, it was our intention to endeavor to get together a carload of bee-keepers from the East and North to join here in Chicago, and go on to San Antonio. Bee-keepers all along the way could have joined the party, just as they did on that memorable trip to Los Angeles two years ago.

But since it has been definitely decided to hold the convention in Chicago instead of San Antonio, we have wondered if it would not be possible for the bee-keepers of the South to get up a carload of themselves for Chicago. Perhaps bee-keepers around Denver, and further west, could also come in a carload. Then likely those in the East could meet in Buffalo and come in a carload from there.

We do not see why there shouldn't be plenty who could help work up at least the three carloads indicated. There are a lot of bee-keepers that will want to come to Chicago. And surely the bee-keepers of Chicago and vicinity will be glad to meet them. The more the merrier. And Chicago will be big enough to take care of all who come—Dec. 5, 6 and 7, 1905.

### Comb Honey by Freight

Mr. Edwin Bevins, of Decatur Co., Iowa, sends us a letter from a commission house, in which appears this paragraph:

"We have your favor in reply to ours, and note you are shipping us a crate of honey. In the crate you use the glass is exposed, but in the crate illustrated in our circular the glass fronts are all inside, and most railroads charge from 25 to 30 percent less freight on shipments packed this way. In some of your crates that arrived lately the glass fronts were broken, and the honey in one or two sections had oozed out."

Our advice has always been to pack cases of comb honey so that the glass would be exposed. We supposed this was what the railroad companies wanted, so that their freight

men could easily see the character of the goods they were handling.

We would like to have all the honey-dealers who quote the market for the American Bee Journal write us for publication anything they may have to say on this subject. No doubt such expressions would be of mutual aid to shipper and dealer.

### Fall Contraction of Hive-Entrances

Gleanings in Bee Culture advises that in the Northern States, except where a late flow of honey is on, the entrances of all colonies should be closed down to not larger than 6 inches by  $\frac{1}{4}$  inch deep, as early as the first of September. That seems pretty close quarters, but it may be all right. If correct, a good many will have to do some more contracting. With an entrance only  $\frac{1}{4}$  inch deep there is danger of clogging by dead bees. This may be helped by a rim one or two inches deep placed under the hive, the entrance above the rim.

### Don't Feed Thin Syrup Late

If any colonies are still lacking in stores, the sooner they are attended to the better. A caution, however, is now needed that was not needed years ago. Of late it has become the fashion to recommend feeding syrup thin, as much water as sugar. The fashion is a good one provided the feeding is done early. But at this time of the year bees should not be expected to evaporate a lot of water. So to each pint or pound of water add  $2\frac{1}{2}$  pints or pounds of sugar. One advantage of early feeding is that the bees so manipulate the thin syrup that it will not granulate in the combs, and there is danger that the later fed and thicker syrup may graulate. To help in this direction, add a fifth of extracted honey. Lacking this, an even teaspoonful of tartaric acid, previously dissolved in a cup of water, may be added for each 20 pounds of sugar. At this time of year it is better to give the syrup hot.

### Paste for Labeling Tin

General Manager N. E. France has this to say on this subject:

To make labels stick to new tin cans, I first wipe the tin with a cloth wet with strong vinegar, then either of the following four kinds of good paste will stick:

1. Dextrin, 1 ounce; glucose, 1 ounce, well mixed, warm.
2. Gum arabic dissolved in water.
3. Gum tragacanth soaked 3 days in cold water.
4. Borax, 1 ounce; gum shellac, 4 ounces; boiling water, 1 quart.

Another good paste is made by mixing wheat flour in cold water, then boil.

### Reserve Combs for Feeding Bees

Pretty late to say anything more about it now; but where such a thing is yet possible it is highly advisable to have extra combs of sealed honey. They will come in handy next spring.

### Outdoor Feeding of Bees

The editor of Gleanings in Bee Culture, after some "rassling" with the outdoor-feeding problem, made a call for a "perfect outdoor feeder." Now, however, he seems to have solved the problem himself. His plan is certainly ingenious, and well worthy of trial wherever neighboring bees are not sufficiently near to divide the spoils. Here is his solution of the problem in detail:

We have overcome to a great extent the difficulty of wearing out bees experienced with the outdoor feeding. We use 60-pound cans with small holes punched in the top as before. These are now filled with syrup of the consistency of two parts of water to one of sugar. The weaker syrup has less of a tendency to make the bees scramble against each other. Then, to mitigate further the damage to the bees by reason of their struggling against each other, the 60-pound cans are elevated some 10 feet above the ground. The wire bail or handle that is in the top is unsoldered. The can is then turned upside down, and the handle is soldered to the bottom. The other end of the can is perforated with small holes, as before explained. A rope is passed over a limb of a tree, 12 feet or more above the ground. When the can is filled with the two-to-one syrup, the rope is tied to the bail (now on the bottom of the can), when the can is hauled up to the height of about 10 feet. It may take several hours for the bee to find it; but when they do they will begin in earnest.

The bees will form in bunches at the per-

forations, and drop down; but instead of dropping with a thud or a jar to the ground or in the grass, sustaining more or less of a shock, and wearing out their wings in the scramble to take wing in the grass, they catch wing *before* they actually strike the ground, and fly up again. They no more than get a little sip of syrup than down they go again, catch wing, fly up, take a sip and down again, and so on.

The under side of the tin is so smooth that there is nothing for the bees to cling to, and they can not do very much scrambling. But just the minute two or three get to tugging at the same hole, down they go. The result is, we have produced almost all the conditions of an artificial honey-flow. It takes the bees so long to get a load of syrup that they fly back and forth to the hives quietly, and without excitement.

Two 60-pound cans of dilute syrup will keep a yard of some 300 colonies during an absolute dearth of honey quiet for a couple of days, so that the hives can be opened indiscriminately, and combs exposed without any robbing. It begins to develop now that the bees that do most of the robbing represent but a very small portion of the whole yard. It is these that we keep busy by outdoor feeding. As they can not do any scrambling to any extent, there is not the

same wear and tear that we experienced in our early experiments. We fed up for winter all of our 300 colonies at the home-yard by this outdoor feeding. What is more, this syrup is ripened in Nature's way, and therefore must make an ideal winter food.

#### Adulterated Honey in Minnesota

Mr. P. J. Eckman, of Watonwan Co., Minn., sent us a clipping taken from the Farm, Stock and Home, of Minneapolis, dated Sept. 15, 1905, which gives a list of "Impure Foods," reported by Hon. E. K. Slater, Minnesota's dairy and food commissioner. In that list we find the following paragraph:

Strained Honey. "Purity" brand. E. G. Bailey Co., Detroit, Mich. Illegal. Adulterated with commercial glucose. Sold as pure honey.

If only all the States would get after the adulterations, and warn the public against them, it would be a good thing for the consumers, and also the producers of pure products. Some day we hope it will be so.

544 cases; to Europe, 1464; to Mexico, 1; to Central America, 4; to South America, 21; to Hawaii, 56; to the Pacific Islands (such as Tahiti, Suva, etc.), 5; to the Philippines, 334; to Japan, 17; to China, 95; to the Far East, 32; to Australasia, 1; to the British Possessions, 166. In all a total of 2739 cases, against some 9232 cases during the same period of 1903-04.

Of beeswax the statistics show that some 6644 pounds went to the Atlantic United States, and some 15,297 pounds to Europe; the balance of the 25,490 pounds (year's total report) being scattered between Central America and the Philippines. The figures show that during the same period of 1903-04 there were but 165 pounds shipped out of the port of San Francisco, which certainly shows an extraordinary difference.

Reports from authentic sources in Southern California lead me to believe that there will be from a third to a half crop of honey, with prospects a little better in the central portions of the State. The California National Honey-Producers' Association is advising its members to hold their crop at the following figures: White, 5 cents; light amber, 4½ cents; amber, 4 cents. One authority gives as his estimate of the honey crop of Southern California something like 125 carloads of 20 tons each; while another party, equally well thought of in the trade, and supposed to be a good judge of conditions, estimates the crop at 175 carloads. Figuring on that basis would mean a proportion of about 125,000 cans of the extracted product, and possibly 15 cars of comb honey. They say that the National Biscuit Company has made purchases aggregating 75 carloads, this concern being the largest single consumer of the product of the busy bee in the United States.

From all present indications I am warranted in believing that we will soon see materially higher prices out here for our product. We are told that Arizona's crop is almost a failure, that Colorado will have only about 60 percent of a crop, that the crop throughout the Eastern States is light, and the market well cleaned up; so it does not take so much of a guesser to figure out that an advance is a very probable result. Our honey is worth more money than we are asking for it, and we will probably wake up to the fact in a few days or weeks. "SAN FRANCISCO."

The Apiary of J. M. Butler appears by picture on the first page this week. Mr. B. wrote us as follows, Aug. 10:

I want to thank you for the valuable information I have received through the columns of the American Bee Journal. I also send a photograph of my apiary of 42 colonies, spring count, which I increased this season to 53. I notice that some have been hoisting of early swarms; my first swarm issued May 2, and I had 6 swarms before May 10. I never fed my bees anything, either. I put them out of the cellar April 1, and everything looked favorable for a big honey crop, but it failed, as it was too cold at night for the bees to do much. I secured only a few hundred pounds of honey where I should have had as many thousand pounds.

The picture was taken in fruit-bloom, and the trees the hives are under are cherry-trees; they were one solid mass of bloom.

It is myself examining a frame of brood and bees, and further back are my wife and a little boy who is making his home with us.

J. M. BUTLER.

Mr. Chas. Mondeng requests us to publish the following notice:

MINNEAPOLIS, MINN., Sept. 28, 1905.

I am now out of the Mondeng Mfg. Co., and so am no longer responsible for queen and bee orders sent to the Mondeng Mfg. Co., as they are not turned over to me. I wish that all mail orders for queens and bees, that are intended for me, would be sent to me personally (at 260 Newton Ave., North), and I will see that they are promptly taken care of.

CHAS. MONDENG.

## Miscellaneous News Items

Nominations for National Election have been made, and the ballots counted with the following result, as per notice received from the General Manager:

FOR PRESIDENT—C. P. Dadant, O. L. Hersbiser, J. U. Harris.

FOR VICE-PRESIDENT—Geo. E. Hiltod, C. P. Dadant, J. A. Green, O. L. Hersbiser, F. Moth, W. Z. Hutchinson, Dr. Miller, J. U. Harris.

FOR SECRETARY—W. Z. Hutchinson, J. A. Green, L. Scholl, E. T. Abbott.

FOR GENERAL MANAGER—N. E. France, W. Rohrig, W. H. Laws, F. Rauefuss.

FOR THREE DIRECTORS—E. Wilcox, M. H. Mendleson, M. M. Baldrige, Dr. Miller, C. A. Hatch, W. S. Poucher, E. W. Alexander, J. M. Hambaugh, E. R. Root, J. McIntyre, G. W. York, G. B. Howe.

The foregoing, then, are to be the candidates, although their nomination does not prevent any member of the National Bee-Keepers' Association from voting for some other member not included in the above list, if he so desires.

The National Program was already on the printing press last week when we received the following from the Secretary:

FRIEND YORK:—Just after M. A. Gill's paper, in the forenoon session of the second day, in the program of the National convention, add the following: "Producing Both Comb and Extracted Honey On the Same Colony"—Jas. A. Green, Grand Junction, Colo. W. Z. HUTCHINSON, Sec'y.

L'Apicoltore, the leading Italian bee-paper, published in Milan, in its September editorial mentions the passage in Italy of Mr. Frank Benton, the American Government apiarist, who visited several of the leading Italian apiarists, and presented to the Italian Association a photographic view of the National apiary at Washington. The editor of L'Apicoltore incidentally mentions the magnitude of the bee-interests in America, the reports of whose crops seem to be disbelieved by many European apiarists, so great is the

difference in methods and results between Europe and America.

In the same number is to be found a translation of the visit of the editor of the American Bee Journal to Dadant & Sons, which was published in our issue of July 20. The publisher of L'Apicoltore introduces the subject as follows:

We owe to the kindness of Signor V. Asprea the translation of the following article taken from a late number of the American Bee Journal. In presenting this to our readers we are sure to please them. The name of the great American apiarist, Charles Dadant, will bring back to their memory his many writings published in the columns of our journal, attracting the attention of Italian bee-keepers to the methods of bee culture in use across the Atlantic, and recognized by him as the most practical and profitable. They will learn with interest of his son, Camille, justly esteemed collaborator and to-day worthy continuator of the work of his illustrious father, and head of the new house. We regret to be unable to present also the photographs of the Signor Dadant and of his sons, so splendidly executed, which adorn the cover page of the American Bee Journal, but we will take the liberty to repeat to our readers, with good cause, the words of the editor of the American Bee Journal.

Our California Honey-Letter.—One of our correspondents, located in San Francisco, Calif., wrote as follows Sept. 18:

EDITOR AMERICAN BEE JOURNAL—

Our local market is quiet just at this time, but prices are extremely firm. The following prices rule here to-day: New crop, comb, per pound, 10 to 12 cents. Extracted, water-white, 6 cents; light amber, 5 to 5½ cents; dark amber, 3 to 4 cents; and Hawaiian, 2 to 2½ cents.

Fair grade of beeswax would bring 26 to 28 cents per pound.

The figures covering the exports of various commodities from the port of San Francisco during the past year are now available, and the following data culled therefrom may be of interest to the honey-trade. The figures apply only to shipments made by steam or sailing vessels leaving this port between July 1, 1904, and July 1, 1905:

To the Atlantic United States were shipped

## Contributed Special Articles

### Changing to a Larger, Full-Weight Section

BY L. V. RICKETTS

IN advocating a change from the present to a larger size section, there are many things to take into consideration. The thickness, length and height of the section should be suitable to the inside dimensions of the super. The super should be of the same length and width as the brood-chamber. The width and length of the Langstroth hive is the standard. There are many millions of dollars' worth of hives, frames, combs, etc., of this dimension. A hive of the Langstroth dimensions is perhaps as near the right size as we will ever get. I believe the Langstroth dimensions are here to stay. There is something connected with this hive that is dear to every true bee-keeper in this country. It is the name, "Langstroth."

From the above we conclude that we should use a section whose dimensions are best suited to the inside dimensions of the super in which they are to be used. Perhaps the  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{8}$ -inch bee-way section is the one in most general use at the present time. Its width and thickness are suited to the width and length of a hive of the Langstroth dimensions.

A section thinner than  $1\frac{1}{8}$  inches will require more comb foundation per pound of honey than will the  $1\frac{1}{8}$ . Therefore we conclude that as to width and thickness the  $4\frac{1}{4} \times 1\frac{1}{8}$ -inch section is the most desirable of any of the sizes.

As stated in a previous article, this section, when fairly well filled with separated honey, does not weigh more than  $14\frac{2}{3}$  ounces per section, or 22 pounds per case of 24 sections. This, I think, should be increased to 16 ounces per section, or 24 pounds, net, per case of 24 sections.

As already stated, the width and thickness of the  $4\frac{1}{4} \times 1\frac{1}{8}$  section is suited to the width and length of the Langstroth hive. Then in order to have them hold 16 ounces of honey it will be necessary to use a section taller than  $4\frac{1}{4}$  inches. We find by calculating, that if a  $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{8}$ -inch section holds only  $14\frac{2}{3}$  ounces, one of the same width and thickness should be  $4\frac{5}{8}$  inches high in order to hold 16 ounces. Therefore we conclude that a section  $4\frac{1}{4} \times 4\frac{5}{8} \times 1\frac{1}{8}$  is the best size of section. A section narrower than  $4\frac{1}{4}$  inches does not fill the length of the super as it should. If more than  $4\frac{1}{4}$  inches wide four of them will not go into a super with common section-holders. A section thinner than  $1\frac{1}{8}$  inches will not fill the width of the super as nicely as does the  $1\frac{1}{8}$ , and it will require more comb foundation per pound of honey.

The cost of changing from the square to the tall section does not amount to very much. A strip of wood  $\frac{3}{8}$ -inch thick nailed on the top or bottom of the super makes all the necessary change in the super. The end pieces of section-holders, together with separators and shipping-cases, will need to be  $\frac{3}{8}$  inch taller. I believe the manufacturers' prices for these supplies (sections included) would be no higher than for the ones now in use. By the old way we use 24 sections, 24 sheets of comb foundation, and one shipping-case in order to produce and sell 22 pounds of honey. By the new way we produce and sell 24 pounds for virtually the same expense for supplies.

By the old way the consumer pays for 2 pounds of honey that he never receives, and is disappointed. This pay usually goes to the retailer, and is so much over and above a reasonable profit. This extra pay does not benefit the producer in the least, on the contrary, it is an injury to his business. By the new way the producer sells and receives pay for 24 pounds of honey, and the consumer pays for and receives 24 pounds—both are satisfied.

In using a section  $4\frac{5}{8}$  inches tall with the bottom of the section-holder  $\frac{1}{4}$  inch thick, and a  $\frac{1}{4}$ -inch bee-space above the sections, it will require a super  $5\frac{3}{8}$  inches deep. This can be changed to the Heddon hive or shallow extracting super, by fastening  $\frac{1}{2}$ -inch strips on top with screws or nails. These strips can be removed without injury to the super. This super can be used for a separable or shallow brood-chamber, which, for those who prefer such a hive, would be convenient indeed. Then we have a live-body, section-honey super, extracting super, and chunk-honey super—all in one.

We should strive to establish, as nearly as practicable, a

standard in all our aparian fixtures, and, above all, to establish and maintain a standard weight for a case of No. 1 separated honey. This should be 24 pounds, net, including weight of sections for a case of 24 sections.

Although I have given the foregoing but little thought, I will suggest that the weight of No. 2 separated honey be not less than 21 pounds, and No. 3 not less than 18 pounds per case of 24 sections. This would be an average of 16 ounces per section for No. 1, 14 ounces for No. 2, and 12 ounces for No. 3.

Whitman Co., Wash.

### Extracted vs. Comb Honey for the Masses

BY H. A. SMITH

FROM time to time we find set forth in the different bee-papers the way in which some one has successfully disposed of his season's crop of honey. Why should this be such a perplexing problem in some localities? The miller has no trouble selling his flour, or the butcher his meat. Why, then, does honey not meet with the same demand?

I think I have found the reason, at least in this locality.

Honey is considered an expensive luxury, and I believe the little one-pound section, which is composed partly of indigestible wax and wood, to be at the bottom of the trouble.

To talk honey up to the public brings before their mind's eye a neat little square of white comb honey, which is certainly very tempting, but the cost prevents them from investing in more than a few sections. These are not the conditions which are going to get a crop of honey off our hands.

Well, then, why not alter these conditions? Produce less of those nice, tempting supposed-to-be pounds of honey, and give the people something far easier to digest, and something a great deal easier to buy, and more for their money.

Some one may suggest dropping the price of section honey to overcome the evil. We are not getting any too much for our section honey now, considering the price of sections, foundation, separators, shipping-cases, etc. We can not afford to sell it any cheaper, and if the price of materials goes up any further, the price of section honey must go up also.

We found out long ago that wax does not digest, and no doubt in many instances the supposed indigestible honey, but really the wax has prejudiced many against honey.

As I said before, when one buys a section of honey he very seldom gets the full pound, and even then a large portion is taken up by the useless wood and harmful wax. On the other hand, when buying extracted honey, one gets his full pound of honey, with no indigestible element, and for at least 5 cents a pound cheaper than comb honey.

I believe before we can educate the public to treat honey as a cheap and wholesome article of food, bee-keepers will have to leave the comb where it belongs—with the bees.

Ontario, Canada.

### Sulphur vs. Bisulphide of Carbon for Fumigating Empty Combs

BY F. GREINER

IT requires a great deal of watchfulness to summer over a lot of combs without being damaged by wax-moth. It is not the large wax-moth which is so troublesome, but the larva of a very small, silvery moth which puts in her work. There is also another dark-colored, almost shiny little larva or caterpillar; it has a fuzzy garment on, so it seems, and often molts, judging from the skins accumulating. Neither one of these pests tunnels through the combs, as the large wax-moth larva does, but lives more on the surface and in the cells, and destroys the combs, although not as rapidly as the large moth. It is taxing my vigilance to keep the upper hand of them, and the 60 sets of combs, not used this year on account of the poor season, have to be gone over every little while.

Sulphur fumes will rid us of these pests, but have to be applied from time to time during the warm season. Instead of the burning of sulphur, bisulphide of carbon has been recommended by a number of bee-keepers of late years. This liquid drug, when it evaporates, forms a gas which is detrimental to all animal life. It is also very explosive. It must be handled with great care. Our German bee-keepers warn against its use on this account. I have experimented somewhat with it, and have been successful in eradicating my fields from woodchucks, but not my combs from the moth-larva, etc. Probably I did not use enough of the stuff to kill.

Some one has recently advised using one ounce of bisulphide of carbon to every cubic foot. I have never bought this drug by the barrel; but in small quantities it has cost me 35 cents per pound bottle. At the rate of one ounce per cubic foot, I would have had to buy about six bottles, at a cost of about \$2.00, to fumigate once. Ten cents' worth of sulphur made a sure thing of the job, and the risk of fire is no more than in the case of bisulphide of carbon. To use the latter is very handy, and I began to think I would use it more extensively on that account, but when I found that 1½ ounces of it was not sufficient to kill the moth-larvæ in a stack of five sets of combs, I made up my mind that sulphur was enough cheaper, and better, to pay for the extra trouble.

In reality, the trouble with the sulphur is not so very great, either. It is not at all necessary—as Mr. Flaxer thought it was—to place the combs *over* the burning sulphur. It has always been my practice to burn the sulphur on top of the stacks of combs or comb honey. It is surprising how quickly the sulphur fumes will drop clean down to the bottom of the stack, no matter how high this is, and force themselves through all the cracks and crevices. Neither the combs nor the comb honey has to be moved. All that is necessary is to place an empty hive-body on top of a stack, and inside of this put a suitable dish with live coals of fire; upon this is thrown a handful of sulphur, when the whole is covered up tight with a hive-cover. This has been my way ever since I kept bees.

The quantity of sulphur necessary will soon be found out by practice. Two and one-half ounces is sufficient for five sets of combs—perhaps less would do. In fact, for fumigating comb honey this is too much, and would leave a green deposit on the surface of the comb as well as the wood of the section. One and one-half ounces is about what I use with 10 comb-honey supers, each of 24 sections.

The green discoloration of section honey by a too liberal use of sulphur must be avoided, as it impairs the looks of the product. Honey left on the hives till September needs no fumigating. It is the early honey removed from the hives in July which suffers, if any. This should be treated even where Italian bees predominate. It is safer. I have seen fine comb honey exhibited at Fairs with perforated cappings because this matter had not been attended to. Ontario Co., N. Y.

## Quality in Honey, then Quantity

BY GRANT STANLEY

THE production of honey of good quality is a feature of bee-keeping that requires considerable thought. In reading the various bee-papers from time to time, as well as having had personal conversations with several bee-keepers, I am about led to believe that the bee-keeper himself needs considerable educating on this subject as well as the public. If we can get bee-keepers as much interested in the matter of quality as they seem to be in quantity, we will in all probability hear less about inferior honey.

Now, while it is true that we are trying to induce, or rather educate, the public to know more about honey, endeavoring to make it a staple article rather than a mere luxury, it is equally true that we must place before the public an article even above suspicion, an article of as uniform quality as is possible to get. We must do this if we expect to create the demand our product warrants. It is certainly all wrong to try to educate the public to use an article of inferior quality.

Now let us look at the producers of any commodity, for instance. They simply exhaust every effort in the matter of quality, knowing very well that if they can place an article on the market of the highest quality, that the demand will rapidly increase, and eventually a great deal more be consumed. In exactly this manner many small undertakings have grown to very large proportions.

I am afraid that too many bee-keepers are too anxious to run the extractor, and as a result much honey is being extracted before it is sealed by the bees. Yes, and possibly some of it scarcely has been in the combs more than a few hours. The Hasty Afterthinker has recently said in these columns that, "One of the worst things in connection with our craft is the widespread disposition to stretch terms and provisoes, and extract honey in a dreadfully unfit condition." If we will exhaust our best efforts in catering to the people's wants in connection with an article of undoubted quality, I see no reason whatever that honey would not become, as it should be, a staple article of the world.

Don't forget *quality*, and you will find it will pay, and pay well.  
Lycoming Co., Pa.

## Convention Proceedings

### Report of the Chicago-Northwestern Bee-keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 681)

REPORT OF THE INSPECTOR OF APIARIES.

Mr. Abbott—This whole question hinges on how the disease gets into the animal. We lose sight of that sometimes. Take for instance some germ diseases that are communicated to human beings, such as tuberculosis in which the germ that produces that must find a lesion some place. If there is a lesion on the outside of the body in some of the glands and it lodges there it will take root and produce the disease, so that you have tuberculosis of the different organs. It is not always in the lungs. A great many people die of consumption that never had anything the matter with their lungs; that is, from tuberculosis. As I understand, the development of the germ of foul brood is only in the larva. In what way does the germ get into the larva? Does it get into it by contact and communicate itself by coming in contact with the larva, or is it taken in by the alimentary canal? There are some diseases that the human family get that are taken in by the water they drink, such as typhoid fever, and must be taken in in that way; they cannot be communicated by coming in contact with a gland, but they must come in contact with the inside of the human body somewhere along the alimentary canal, mostly in the lower bowels in typhoid fever. Now, then, if foul brood is a development in the larva, in the alimentary canal, and it can only be communicated by passing in in that way and coming in contact with certain portions of the larva, then it must be something that the larva will eat, to have the disease communicated. The larva does not eat anything but honey, or the thing that might be mixed in the honey. Now, whatever does not mix with the food of the larva cannot carry the disease, as I understand it. So that the question is, What condition of things must exist in order that this germ be in the stuff that is fed to the larva? Because the germ is harmless in honey, is harmless every place so far as the disease is concerned, except it is in the alimentary canal of the larva; and if there is not some way by which it gets in there, it is as harmless as a chunk of sand, as I understand it. It only gets in through the feed, and they only feed bees honey, and the hive may be covered with the germs and not affect it in the least.

Mr. Dadant—I think Mr. Abbott was asking me the question. I think he is very correct in that matter, and the fact is, I was about to rise to make the same suggestion, with this addition, that it is stated by authorities that formic acid, which is the constituent of the poison of the bees, is an antidote for foul brood, and that would explain why the bees never have foul brood and never suffer from it. The bee carries its necessary antidote with it. It is quite likely that the disease could only be transferred to the larva by or through the honey, or through other larvæ which, of course, would pass it to the bee, and the bee pass it back to the larva in feeding. It seems to me that is very conclusive. At the same time, if there are any germs at all in the hive, and they can be passed at all so as to be fed to the larvæ, it will promote it.

Mr. Wheeler—You know if you put a clean super on a hive of old combs and the bees go to work there, they will drag from those old combs out onto the new comb and will color them. Now isn't it possible for the bees to travel from the bottom-board around this bad brood and drop those bad spores? Such questions as that are of vital importance, and I think a little of the money that is raised ought to be used for investigation, not entirely for going around and doing this business. While I think you know all these points, some man ought to be hired and paid for his time. It is either yes or no; they either give that disease in that way or they don't, and some man ought to be able to find it out.

Mr. Swift—I think the bee-keepers will find the treatment of foul brood is something like the practice of medicine.

What was first-class practice 25 years ago is bad to-day, and it is only by experimenting and testing that we will ever get at the right thing. There is no question—I found a doctor here just the other day who told me that operations that were frequent two years ago are condemned to-day by the bulk of the profession, that is, by the advanced profession, and yet they were the popular and proper thing two years ago. It may be the same thing in regard to foul brood. Tentative work is the only thing.

Mr. Root—Mr. Abbott has struck the key-note, it seems to me, as to how foul brood is transmitted. If we take Mr. McEvoy's experience, and the experience of foul-brood inspectors, it does not seem to be transmitted by the hive except through the honey, and if this theory is correct it solves nearly all the trouble. The danger lies in shaking the combs and using them over again, because in shaking the combs you may shake the honey onto the hives.

Mr. Wilcox—I am not going to shed any light on the subject, but I wanted to finish the thought presented by Mr. Wheeler. He said we should spend some of this money for investigation. So far as I am concerned, and many others, we came here for that very purpose, to investigate. I didn't know where to go to find men better informed on the subject. I don't know how to conduct an examination or investigation that would be more satisfactory than to be at a convention with such men as we have here. If we cannot learn it from the combined wisdom of the best bee-keepers in the country, I don't know where to find it. That is the way to spend the money.

Pres. York—I think Mr. Wheeler meant that we should have scientific investigation by scientific men.

Mr. Moore—I want to take exception to Mr. Wheeler's remarks. He says we must not go ahead with this thing until we know exactly where we stand. That would apply to everything in the world. We must not try to keep bees until we know all about it. How do we learn except by starting and using the things we know? The idea that we should not try till we know all about it is all bosh. Where would our medical profession have been on that basis? Mr. Wheeler says the bees will take these germs and scatter them all around, and then those foul-brood germs will get everywhere. Dr. Howard gives the answer to that. By exposing foul-brood germs to light, air and dust they die. We know that light and air and dust are present everywhere. Ask your wife, if you don't believe it. And those foul-brood germs scattered anywhere are exposed to light and air and dust, and that is fatal to them. Some more scientific man than myself can tell you how soon. Two of our members have said that which is an insult to our intelligence, and to inspectors everywhere; they say we are going to favor certain parties; that we are going to be prejudiced; that we are not going to do right. Every man who has ever gone around inspecting bees knows that is not true. We are meeting everybody, and I tell you we are human; we want people to like us; we want to be popular, and the way to do that is to do right, and to be just, and honest, and help our brothers where we are right.

Dr. Miller—How can you favor?

Mr. Kimmey—By skipping foul brood and saying it is not foul brood.

Dr. Miller—Suppose you do skip a man, would you favor that man by doing it?

Mr. Kimmey—Of course you wouldn't.

Mr. Wheeler—I was misquoted, or misunderstood. I didn't say it was best to do nothing till we found out everything. That is a misstatement. I don't mean that. I didn't say anything of the kind. I believe all such investigations are good, but I believe there is no use going to an extreme in the matter, and doing things that are unwarranted, until we have good ground.

Mr. Reynolds—I will relate my experience in that regard. Mr. Moore came to my place last July about 20 minutes to 12, and asked how my bees were getting along, and I told him pretty fairly. He said, "Have you any trouble?" I said, "Yes, with one hive; it is marked there." He said, "Light the smoker and we will go and see it." We lit the smoker, and just then my wife put her head out of the door and said dinner was ready, so we went and had dinner. That was the end of it. A neighbor of mine acknowledges that his apiary is rotten with foul brood, but a short distance from me; he hasn't the money to clean it up. I sent Mr. Moore to somebody else whose apiary was fairly rotten with it, and he left orders there as to what was to be done. The man came to me to ask me to help him out, and I told him I

didn't like to go there amongst his bees for fear I would carry it home. Mr. Moore said to me he would be glad to put in a few days more if he only got his expenses. I told him to write to him and get his address. This man is worth over \$50,000 and would gladly pay to have it done. He wrote to Mr. Moore and the letter never came back, and Mr. Moore has never answered. I was there nine times trying to get that man to do it. His wife said to me he would be fined if he didn't have this done, by the State. After that I could do nothing. The bees are all hanging in five frames in soap-boxes to-day.

Mr. Moore—I had no appropriation for answering letters, but I paid the postage and answered every letter as far as I know. It was wholly unintentional if anybody was neglected. I answered a number of inquiries where I couldn't personally go.

Mr. Smith—I will just say for the information of Mr. Wheeler, that there is now in Washington a scientific process. Mr. France is on his way there with foul brood, and the best scientists in the United States are trying to solve that problem, and it is better than we inspectors can do, and we expect information from there that will be published in all the bee-papers.

Mr. Moore—I feel very deeply in this matter, to state that any man who goes abroad and tries to help the bee-keepers ought to go for two years to the Agricultural College at Champaign and take a regular scientific course in entomology and microscopy. That ought to be done. The question is, Who is going to pay for it? I was appointed by the chief inspector, Mr. Smith, as deputy inspector. In the pursuit of my duties I spent 33 days calling on bee-keepers within my reach. I followed a totally different scheme from my chief, Mr. Smith. He gave me no instructions as to what I should do. So I took the addresses that I had of the members of our Association, and there is something like 300, and attempted to call on everybody. It was published in the American Bee Journal, and we tried to advertise to every one that we would go and see whoever called for us within say 20 miles of Chicago. But we got no responses. I think there was one or two who wrote to me, suggesting that they would like a visit. I called in, on my own plan and out of 135 apiaries I found about 25 diseased. Now, you see, if I had attempted simply to go where there were complaints I would have had two out of 25. I found 23 diseased apiaries by dint of calling on everybody and examining the hives in the apiary that seemed to show disease or weakness.

Dr. Miller—How many of those 23 knew before you called that their bees had foul brood?

Mr. Moore—Not to exceed two or three. I would have to guess at that. They knew that the bees had not done as well as they did some time before, and they had not gotten any honey from that hive or from other hives, but that they had this awful disease that we understand as foul brood, they didn't know.

Mr. Dadant—Were they foul-broody in every case?

Mr. Moore—You understand it is a great deal easier to ask questions than answer them. I myself had about 35 colonies and lost practically the whole thing with foul brood. I had no experience with it, and it got into a dreadful state before I knew it was foul brood; and I didn't go at it in the scientific way that Mr. McEvoy and Mr. France teach, and that we all practice nowadays, and the result was I lost the whole thing. I found foul brood in quite a number of different stages in the hives. I saw foul brood, as I say, in those 25 apiaries, which would mean 75 to 100 colonies affected; and after a while one gets the idea in his head, and I am satisfied now that I know foul brood when I see it. It is not necessary to smell anything at all to find foul brood. The expression has been used that one who cannot tell foul brood in his hives when he smells it is not competent to treat the disease. I believe that is true, because you can see foul brood with your eyes a long time before you will smell it at all, a good sunlight helping you. That shows to me that the disease is much more widely distributed than any one has an idea. I believe the only way to do these things is to make a clean sweep of them. With infectious diseases we make laws to protect the public and we don't care a snap of the finger for the individual who is injured, as long as the welfare of the entire people is at stake. Some laws are made paying injured individuals for the loss of their goods, such as cattle and some other things, but as far as I know there is no law in the United States compensating any bee-keeper for the loss of his bees. Now, the reason has occurred to

me why. Under our accepted treatments—we call it the McEvoy treatment—you can save your bees in a great many cases. If you go to the Legislature and say, "We can save our bees, but there is a big loss there, and we want to pay the bee-keepers for it," they won't understand it. If you save your hives and bees they can't see where there is much loss at all; and the duty of the inspector is to help you, and give you a money value, of course, in helping you to eradicate the disease and to save your bees and hives. Consequently, they would not give any compensating clause in any law to that effect. I made a minute of every case, and I can tell you the names, number of colonies they have, and the number of hives infected, and what I said. It would take a month if I would attempt to cover that ground.

Pres. York—Did the foul-brood inspector visit all the bee-keepers in this (Cook) County?

Mr. Moore—Not by any means. In Cook County we have from 350 to 400 bee-keepers, and my total visits were 125 or 135 calls.

Mr. Wheeler—Did you do any work in helping to get rid of the disease?

Mr. Moore—I did everything that was possible. Where there was an opening I made appointments and went back on other days and helped them cure the disease. I spent in some cases half a day with individuals to see the thing was done properly. I am green alongside of these people who have made a life study of it; I feel as if I were in the A B C class. I don't want any one to get the idea that I think I am an authority on this subject, but I want to contribute my information for the general good. The people all over our State are not competent to treat it any more than they are competent to treat a case of diphtheria or typhoid fever.

Mr. Wilcox—How much is a diseased colony damaged by treatment?

Mr. Moore—Every day it is without any treatment?

Mr. Kimmey—Yes, of course.

Mr. Moore—I say it is not damaged one cent's worth.

Mr. Wilcox—How much do you have to treat those which are not diseased?

Mr. Moore—I don't like to answer these questions because it means more experience than I have had, but I give my opinion. I go to a man's apiary and he has 20 or 30 colonies. How am I to tell which is diseased? We usually go from May to September. At that time of the year the colonies are prosperous if they ever are. We walk up and down the rows of bee-hives and we talk to the owner and say, "Now, which colony has not been prosperous?" He says, "This one." We open that hive. Something is the matter with that colony; it may be queenless, it may be entirely dead, or it may be nearly dead with foul brood; and with or without smoke we open it. Almost at a glance, when you get a frame out from the middle of the brood-nest you can tell what you have got. If he suggests this or that hive we always open that. If you are not satisfied with what he suggests, say, "All right, I will look around a little." You open one, two or three hives and you have a general view of the situation. When he has 10, 20 or 30 colonies we don't attempt for a moment to go through them all.

Mr. Wilcox—You treat them all whether they are foul-broody or not?

Mr. Moore—Under our law we have no power to treat at all; we have simply to give advice. If they allow us to treat we are glad to do so.

Mr. Wilcox—What I want to find out is whether there are any damages to be paid for it?

Mr. Moore—Whether there ought to be a law giving damages to the bee-keeper? There should not, in my judgment.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Getting Unfinished Sections Cleaned Out

You will have some sections that are only partly filled. Don't think of keeping them as they are, to be filled by the bees another year. Even if only a few drops of honey are in them, they must be cleaned out thoroughly. Those few drops will granulate and affect the new honey that the bees put in. You must manage to have the bees empty out this fall—the sooner the better—every last vestige of honey. A good way is to pile up the sections where the bees can get at them, covering them up close against the entrance of the bees except a little entrance that will allow only one bee to pass at a time. If the bees have full sweep at them, they will pounce upon them in great clusters, and the combs will be torn all to pieces. Not more than 5 to 10 supers should be in a pile. The piles should be where they are sheltered from the rain, and left for some days, until the bees cease visiting them entirely.

### Honey Freckle-Cure

A good freckle cure is the following: Eight ounces of extracted honey, 2 ounces of glycerin, 2 ounces of alcohol, 6 drams of citric acid, 15 drops of the essence of ambergris—"The Woman Beautiful," in Chicago Record-Herald.

### Don't Leave Sections On the Hive

Some of the sisters who are new in the business will doubtless make the mistake of leaving sections on the hive long after the time they should be off. In the first place they are left on in the hope that the bees will do some storing in them, and then when possibly it is seen that the bees are doing no more

work, the sections are still left on with the thought that no harm will come of leaving them, and so they are left in some cases till November.

Those sections, however, are not just as well on the hive as off. When the bees stop storing in them they are likely very soon to begin carrying down honey out of them to fill up the cells left empty by the young bees hatching out. First, the unsealed cells will be emptied, and a section with a few unsealed cells looks a good deal better with those cells filled than to have them empty. If the sections are left on long enough, the bees will begin the work of uncapping.

But carrying down the honey isn't the worst of it, for the honey thus carried down will be a good thing in the brood-chamber, and the emptied sections can be used to advantage another year, provided they are properly cleaned out. The more serious matter is the glue. At the close of the honey season the bees do a land office business at gluing, and the cappings and the edges of the unsealed cells are varnished over with a thin coat of glue—sometimes a rather thick coat. If a section contains foundation that is very little drawn out, or not at all drawn out, it is sometimes so badly glued the bees will utterly refuse to use it another year.

Get those sections off.

### Objections to the Plain Sections

Whatever advantages there may be in plain sections, an experience in putting up a few cases of them has emphasized an objection not generally mentioned in print. A woman who was helping expressed it somewhat quietly by saying, "You run your finger into 'em too quick." By that she meant that great care must be taken on the delicate comb will be damaged in handling, because there is so little of the wood at the edges to protect

the comb. It would be interesting to know whether any of the rest of the sisters have found the same experience. If so, they will be likely to say that they can scrape and pack two cases of the old kind as quickly as one of the plain. The more careful handling necessary makes the work slower. Then, too, one's feelings count for something, and it's a more nervous job to handle the plain sections. One must also be just a little more careful in setting down a plain section or it will topple over—not a very serious matter with the square sections, but quite noticeable with the tall ones.

### More Lightning-Bug Talk

If any of the sisters who are doing editorial work undertake to introduce anything about bees, they will do well to submit it first to some one who has a little information in that line. Mrs. Lena Blinn Lewis edits the department "Our Young People," in the Union Gospel News, and she is no doubt an excellent woman of veracity in other things, but here's what she tells her young people about bees:

"A bee that works only at night is found in the jungles of India. It is an unusually large insect. The combs are often 6 feet long, and from 4 to 6 inches thick."

### A Pretty Girl and the Honey-Bee

It is as natural for a girl to make herself pretty as it is for a bee to gather honey. Who would stop either in so sweet an occupation?—MME. QUI VIVE, in Chicago Record-Herald.

In accord with the general rule of proceeding from the known to the unknown, it might be better to say: It is as natural for a bee to gather honey as it is for a girl to make herself pretty.

### Maeterlinck's "Life of the Bee."

We have a few copies of this book, price, post-paid, \$1.40; or with the American Bee Journal one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### APICULTURAL AND OTHER CONTRADICTIONS.

To the man who is so very indignant about apicultural contradictions I would say, people disagree about everything *except the things they don't care anything about*. How about religion; do they agree about that? How about politics; do they agree about that? If it comes to that, how about farming; do they agree about that? And editing—we have the editor who writes the whole journal himself, and the editor who never writes a line, and all grades between. Page 597.

### THE "NATIONAL BISCUIT" STORY.

Don't more than half believe that 70-carloads-of-honey story. Pounds, say 5,600,000. Would swallow up the product of 560 apiaries producing 5 tons each to fill one order. Where were the whole of us while 560 of us were being scooped? Page 597.

### LIBERATING THE QUEEN THROUGH CANDY.

Bees may gnaw through candy and get at a queen too soon. With cardboard over the candy you run heavy risks of having the queen not liberated at all. Seems to me that a thin bit of very soft woolen goods would be the right thing to put over candy. Bees would never let it alone, and it would delay them quite a bit. Page 597.

### BEE-PARALYSIS—FOUL AND PICKLED BROOD.

The long and semi-scientific article of Adrian Getaz deserves well of a critic—but flaws have it in their nature that they draw more attention than merits. Valuable fact to remember (if we could be sure of it) that the *Bacillus Gaytoni* of paralysis is smaller than the *Bacillus alvei* of foul brood. Alas, the figures on page 599 seem to have gone insane somehow or other! As given they make *Bacillus alvei* forty times as long as it is thick—amazingly thread-like—and causing us to wonder why no one ever told us that before. My previous idea of the creature is more like four times as long as it is thick. And *Bacillus Gaytoni* more than four times as thick as it is long! Too badly out of shape for belief. Science and its conclusions are good things; but they should not be swallowed whole, not even by the unscientific seeker after the facts. Science about foul brood needs more verification, and is in a badly mixed up state. It is hardly in condition to say, "That is an error," if a multitude of practical persons engaged in practical work find that adult bees appear perfectly healthy in foul-broody hives. I would suggest that Mr. Getaz give us the alleged microscopic observations without *absolute* conclusions therefrom.

I regard the Getaz experiment on a bad case of paralysis as valuable. Requeening with a young, healthy queen saved the colony for the time being, and resulted in all old, diseased bees being driven out soon after; but the new generations of bees still had some of the disease among them. The conclusion that requeening is not a sure cure, but always an improvement, seems justified. Presumably the infection is in the hive all the time, and not a day passes without many individuals contracting it. That a very subtle and pervasive infection is best fought with vapor, seems reasonable; and we may take at least with decided interest the conclusion that the vapor of camphor is the best thing we have at present. Curious that bees make such haste to propolize camphor, and cover it up inside of 24 hours. (Hardly do that if they couldn't smell it.) The propolizing difficulty ought not to be very hard to overcome. Say put the camphor in a large queen-cage, and shift from one cage to another occasionally. Still Mr. Getaz may be right, that the best way is

to put it in after the weather forbids much dabbling of propolis.

Perhaps the section on pickled brood is the most valuable one in the article. Many of us have no experience with pickled brood—and a good many know nothing of it either by experience or any other way. According to our writer the disease is unique in that brood-rearing stops. Hive gets "empty, swept and

garnished" like the Soul in the parable. Queen lays no more. And on the introduction of a healthy, laying queen no attention is paid to the eggs she lays. They just stay *in statu quo* till in 8 or 10 days they disappear. Queen herself soon disappears if the original one is left. Evidently it is a pretty strenuous sort of plague that these words describe. A bacterial disease brought in with the pollen, which is its first nidus. But if only a little is brought in I suppose we may expect partial results—some dead and some healthy brood in the hive at the same time, and recovery. At least I think many cases have been reported in print which were not fatal.

That brood may simply starve sometimes by the hive getting so hot, and keeping so hot continuously, that the nurses stay away from their duty, is an important suggestion to be kept and tested. Pages 598-601.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

Dr. Miller does *not* answer Questions by mail.

### Too Late to Divide Colonies

I have several 2 story 10-frame hives that are so full of bees that they lie out considerably of late. Now I want increase. Which is the better, to divide now or wait until spring? I will have to buy queens. Will they have plenty of honey?

I had one swarm from 28 colonies, spring count, and an average of about 75 pounds of extracted honey per colony. MISSOURI.

ANSWER.—It will likely be better to wait till spring. Less risk about wintering.

### Trembling Queen—Nucleus Management

I have 3 nuclei with queens hatched from cells that I gave them Aug. 23. But I don't see any eggs. One of the queens appeared to be trembling very much, and not able to get around well, remaining about the same place on some sealed brood that I had placed in the hive. She appeared to be slighted by the workers. At this time of year I suppose it possible that the queens may not mate. If so, do you think they will be of any service to me? They all look well except the trembling of the one. What would you do under the circumstances? I am anxious to save them. OREGON.

ANSWER.—That trembling queen is pretty certainly no good. To each of the other nuclei I'd give a frame with unsealed brood. If no eggs were present a week later, I'd unite them with some colony. There is a possibility the queens might be all right next spring, but not a probability.

### Red Clover Bees—Late Swarming

1. Last July I introduced 7 red clover queens. The progeny of these queens varies somewhat from a dull yellow of 3 bands to a real bright golden yellow of 3 bands, and in the latter case the yellow on the underside of the abdomen extends clear back to the tip. Should the progeny of these queens all be *exactly* alike as an indication of purity? The drones also vary from a slight indication of yellow to a bright orange yellow, showing in 2 or 3 bands. Should the drones all be marked *exactly* alike? These bees all seem to be regular hustlers, and I am pleased with them, but at the same time I would like to have them pure Italians.

2. My bees are now putting in vigorous work on goldenrod and other autumn bloom (of which there is profusion here), and are storing quite a good deal in the supers. If I

take off the supers any time after Sept. 15, and compel the bees to work in the brood-chamber, will it have any bad effects?

3. A neighbor had a swarm issue Aug. 20. How late in the season have you ever had swarms issue?

4. My colonies are *very strong*. Is there any danger of swarming after Sept. 1, especially if I take off the supers and crowd the bees all down into the brood-chamber? INDIANA.

ANSWERS.—1. They might be pure red clover queens without being pure Italians, but of course they should be pure Italians if they were sold as pure Italians. A difference as to tinge of yellow would not condemn them, the specification as to purity of Italian blood being that the workers should have 3 yellow bands. Drones vary in their markings, even when of pure blood.

2. There could be no bad effect unless the queen were so cramped for room as to have too few cells for brood, and there is not much danger of that, for she is likely to be winding up the laying business anyhow. Of course there is a possibility that the crowding might go so far that there would be no room to contain all the honey; in which case it would be a nice thing to take out a full frame and replace it with an empty one.

3. I've had them in September.

4. Yes, there's always danger that bees will do some fool thing in the way of swarming, but the very strong ones are not so likely to swarm as some weak one that has reared a young queen. Crowding now is not likely to produce swarming.

### Wood Splints vs. Wired Frames—Changing from 9 to 8 Frames

I am now getting frames ready for next year's extracting and increase.

1. Will the wood splints, to which you so often refer, take the place of horizontal wiring of frames, when the latter are to be used for extracted honey? In other words, are splints as strong as wire when used in this way?

2. My hive is a 9-frame one, *i. e.*, takes 9 loose-hanging standard Langstroth frames without a dummy. The frames are 7 inches wide; bottom and end bars the same width. As propolis is freely gathered here in July and August, would you advise me to change to a nail-spaced frame such as yours by reducing the number to 8, and using a dummy—for extracted honey?

3. My present combs are all built on wired frames. Would cutting the combs out and placing them in new, unwired frames after

your pattern make them liable to break away when extracting? QUENEZ.

ANSWERS.—1. I don't know. When fresh put in, it seems the wiring ought to be stronger, for the wire is fastened to the wood, and the splints are not. Yet with ordinary wiring there is no fastening of the comb to the bottom-bar, and with the splints the foundation is fastened to the bottom-bar as securely as to the top-bar; so there may be no difference after all.

2. For a brood-chamber I would most strongly advise changing from loose-hanging frames to the Miller frame, no matter how plenty propolis might be. As to extracting-combs, I don't know. The wider frame will be more in the way of the uncapping-knife. Some say the nails are too much in the way of the uncapping-knife. I don't think they are; but then I have tried them in the extractor only on an exceedingly small scale; so I can't be certain. There being only two nails on each side, and those two being at one end of the frame, makes it quite a different affair from what it would be if the nails were at each end on the same side. Even if the nails should be in the way of the knife, you could get around that difficulty by using a little cylinder of wood  $\frac{1}{4}$  inch long, and the same or less in diameter, driving the nail through this so as to have it serve as the head of the nail. It could not hurt the knife to strike this wooden nail-head. I have tried a very few such spacers.

3. I have transferred into Miller frames from wired frames by the hundred, and in a little while the bees seem to have the combs as solid as if they had been built there.

### Perhaps Defective Eggs

A queen hatched July 17, 1905, and was laying July 26 when I clipped her wing. She was a very big, yellow queen. August 5 there was not a larva in the hive, but 3 frames well filled with eggs. Then I gave her 1 frame of honey and 2 frames of brood and bees. August 12 there was no larva except in the frames I gave her Aug. 5. Then I gave her another frame of brood, and so I did every week up to Sept. 16, when I killed her; but not one of her eggs had hatched. Whatever brood or eggs I gave her from other colonies was all right. When I gave her eggs to a queenless colony the bees kept them a few days and then disposed of them. The eggs were the same in appearance as any other eggs. What is your opinion of this? MASSACHUSETTS

ANSWER.—I have read of very few such cases, and had just one case in my own experience. It could hardly be any defect in the fertilization of the eggs, for in that case they would have produced drones, so the only explanation seems to be that in some way the eggs themselves were defective.

### Superseding Queens by Exchanging Brood

When I wrote you about the plan of requeening by killing the poor queen and changing her brood for brood of the best queen, I had an idea that, although the plan involved some trouble, yet I felt that with this exchange the work was ended and results sure, barring the possibility that the queen reared might not return to the hive from her wedding flight. It was to save the cost and possible loss of queens in introducing that I adopted the plan. It may be that some work could be saved by having sealed queen-cells ready at the time the old queen is killed, but I had but few swarms, and but few cells from the swarming colonies, and did not care to work any colonies specially for queen-cells. There is only a limited time in which this plan I speak of can be practiced, and probably it is best to have sealed cells or young queens on hand at all other times when the poor queens are removed.

This plan of changing brood is one I have thought practicable from the time when the developments of the season have proven which are your inferior queens up to the time when there is danger that the young queens will

not produce enough young bees to insure safe wintering.

I suppose that when you speak of giving a sealed cell in an introducing-cage, you mean giving it in the West cell-protector, or something similar. I am wholly unfamiliar with the use of these protectors, but suppose they are designed to prevent the bees from destroying the cells before the young queen emerges. I have done almost all of my introducing by the caged-queen plan.

I believe there is a spiral cage used sometimes to hold the virgin queen in a hive until given to a nucleus or otherwise disposed of. You can tell me about this thing just as if I were a little boy learning his a b c's.

Mr. Abbott's plan of introducing I think is a very good one, but if the requeening is to be done at the time above indicated, I believe I would rather requeen by exchanging brood. IOWA.

ANSWER.—(This refers to the "Plan of Superseding Queens," page 603.) As you have been trying the plan of killing the queen and exchanging brood for that of superior stock, I am wondering a little whether you have not discovered another objection that I did not mention on page 603: that is, that in a good many cases the colony would swarm as soon as the first virgin was sufficiently mature, unless indeed you took the pains to kill all cells but one.

When I spoke of giving a cell in an introducing-cage, I meant an introducing-cage of the same kind as used in introducing queens, the Miller introducing-cage of the catalogs, or something like it. There is something about it that makes either a cell or a queen safer in a cage than out of it, even if the bees can pass freely in and out of the cage. It is likely that a West cell-protector is just as good for a cell, but it would not do for a virgin or a laying queen, and these I have generally used. The West cell-protector covers the cell so the bees can not tear it, all but the point of the cell, with the understanding that when the bees demolish a cell they attack it on the side, and not at the point.

Please report fully what has been your experience with the plan of changing brood, giving both the advantages and the disadvantages you have discovered.

### Keeping Down Swarming

I now have 13 colonies in 8-frame dovetailed hives, both black and Italian bees, and I don't want to increase to more than 20 to 25 colonies at any time. Would it help to keep down swarming if I used 10-frame dovetailed hives? Would it also cut down the amount of comb honey in supers as compared to 8 frame hives? I run for comb honey only. We have both white clover and basswood; also some golden-rod and buckwheat in the fall, and quite a few fall flowers in the woods and along the river. IOWA.

ANSWER.—With the same treatment you would be likely to have less swarming with the larger hive, and unless you gave special attention to the 8-frame hives you wouldn't be likely to get any more honey from them.

### Bees on Platform—Web-Worms in Section Honey—Carniolans and Cyprians—Uniting Colonies

1. My bees are all on a platform where there is much walking. Will that do any harm?
2. Do the web-worms ever get in section honey?
3. Where can I get pure Carniolan queens? I got 2 last year and they had 3 gold bands.
4. Where can I get pure Cyprian queens? I got 4 last year, and not one with the first quality of the Cyprian.
5. For a double-wall hive with dead air space, will tin do as well for the inside walls as wood? If not, why not?
6. What kind of perfume is sprinkled over bees when uniting 2 colonies to make them of the same odor? VIRGINIA.

ANSWERS.—1. Probably not. Bees get used to such things.

2. Yes, indeed.

3. I know nothing about it beyond what is to be seen in advertisements.

4. Again I can give no help beyond advertisement. The Government imported some, but I don't know that they are obtainable.

5. No; tin is a better conductor of heat than wood.

6. Generally they are perfumed. I think peppermint has been used, and anise, cloves, or any other perfume might serve the same purpose.

### Sowing Alfalfa Clover Seed

What is the best time and method of sowing alfalfa clover seed? MISSOURI.

ANSWER.—In this part of the country the time and method is the same as for red clover; but it is not cultivated here to a great extent, and if there is anything different to be done possibly some of our good friends who "live in clover" of the alfalfa stamp will tell us more about it.

## Reports and Experiences

### Asters and Snakeroot

What are the names of the flowers I send?

No. 1 grows in the river bottom. We call it "frost flower" because the frost does not kill it, and the bees work on it from the time it begins blooming until it ceases. It lasts about 4 weeks, or from Sept. 20 to Oct. 20, and produces honey as white as snow.

No. 2 is a new flower here. It grows on the uplands, and the bees work on it in the afternoon; they get pollen. I would like to know if it is a honey-plant also.

This has been a very bad year for the bees, as they have done nothing. The weather was too wet, and when it was not raining it was too cold. There is no basswood or white clover honey, and very little Spanish-needle, but bees are working some now, as we are having nice weather. FRANK HINDERER. Schuyler Co., Ill., Sept. 24.

[Specimen No. 1 is known as the New York aster. No. 2 is the white snakeroot, and No. 3 is the star aster. They are all good honey-plants, and if they are abundant and the weather favorable the bees should reap a good harvest even yet.—C. L. WALTON.]

### Poorest Honey-Year in Kansas

Bees are collecting but little honey. Although heartsease is in full bloom, it seems to yield but little nectar. Three crops of alfalfa have bloomed, but neither crop afforded much honey. The fourth crop is nearly ready to bloom, but late and cool as the weather may be, but little honey is likely to be had from it. This seems to be the poorest year for honey in the history of Kansas. Rice Co., Kan., Sept. 15. G. BÖHRER.

### Mallow—Sage—Knotwood—Smartweed—Marigold

I send 5 plants that I would like to have Prof. Walton name for me, and tell whether they are all honey-plants. Honey is scarce here. It is almost too late for a fall flow now. ANTON G. ANDERSON. Johnson Co. Mo., Sept. 14.

[Specimen No. 1 is the sand mallow, and so far as I know is not a good honey-plant. Some of the mallows are honey-plants, and if the bees work on this variety they are surely after something worth while.

No. 2 is the narrow-leaved sage, and is a good honey-plant. It belongs to the famous

LEWIS' GOODS

At Root's Factory Prices

## Honey and Beeswax

**CHICAGO, Aug. 18**—The demand has absorbed all the offerings of fancy and A No. 1 grades of white comb honey at 14c, while No. 1 has sold at 13@13½c. No call at present for other than the best grade, it really being difficult to place what ordinarily is called No. 1. Extracted, white, 6@7c; amber, light and dark, 5@6c. Beeswax, 28c.  
**R. A. BURNETT & Co.**

**KANSAS CITY, Aug. 24**—The honey market here shows a decided improvement and the market is firm at \$2.85 to \$3.00 for No. 1 and fancy white comb in 24 section cases. Amber and other grades are selling for less, according to quality. Extracted in fair demand, white selling at 6½ cents; other grades down to 4½c. Beeswax, 28c.  
**C. C. CLERMONS & Co.**

**CINCINNATI, O., Sept. 8**—It appears by this time, that comb honey will not be so plentiful. In some parts of the West the crop has been more or less a failure. Prices so far have not changed much yet. Fancy white comb, 13@15c. Extracted seems to be more plentiful. In barrels, light amber, 5¼@5½c; in cans, ½c more; white clover from 7@8c. Beeswax, 26c.  
**C. H. W. WEBER.**

**INDIANAPOLIS, Sept. 2**—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. 1 quote fancy white at 14@15c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.  
**WALTER S. POWDER.**

**NEW YORK, Sept. 22**—New crop is beginning to arrive quite freely from New York State and Pennsylvania, and is in fair demand at 14c for fancy white, exceptionally fine quality may bring 16c; 13c for No. 1 white, and 11@12c for No. 2 white and amber; no buckwheat on the market as yet. Extracted, in good demand at last quotations. Beeswax, firm and scarce at 29@30c.  
**HILDRETH & SEGELKEN**

**PHILADELPHIA, Sept. 21**—There seems to be an unusually large quantity of comb honey offered in the market at this time and prices for new goods are somewhat weak. We find small lots of bee-keepers in the vicinity offering it at almost any price, regardless of the actual value. Honey has been sold in Philadelphia at the following prices during the week: Fancy, 13@16c;

No. 1, 11@14c. Extracted, amber, 5¼@6½ cents; white clover, 6¼@8c. Beeswax, firm, 28c.  
We are producers of honey and do not handle on commission.  
**WM. A. SELSER.**

**TOLEDO, Aug. 18**—The market on comb honey at this writing is practically the same as last; however, honey is being offered quite freely, and this has a tendency to decline the price. On account of the heavy receipts of fruit there is no great demand for either comb or extracted at present. Fancy white clover in a retail way brings 15c; No. 1, 14c; little demand for amber. Extracted, white clover, in barrels, 6@6½c; in cans, 7@7½c; amber in barrels, 5@5½c; in cans, 6@6½c. Beeswax, 28@30c.  
**GRIGGS BROS.**

**CINCINNATI, Sept. 7**—There is little to report since our quotation two weeks ago. The supply of both comb and extracted honey is fair, and the demand is good. We offer extracted honey as follows: Amber, in barrels and cans, at 5¼@6¼c, respectively. White clover at 7@8½c. Fancy white comb honey at 12@15c. Beeswax, 29 cents.  
**THE FRED W. MUTH Co.**

**ALBANY, N. Y., Sept. 21**—Honey demand improving here as the season advances, and as next month is the best month we look for good prices. Buckwheat comb is scarce; that is, straight buckwheat. We quote fancy white, 15c; No. 1, 14c; mixed, 13c; buckwheat, No. 1, 13c; mixed, 12@12½c. Extracted, white, 7@7½c; mixed, 6¼@7c; buckwheat, 6½ cents. Beeswax, 28@32c.  
**H. R. WRIGHT.**

**SAN FRANCISCO, Sept. 20**—White comb, 1-lb-sections, 9@10 cents; amber, 7@8c. Extracted, water-white, 4¼@5¼c; white, 4@4¼c; light amber, 3¼@4 cents; amber, 3@3¼c; dark amber, 2¼@3c. Beeswax, good to choice, light, 25@26c.

The comb-honey market is firm at 8¼c to 10c a pound. Southern California's output this year will approximate 175 car loads. Last year's crop was practically nothing, and present prospects are for higher prices. With the market practically cleaned up last spring, coupled with the fact that the honey crop is light in all Eastern producing States, the honey men of southern California may reasonably look for better prices the coming fall and winter. The present market price for extracted honey is around 5c. The crop estimate above given means about 125,000 cans of extracted. Of comb honey southern California will have, it is thought, not more than 15 carloads. While California will have about the largest crop in many years, there are some localities where the bees have done practically nothing. Arizona is nearer to a honey failure this year than in 20 years. The crop has not been so light throughout the East in a decade, while Texas is said to be only within 60 percent of its normal production.

# AMERICAN BEE JOURNAL

WEEKLY—\$1.00 A YEAR

Published by GEORGE W. YORK & CO., 334 Dearborn Street

45th Year

CHICAGO, ILL., OCTOBER 12, 1905

No. 41

WEEKLY

## THE "GOING-TO-BEES"

BY NIXON WATERMAN

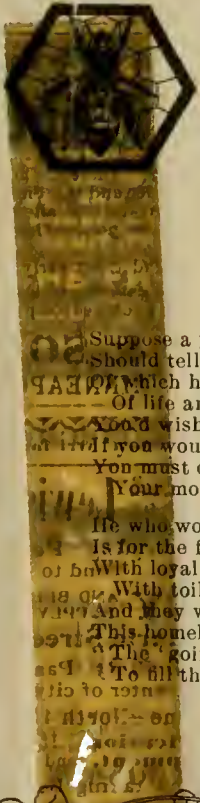

Suppose that some fine morn in May  
 A honey-bee should pause and say:  
 "I guess I will not work to-day,  
 But next week or next summer,  
 Or some time in the by-and-by,  
 I'll be so diligent and spry  
 That all the world must see that I  
 Am what they call a 'hummer!'"

Of course you'd wish to say at once,  
 "O bee! don't be a little dunce  
 And waste your golden days and months  
 In lazily reviewing  
 The things you're 'going to do,' and how  
 Your hive with honey you'll endow;  
 But bear in mind, O bee, that now  
 Is just the time for 'doing.'"

Suppose a youth with idle hands  
 Should tell you all the splendid plans  
 Which he dreams, the while the sands  
 Of life are flowing, flowing;  
 You'd wish to say to him, "O boy!  
 If you would reap your share of joy  
 You must discerningly employ  
 Your morning hours in sowing."

He who would win must work! The prize  
 Is for the faithful one who tries  
 With loyal heart and hand; whose skies  
 With toil-crowned hopes are sunny.  
 And they who seek success to find,  
 This homely truth must bear in mind:  
 The 'going-to-bees' are not the kind  
 To fill the hive with honey."

—Saturday Evening Post.

Get New Subscribers

Why not get a New Subscriber for the American Bee Journal, to send with your own renewal?

# 10 WEEKS CENTS

We wish every reader of the American Bee Journal to become acquainted with **GLEANINGS IN BEE-CULTURE**. We extend a cordial invitation in our offer to send you the paper 10 weeks for 10 cents.

There is no bee-paper in the world like Gleanings. Its aim is to meet the needs of every bee-keeper everywhere, and it does it. Whether you own one colony or a thousand or are merely interested you cannot afford to miss a single number. Gleanings is progressive. Every number is an improvement over the last.

## Contributors

It is useless to state that **GLEANINGS** excels in this point. Regular departments are edited by Dr. C. C. Miller, G. M. Doolittle, Prof. A. J. Cook, J. A. Green and Louis Scholl. These names speak for themselves for they are the best writers of the day. Every issue contains articles from the pens of the best bee-keepers all over the land. A list of them would be the catalog of the most successful bee-keepers the world over. We will soon begin a series of remarkable articles by E. W. Alexander. We are safe in saying a higher price was never paid for an article of this class than we paid for a single one of this series. Every one of them will be worth hundreds of dollars to bee-keepers.

## Half-Tone Illustrations

During the past summer we have had a special artist to take photographs for us. He has traveled on our account alone the past summer over 4000 miles and we can promise some very fine pictures. Many of the Second Prize Photo Contest, American and Foreign, will appear soon. Our engravings are made by the very finest engravers in the United States. Just this wealth of illustration doubles the value of the paper.

## Advertisements

Gleanings prides itself on the clean class of advertisements it carries. Its subscribers show their appreciation of the fact by their liberally patronizing them. There is no better medium in the United States for those catering to the needs of the bee-keeper. We now print 25,000 copies and yet with our special edition (Dec. 15, 40,000) our old rates hold good which were based on 20,000 circulation. Gleanings gives its subscribers and advertisers full measure, pressed down and running over.

## December 15th Issue

We are pleased to announce that extensive plans are now under way for a Special Christmas Issue of Gleanings. It is planned that this issue shall far exceed in its wealth of contributed articles, its half-tones and its cover design than anything that heretofore has been attempted in bee-keeping literature. The cover is to be designed and printed by one of the best color printing establishments in the United States. The design is something unique and beautiful indeed. This issue will contain nearly 100 pages, and 40,000 copies will be printed, making a bee-keepers' magazine that compares favorably with any magazine of the present day.

## Subscribe

When you have read this notice take up your pen and tell us to send you **Gleanings Ten Weeks** and enclose **Ten Cents**, in coin or stamps. Don't put it off. The magnificent Christmas Number alone will be worth 25 cents to any bee-keeper. We don't promise this number to any but subscribers. Don't put this matter off for you will never be able to spend 10 cents to better advantage.

THE A. I. ROOT CO., Publishers, Medina, Ohio.

CHICAGO, ILL., OCTOBER 12, 1905

Vol. XLV—No. 41

## Editorial Notes and Comments

### Good Seasons Still to Come

Bee-keepers, as a class, are optimists. Some seasons are good, and some are poor, yet they are always hoping that the next season will be one of the good ones. A few years ago the editor of the Bee-Keepers' Review, however, had a fit of pessimism, and expressed the belief that we could not expect in the future as good crops as had prevailed in the past. He has now recanted, and fully reinstated himself in the ranks of the optimists, as expressed in the following:

"Along in the '90's we had very poor honey crops here in Michigan—so poor that I came as near being discouraged as I ever did. I began to feel that, as the country was being cleared up, the honey-plants were disappearing, and that the good crops were things of the past, and not of the future. In this I was mistaken. The last three years have furnished excellent harvests."

### A Defense of Tanging Swarms

Some of the younger readers may not know what tanging is. Formerly it was a common custom, upon the issuing of a swarm, for all hands to join in ringing bells, blowing horns, pounding on tin pans, and making noises in any other way that suggested itself. That was tanging. It is not certain that any intelligent bee-keeper of the present day practices tanging, but nearly two pages of a late issue of *Gleanings in Bee Culture* is occupied with a sort of defense of the custom. Nor is it a densely ignorant writer who makes the defense, but a professor; Prof. Edward F. Bigelow.

To the argument that 99 out of 100 swarms would settle anyhow without the noise, Prof. Bigelow replies:

"This point is weak. The noise is made after the clustering, in my experience, when the swarm has refused to go into the hive or to remain."

Doubtful if that experience is general. His closing words are:

"As a countryman I resent the imputation by the so-called funny papers, that 'we farm-

ers' have been doing such 'fool things' for many generations. I guess we know what we are about, some of the time, city chaps to the contrary notwithstanding."

If "city chaps" do no worse than to call tanging one of the "fool things," they will steer closer to the truth than they generally do when talking about bees.

### Greasy Waste for Fuel

Greasy cotton-waste, such as can be found thrown away along the track near any railroad station, has been highly commended as smoker-fuel. Rev. R. B. McCain, in *Gleanings in Bee Culture*, claims as a special advantage that when one handles the stuff the fingers become greasy, and as a consequence propolis does not stick to them. Taking his cue from this, Dr. Miller, who has been in the habit of using butter to clean the propolis off his fingers, proposes that hereafter he will "try the plan of going to the hive with 'butter-fingers' prepared in advance."

### Stand or Colony?

The following letter has been received:

EDITOR AMERICAN BEE JOURNAL—

Your strictures on page 630, on the use of "stand of bees" in place of the later adopted hrat, "colony of bees," are not well supported, and these strictures will give way every time you try to make a "stand" on them, by them, or for them.

The redeeming feature of those strictures is the ending of them by, "Perhaps some one can explain." Certainly, *some many* can explain.

Your ideas of the word "stand" have been evolved by your close environment with the editorial stand. You, therefore, pass over Webster's definitions of the noun "stand" until you come to the 6th—"a small table"—refusing to be comforted by the more general 3d definition, "A stop; a halt; as to make a stand; to come to a stand."

Now, what more applicable expression can be used when a swarm of bees has passed into a hive and has "made a stand," which every little worker would die to maintain—what more appropriate than "a stand of bees?" The expression, "A colony of bees," compares with it as dish-water does to cream.

"Stand of bees"—a natural linguistic evolution from the Anglo-Saxon "staend."

"Colony of bees"—a brat midwived into the English vocabulary about 15 years ago by a coterie of dignified apiarists, who, looking with askance upon their plain old Anglo-Saxon "Mother English," were anxious to acquire a cheap linguistic notoriety by dabbling in French-Latin. AUG. GREENFIELD.

It is not easy to decide just how far this letter is to be taken seriously, and how far it may be intended in a humorous vein. Certainly, however, the word "colony" is hardly the best word to choose, if we could go back far enough to decide over again. But we would have to go back more than the 15 years suggested by our correspondent, for the word "colony" has been in common use for many more years than that, no matter when it may have first appeared in the dictionaries. The bees in a hive form a family rather than a colony, taking the word "colony" as used when speaking of people, yet scientists use the word "colony" as applying to an aggregation of individuals in a common household or zoocleum, as in corals, polyzoans, etc.

To take the stand that "stand" is the better word because bees make a stand, defensive or offensive, is hardly safe. For only a small number of bees make the stand, and the word could properly apply only to that small number making the stand. Besides, when those bees from Caucasus, which are so gentle that they never make a stand, become so common in this country that no others are known, how could the use of the word "stand" be justified to future generations?

### Comb Honey Not Machine-Made.

We have a fair supply of the typewritten letter on this subject, which appeared in the *Chicago Daily News* of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

### Maeterlinck's "Life of the Bee."

We have a few copies of this book, price, post-paid, \$1.40; or with the *American Bee Journal* one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

## Miscellaneous News Items

Mr. M. M. Baldrige, of Kane Co., Ill., called on us recently, and requested us to ask members of the National Bee-Keepers' Association not to vote for him for Director.

**Honey-Vinegar.**—Secretary Hutchinson informs us that Mr. H. M. Arnd, manager of the York Honey and Bee-Supply Co., who at great expense took a course in honey-vinegar making, will prepare a paper for the National convention, on "Successful Experience in the Making of Honey-Vinegar." As we use some of Mr. Arnd's honey-vinegar on our home table, we know that it simply can't be beat. He will appear on the program at the morning session of the third day, Dec. 7.

Mrs. Cora E. Just, wife of W. P. Just, editor of the Sauk County (Wis.) News (who is also a bee-keeper), passed away Sept. 15, a few hours after having given birth to a daughter. The copy of the News for Sept. 21 was a memorial number, containing a half-tone picture of the deceased, and also the funeral sermon, besides two beautiful poems entitled, "Alone," and "Not Lost, But Gone Before." It was all very sad. Our sincere sympathy is hereby tendered to our brother in his sore bereavement.

The Minnesota Fair Premiums in the Apiary Department, were awarded this year by Wm. Russell, the Minnesota inspector of apiaries. A clipping kindly sent us by Ethel H. Acklin, contains the following announcement of the winners of the premiums offered:

The grand sweepstakes for the largest, best, and most attractive exhibition in the honey department was awarded as follows:

1st, H. G. Acklin; 2d, Moser's Apiaries; 3d, J. B. Jardine; 4th, W. K. Ansell.

Mr. Acklin took 13 1st premiums, Mr. Jardine 5, Moser's Apiaries 3, Mr. Ansell 3, and Alfred Ziemer, 1.

**Ahead of Bee-Stings for Rheumatism?**—One of our young lady friends here in Chicago, on learning that we had a slight touch of rheumatism lately, sent us the fol-

lowing "new treatment," by special delivery stamped letter, with these words:

"Here's a cure for you. Try it *immediately*!"

MR. KELLY—"An' how are ye this mornin', Mistress Flynn? Is yer rheumatiz any better?"

MRS. FLYNN—"Well, yis, I think it is, I thank ye kindly. The new doctor's treatment is doin' me a worl' av good, I belave. He advises me to take queen ann [quinine] eternally, and to ruh anarchy [arnica] on me j'int's. So I'm doin' it, an' I think it's helpin' me wonderfully."—From Puck.

**Wedding Bells at Dittmer's.**—As "Miss Bessie Dittmer" she is no more. She is now "Mrs. Julius Hammer." A notice in the Augusta (Wis.) Eagle for Sept. 22, reads as follows:

We take pleasure in announcing the marriage, on Wednesday afternoon of this week, of Miss Bessie Dittmer, eldest daughter of Mr. and Mrs. Gus Dittmer, to Mr. Julius Hammer, Rev. E. Z. Thwing officiating. The ceremony, which was witnessed only by the near relatives and a few intimate friends, took place at the home of the bride's parents, which had been beautifully decorated for the occasion by the ladies of the Matrimonial Club. At 4 p.m. Rev. Thwing pronounced the words that made the twain one, which was followed by the warmest congratulations and a bountiful wedding supper.

The bride is one of Augusta's most popular young ladies, and is highly respected as a lady of most estimable character. The groom is a trusted employee at the Victory Mercantile Co.'s store, where his integrity of character and genial ways have won for him many friends.

The presents were both numerous and elegant, comprising silver, china, and household articles. One of the evidences of the estimation in which the worthy couple are held, was a surprise reception given them at 7 o'clock in the evening by about 30 young ladies.

We wish to add our congratulations also, and hope for our young friends a long and happy life.

"Bessie" was her father's "right hand girl" in the comb foundation factory, where she was an expert at running one of the mills. His loss will be Mr. Hammer's gain, however. But making a good home, as she will do, will even be ahead of making good comb foundation.

"The Honey-Money Stories," mentioned several times already in these columns, seems to be exceedingly well thought of, if we may judge from the expressions of appreciation that have been printed and also written so far.

The following is from the Bee-Keepers' Review:

"The Honey-Money Stories" is the title of a 64-page booklet recently gotten out by George W. York & Co., of Chicago. It is printed on enameled paper, and beautifully illustrated with between 30 and 40 halftone engravings. In the back of the book are three bee-songs, set to music. It is edited by Earl M. Pratt, and contains a variety of short, bright stories, interspersed with facts and interesting items about honey and its use. In fact, the primary object of the book seems to be that of awakening interest in honey, and increasing its consumption.

The Progressive Bee-Keeper contains this paragraph:

"The Honey-Money Stories" is the title of a 60-page pamphlet published by George W. York & Co., Chicago. It is tersely written, well printed and interspersed with pleasing illustrations arranged in an attractive manner, calculated to increase the desire of the reader for the best of sweets. We congratulate Mr. York on the manner in which this book is gotten up.

Then comes the following from one of Chicago's physicians, who is also interested somewhat in bees:

That "Honey-Money Stories" is certainly interesting. I know of no better way to instruct the public in the great virtues of pure honey than by a perusal of its bright and appropriately illustrated pages. The person that conceived this attractive method should be encouraged. All honey-dealers and keepers of bees should show an enthusiastic interest in a publication so aptly in their favor, and nothing quite so tangibly encourages as a steady flow of cash orders. The writer knows whereof he speaks.  
M. DEE.

We may say the price of a copy of "The Honey-Money Stories" is 25 cents, postpaid, or 5 copies for \$1.00. It is clubbed with the American Bee Journal one year—both for only \$1.10. Send all orders to the office of the American Bee Journal.

Mr. and Mrs. A. L. Boyden, of The A. I. Root Co., were in Chicago Oct. 7 and 8. Mr. Boyden made this office a brief call. Everything is "humming" at "The Home of the Honey-Bees" these days. The extra-large discount now offered on orders for bee-supplies for next season seems to have struck a popular chord among bee-keepers.

## Contributed Special Articles

### Honey-Dew—Sucrose in Honey—Poisonous Honey

BY PROF. A. J. COOK

THERE is something about this sugar or honey question that I think needs clearing up in many of our minds. In the first place, as to the nature of honey-dew. There are two views held—one that it is a secretion from the plants, and the other that it comes exclusively from insects—mainly scale insects and aphids.

By honey-dew I mean the sweet nectar droplets that we find scattered upon the foliage of various herbs and trees. I once thought these must be a product of the tree itself, as I found a willow the foliage of which was thickly dotted with these droplets, so much so that it was sticky. I examined and could find no insects. My experience since that time convinces me that had I investigated high up in the tree, I would have found scores of the willow aphids, and that from this insect came this honey-dew.

For years now I have been striving to get evidence that this scattered sweet on the leaves of plants is a secretion of the plants themselves. I have yet to get any direct evidence to that effect. It is true that many plants, like the cotton, have extra-floral glands, and secrete nectar, but this never falls in droplets as in the case of the real honey-dew.

Again we note that the honey-dew is of benefit to the insects, as in attracting bees and wasps it secures a body-guard which protects the insects from birds. I have had ocular proof of this over and over again. On the other hand, we could not see how it would be any gain to the plants to scatter this sugar solution over the foliage, for it also attracts a black

fungus which must be injurious to the plants. Plants and animals *do* not work usually in Nature to effect their own harm, but always their good.

#### THE NATURE OF HONEY-DEW.

As I have said before, honey-dew is reducing sugar, usually called glucose or grape-sugar. This, then, is like honey, like the sugar of digestion, and like liver sugar formed on the body, and is undoubtedly a sugar that takes less energy on the part of the bees to convert it into honey than does the cane-sugar of the floral nectar. If, then, this honey-dew has no distasteful elements, it is probably the best food for bees, as bees are hard worked at best, and we can well imagine that they might live longer with less of digestive labor to perform. The short life of the bee during the active season argues an overdose of hard work. Dr. Miller objects to this reasoning in view of the fact that organs are stronger with work. I think the Doctor would hardly urge that this were true of overworked organs. As I believe that honey is the best sugar for us—especially if our stomachs are of frail make-up—so I believe that honey-dew may often be a godsend to the bees.

#### SUCROSE IN HONEY.

In a recent number of one of our leading bee-papers, it was stated that there was more sucrose in honey stored by bees from cane syrup than that from floral nectar. And it was further urged that this would enable the chemist to determine this kind of "adulteration," as the large amount of cane-sugar of sucrose would be certain evidence that it could not be honey from floral sources. I believe this statement needs to be taken with some allowance. Bees may be made to take a great deal of syrup in a very short time; I have fed over 20 pounds of syrup at night to a single colony, and have found it all stored in the morning. Some of this was extracted from the comb in the morning, and some after it was sealed over. The amount of sucrose had very greatly diminished in the capped honey. This shows that digestion went on after the honey was stored, or else that the bees took it again into their stomachs, which is not probable.

Bees usually gather nectar from the flowers very slowly, and thus the digestive juices are ample, and the sucrose or cane-sugar of the nectar is very perfectly reduced to grape-sugar, or dextrose and levulose. I imagine that they might gather so rapidly that this reduction would be much less perfect—there being too little time for full digestion—in which case we would have a large percentage of cane-sugar in the honey, although it would be from floral sources. Hives on the scales here now (May 18) show 24 pounds per day. On the other hand, if we should feed cane-sugar syrup very sparingly this would be fully digested. I do not believe any chemist would be justified in pronouncing upon the source of honey from the percentage of cane-sugar which it contains. This is no guess with me. It is the result of actual test.

#### POISONOUS HONEY.

Again we have an article in one of the bee-papers giving a case of severe poisoning from the eating of honey. I have often expressed in the papers my doubt of the truth of such statements. I doubt if bees ever collect nectar from flowers or other natural sources which results in poisonous honey. Else, it seems to me, this kind of honey would be very much more common. We know honey is often poisonous to certain people, and is it not more than probable that such sickness comes from over-eating or individual idiosyncrasy of the person, and not that the honey is really poisonous?

I have several times received this so-called poisonous honey, and have eaten it and received no harm at all. It seems to me that the sickness can be explained with no accusation against the honey in the explanation, while I do not see how we can believe in poisonous honey from flowers, and find the occurrence so rare. I knew a whole lot of students who were once made deathly sick by eating honey. They found a bee-tree; it was late in the forenoon, and they were hungry. They ate immoderately, as boys will at such times, and very few of them escaped the punishment for their intemperance. It would be folly to say that the honey that they ate was poisonous.

Let us inquire further before we give too much credence to this matter of poisonous honey-plants.

Los Angeles Co., Calif.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the *American Bee Journal* one year—both for \$1.75. Address all orders to this office.

## Two Queens in One Hive

BY DR. G. BOHRER

**D**URING the present season I found in two different hives two fertile queens, and both laying eggs in each hive. In one case there was a 2-year-old queen with a clipped wing. Early during the swarming season I opened the hive and found several queen-cells sealed, and at once closed it, expecting the colony either to cast a swarm or to supersede the clipped queen, she being old. About one month later I again opened the hive and found a fine young queen laying eggs, and I set the frame she was on on the ground for safety to her, as I wished to look through the hive for a frame of brood with which to reinforce a weak colony. And on lifting out the third frame I found the old clipped queen, still in apparent health, and laying eggs. I removed her, and gave her to a nucleus which she has built up to a fair colony.

In the other case, I had taken a good queen from a colony in the last days of February, that had almost died out. I put her into a cage, made by bending a piece of wire-cloth, 4 inches square, into a flattened cylinder, and placed it between two frames in a colony of hybrids, where she could have access to honey in case the bees refused to feed her. I kept her there until in April, and took the queen that belonged to the colony and liberated the caged queen. The bees injured her by crippling one of her legs, and in a few days started queen-cells, which I destroyed on two different occasions, and thought they had abandoned the idea of superseding her. But about one month later I opened the hive to remove the crippled queen with a frame of brood, for the purpose of starting a new colony, but I found a young queen, and took it for granted that the crippled queen had been superseded by this young one.

I removed the hive to a new stand, thinking that I would give them a queen I had sent for and was expecting in a few days. On her arrival, I opened the hive to put in the new queen, and began to look for queen-cells, knowing that there would be some on the removal of their only queen, as I supposed. I had not gone far until I found the crippled queen and no queen-cells, and also found plenty of fresh eggs; thus proving beyond all doubt that this queen had not been superseded, but that she was still fertile and laying eggs freely, and is still doing so.

But in the presence of all this, in both instances it is highly probable that both of these old queens would have been destroyed, and the young queen left at the head of the colony in each case.

I have called attention to these cases not because they will be of very great worth to the bee-keepers of the world, but because they are interesting on account of the rarity of such cases. In the first case, I feel quite confident that the young queen had entered the hive through mistake, on her return from her bridal trip, as I found no cells from which a queen had lately emerged. But by the side of the hive I found a nucleus deserted by nearly all the bees, their queen being gone, and I supposed she had been lost on her bridal trip until I found the young queen referred to. I have said she had entered this hive through mistake, but possibly she may have been reared in this hive, but I found no evidence to that effect, and it may be possible she entered this hive as a matter of choice, it being far more densely populated than the hive she was hatched in. There were so few bees in it that at times no bees were visible on the outside, while the other hive had more or less bees on the outside, about the entrance, thereby possibly making it more attractive to a queen than a hive with no bees in sight at the entrance.

Rice Co., Kan.

## Advantages of Bottom Starters in Sections

BY EDWIN BEVINS

**O**N page 485, it is asked who besides Dr. Miller has found advantages in bottom starters. Thanks to Dr. Miller, I have used bottom starters the last two seasons, and wish I had begun their use when I began to keep bees. As I ship most of my honey, I find their use a great help towards insuring safe shipment. Better filled and therefore better looking sections are made with than without them.

A top starter that comes almost down to the bottom-bar of the section does not answer so good a purpose. The starter is liable to get swerved to one side, and perhaps attached to the separator.

I put in both starters with a Parker foundation fastener, putting in the bottom one first. The work is done just before

the sections are needed on the hives, and when the weather is so warm that artificial heat is not needed. Dr. Miller uses a Daisy fastener, and puts in the starters in cold weather. If I had prepared a whole lot last winter, as he does, I should have to carry most of them over till next season—a thing which I would prefer not to do. The additional work required to put in the bottom starters is not great, and bears no comparison to the advantages which accrue from their use.

I will remark here that I have a Lewis foundation fastener, but have never used it as the Parker does very well for me.

When these bottom starters are used the bees, like Nature, seem to abhor a vacuum, and they go right to work and close up that little vacancy of a quarter inch or so between the two starters. They will extend the comb and begin storing here and a little above before they will do it next to the top-bar of the section.

Here I hope I may be pardoned for remarking a little on the wastefulness of the practice of using only a narrow starter at the top, especially in localities where the flow comes mainly from white clover, and is therefore of limited duration. When these narrow starters are used hundreds of bees in each and every section must form themselves into the shape of a big V, and stay there for days preparing storage-room for that which, during this delay, is being wasted in the fields. When full sheets of foundation are used a hundred bees can find room for work where but one can find it with the narrow strip. I have marveled at the shortness of the time before honey could be seen glistening in the tiny cells when the full sheets of foundation are given. I have also marveled at the rapidity with which supers with the full sheets are filled when the honey-flow is good.

Some bee-keepers seem to have a preference for the narrow starter because of what they call the superior delicacy of the product. Where do they find a market for this delicacy that will take it at a price commensurate with its additional cost to produce? The additional quantity of honey secured by the use of full sheets of foundation will, I am sure, bring more money than will be received from the added price of the delicate product. If delicacy is what is wanted, why not get it in the shape of the finest grades of extracted honey? The one who eats this kind does not have to eat any indigestibility in the shape of honey-comb. But when extracted honey is mentioned, the specter of adulteration arises.

It is not creditable to the fighting qualities of extracted-honey producers that this prejudice against their product goes unrebuked and unremoved, especially in States that have a pure food law. It is not creditable to the general public that it will buy so much butter at 20 cents a pound and upwards, and so little good extracted honey at 8 or 10 cents. The question of palatableness has of course to be left to the

eater, but the question of nutritive value must be left to the chemist.

The difference in the nutritive value of a pound of butter costing 20 cents, and of 2 pounds of honey costing 20 cents, is, I believe, largely in favor of the honey.

It is hard for me to believe that there is not some way to inspire in the mind of the public so large a degree of confidence in the purity of extracted honey as to lead to its larger use. I will reiterate what I have said before, that the small towns and country districts should get more of it than they do through the efforts of the local bee-keeper.

I will now turn myself into a peace plenipotentiary with a view to the bringing about of a reconciliation between Dr. Miller and Mr. Hasty. Dr. Miller puts bottom starters in his sections and wants the lock corners down. Mr. Hasty wants to know why, and the Doctor says that it is because—because they look nicer so. How much difference there is between "better" and "nicer" I will leave the Doctor to explain. I will venture a guess that the lock corners sometimes have some stains in the joints that do not get removed.

When Mr. Hasty says that sections with lock corners up are much more liable to be pulled apart in handling, he seems not to remember that Dr. Miller not only uses bottom starters but T tins also. The liability to pull apart is, I think, much greater where section-holders are used than where T tins are used. I use section-holders, and put the lock corners down. It requires some care to avoid pulling apart, but I prefer to use this care because—because the tops of the sections are more easily cleaned when perfectly smooth, and look a little better (or, shall I say, nicer?) when cased for shipment.

Just here I have concluded to give up the job of peace-maker. The differences between the ideas and practices of the two men are irreconcilable. Mr. Hasty's short-comings are appalling. Here is a list of them:

1st. He wants the section, whether in pile or case, to stand the other side up from what it was when being built. I suppose that is to enable the honey *all* to run out in case of any bruising or abrasion of the cappings.

2d. He doesn't say that he makes finger-prints in the honey sometimes, but leaves the impression that he does.

3d. He leaves the supers on the hives till the bees have removed the honey from the unsealed cells. How much travel-stain does the surfaces of the sections acquire while waiting, and how many bees are monkeying around there that might be more profitably employed somewhere else?

Lazy? No use for the interrogation point. Mr. Hasty owns to the soft impeachment. So I will simply say, "Lazy."

Summing things all up, Mr. Hasty, you're a bad 'un. Repeat and reform, or have some fellow bigger'n you, with a shingle in his right hand, take you across his knee.

Decatur Co., Iowa.

## Convention Proceedings

### Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 698.)

#### BEEES AS PROPERTY, AND ASSESSABLE.

Mr. Swift—Our bees as property are not assessable under the laws of the State of Illinois. If they are not assessable and produce no revenue why should the State pay revenue back? Take cattle or any animal that is diseased, every one is assessed upon that animal and pays revenue into the State.

Dr. Miller—They may not be assessable but they are assessed; I pay taxes on my bees.

Mr. Swift—You don't have to. They are not assessable.

Mr. Moore—You are a little in error, Mr. Swift, in the schedule is a clause which says, "Other property." Now to a really conscientious man, if he calls bees property, he ought to list them; and I know of two or three who list them and are assessed. Now if we are assessed, that will give us certain rights before the Legislature.

Mr. Swift—The only thing is this, bees come under that

class of *fera natura*—they are wild by nature; and consequently anything of that character is like a flock of prairie chickens—the farmer does not have to pay taxes on them. Bees are not assessable under the revenue laws of the State of Illinois unless a man chooses to list them as "other property." Consequently this is my opinion. The Supreme Court may differ from me—I am not certain it has ever been adjudicated upon by the Supreme Court—but I think they are not assessable from the very fact that without any provocation a colony of bees does sometimes take wing and go away in the spring. It is the very fluctuating character of the thing. A man in the fall might have 100 colonies, and in the spring he might not have more than 15, and according to Dr. Miller, then, he has to go before the Board of Supervisors and the Committee on Payments and present his claim for the loss of his property, unless he chooses to pay on something he has not got. Under those circumstances, the bees not being assessable, by the very nature of the property, as property that is fixed and tangible is, that can be gotten hold of or levied upon—because I don't believe there is a sheriff in the State would levy on a hive of bees—by that very fact you could not go before the Legislature and ask any law that would give force that a bee-keeper should be recompensed if his bees were injured by being treated for foul brood or any disease. But if you can get the Legislature to recognize that this is a source of revenue for the State, and of wealth to the individual, and his wealth in that way can be assessed and taxed as his money and household goods and the things he can buy as the result of his product, then they will legislate and will do what they have done in the past—give you any appropriation for the protection of that industry. But when you come to ask for recompense for injury done by making the injured better,

you have gone up against the wrong thing, and will meet a snag every time.

Mr. Dadant—I would be very glad to hear bees are not assessable. I have been paying taxes on bees for many years. The argument is very good but it is not only bees; there is the hive, the combs, the brood, the honey, the supers and sections of foundation and all that belongs to the hive. I pay taxes on my bees; I pay taxes on the comb foundation I manufacture. All this belongs to the bees. If the bees are not assessable, and all this other part of the property is not taxable, I have \$15,000 worth of goods on hand. I have been paying taxes, and I would be ashamed not to pay taxes.

Mr. Swift—Mr. Dadant does not bear in mind that he is in a manufacturing industry.

Mr. Dadant—We would suffer from foul brood if our bees had it.

Mr. Swift—You say your wax does not get affected by foul brood. As a manufacturer with an industry with a capital stock, then, you would be assessed upon it whether incorporated or as an individual; but here is a man that has got 50 colonies of bees on his farm—I don't believe he can be assessed on them. If a test case was made, from the very fact of its fluctuating character, I do not believe he could be assessed. The honey might be assessed, and possibly the hive, if you could fix what the value would be, but not that which deteriorates and is so fluctuating it would be almost impossible to determine. But the product of the bees in his possession is property that is assessable. Just the same as in your commission business if you have a thousand cases of honey in your warehouse on the first day of April you are assessed upon that, upon its market value, upon a fifth of its fair cash valuation. But upon bees out in the field there is no assessment. I don't believe it ever can lie.

Mr. Colburn—I had hoped to continue this discussion on foul brood because I am particularly interested in it. I am no lawyer, but listening to the gentleman here I want to say this, he makes a particular point of *fera natura*. I want to ask if the wild ox and the wild goat and all animals were not at one time *fera natura*? Mr. France has a great many papers here pertaining to the legal status of bees. Quite a number of decisions have been made lately in regard to that very point. Bees sometimes leave my premises and go on the premises of my neighbor. The question is whether I could go after them or not. Mr. France might be able to tell us about the legal status. As to bees being assessable in consequence of their fluctuating nature, you might answer the question by saying a man might have 50 cows on his place and they may all die. Therefore I don't consider that is a good argument in that view of the case, for the assessor doesn't care a cent what is to become of that property; if he finds it in my possession he will assess it. The big factories up in the stock yards have a million, or two million dollars' worth of pork piled up there. When the assessor goes around it is all in New York, but if it is there he will assess it. The same way with bees. I think they are assessable if they are there at the time the assessor comes around.

Mr. Kimmey—I want you to indulge me just a minute. All of these men who have talked want this discussion stopped. I am responsible because I asked the question. I used to be a lawyer myself. I didn't know much law and have forgotten a good deal I once knew. But I commenced in 1868 in the business and have been connected with it ever since, and after listening to Mr. Swift on the question whether bees are assessable or not, I believe he is mistaken.

Pres. York—They used to be when you studied law!

Mr. Kimmey—You men that have been convicted at law don't say anything. You remember the Irishman who said, "I don't want to go to trial." The judge says, "You needn't be afraid, you will get justice, and be jailed." He replied, "That's just what I don't want." [Laughter.] It is true my bees go out on my neighbor's lawn and gather their honey, but it is also true that bees have been recognized by the laws of this country as property, but prairie chickens have not. You can steal bees but you can't go over to the other man's farm and steal prairie chickens. Of course you can commit trespass. But when you steal a colony of bees don't you believe they are *fera natura* and that you can get out of it. You will go to the penitentiary, probably. He can sell the prairie chickens after he shoots them.

Mr. Smith—He can't sell them after he shoots them.

Mr. Kimmey—There is another fellow that has been caught. [Laughter.] If you obey the law you can shoot them. There is a certain time of the year. Do we want to say we are going to own property that is valuable to us, out

of which we make our living, and that it is not assessable? If there is any such idea as that let us be honest and fair and drop it. If they are not assessable I think they should be made so. I rather insist upon Mr. Moore making a statement because he came to my house and we had a peculiar experience down there. Mr. Moore came to me from visiting an educated gentleman, a man that knows all about the anatomy of the bee and foul brood, and that sort of thing, and Mr. Moore told me that this gentleman had one case of foul brood. I had never seen any and I wanted to see, and feel, and smell it. I went up there and I told the gentleman that I wanted to see the colony of bees that Mr. Moore said had foul brood. He says, "You can't see any foul brood here." He also said he had once been cleaned out entirely by foul brood. I was ready to believe there was something there. I know he bought some bees of another neighbor who had foul brood. I had some of the same bees; in fact, the only ones I had to commence with came from there. I was interested in it. He said he had a small nucleus that was doing fairly well and in the meantime had a hive full of comb, no bees, and he wanted those bees to take care of that comb, and so set the hive with the comb on top of the nucleus. Consequently the queen and some of the bees moved out, and then came the cold weather last spring and the brood in the lower hive died. I was ready to believe that story. He also said that Mr. Moore said he was not an expert. I suppose Mr. Moore said the same things to him that he said this morning. I took it for granted there was no foul brood, and didn't insist upon an examination. It seemed to me, then, and it seems to me now—I want to be frank and fair about it—Mr. Moore either ought to know what foul brood is, without going two years to the agricultural college, or else Mr. Moore ought to stop inspecting. I believe after hearing him talk here this morning that the bees of the gentleman I referred to had foul brood, and that Mr. Moore knew it. I think he wants to shake off some of his modesty and say he knows foul brood when he sees it. I want to mention another thing this gentleman told me. He said, "Notwithstanding I believe there is no foul brood I am going to burn that thing up, hive and everything," which he did that night; and I believe that is the proper spirit that any one should show even though one may have a doubt in regard to it. A hive of bees of course is not of much consequence, but if he finds it in one, and there is more than one hive, he should be willing to investigate. Mr. Moore came to my place and looked my colonies over and did it in a very thorough manner, for which I am obliged to him. I said, "How much do I owe you?" He replied, "You owe me just one dollar, and I want you to pay it to join the Chicago-Northwestern Bee-Keepers' Association. I want to state the facts, and I am impelled more to say it by the remarks the gentleman made in the rear of the room. I believe Mr. Moore has done his duty, and he is a good man, and I don't want him to go around saying, "I don't know," when he does.

Mr. Moore—I am not correctly quoted in the case which Mr. Kimmey has mentioned. The gentleman Mr. Kimmey referred to merely plays with bees for pleasure. He told me he had practically been cleaned out with foul brood, but that he hadn't any at that time; and I certainly told him, as I have told everybody, that I knew foul brood when I saw it, absolutely, and I do know it. When it comes to these scientific matters, in which every subject is involved if you come right down to the very bottom of it, I say I am not an expert, as Mr. France or Mr. McEvoy is, because I have not got their years of experience. But I absolutely know foul brood, and I told that gentleman so, and he said, "I haven't got it." We examined one or two of his hives and the bees were very cross; I got stung repeatedly. We had smoke, too, lots of it. When we got done with that hive I showed him he had foul brood, and I showed him the proofs of it, and he admitted that it was foul brood. There was also pickled brood in the same frame with it in the same colony; and he didn't deny to me at all he had foul brood in his apiary.

Mr. Kimmey—When Mr. Moore was in our section he went to every bee-keeper he could find, and spared neither time nor pains in going to the bottom of all of them. I gave him the name of every bee-keeper I knew within five or six miles, and I understand from hearing from them that he visited all of them.

Dr. Miller—I have a resolution to offer: "Resolved, That it is the sense of this Convention that it is desirable that bees should be assessed and taxed."

Mr. Smith—I might say that that same resolution was passed at the State Bee-Keepers' Convention two weeks ago, in Springfield.

Mr. Moore—I want to correct some of these lawyers that are talking about common law and State law. Whenever the Illinois Legislature raises its hands it wipes the common law off the land.

Pres. York put the motion, and a vote having been taken it was declared carried.

#### BLACK BROOD—PICKLED BROOD.

Mr. Colburn—We hear about black brood, and this summer I ran across two or three symptoms in my apiary of something not exactly like foul brood. Some four years ago upon the North Side I had an apiary and I had something I didn't understand, so I sent a portion of the brood to Dr. Howard, and he returned it stating it was not foul brood, but pickled brood. This year I have something just like both,

and not like either. I think possibly we may be getting a little taste of black brood; and possibly the reason we differ is that we are looking at things from different points, or rather have a different disease; that may account for the discrepancy of symptoms, etc., which we find in different hives.

Dr. Miller—I rise to a question of privilege. I have a whole lot of speeches on foul brood, and I know you would be delighted to hear them, but I think the time is passing, and I believe we ought to hear from Mr. France.

Mr. France—I don't know just what part of this discussion you want. Do you want the description so that you may know without guessing when you look into a hive or not?

Dr. Miller—Give that first as briefly as you can.

(Continued next week.)

## Mr. Hasty's Aftershoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

#### PUTTING WEAK COLONIES OVER STRONG.

And now we have a report of 6 colonies put over 6 stronger ones and left a long time—left till the middle of June, and still not a queen killed. And to make it seem more remarkable, they were on shallow frames. Still, on reflection, we may decide that it's not much of a "booster" for the new method, after all. They were bees of a very quiet disposition to begin with; and our perishing remnants are not always such. These colonies were sufficiently strong that they scarcely needed anything in particular done for them—i. e., hardly the kind of colonies we have been studying. They were strong enough to be above the temptation to abandon their own organization and join as individuals a stronger crowd. This is what works the ruin in many of the cases of failure, I suspect. While alone it's "root hog or die;" but when put in the same hive with a more prosperous colony the third alternative of naturalization presents itself; and they accept it until the queen has no one to protect her (or thinks she's coming to that). All the same, we can thank E. W. Diefendorf for his very instructive record. Page 604.

#### ONLY 1 SWARM FROM EACH 9 COLONIES.

Only 30 swarms from 271 colonies is quite a record. The apparent reason of it—steady and abundant honey-flow—is the point for us to remember. You see, in these days everything is being called in question; and some of our professional idol-smashers are liable any day to deny with contemptuous laughter that swarming is ever hindered by abundant honey in the fields. Let's have this item of Wm. Kernan's ready for him. Page 604.

#### DARK HONEY BELOW AND WHITE ABOVE.

Fine theory, to have all vacant space below filled with dark honey, and so much the more white honey put above. Sometimes, with some bees, I guess it would work. If I should try it maybe expansion of the brood-nest would take place, and the dark honey be moved up above to mix in. Page 613.

#### SECTION HONEY NEVER POISONOUS.

Natives who chew up combs, brood, feathers and all, might possibly get poison where there was none in the honey. Also even with poison present in the cells of thin sweet prepared for immediate use, there might be none in the sealed surplus honey. That poison should be only in wild honey as noted, may be because it comes from a plant that grows only in limited localities, and those localities all distant from the white man's bee-keeping. I'll guess, however, that the New Zealand poison comes in always in small quantities, and never at a time of year when surplus is being stored. Consequently, it is always in or near the brood-nest, and trouble nobody except when the brood-nest is broken up, as it is in getting honey from a bee-tree. The possi-

bility of a poisonous fungus, growing in the pollen of the hive in cold weather, should not be forgotten. This would account for similarity of symptoms in widely different localities. Also vindicates the common sense of the bees—pollen not poisonous when they brought it in. I rather think it remains to be proved (with no probability of there ever being any proof) that serious poisoning ever resulted from section honey, or from extracted honey if produced as it should be—in a super entirely away from the brood.

It wouldn't pay the Association to distribute that Lancet article free. Page 613.

#### COLOR OF BEESWAX.

I'm not sure he is wrong, but I think he is—C. P. Dadant, on page 616, where he says "beeswax is always white when first pro-

duced." The way it stands in my mind is this: When beeswax is produced by bees that have been mostly at secreting wax for a long time the scales are white; but when produced by bees that have recently been digesting large amounts of pollen to feed young brood, the scales have a yellow tinge to start with—blood and secretions and all getting some of the superabundant coloring-matter of the pollen. May be I'm wrong. Analogy: Absolutely pure butter is white, I suppose. The food the cow gets in January does not color it; but the food the cow gets in June colors it yellow.

#### VEST-POCKET FOUNDATION HOLDER.

Capital, Editor York! Just one of the simplest, cheapest, and most effective of ways to combat the manufactured-honey fib. A nice little holder for the vest-pocket with comb foundation in it. Should contain at least two pieces, one of surplus foundation and one of brood foundation. Show the good folks right and left one of the props the fib rests on. And yet Mr. Wheeler has worked on this line and things oft went badly awry. No. 1 retold to No. 2, and No. 2, to No. 3; and somewhere on the line the new and truthful explanation got changed back into the old falsehood or something about as bad. Queer creatures humans are. Page 617.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

#### What Has the Harvest Been?

What have the sisters accomplished this year? Please let us have your report, if it is nothing more than a postal card saying how the harvest has been. If the total amount of honey is given, please give also the number of colonies, spring count.

Can't the sisters do a little better than the brothers in this respect? Every now and then a brother reports something like this: "I got 1500 pounds of nice section honey this year," but forgets to say a word as to how many colonies he got it from. From that statement alone one gets no idea whether the season was bad or good. If he had only 10 colonies, then 15 pounds was phenomenal, but if he had 100 it was a failure. Either he should give along with the amount of his crop the number of colonies he started the season with, or he should give the average yield per colony. Indeed, it wouldn't be a bad thing to give both.

But any kind of a report from each of the sisters will be welcomed, together with any little item of interest that may occur. Please let us hear from all.

#### Bee-Smokers with Light Springs

In many things a woman, with less strength, wants things lighter than a man. But the rule does not apply to smokers. A woman, when working at bees, needs just as

big a smoke as a man. Neither does the one with a few colonies need a smaller smoker than one with 100. For all the difference in the price, one may as well have a good-sized smoker as a toy, even if one has only 2 colonies. To be sure, a smoker is not used a great deal with 2 colonies, but when one is needed a good one is needed, one that will hold a lot and give a big volume of smoke, if a big volume is needed. And a colony needs just as big a smoke if it's the only one in the apiary as if there are 99 others beside it.

But there is one thing a woman ought to insist upon in a smoker. For that matter, so should a man. That one thing is a light spring. There is no sense in buying the spring in a smoker so stiff that one's hand feels like cramping after half a day's work. All the stiffness needed in a spring is enough to throw open the bellows without letting the smoker drop out of the hand. Smokers in general are made with springs much too heavy, but if you insist upon it you can get one with a light spring.

#### Results of the Season at Dr. Miller's

The season of 1905, at Marengo, as in many other places, was one of brilliant promise resulting in more or less blasted hopes. White clover was in great abundance, and the bees had more than they could do. About the third week in July, however, the flow closed. White clover seemed as abundant as ever, and

so continued for weeks after it ceased to yield nectar. It didn't seem too dry nor too wet; neither too hot nor too cold; nothing appeared to be wrong with the clover bloom, but it just stopped yielding. There were one or two little spurts, but they didn't last. So a good lot of the sections we had prepared were never taken out of the shop.

Too much faith in the great prospects made us unusual trouble with unfinished sections, and it would have been better if so many had not been put on. But the prospect when they were put on was just as great as it was at the same time in 1903, and if the yield had continued as it did in that year, there would have been loss with less sections on. So how is a body to tell?

One good thing about it was that there was no trouble from the harvest gradually shading off from white clover into darker honey. The last was of the same quality as the first.

A peculiarity this year was that until near the last of September no bees were seen at the watering places. Usually they visit these places more or less throughout the season.

Taking account of stock, here is the way the matter stands for the season:

178 colonies, spring count, gave 11,500 pounds of comb honey and increased to 218 colonies. Part of that 11,500 is estimated, but the estimate is under rather than over the mark.

After all, a yield of 64½ pounds per colony with 22 percent increase is by no means so bad as it might be. Indeed, if we could be sure of as much every year it would do very well. But, then, we had counted on such big things for 1905.

**Honey-and-Almond Paste**

Probably few of the sisters feel they have time for a "beauty massage," but it may be well for them to know that honey is an important ingredient of the paste used for that purpose, in case some one else wants to know about it. Here's a recipe taken from "The Quest for Beauty," in the Chicago Daily News:

"To make honey-and-almond paste to use in massaging the arms, rub the yolks of two

eggs with ¼ pound of extracted honey and 2 ounces of ground bitter almonds. Then add slowly 2 ounces of almond oil and ¼ dram each of attar of cloves and attar of bergamot."

**Our Latest Swarm**

Not long ago some one asked what was the latest we had ever had a swarm. This year we had one Sept. 22. It seemed a very foolish thing for a swarm to issue at that time, when there was nothing yielding nectar, and nothing but certain death to look forward to; but bees sometimes do foolish things. No one knew where the swarm came from, so it could not be returned. But it was a very accommodating swarm, and settled on a fence-post, so all that was needed was to hold a hive on top of the post till the bees went up into it.

**Results of the Season**

My 10 colonies, spring count, gave me about 300 pounds of white honey. I think there will not be half as much late honey. This is a poor locality, as the farmers raise so many grapes and potatoes. My golden Italians, from a queen received last year, did not swarm this year, but gave me 75 pounds of honey, and are in fine condition for winter.

Honey moves off slowly here. I sell mine to customers in the country and surrounding villages. MRS. NELLIE G. PAXSON. Erie Co., N. Y., Oct. 2.

**Bees Did Fairly Well**

My bees did fairly well this season considering the weather, for we had a great deal of rain through white clover, and also during buckwheat. I secured 650 pounds of surplus honey from 20 colonies, spring count, and had only 9 swarms. My bees are in good condition for winter.

I enjoy working with the bees. They are a great study. MRS. MARTIN SCHLEMMER. Jefferson Co., Pa., Sept. 25.

be honey, or if you chose to call it so, it would be adulterated. Glucose, if chemically pure, is composed of much the same material as honey, but its cost is more than the price of honey. The commercial article contains impurities which make it unfit food for man or bee.

2. No, it would still be adulterated, and there would be considerable loss in feeding. The bees are always throwing off moisture from the food they consume, whether you are feeding them or not; and when the walls of the hive are cold enough the moisture condenses on them, often trickling out of the entrance.

3. I don't know how many kinds there are. If you had all the kinds in the world, you might start another kind by giving a different name to yours. Pure Italians are supposed to be those whose workers have 3 yellow bands.

4. I don't know; there are several who have a large number of colonies, and the number is so constantly changing that the one who had most last year may not have the most this year.

Referring to an omitted part of your letter, you are quite right to use just as little smoke as possible; and your plan of finding the queen by running the bees through excluder zinc, although well known, is good.

**Best Bees and Hive—Finding a Location**

Before long I contemplate purchasing a farm "Out West," in the United States, and should like to know which are the best parts in which to purchase—where the land will increase in value, and yet be good for general farming, poultry keeping and bee-keeping. I have lived "Out West" before, but where I lived the land has gone up to such a value that I think there is nothing in it. My property here is on sale now. I shall buy no land or farm until I have seen it.

1. Which bee among the following is considered the best all-purpose bee, and which makes the best cross: Black, Carniolan, 3-banded Italian, and Cyprian?

2. Which hive do you consider the best all-purpose hive, that is, for producing comb honey, also extracted honey?

3. Which State among the following do you consider the best for all-purpose farming (and name a few places where good land can be bought that would be likely to go up in value): Missouri, Iowa, Kansas and Nebraska, and Oklahoma Territory?

4. Could you name two or three reliable land dealers? ENGLAND.

ANSWERS.—1. The Italian seems to be mostly in favor as a general-purpose bee. There are some bees of mixed Italian and black blood that are good, and Prof. Beaton speaks highly of a cross between Italians and Carniolans.

2. That seems to be more or less a matter of taste, and perhaps there is nothing better than the dovetailed, which is nothing more nor less than a plain Langstroth hive with lock-joint corners.

3. Probably there isn't very much difference. In each of them you'll find the desired conditions. Oklahoma being the newest, probably has the best chance for going up in price.

4. I don't know; that's outside the scope of a bee-paper; but advertisements of them abound.

**The Hive Question and a Beginner**

A manufacturing business keeps me in the city throughout the day, but at other times I live in the country. In the mornings and afternoons there is opportunity for divers outdoor work, or rather recreation. For many years I have been interested in entomology, yet it was only last spring that I was taken with the fever to "grow bees."

May 19 a swarm of common brown bees was obtained from a farmer about 8 miles distant from my home; these were installed in a new 10-frame Langstroth (Root-Dovetail) hive; the bees prospered, and on June 15 a super was put on, the sections having narrow foundation starters. By Sept. 1, 4 sections were partially filled with honey, and some 10

**Doctor Miller's Question-Box**

Send Questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

**Bee-Smokers and Smoker-Fuel**

1. What kind of a bee-smoker does Dr. Miller use?  
2. What is the best smoker-fuel? IOWA.

ANSWERS.—1. Corneil and Bingham. In one thing I want a smoker different from usual. I want a light spring. I don't think there's any good reason in wasting strength to use a smoker with a spring as heavy as those usually sent out.

2. A whole lot of them. We are using chips from the chip-yard. Not because they are the best in the world, although they are excellent, but because they are for us a little more convenient than anything else as good. Cotton-waste, burlap, hard wood, etc., are as good or better; but we can get the chips more easily. Something else may be better for you, because more easily obtained.

**Getting Bees to Adulterate Honey—Kinds of Italian Bees**

I am a beginner, having started with 7 colonies last spring in box-hives, and have increased to 15. Some seem to be good and some not so good, but they may all be the same by spring—dead!

1. If honey is pure nectar from the flowers,

then would not bees fed sugar syrup till they store it in the sections and cap it over produce adulterated honey? Or can the bees separate the part of honey there might be in the sweet and cast the rest away? It seems to me that the arguments are that extracted honey could be adulterated and could contain some glucose. What is glucose composed of? There is some kind of table molasses that bees will not bother with at all. I have mixed it with sugar and made syrup which they took gladly. Now I believe that the sugar and pancake syrup both were converted into honey. If either or both contained glucose and it was carried in, stored and capped, was it honey afterward? If so, was it adulterated?

2. If I should feed bees adulterated honey would I get in turn good, pure honey about pound for pound? I fed bees thin syrup one day, and the next morning found water running out of the hive, but with no sweet taste. It tasted, as nearly as I could tell, like rainwater. It had been extracted by the bees from the syrup.

3. How many strains of Italian bees are there? I see 3-banded, 5-banded, long-tongue, red clover, yellow, etc. Do they all mean 3 and 5 banded Italians?

4. Who is the largest bee-keeper in America, and where is he located? About what is his average number of colonies? ILLINOIS.

ANSWERS.—1. If you should get the bees to store either sugar or glucose, it would not

or 12 others partially filled with comb, about one-fourth of which is drone-comb.

Frequent practice on this first hive dissipated "bee-trembles," and June 7 a second empty hive was bought, into which was put a 1-frame nucleus of bees and a select tested golden Italian queen. On each side of the nucleus were hung full sheets of foundation, the remaining frames being fitted with half sheets of foundation. Despite excessive rains during the summer (about 2 feet of rainfall) the yellow bees have prospered, and the hive now contains 5 frames of brood, 2 frames full of honey, and 3 frames being drawn out in snowy comb; there is promise that this colony will be very strong before cold weather in December.

After reading all available bee-catalogs, a copy of "Langstroth on the Honey-Bee" was purchased, and the American Bee Journal subscribed for. Then my troubles began; between the conflict of opinions in the book and Journal, aggravated by "original" views of neighbors, I am floored. One authority maintains that a deep frame is best, another contends for the shallow closed-end frame; neighbor B says my 10-frame hives are too wide, while neighbor C tells me that B knows nothing about bees, and so it goes. In the meantime the reading is continued, the bees themselves are watched, and I am beginning to have opinions of my own.

1. Well, in anticipation of next year I must soon determine the style of hive best adapted to this section of country; my conclusions based on reading, asking, and three months' observation of two hives, inclines me to the deep Langstroth (11½ inches) with 10-frames and full sheets of foundation. This large hive full of hustling bees should yield (theoretically) excellent results. Do you think so, too?

2. Will any advantage follow the use of a telescope cover (as on the Langstroth-Dadant hive), furnishing about ½ inch air-space all around the super and upper edge of the hive-body, comb honey being wanted from some and extracted honey from other hives? The hives are to be left outdoors all winter, entrances reduced, and absorbent (dried maple leaves) put over the brood-chamber.

3. My hives are on stands one foot high. Is it better to have them rest on the ground?

4. Is the Alley method of queen-rearing suited to a novice? I know more about rearing beetles and bugs than about "growing bees."

5. If virgin queens are reared from the golden Italian queen, and drones from the so-called "Adel" Italian queen, will such a cross produce useful workers, or will there be a tendency towards prettiness at the expense of other and more valuable qualities?

While bee-keeping with me is not primarily a money-making venture, I want to start right. There is a fascination about it, and I continue to wonder why I never "took to the varmints (?) " before. VIRGINIAN.

ANSWERS.—I have read with no little interest the account of your perplexities on being initiated into the ranks of bee-keepers. You may just as well make up your mind that you will always meet such contradictions. For more than 40 years I've been at it, and there seem to be just as many contradictory views as ever. But it will hardly kill you. The fact that I am still alive, and outside the walls of an insane asylum, may reassure you. Indeed, I think that one of the fascinating things about bee-keeping is that very element of uncertainty; always some unsettled problem, always the search after the truth, which, in many cases, eludes one's grasp like a will-o'-the-wisp, but always with just enough success to make one eager to keep up the pursuit. I hope that your interest may increase rather than abate, and that this may not be the last time you are driven to this Question-Box.

1. I'm afraid you'll have to do some experimenting on your own account before you can have a satisfactory answer to your question. One thing in favor of such large hives is the freedom from swarming. Yet you can not count too strongly on that. At one time I had two "Jumbo" hives, and looked forward hopefully to good results the following year. Would you believe it? the next summer the first swarm I had issued from one of

these Jumbo hives! For extracting you can count pretty safely on them; but as to comb there is need of experimenting *right in your locality*.

2. Yes, that space will be of value. Instead of air, it might be better to have it filled with cork-dust.

3. Better for the hives to be up; better for the operator to have them down. Also a little better for the bees to have them down. They can crawl in more easily when they drop to the ground heavily-laden in front of the hive. Try most of them down.

4. Yes, there's nothing difficult about it.

5. If both parents are good I see no reason why the cross should not be good.

## Reports and Experiences

### Very Poor Season for Bees

The season of 1905 started off in elegant shape. White clover came on early, and things were humming—especially the bees—and we got ready to swipe a large lot of sweet stuff. Things went on swimmingly, and we got the supers on—2, 3 and 4 to the hive—and the bees were just tumbling over each other to fill them, and we were leaning back in our easy chair thinking what a lot of honey we were going to have to sell, and planning how we would spend the money we got for it—when, all at once without warning, presto! and the honey-gathering stopped, and the bees got cross and hung around the hives and house looking for a scrap; and all this before we had gotten a single section of honey filled out!

White clover continued to bloom, but the bees paid no attention to it, and did no more gathering until the heartsease came on, and we have had so much rain and east wind that they have not done much on that. We will have a few hundred pounds of extracted, but no comb honey to speak of. Well, we suppose such is life in the West, and in other places as well.

The American Bee Journal is like Castoria or Mrs. Winslow's Soothing Syrup in a family of children—we can't get along without it. We would like to have it every day, but as we can't we will take it as often as we can get it. Long may it continue to enlighten the American public on the subjects of bee-keeping and—so-called manufactured comb honey.

J. M. LINSOTT.

Gage Co., Nebr., Sept. 21.

### A Summer's Experience with 3 Colonies

I desire to present a few facts from my experience this summer in the management of 3 colonies of bees, which appears to me to be important when the end aimed at is pounds of honey.

In the fall of 1904 I put into the cellar 2 strong colonies of bees in 10-frame hives; also one nucleus. One of the strong colonies had an Italian queen and the other a native queen; there was also a native queen in the nucleus.

About March 20 I took them out, all 3 in apparently fine condition. The 2 strong colonies built up rapidly, the Italian rather outstripping its darker rival both in honey and brood, when about May 20 each had honey and brood in 10 frames. I then gave each of them 10 frames in another brood-chamber, supplied partly with full sheets of foundation and partly with comb, moving a frame of brood into the upper story, making a 20-frame hive of each.

At about this time I noticed that the nucleus was not thriving, and an examination

### Northern King Queens

One Untested, 50c; Tested, \$1.00. Try one. Address, B. F. SCHMIDT, R.F.D. 1, North Buena Vista, Clayton Co., Iowa.

showed that they were queenless. I gave them a frame of brood from the Italian colony, and they were slow about starting queen-cells, but in due time I had an inferior looking queen, which I replaced a little later with a queen purchased in the South.

About June 20 I noticed, while examining the Italian colony, a frame in the upper brood-chamber with 2 uncapped queen-cells with an embryo queen in each—a most unwelcome condition of things, as I had decided to test the merits of those 2 strong colonies. Accepting what appeared to me to be inevitable (swarming), I decided to anticipate the job, and about a week later I brushed the bees into an 8 frame hive, gave them 6 frames with starters, and contracted the brood-chamber to meet the conditions, and put on a section super with queen-excluding zinc-board.

I was surprised while looking over the frames of brood in not finding more than the 2 queen-cells, which I had previously noticed. I destroyed one of the queen-cells and started a nucleus with the other, using 4 frames of brood and honey. The other 16 frames I put with the original nucleus, which I wintered over.

About July 20 the original colony of Italians, which were now confined to 6 frames, swarmed. I happened to be in the garden at the time. The old queen came out with the bees in a condition apparently too feeble to fly, and I found her crawling around on the ground near the entrance. I caged her and

## A Solid Gold Fountain Pen Free!

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are pure Para Rubber, handsomely finished. The simple Feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

### How to Get this Fountain Pen Free!

To a present paid-in-advance subscriber, we will mail this Fountain Pen free as a premium for sending us 3 NEW SUBSCRIBERS to the weekly American Bee Journal for one year (with \$3.00). Surely, this is an easy way to get a good Fountain Pen. Or, if unable to get the new subscribers, and you want one of these Pens, forward to us \$1.25 and we will send it to you by return mail. Or for \$2.00 we will send to any one the American Bee Journal for one year and a Fountain Pen.

This Fountain Pen would be a splendid gift to a friend or relative. Why not order both Pen and Journal for some bee-keeper as a present?

Address all orders to

allowed the bees to return to the hive. It then occurred to me that the bees had been trying to supersede the old queen when they had 20 frames, and were still attempting to do the same thing, and, in addition, some swarming, as their quarters were too confined. An examination showed that they had another queen and 10 or 12 queen-cells. I brushed the 6 combs and provided the bees with 6 new frames with starters, and started another nucleus with the 6 frames of brood and honey taken away. Now this all resulted from the mistaken notion that the bees were getting ready to swarm when in the 20-frame colony.

Now as to results in honey-pounds: I got from this colony twice brushed about 50 pounds of section honey. From the original native-bee colony, which I built up by adding additional brood-chambers until it contained 50 Langstroth frames, about 200 pounds of extracted honey, and by the same management I believe I should have gotten 250 or 300 pounds from the Italian colony, as they appear to me to be superior to their darker sisters.

To the credit of the Italian colony I have 2 nuclei, one of which I shall have to feed this fall.

I will say in explanation of that 50-frame colony, that I do not own an extractor, and was compelled to build them up in that fashion to meet their increasing needs: however, I believe there is no plan so likely to bring about good results as this building-up plan, by the addition of more brood-frames and the consequent space for expansion and storage thus obtained; and, conversely, the 8-frame brood-chamber and super, with its swarm-engendering proclivities, is the plan most commonly pursued with results in honey-pounds practically *nil* in this locality.

A. E. BURDICK, M.D.  
Palo Alto Co., Iowa, Sept. 19.

**CONVENTION NOTICES.**

The National Bee-Keepers' Association holds its annual convention at the Revere House, corner of Clark and Michigan streets, in Chicago, during the Fat Stock Show, when exceedingly low rates may be secured on the railroads. The dates for the meeting are Dec. 5, 6 and 7. Rates at the hotel are 75 cents for a room alone, or 50 cents each, where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants.  
W. Z. HUTCHINSON, Sec.

Illinois.—The annual meeting of the Northern Illinois and Southern Wisconsin Bee Keepers' Association will be held at Rockford, Ill., Oct. 17 and 18, 1905. All those interested in bees and honey are requested to attend, as no pains will be spared to make this meeting the most successful of its kind ever held.  
J. W. JOHNSON, Sec.

Minnesota-Wisconsin.—The annual meeting of the Southeastern Minnesota and Western Wisconsin Bee-Keepers' Association will be held at the County Commissioners' Rooms in the Court House at Winona, Minn., on Oct. 24 and 25, 1905, at 10 a.m. of each day. All beekeepers invited with their wives, and help to make the convention a success.  
JOSEPH M. REITZ, Sec.  
W. K. BATES, Pres.

Georgia.—The Southern Bee-Keepers' Association will hold a meeting in Atlanta, Ga., during the State Fair, Oct. 20, at 10 a.m., on the Fair Grounds, at the apiaria exhibit. All beekeepers and those interested are invited to attend and take part.  
JUDSON HEARD, Sec.

**Standard-Bred Untested Italian.... Queen, 75 cents**

2 for \$1.40, or 4 or more at one time, 60 cents each for balance of season. The Weekly American Bee Journal one year (either new or renewal subscription) with one of these fine Queens—both for \$1.50. Better have one or more of these Queens. They give satisfaction. First come, first served.

**An Untested Italian Queen-Bee FREE as a Premium**

For Sending One New Subscriber

for the American Bee Journal for a year with \$1.00.

As has been our custom heretofore we offer to mail a fine Standard-Bred Untested Italian Queen to the person who complies with the following conditions, all of which must be strictly followed:

1. The sender of a new subscriber must have his or her own subscription paid in advance at least to the end of this year.

2. Sending your own name with \$1.00 for the Bee Journal will not entitle you to a Queen as a premium. The sender must be already a paid-in-advance subscriber as above, and the new subscriber must be a NEW subscriber; which means, further, that the new subscriber has never had the Bee Journal regularly, or at least not for a whole year previous to his name being sent in as a new one; and, also, the new subscriber must not be a member of the same family where the Bee Journal is already being taken.

We think we have made the foregoing sufficiently plain so that no error need be made. Our Premium Queens are too valuable to throw away—they must be earned in a legitimate way. They are worth working for.

# Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½ cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less,  
**R. A. BURNETT & Co.**

CINCINNATI, Oct. 6.—Reports from different parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakenly expects to receive these prices for his product. The above are our selling prices.)  
**THE FRED W. MUTH Co.**

PHILADELPHIA, Sept. 21.—There seems to be an unusually large quantity of comb honey offered in the market at this time and prices for new goods are somewhat weak. We find small lots of bee-keepers in the vicinity offering it at most any price, regardless of the actual value. Honey has been sold in Philadelphia at the following prices during the week: Fancy, 13@16c; No. 1, 11@14c. Extracted, amber, 5½@6½ cents; white clover, 6½@8c. Beeswax, firm, 28c.  
We are producers of honey and do not handle on commission.  
**WM. A. SELSER.**

TOLEDO, Aug. 18.—The market on comb honey at this writing is practically the same as last; however, honey is being offered quite freely, and this has a tendency to decline the price. On account of the heavy receipts of fruit there is no great demand for either comb or extracted at present. Fancy white clover in a retail way brings 15c; No. 1, 14c; little demand for amber. Extracted, white clover, in barrels, 6@6½c; in cans, 7@7½c; amber in barrels, 5@5½c; in cans, 6@6½c. Beeswax, 28@30c. **GRIGGS BROS.**

CINCINNATI, O., Oct. 7.—The nice weather holds back the demand for comb honey. Crops

seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, ½c more. White clover from 7@8c. Beeswax, 26c.  
**WALTER S. POWDER.**

INDIANAPOLIS, Sept. 2.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 14@15c; No. 1 in best demand at 12c, and amber dull at 10c. Poor grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.  
**WALTER S. POWDER.**

NEW YORK, Sept. 22.—New crop is beginning to arrive quite freely from New York State and Pennsylvania, and is in fair demand at 14c for fancy white, exceptionally fine quality may bring 16c; 13c for No. 1 white, and 11@12c for No. 2 white and amber; no buckwheat on the market as yet. Extracted, in good demand at last quotations. Beeswax, firm and scarce at 29@30c. **HILDRETH & SEGELKEN**

ALBANY, N. Y., Sept. 21.—Honey demand improving here as the season advances, and as next month is the best month we look for good prices. Buckwheat comb is scarce; that is, straight buckwheat. We quote fancy white, 15c; No. 1, 14c mixed, 13c; buckwheat, No. 1, 13c; mixed 12@12½c. Extracted, white, 7@7½c; mixed, 6½@7c; buckwheat, 6½ cents. Beeswax, 28@32c. **H. R. WRIGHT.**

SAN FRANCISCO, Sept. 20.—White comb, 1-lb. sections, 9@10 cents; amber, 7 8c. Extracted, water-white, 4½@5½c; white, 4@4½c; light amber, 3½@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 25@26c.  
The comb honey market is firm at 8½c to 10c a pound. Southern California's output this year will approximate 175 car loads. Last year's crop was practically nothing, and present prospects are for higher prices. With the market practically cleaned up last spring, coupled with the fact that the honey crop is light in all Eastern producing States, the honey men of southern California may reasonably look for better prices the coming fall and winter. The present market price for extracted honey is around 5c. The crop estimate above given means about 125,000 cans of extracted. Of comb honey southern California will have, it is thought, not more than 15 car loads. While California will have about the largest crop in many years, there are some localities where the bees have done practically nothing. Arizona is nearer to a honey failure than any other in 20 years. The crop has not been so light throughout the East in a decade, while Texas is said to be only within 60 percent of its normal production.

## Get New Subscribers

Why not get a New Subscriber for the American Bee Journal, to send with your own renewal?

# 10 WEEKS CENTS

We wish every reader of the American Bee Journal to become acquainted with **GLEANINGS IN BEE-CULTURE**. We extend a cordial invitation in our offer to send you the paper 10 weeks for 10 cents.

There is no bee-paper in the world like Gleanings. Its aim is to meet the needs of every bee-keeper everywhere, and it does it. Whether you own one colony or a thousand or are merely interested you cannot afford to miss a single number. Gleanings is progressive. Every number is an improvement over the last.

## Contributors

It is useless to state that **GLEANINGS** excels in this point. Regular departments are edited by Dr. C. C. Miller, G. M. Doolittle, Prof. A. J. Cook, J. A. Green and Louis Scholl. These names speak for themselves for they are the best writers of the day. Every issue contains articles from the pens of the best bee-keepers all over the land. A list of them would be the catalog of the most successful bee-keepers the world over. We will soon begin a series of remarkable articles by E. W. Alexander. We are safe in saying a higher price was never paid for an article of this class than we paid for a single one of this series. Every one of them will be worth hundreds of dollars to bee-keepers.

## Half-Tone Illustrations

During the past summer we have had a special artist to take photographs for us. He has traveled on our account alone the past summer over 4000 miles and we can promise some very fine pictures. Many of the Second Prize Photo Contest, American and Foreign, will appear soon. Our engravings are made by the very finest engravers in the United States. Just this wealth of illustration doubles the value of the paper.

## Advertisements

Gleanings prides itself on the clean class of advertisements it carries. Its subscribers show their appreciation of the fact by their liberally patronizing them. There is no better medium in the United States for those catering to the needs of the bee-keeper. We now print 25,000 copies and yet with our special edition (Dec. 15, 40,000) our old rates hold good which were based on 20,000 circulation. Gleanings gives its subscribers and advertisers full measure, pressed down and running over.

## December 15th Issue

We are pleased to announce that extensive plans are now under way for a Special Christmas Issue of Gleanings. It is planned that this issue shall far exceed in its wealth of contributed articles, its half-tones and its cover design than anything that heretofore has been attempted in bee-keeping literature. The cover is to be designed and printed by one of the best color printing establishments in the United States. The design is something unique and beautiful indeed. This issue will contain nearly 100 pages, and 40,000 copies will be printed, making a bee-keepers' magazine that compares favorably with any magazine of the present day.

## Subscribe

When you have read this notice take up your pen and tell us to send you **Gleanings Ten Weeks** and enclose **Ten Cents**, in coin or stamps. Don't put it off. The magnificent Christmas Number alone will be worth 25 cents to any bee-keeper. We don't promise this number to any but subscribers. Don't put this matter off for you will never be able to spend 10 cents to better advantage.

THE A. I. ROOT CO., Publishers, Medina, Ohio.

## Editorial Notes and Comments

### The Chicago National Convention

The program being arranged for the National Bee-Keepers' convention, to be held here in Chicago Dec. 5, 6 and 7, is one that it will pay to hear all the way through. Some exceedingly important subjects are to come up for discussion and action, and so it is hoped that it may be a very representative gathering of bee-keepers of the United States, Canada and Cuba.

Some may feel that they can not afford the expense. Some years ago even so experienced and successful a bee-keeper as Mr. C. P. Dadant said he felt well repaid for attending the National convention held in St. Joseph, Mo., just for one thing learned about wintering bees. Last year Mr. and Mrs. Gus Dittmer, of Wisconsin, told the writer that the Chicago-Northwestern convention, which they were then attending, was a very profitable investment for them. And so it goes.

Come to the National convention in Chicago, Dec. 5, 6 and 7, and get new inspiration besides several other things that may not be estimated in dollars and cents.

### Loss from Outdoor Feeding

J. A. Green says in *Gleanings in Bee Culture* that a loss of bees that was serious occurred in outdoor feeding upon the occurrence of a cold, drizzling rain last spring. Although he put out no feed on that particular day, he found to his disgust that the bees came out after the feed as usual.

"They hovered around the feeders until they became wet and chilled. Bees were scattered all over the ground, and festooned over everything near the feeders that would support them, until many thousands of them perished. The losses from that source probably came near balancing the good done by the stimulative feeding. The loss of bees probably would not have been so great if the feeding had been done under an open shed so that the feeders would have been sheltered from the rain. If this had been done, especially if the feed had been kept warm, the bees could probably have made their way through the rain without much loss."

### Carload of Honey—Queen-Cage Cardboards

We have received the following from Dr. Miller:

Our genial Afterthinker, to whom we are all so much indebted, expresses doubts as to the 70-carloads-of-honey story. It isn't clear just what is the ground of his skepticism, unless it would be that it would take the output of 560 apiaries with 5 tons each. What he says appears on page 699. I suppose his skepticism will be about 7 percent stronger when in the same number, 5 pages earlier, he reads of 75 carloads being purchased by the same company. Incidentally it may be noted that "San Franciscan" estimates a carload at 20 tons, and Mr. Hasty at 40. In this locality the capacity of a freight car is not over 30 tons. Isn't there some way by which we can get some definite information besides what "they say?"

On the same page, Mr. Hasty says, "With cardboard over the candy you run heavy risks of having the queen not liberated at all." There's no heavy risk "in this locality," Mr. Hasty. I've used cardboard over candy in hundreds of cases, and I think I never had more than 2 or 3 cases in which the cardboard was not gnawed away. I'm wondering whether those heavy risks are not based on placing the cage over top-bars. I always place it between brood-combs.

C. C. MILLER.

We are under the impression that a carload of honey usually runs from 12 to 15 tons. We think there are not many carloads of honey that weigh as much as 20 tons. If we are wrong in this we will be glad to publish a correction.

### Winter Packing with Newspapers

Editor Root, in *Gleanings in Bee Culture*, says that Vernon Burt, last winter, successfully wintered 300 colonies of bees in the following manner:

"Early in the fall he sees that his colonies are well supplied with sealed stores. He uses the Danzenbaker hive; and if the cluster can be crowded into one section, one section is given. If they require two, of course they are allowed to have them. The same super cover that is used to cover the super for comb honey is put on top of the brood-nest. This the bees seal down hermetically. On top of this cover are placed several thicknesses of

newspaper laid out flat. On top of the paper is placed a shallow chaff tray containing chaff or any other equally good packing material, to the depth of 3 or 4 inches. The paper sticking out in all directions is neatly folded down around the sides of the hive. Over the chaff tray, and fitting snugly against the paper folded against the inner hive, is crowded a deep telescoping cap made of  $\frac{3}{4}$  lumber, with a tin roof. The actual packing material on top is some 4 or 5 inches thick. The sides of the hive are protected by the folds of paper and the outer case. This outer case comes down to within about one inch or so of the bottom-board. As the heat naturally rises inside of the hive, there is no need of making a double-wall bottom-board, nor of protecting the bottom edges of the hive."

### Bee-Insurance

By paying 2 cents per colony, British bee-keepers are insured against claims for damage done by their bees.

### National and Other Conventions

It is almost impossible to expect that any annual meeting of the National Bee-Keepers' Association would not conflict with some other convention. And so it has come to pass that the Minnesota State convention meets Dec. 6 and 7, at the same time as the National here in Chicago. This will of course prevent many good Minnesota members from attending the National convention.

But why not change the date of the Minnesota meeting? It could likely be more easily done than changing the date of the National convention, especially as it is more important that low railroad rates be in force for the National than for any State convention.

It seems to us that the National convention should always be given "the right of way" in preference to that of any local convention.

### Our Convention Reports

We have received the following in reference to the Chicago-Northwestern convention report now appearing in these columns:

MR. EDITOR:—Never before was I so impressed with the value of a good report of a bee-keepers' convention as in reading late numbers of the *American Bee Journal*, containing the report of the proceedings of the last Chicago-Northwestern convention. The report is so full and so good that it is the next thing to being present at the convention in person. The social feature is impor-

tant—meeting old friends and forming new acquaintances, seeing the faces of those whose names have become familiar from reading the bee-journals, and watching the animated features of those who are speaking.

Yet in one respect reading the printed report has an advantage over actual attendance. Sometimes one's attention is distracted and some of the proceedings are missed; one can not go back to hear it over again in the convention, but there is nothing to hinder reading any part of the report over again. Often, too, when so much is crowded into one, two, or three days at a convention, the mind becomes wearied so that there is danger of some good points being lost, or at least their full bearing not properly understood for lack of time to think them over. All the time necessary can be taken in reading, and one can stop as long as one chooses at any given point, making the report of value even to those who were at the convention.

Thanks for such good reports.

#### ONE WHO WAS THERE.

Convention reports have always been one of the strong features of the American Bee Journal. There is much of interest and value that can be had in no other place except at conventions of bee-keepers. Many who are induced to talk at conventions would never think of writing for the bee-papers. And often such people are the very ones who know a great deal about the successful management of bees from years and years of actual experience.

While there may be somewhat of repetition in the reports of conventions, still there is a spice and variety about them that no other kind of reading-matter furnishes.

We expect to continue to give as many convention reports, and as correct ones, as possible, for we believe they are appreciated by the great majority of our readers.

#### Bee-Keepers' Licenses

In this country there is nothing to hinder one from locating an apiary anywhere, only providing one can buy or rent enough ground to locate the apiary. In Australia it is a little different, as witness the following from a report of the meeting of the Victoria Apiarists' Association, as published in the Australasian Bee-Keeper:

Mr. W. L. Davey said that "it rests with the members of this Association whether they are satisfied with the license as at present. The Government has allowed others to take up licenses alongside members' sites. This is not fair; we want some protection in this direction from the Government."

Mr. Cute suggested that the Government be asked to pass a law not to have licenses issued nearer than 2 or 3 miles apart. His branch, Wartook, was in favor of 3 miles apart.

Mr. A. Anderson moved: "That a  $\frac{1}{4}$ d per acre for a radius of one mile on each side of the apiary, and two-sixths for the license" be offered to the Government. Mr. Howard seconded. Carried.

There would probably be some bitter feeling if anything in the shape of a license should be required for occupying Government lands with bees in this country. And yet there are likely not wanting those who would be glad to pay a license even for placing bees on their own lands, if thereby they could be made secure against interference in their pasturage.

**Maeterlinck's "Life of the Bee."**—We have a few copies of this book, price, postpaid, \$1.40; or with the American Bee Journal one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

## Miscellaneous News Items

**Mr. F. Greiner, of Ontario Co., N. Y.,** writing us Oct. 9, said:

"The honey season has not been very favorable, still we have some honey; average about 30 pounds of comb. Some bee-yards did much better than others."

**Mr. Morley Pettit, of Ontario, Canada,** wrote us Oct. 11:

"I finished extracting buckwheat honey a week ago. My output this year is, all told, about 40,000 pounds. Not bad for a young Canadian."

Well, we should think that was *very* good. Who, over the line, can make a better report than that of Mr. Pettit? He is one of the younger generation of Canadian bee-keepers. Can any of the "old timers" show a better record for the season of 1905?

**"Advanced Bee Culture."**—The new edition of this book, by W. Z. Hutchinson, to be out next month, is a most beautifully gotten up bee-book. It is printed on heavy, enameled paper, profusely illustrated with beautiful halftone engravings, and the front cover embellished with a green vine of clover—a golden bee sipping nectar from one of the snow-white blossoms. Most important of all, however, is the simplicity and freshness, the inspiration and real *helpfulness* of its contents. From his years of experience as bee-keeper and editor, Mr. Hutchinson tells in plain, simple language, what he believes to be the most advanced methods of keeping bees for profit, from early spring until the end of the year. The book is almost wholly re-written, and contains nearly twice as much matter as did former editions. In short, every man who would make the most money out of bee-keeping as a business, *must* have this book.

The price, postpaid, is \$1.20; or we will club it with the American Bee Journal one year—both for \$2.00. Send all orders to the office of the American Bee Journal.

**Kretschmer Mfg. Co. at Council Bluffs.**—Only those who have had experience in moving a factory or manufacturing plant know what it means to transfer it to another place. The Kretschmer Mfg. Co. have just been doing that stupendous thing, as they have gone from Red Oak, Iowa, to Council Bluffs, Iowa. They have also added a little over 50 percent to their working capital. The reasons for moving are given in a printed notice which reads as follows:

"The ever increasing demand for our goods necessitated the erection of a larger factory, with better shipping facilities.

"Council Bluffs, Iowa, is the greatest Western railroad center, with 15 railroads radiating in every direction, and freight-rates for the West the same as from Omaha. Here we have just completed the largest factory of its kind in the West—modern, up to date in every detail. As the oldest manufacturers of bee-keepers' supplies (over 42 years' actual experience), we have gathered many valuable ideas for the erection of a complete factory, fitted with the best labor-saving machines, many constructed expressly for our work, operated by 10 electric motors, and all in

charge of experienced workmen, nearly all of whom have been with us for years.

"A railroad track not only runs to the doors of our factory and warehouses, but also through the entire length of lumber sheds and yards, so that carload shipments can be loaded or unloaded direct into warehouse and factory. Paved streets, right to the door of the factory, enable us to haul immense loads of goods for local shipments, with little expense for drayage."

The Kretschmer Mfg. Co., now of Council Bluffs, Iowa, are among our many regular and reliable advertisers. We wish them continued success in their new location.

**The Truth About Honey.**—A few changes have been made in the reading of the Comb Honey Guarantee Circular for shipping-cases gotten up by The Honey-Producers' League, so that it will be suitable for bee-keepers to use in their correspondence, putting one in with every letter they write. It is headed, "The Truth About Honey," and is printed on both sides of a light manilla card-board. It is sent postpaid in lots of 50 for 10 cents, 100 for 20 cents, etc. Every bee-keeper should use it, as it will undoubtedly help to popularize the use of honey.

The Guarantee Circulars for use in shipping-cases should be used by every bee-keeper who sells comb honey by the case. These circulars are the same price—10 cents for 50 copies, postpaid.

Send all orders to this office.

**A Large Apiary.**—Ventura Co., Calif., claims one of the largest apiaries in the world, comprising some 2000 colonies of bees. It is owned by one Mendleson, a pastmaster in handling bees. We were informed by Mr. McDonald, who owns an apiary adjoining that of Mendleson, that the latter's income this season, over and above his running expenses, will be \$10,000.—Rural Californian.

#### Comb Honey Not Machine-Made.

We have a fair supply of the typewritten letter on this subject, which appeared in the Chicago Daily News of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

#### Comb Honey Guarantee Circulars.

—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before nailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

### Bee-Keeping on a Large Scale

BY ADRIAN GETAZ

THE question is sometimes asked whether a bee-keeper ought to add some other occupation to the keeping of a moderate number of colonies of bees, or increase the number of colonies by adding apiaries. I will not undertake to discuss that question this time, but take for granted that the decision is to keep more bees and have a number of out-apiaries.

I suppose that it is admitted that the income from a single colony is necessarily limited, and at the present prices of honey not very great; and that if anything like a liberal revenue is to be derived from bee-keeping alone, a large number of colonies is the first requisite. With the large number comes the necessity of adopting short cuts, and what might be termed a method of wholesale manipulation. In this paper I propose to describe briefly the methods or management followed by some of our largest bee-keepers. The information I have condensed here is chiefly taken from the articles lately published on the same subject in the Bee-Keepers' Review.

MR. E. D. TOWNSEND, OF MICHIGAN.

Mr. Townsend believes in using large hives, not less than 10 Langstroth frames, anyway. The colonies are wintered out-of-doors, either in chaff hives or packed in chaff-packing cases. Each colony should have enough honey in the fall to go through the winter and build up freely during the spring. He estimates 25 to 30 pounds. He says that with plenty of honey in the spring the bees will build up better than with less, and all the spreading of brood-nest and stimulative feeding that could be conjured.

The upper stories are put on about June 1; that is, about two weeks before the main flow of honey. The strongest colonies receive two upper stories. This abundance of room (I suppose already built combs are given) prevents swarming altogether, or practically so, so that no watching for swarms is needed.

A first extracting is done about July 1. The honey then is all from clover, and Mr. Townsend wants as much as possible of pure clover honey, as the price is higher. But for that the extracting might be postponed. In August the main extracting is done, the honey then being a mixture of clover and basswood.

The essential is to have always plenty of empty combs on every colony. The apiarist should have enough combs and upper stories so as not to be obliged to extract in a hurry during the flow. Mr. Townsend puts about 100 colonies in each yard, the yards being quite far apart. He says that in some localities the honey may be missing, while 25 or 30 miles away there may be a crop. With out-apiaries far apart, one or the other will give a crop almost every year, and insures a regular income. He does not make any increase, as he thinks it is cheaper to buy than to rear bees. If any moving is to be done, it is done preferably in May. As his apiaries are on rented grounds, he puts on every one a honey-house constructed so that it can be taken apart, moved "in the flat," and reconstructed easily. As there is no watching for swarms, he prefers to have the bees sufficiently far from the houses or highways so as not to have any trouble. Weak colonies are left to themselves to build up—never united.

MR. E. F. ATWATER, OF IDAHO.

Mr. Atwater's locality has only poor and rather uncertain flows. For that reason he produces only extracted honey. The bees are wintered either on the summer stands where a windbreak is available, or in light, open sheds, facing south, with two tiers of hives in each shed. The sheds keep the hives dry, and protect them from the high winds prevalent in that State. No packing is needed, as the winters are mild enough to dispense with it.

All colonies must have an abundance of stores and bees in the fall, for the frequent flights, with large consumption of stores, will usually result in the loss of all weak colonies during the winter.

He prefers a large hive, and thinks that even the Draper

barn is hardly large enough. He doesn't want any self-spacing frames in the upper stories, as there they should be placed further apart than in the brood-chamber, to save time in uncapping and extracting. He prefers plain frames, hanging on casing nails. About May 10 shallow cases are added to the colonies that may need them. Some equalizing is done.

Between June 1 and June 10 enough supers are put on to hold the first flow of alfalfa. If any colony is crowded below, one or two combs of brood are raised in the supers and replaced with empty combs. Plain zinc excluders are placed on every colony.

The first flow from alfalfa is extracted completely in July. The extracting outfit is hauled from yard to yard in a special wagon. Escapes are not used. The alfalfa honey is so thick that it must be extracted while warm from the hive. The second flow from alfalfa is extracted in August. The supers are then stacked in the yard and the bees allowed to clean them. Owing to the abundance of room but very few colonies swarm during the first flow, and these are among those superseding their queens. No swarming takes place during the second flow, not even in crowded colonies or those superseding their queens. Mr. Atwater produces some comb honey also.

MR. R. C. AIKIN, OF COLORADO.

Mr. Aikin prefers wintering bees out-of-doors packed in chaff. The colonies should be strong and have stores enough to last until May 1, no matter how much brood might be reared before that date. This packing is left until quite late in the spring in order to protect the early brood against the changes of weather. A visit is made about April 1, to ascertain the condition of the bees, to feed those that might be short of stores, and to unite the queenless ones with some others. His locality fails to produce pollen early, and there is but little nectar to be gathered until the main flows. So flour is given early if there is need. On account of brood-rearing each colony consumes from 40 to 60 pounds of honey from the fall to the main flow. And it is important that brood-rearing should be carried to the full extent, this being encouraged as much as possible. The queens are all clipped.

During May some colonies will get so strong that they might swarm. To all such an additional story is given under the brood-chamber. About 5 days before the flow opens a super with sections full of foundation and one or two baits is given to each colony, so they get used to it before the flow comes. When it comes, the additional stories are removed, and more supers are put on so that each colony has from three to five (his supers holding 28 sections). The queens are all removed. The queen-cells are cut out at once, and again 8 days later. A few colonies are set apart for building cells. After the other colonies have been 4 or 5 days without unsealed brood, these cells are given them to requeen. The young queens begin to lay during the latter part of the flow, and thus cause the honey accumulated in the brood nest to go "upstairs." When needed, supers are added below those partly worked, except near the end of the flow, when they are put above. The flow in this locality lasts from 40 to 60 days.

This process to prevent swarming and keep the bees together is the same as used by Messrs. Elwood & Hetherington, except in one respect: When they remove the queens they take one or two combs with each and form as many nuclei. Then 16 days after removal each queen is returned to her former home. If a queen is too old or otherwise deficient, the colony is allowed to requeen from one of its own cells.

#### A FEW COMMENTS.

When I began this paper I intended to give a description of at least half a dozen leading apiarists instead of three. I soon discovered that it would lengthen the contribution too much and contain too many repetitions. The following few points should be mentioned:

1. A honey-house should be put up at every apiary right in the midst of the bees, and built so that it can be easily removed, for an apiary placed on somebody else's land may have to be removed at any time.

2. Some have an extracting outfit complete at every apiary. It costs more, but saves the hauling. It has the advantage that should an unusual flow happen, the extracting might be done simultaneously at every point needed.

3. The majority insist on having enough combs to pile up on the hives until the honey is ripe, or the apiarist ready. Two or three say that in dry climates (California or Colorado) the honey will ripen just as well in the tanks as in the hives, and they prefer to extract often.

4. All but two want the different yards 2 or 3 miles apart, and as accessible as possible to the home apiary. The other

two want them at quite a distance in order to have the chance of catching a crop at some one or other place.

5. The number of colonies at each yard, without overstocking, is estimated at about 100 in the East, to 200 or 300 in California. One exception is Mr. Alexander, of New York State, who claims that almost any locality could support 500 colonies as well as 50 or even less.

6. The summary of all is what the Dadants told us long ago: Plenty of empty combs both for brood and honey. With that condition the number of swarms will be insignificant.

7. Very few extensive bee-keepers work for comb honey. The swarming can not be entirely avoided, and recourse must be had either to removing queens or "shook" swarming, as it is now called. In a small apiary it is best to treat the colonies that do swarm, and not bother the others; but with hundreds or thousands of colonies such discrimination is impossible.

The "shook" swarming will be considered in another article. Knox Co., Tenn.

## Bee-Keeping as a Specialty

BY GRANT STANLEY

THERE has never been a time in the history of this country in which the service of the specialist was in such great demand as it is at the present time. We see it on every hand; the cry goes out all over the land for specialists; it goes out from all manufacturing establishments; it goes out from railroad companies, for men specially fitted for various lines of work; it goes out from every branch of the Department of Agriculture, at Washington; it even goes out from patients seeking treatment for various diseases. The cry to-day is for the specialist. We fairly seem to be passing through a reconstruction period. The reason for all this is not far to seek; surrounding conditions have become remarkably changed, and along with it various questions of a complicated nature, as well as of extreme importance, have presented themselves; questions of such a nature that only the specialist, or one who has been specially trained, can bring the result of his efforts into practical use—men of ordinary intelligence and ability will not do.

That bee-keeping has received a wonderful impetus within the last year or two there can be little doubt. This too long neglected pursuit is at this time receiving special attention. The Department of Agriculture, at Washington, has been awakened to its possibilities; the various State experiment stations are offering short courses in bee-culture, and some have even arranged correspondence courses for those unable to attend the school. There is certainly plenty of room for specialists in the bee-keeping ranks, and, as in any business, his efforts, properly directed, will result in great benefit to himself as well as to others; in fact, no well-directed effort is spent in vain. The bee-keeper who will specialize will soon find that his word has become authority, and, furthermore, his service will quite likely be in demand.

The bee-keeper who will specialize will have studied the various bee-diseases, and will be in position to eradicate any disease the minute it becomes manifest in his apiary; yes, he will quite likely go a step further, and apply such preventive measures that his bees will not become diseased: he will have mastered the question of disposing of his honey crop at the highest possible price obtainable; in fact, he will so direct his efforts that his product will be in demand; he will be able to reduce winter losses to a minimum, as a result of his thoroughly studying the essential features of successful wintering; the blooming of all nectar-producing plants will receive like consideration; in fact, the whole subject will be held up and studied on every side. It is the men who have become thoroughly acquainted with the elements underlying success at every point, to whom we must look to carry this work forward.

There are too many people who look on bee-culture as a business of little importance; in fact, enough would laugh at the idea of making bee-keeping a specialty. Others have not sufficient confidence in themselves to "keep all eggs in one basket," but is it not true that the men making a specialty of their business are the most successful? Is it not true that with a combination of pursuits a man must direct his thought and energy in several places at the same time, not being able to bring the best out of any of them, while in the making a specialty of one pursuit his whole thought and effort is centered to one point? And is it not true that only in this manner will the highest success be achieved?

Let us remember that what is worth doing at all is

worth doing well; it is worthy our best efforts, and I assure you that if proper remedies are applied bee-culture will be brought to a very high degree in the near future.

Lycoming Co., Pa.

## A Tree Colony—Two Queens in One Hive— Bees and Dark vs. Light Colors

BY W. W. M'NEAL

I WISH to relate a little incident which happened in my apiary the past summer, that may be of interest to some. On or about August 1, one of the Italian colonies cast a swarm. The queen that went with the swarm was a virgin, and they settled on a limb of a cherry-tree about 12 feet from the ground. The limb was not over 3 inches thick where the swarm was clustered, but a smaller one branched off from there, affording, seemingly, a satisfactory lodging place. From that location the bees could fly out and in among the branches with few obstructions; but the sun could shine full on the cluster during a portion of the afternoon. The floral conditions were very bad at the time, and I did not regard the swarm as being of sufficient value to pay for the trouble of hiving it, so I left it to its own sweet will, and discovered, several days later, it had decided to stay. I left it there till Sept. 1, then I hived it.

Now the bees built 5 small combs, the center ones being about twice as large as a man's hand. Brood was being reared successfully, the queen having mated all right. Considering the state of the weather, there being frequent rains while the swarm was keeping house outdoors, it makes the case a remarkably singular one. I don't think I ever witnessed a similar case in my 20 years' experience with bees.

At another time the past summer, when I was looking for the queen in a certain colony, I found what was presumably mother and daughter reigning jointly, seemingly, in perfect accord. Both queens appeared to be in good condition, and there was more than the average amount of brood in the hive. I have met with this experience several times before; but it shows how far bees will at times depart from their customary habits.

Let me relate just this one more—an experience with bees and chickens. Having observed that bees were influenced to some extent by certain colors, I thought to test the matter in this way:

I would fence in the apiary with poultry-netting, and then turn in several broods of little chickens. Well, I did so, and found that the little white chickens could run about without being molested, rarely, if ever, by the bees. Brown leg-horns were not taken much notice of, but coal-black chicks were often stung to death.

If any of the readers of the American Bee Journal have witnessed anything that leads them to believe that bees are angered by the sight of dark-colored objects, I would be pleased to hear from them through its columns.

I have noticed boys in knee-pants and black stockings were more often stung on the legs when walking through the apiary than were bare-footed boys, or when shoes were worn without stockings to protect the legs. Scioto Co., Ohio.

## Convention Proceedings

Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill.,  
Nov. 30 and Dec. 1, 1904

(Continued from page 714.)

DETECTING FOUL BROOD.

Mr. France—There is one thing of vital importance to Illinois, that the State Association and the Chicago-Northwestern, now made a part of it, hand in hand together work for the needed legislation this winter, and not wrangle so much over other things. I am on my way to Washington to help Prof. Benton get out a bulletin, of which there will be published 50,000 copies for free distribution to the bee-keepers of the United States, on the diseases of bees. I find that edu-

cational literature on this subject will do as much good as inspecting. As soon as we can get the people educated I question if we will need any inspectors. [Applause.] As I said yesterday, unfortunately in our State I find a very small proportion of the bee-keepers who read bee-literature, and it is going to take some time to get them educated. Until that time we will have need of those other devices. To those of us here who have not seen foul brood, this sample I am taking with me to Washington—(by the way, it has odor enough)—is a sample procured out of a hive in the city of St. Louis while I was down there at our National Convention. That disease was contracted from your State, across the river, by bees robbing from the city of St. Louis, so that your State transmitted it over there. It is a very serious case of disease.

Mr. Wheeler—How can you prove that?

Mr. France—We prove it in this way: The strongest colonies of bees that this man had in St. Louis were, in the fore part of the season, very busy bringing in honey and apparently robbing from somewhere. He took chop dust and put upon those bees so that he might see how long it would take for them to go and come back again. He got the time, and he discovered them all going directly east across the river. He went across the river and found a bee-yard infected with foul brood, and these bees with the dust on, going in and out.

Mr. Wheeler—Did he have other colonies?

Mr. France—Yes, there are three others that have stolen away from this naughty colony which was the strongest, and to-day is a dead colony in the hive. Now the disease in appearance varies according to the localities, but I find some few things that do not vary a great deal: The sunken capping; the ragged, perforated holes in the capping. I believe in all the States that is common. The bee in the larval age, at about six to eight days from the egg, will first to the naked eye show the appearance of the disease; earlier than that you would need a glass. I am taking this from the point of those who want to use just the naked eye, as you can't, without a glass, see it before that. The bee will, in the larval age, instead of crawling around as it should, stand upon the point ends of that larva with its back up. It is diseased, in agony, and in that condition it does not lie down naturally. There is a little yellow cast on either side of the back. It finally straightens out the same as the natural larva, and in standing up it lacks the vitality to retain itself in that shape and falls back again to the lower side-wall of the cell. That is the time that the larva will make itself adhere to the side-wall and will never let go.

Now, there is a marked difference between black brood, pickled brood, and foul brood. Foul brood, when it once strikes the lower side-wall, stays there as if fastened with glue. The bees can not remove it except in one way. If those combs have been thoroughly fumigated with formaldehyde it has a chemical action on those and they do remove it in some cases, but not in all. That bee in the last dying effort gets quite a dark color, and it throws out its tongue frequently with force sufficient so that the tongue strikes the upper side-wall and as such will hold as if put there by glue. That will have a tendency, as the body of the bee dries out, to draw the head up. This tongue has a tendency still to hold, and in the sample I have here there are many of those larvae at that age with the tongue still holding thread-like to the upper side-wall. That is the only reason I can give why always in foul brood the head of the larval bee has a Chinese-shoe-fashion or turn-up; it is because of that.

Now, the body of the bee becomes flattened and dark-brown, nearly coffee-color, and just at that point in giving way, as it drops down, there is a dark, very nearly a black streak across the body of the bee, and apparently on either side little brown streaks that will remain in that condition for about two days. It will continue to dry on the point on the lower side-wall until it is no thicker than the side-wall of the comb, sometimes even thinner than that, but the head end of the bee having dried in that curled-up shape shows itself to the eye much quicker than the balance of it further back.

How to look at the comb is one of the most important features that the bee-keepers of our country have not learned. They take a comb and hold it looking straight down into the cells. I confess I can't see foul brood in that way. For the benefit of this bulletin we are getting out, I went to an artist the other day with this comb and told him I wanted to be photographed, but to take the picture from the rear. I wanted to show how to look down in the comb. As an illustration we will suppose this to be a comb of foul brood, and I want to look into it and there is the light—and by the way, never take candle light or electric light—you want good day

light in order to see it satisfactorily. If I were to hold it upright, and stand with the light coming over my shoulder, I would still look down into the bottom of the cell and see no foul brood. But let me tip the top towards me so that my eye looking in there will strike the lower side-wall about one-third the length towards the base, then I will see those black-brown heads readily all through the comb. You need never question it. Black brood or pickled brood will never have the appearance that foul brood does. In every state where I have found it, there is a marked difference. This photo is simply showing where I am holding up the comb. I made a streak on the negative showing the angle of the rays of light. It should be coming over the shoulder, and then tip the top of the comb towards you.

Mr. Wheeler—Have you learned anything definite this last year about fumigating?

Mr. France—I took one apiary badly infected where there were several hundred combs, and from the fact that formaldehyde gas is one of the best disinfectants the medical world has to-day, there was a great possibility, and I had a box made by one of the best carpenters, which was perfectly airtight, all jointed, and white lead put in the joints. I put in that box quite a number of combs, leaving about an inch and a half space between each two combs. I had Mr. Weber's lamp and followed his directions with one exception—I gave twice the amount, and doubled the time in which it was fumigated. I aired the combs, and two days later I put them back into clean hives, put the bees back on those combs, and went to Los Angeles to the National Convention; came home, went immediately up there, and by the time I got back they had the brood hatched. In about three-quarters of those hives I found foul brood beginning to appear. I went to further investigation on the case and I found this, that every frame I had fumigated had here and there a cell that was capped over at the time. Those that were not capped over the bees had cleaned out, and I could not see any foul brood, but where they had not taken that capping off, seemingly the chemical properties of the acid had not destroyed the germs, and the brood in those cells was diseased. So that if I were to fumigate combs I should first uncap everything sealed and put it in an extractor, and I would throw that brood till I was satisfied I had thrown everything out of it possible, and then fumigate it. There is a possibility, but bear in mind we are running a great risk and I would not recommend it. I have carefully weighed the combs, carefully weighed the wax rendered from a set of combs, and considered the price of foundation, and in Wisconsin we can change a hive infected with old and black combs to comb foundation at the cost of 12 cents per colony. Why do we put any stress upon the loss in that line? Those bees have as much new vigor and ambition to work on foundation, over the other one, as a boy has over a new suit of clothes.

Mr. Wheeler—We have heard a good deal about fumigating the hive with a spray; there is a man in California that has practised that. He sprays the bottom-board and allows the fumes to go up in the combs.

Mr. France—I have tried that somewhat, but there is a marked difference between California's dry atmosphere and here. I question, with the experience I have had within the last two years, if the hive is thoroughly clean that there is any danger. I put the bees right back into the same hive on comb foundation, and I have no trouble.

Mr. Wheeler—Do you shake them out twice?

Mr. France—Yes. I tried two apiaries by shaking once, and in the majority of cases it cured it, but here and there would be a case in an apiary where it did not, and it would not be safe. We do not lose a great deal if we do this at the beginning of the honey-flow. As an illustration, up in Central Wisconsin I reached an apiary of 15 or 20 colonies, all infected, quite late in the afternoon or evening of the first day of basswood bloom. The man was a very thorough man; his surroundings all showed it. I repeated to him what I would do with the apiary, were it mine. I said, "Do you understand it?" He said, "Yes." Now as a teacher I learned that the best way to know that the student understood what I told him was to let him tell it back to me again. I said, "You tell me, if you please, what you are going to do with those bees." He did, and I had to correct him only in two places, so I was satisfied he understood how to do it, and do it thoroughly. Thirty days later I returned to the apiary to see what the effect was. The same hives were there and I could find no indications of the disease. That was two years ago, and there is none there yet. So I am satisfied it is treated and cured. And on those hives was from 16 to 18, and on one hive 24 pounds of section comb honey within 30

days after they had been treated. That colony had not suffered very much.

From another apiary that had gone down from a large to a small number, the apiary having been treated, those bees had been taking first and second premiums at our Wisconsin State fair. It doesn't hurt a boy to have a new suit of clothes. The cost is a very minor affair. The worst difficulty with me, for the first few years at least, was to adjust myself to the peculiar condition of each individual bee-keeper. There is the worst feature I find as an inspector. One man is glad you have come, and will do anything, even leave the harvest, if you please, to have that work attended to; the other man is the very opposite—he would sooner you would

get away from there; he would promise anything to get rid of you; and the surroundings correspond. That is the man who needs an inspector, not the other man. In order to help out I have taken with me for the last two years a German wax-press, having a case made so that I could check it as baggage. Where I find a badly infected yard, with the class of bee-keeper whose surroundings are not favorable, I take off my coat and I stay there and clean up the premises myself, and take my wax-press and go on. If I leave it to him a neighbor who is making his living out of the business will suffer from the indifference of this friend.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Squab-Raising with Bee-Keeping

The question as to what may be run in connection with bee-keeping is one that is always in order. An article in White's Class Advertising with reference to the Plymouth Rock Squab Company, contains a paragraph which suggests the possibility of squab-raising as a side-line for the bee-keeping sisters. The paragraph is as follows:

"The records at the Boston office show that women are singularly successful in this industry, for it is easy work, and work to which they are especially adapted. Squab-raising is also a business which is run by a great many in conjunction with poultry."

### Finding Queens

Mr. D. M. Macdonald, copying in the British Bee Journal some instructions given in this department for finding queens, adds this comment:

"There is no royal road to finding a queen, and practice is what the novice needs. It becomes, in general, a simple process—although at times some queens, especially young ones, prove very elusive, and are really adepts at the art of hide and seek."

Good sense in that. Practice is everything. Just keep at work finding queens and it will soon cease to appear such a difficult thing.

### Sisters, Use Honey in Cooking

Any sister who has never tried honey in cooking is making a mistake. Cake is not in great favor at our house, but honey-cookies are a standard article. Besides being universally liked, they keep indefinitely—if not eaten before the termination of that uncertain period.

### A Canadian Sister's Success

The Canadian Bee Journal says that Miss Treverrow is, "so far as we know at present, the most extensive and successful lady apiarist in Ontario, her average this season amounting to fully 130 pounds to the colony of white honey. Miss Treverrow uses the 8-frame Langstroth hive exclusively. Referring to this she humorously stated that she was not one of the 'big fellows,' and does not intend to be."

That is decidedly interesting, but it is just a bit exasperating that Editor Craig leaves us in the dark on two very important points. Please, Mr. Craig, won't you kindly tell us how many colonies there were in that apiary that averaged 130 pounds, and also whether the honey was comb or extracted? You see it makes a big difference whether there were

5 or 50 colonies. In a good location, with no other beea near, the average from 5 colonies might be very much more than from 50, and 130 pounds of comb honey would be as good as about 195 of extracted.

In any case, Miss Treverrow did well, but just how well can be better understood if we can have the desired light on those two points.

### Honey for Chapped Lips

Either white vaseline or honey will make a pleasant application for chapped lips. Don't bite the lips. It is evidence of nervousness, and will keep your cupid's bow in very ragged, unlovely condition.—Chicago Record-Herald.

### Bee-Keeping for Women

In these days when so many women are engaging in all kinds of enterprises to make a living for themselves, and often to make a living for others, it does seem strange that so few women engage in bee-keeping. With modern methods, so that one need not be on

hand all the time to watch for swarms, bee-keeping can fit in with almost anything else. Reading in the National Daily Review about what a set of enterprising women are doing with chickens and eggs down in a certain part of Tennessee, one wonders why those same women don't join in bees with the biddies. From Morristown, Tenn., a place of less than 3000 souls, there were shipped in a year 223 carloads of eggs and 703 carloads of poultry, representing the enormous value of nearly \$3,000,000.

Now that isn't because there are some men of big capital who have started poultry establishments on a large scale. "To the women of East Tennessee, those living in the small towns and farming communities, is given the credit largely for this enormous volume of business." The chickens and eggs are largely taken to the small country stores all over East Tennessee, and are there gathered up by the hucksters who ship them in to Morristown or other near-by points.

That shows the power of littles when gathered into one great aggregate. Suppose one woman out of 20 throughout the land should keep 5 colonies of bees, and each colony should average 25 pounds of comb honey yearly, do you think that would add anything worth while to the wealth of this Nation? Let's see. One out of 20 women, at a very moderate estimate, would give 500,000, and with 5 colonies each, giving an annual yield of 25 pounds at 12 cents per pound, the whole would foot up the neat little sum of \$7,500,000. Worth while, isn't it? And that would be just so much that is now going to waste.

Why under the sun don't more of the sisters go at it?

## Mr. Hasty's Aftershoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### POLITENESS DEFINED

Stinging with sharp words, and then saving our "face" and reputation by offering the honey of a smile! "Afeared" the ladies do not have the monopoly of that naughtiness. How shall we attack this mightily respectable sin? Let's circulate (vest-pocket holder style) the best of all definitions of the word, politeness: Politeness is real kindness kindly expressed. Page 618.

### THAT SUGAR-WATER SUMMER DRINK

Also afeared, Sister Wilson, that weakly sugared water exposed four days in summer will have considerable drunk in it. Fraud anyhow. The idea of its specially recommending itself to bee-folks because it consumes two ounces of honey to over four gallons of the stuff! Let us spew it out of our mouths. (In dumb show, without taking any in, best way to do that.) Page 618.

### "SHRINKAGE" IN SCALE-WEIGHTS.

It be-wonders me what Geo. H. Kirkpatrick means by "shrinkage" in connection with his scale-hive weights on page 630. Hardly do to say that nectar just brought in decreases in weight so little as one-seventh or one-

fourth in becoming ripe honey—and what else can it be? Also, I wonder if the figures in the column of gains result from weighing once a day or twice a day. There is a decided loss of weight by night—more when they have much young brood and less when they are rearing little—more when the gathering is large and less when the gathering is small—more when the nectar is thin and less when the nectar is less thin—and I suppose more when they get through roaring (fanning) long before morning, and less when they don't get the fanning job well done. For steadiness of yield with no cyphers in it this record is rather remarkable. Two maximums a few days apart, one jumping to 16½, and one of the growing kind growing up to 18½—big figures both.

### HOW BEES BUILD HONEY-COMB.

After giving so lucid and interesting an account of comb-building as Mr. Doolittle has done—and getting such a trouncing for it as Arthur C. Miller gives him on page 631, I think he should reply—unless prepared to admit that the main statements of his account were worthless. Meantime I guess I won't mix in—any further than to say that I am not yet fully convinced that the bee does not help

itself by certain rough-and-ready measurements—touching the work with some of its members. A live creature doesn't have to measure as a machine would have to do it.

And here's a big battle at boxing, worth traveling to Frisco to see; Ho, somebody! you go sponge Arthur, and somebody sponge Mr. D.

#### DRONE-JUICE AS AN APIFUGE.

The Forestier experiments which Mr. Dant gives on page 632, are appetizing, to say the least. Half inclined to think, though, that the results will dissolve into thin air when American bee-keepers try a hand. Easily tried and soon settled, I should say. As to protecting the hands with crushed drones, I don't realize any need of having my hands protected. I don't want to work with my bees when they are in any such infuriated frame of mind as to sting my fingers. The beginner would not feel so; but even he would get harm rather than good if he had the means of disregarding entirely the mood that bees badly handled in bad weather can be gotten into. At least one thing in these attractive experiments looks very suspicious.

The understanding is that drones can enter other colonies about as safely as they enter their own. If this is so it's queer that the juice of alien drones themselves would be unnoticed. I don't believe we want an apifuge—not very sorely at any rate. But if wetting a queen in the juice of crushed drones is certain to give her a kind reception in the colony the drones came from, that will be a valuable addition to our resources.

#### DAILY WAX-SECRETION OF BEES.

No, sir. Your 26,000 bees are not going to secrete a pound of wax in one day. That would require each bee to secrete wax at the rate of its own weight in 6 days. Cut those figures down heavily. Nearly 20 years ago I was much interested in my own experiments on this line. Memory poor, and haven't time to hunt up the records just now, but the wax-secretion of a colony is nearer an ounce per day than a pound per day. Wax is produced in scales—scales small and thin—and only 6 of them on a bee. They would have to grow too much like Jack's bean-stalk to equal one-sixth of the bee's total weight in one day. Page 634.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.  
 Dr. Miller does not answer Questions by mail.

### Removing Supers for Winter

I have 15 colonies of black bees, with supers on. Will it be best to take the supers off, and leave them off during the winter, or leave them on the hives empty?

TENNESSEE.

ANSWER.—It will be well to take off the supers, most certainly if sections are in them. No harm to leave the supers on if they are filled with some sort of packing.

### Increase and Rearing Queens

1. When I get out and can attend to the bees, if I find they have eggs and larvae in the brood-nest, would you advise me to put a division-board in the hive, placing the combs, larvae and part of the bees on one side, shutting off the queen and bees on the other side? Understand, this is with the view of making increase between now and spring. I noticed the bees were active upon the flowers before I was disabled, and hope there are still drones.

2. If the queenless bees should make queen-cells and place therein an egg, how long before the cell will be capped?

3. What is the time, generally speaking, from the capping until the queen cuts herself out of the cell?

4. How long is it, on an average, from the placing of an egg in a queen-cell till she comes out a full-fledged queen?

5. If there are no drones, can we not by feeding incite the queen to laying, and thereby produce drones?

6. If there are drones, and the queenless bees have formed queen-cells, would you form a nucleus of bees by taking 2 frames of bees and one of honey, giving each nucleus a capped queen cell?

7. How long after the cell is capped should it be before it is placed in a nucleus?

CALIFORNIA.

ANSWERS.—1. A man who has been through the mill as you have, certainly deserves to succeed, but I doubt the wisdom of making any increase before next season. A colony gotten through the winter in good shape, and strong for the beginning of the season, will allow you to build up better than two weaklings that you might have if you divide now. Moreover, if you decide to try the plan you outline, you might do so without any great

loss, and then unite for winter if you did not succeed.

2. In 8 or 9 days from the time the egg is laid the cell should be capped. But instead of an egg, queenless bees will start with a larva 2 days or so of age, and ought to be capped 4 to 6 days later.

3. About a week.

4. 15 or 16 days.

5. Possibly, but it's uphill business.

6. Yes, but hardly so late in the season.

7. The riper the cell the better, say within a day or two of hatching, or 5 or 6 days after it is sealed.

### Wintering Bees in a Building—Taking Off Supers for Winter

1. I have recently put up a building to winter bees. Can I cut a hole in it and place the hive in front of it?

2. I would also like to know if I can paint a hive when the bees are in it. If so, when is the best time to do it?

3. When should I take off supers for winter?

VERMONT.

ANSWERS.—1. Yes, you can have a small opening in the wall, and have a passage leading to it from the hive. But reports of wintering in this way have not generally been the most favorable.

2. Yes, the bees will not object, and the best time, so far as they are concerned, is when they are not very actively at work. Now is a good time.

3. Just as soon as the bees stop storing, and in the present case that probably means some time ago.

### Management for Comb Honey

I have paid the strictest attention to the questions you have answered in the American Bee Journal, but kindly inform me if I have the right idea of the way you handle your colonies to produce abundantly of comb honey. I do not know of your method of getting colonies ready for the flow, but Mr. Donlitle's plan is as follows:

Six weeks before the flow, take a frame of honey, breaking the cappings, and place the same in the center of the colony. After 7 days he inserts another frame of honey in the center of the brood-nest, prepared as before.

I failed to say that when he has decided to commence operation he equalizes the stores so that he knows each colony has enough to carry it at least 2 weeks without any fear of starvation. Is your plan different from this? Will I be asking you too much for your plan?

Here is my point: If you have colonies good and strong, and ready for the flow, do you contract the brood-chamber down to say 5 or 6 frames, so the queen has only a few frames to lay in, and so the bees will rush the nectar into the supers?

Also, by having only 5 or 6 frames in the brood-chamber, you don't rear considerable bees to become consumers instead of gatherers after the flow is over. DELAWARE.

ANSWER.—All I do is to see that each colony has abundance of honey, and then let them build up at their own sweet will. So you see you're not asking a great deal when you're asking me to tell you that, and you will please feel free to ask any questions you like.

As to further management, I don't contract to anything less than one story of 8 frames. If the queen will occupy more than one story, I give the second, and then, when supers are put on, the colony is reduced to one story. That useless-consumer theory may be overworked, and I'm not afraid of having colonies too strong at any time.

I thank you for your kind words at the end of your letter.

### May Be Robbing—Feeding for Winter

1. I believe my bees have paralysis. I have only 3 colonies; they have stored no honey. There are no other bees within a mile. It looks as if my bees were robbing each other. I have sprinkled sulphur over them once. How often ought I to sprinkle them? They are all fighting each other. A few seem to try to get into the top of the hive, but I think they are my own bees. I have contracted the entrances.

2. If I feed with a Boardman feeder, will the bees whose hives are filled up below take it up into the super? Two of the colonies have one super on, and one has more.

3. Would it be better to use a half-gallon Mason jar rather than a Mason quart jar?

4. The bees may have honey below. How much syrup ought I to feed them?

5. Would it be best to requeen them? They are black and cross. According to the American Bee Journal they have bee-paralysis.

MISSOURI.

ANSWERS.—1. If it is a case of paralysis, keep up the sulphur every day or two till cured. But your saying the bees try to get in at the top makes it look like a case of robbing.

2. Whatever feeder you use, the bees will carry up into the super the feed after the brood-chamber is filled, and of course that wouldn't do.

3. One will answer as well as the other.

4. That depends upon how much they already have. Feed till they have in the brood-chamber about 30 pounds in all.

5. It would be profitable to get a better strain of bees.

### Location for Bee-Keeping—Miller Feeder

1. If you were free to select a location for bee-keeping, where would you go?

2. What do you think of Northwest Colorado as a location for a bee-keeper? also Southwest Missouri? and Big Horn Basin in Wyoming?

3. Where can we get such information in a ready reference form?

4. Should the inside wall of the Miller feeder be a bee-space, or less, from the bottom? Would it not be better to be less than a bee-space, to keep the bees from the main part of the feeder? IOWA.

ANSWERS.—1. I don't know. It's a problem on which I'd put a lot of study if I had it to decide. It certainly wouldn't be likely to be such a location as I now have, with only

# Reports and Experiences

## Poorest Honey Season

This is the poorest season I have ever known—only one-third of a crop, owing to excessive rains. O. M. BLANTON.  
Washington Co., Miss., Oct. 8.

## Bush Clover

I send a plant or blossom and would like to know its name. The bees are working on it. There is only one plant of it here, so I will save some of the seed. A. J. DIEBOLD.  
La Salle Co., Ill., Oct. 6.

[The plant in question is the bush clover, and a very good honey-plant, too. It takes possession of waste-places and scarcely ever becomes obnoxious. So you need not hesitate to let it spread.—C. L. WALTON.]

## Blessed with a Good Season

I see that reports from some places show a poor crop of honey. I have been blessed with as good a season as I ever had, and nothing from basswood. The crop was mostly from blue thistle, and as fine honey as I ever had. I had a hard time to extract it, as I always leave it on the hive until capped unless fall honey begins to come in, and my comb honey was the whitest I ever set eyes on. I sold the extracted at \$5.00 for a 60-pound can, and can returned, as fast as I could take it off. Comb honey went at 14 cents, and the buyers resold at 20 cents, but that has been my price for years, regardless of crop, and I never have any on hand by Sept. 10.

It looks strange to me that bee-men have hard work to sell their honey crop. I would like to have what I could dispose of at the above figures. There is hardly a day by Sept. 1 but I have to turn down orders. The largest crop I ever had was 9800 pounds, about one-half extracted. That year it was all gone by Sept. 3. One buyer in Boston would take all I could produce every season. I let him have only one-half of my crop this year; and last year I could not let him have a pound, as the last two winters I lost most of my bees. I have only 75 colonies now, not all Italians. C. M. LINCOLN.  
Bennington Co., Vt., Oct. 9.

## Fine Bee-Literature

I have gone through the first 5 copies of the American Bee Journal, and must say I like it fine! Those 5 copies are worth more than the subscription price. Too bad so many "would-be" bee-keepers do not value our bee-literature. J. G. BAUMGAERTNER.  
Clinton Co., Ill., Oct. 12.

## Scarcely an Average Honey Crop

The honey crop in this locality could scarcely be called an average one, yet it was far better than last year. The weather continued very cool and wet until June, but in spite of unfavorable conditions brood-rearing was kept up remarkably well, which gave plenty of bees to gather from basswood, and basswood never bloomed nicer here than it did this year. The weather was also favorable for the bees during the time it bloomed. Asters are now beginning to bloom, and always gives a bountiful supply for winter stores. There is no feeding of syrup or other substitutes for honey here in the fall, as asters furnish all the stores necessary for winter.

I have 47 colonies of bees at present, all in Langstroth 8-frame hives, and all in fine condition for winter. About all colonies have young queens, which, as a rule, insures a populous colony of young bees, which will winter with very little protection from cold. From

my experience too much importance can not be attached to giving young queens about swarming-time. Queens given then keep up laying until late in the fall, which produces bees of just the right age to live through the winter and rear brood in the spring.

Golden Italians are superior to any other strain of bees as honey-gatherers, and also for gentleness, in my estimation; they also winter well. JAMES WOLFE.  
Marshall Co., W. Va., Sept. 20.

## Virgin Queens and Swarming Out

At last that all-important question (to me, at least) is being discussed, viz : Mating and swarming out of virgin queens. In this locality no worse advice could ever be given, than that of giving a frame of unsealed brood. The last virgin, when so helped, will bring out a swarm every time when there is honey to be found. Exceptions: Very early in the spring, say about March 1, or very late in the fall, say after the middle of October. Queens from these post-constructed cells are every bit as good as any.

Bees in Florida did not do much the past spring. It was rather cool, rainy and windy. One single rain-storm of 2 hours' duration in May ruined one of Florida's finest honey crops, viz.: honey from tupelo-gum.

My first surplus I got from corn, or, rather, corn-tassels. Yes, Dr. Miller, here in my location, on sandy, piney woodland, bees work on corn-tassels just as long as there is any dew on the grass in the morning, and no longer; a few bees would hover also over the corn-tassels a very short time before sunset, but on two or three days it showered, the sun coming out now and then boiling hot from behind the clouds. Bees worked on these days full time.

The fall crop—cotton and pea-vine honey—is only one-half of what it was with me last year.

About 2 years ago Mr. Sheppard, from this State, made a statement in Gleanings that in his location the first swarm came out with a virgin queen. At that time it was explained something like this: 1. Probably Mr. S. did not notice the first swarm with the clipped queen. (I, myself, thought so, too.) 2. Probably the weather delayed the issuing of the prime swarm. I also had 2 prime swarms come out this year, each accompanied by a virgin queen.

In my case it was simply a case of supercedure. As proof I will say that the bees constructed just one queen-cell. Further, the

two old queens (in 8 and 10 frame hives) did rather poor duty right on. The weather was ideal for swarming. Well, the old queen did not come out, but left this chance for her virgin daughter.

Now I am of the opinion that the unsealed brood was the reason that the *only* virgin left the hive; because after the old "mama" died, there being no unsealed brood at the time the young virgin took her flight, she (the virgin) remained.

Will Mr. Sheppard, if he should see this, please answer through the American Bee Journal how long the old queen lived after he had the experience of a prime swarm with a virgin queen?

I am a bachelor, and have nobody to watch for swarms, consequently I run a home apiary like an out-yard. I generally open the brood-chamber every 8th or 9th day, and consequently know what I am writing about.

D. J. PAWLETTA.  
Columbia Co., Fla., Oct. 5.

## CONVENTION NOTICES.

The National Bee-Keepers' Association holds its annual convention at the Revere House, corner of Clark and Michigan streets, in Chicago, during the Fat Stock Show, when exceedingly low rates may be secured on the railroads. The dates for the meeting are Dec. 5, 6 and 7. Rates at the hotel are 75 cents for a room alone, or 50 cents each, where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants. W. Z. HUTCHINSON, Sec.

Minnesota-Wisconsin.—The annual meeting of the Southeastern Minnesota and Western Wisconsin Bee-Keepers' Association will be held at the County Commissioners' Rooms in the Court House at Winona, Minn., on Oct. 24 and 25, 1905, at 10 a.m. of each day. All bee-keepers invited with their wives, and help to make the convention a success. JOSEPH M. REITZ, Sec.

W. K. BATES, Pres.

Georgia.—The Southern Bee-Keepers' Association will hold a meeting in Atlanta, Ga., during the State Fair, Oct. 20, at 10 a.m., on the Fair Grounds, at the aparian exhibit. All bee-keepers and those interested are invited to attend and take part. JUDSON HEARN, Sec.

## Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½ cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less.

R. A. BURNETT & Co.

CINCINNATI, Oct. 6.—Reports from different parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakenly expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH Co.

TOLEDO, Aug. 18.—The market on comb honey at this writing is practically the same as last; however, honey is being offered quite freely, and this has a tendency to decline the price. On account of the heavy receipts of fruit there is no great demand for either comb or extracted at present. Fancy white clover in a retail way brings 15c; No. 1, 14c; little demand for amber. Extracted, white clover, in barrels, 6@6½c; in cans, 7@7½c; amber in barrels, 5@5½c; in cans, 6@6½c. Beeswax, 28@30c. GRIGGS BROS.

CINCINNATI, O., Oct. 7.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, 4c more. White clover from 7@8c. Beeswax, 26c.

C. H. W. WEBER.

NEW YORK, Sept. 22.—New crop is beginning to arrive quite freely from New York State and Pennsylvania, and is in fair demand at 14c for fancy white, exceptionally fine quality may bring 16c; 13c for No. 1 white, and 11@12c for

No. 2 white and amber; no buckwheat on the market as yet. Extracted, in good demand at last quotations. Beeswax, firm and scarce at 29@30c. HILDRETH & SEGELKEN

ALBANY, N. Y., Sept. 21.—Honey demand improving here as the season advances, and as next month is the best month we look for good prices. Buckwheat comb is scarce; that is, straight buckwheat. We quote fancy white, 15c; No. 1, 14c; mixed, 13c; buckwheat, No. 1, 13c; mixed, 12@12½c. Extracted, white, 7@7½c; mixed, 6½@7c; buckwheat, 6½ cents. Beeswax, 28@32c. H. R. WRIGHT.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c.

C. C. CLEMONS & Co.

INDIANAPOLIS, Oct. 12.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c. WALTER S. POWDER.

PHILADELPHIA, Oct. 10.—Honey has been arriving freely in the last 10 days, but as the quantity in the producer's hands is somewhat uncertain, the market is rather fluctuating, and sales have been made at various prices, which hardly fixes the market. We quote: Fancy comb, 14@15c; No. 1, 13c; amber, 11@12c. Extracted honey, white, 7c; amber, 6c. Beeswax sells freely at 23c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

SAN FRANCISCO, Oct. 4.—White comb, 1-lb. sections, 8@9c; amber, 6 7c. Extracted water-white, 5@6c; white, 4½@4¾c; light amber, 3¾@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 25@27c.

Dealers complain that there is very little sale for honey in this market, and that so long as apiarists continue to hold at present figures there is little likelihood of any improvement. Growers are not at all alarmed over the outlook, as it is believed that they will find a ready market for their crop as soon as the fact of the shortage of the yield in many sections becomes established. As the matter now stands there seems to be a deadlock between growers and dealers, with little possibility of any improvement in the situation except through concessions on the part of the apiarists.

Please mention Bee Journal when writing advertisers.

### Orders may be sent to any Branch House or Dealer

#### Well-known Dealers

The dealers, whose names follow, are well known to bee-keepers. They have been, for the most part, long established in the bee-supply trade, and have a knowledge of the business most valuable indeed to the bee-keeping fraternity. Their advice may be had on any question of Supplies, etc., for the asking.

#### The Large Stocks

Nowhere else is it possible to find such well-assorted stocks of goods for bee-keepers as are carried by dealers in Root's Goods. No matter whether you require a little 5-cent article or a carload of goods, these dealers can serve you promptly. Stocks are frequently carried amounting to \$5000 and upward.

#### Shipping Points

You will observe that these dealers have excellent shipping facilities—guaranteeing you quick delivery and low freight rates.

#### Prices, Discounts

The prices, terms, discounts, etc., are identical with the home office at Medina (with rare exceptions). Full particulars may be had before ordering, if desired, by writing the dealer nearest you. You can, however, use our Medina catalog and terms, and, if any variation, your dealer will advise you, if requested, before shipping.

#### Other Dealers

Besides the following list, there are many others who handle some of Root's Goods. The following is by no means complete for hundreds of dealers come to us for many of the goods of which we are the exclusive manufacturers. *Insist on getting Root's Goods.*

#### Local Dealers

In addition to the following list who carry large stocks, and furnish at both *wholesale and retail*, we have in every State a large number of local dealers who handle our goods exclusively. As there are over 500 of these dealers, space will not permit giving their names at this time; but information will be given by us, on request, to any bee-keeper regarding the dealer nearest him handling Root's Goods.

Vol. XLV—No. 43

## Editorial Notes and Comments

### Honey Publicity

One of the best articles yet written on advertising honey appears on page 743. Mr. Green has certainly given a whole lot of sound advice to honey-producers in a very short space. And if his suggestions are carried out a great deal more honey will be consumed by the public than is now being used.

What The Honey-Producers' League needs to do is to get busy on a trade-mark or brand for the honey of its members, and then advertise such trade-marked or branded honey in periodicals like the Ladies' Home Journal, The Delineator, Woman's Home Companion, etc.

Mr. Green gives the League a very strong endorsement, and also points out almost its only weak spot—having provided for no trade-mark or brand for the honey of its members. But this can be remedied, and doubtless will be.

Surely, what breakfast-food makers have done in the way of creating a great demand for their products, honey-producers can also do, if they will follow the same sensible, business-like methods. The Honey-Producers' League was organized for a good purpose, and its machinery needs only to be worked in order that resulting benefits may be enjoyed. But a larger membership is also needed. See page 738 for directions for joining.

### Treatment of Robbing Among Bees

The following methods are given in the British Bee Journal:

"Remove the hive attacked to some shed or outhouse, giving the bees ample ventilation. Allow the robbers free entrance into a new hive on the old stand, supplying them with very weak syrup. When they have had some of this, dilute it until it is little more than sweetened water. They soon give up in disgust, and, next day, the colony may be safely restored to its old stand.

"As a means to prevent robbing, use cheese-cloth. It is very cheap and durable. Envelop the hive with it, and in 10 or 15 minutes open the cloth at the top to allow the robbers within to escape, and then close it again, repeating the operation about every 10 minutes until all

have escaped. The home bees are allowed to enter at sundown, though it is better to leave the cloth on for 24 hours, if robbing has been persistent. If however, the cloth was put on when robbing first began, it may be removed within an hour, as the colony will then have recovered from their disorganization."

If the last method proves successful, it might be made to work automatically, thus saving the trouble of attention every 10 minutes, by having the cheese-cloth finished out at the top with a Miller escape; that is, a robber-cloth with wire-cloth cone.

A plan of treatment that comes from Germany, is to cellar the victim and put in its place an empty hive of the same appearance. In this empty hive put a smoker going full blast, and before long the robbers will desist in disgust, and next day the colony can be returned.

### How You Can Help Others

It frequently happens that a question is asked in these columns which can be answered only by a bee-keeper in the locality referred to by the question. Whenever such question appears, any one who is able from actual experience to give the information desired, is requested to do so without further invitation.

It is our desire to make the American Bee Journal as valuable as possible to all of its subscribers, but in order to do so we often need the help of our readers. As you have been aided by the writings of others, why not give out a little yourself, when some question is asked, to which you really can give the right answer? Why not?

### Why the Failure of Honey Harvest?

In Irrigation—the official organ of the Colorado State Bee-Keepers' Association—R. C. Aikin discourses in a very interesting manner regarding the failure of the honey crop in Colorado. It is evident that he has been watching the matter with keen interest for a series of years, and he tells about failures or successes under this or that condition, and

then just as the reader with tense interest is expecting an answer to the long-unanswered problem, Mr. Aikin says:

"Almost daily I am asked why the honey failure; I am forced to admit I do not know. We all do know that we may have the bees and the bloom, yet no returns. Why?"

And there you are, with the problem thrown back upon your hands.

Although the question is one that will always be of interest, even if always left unanswered, there is comfort in the thought that even if we did know all about the cause of the failure to secrete nectar, it is something beyond human control, and the solution of the problem would only satisfy curiosity, leaving us as powerless as before to do anything about it.

### Photographs of Things Apiarian

We wish to invite those of our subscribers who have good photographs of apiaries, or something apiarian, to send them to us for the American Bee Journal. We may not be able to use them all, either because we do not think them available, or from defective photography.

If, after receiving the photographs, we decide that we can use them, we will request some descriptive matter to accompany them when used in these columns. If it is desired that we return any photographs, either used or unused, we will do so if requested.

We wish to thank those who have kindly sent us good photographs in the past. They have helped greatly the appearance of the American Bee Journal. Should any, whose pictures have been reproduced, desire to purchase the engravings, we will be pleased to sell them at a liberal discount.

### Educational Advertising on Honey

We find the following item in the September Butterick Herald, a magazine for advertisers:

#### HONEY IGNORANCE.

Honey has attached to it a great popular suspicion that ought to be overthrown by educational advertising. There never was in this world a pound of artificial comb honey.

Counterfeit strained honey is in the market by the ton, but to put the sweet into a wax comb is a trick that can be performed only by bees. Yet somehow, somewhere, a super-

## Miscellaneous News Items

stitution got abroad that comb honey is easily simulated—and millions of cautious persons believe in this myth.

It is said that there is even a large standing reward for any one who will produce a pound of artificial honey in the comb and demonstrate that it is artificial.

A convention of bee-keepers not long ago discussed the advisability of an advertising appropriation to down this myth—for if it could definitely be laid low the demand for comb honey must necessarily grow by leaps and bounds.

There is no doubt about it, we think, that if the consuming public could be made to feel that all comb honey is absolutely the product of bees, they would use it to such extent that there wouldn't be a tenth part enough produced to supply the demand.

Also, if the dear public could be shown that certain brands of extracted honey were genuine bees' honey, we believe there would soon be such a general call for it that bee-keepers would find it very profitable to increase their apiaries, and, besides, there would be many more who would begin bee-keeping who are now favorably situated to do so.

What is needed first is some general advertising to educate the public on honey, and then special advertising of certain absolutely pure brands of honey.

### Alfalfa and Sweet Clover

Some will no doubt be surprised to learn from R. C. Aikin, in Irrigation, that although alfalfa is the chief honey-plant in his part of the State, "the increase of sweet clover," says Mr. Aikin, "has brought it up until it is almost, if not quite, an equal. Alfalfa, when it does bloom, is in a body; when the bee finds a field of it the bloom is there in quantity, giving work without so much ranging; but with the sweet clover it is clumps here and there, long strings on ditch-banks, roadsides and such. It has been my belief for years that, as a rule, it is the plant and bloom that we find in large bodies that is most to be depended upon for surplus. There is no question in my mind but that all plants yield more or less nectar, the only thing necessary to make the plant a dependence is that it be in a body and in proportion to the demands upon it.

"It is not at all common," he says, "for bees to work early in this country; alfalfa seldom gets to business until 10 to 12 o'clock, when the sun has become hot. Our bees do not work early, but they do keep going until almost dark when there is nectar."

### Non-Interference in Locations

In Australia, priority rights as to location have led to the adoption of the following rule by the Victorian Apiarists' Association:

"In the establishment of apiaries by members of this Association, it shall be recognized as a general rule that a distance of at least 3 miles shall be kept from any other member's apiary, excepting in localities where the bee-keepers of any branch agree that 2 miles is sufficient, as regards that particular district."

Maeterlinck's "Life of the Bee."—We have a few copies of this book, price, post-paid, \$1.40; or with the American Bee Journal one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 427 pages.

**Good for Minnesota!**—We are informed that the Minnesota Bee-keepers' Association have decided to postpone the time of their annual meeting in deference to the National. Both Associations had selected the same dates. We are glad to know that the Minnesota bee-keepers have taken the action mentioned. They will not regret it. No doubt they will have a number of representatives at the National convention now that they will not need to miss their own meeting in order to come to Chicago.

**A County Fair Mix-Up.**—F. W. Hall, of Sioux Co., Iowa, is one of that State's wide-awake bee-keepers. But the following experience, taken from the Iowa Index, probably waked him up a little more than he anticipated:

The Sioux County Fair, from reports, was certainly a success. F. W. Hall, with an exhibit of honey and apiarian fixtures in the Art Hall, had quite an interesting experience. The Orange City bees seemingly took it for granted that the display was spread for their especial benefit, and turned out in swarms. By the close of the second day it was necessary to pack up and get away with them in the dark. In doing so one of the horses—then tied to the rear end of the wagon—got his halter-strap caught, and upset the wagon on which the display was loaded. A general mix-up was the result. But nothing serious occurred beyond a lot of broken honey, combs, and spilled extracted honey. To partly offset his loss, Mr. Hall carried off the first prize on comb honey, extracted honey, and for best display.

"The Honey-Money Stories"—the illustrated booklet recently issued—is thus kindly referred to by the American Bee-Keeper:

"The Honey-Money Stories" is the title of a 64-page booklet just issued by George W. York & Co., Chicago. It is unique in style, and is calculated to do missionary work among the masses, in the interest of the honey-business. It presents 33 illustrations, is beautifully printed on plated stock, and sells for 25 cents. It is a book that will not fail to interest every bee-keeper, nor any one else, for that matter. It is cheap at a "quarter," and those who send to the publishers for one at 334 Dearborn Street, Chicago, will get their money's worth.

While the retail price of "The Honey-Money Stories" is 25 cents, postpaid, we send 5 copies for \$1.00; or one copy with a year's subscription to the American Bee Journal—both for \$1.10. It should pay well to circulate "The Honey-Money Stories" among should-be users of honey.

**J. G. Creighton and Apiary.**—Referring to the picture on the first page, Mr. Creighton sends the following:

I was born in Hamilton Co., Ohio, 1844, and was brought up on the farm. I served through the Civil War, and am a holder of three honorable discharges.

My bee-keeping commenced about the year 1871, and since that time I have had many ups and downs in the business. I winter my bees on the summer stands, and in the early part of my bee-keeping my loss was great, but after I abandoned the honey-board and used leaves for an absorbent to take up the mois-

ture, my success was greater in wintering and my number increased to 49 colonies.

Foul brood struck my apiary the forepart of the '90's. I had never seen a case of it, and by extracting and exchanging frames I scattered it all through the apiary. Within 2 years it put me out of the bee-business. For 3 or 4 years I kept no bees, but the desire had so fastened itself upon me that I started into bee-keeping again. Foul brood has struck me two or three times since I last started, but with my past experience I soon got clear of it again, and to-day I have over 60 colonies of Italians and Carniolans crossed, clear of disease, and never had them in a finer condition to go into winter quarters than now, although this year has been one of the poorest I ever experienced for honey, on account of a short white clover crop and wet weather.

The picture I sent you is of my apiary and myself, with my left hand on an extracting frame of honey resting on an observatory hive. There are 3 cakes of beeswax on a case of 2-pound sections, and in front of me is a cake of beeswax surrounded with 7 bottles of honey on a case of 1-pound sections. This honey, wax, and bees took the 1st premium, that A. I. Root offered at the Harvest Home Fair, Aug. 26, 1905. J. G. CREIGHTON.  
Hamilton Co., Ohio, Sept. 28.

**The National Convention and Presidency.**—We have received the following from Mr. R. F. Holtermann, of Ontario, Canada:

EDITOR AMERICAN BEE JOURNAL—Would there be any advantage in offering a place or inducements to show any *new ideas* or inventions in bee-keepers' appliances at the coming National convention?

As nominations for the National appear in order, I would just like to say that in my estimation Mr. C. P. Dadant has the best claim upon the position of president. I know he is of a retiring disposition, yet I believe he would value the position of president if it came as an expression from bee-keepers of their regard, and a recognition of his value to the bee-keeping fraternity. I do not believe that a man should become president simply because he is vice-president, but ordinarily the vice-president should have first claim on the presidency.

There is perhaps no bee-keeper's name which has the solid respect and warm regard of the world's bee-keepers to a greater extent than C. P. Dadant; none which would to a greater extent shed luster abroad upon the National Association, and I judge as one who is a reader of British, German, French and Australian bee-papers.

R. F. HOLTERMANN.

As to exhibits of any kind at the National convention here in Chicago, Dec. 5, 6 and 7, we would advise writing to the secretary, W. Z. Hutchinson, Flint, Mich.

As to Mr. C. P. Dadant being elected president of the National Association next month, we supposed that was practically settled. Of course it will require the formality of a ballot to place him in that position. He is perhaps the best known bee-keeper in the world, aside from Mr. Thos. Wm. Cowan, possibly. We have no doubt that the membership of the National will elect Mr. Dadant almost unanimously as president for the year 1906.

**Comb Honey Guarantee Circulars.**—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before mailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

### HONEY PUBLICITY

#### The Great Possible Value of The Honey-Producers' League—Suggestions as to How This May Be Accomplished—A Similar Case

BY STEPHEN N. GREEN

AS a student of advertising, the problems that The Honey-Producers' League have undertaken are to me very interesting. The first reading of the constitution, from an advertisers' standpoint, suggested some improvements, particularly in regard to a trade-mark. Unless the Executive Board has power to provide for a trade-mark, the League is making a serious mistake the first year of its life; but I will speak of this matter later. Being only indirectly interested in the League, after first glancing over the prospectus the matter slipped my mind until reading an article on a similar project. The case of the honey-producer and the prune-grower was such a striking parallel that I became again interested, and have put some study on the subject. The article to which I refer is "Prune Publicity," by Homer C. Kratz, of California, in the August number of Ad Sense. I am quoting the article practically complete. The italics are mine to emphasize the points that I wish especially to enlarge upon.

The San Joaquin Valley, and Fresno County in particular, produces nearly all the raisins used in the United States, and it is also a prolific producer of that much-abused article, "prunes."

*Indirectly, the attempt of the funny man to have his joke at the expense of the prune has cost the growers of California and Oregon much money.*

The joke about being "full of prunes" has been no joke to the growers. It has hurt the sale of their product, and will eventually cause them to spend many more dollars to remove the impression that the prune is a joke.

We will agree that the prune is one of the most healthful and delightful fruits grown. There is hardly another more beneficial to the user. There is not another fruit with its keeping qualities and its cheapness to the consumer; yet with all these advantages the prune-grower does not make money. He never will until he begins using persistent, logical, and convincing advertising. He will have to spend many dollars that may apparently bring no return, yet all the time good is being done in educating the people up to the necessity of using prunes.

There are many examples of the class of publicity before the prune-growers. *The breakfast-food people have demonstrated clearly and conclusively that advertising will sell any thing.*

I venture the assertion that I can take alfalfa—one of the staple crops of Fresno County, in California—burn it, bake it, grind it up into a breakfast food, advertise it by telling of its health-building properties, and sell it by the thousands of tons. A nice little story about its recently discovered nutritious qualities—its nerve-building, brain-restoring possibilities—and its wholesomeness will send the food-crank to the grocer for "Alferina" breakfast food just as quickly as he goes for H. O. buckwheat, or grape nuts that are not made from grapes.

*The first step in prune publicity is co-operation.* No individual grower can succeed in making the public use more prunes. There must be an association of growers. There must be a fund for the dissemination of prune knowledge. There must be intelligent direction of the distribution of these funds. The story of the prunes must be told in an interesting way—the pictures should show the orchards in all their beauty—the advertising should create a desire to eat prunes, and, after being eaten, should make the eater feel that his system is being built up.

Glittering generalities won't sell prunes—the talk must be clear, concise, logical, brief, pithy. Let the medical man tell his story. First, get the health facts from him, build on that structure, and you will build as the patent medicine and the breakfast food man does; you will see the dollars come rolling in faster than they go out.

*We will all agree that any food product, to be properly advertised, must be known by a distinctive name, brand, or trade-mark.* Whether the prune is grown in Oregon or California, there must be a distinctive title that the buyer will recognize and want.

*The advertising must appeal to women,* as they do the buying; and if they get interested, many a man will get prunes who never tasted them before.

Prunes go upon the market in an unappetizing condition. They look hard, and, to the uninitiated, moldy. The man or woman who does not know how delicious they are will be sure to pass them by. Now, in addition to educating the public in the use of prunes, let us

go a step further and give the public a package it will appreciate. Why not put a brand of prunes on the market all ready for use—already cooked—put up in glass jars, so that the clear juice and the rich syrup may be seen. *The tempting fruit will make itself wanted at sight, and will bring a high price.* If the housewife could get her prunes already cooked, only needed warming, how much more would she use?

We have before us the examples of the meat trusts in putting prepared food on the market. Ham, corned beef, chickens, turkeys, horse-meat (and Oregon puts up some of the latter), all go to the consumer ready to use, and the result is seen in the millions of dollars sold annually. I think canned dog might be put on the market under another name, and, with persistent advertising, pass for a health food.

Prune-growers should profit by the experience of those who have grown rich giving the public the things they will buy. *Establish your brands and your trade-marks; ship none but good fruit; put up prunes in an appetizing way, and tell the people your story every day. Tell it to the women; the hand that rocks the cradle can fill the prune-grower's pocket if it chooses.* Woo woman into using prunes, through the press; make her understand the value of prunes, and, as I have written before, many a man will be "full of prunes" before he knows it.

#### AN ATTEMPT OF THE FUNNY MAN TO HAVE HIS JOKE.

The bee-keeper may gather one grain of comfort that he alone has not been the only target for the arrows of the "funny" man. That little joke of Mr. Wiley's, that he did not label, is not the only one that has made the innocent suffer. Now, right here is where the League is doing a work that alone justifies its being. When one comb-honey lie appears it should get a retraction, and publish 10 good articles to make up for the one bad one. Not only use the pound of cure, but remember the ounce of prevention. That statement to go into shipping-cases should be well taken care of by every manufacturer or producer. This kind of "free" publicity costs but little, and is *very* effective. Use it to the limit. Get the newspapers everywhere to publish interesting, truthful stories about bees and honey, and you get the people to talking—just the best kind of advertising.

#### ADVERTISING WILL SELL ANYTHING.

Yes, if you can sell sawdust for breakfast food *why* can't you sell honey by the mere force of advertising? Honey presents magnificent opportunities for *good* advertising. Why, the great advertisers themselves use honey as a standard for comparison. Does not "Nabisco" remind you of honey? and, too, the National Biscuit people recommend its use with their Uneda Biscuit. The Rubifoam people tell you their dentifrice is "as sweet as honey;" and how the Karo-syrup people did disgrace the fair name of honey to elevate their glucose mixture! for who will forget "better than honey for less money?" By the way, what has become of "Karo?" Let me say right here that even advertising can not fool all the people all the time; but I will take up the matter of merit as the foundation of advertising success later.

#### ADVERTISE HONEY—NOTHING EASIER.

What news the chemist can tell you! and the doctor! and don't the children cry for it? Is there anything more delightful to the taste than good honey? How many products come in such a variety of forms, and can be put to so many uses?

#### THE FIRST STEP IN PRUNE PUBLICITY IS CO-OPERATION.

Naturally the first step in honey publicity *must* be co-operation. The Honey-Producers' League is the *way*; but the bee-keepers must furnish the *means*. Join the League. Don't put it off. Don't wait for the other fellow to do it, and you expect to get the benefit. Make this a personal matter. If *you* don't get into line the League can not be the greatest possible power. If bee-keepers don't co-operate, the honey-market will not pick itself up. If you don't co-operate you will always get low prices, your product will be slandered, your interests will be trampled on. *Get together—co-operate.*

#### MUST BE KNOWN BY A DISTINCTIVE NAME, BRAND, OR TRADE-MARK.

Right here is the only fault I have to find with the League. I read the constitution once, then again. What! no provision for a trade-mark? Have the founders forgotten a fundamental principle in advertising? Well, they will some day see their mistake, and it is easy to remedy, as the powers of the Executive Board are broad. Am I not right about this? For instance, can you name (?) an article successfully advertised that has not a distinctive name, brand, or trade-mark, or uses an apt catch-phrase? Aside from the absolute necessity of an article having a trade-mark, there is another side to the matter. When the League overlooked a trade-mark, it also overlooked a quality in human nature, and bee-keepers *are* human. Nearly every one expects *direct* returns from his

money. Not many of us can afford to invest our hard-earned coin in philanthropic enterprises; we must get some in return. As the League now stands, it offers its members little direct returns. Now, a trade-mark on a member's product would raise the market value of it, provided, of course, the trade-mark be properly advertised. When a bee-keeper sees that he gets two dollars for the one he invests, the League will not have to work for subscribers. Oh, no! they will simply rush for admittance. Advertising a trade-mark will produce *direct* returns for the League's members, without a trade-mark (understand by this some distinct brand of some kind), your advertising is sure to reach an end, for such advertising feeds itself little, so has no means of growth. If the League does not give its members some benefits over and above what the outside gets, they will be very slow to subscribe, and extremely hard to get.

#### APPEAL TO THE WOMEN.

I do not know what plans the League has for advertising its product; but it surely can not fail to see the need of placing the bulk of its advertising before the women. It's the women that set the table, and it's the women that buy, so it's the women that the League *must* reach. Woo the women! Tell her your story, Mr. Honeyman, and you will not complain of slow markets.

#### WANTED AT SIGHT, AND WILL BRING HIGH PRICES—QUALITY AND ATTRACTIVENESS THE TWIN SISTERS OF SUCCESS.

Honey *has* the quality. But don't let honey without quality get on the market if you can help it. Don't make the fatal error of letting the League's trade-mark cover a poor product. Make *sure* of this matter in *some* way. What is more disgusting than unripe extracted honey? It will spoil ten sales where one is made. Make it a very serious offense in the League to market such honey. Show the outsider where he is penny wise and pound foolish in doing this. Give good weight. If the section doesn't weigh a pound, do not allow this impression to be carried. When a section doesn't weigh the full pound, honestly say so, and charge less for it.

Honey *is* attractive, and attractiveness is a great selling force. Market the best grades only, and see to it that grading is done right. Don't, *don't* allow your trade-mark to market an inferior article. Strictly grade your comb honey; and bottle and neatly label the extracted; carefully sack the candied. Expect and ask a good price for your product, and you will get it, and have no trouble in doing so.

#### ESTABLISH YOUR BRANDS AND YOUR TRADE-MARKS.

To sum up, spend your money in judicious advertising in magazines, newspapers, etc. Get all the free advertising possible, you using your influence at home and abroad. Talk honey yourself, and be enthusiastic over it. Get a trade-mark, and make it stand for something. Then The Honey-Producers' League will be on the road to success, and be a powerful factor in the honey markets.

The problem is a complex one, and I have not by any means touched all the points. It will not be completed in a day. Mistakes will be made. But don't make the greatest mistake—not doing *any* thing. There is abundant material in beedom—brains and product—to make the League a great success. Don't wrangle among yourselves. Forget your *little* differences in the *great* cause. Make your motto, "Co-operate and advertise." You may then rightly expect a bright future for honey.—Gleanings in Bee Culture.

## Wintering Bees on Solid Sealed Combs of Honey

BY J. L. BYER

**W**HILE it is always with a degree of pleasure and profit that we peruse anything from the pen of so practical an apiarist as Mr. C. P. Dadant, nevertheless I feel to take issue with part of his article on page 679, entitled, "Work in the Apiary for October." I refer to the oft-quoted statement which Mr. Dadant sanctions; in effect, that "a colony will not winter well on combs that are entirely filled."

By way of preface, let me say that while such teaching may be orthodox, it is entirely erroneous as far as wintering bees outdoors in our cold Ontario winters is concerned. As is well known by most Ontario apiarists, so successful an outdoor winterer as Wm. McEvoy, is an enthusiastic exponent of the system of wintering on *entirely sealed combs of honey*; and, I may add, what experience I have had in the matter was prompted by Mr. McEvoy's teaching.

My Cashel apiary is in a splendid clover location, but with absolutely nothing after the clover quits yielding. With large, 10-frame Quinby hives and Carniolan bees, for three or four falls I was confronted with the problem of fitting up colonies in big, *empty* brood-chambers for winter, after the supers were removed. During those years no combs of clover honey had been saved, and so to save the bees from starvation, of course I had to do the next best thing—feed sugar syrup. To feed 30 or 40 pounds direct into those big brood-chambers gave anything but best results, as it was too much scattered through the hive, and a large proportion was always left unsealed.

Now for the "better system" and its results: Half of the combs (the lightest ones) were removed from each colony needing feed, and a common division-board placed next to the last comb; a Miller feeder was placed on the hives, and sufficient stores fed so that each of the 5 combs was sealed to the bottom. Often large clusters of bees would be outside of the division-board until quite cold weather, but when real severe weather came on, somehow they always seemed to get "inside."

*Every* colony so treated *always* wintered in grand condition, which could not be said of colonies left with the full number of combs, even when they had sufficient honey. Outdoor winter losses in cold climates are generally brought about by one or two causes: Either the honey near the cluster is all consumed during a protracted cold snap, and the bees starve, or else a strong colony starts a brood-nest early in the winter during a warm spell, and the vitality of the bees is so worn out that they are unable to stand the latter part of the winter, and die of dysentery, or, perchance, later on fall a prey to that mysterious "spring dwindling"—the non-de-plume of "bad wintering."

On solid sealed combs the bees care nought for cold snaps. They don't have to move to the honey. They are "there" all the time; as friend Mr. McEvoy says, they just have to "lean over and help themselves." No brood-nest is started early in the winter, from the simple fact that there is practically no empty comb at that time for the queen to deposit eggs in. The vitality of the bees is thus saved, and the bees are healthy and strong to rush things in the spring when the brood will be of use.

While I would not advise any one having hives heavy in stores to go to the trouble and expense of putting on entirely sealed stores, yet I would unhesitatingly urge all who may have light colonies to give the system a fair trial. While I haven't money to burn, yet I would have no fear in offering compensation for cases of poor wintering following such treatment, provided usual protection was given to the bees. It is needless to say that no matter how successful it may be, the system will never be popular, because of one factor—labor.

In conversation with Mr. J. B. Hall, I was told that from his experience there was no question but that bees wintered in splendid condition on solid sealed stores, but because of the extra work in spring and fall he did not follow the plan extensively.

Perhaps it is just as well that the system is not more in vogue, as it would mean winter losses practically *nil*, and a consequent overstocking all over the country. This may seem like extravagant language, but I am thoroughly convinced that in our climate, where the temperature often drops to 20 degrees below zero (I would have no fear if it was 30), and the bees are frequently confined for 5 months without a flight, that colonies in normal condition, *i. e.*, with good queens and plenty of bees, will winter 99 cases out of 100.

As to cellar-wintering, I have had no experience, but at least one successful cellar-winterer—Mr. H. G. Sibbald—has told me that "solid sealed stores are just as successful and necessary for cellar-wintering as for outdoors."

With all due respect, I would ask if Mr. Dadant, and others who advance the theory of poor wintering on "solid" combs of honey, have ever really tried the plan.

If they have, and report from experience, it might be well to compare notes and see why such vastly different results are obtained by different apiarists. If the teaching has nothing to substantiate it, by all means let it be relegated to the wastebasket (already pretty well filled), where many other exploded theories have been consigned in times past.

In looking over what I have hastily written, I was led to think that I might have given the impression that it was necessary to feed sugar syrup. For reasons not necessary to enumerate here, I would say that we feed practically no sugar now, but, when colonies are light, *solid sealed* combs of honey are given to make up the deficiency.

York Co., Ont., Canada, Oct. 11.

## Convention Proceedings

### Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 730.)

#### DETECTING FOUL BROOD.

Mr. Wilcox—Have you traced the source of foul brood to bee-trees or wild bees in the woods?

Mr. France—That was brought out very strongly the second year I was out. One man said, "There is no use treating my bees because the woods are full of bee-trees, and you will never get rid of it." I used to hunt bee-trees. So after I had treated all the bees in the vicinity, and before I got through, I found two bee-trees. One of them was where a swarm had gone from an infected hive; it was away over yonder on a bluff. This man said that that tree must be diseased. I said, "On what basis can you argue that that is diseased?" He said, "Why, the bees went from here over there; they carried the honey with them, and I am dead sure it is diseased." I said, "Wait a moment. What did we do to this hive?" "We took away the combs; we gave them foundation." "Have they got any over there?" He said, "No." I said, "After they had drawn out the foundation we took that away and made them go again and they had nothing; they had to consume all the honey they took with them to produce the first combs, to start to store the honey they gathered from the field, and I will venture the assertion they are not diseased."

We went over and cut the tree down, felling it very carefully, and there was no disease. We cut some other trees and I found trees where the bees had died from lack of protection; and I also found this, that within a year's time after a colony of bees had died the squirrels and the bee-moth will eradicate everything in the interior of that tree; there is no danger left. If the bee-keepers will attend to their end of the work they need not worry over the bee-tree problem. There is just one way a bee-tree might be infected. If a colony has combs drawn and has wintered over, or towards the latter portion of the season they have somebody who is careless, thereby having foul brood, that bee-tree bees could go and rob from an infected bee-hive and transmit it to that tree; but we all know it is a matter of short duration; that colony of bees would not last long; squirrels and moths would soon eradicate what is in the tree. If we do our part we will get rid of foul brood.

Pres. York—What kind of a foul brood law do we need in this State?

Mr. France—Coming out of another State I hardly like to recommend, but my opinion is this: Keep the appropriation you have; put in effect your inspector with authority, and you will accomplish a great deal of good.

Pres. York—You mean as to a compulsory clause?

Mr. France—Yes. Now this comb I have here is an illustration. As I understand this apiary is in your State; your inspector wants to investigate that apiary and has been objected to. Look at the situation. We will take as an illustration a row of these seats, each one representing different apiaries. The inspector comes to this party and wants to look at the hives. "Yes, I am glad to have you come in." The next says, "My bees are all right." The inspector says, "I don't like to look at these, but while I am here I will look at them." The answer he receives is, "You get off the premises." He has got to go. You see the weak point in the law. What would we do with contagious diseases amongst ourselves if our law did not admit of our health warden coming in and saying "this is small-pox," or any other contagious disease, "and they must be quarantined." You say, "No, we have no small-pox; let everybody come in and out." It is just as necessary for your inspector to be clothed with that authority if you would get the desired effect.

Mr. Kimmey—You have considered the possibility and propriety of having a National foul brood law?

Mr. France—Yes, but we have first got to demonstrate

through the States before we get that. It may come to that in time.

Mr. Pease—What proportion of the States have foul brood laws?

Mr. France—I think about nine.

Mr. Abbott—Let me suggest that you cannot have a national law.

Mr. Colburn—We have a pure-food law.

Mr. Abbott—That is interstate commerce.

Mr. Wheeler—What is your plan in regard to appointing an inspector? How is it proposed? I suppose the law will have to be plain.

Mr. France—I think that those who are interested in the line of work should select one whom they think competent. I don't believe it is a good plan to allow this to be a political appointment. Let that man be selected by the State or local association. They know better who they want than any other person, and let their recommendation be of the one who serves them best. They cut out that portion of our Wisconsin Law. I fought it to the bitter end. It was first, "Upon recommendation of the Bee-Keepers' Association the Government shall appoint." The political men saw fit to modify our law, and now it says, "The Governor may appoint."

Pres. York—If he does not care to appoint anybody, you have no inspector?

Mr. France—No, sir, and the State Association is not asked, although it is still recognized. They have asked the State Association. There is another thing they do in Wisconsin. The State Board of Agriculture asked the bee-keepers whom they want to be judges at the State fair. They consider that the State Bee-Keepers' Association ought to know who is competent for that; and the one they recommend has always been appointed. Now in regard to this sample of foul brood, I have here, I will confess this much: In this room, with the light you have to look into, I would guarantee it would be almost a failure to see the various stages of foul brood, from the fact that you would get shadows that you wouldn't get in day-light, but I have illustrated to you how you should look to see it.

Pres. York—I should think now that we ought to be able to know foul brood or almost smell foul brood or something, by this time, as we have been talking about it all forenoon. I was glad to have it discussed, but I was afraid some that were not particularly interested would get tired of it.

Mr. Meredith—My reason for coming here was based almost entirely upon what I could learn about foul brood, knowing that the disease is around Batavia, and I think in an apiary that was inspected by one of the inspectors. If I am going to keep bees I want to be in condition to know when my bees are free from disease, or take such measures to see that they are.

Mr. Moore—I want to speak of a thing that has not been mentioned here by anybody. In regard to fumigating to cure foul brood, I have taken the same stand as Mr. France and our best authorities, but I thought it was not well to recommend fumigating on the ground that we didn't know whether it was successful in all cases; and, second, it is dangerous to put a knife into the hand of a beginner. It is dangerous to put a remedy we are not sure of in the hands of the average, inexperienced bee-keeper. I had quite a long talk with Dr. Eaton, who, I thought, would be here to-day. He is the chemist of the Illinois Food Commission, and we talked about this very matter of formalin fumigation. I said to Dr. Eaton, "Here you have a cup of honey. Down in the bottom of that is a spore of foul brood covered with honey an inch or two deep. If you fumigate that thing for a month or two with formalin what will happen?" He says, "After a while the formalin will unite with the honey. It has an affinity for water, and honey is a solution of water and something else; and you will have a compound of formalin honey, and so on." I said, "What will be the effect on this spore in the bottom of the honey?" He said, "It will absolutely destroy it." I said, "What do you think if we take our combs of foul brood and shave off the coverings of the cells with a sharp knife so as to expose the honey, pollen and germs of foul brood, if you put it in a boiler of water and jounce it up and down, then put it in the extractor and whirl it like everything so as to throw out everything that is dissolved by the water, and then fumigate a long time, what will be the result?" His opinion was that because formalin combined with the water it would absolutely destroy everything in the comb that was infectious. Now there is a point for these people that have

facilities like Mr. France and Mr. Smith, perhaps, to experiment upon. It seems to be a new way of experimenting with formalin gas.

Mr. Dadant—You can't get water to the bottom of the cells by dipping it in water.

Mr. Wheeler—I think that is proven every time you fumigate a hive. From that gas that is generated there is a steam, and there is nothing more penetrating than steam. The combs, after they come out of the fumigation, will be wet with steam. Surely the very bottom of the cells will be saturated by steam from the formaldehyde gas.

Mr. France—Anywhere over the States, since I have been in this National position, the members have taken it as a matter of fact that when they get into any trouble or grievance no matter what it is, "fire" it into the General

Manager: and among other things they "fire" in samples of foul brood from all over the States. I analyze them as well as I possibly can, and give a report. But I want to make this one statement: Whenever you are sending samples of suspected material by mail, put it in something so that it will stand the racket in the mail. So many of the packages come all smashed up. I had one come the other day with a piece of newspaper around it and a two-cent stamp on it, and the whole thing was about as thick as a piece of cardboard when it reached me.

Dr. Miller—Put it in what?

Mr. France—The best of all is a tin box next a wooden box. And, by the way, the United States mail people may get after you if you don't.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bee-Keeping in Australia

I just came upon the following in our daily paper:

"In many parts of the Australian continent bee-farming has become a profitable and popular occupation. There are at present over 25,000 colonies in Australia, producing from 10,000,000 to 15,000,000 pounds of honey annually."

Can you or any of the readers of our valuable American Bee Journal, give any more light on the subject of bee-keeping in Australia? If so, I should be very grateful to have some one write an article on the subject.

ELSIE A. CUTLER.

Kent Co., Mich., Oct. 7.

The writer has never been in Australia, but some reading of the two bee-papers published there (and incidentally a visit from the editor of one of them), warrants the statement that bee-keeping in Australia is in many respects the same as in this country—hives, management, etc., being more like those in use here than those in use in the mother country, England. Great yields have been recorded, but perhaps no greater than in some parts of this country, and prices run so low that the business is not so very profitable. A large part of the honey is secured from eucalyptus-trees, which Australians rate the finest in the world. Unfortunately, people outside of Australia do not all agree in this view, and repeated efforts to obtain a favorable reception for it on the London market have not been successful. It certainly has a peculiar flavor, unlike any other honey, but that peculiarity does not seem to commend it greatly outside of Australia.

Judging from what is said in the Australian bee-papers, and from the one specimen seen here, the bee-keepers of that far-away land are a bright lot of people, concerning whom it is a pleasure to be informed.

### Buying Bees in Fall or Spring—Shipping Bees

DEAR MISS WILSON:—Will you kindly give me your advice on the following points:

Two sisters, friends of mine, have bought a little farm. They will not occupy it until spring. (It's in New Jersey). They want to keep bees. Is it best for them to purchase this fall or in the spring? Also, is it safe to ship bees, and is it not quite expensive—the express charges? NEW YORK.

Firstly, it is not advisable for beginners to buy in the fall. Better buy in the spring and avoid the risks of wintering. If one or two colonies should be bought as a starter in the fall, and if one or two out of those one or two should die in the winter, it would be a pretty large-sized wet-blanket on the whole business.

If bought in the spring, the likelihood is that there would be a larger number by fall, and if one or two should fail to winter, the loss would not be so heavy. Besides, the experience with bees through the summer, although not directly bearing on wintering, gives one a knowledge that makes the chances for successful wintering greater. If the bees are bought in the fall, the chief experience of the winter will be that of worrying as to whether they will come through alive. Just as well to omit that part of the program and start in fresh in the spring.

Secondly, bees can be shipped with safety if properly prepared. But on most railroads they can be shipped by freight only in car lots, leaving the express as the only way to ship small numbers, and express charges on full colonies of bees are something fearful, especially if the distance be great.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### A MUSICAL FACE—BEE-MUSIC.

People mostly try to "keep their face." Journals mostly try for a change of face. As a new variety of face, No. 37 opens with some bee-music for bee-sisters and apicultural going-to-be's. Comrade Secor is well up toward his best in this, the second verse being especially a gem. Nice music, did you ever think of it, is divided into two classes, the good class and the better class. The good class sounds nicely when properly played and sung at the instrument. The better class is quite able to get away from the instrument, and we hear people singing snatches of it almost unconsciously. This effort of Editor York's I have tried to locate in the higher class, but I rather think the other one is its real place. By the way, if the bees get in the Linden tops *superlatively*, 5 pounds in a bunch, and Prof. Bigelow gets after them with his revival of the old "bee-music," it will be quite unavailing to sing "bye baby" in opposition to it.

### EXCESSIVE SWARMING AND NURSE-BEES.

It has become tolerably plain that excessive swarming bears some sort of relation to excess of nurse-bees over and above the young brood which they desire to feed. The idea advanced by Adrian Getaz, page 645, may prove a very valuable one indeed. If we can make the nurse-bees go to the fields to work, for want of anything else to do, they will not again become supernumeraries, stirring up

That last question being answered as it is, another question is likely to arise, and there is no law against answering more than is asked. If high express charges bar out the shipping of full colonies, how shall the start be made? One way is to get a 3-frame nucleus instead of a full colony. Express charges will be very much less, and such a nucleus will rapidly build up into a full colony.

A still better plan is to buy a colony of best blood from some one close at hand. Very likely that can't be done. Well, then, buy from some one close at hand a colony that isn't of best blood. You see there isn't the same objection to "starting wrong" with bees that there is with any other kind of stock.

If you start with Rouen ducks, you can't change your flock to Pekins; you've just got to begin over again with Pekin ducks, and the same way with other stock. But it is different with bees. Get a colony of bees of any kind; buy for a dollar a queen of Italian stock, and in 6 weeks of the working season your whole colony will be Italian bees. The chances are that that will be the best way for you to start.

While waiting for spring to come, it will be a good thing to get a bee-book and study up in advance.

discontent and swarming. I fear, however, that sometimes some bees (especially when the flow is poor) will sulk much more than 4 days, and resume queen-rearing the minute it is made possible for them. But if we can not have a remedy that works all the time, a remedy that works part of the time may be worth considerable. And that's a wise idea (not altogether a new one) that colonies that refrain from swarming of their own accord store better than those successfully prevented from swarming. A wee bit tantalizing this fact is.

### SWARMING OUT AND VIRGIN QUEENS.

The solution given by Mr. Muth-Rasmussen also seems to be an excellent one. Bees do not swarm out with a virgin on her mating trip except when they have no young brood to fix their minds on. Page 645.

### YOUNG OR OLD BEES AS QUEEN'S ESCORT IN THE MAILS.

It surprised me to hear C. P. Dadant give decided preference to old bees fresh from the fields as companions for a queen on a journey. I had seen quite young bees recommended, and supposed that all shippers preferred them. Willing to believe he is right. I wonder if the *why* of the matter is known. I'll guess that young bees feed the queen semi-digested food to some extent, and that old bees do not. Presumably while she is on a journey she is better off not to have any-

thing stimulative to egg-production. Perhaps also digestive efforts in the queen's behalf exhausts the bees so that they die sooner than old ones would; and when they are gone the queen soon dies also. Page 647.

#### PUTTING WEAK COLONIES OVER STRONG ONES.

W. T. Cary seems to add a new wrinkle to the new plan of putting weak colonies over strong ones without entire uniting. Gives the upper colony a separate entrance so they do not have to go below unless they want to. Worked tolerably well in one case. The appearance was that a few old bees from below came up and got killed; lots of young ones came up and were adopted; and the upper bees generally refrained from going below. We seem to be getting a great variety of performances on the part of the bees. Page 647.

#### PRICES OF BEE-SUPPLIES.

High prices of supplies to keep Tom, Dick and Harry out of apiculture, eh? Might not T. D. H. and Co. revert to box-hives and market chunk honey, instead of "clearing the coop?" But when J. E. Johnson advises amateur hive-makers not to cut their pieces "pretty near square," but exactly square, he is getting in good didactic work. Nice store-boxes of pine to be had almost gratis—I fear their day is declining, if it has not already passed. Try literature, Mr. J. Your phrase, "All raise at once, just like the curtain of a stage," shows budding talent in that direction. Page 648.

#### WAX-WORMS, WASPS, SPIDERS AND COMBS.

According to page 651 (which agrees in a measure with my experience also), there was trouble with worms in section-honey years ago, but not enough now to call for any remedial measures. Why? Don't believe it's wholly, or even mainly, owing to Italian bees. I suspect some other and deeper reason. Why was the supposedly endless pest of flies much milder than usual this year? Bad enough yet—but one would like to know why the mitigation. Same thing even more pronounced appears with another race of insects—the wasps. I do not remember a year before when available roof-crannies were not greatly populated—mud-wasps and paper-wasps in great abundance, several species of each. This year they are actually scarce. Don't know as I am exactly rejoicing about this last. I think wasps on the whole do us more good than harm, devouring the wax-larvae which come where they can get at them. Combs widely spaced in clean, empty hives often get through the hot weather all right. I would like to know whether we should apportion the greater credit of this to the wasps or to the spiders. It isn't nice to be thanking the wrong people even among our small neighbors. *Mice* will sometimes devour and clean out larvae when they have gotten so fortified with webs that no insects could do much with them. If mice make a regular business of going over all well-spaced combs they have access to, possibly more credit belongs to them than to either spiders or wasps. Wish I knew more about it.

swarm, then why, in the Sibbald plan of artificial swarming, is the queen left with the mother colony and placed on the new stand, reversing her location?

3. If bees will build drone-comb when no queen is present, are they not likely to do so in the Sibbald plan of artificial swarming until the first young queen hatches (when frames with only foundation are put in the hive on the old stand)?

4. I began bee-culture last May with 8 colonies of hybrids in 2-story 8-frame Langstroth hives, and not being able to stay at home to watch, I "shook-swarmed" them. None of the bees of the mother colonies went into the supers (extracting-supers). The "shook" swarms hardly filled the super, so I got no surplus. My neighbor who lives a half mile from me, in a location no better than mine, and with colonies no stronger, and hardly as strong, got 210 pounds of surplus honey from 3 colonies of the same kind of bees. He tiered up and got no swarms. Of course I, being a beginner, disturbed the bees quite a little in looking for queen cells, to determine when to shake, and was probably somewhat awkward and nervous in doing the shaking, which made them so cross that it was almost dangerous to go near them for awhile. But why should I get so little honey compared with what my neighbor got from fewer colonies? I might add that we had plenty of clover bloom, but it rained so much that old beekeepers got only half a crop. In other words, I suppose, the honey harvest was cut short by the rains, and would not that work against me more than against one who did not let his bees swarm, or did not divide them?

I have just bought and read with pleasure your elegant book, "Forty Years Among the Bees." WISCONSIN.

ANSWERS.—1. If the queen were left with the mother colony on the new location, and all queen-cells removed, there would be no likelihood of any swarm. No more would there be if all cells were left, for feeling their destitute condition, and with no field-bees bringing in any stores, the workers would themselves destroy the cells. So that's not the reason. The old colony would be the better for having the queen. But the swarm would suffer for want of it. A swarm without a queen—natural or artificial—would be in pretty bad shape. No brood would be reared, and the numbers would rapidly diminish, making the swarm in poor condition for storing; and the swarm is the part depended upon for the harvest, not the mother colony.

2. In the Sibbald plan the shifting of the old colony from side to side is intended each time to throw all its field-bees into the swarm, thus keeping up its strength till a young queen is reared from the queen-cells that in the first place were left in the swarm.

3. Queenless bees are little inclined to build comb of any kind. With 2 frames filled with comb they are not likely to build any at all, in the Sibbald plan, until the young queen emerges, and then they are ready to do a good business at comb-building, and all of it worker-comb.

4. Put it down as a fixed fact that in a location where the main harvest is rather early, and there is no heavy fall flow, any dividing of forces, either by natural swarming or otherwise, is sure to cut in on the crop. You can't have your cake and eat it, too, and if you take away from the strength of a colony to make another colony, that surely will take away part of your crop, and the earlier the closing of the harvest the worse it is to divide forces.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

### Good Locations for Bee-Keeping—Shipping a Carload of Bees

The summer is past, and the harvest is ended, and I have a large crop of blasted hopes, but I don't think they will bring me in much cash. It just rained the bees out in this part of the country. It was so cold and wet during clover bloom that the bees could not do much, and not a pound of white honey was harvested, but the bees built up strong, and we looked for a good crop of yellow honey, but just as the fall flowers began to bloom it commenced to rain, and kept at it every few days until about 2 weeks ago, and my crop is 8 pounds of finished honey and 30 or 40 pounds of unfinished, from 74 colonies; and I will have to feed 100 pounds of sugar for winter stores.

Well, such is the life of a bee-keeper in Missouri. I am thinking now of making a change, and I want to ask some questions:

1. Is Jasper Co., Nebr., a good place for bees? I am told there is lots of alfalfa there. If not, what part of Nebraska is the best for bee-keeping?

2. Can bees be wintered there on the summer stands in single-walled hives?

3. How many colonies can be shipped in a car? Please give instructions as to how to prepare bees for shipping, and how to load them in a car. Can the hives be placed on top of each other in the car?

4. How is Illinois for bee-keeping, say in Montgomery County? MISSOURI.

ANSWERS.—1. Minute information as to particular localities is hard to be obtained except by personal visitation or information from some one on the spot. I don't know what are the best localities in Nebraska, and if I could name the very best locality in the State, it would be of no use to you if that locality is already fully occupied. If Jasper County has much alfalfa, that points toward a good place for honey.

2. Yes, if properly protected.

3. Perhaps 500. The hives must of course

be fastened bee-tight, but with plenty of ventilation. The hives must be placed so the frames will run parallel with the track, so the bumping will strike the combs lengthwise and not sidewise. If there are no more than will stand on the bottom of the car—say 90 to 100 hives—the only fastening needed will be strips nailed to the floor so the hives can not move in any direction, the strips being 1 or 2 inches thick. If the hives are piled on top of one another, then they must be strongly fastened by braces running from side to side, or else from top to bottom; perhaps both.

4. I don't know, but it probably averages fairly with the rest of the State.

### Fertilization of Queens

Does a queen become fertilized after 15 days? Does she stay in the hive, or what becomes of her? KANSAS.

ANSWER.—A queen may be fertilized after she is 15 days old, but the chances for it are not the best. A queen that is not fertilized before that age generally disappears; I don't know for sure just what becomes of her. If, however, she remains in the hive, and is not fertilized, she will begin laying, her eggs producing only drones.

### Swarming Methods and Surplus Honey

1. When we practice artificial swarming by the "shook swarm" method, why is it necessary, if at all, to shake the queen on the old stand and into the new hive? Is it because a swarm would be likely to issue if she should be left with the mother colony on the new location (even though all queen-cells were removed)?

2. If there is a reason why the queen should be left on the old stand with the "shook"

### Excluder Zinc and Queen-Rearing—A Queen-Introducing Experience

1. In your plan of queen-rearing, do you use perforated or queen-excluding zinc to keep the queen in the upper story?

2. On Saturday, Oct. 7, I introduced a queen. The bees seemed to be all right all day. I was called away and my children, 16 and 12 years of age, watched them. On Sunday morning the bottom-board was covered with dead and crippled bees running out of the entrance and covering the ground all

around. There was indication of robbers and no fighting. What is your opinion of the cause?  
OHIO.

ANSWER.—1. The queen is in the lower, not the upper story. Queen-cells or virgin queens, caged in some way for protection, may be kept in the same story with the queen; but generally, for the sake of convenience, they are kept in an upper story over an excluder.

2. I don't know. It may be that a small vagrant swarm entered, and its bees were killed by the colony.

### Feeding Bees for Winter

1. I started with one colony last spring, and now have 6. I am feeding some of them, and getting them ready for winter? Should I put the frames that are filled best in the center of the hive, and the poorest on each side? I use 8-frame dovetail hives.

2. How many pounds of syrup does it take to equal a pound of honey, if it is made of equal parts sugar and water. I suppose this is quite hard to estimate, but could you give me some idea? My bees may go through all right, but I think the hives are a little light to be safe.  
MINNESOTA.

ANSWERS.—1. I really don't feel sure just what is the best arrangement. Following the example of the bees themselves, it would be to have the outside frames entirely filled, and the upper parts of the central frames well filled. But you may not have exactly that kind of combs, and if you have combs that are entirely filled and others that are practically empty, it might be best to put the empty combs all at one side.

2. Take 5 pounds of sugar and 2 pounds of water, and you will have a syrup of about the consistency of honey. According to that, if you take 5 pounds of sugar and 5 pounds of water, and the bees evaporate it down to the consistency of honey, you will have about 7 pounds of the evaporated syrup. Not quite so much as that, for there is some loss in the evaporating. But look here, my good friend, you're not thinking of feeding equal parts of sugar and water, are you? That would be all right for August, and even early in September, but as late as this the proper proportion is 5 pints or pounds of sugar to 2 pints or pounds of water. And next year please get your feeding all finished before it is so late.

## Reports and Experiences

### Honey Almost a Failure

The honey crop is almost a total failure. I have none to sell from 60 colonies.

J. W. JOHNSON.

Stephenson Co., Ill., Oct. 2.

### Long Season for Bees

This has been a long season here for bees to gather nectar. My bees have worked a greater number of days since April 1 and up to the present time than ever before in my recollection in one season.

W. E. WILLIAMS.

Hillsdale Co., Mich., Sept. 22.

### Records of Good Queens

On page 620, E. J. Bryant, of Kane Co., Ill., gives this queen record: "I got the queen in 1904. Last spring the colony was very strong, and was divided June 15. A monster swarm issued on July 5, and on July 13 another swarm, making 4 swarms [should be 4 colonies], and the honey product is 200 pounds from one queen, or, in other words, from 4 colonies."

Now I will give the record of another good queen:

The first swarm I had this year issued June

25. I gave the colony from which it issued a super for comb honey to prevent an after-swarm. This virgin queen would not hatch; left the hive and began to lay before July 4; on the 10th I had to give 2 more supers, which were all filled by the 28th, and on Aug. 15 I had taken off 136 finished sections; on Sept. 25 they had completed 48 more, and had 24 more about  $\frac{1}{2}$  drawn out, making 184 finished sections. This is the individual record of a young queen. Who has one that will beat it? I call her a good queen.

The swarm that issued stored 72 sections. If I double them up, giving the record of the old queen, like Mr. Bryant did, it would read: 2 colonies, and 256 sections of comb honey. But I can not see how it is right. I believe in individual records.

I do not know whether the tongues of my bees are long, or whether their wings are strong, but I do know they are hustlers, and there has been scarcely a day but what from 1 to 2 quarts of bees have hung out in front; with 3 or 4 supers on to-day, fully 2 quarts of bees are hanging out, with a partly drawn super. But the harvest is over.

T. R. G. WELCH.

Morgan Co., Utah, Sept. 27.

### Maple-Leaved Goosefoot

I send a plant found in a corn-field that grew quite large, and was loaded with bloom, and bees were working on it very freely. I have never seen anything like it before.

This has been a poor season, only about half a crop of honey. Still I would not do without the "old reliable" American Bee Journal.

E. C. MESSING.

Randolph Co., W. Va., Sept. 27.

[The plant is the maple-leaved goosefoot or pigweed—*Chenopodium hybridum*—and is so named because the leaf resembles that of the maple. It is not an exceptionally good bee-plant, but may yield some nectar.—C. L. WALTON.]

### Drawn Sections Changing Color

On page 683 is a question asked by one who signs himself "Ohio," about his "combs turning straw color if left on the hive over winter," and Dr. Miller replies that he "never knew such change of color," etc. I never used "bait-combs" until last spring, when having a lot of sections filled about one-quar-

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

GEORGE W. YORK & CO.

Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

# BEE=BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

CHICAGO, ILL.

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

ter or one-half of sealed comb, I used them by placing one in the center of each of my first supers, and, *invariably*, when I removed those supers in order to case the honey, those bait-sections were a light amber if the balance were snow white; and a dark brown if the balance were light amber. It seems strange, and I, myself, can not account for it. I will repeat the plan next season, and see if the bees will also repeat the process on their part. I write this thinking others may have had the same experience as myself. I tried this over 100 hives, so it was not to be attributed to a few "freak bees." W. N. Root.

Christian Co., Ill., Oct. 3.

### A Correction

EDITOR YORK:—In the last paragraph of my article on page 695, I am made to say, "Although I have given the foregoing but little thought," etc. It should read, "Although I have given the following but little thought," etc. When I read the article I thought that I probably had written the word "foregoing" instead of "following," but on examining the original copy I find the word "following" written.

L. V. RICKETTS.

Whitman Co., Wash., Oct. 14.

### Sowing Alfalfa Clover Seed

Replying to "Missouri," page 700, regarding the sowing of alfalfa clover seed, I would say the best results are generally obtained by sowing in August, using ground that has grown a crop of oats, barley or wheat. As soon as possible the grain should be hauled off the ground and either stacked or thrashed, and 10 loads of manure to the acre be spread on the ground once. The ground should then be double-disked, harrowed, and left until about Aug. 10, when it should be again disked, harrowed, seeded, and reharrowed to cover the seed. Twelve to 15 pounds of seed to the acre is sufficient. It is a good plan to sow about half the seed on the field the first time over, and then cross the field, sowing the other half. This will insure a more even distribution of the seed.

The alfalfa should make a good growth in the fall, and not less than 3 good cuttings of hay should be made the following season, and 4 if conditions are favorable.

Remember that it is necessary to make the first cutting early, generally not later than June 1, even though the weather is such that the crop can not be cured. I sowed 35 acres of alfalfa on Aug. 8, and it is now over 15 inches high all over the field.

CHAS. WINKLER.

Adams Co., Nebr., Oct. 6.

The National Bee-Keepers' Association holds its annual convention at the Revere House, corner of Clark and Michigan streets, in Chicago, during the Fat Stock Show, when exceedingly low rates may be secured on the railroads. The dates for the meeting are Dec. 5, 6 and 7. Rates at the hotel are 75 cents for a room alone, or 50 cents each, where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants. W. Z. HUTCHINSON, Sec.

Minnesota.—On account of the National Bee-Keepers' Convention at Chicago on dates conflicting with ours, the Executive Committee has decided to postpone the usual annual meeting of the Minnesota Bee-Keepers' Association until further notice.

MRS. W. SWINGATE, Sec.

Illinois.—The 15th annual meeting of the Illinois State Bee-Keepers' Association will be held in Springfield, on Tuesday and Wednesday, Nov. 21 and 22, 1905, at the G.A.R. Hall in the Court House. The good results of this meeting rest on the members who attend it. Our State gives us an appropriation to publish our report and to suppress foul brood, and it is the duty of every bee-keeper of the State to have a voice in the manner in which this appropriation is used. All bee-keepers are invited to come, and bring their wives. The railroad rates will not be higher than an open rate of one fare and a third for the round trip, and efforts are being made by our Odd Fellow friends to secure a one fare for the round trip. Good hotel accommodations can always be had at reasonable rates. JAS. A. STONE, Sec.  
Route 4, Springfield, Ill.

## THE ONLY LOCK

Corner that is perfect is made by us. It can not be otherwise. The end rabbet runs by and nails to the sides. Can't split off nor warp. Perfect in every way. Lumber of the best quality. DISCOUNT—well, it will ASTONISH you. All kinds of Supplies. Write your wants.

## A Solid Gold Fountain Pen Free!

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are pure Para Rubber, handsomely finished. The simple Feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

### How to Get this Fountain Pen Free!

To a present paid-in-advance subscriber, we will mail this Fountain Pen free as a premium for sending us 3 NEW SUBSCRIBERS to the weekly American Bee Journal for one year (with \$3.00). Surely, this is an easy way to get a good Fountain Pen. Or, if unable to get the new subscribers, and you want one of these Pens, forward to us \$1.25 and we will send it to you by return mail. Or for \$2.00 we will send to any one the American Bee Journal for one year and a Fountain Pen.

This Fountain Pen would be a splendid gift to a friend or relative. Why not order both Pen and Journal for some bee-keeper as a present?

## Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½ cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less.

R. A. BURNETT & Co.

CINCINNATI, Oct. 6.—Reports from different parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH CO.

NEW YORK, Sept. 22.—New crop is beginning to arrive quite freely from New York State and Pennsylvania, and is in fair demand at 14c for fancy white, exceptionally fine quality may bring 16c; 13c for No. 1 white, and 11@12c for No. 2 white and amber; no buckwheat on the market as yet. Extracted, in good demand at last quotations. Beeswax, firm and scarce at 29@30c.

HILDRETH & SEGELKEN

INDIANAPOLIS, Oct. 12.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.

WALTER S. PODER.

CINCINNATI, O., Oct. 7.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover

from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, ¼c more. White clover from 7@8c. Beeswax, 26c.

C. H. W. WEBER.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c.

C. C. CLEMONS & Co.

ALBANY, N. Y., Sept. 21.—Honey demand improving here as the season advances, and as next month is the best month we look for good prices. Buckwheat comb is scarce; that is, straight buckwheat. We quote fancy white, 15c; No. 1, 14c; mixed, 13c; buckwheat, No. 1, 13c; mixed, 12@12½c. Extracted, white, 7@7½c; mixed, 6½@7c; buckwheat, 6½ cents. Beeswax, 28@32c.

H. R. WRIGHT.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade.

GRIGGS BROS.

PHILADELPHIA, Oct. 19.—Honey has been arriving freely in the last 10 days. There are still some small producers who have a few hundred pounds, and want to dispose of it quickly and get their money, who are keeping the prices down. We quote: Fancy white, 14@16c; No. 1, 13@14c; amber, 10@11c. Extracted honey rules firm at 5½@6½c for amber; 6½@7½c for white. Beeswax firm, 28c.

We are producers of honey and do not handle on commission.

WM. A. SKLSEK.

SAN FRANCISCO, Oct. 11.—White comb, 1-lb. sections, 8@9cents; amber, 6@7c. Extracted-water-white, 5@—c; white, 4½@4¾c; light amber, 3¾@4 cents; amber, 3@3½c; dark amber, 2¾@3c. Beeswax, good to choice, light, 25@27c.

There is little activity in the local honey market, as dealers and growers do not seem able to make their ideas in regard to prices conform. At the present rate of demand, dealers do not feel warranted in paying more than 4c a pound for extracted honey and 8c a pound for comb honey, choice basis. On the other hand, growers are aware of a scarcity in some sections and are holding for higher prices. A prominent bee-man of Bakersfield says that the honey crop of the county is a little above the average this year, but the price is small. Extracted honey is only bringing about 4 cents a pound. The extracting for the season is about completed.

Please mention Bee Journal when writing advertisers.

### Engravings For Sale

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and using in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid. Address,

**GEORGE W. YORK & CO.**

334 Dearborn Street, - CHICAGO, ILL.

Please Mention Bee Journal  
when writing advertisers.

### LOSS BY LICE

on poultry amounts to many times the cost of Lambert's Death to Lice—the sure preventive. Loss can be saved and profit made by its use. Frees sitting hens from lice without harming eggs or chicks. A trial 10c box will prove it. 100 oz. by express \$1.00.

D. J. Lambert, Vice-Pres.  
406 Mason Bldg., Chicago, ILL.

## Bee-Keepers' Early Discounts

Now is the time to send in your order for goods for use next season, and for all orders where cash accompanies we allow the following discounts:

Before October 1	deduct 10 percent
“ November 1	“ 9 “
“ December 1	“ 8 “
“ January 1	“ 7 “
“ February 1	“ 6 “
“ March 1	“ 4 “
“ April 1	“ 2 “

Freight-Rates from Toledo are the lowest. Can take Honey and Beeswax in exchange for Supplies if you desire. Send for free illustrated Catalog. It describes and illustrates everything for both the Poultry and Bee Keepers.

**GRIGGS BROS.**

521 Monroe Street,

TOLEDO, - OHIO.

Mention Bee Journal when writing.

## Bee - Supplies !

We carry a large stock and greatest variety of everything needed in the Apisary, assuring best goods at lowest prices, and prompt shipments. We want every bee-keeper to have our Free Illustrated Catalog, and read description of Alternating Hives, Massie Hives, etc. Write at once for Catalog, either English or German language.

**KRETCHMER MFG. CO., Council Bluffs, Iowa.**

Why not get a New Subscriber for the American Bee Journal, to send with your own renewal?

# A GOOD INVESTMENT

16 2/3 Percent Interest.

Absolutely Safe.

A Chance for Bee-Keepers Only.

Read again what Editor York says regarding it on page 661, Sept. 21, American Bee Journal.

## ONLY 5 DAYS LEFT

To secure our 9 percent October Discount.

### Discounts for Early Cash Orders

For cash orders before Nov. 1 .....	9 percent	For cash orders before Feb. 1 .....	6 percent
“ “ Dec. 1 .....	8 “	“ “ Mar. 1 .....	4 “
“ “ Jan. 1 .....	7 “	“ “ Apr. 1 .....	2 “

The above are the discounts which we offer for early cash orders.

You will notice that after January, the discount drops 2 percent a month; and if we find that advancing prices of materials do not warrant the larger discount, we reserve the right to reduce the amount.

### Orders may be sent to any Branch House or Dealer

#### Well-known Dealers

The dealers, whose names follow, are well known to bee-keepers. They have been, for the most part, long established in the bee-supply trade, and have a knowledge of the business most valuable indeed to the bee-keeping fraternity. Their advice may be had on any question of Supplies, etc., for the asking.

#### The Large Stocks

Nowhere else is it possible to find such well-assorted stocks of goods for bee-keepers as are carried by dealers in Root's Goods. No matter whether you require a little 5-cent article or a carload of goods, these dealers can serve you promptly. Stocks are frequently carried amounting to \$5000 and upward.

#### Shipping Points

You will observe that these dealers have excellent shipping facilities—guaranteeing you quick delivery and low freight rates.

#### Prices, Discounts

The prices, terms, discounts, etc., are identical with the home office at Medina (with rare exceptions). Full particulars may be had before ordering, if desired, by writing the dealer nearest you. You can, however, use our Medina catalog and terms, and, if any variation, your dealer will advise you, if requested, before shipping.

#### Other Dealers

Besides the following list, there are many others who handle some of Root's Goods. The following is by no means complete for hundreds of dealers come to us for many of the goods of which we are the exclusive manufacturers. *Insist on getting Root's Goods.*

#### Local Dealers

In addition to the following list who carry large stocks, and furnish at both *wholesale and retail*, we have in every State a large number of local dealers who handle our goods exclusively. As there are over 500 of these dealers, space will not permit giving their names at this time; but information will be given by us, on request, to any bee-keeper regarding the dealer nearest him handling Root's Goods.

## Editorial Notes and Comments

### Convention Going

We have received the following from Mr. R. F. Holtermann, one of Canada's "convention goers:"

EDITOR AMERICAN BEE JOURNAL—

Your statement about going to conventions can not be too strongly endorsed. I have gone to more North American, International, and now National, conventions than any other Canadian. I have also attended a great many conventions in Canada, and spent a considerable sum in my education in this direction. I look upon it as a business investment which has paid me well.

To get the greatest benefit from conventions, we must not be as pliable as putty, and have our ideas moulded by every new person who takes hold of us; but we must be unprejudiced, and open to solid reasoning. People who think they have reached perfection will not—yes, can not—learn anything more; but to others a convention properly conducted must be profitable.

I have this season, from 296 colonies, spring count, secured a good, fat 60,000 pounds of honey, and have had to do no feeding for winter. I want no system which artificially or otherwise breaks up colonies, and I believe I have come closer than anything I have yet seen or heard of, to increase now in the production of extracted honey. I have some points which I have not seen brought out.

I hope to be present at the coming National convention in Chicago.

R. F. HOLTERMANN.

The American Bee Journal has always been a strong supporter of conventions among bee-keepers. It feels encouraged to know that so able a bee-keeper as Mr. Holtermann also endorses its stand on the subject. Any bee-keeper who desires to make the greatest success of the business of honey-production makes a large mistake if he fails to attend conventions. Of course, sometimes it may be utterly impossible to go, and, if so, that is to be regretted. But a big attempt should be made to "get there," especially to the larger State and National conventions.

Every bee-keeper who can possibly arrange to attend the National convention here in Chicago next Dec. 5, 6 and 7, should do so. We do not say this because it is to be held in Chicago, but because it is the National organization of bee-keepers. It is the largest

thing of its kind on this continent, and has done more for American bee-keeping than any other similar organization. It can, and will, do much more along the same line. But in order to do so, it must have the hearty co-operation of just as many live bee-keepers as possible.

Come to the National convention, Dec. 5, 6 and 7.

### Cakes of Beeswax Without Cracks

More than once in these columns the advice has been given to cover up warm so the wax shall be a long time cooling, or to put the wax in the stove oven at night, leaving it there all night so as to cool off slowly as the stove cools off. Evidently this hardly applies to large quantities, the size of the cake being limited by the size of the vessel admitted by the oven.

In Gleanings in Bee Culture Leslie Burr says the only practical way with large quantities is to dip the wax from one tub into another. The cracking is caused by the fact that the outside part of the cake becomes solid while the central portion is still hot. When the hot wax is poured back and forth from one tub to another, the whole mass becomes cooled more uniformly, hence no cracking.

### Points in Moving Bees

Migratory bee-keeping seems to be more in vogue in Australia than in this country. From a symposium in the Australasian Bee-keeper on the subject of moving bees, the following points are taken:

In place of wire-cloth for ventilation, bagging or hessian (burlap?) may be used, both on top and at the entrance.

Remove all combs filled with honey, and replace with empty ones placed in the middle of the brood-nest.

Make all preparations that can conveniently be made the night before, so an early start can be made on the journey the following morning. (In Germany the start is some-

times made not long after midnight.) Chas. U. T. Burke says:

"I would only take one load each day, starting each time at daylight. If you have them shut up, and shift them in a broiling sun, many will be smothered, and what are alive would take a week or more to recover, so always shift your bees as quickly as possible as early in the morning as you can. Hives have time to cool down through the night, whereas if you shift them at night they are quite hot from the heat of the day, and all hands disagreeable at being disturbed."

To make the bees mark their proper locations more certainly, pile green bushes or grass at entrances, leaving them there two or more days.

J. A. Hutchinson advises that heavy twine be used to fasten the harness-tugs to the whiffletrees, so that if anything happens that makes it desirable to unhitch the team quickly, the strings can be cut.

### Rubber Bands for Transferring

Grant Stanley suggests in Gleanings in Bee Culture that instead of strings and splints, rubber bands be used to hold combs in frames after the pieces are transferred. Then when the bees have had time to fasten the combs in place, cut the bands by running a sharp knife lengthwise over the top-bars.

### Definition of Honey Explained

To those who are familiar with what has been said as to the Government definition of honey, the following circular is self-explanatory:

EXPLANATION OF STANDARD FOR HONEY.

On Dec. 20, 1904, the Secretary of Agriculture, acting under authority of Congress, and upon the recommendation of the Committee on Food Standards of the Association of Official Agricultural Chemists, proclaimed the following standard for honey:

"Honey is the nectar and saccharine exudations of the plant, gathered, modified, and stored in the comb by the honey-bee (*Apis mellifica*). It is laevo-rotatory, contains not more than twenty-five (25) percent of water, nor more than twenty-five hundredths (0.25) percent of ash, and not more than eight (8) percent of sucrose."

This standard was adopted after careful publication of an earlier suggested standard as a basis of criticism, and after careful consultation with leading authorities in apiculture.

Since the standard was issued many letters

have been received from bee-keepers representing many of the States of the Union, expressing a desire that the standard should be changed so as to avoid the exclusion from standard honey of all honeys that contain honey-dew. In support of this plea, it is urged that the bee-keeper is unable to prevent the introduction of some honey-dew, whether taken directly from the plant or from the aphids, and that small quantities of this material are not injurious to the honey.

These requests being brought to the attention of the Committee on Food Standards at its meeting in Chicago, beginning May 29 last, the committee adopted the following minute:

"The standard does not in any way exclude small quantities of honey-dew from honey. We realize that bees often gather small quantities of honey-dew that can not be detected in the finished product by chemical means, and does not damage its quality. It is only when relatively large amounts are gathered that the quality of the honey is impaired, and it fails to meet the requirements of the standard. It is generally agreed that such a large amount of honey-dew is injurious to the quality of the product, which can not then be properly regarded as honey."

Bee-keepers have reason to be thankful for this ruling, which seems evidently to have been framed with a sincere desire to be fair to the producers of honey, and at the same time to protect the interests of the consumers. Indeed, whatever is to the interest of the consuming public is, in the final analysis, to the interest of the producer.

It now lies with bee-keepers to be so careful as to the quality of the honey they put upon the market that the confidence of consumers may constantly be more firmly established than when they buy anything under the name of honey they are buying the pure article from the laboratory of the busy little denizens of the hive.

There is no disputing the fact that there are exceptional cases in which bees store that which is not desirable as an article of food; also that the best of honey may be so treated as to be unrepresentable. But no complicated analysis is necessary to distinguish such product. It is only necessary to taste it; and the man who puts it on the market is a fool or a knave, or both.

### Fencing Bees with Barb-Wire

Mention is made in the Australasian Bee-Keeper of an apiary thus enclosed. The hives are placed with their entrances close up to the fence. This does not obstruct the flight of the bees, but allows cattle and horses to eat down the grass close up to the entrance of the hives, and also allows a smaller space of ground to be enclosed.

Possibly some one on this side of the globe may have tried this, and will be kind enough to give us the advantages and disadvantages of the practice.

**The Truth About Honey.**—A few changes have been made in the reading of the Comb Honey Guarantee Circular for shipping-cases gotten up by The Honey-Producers' League, so that it will be suitable for bee-keepers to use in their correspondence, putting one in with every letter they write. It is headed, "The Truth About Honey," and is printed on both sides of a light manilla card-board. It is sent postpaid in lots of 50 for 10 cents, 100 for 20 cents, etc. Every bee-keeper should use it, as it will undoubtedly help to popularize the use of honey.

The Guarantee Circulars for putting in shipping-cases should be used by every bee-keeper who sells comb honey by the case. These circulars are the same price—10 cents for 50 copies, postpaid. Send all orders to the American Bee Journal office.

## Miscellaneous News Items

**Home-Apiary of Otto Luhdorff.**—On the first page are shown some pictures sent us by Otto Luhdorff, of Tulare Co., Calif. When sending them he wrote thus:

I am enclosing 3 pictures. No. 1 is my home apiary, consisting of some 75 colonies on a lot in a city which has about 5000 inhabitants. I never had any trouble with my neighbors on account of my bees; they are very tame—I mean the bees, not the neighbors. The hives are standing in the shade of fruit-trees.

No. 2 is a hive on scales which weighed on Sept. 15, 235 pounds, now (Oct. 7) over 240 pounds—the limit of the scales. In front of the hive is a frame of honey which shows how white the bees cap their combs.

No. 3 is the same hive and a frame of queen-cells. The bees accepted every cell; rather unusual, at the same time a very strong colony. All brood was capped and young brood always hatching, which was favorable for the development of cells.

The bees are a little side-issue with me, as I drifted into bee-keeping for pleasure.

OTTO LUHDORFF.

**Illinois Fair Premiums.**—The winners of premiums in the bee and honey department of the recent Illinois State Fair are as follows:

Display of comb honey—1st, Aaron Coppin; 2d, C. Becker; 3d, Geo. M. Rumler.

White comb honey—1st, Jas. A. Stone & Son; 2d, Aaron Coppin; 3d, C. Becker.

Amber or dark comb honey—1st, C. Becker; 2d, Jas. A. Stone & Son; 3d, Aaron Coppin.

White clover comb honey—1st, Jas. A. Stone & Son; 2d, A. Coppin; 3d, C. Becker.

Sweet clover comb honey—1st, Louis Werner; 2d, Jas. A. Stone & Son; 3d, A. Coppin.

Basswood comb honey—1st, Jas. A. Stone & Son; 2d, Aaron Coppin; 3d, C. Becker.

Display of extracted honey—1st, Jas. A. Stone & Son; 2d, C. Becker; 3d, A. Coppin.

Honey extracted on the grounds—1st, Jas. A. Stone & Son; 2d, C. Becker.

Frame of comb honey for extracting—1st, C. Becker; 2d, Louis Werner; 3d, A. Coppin.

Display of candied honey—1st, C. Becker; 2d, Jas. A. Stone & Son; 3d, Aaron Coppin.

Display of beeswax—1st, C. Becker; 2d, Jas. A. Stone & Son; 3d, Aaron Coppin.

Dark Italian bees—1st, Aaron Coppin; 2d, Louis Werner; 3d, C. Becker.

Golden Italian bees—1st, Aaron Coppin; 2d, Louis Werner; 3d, C. Becker.

Carniolan bees—1st, Louis Werner; 2d, C. Becker; 3d, Aaron Coppin.

Honey-vinegar,  $\frac{1}{2}$  gallon, with recipe for making—1st, Jas. A. Stone & Son; 2d, C. Becker; 3d, Aaron Coppin.

Display of designs in honey—1st, Geo. M. Rumler; 2d, Aaron Coppin; 3d, C. Becker.

Display of designs in beeswax—1st, Jas. A. Stone & Son; 2d, Aaron Coppin; 3d, C. Becker.

**Prime German Candy Honey.**—This nation is frequently credited with being chief in the matter of humbuggery and adulteration. Of late, however, at least in matters that specially interest bee-keepers, the Yankee nation is in danger of losing its dizzy eminence as faker-in-chief. In Europe, thousands of wax-presses are in use by bee-keepers, who make their own foundation, a chief reason for this being the fact that it is difficult to buy foundation that can be relied upon as unadulterated. Some specimens on the mar-

ket show upon analysis 72 percent of paraffin and only 28 percent of wax. In this country the difficulty would be to find any sample of foundation not absolutely pure.

There is no attempt to dispute that in this country glucose has been used to a large extent as an adulterant. But too great publicity is not courted by those who sell something under the guise of honey which contains in it nothing that has ever been in the honey-sac of a bee. Dealers in pure honey in this country are not likely to be approached with offers of bargains in the adulterated stuff. For brazenness in that line, pre-eminence must be accorded to adulterators across the water, as is shown by a letter received at this office direct from the "North German Honey and Wax-Works." Enclosed with the letter was a "Price-list of prime candy honey"—very queer tasting stuff—sold in wooden casks, wooden pails, tin boxes, enameled pails, glasses, and tins, at prices varying according to style of package from  $3\frac{1}{2}$  to  $9\frac{3}{4}$  cents a pound.

**"The Honey-Money Stories."**—This is a 64-page-and-cover booklet,  $5\frac{1}{2} \times 8\frac{1}{2}$  inches in size, printed on enameled paper, entitled, "The Honey-Money Stories." The cover has a picture of a section of comb honey,  $3\frac{1}{2}$  inches square, the comb being in gold-bronze, which gives it a very attractive appearance. Then on the gold-bronze comb are printed these words: "From Honey to Health, and from Health to Money."

It is edited by Earl M. Pratt, and contains a variety of short, bright stories interspersed with facts and interesting items about honey and its use. The manufactured comb honey misrepresentation is contradicted in two items, each occupying a full page, but in different parts of the booklet. It has in all 31 halftone illustrations, nearly all of them being of apiaries or apiarian scenes. It also contains 3 bee-songs, namely, "The Hum of the Bees in the Apple-Tree Bloom," "Buckwheat Cakes and Honey," and an entirely new one, called, "The Bee-Keeper's Lullaby." This last song has not been published before. The songs alone ought to be worth more than the price of the whole thing.

It is a booklet that should be placed in the hands of everybody not familiar with the food value of honey, for its main object is to interest people in honey as a daily table article. It is thought that it will be just the thing to sell on railroad passenger trains, on news stands, etc. The stories and items are all so short and helpful, and the pictures so beautiful, that it likely will be kept by any one who is so fortunate as to get a copy of it. Its postpaid price is only 25 cents, but the health-value of its contents would run up into dollars. We mail 5 copies for \$1.00, or club it with the American Bee Journal—both for \$1.10. It would be very nice for a gift to a friend. Send us a six months' new subscription for the American Bee Journal with 50 cents, and we will mail you a copy of "The Honey-Money Stories" free as a premium.

**Comb Honey Not Machine-Made.**—We have a fair supply of the typewritten letter on this subject, which appeared in the Chicago Daily News of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

## Contributed Special Articles

### Caring for Comb Honey After Taken Off the Hive

BY G. M. DOOLITTLE

WILL you please tell us through the columns of the Bee Journal how to take care of comb honey after it is off the hive; that is, from the time it is taken from the hive till it is taken to market? I am a beginner in the bee-business, and when I took off my honey I put it in a cool room on the north side of the house, thinking that this would be a good place for it; but some way, now that I am preparing it for market, it does not look as good and white as it did when I took it from the hive, and the honey that is in the few unsealed cells next to the wood of the section, runs out if I tip it the least bit sidewise. What is the trouble?"

I doubt if there ever was a season since I have written about bees when I had so many inquiries about the care of comb honey as now, and from the letters received it would seem that, owing to the generally poor season in most parts of the country, the honey the bees obtained was thinner or less evaporated than usual. But, to the question:

The first requisite for caring for comb or section honey, after taking it from the hives, is a good, warm room in which to store it. Don't for any reason store it in the cellar, as so many beginners seem prone to do, nor make the mistake the questioner did, of storing it in a room on the lower floor on the north side of the house, for this is nearly as bad as in the cellar.

It seems strange to me that nearly every one who has not been told better, will take it for granted that honey should be stored in a refrigerator, or some place as cold as can well be found. If they would stop to think a moment, they would know that the place where the bees keep it is *warm*, and the bees are models for keeping honey. The warmer honey can be kept the better, till a degree of 100, Fahr., is reached, and to secure such a high temperature without being obliged to keep a fire, quite a few of our most practical apiarists put it in an upper chamber or the attic. In this way the rays of the sun shining all day directly on the roof warms the room and the honey up to near this 100, Fahr., point, and the honey being thus warmed during the day holds the heat till well toward morning, so that it is thickening and ripening to such a place very much the same as it would were it left with the bees. The only objection that can be brought against such an upper room is the amount of heavy work required in lugging the honey up and down the stairs. Where an elevator can be used, such a place is just the thing.

As a body of honey once thoroughly warmed will hold the heat for a long time, the average temperature of such a room on the south side of the house will be pretty high, ranging from 80 to 100 degrees the most of the time up to Oct. 1, thus ripening the honey splendidly. The object of this is to have the honey growing better and better, instead of poorer (as did that of our correspondent in his lower north room), and that from the moment it leaves the hives, this causing the honey in those unsealed cells—where there happens to be any around the outside of the comb next the wood, which is spoken of above—to become so thick that it will equal any in the section. Ofttimes it is better not to wait until these unsealed cells next the wood of the sections are *all* sealed over, for to wait for them to be so is often a great waste of time, especially so for those sections near the outside of the surplus arrangement. When the honey is taken from the hive, that in the unsealed cells is often so thin that if the sections are held so the mouths of the cells are down, it will leak or run out badly; but by leaving it in a warm room, as above, for three weeks or a month, it can be handled as you please, tipping it over, etc., and not a drop of honey can be shaken out. And after it gets to market, if it is stored in a damp, cool place, it will be some time before it will take on moisture enough to affect it to any great extent.

Perhaps all will not agree with me; but I think that all comb honey should be stored in such a room at least a month before casing or sending to market, to ripen, or "sweat out," as it is more usually termed. I know that it is a saving of time and labor to case it as soon as it is taken from the hives; but I think it pays for all the extra time and labor required, in the better quality and appearance of our product.

Having moved to the old Doolittle homestead during the past year, and there being no place for keeping honey except the chambers, I have built a place for the same, not wishing to perform all the labor necessary to keeping it in an upper room. This building is in the form of a "lean-to" on the south side, it being 12 feet wide and 24 feet long, the 24 feet being east and west, with the one-sided roof slanting toward the south. This roof and the three sides have been painted with what is known here as "Venetian red," and the sun heats it up, even after quite a cold night, to from 80 to 90 degrees by 10 a.m. When it gets up to about 100, the windows are opened so that the air, coming through the screens on them, can carry out all moisture, and thus I have it hot and dry on every sunshiny day. At night the windows are closed, and they are left thus except when the mercury rises above 90.

When the honey was taken off, the first super was set on 2 inch square blocks, one under each of the 4 corners, the blocks resting on the floor. Then on each of the 4 corners of this super were placed 4 1-inch square blocks, on which to set the next super, and so on till a pile of 10 supers high was reached, when a new pile was started. In this way there was a 2-inch space (under) between the first super at the bottom and the floor; and an inch space between each and every (other) super. This allowed the heat and air to circulate under, above, and around every section of honey in every super, and when I came to get the honey ready for market a few days ago, I never had honey any better ripened before. Some of it used on the table was so thick that even the honey in the unsealed cells next the wood of the sections would stay almost half a day before dropping out, where the knife was used in cutting the comb of honey out for use. I am much pleased with the result, and especially as it is an easy matter to handle the honey for all purposes from this room.

Onondaga Co., N. Y.

### Work in the Apiary for November

BY C. P. DADANT

IF you have not removed all the supers during October, the cool mornings of the early part of November must be used for this purpose. It is well to examine the hives and make sure that none of the entrances are too deep; that is, deep enough for mice to go through, as there is greater danger of disturbance from mice in the very coldest weather. A very strong colony may get rid of the mice, but an average colony which does not cover all the combs during cold weather, will be very much disturbed by the mice gnawing at the unoccupied combs.

We like to reduce the entrances of the hives to the space necessary for ventilation only. We believe in sheltering the bees against changes of temperature in all possible ways. It is true that bees can winter, and do winter, with a great deal of ventilation, even with the bottom-board entirely removed, but this is done at the expense of an extra amount of food. A good colony of bees in a healthy condition will keep warm during the coldest weather, but it will require a greater quantity of honey in cold weather, and the colder the atmosphere the more they will consume. That is why bees wintered in the cellar consume so little. It has been estimated by some apiarists that colonies may consume as little as 5 pounds of honey in the cellar during the winter. This is a low estimate, but I am satisfied that 8 or 10 pounds is a fair estimate, while nearly double that amount will be consumed in a cold winter on the summer stand. It is evident that bees produce heat by the consumption of stores.

While we want to shelter the hives against the cold winds and storms of winter, we want to secure them against an excess of moisture by the use of absorbents over the cluster. It has been held by some that upward ventilation is necessary. I doubt this, and believe that the only advantage of upward ventilation is the carrying away of the moisture, which, in a tight-fitting hive, would condense and wet the interior of the hive. But upward ventilation also carries away heat. So we have made it a practice to remove the tight-fitting cloth which is placed over the brood-chamber during the warm season, and replacing it with a straw-mat covered with forest leaves. This does not allow of any loss of heat, but absorbs the moisture as fast as it is produced. This moisture is not often injurious; usually it condenses in the corners and runs down and out of the hive, especially if the hive is tilted forward as all should be.

But I have seen two or three winters in my experience in which the condensation of moisture was so great that it literally soaked the combs, the bottom-board, and all the dea-

bees that usually fall to the floor of the hive. In this condition the living bees were helpless and soon died, for nothing short of a transfer on dry combs could help them, and such a transfer was impossible in cold weather. But in every case where our bees had upper ventilation, or absorbents in the upper story, the conditions were entirely different, as the moisture had been allowed to pass off as fast as produced. This experience was plain, for we saw the same result in hundreds of hives.

As I said before, this happened only in two or three winters, but the experience with the hives that had a water-tight ceiling was so lamentable that it became an absolute rule with us never to winter bees out-of-doors or in the cellar without giving them either moisture absorbents in the upper story or upper ventilation, the former being very much preferable on account of the economy in heat.

Any sort of covering will do that allows the humidity to pass on through. Langstroth, at one time, recommended corn-cobs, carefully piled side by side, so as to leave no interstices. Some apiarists recommend cork-dust, which would be all right if not so expensive. A sack full of chaff, or leaves, or wool-waste, cotton, or even carpets, will be far superior to the ordinary tight oil-cloth which serves during the summer.

Outside shelter is good, no matter in what shape, and the material used for this purpose will differ according to the location and ease of securing it. An outer covering or case is the best if it were not for the expense. We have sometimes wintered small colonies in small-sized hives by covering them with a large dry-goods box, which was tipped back during warm days. With such a covering a very small colony or nucleus is often wintered safely, and helped through the spring months without much trouble. But it requires constant attention, as they must be given a flight whenever the weather is suitable.

Above all things, it is well to put our bees in winter quarters before the opening of cold weather, so as not to disturb them after the cold days have begun. Hancock Co., Ill.

## Requeening Colonies—Uniting Weak with Strong

BY EDWIN BEVINS

THERE seems to be an unfortunate or misleading use of words in the heading of that article by W. T. Cary, on page 647. Under the heading, "Uniting Weak Colonies with Strong Ones," Mr. Cary tells how he *requeened* 2 colonies in an old-fashioned way—how he didn't requeen the third one, and how he *did* requeen the fourth one.

Mr. Cary does not say that he used bee-ziuc when he tried to requeen the 2 colonies which had their old queens killed, but, supposing that he did, I will venture to say (begging his pardon) that I believe his method of procedure was a great mistake. The work might have been done without any fighting or the loss of a bee.

My way would have been to place those shallow extracting supers having the nuclei and young queens on bottom-boards having the usual  $\frac{3}{8}$ -inch strips to form entrances. Then I should have removed the covers and put two thicknesses of newspaper with small holes over each nucleus, and then set the hives with the queenless bees on top. There would have been no fighting, and there would have been no swarm, unless the work had been delayed so long that queen-cells had come too near maturity.

Now comes the puzzling part of Mr. Cary's experiments. His attempt, it seems, was to requeen a colony having a laying queen with a young queen hatched from a queen-cell in a nucleus placed above the colony to be requeened. It is well known (so queen-rearers say) that a virgin queen reared over a colony will, when released, go below and kill the laying queen. It is evident, however, that Mr. Cary did not intend to requeen in this way. He waited until the young queen was laying, then removed the temporary bottom-board and put in its place two honey-boards. These, it seems, served to protect the young queen and prevent any great disturbance. The rear entrance may have contributed something to this result.

If only requeening was what Mr. Cary had in view, why did he not kill that old queen when the young one came on the stage of action, and then unite by some of the usual methods? If the purpose was to test the efficacy of two honey-boards instead of one, in the preservation of peace between a strong colony of bees with a laying queen below, and a weak colony or nucleus with a laying queen above, then the experiment has some significance. The results obtained by

the use of two honey-boards instead of one will be awaited with interest.

When a weak colony in spring is put over a strong one with a view to build up the weak colony by the aid of the warmth and superior numbers of the strong one, it would not be prudent to give a rear entrance to the upper colony, as many bees would seek the old location and be lost.

I am a little curious to know what Mr. Cary would have done with that nucleus if those hybrid rascals had not swarmed. Did he put the two honey-boards between the nucleus and the rascals?  
Decatur Co., Iowa.

## Convention Proceedings

### Report of the Missouri Convention

The Missouri State Bee-Keepers' Association met in Sedalia, Aug. 22 and 23, 1905. The convention was called to order by Pres. J. W. Rouse at 2:30 p.m., Aug. 22. Prayer was offered by Dr. Drunert. Roll called and the following members found present: E. T. Abbott, Lewis A. Osborne, M. E. Tribble, J. T. Shackelford, W. T. Cary, J. W. Rouse, R. A. Holekamp, N. R. White, M. E. Darby, W. H. Wilmer, Dr. F. H. Drunert, E. E. Lawrence. W. T. Carrio came later. The following joined during the session: E. G. Guthrie, N. C. Lang, E. B. Gladish.

Secretary Cary and Assistant Secretary Holekamp read their reports, the latter's showing a balance due him of \$42.15, which he kindly donated to the Association.

On motion, the secretaries' reports were approved, and a hearty thanks tendered Mr. Holekamp for the noble work he had done, and for his donation to the Association.

Pres. J. W. Rouse gave an address.

At the night session Mr. Holekamp read a paper on foul brood, and a discussion followed in which L. H. Wilmer, Dr. Drunert, E. T. Abbott, and others, participated.

Hon. Geo. B. Ellis, secretary of the Missouri State Board of Agriculture, was introduced to the Association. Mr. Ellis gave a valuable talk on bees and their relation to farming and horticulture, and promised to issue a State bulletin about bees.

### SECOND DAY.

The meeting was called to order by Pres. Rouse; prayer by E. T. Abbott.

The election of officers resulted as follows: J. W. Rouse, president; M. E. Darby, vice-president; Robt. A. Holekamp, of St. Louis, secretary; and M. L. Long, treasurer.

Mr. Holekamp read a paper on "How to Transfer Bees from Box-Hives to Movable-Frame Hives." It was listened to with great interest, and a discussion followed in which Messrs. Wilmer, Abbott, and others, took part.

A motion was made to raise \$25, or as much thereof as possible, to help pay Mr. Holekamp's expenses to the convention of the National Bee-Keepers' Association in Chicago. Mr. Holekamp refused to receive the donation, saying that he would pay his expenses himself. But he said that a free-will contribution to the funds of the Association would be very acceptable, as the treasury was always empty, and a good deal of good could be done with some extra money, as it could be used for printed matter and postage to bring new members into the Association, and to bring the old members in closer touch with it. Thereupon it was voted that the secretary be instructed to issue a circular calling for free-will contributions to the funds of the Association, to be used at the discretion of the secretary in promoting the welfare of the Association, and enlarging its membership through circularizing and furnishing such literature as would interest the bee-keepers of the State.

E. T. Abbott brought up the advisability of patronizing the Progressive Bee-Keeper, the only paper in Missouri devoted exclusively to bee-keeping. The secretary, on motion, was instructed to write to the editor of the Progressive Bee-Keeper, asking him to co-operate with the bee-keepers of Missouri.

Mr. Abbott offered to print 4000 or 5000 small circulars free of charge to be sent out in the catalogs of bee-supply dealers, to stir up the interest of the bee-keepers of the State in the Association.

The secretary was instructed to prepare such a circular and send it to Mr. Abbott. A vote of thanks was tendered Mr. Abbott for his kindness.

It was voted that every member of the Association be requested to act as a committee of one to form a bee-keepers' club in his own county or vicinity, whose members must become members of the Missouri State Bee-Keepers' Association and of the National Bee-Keepers' Association, thus furthering the interest of the Association and of the bee-keepers of his county or vicinity.

At the afternoon meeting a committee, previously appointed to decide as to when a member becomes delinquent, reported as follows:

We, your committee on interpretation of the constitution in reference to membership, beg leave to report the following:

That record of membership should be made to conform to that of the National Association, beginning the day that the secretary receives the dues, and entitling to all privileges of the Association for one year from that date.

JAS. T. SHACKELFORD,  
M. E. DARBY.

Mr. Holekamp informed the Association of the organization of The Honey-Producers' League, formed for the purpose of increasing the demand for honey by advertising it in the large journals of the country and otherwise, this advertising to be done in a general way through articles intended to counteract the bad effects of announcements detrimental to the interests of bee-keepers, and calling the attention of the masses to honey as a healthful sweet.

The sympathy of the Association was extended to Pres. Rouse, who had lost his beloved wife since the last meeting.

On motion, the officers of The Ruralist were thanked for kindly allowing the use of their large office-room for the meetings of the Association; also Mr. Osborne, and the people and papers of Sedalia, were thanked for their kindness towards the convention.

The secretary was authorized to use his discretion about having the minutes of the meeting printed.

The convention then adjourned *sine die*.

R. A. HOLEKAMP, Sec.

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 746.)

### MAILING INFECTIOUS MATERIAL.

"Would it not be a violation of the United States postal law to send infectious diseases of any sort through the mail?"

Mr. Reynolds—I would say, as one working in the mails, that it is.

### BEE-KEEPING FOR WOMEN.

"Is bee-keeping a pleasant and profitable occupation for woman?"

Pres. York—We have not heard much from the women, it seems to me; I think we had better hear from Mrs. Stow, the vice-president of the Association. Mrs. Stow, what can you answer to that?

Mrs. Stow—Bee-keeping has been very pleasing to me, whether it has been profitable in all respects I don't know, but I don't think I would say that it has not been. I have enjoyed the work with my bees for the last 20 years more than anything else that I have known of, except my own family duties; and the only objection I can see is that there is some hard work about it; that unless she can have the help of a man once in a while, or a big boy, it would be a little too hard for her. But there is so much of the work that can be done by a woman just as well as by a man, that I think it is all right for a woman, if she has the taste to go into the business. I like outdoor work, and enjoy nature and studying it; and it is one of the advantages that any woman going into this business has, as it is done at home, and she can interest her own family in it; it is not like going out to work. But if a woman went into it by herself with the idea of making a living by it, I don't know whether I could say she would be able to do so.

Mrs. Glessner—I am such an amateur bee-keeper that I don't believe anybody that keeps bees would want to hear anything I have to say. Let me tell a story. I have only a very small number of colonies, as I have taken entire charge of them myself. One day when I was busy, and very much engaged—I have a little house down in the White

Mountains—I saw a little skunk down the path coming towards me. I was so much engaged I simply went right on with my work, and kept an eye on him. After a while he came down another path, and it was so tempting, he was so close to me, that I thought I would see if I couldn't capture him. So I picked up an empty bee-hive without a bottom-board, but with a cover on it, and I walked out very gently and clapped it over the "gentleman," and then piled some stones on top so that he couldn't lift the cover up; then I went away. My son's house is up in the woods a little way, and I went to the telephone and called him up, and said, "I have a little skunk in a bee-hive down at the bee-yard, and I would be very glad if you would come down and help me." There was quite a little pause, and quite a little snicker, and finally he said, "Of course. What shall I bring?" I said, "You might bring some fire arms of some sort." So I armed myself with a bottle of ether and chloroform, and a little, long syringe. We pushed the cover off a little bit and I threw in the ether and chloroform. Then we tied a long string around the bee-hive and he put me off to one side and said, "Now, when I say 'Pull,' you pull." I pulled, and he fired, and we had one dead skunk, and no odor at all. [Applause.]

Miss Wilson—I don't know that I have anything new to say, except I think it very much depends upon the woman, just the same as it does upon the man. Not all men will make a success of bee-keeping, and not all women. If a woman is intensely interested in bees, and has a good deal of pluck, and grit, and energy, she will make a success of it. If she is afraid of bees and doesn't care for them, and is not interested in them, I don't know that she would be very apt to make a success of it. As to the profit of bee-keeping, I think there are other profits to be considered than dollars and cents. The health of many women would be improved, and they would enjoy a great deal of profit outside of dollars and cents. As for me, I am very sure that the profit in regard to my health would have been a sufficient inducement for me to have gone into bee-keeping; and I think many women would find the same thing, besides materially adding to their finances at the same time.

Pres. York—I think Mrs. Stow said something about having a man to help her. What do you say about that, Miss Wilson?

Miss Wilson—I think it would be very advisable—if you can get one. [Laughter.] I think you can get along without them.

Pres. York—Next, I was going to ask Miss Wilson to tell about the man that helps her.

Miss Wilson—If you could all have as good a man to help you as I have to help me, I would advise you all to have a man.

Mr. Wilcox—Can you tell us any reason why a woman producing comb honey cannot make it as profitable as a man can?

Miss Wilson—I don't know of any reason; I say it all depends upon the woman.

Miss Candler—I don't know, only as Miss Wilson says; bee-keeping is very nice, very profitable, and very healthful.

(Continued next week.)

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### GATHERING NECTAR LONG DISTANCES.

Conclusive evidence that a ton of honey was gathered 5 miles away would be well worth our consideration. That which C. M. Tarr gives on page 652, approximates it somewhat, but without being quite what juries require to hang a man by. Possible that they got enough buckwheat from the 4-acre field to flavor decidedly nearly a ton of afternoon honey, not buckwheat at all—and not a bee going to the 5-mile fields at all.

### MR. BLUNK AND HIS APIARY.

How grand, gloomy, peculiar and solitary Mr. Blunk looks in his apiary! And gentlemen galore in white bosoms look on afar off—to do him sufficient reverence—or to see him get stung.

In marching a whole apiary at once, little by little, *a la* Blunk, I once had occasion to see that the rear rank soon comes to have many more flying bees than the front rank, even with care and slow progress. Pages 657 and 663.

### A NATIONAL ADVERTISING COMMITTEE.

A separate fund for advertising, administered by a committee subject to the National Association, seems an excellent plan—provided the scheme that at present has the floor actually needs mending or supplementing. Page 662.

### A POINT ON DEEPER SECTION-CASES:

Excellent! Don't have cases so scant in height that a few sections can by any possibility have to bear the weight of a whole stack above. Crushes things—and crushing, even if limited to a small fraction of an inch, is very bad medicine. Covers and walls should carry the weight. Page 662.

### WHAT MORE THE NATIONAL ASSOCIATION SHOULD DO.

Wrestling with the question, What more shall the Association do? the experts go in. Almost half—13 out of 27—do not advise advertising; 7 out of 27 do advise it; and the other 7 use language that can be construed to favor it. Warfare against adulteration is advised by 12 out of 27. Only 4 come out flat-footed for helping members sell their honey; but 3 more talk in that direction. Although alone in his class, I think McEvoy gives the prize answer—because he advises an inside rather than an outside work, getting beekeepers to ripen their extracted honey better,

and so offer the public a better article. We read something about beginning at the house of God—and surely those who start out to set a wrong world right should take an early opportunity to attack scandalous wrongs among themselves—clear up our own doorway, and then get after other folks. Page 662.

### NUMBER OF BEES TO STORE A POUND OF HONEY.

The motto, "Keep all colonies strong," which Doolittle quotes and queries about on page 663, merely needs to be annotated a little. Very valuable within proper limits. (Put it negatively—never let a colony get below 10,000 if you can help it.) Preserve the difference between "strong" and "extra-strong." There are times when it is rather a waste for a colony to be extra-strong. But also there are times when none but extra-strong colonies will give you any surplus worth mentioning.

Single bee thought capable of bringing in, in the course of its life, an ounce of nectar, and this the equivalent of a third of an ounce of honey. This allows 48 bees to store a pound. I think we have as yet very few such estimates to lay our hands on. If forced to guess, without time to hunt data and figure on them, I should have guessed much less. Don't want to object exactly to the Doolittle estimate, but suggest that it should be considered merely a rare maximum, or theoretical possibility. A 6-pound swarm numbers 26,400 bees. Let's hive them on empty combs and reckon with them 45 days after (when the last of them die). All have their 27 days of field-work in front of them except say one-quarter (6600 bees) which have already worked a field, some more some less, but the average not so much as 13½ days. So from the 26,400 subtract 3300 to even this up, and we have left 23,100 bees. But the 38th day after hiving, 1000 additional bees go a-field; and they work 8 days before our 45 day period is out. The 39th day 2000 more go; and they work 7 days. So on to the end. These finality additions figure the same as 2370 bee-lifetimes. Add 2370 to 23,100 and our real number to figure on is 25,470. At 48 bees to the pound these bring in 530 pounds. We will allow them to use up 1½ pounds per day for the 45 days (total, 66 pounds), and look to find 464 pounds of honey in the hive. Manifestly this is four times as much as we are to expect in any ordinary circumstances. So, as a standard, it would be more sane to say 200 bees to store a pound—and this desirable standard rather seldom reached.

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### "Woman in Industry"

The daily papers tell us that Congress is to be asked to authorize a thorough investigation upon the general subject of "woman in industry," and as the strenuous individual who at present holds with no lax hands the reins of Government, "is said to have been consulted and to have expressed warm sympathy with the project," it is quite possible that something may be doing in that direction.

Now the question is as to just how much that is going to affect us of the bee-keeping sisterhood. Is a congressional committee likely to swoop down upon us any day, or are

we to have due notice of its coming in advance, so that we may do some special picking up, and have all trim and tidy in our yards? And will the said committee come provided in advance with bee-veils, or are the sisters expected to furnish them?

We are told that of the 5,320,000 women of 10 years or over engaged in "gainful occupations" in the United States in 1900, 980,025 were credited to agricultural pursuits. Wonder how many of that number were set down as bee-keepers. And how many colonies of bees should be in the care of one of the sisters to take her out of the list of "domestic and personal service" (there were 2,099,165 of that class) and put her in the list of agri-

cultural pursuers? A single colony would hardly justify changing the label on a sister; 100 colonies certainly would; but where is the line?

Perhaps it may be well to wait till those investigators, or inquisitors, or whatever they may be, shall get around.

### "Touch Not, Taste Not, Handle Not"

On page 720, Mr. Hasty objects to that sugar-water summer drink with only 2 ounces of honey in it. All right, Mr. Hasty, let's strike out the sugar altogether and substitute 3 pounds of honey instead, and make a better drink of it.

Now as to the really serious objection—the "drunk" in it. Is it really true that there is any more alcohol in it than in any effervescing summer drink? We don't want to go so far as to object to yeast in bread. However, if there is the least danger in that direction, by all means let's have nothing to do with it. Goodness knows, we sisters don't want to advocate anything to help the saloon business.

### Summer's Obseques

The gentian weaves her fringes,  
The maple's loom is red.  
My departing blossoms  
Obviate parade.

A brief but patient illness,  
An hour to prepare;  
And one beloved this morning,  
Is where the angels are.

It was a short procession—  
The bobolink was there,  
An aged bee addressed us,  
And then we knelt in prayer.

We trust that she was willing—  
We ask that she may be.  
Summer, sister, seraph,  
Let us go with thee!

In the name of the bee,  
And of the butterfly,  
And of the breeze—Amen!

—EMILY DICKINSON.

### Dark Honey for Spring Feeding— Color of Beeswax

I just want to tell Mr. Hasty that he is welcome to regard it as proof that "Great minds run in the same channel"—the fact that two of his "Afterthoughts" came to me also in reading the recent copies of the Bee Journal.

I thought that the matter of having plenty of dark honey for spring use in the brood-chamber might be overdone, though likely it seldom is. For myself, if I found it desirable to feed just before the white honey came freely, I would prefer good sugar syrup, and regard a trace of it in the supers as less objectionable than old, dark honey. Doubtless the advice was meant to cover earlier feeding in advance of fruit-bloom. In that case, it is good advice for the *small-hive* men. Those with large hives well filled in the fall would surely have less of that kind of work to do.

The other "thought" I had that jibed with Mr. Hasty's, was anent the color of beeswax. I thought Mr. Dadant's statement that *all new wax is white* a remarkable one. I thought that possibly he meant *undiscolored*, or *clean* instead of *white*, as he was talking of travel-stain in that connection.

With me, the color of freshly-built comb—where there is no admixture of old wax—ranges from the snowy through various shades of cream to what might be termed *straw color* or yellow. I had not thought of the reason for the difference, and am not prepared to accept Mr. Hasty's view of the matter. I set it down simply as an *idiosyncrasy*. It seems to me that is a good deal easier.

My sympathies are with the *man looking for a location*. He wants advice from some one who could give it to him without having at the same time "an ax to grind." If the edi-

tor will permit me to say it, I would like to tell him that Nebraska has the requirements he desires. Here in central Custer County our land has been changing hands of late at double the price it brought five years ago. Improved farms bring something like \$30 per acre. The price is bound to advance, as land

to the east is so much higher. Intrinsicly it is no better. We have here a soil that is *unrivaled*, and it is not "drouth-stricken Nebraska." Our rainfall last summer was phenomenal. No, gentlemen, I have no land to sell!  
(Mrs.) A. L. AMOS.  
Custer Co., Nebr., Oct. 16.

very much better to keep the bee-moth in subjection. Italians are quite generally considered better than blacks.

3. Bees do not generally fight unless they are fighting robber-bees, or unless bees of 2 colonies in some way get together in the same hive. If they are fighting robbers, they ought to fight, and you can help to end the battle in any way that will stop the robbing, such as closing the entrance down to a small size, so the bees can defend it better. Other things can be done to prevent robbing, but to give them all here would take too much space. Study up the subject in your bee-book, and watch what is said at different times in the bee-papers.

4. Sealed combs of honey of the best quality. Next to that comes sugar syrup fed early, say in August or September.

5. The worms are not the cause of the trouble. If a cow dies, and if you leave the carcass above ground in hot weather, you will find it full of worms, but it isn't the worms that killed the cow. Neither is it the worms that kill the bees. They get in their work when the colony becomes queenless, discouraged, or too weak to defend itself. The cases are not exactly parallel, for the worms do get in some of their work before the colony is dead. Keep your colonies supplied with laying queens, keep them strong, and especially of Italian blood, and you can snap your fingers at the moths.

6. Yes, when the first swarm issues, hive it and set it on the old stand, putting the old hive as closely as you can beside it; then a week later move the old hive to a new place some distance away. That will pretty surely prevent any further swarming.

7. Better not disturb them till they get to work next spring; then transfer them to a movable-frame hive as directed in your bee-book.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

### Wintering Bees—Feeding for Winter Stores

1. To winter bees outside which would you prefer, to contract the hive down to as many frames as the bees actually cover, and place a chaff division-board on each side, or leave the full number of combs?

2. Will not those combs keep the bees just as warm as the chaff division-boards would?

3. Last winter I used these division-boards and my bees wintered fairly well; but all of my neighbors did not use them, and their bees came through in fully as nice condition as mine. Does that not indicate that the division-boards caused me unnecessary work and expense?

4. I observed several times, when feeding sugar syrup, that the bees flew from the hives in the morning, and usually a few rods from the hive, and while on the wing squirted out a fine stream of liquid. Now, I explained it in this way: The water which during the night evaporates from the syrup in the combs while condensation is going on, is taken by the bees into their honey-sacs, and in the morning carried out and excreted. Was I right?  
ILLINOIS.

ANSWERS.—1. To leave the whole number.  
2. A French authority made experiments that seemed to prove clearly that they would. It seems hard to believe that there would not be a gain in having division-boards allowing no air to pass around them; but even if there were some gain it is not likely that it would pay for the extra trouble and disturbance of the bees both spring and autumn.

3. It looks that way, provided the winter was severe as usual.

4. I hardly think so. I don't believe the bees ever take up water that has evaporated, unless they are in need of water; but the water they discharged was that which came from the thin syrup they had taken into their honey-sacs.

### Sucrose in Honey

I am interested in Prof. Cook's article on page 710. We have a strict law in this State against any adulteration of honey, and according to Prof. Cook's argument any of our honey extracted during or soon after a heavy flow would show at least traces of sugar. As this would be enough to condemn it, are not all the extracted-honey producers in danger if the State should send out inspectors to analyze samples of honey, which it is liable to do any time?  
NEW YORK.

ANSWER.—I don't know enough to know all the possibilities in such cases, but I hardly think any trouble is likely to arise. Those who are empowered to see that the law is not violated are not likely to be ignorant of the facts that Prof. Cook gives, and the presence of such proportion of non-inverted material as the bees would leave would not be considered proof of adulteration.

### May Be Bee-Paralysis

Last week we had 2 heavy frosts, and since that time one of my colonies has been carrying out dead bees. They began this the first

warm day we had after the frost, in the middle of the day. They come out of the hive and crawl around on the ground and act as if they can't use their wings. Do you think it can be bee paralysis?  
IOWA.

ANSWER.—Yes, it may be paralysis. If it is, you will find the bees more or less shiny, and there will be a trembling motion of the wings. As far north as Iowa you need not feel very anxious about a case of paralysis.

You say in your letter that you found no answer to a question you sent some time ago. I'm a little afraid something went amiss with that letter, for I never knowingly fail to answer any question sent for reply in this department. If at any time any correspondent finds no answer within a reasonable time, it will be a pleasure to have the question repeated; or if any further light on any question is needed, by all means try, try again. I want to help all I can, and will answer just as far as I know; only it is hardly expected that any one will send questions already fully answered in the bee-books. This department is meant to supplement the bee-books as fully as possible.

### Darkness in Wintering Bees—Transferring Bees, Etc.

1. Must the bees have darkness in the winter when they are in the house upstairs?

2. What is the difference between Italian bees and the common? Which is the better?

3. Can bees be stopped when fighting? If so, what way is best?

4. What is best to feed bees in winter?

5. I have lost a few colonies of bees in this manner: I bought 4 colonies and lost 2; they had worms in the brood-combs, and the bees were all gone. In some corners there could be seen bee heads, feet, bodies, etc. By this it looks as if the worms ate the bees. I have one colony at which I looked one day to see how they are; they had 8 brood-frames full, in nice and neat order in 11 days. I had not looked in it for 7 days, and found that there were no worker-bees, but all drones and worms. What was the cause?

6. I made a hive from a hollow basswood log 3 feet high and about 22 inches wide, and put in 3 sets of frames, 2 sets for the brood and 1 set for the super. The brood-frames can hold about 70 pounds of honey; the bees filled that, but just stored a little in the super—not even a pound—and swarmed 5 times. It was an early spring swarm. Can I stop the swarming?

7. A neighbor found some bees in the woods in a basswood-tree, and asked me how I could put them into a modern hive. I am only a beginner this year. I have a basswood-tree near my woods in which I know there are bees. Do you think I could transfer them into a modern hive? If so, when?  
WISCONSIN.

ANSWERS.—1. If the bees are in a room where they can get out into the room, it should be dark. If a passage-way leads from the hive to the outside, so that no bees can get out into the room, then it doesn't matter whether it is light or dark. Unless the bees have such a passage to the outdoor air, upstairs is not a very good place to winter them.

2. One difference is in color. Italians have three yellow bands. There are differences in disposition, Italians not being so cross, and

## Reports and Experiences

### The Season of 1905

The past season has been remarkable in this locality for three things. 1st, for excessive and long-continued swarming; 2d, for the fact that the more a strong colony was divided within reasonable limits, the more surplus honey was secured; and 3d, but not least, a most unusual fall flow of honey.

Last fall I put 13 colonies into the cellar. One of these died; but the other 12 came out in fine condition. Some one may say 13 is an unlucky number anyhow. Perhaps it is, but no more so in my case than 14, for I had that number of colonies until somebody stole one in September. I planned to increase the 12 colonies to 30. For this purpose 3 of the best were selected for increase by the nucleus plan, and 4 others for a test of the Alexander plan. One colony was devoted to the production of comb honey; all the others were run for extracted.

The 3 colonies were increased to 15 good strong ones. The 4 Alexander colonies gave me 4 new ones. I had to divide the comb-honey colony on account of excessive swarming, and I hived one natural swarm by itself. This gave me just 30. All these divisions were made early in the season, and about 25 of them gave more or less surplus honey.

The first to swarm were some of the lower stories of the Alexander colonies. Next came the colonies that were not divided. Soon after there came the upper stories (or what had been) of the Alexander colonies. Next the 3 two-frame nucleus colonies formed by taking the queen and 2 frames of brood and bees from the 3 colonies selected for increase by the nucleus plan. Last of all came the 2-frame nuclei formed of 2 frames of brood and bees, each one having reared its own queen.

The first swarm of the season came out June 1, the last Aug. 29, making just 90 days' continuous swarming. About 4 of the nuclei having reared their own queens did not swarm. In the spring all colonies, as soon as

they had 6 or 7 frames of brood, were given an extra brood-chamber placed under the first. But no brood was reared in the lower story in a single instance. All colonies made preparations for swarming with the lower story practically empty.

When the honey-flow began, all strong colonies were given 2 supers having a capacity of 40 pounds each. But the bees would swarm just the same with one or two supers. When the weather became fairly warm I raised up each hive from its bottom-board, and put one-inch blocks under the two front corners. The bees clustered in this open space all summer, and the hives were not let down until Sept. 13. When I caged a queen I could push the cage in on the bottom-board in the middle of the cluster of bees.

I do not give any upward ventilation, as it is not a good thing for the bees during the cold nights which we have in this northern country.

In regard to the yield of honey, the colonies not divided gave, in round numbers, 80 pounds each; the colonies treated by the Alexander plan, 115 pounds, and the 3 colonies run on the nucleus plan, 140 pounds each. My banner colony for the season gave me 4 good, strong, new colonies, and the 5 together produced 200 pounds of extracted honey. They also secured an average of 30 pounds each for winter stores. Will some of the experts tell us what was the total amount gathered for the season?

For the first time in many years there was a good fall flow of honey. The last 8 days of August were almost equal to a good basswood flow. Some colonies gained about 30 pounds each during that time. My last honey was extracted Aug. 23 and 24, to avoid getting the fall honey mixed with the early white honey. As it proved, the bees had room for this late flow in their brood-chambers. This last extracting was a mixture of clover, basswood, more or less wild flowers, and a little from goldenrod. It was of a rich, golden color and very choice flavor. To my surprise it began to show signs of granulating the first week in September. By the end of September it was so far advanced that I was obliged to put it in a warm place to prevent it from becoming solid. I have never read or heard of so early granulation.

I put 375 extracting-combs outdoors to be cleaned out by the bees, and fed 100 pounds of sugar in the open air at the same time with no trouble from robber-bees. My 30 colonies are all in first-class condition. F. L. DAY.  
Becker Co., Minn., Oct. 12.

### First Year a Success

This is my first year at the bee-business. I started with 50 colonies, and sold \$450 worth of comb honey, besides increasing my number of colonies to 95. Besides, I had a 4 months' fine outing for my wife, daughter, and myself. I attribute it all to the good old American Bee Journal. I have a lovely place for an apiary in the mountains, 15 miles from home. We had a moderately good season.

C. A. PRESTON.

Orange Co., Calif., Oct. 17.

### Apicultural Station in California

The United States Department of Agriculture has now an apicultural experiment station at Chico, Calif., under the direction of John M. Rankin, of Washington, D.C. They make a special study of different races of bees, bee diseases, and honey-plants.

Mr. Rankin lately made a trip over California; he passed through Tulare County about the middle of September, and visited a number of apiaries. He shows great interest in the business, and makes a very favorable impression.

I believe this experiment station will be of great benefit for the bee-keepers of California—one of the largest honey-producing States of the Union. The bee-keepers are very glad that the Government has finally done something for them.

What we really need in this country are certain kinds of trees, such as shade-trees which produce honey between fruit-bloom and the time alfalfa yields, which is between April 1

and July 1. I believe that certain kinds of eucalyptus will be valuable in this respect. It certainly will take a number of years to show results, and it is of great importance that the Government has taken up this kind of work, which the bee-keepers could not undertake on account of the expense. OTTO LUBBORFF.  
Tulare Co., Calif.

### Bee-Keeping in Washington

I came from Indiana to this place a year ago this month. I have had no experience with bees, but I surely think this is going to be a grand place for them. I got 3 colonies in the spring, 2 of which swarmed twice each; the other didn't swarm at all, and from it I have taken 218 pounds of nice honey.

W. S. HAXTON.

Benton Co., Wash., Oct. 5.

### CONVENTION NOTICES.

Illinois.—The 15th annual meeting of the Illinois State Bee-Keepers' Association will be held in Springfield, on Tuesday and Wednesday, Nov. 21 and 22, 1905, in the room of the Board of Supervisors in the Court House. The R. R. Rates will be as follows: All lines in the Western Passenger Association will make an open rate of one fare plus 25 cents for the round trip to Springfield, except from near points where a fare and one-third would be less. All lines in the Central Passenger Association will make a similar rate on the Certificate plan, and if not convenient for any attending our meeting to come over the lines in the Western Association, if they will write me I will send them certificates which the Grand Secretary of the I.O.O.F. assures me your local secretary of the same order will gladly sign. The Central Passenger Association Lines are as follows: B. & O. S. W. R. R.; Big Four Route; C. & E. I. R. R.; C. H. & D. R. Y.; L. I. & I. R. R.; J. & St. L. R. Y.; L. E. & W. R. R.; L. & N. R. R.; Southern R. Y. (St. Louis Div.); T., P. & W. R. Y.; T., St. L. & W. R. R.; Vandalia Line; Wabash R. R., east of Tolono.

The good results of this annual bee-meeting rest on the members who attend it. Our State gives us an appropriation to publish our report and to suppress foul brood, and it is the duty of every bee-keeper of the State to have a voice in the manner in which this appropriation is used. All bee-keepers are invited to come, and bring their wives. The railroad rates will not be higher than an open rate of one fare and a third for the round trip, and efforts are being made by our Odd Fellow friends to secure a one fare for the round trip. Good hotel accommodations can always be had at reasonable rates. JAS. A. STONE, Sec.  
Route 4, Springfield, Ill.

The Chicago-Northwestern Bee-Keepers' Association will hold a social session at the Revere House, Dec. 5, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to. All who are accustomed to paying their dues to our Association, thereby getting two memberships for the price of one, will please hand the \$1 to the secretary, or mail it to him as usual. The time in the evening will be given to the National, as will also the whole of the two following days. Everyone is cordially invited to be present, both at the short sessions of the Chicago-Northwestern, and at the 7-session meeting of the National Association.

HERMAN F. MOORE, Sec.

Park Ridge, Ill.

N. B.—Any one paying their dues to the National Association direct, will have to pay another dollar to the Chicago-Northwestern, if it is desired to become a member of the latter organization also. Hand your dues to H. F. Moore, the Secretary. H. F. M.

The National Bee-Keepers' Association holds its annual convention at the Revere House, corner of Clark and Michigan streets, in Chicago, during the Fat Stock Show, when exceedingly low rates may be secured on the railroads. The dates for the meeting are Dec. 5, 6 and 7. Rates at the hotel are 75 cents for a room alone, or 50 cents each, where two occupy the same room. Meals are extra, or they may be secured at near-by restaurants. W. Z. HUTCHINSON, Sec.

# a Farmer Says

Some good words about our Booklet on Farm Telephones.

“ Sweet Valley, Pa., Aug. 15, 1905.  
Stromberg-Carlson Tel. Mfg. Co.,  
Gentlemen:—Your booklet reached me safely. You have many valuable and timely suggestions, and I only hope that it may find its way into every locality that does not have the advantage of telephone service. THERE IS NO ONE THING AT THIS TIME DOING MORE TO BRING THE FARMER ON AN EQUAL FOOTING IN BUSINESS, EDUCATION AND CULTURE, WITH HIS URBAN BROTHER, THAN THE TELEPHONE.  
As we have two well constructed, thoroughly equipped, successfully operated telephone lines in this locality, one known as the Lake and Lehman Telephone Co. and the other The Farmers Telephone and Supply Co., I can do no more than to wish you success. Sincerely yours,  
A. E. Lewis. ”

What Mr. Lewis says about the value of the telephone in the Farm Home is seconded by all farmers after they have once enjoyed the privilege of telephone service.

We have several booklets which will tell you how to get a telephone line started in your community and how to buy telephones and construction materials to the best advantage. Ask for our booklet 80-B, "How the Telephone Helps the Farmer." We will send you a copy by return mail.

**Money in Peeps.**—Many successful enterprises have sprung from the most humble beginnings for, "Mighty oaks from little acorn grow," is a proverb that fits the poultry business better than any other industry. The raising of chickens can be started in a small way and the flock gradually increased till one has just as many birds as he can handle.

To quickly and successfully accomplish this the hen nowadays is used only for egg-production—an incubator hatches the "peeps." One of the most modern and at the same time most successful chicken hatcheries is the incubator known as the Wooden Hen. It is made by George H. Stahl, of Quincy, Ill., the well-known maker of incubators and brooders. The catalog which this firm issues is one of the most instructive books on poultry-raising which has been issued in recent years. It is quite elaborate, containing many plates in natural colors, including views showing the development of the chick from the egg to the bird. They mail this book free to all inquirers. Mention the American Bee Journal when writing.

## A Great Offer!

Beginning with Jan. 1 we will discontinue sending THE MODERN FARMER to any one the moment his subscription expires, and, in order to get as many new subscribers to this, the cleanest and best farm monthly published on this continent, and to introduce it into new communities, we will send a TRIAL subscription, one year to NEW subscribers only, for 15 cents in silver. The paper will stop when your time expires, and will not be furnished any one whose name is on our list now, at this price. This offer will only hold good for a SHORT TIME. Send now before it is withdrawn. Sample copies free to you and any of your friends whose names you may send. Address.

## Bargain in Bee-Supplies

On account of removing from the city, I wish to sell at once the list of bee-supplies given below. Will sell the lot at less than one-half the present retail prices as shown by Root's catalog. They certainly are a big bargain.

- 7—8-frame hive-stands
- 2—8-frame wood-zinc boards
- 2—Dapzenbaker Hive-covers
- 3—Reversible hive-bottoms
- 9—10-frame dovetailed supers
- 5—10 frame dovetailed winter cases
- 4—8-frame dovetailed supers
- 9—8-frame dovetailed extracting-supers
- 22—10-frame dovetailed hives
- 3—8-frame dovetailed hives

- 75—M fences
- 1—Danzenbaker bottom and detachable alighting-board
- 10—8-frame hive covers
- 16—Hoffman top-bars
- 800—4x5x1 3/8 sections (new)
- 7—Miller feeders
- 2—8-frame bee-escape boards
- 25—8-frame hives (new)
- 25—8-frame 2P supers (new)

500 plain sections (new)

**\$40 will take the lot if ordered at once.**

## Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to the past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5@6 1/2 cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less.

R. A. BURNETT & Co.

CINCINNATI, Oct. 6.—Reports from differ parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5 1/2@6c; white clover at 6 1/2@7 1/2c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH CO.

INDIANAPOLIS, Oct. 12.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.

WALTER S. POWDER.

ALBANY, N. Y., Oct. 23.—Honey demand is better this week. The weather is cooler and more inclination from grocers to stock up. We quote: Fancy white comb, 15c; No. 1, 14c; No. 2, 13c; mixed, 12@13c; b. ck wheat, No. 1, 12@13c; No. 2, 11@12c. Extracted, white, 7c; mixed, 6 1/2c; buckwheat, 6 1/2c. Beeswax, 29@32c.

H. R. WRIGHT.

PHILADELPHIA, Oct. 19.—Honey has been arriving freely in the last 10 days. There are still some small producers who have a few hundred

# Headquarters for Bee-Supplies

**C. H. W. WEBER** CINCINNATI OHIO

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

pounds, and want to dispose of it quickly and get their money, who are keeping the prices down. We quote: Fancy white, 14@16c; No. 1, 13@14c; amber, 10@11c. Extracted honey rules firm at 5 1/2@6 1/2c for amber; 6 1/2@7 1/2c for white. Beeswax firm, 28c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6 1/2c. Beeswax, 28c.

C. C. CLEMONS & Co.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6 1/2@6 3/4c; amber, in barrels, 5@5 1/2c; in cans, 1c to 1 1/2c higher. Beeswax in good demand, 26c cash, 28c trade.

GRIGGS BROS.

CINCINNATI, O., Oct. 24.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12 1/2@14c. Extracted seems to be more plentiful. In barrels, light

amber, 5 1/2@5 3/4c; in cans, 1/2c more. White clover from 7@8c. Beeswax, 28@30c.

C. H. W. WEBER.

NEW YORK, Oct. 20.—Comb honey is now arriving very freely and the demand is good for nearly all grades. We quote fancy white at 13@14c; No. 1, 11@12c; amber, 10@11c, and buckwheat, 10c. Extracted in good demand. Arrivals of California are large while from other sources receipts are very light. We quote California at from 5 1/2@7c per pound, according to quality and quantity. Southern in barrels and half-barrels, at 55@60c per gallon. Beeswax firm and scarce at 29@30c.

HILDRETH & SEGELKEN

SAN FRANCISCO, Oct. 18.—White comb, 1-lb. sections, 8@9cents; amber, 6@7c. Extracted-water-white, 5@—c; white, 4 1/2@4 3/4c; light amber, 3 1/2@4 cents; amber, 3@3 1/2c; dark amber, 2 1/2@3c. Beeswax, good to choice, light, 25@27c.

The honey market continues featureless, except for the obvious disinclination of apiarists to sell at the ruling quotations and the inability of the dealers at the present writing to offer more. Five cents per pound for extracted honey seems to be as high a figure as dealers are able to contract for, and even at this figure they are extremely reluctant to buy. Comb honey brings 9c, strictly choice basis, and the transactions at that figure are very limited. Lately, however, there are rumors that growers are beginning to let go of some of their holdings at the figures mentioned.

## WANTED

FANCY COMB HONEY IN NO-DRIP SHIPPING CASES, ALSO EXTRACTED HONEY. IF YOU HAVE ANY TO OFFER, QUOTE US YOUR ROCK BOTTOM CASH PRICE DELIVERED HERE, AND MAIL US A SMALL SAMPLE OF THE EXTRACTED HONEY. WE BUY EVERY TIME THE PRICE IS RIGHT, AND REMIT PROMPTLY.

## Orders may be sent to any Branch House or Dealer

### Well-known Dealers

The dealers, whose names follow, are well known to bee-keepers. They have been, for the most part, long established in the bee-supply trade, and have a knowledge of the business most valuable indeed to the bee-keeping fraternity. Their advice may be had on any question of Supplies, etc., for the asking.

### The Large Stocks

Nowhere else is it possible to find such well-assorted stocks of goods for bee-keepers as are carried by dealers in Root's Goods. No matter whether you require a little 5-cent article or a carload of goods, these dealers can serve you promptly. Stocks are frequently carried amounting to \$5000 and upward.

### Shipping Points

You will observe that these dealers have excellent shipping facilities—guaranteeing you quick delivery and low freight rates.

### Prices, Discounts

The prices, terms, discounts, etc., are identical with the home office at Medina (with rare exceptions). Full particulars may be had before ordering, if desired, by writing the dealer nearest you. You can, however, use our Medina catalog and terms, and, if any variation, your dealer will advise you, if requested, before shipping.

### Other Dealers

Besides the following list, there are many others who handle some of Root's Goods. The following is by no means complete for hundreds of dealers come to us for many of the goods of which we are the exclusive manufacturers. *Insist on getting Root's Goods.*

### Local Dealers

In addition to the following list who carry large stocks, and furnish at both *wholesale and retail*, we have in every State a large number of local dealers who handle our goods exclusively. As there are over 500 of these dealers, space will not permit giving their names at this time; but information will be given by us, on request, to any bee-keeper regarding the dealer nearest him handling Root's Goods.

# THE A. I. ROOT CO., Medina, Ohio.

ESTABLISHED IN 1861 THE AMERICAN OLDEST BEE-PAPER IN AMERICA

# BEE JOURNAL

(Entered at the Post-Office at Chicago as Second-Class Mail-Matter)

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor

CHICAGO, ILL., NOVEMBER 9, 1905

Vol. XLV—No. 45

THE AMERICAN BEE JOURNAL is absolutely an independent publication, and not connected with any bee-supply business whatsoever. It stands entirely upon its merits as an educative force in the field of bee-keeping, and as a medium for legitimate advertisers in apicultural or other lines. It is the oldest, and only weekly, journal of its kind in America. Its publishers believe that it deserves to be in the hands of every would-be progressive successful bee-keeper in the land. It is in its 45th year, and to-day is acknowledged to be better in every way than at any time during its long and honorable history.

## Editorial Notes and Comments

### Chicago-Northwestern Convention

Just after the forms of last week's American Bee Journal were closed, we learned that the managers of the annual Chicago Fat Stock Show, previously announced for Dec. 2 to 9, was postponed for two weeks, or Dec. 16 to 23, on account of delay in getting structural steel for the new amphitheater building.

On account of this, the Chicago-Northwestern Bee-Keepers' convention will be held on Tuesday, Dec. 19, at 10 a.m. and 2 p.m.

We suppose the National convention will also be postponed for two weeks, which would make it Dec. 19, 20 and 21, as the low railroad rates will not be in force during the first week in December, but will be from Dec. 16 to 23. By another week doubtless something definite can be announced concerning the National.

### Improving the Stock of Bees

Much has already been said in these columns about breeding from the best, so as to improve the stock, but so long as not 1 bee-keeper in 10, if indeed 1 in 50, practices anything in that line, no excuse need be made for frequent reference to the subject. This time is given the practice of an Australian bee-keeper, Chas. U. T. Burke, who says in the Australasian Bee-Keeper:

"When I got rid of the undesirable races I started to work to get equal workers and honey-gatherers in each hive. The first good season one colony would give a yield of say 200 pounds of honey for the season; another a yield of 150 pounds; another 100 pounds; and yet another only 50 pounds of honey for the season, so that something was evidently wrong, considering that all colonies were equalized and had a fair start at the commencement of the season. I reared queens

from the 200-pound yield, and cut off the heads of queens from colonies yielding 50 and 100 pounds of honey, and replaced them with young queens from the high yielders. Next year a similar thing occurred, though the number of low yielders was not so great; among them being some of the high yielders of the year before. I still kept on breeding queens from the high yielders to replace the low yielders, until after 8 years of such experience I have a fairly good average lot of yielders, with only an exceptional one now and again being a low yielder, which at once dies."

### Wax-Worms for Fish-Bait

Drone-larvæ have been commended as bait: but now comes Arthur Goldsborough, in Gleanings in Bee Culture, and says that the larvæ of the bee-moth is away ahead—"so tough that they can not be nibbled off, and one larva will catch several fish." Easy to start a hatchery for wax-worms, but they require rather expensive food.

### Prevention of Swarming

More and more it is becoming customary, especially among bee-keepers who have out-apiaries, to follow some plan of management that shall, so far as possible, dispense with the annoyance of swarming. So it is always interesting to learn the management of those who are successful, even if there be nothing particularly original in that management. Here is the plan of one of the veterans, J. E. Crane, as given in the Bee-Keepers' Review:

"Open every populous hive, and, if preparing to swarm, either remove the queen and cut all the queen-cells having larvæ more than three or four days old; or, if the queen has been previously removed, cut out all queen-cells, and, later, give all such a virgin queen. The queen removed, if vigorous, can,

with a comb of brood and a few bees, be made the nucleus of a new colony. Instead of treating all colonies in this way, I prefer to shake the strongest colonies upon empty combs (if I have them) or full sheets of foundation, using the combs of brood for building up weaker colonies, or any nuclei that have been started."

A point upon which light is needed is as to that word "later." Mr. Crane says, "Cut out all queen-cells, and, later, give all such a virgin queen." One's understanding as to how much later might make all the difference between success and failure.

It would be interesting to know, also, whether a swarm ever issues with the virgin queen given.

### Nominations for the National

On page 694 is given the list of names sent in by postal card to General Manager France as the names of those whom the different members desired to be considered as candidates for the respective offices. 3 to 12 names being attached to each office. The Bee-Keepers' Review publishes the list, and then says:

"And now I hope that Bro. France will bear with me if I make a few criticisms. Two years ago the Directors voted that the General Manager should call for a postal-card vote, and the two men receiving the greatest number of votes for each respective office are to be candidates for said office; the names of the nominees and the offices for which they are nominated to be published in the bee-journals."

"What I object to is the publishing of the names of more than two of the candidates, and of indicating which man has received the greatest number of votes. Almost the sole object of this informal ballot is that we may, if we so desire, occasionally elect a new man to office. We wish to place before the members two candidates with equal chances for election, or as nearly equal as it is possible for us to make them. The man already in office has an advantage, but by dividing up the opposition vote among half-a-dozen others he is almost sure of election.

"Another thing: Don't tell who has the greatest number of votes. Say that John Doe and Richard Doe have received the greatest number of votes. If you say that John Doe had the greatest number, and Richard Doe the next greatest number, that practically elects John Doe, and that is the very thing that we wish to avoid.

"As I have already said, we wish to bring two candidates before the voters with as nearly equal chance of election as it is possible. If we give the names of half-a-dozen candidates, and tell which one received the

greatest number of votes, we have practically destroyed the value of the informal ballot, and might just as well hold our elections without any nominations.

"As it is, the very object that the Directors had in view is defeated by the manner in which the results of the ballot are published."

That the General Manager has gone beyond the letter of his instructions there can be no question. But are not the Directors also to blame for upholding him in such action? For he did precisely the same thing a year earlier, and they have at least winked at his action by keeping silence, for it is hardly to be supposed that he would have done the same thing again if any vigorous objection had been made by them.

But did the Board of Directors actually contemplate such action as the Review desires? Evidently the Review reads into the ruling something more than is to be found there, making it read that the two men receiving the greatest number of votes are to be candidates. But the rule does not say they are to be "the only" candidates; not even that they are to be "the" candidates; only that they "are to be candidates."

Grant, however, that it was the intention to make them the only candidates—for there is no denying that specially naming as candidates the two receiving the greatest number of votes looks no little in the direction of making them the only ones—would the course desired by the Review be a wise one?

The Review is speaking close to the mark when it says: "Almost the sole object of this informal ballot is that we may, if we so desire, occasionally elect a new man to office." Perhaps not exactly that, either. A man is not especially desirable simply because he is new. Other things being equal, a new man is not so good as one having had previous experience in the same office. But for years it had been the custom to vote for the same set of men over and over again, just because there was no chance to find out what any one else thought as to fit names for the place. Some of the officers themselves felt that the existing state of things was not desirable—not to say that they thought it intolerable. The

ground for the difficulty was that there was no meeting face to face of the members, no chance to compare notes, no chance to know what others thought, no suggestion of any new name, and when the time came to send ballots by mail the old members were re-elected year after year. The idea of the preliminary nomination by postal card was to get away from this as far as possible, and to get as near as possible to a meeting in person where all names are announced as well as the number of votes received by each. What would be thought if, at any meeting of a deliberative body, an informal ballot should be taken, and the entire proceeding should be kept secret except the announcement that Smith and Jones received more votes than any other, but no member should know which got the higher number of votes? If that were the right policy, then it should be carried just one step further, and only have the name announced of the one receiving the most votes.

The Review says, "If we give the names of half a dozen candidates, and tell which one received the greatest number of votes, we have practically destroyed the value of the informal ballot." Did the Review ever know of an informal ballot being taken where those voting met in person without that very thing being done to which it objects? If the Review is right, then the value of the informal ballot is always practically destroyed. On further thought, however, it will probably modify its views on that point.

Instead of keeping things in the dark, let there be still more light, and let not only all names be given, but the number of votes for each.

### Failure Good for Beginners

J. A. Green very sensibly remarks in *Gleanings in Bee Culture*:

"It is sometimes a real misfortune for a man to have two or three good seasons at his start in bee-keeping. He is building on a false foundation. It takes several years to find out what an average is in bee-keeping. When disaster comes, as it is sure to sooner or later in the shape of a poor season, he is not as well prepared to meet it as if his earlier experiences had been less flattering."

## Miscellaneous News Items

**Julia Ida Mondeng**, daughter of Mr. and Mrs. Charles Mondeng, of Minneapolis, was married to Ernest W. Langdon, on Oct. 30. Our heartiest congratulations are hereby extended to Mr. and Mrs. Langdon.

The **Illinois State Convention** of beekeepers will be held in the Board of Supervisors' room in the Court House in Springfield, Ill., Tuesday and Wednesday, Nov. 21 and 22. It is hoped that there may be a large attendance of Illinois beekeepers. Reduced rates have been arranged for on the railroads. See notice on another page for further particulars.

**Chicago-Northwestern Convention.**—As will be seen by Secretary Moore's notice on another page, there will be a meeting of the Chicago-Northwestern Bee-Keepers' Asso-

ciation on Tuesday, Dec. 19, at the Revere House, where the last two or three meetings have been held. The forenoon session at 10 o'clock will partake of a social nature, and the afternoon session, at 2 o'clock, will be mainly for business.

It is hoped that there may be a large attendance to welcome those who come to be at the National convention, which will likely meet in the evening of the same day (Dec. 19).

All who desire to have their dollar pay a year's membership in both the Chicago-Northwestern and the National Association, will need to mail it in advance to the Secretary-Treasurer of the former Association, Mr. H. F. Moore, Park Ridge, Ill., or hand it to him during the sessions of the conventions. One dollar paid to Mr. France will simply pay a year's membership in the National, and not in any other association also. But a dol-

lar paid to Mr. Moore will pay the annual dues in both.

The **Apiary of E. E. Craven** is shown on the first page. He wrote us that the trees are apple, plum and cherry. He uses Simplicity hives exclusively, and says they somewhat resemble Jacob's coat.

**Mr. Orel L. Hershiser**, of Erie Co., N. Y., writing us Oct. 27, reported as follows:

"I have had a fairly good honey season. My honey crop amounts to over 16,000 pounds. Bees are in fine condition for winter. I will winter upwards of 300 colonies. I am getting good prices for honey."

As Mr. Hershiser is a lawyer, he mixes law and bee-keeping, and the result thereof seems to be all right.

**Mr. Chas. M. Darrow**, Route 1, Milo, Mo., while away from home on Sunday, Oct. 22, lost by fire nearly everything he had except a team, wagon and harness, bees, one cow, and two stacks of hay; with insurance of about half the value. Mr. Darrow is a queen-breeder, and had calls for a large number of his queens during the past season. We understand he has on hand several hundred requests for prices on queens for 1906. Any others desiring his queen price-list can write for it. More queen patronage will help him out on his fire loss.

**Prof. A. J. Cook**, as most of our readers know, sailed for Europe last August. Last week we received the following letter from him, dated Oct. 24:

DEAR MR. YORK:—We are charmingly located, like Paul, in our own hired house—only we are here in grand, old Berlin. It is good to be in such a great university town, and I am big with regrets that it had not been my fortune years ago.

We are at Heilbronner Strasse 30, Berlin, Germany, and shall be here till April 1, 1906, after which we shall see south Germany, Austria, Italy, Switzerland, and the Fjords of Scandinavia. Please say this editorially, if you will be so kind. My friends wish to know my whereabouts.

We are in the finest part of Berlin, but, oh! it is not America. Every day we say, Give us America.

Ever yours truly,  
A. J. Cook.

Prof. Cook will continue to write regularly for the *American Bee Journal*. We have an article from him on the European honey markets and prices, which we will publish in December.

**Jos. M. Martin**, a 150 colony bee-keeper located in St. Joseph Co., Ind., called on us last week. He had 69 colonies last spring, and increased mainly by dividing. His honey crop was about 600 pounds of extracted and a fair amount of comb honey.

Mr. Martin usually at this season of the year gets bees from neighbors who would sulphur them anyway for their honey. He simply shakes them out of the boxes (in which they are) on combs of honey in modern hives. He is quite successful in wintering such transferred bees. Possibly many of our readers could get bees in that way if they have the extra hives and combs of honey necessary. Surely, any man would prefer to give the bees away rather than sulphur them, as he would still have the honey left, and would also be saved the trouble of sulphuring the bees.

### Meeting Bee-Keepers at Fairs, Etc.—A Solution of the Question of High-Priced Bee-Supplies

BY F. GREINER

TO meet the people who are engaged in the same business we are, affords, to say the least, considerable pleasure, and the bee-keeper who does not from time to time mingle with his brother bee-keepers misses a great deal, I dare say, although in turn he often has to suffer great inconveniences and hardships, for the great majority of men have queer ideas of their rights and liberties, *i. e.*, they disregard entirely the rights and comforts of their fellow men, the women and the children. Selfishness reigns supreme. This is sad but true. I am unfortunately sensitive or susceptible to tobacco, and always suffer untold misery when I come in contact with smokers and chewers.

There were gathered about the honey exhibit at the New York State Fair a large circle of prominent honey-producers, and the topics of the day were discussed. I failed to find one who had joined The Honey-Producers' League. All seemed to be rather shy of this new organization of honey-producers, with the honey-producers left out!

High prices of bee-keepers' supplies was the universal lamentation. One of the most extensive bee-keepers said: "It is claimed that I don't kick on high prices, which is true; but the fact is, I never bought but one bee-hive of the manufacturers, which fact, however, is not mentioned."

Another experienced old bee-keeper incidentally said: "Manufacturers have gotten in a way of making bee-hives so complicated that ordinary mortals with no elaborate machinery can make them."

Here are two points which I wish to emphasize. In the first place, if prices are really so high as to give an unduly large profit to the manufacturer, why not follow the example of our first-mentioned friend? Why buy? I am not sure that our bee-supply manufacturers are making too large profit. I never bought but 10 bee-hives and outsides for 100 supers, and those I considered I bought reasonably. Generally I make my own hives; this I have practiced for 30 years, and shall continue it, although lumber is now up to \$20 per 1000 feet.

I have of late been pricing gasoline engines, and find that it would require the cash outlay of about \$100 to rig up for bee-hive making. I doubt if I myself am any more of a mechanic than the average bee-keeper, but I would say that I can get up as good and serviceable a hive as any regular bee-supply manufacturer, using a much more inferior outfit, with the exception of the circular saw, than even the \$100 rigging mentioned above.

But—and now I am coming to the other point: My hives are not of that complicated nature that the *modern* hives are as sent out by the big factories. Let us review the history of hive-making.

When Langstroth made his first hive, all hive-parts were cut off square. This answered the purpose. The frames were made as simple as they could well be made. The length of top-bar required it to be made heavy, which again required its being rabbeted at the ends. This rabbeting gave us, as an incidental advantage, great rigidity of the frame, and constituted about the only difficulty in hive-making. All other work was cutting off square and nailing, and some rip-sawing, of course. Soon, however, hive-making was greatly improved. The boards had to be mitered. With the help of an iron frame the 4 boards were held in shape till nailed. And not to forget, I must mention the beautiful but undesirable bevel at top and bottom of the hives. It was a marvel to me, how it was possible to cut them so perfect that one would fit on the other; also the tops, etc. I began to think that I might as well give up the struggle of hive-making, but for some unaccountable reason—perhaps obstinacy—I continued in my bungling way.

It was another complicated piece of business to get up a chaff-hive of the older pattern, one requiring mechanical skill to put it up. I refrained from following suit, and made my own in a simple fashion. They are good to-day.

The dovetailed hive, Danzenbaker, etc., came last, and the Hoffman-frame. I allowed my better judgment to run away with that "desire" to be up-to-date with the rest, and the best, and so purchased 10 up-to-date hives with Hoffman-frames, and 20 up-to-date fence supers with plain sections. This I have regretted ever since, although I believe I bought them cheap. I greatly prefer the loose-hanging frame to any other, be it closed-end or Hoffman. I have little use for fence separators—plain separators suit me better. I would not even to-day use plain sections, but use the bee-ways. I can handle the plain just as well as the other, and I can save a little in shipping-cases, etc., but the retailer spoils many a box of the plain ones when he wouldn't spoil any of the bee-ways.

In summing up I would say: If the (poor?) honey-producer does not wish to enrich the (rich?) manufacturer, why does he not go to work and make his own bee-hives? About the only thing we will regularly have to buy of the manufacturer are the sections, if we are comb-honey producers, and I doubt if he would become rich very fast at that business even at the present high prices.

Some bee-keepers use large quantities of comb foundation. If I needed it very badly, and did not want to pay the present high prices, I would make that myself. I find I can make a good article for the brood-chamber. This is all that is needed. It would be better if section comb foundation had never been made. By its use very inferior comb honey is now produced. I have produced tons of comb honey without it, not even using it for starters, and can do so again, although it has been a convenience to have it to use as starters.

### Black Bees—A Down-Trodden Race

BY ALLEN LATHAM

ONE can scarcely read through a single copy of the American Bee Journal without some slurring remark concerning the black bee. From all sides one hears this race derided and all other races lifted far above it; even our good Dr. Miller is forever telling his questioners to get Italian bees if they wish to get rid of the wax-moth. Yet there is black blood in Dr. Miller's own bees.

I will not take the reader's time to explain the various reasons for all this opposition to the black bee, but merely say that it is a more or less unfounded prejudice. I doubt greatly whether any one can demonstrate that the black bee is inferior to the Italian in keeping out the moth. Any race will keep out the moth when any colony is in normally good condition, and any race will give way to the moth when there is trouble with the queen, or when starvation is coming in at the entrance.

When, during the early part of this summer, I was greatly troubled with pickled brood, and noticed that the disease was especially bad with the black colonies and showing almost none at all with the straight Italians, I was obliged to acknowledge that here at last was a point at which the Italians surpassed the blacks. Later, however, when I observed that the Italians failed to come up to normal strength, though breeding heavily, while the blacks seemed to hold their strength remarkably well, I tried to get up a defense for my protegee, the black bee. I concluded that all colonies were affected with the disease, but, whereas the black bees died in the larval stage, the Italian workers died soon after leaving the cells. The only gain was in the combs of the Italians being kept free from diseased brood. Many hybrid colonies had their bees die in the pupa state, and thousands of the white workers were carried from the hives.

The disease has gone, and my faith in the black bee is coming back in all its strength, for which reason I desire now to point out still further its superiority to the Italian as a bee of profit when bred with equal care.

It must have struck every thinking bee-keeper as a strange thing that Italian colonies so quickly run back to the black condition. It seems to matter little how few the scattering colonies of blacks there are about the country, and how large the apiaries of yellow bees are, sooner or later they will all be black or dark hybrids unless constant effort is made to prevent this. I observed only the past summer that, though my home apiary is largely headed by Italian queens, and though I keep many more bees than any one near here, only a third at best of my yellow queens mated with other than black drones.

How shall we account for this strange fact, if it is acknowledged to be a fact? How does this inferior black bee with its predisposition to yield to disease, its inability to cope with its enemy, the moth; its weak honey-getting power, and

its general, all-around worthlessness—how does this black bee, I repeat, manage to run out of existence its yellow cousin whose splendid attributes are printed on the advertising sheets of every journal devoted to apiculture? The question is a difficult one, and one which I should have been inclined to give up had I not stumbled upon a possible answer the past season.

It has been my purpose for some time to save this black bee from contamination with other races, if possible, and seek to give it a chance through careful breeding to prove its qualities. During the past summer I have been rearing queens from an old black queen of unusual excellence.

The task has been very up-hill labor. I have reared 30 or more queens with great care, and now have only a few mated queens to show for my labor. Out of the last dozen which emerged most promisingly, more than half failed to mate or were crippled on their return by being balled. Many were killed outright. Yellow queens at the same time were mated with no difficulty.

To account for this thing was a puzzle till I happened to see one of the black queens fly. She went like a bullet. Surely it would take a swift drone to catch her! One of the queens was gone nearly, if not quite, half an hour, yet returned unmated. This was during the last week of September, and only a few drones were still alive. The yellow queens, however, mated in spite of the scarcity of drones.

There seems to be but one answer. The flight of black bees is stronger than that of Italians. The drones found it easy to overtake the yellow queens, but were mostly distanced by the black queens.

Here we have an explanation for the frequent mismates which we encounter when trying to rear Italian queens. In the wedding-race the black drones distance the yellow drones, and, unless the yellow drones happen by chance to be better situated in the race, the accepted suitor is black. This will explain why eventually, if left to themselves, black bees will run yellow ones out of existence.

I fully expect that little credence will be given this theory which I have just advanced, especially since the prejudice against the black is so firmly rooted; but I feel confident that what I have advanced can not fail to arouse the interest of every thinking bee-keeper. Even if the reader does cry "Bosh!" he will be set to thinking, and thinking is what makes of us better bee-keepers.

## Wax-Rendering Methods and Equipment

BY ARTHUR C. MILLER

ONE of the difficult things for most of us is to get a new point of view for a subject, to approach it from a different side. This seems to be noticeably the case in regard to apicultural matters, due partly to the old superstitions which still cling about it, and partly to the literature on the subject. These thoughts are suggested by some recent comments in the bee-press on current practices, particularly some regarding the extraction of wax.

Wax-presses have received much attention of late, all sorts of home-made affairs being illustrated and written about. They are exploited as being the proper thing for securing all the wax from old combs, this claim being made by one firm for the presses they make. Any one with half an eye knows that such results are impossible with any wax press now made. It is only necessary to examine the refuse from a wax-press to be assured of the fact that much wax remains in it. And the greater the mass of material put in a press the greater the proportion of wax retained. This principle of wax-extraction is wrong, and no amount of "clawing over" of the slumgum will remedy the evil.

Not long since there appeared in these columns an article by Mr. Dadant, describing a French contrivance for recovering wax, consisting of a double-ended paddle rotating below a strainer. The kettle, or pail, was to be filled with water and comb, the paddle and strainer adjusted, and as the paddle stirred the mass below the strainer, the freed wax rose to the surface. Aside from a brief adverse comment by Mr. Hasty, no notice appears to have been taken of it, and yet within that little contrivance lie the true principles for the extraction of wax. To be sure, the machine is incomplete and crude, but, properly developed, it is to be the wax-extractor of the future.

Old comb consists of various sorts of fiber and other substances of an absorbent nature, and as soon as the mass reaches the melting point of wax these substances take it up. To get it out, the mass is squeezed; but until you can squeeze

a sponge dry, do not expect to press all the wax from a mass of old comb. When melted under water the absorbent substances take up much of it, affording better opportunity for more wax to be secured; but even the mass must be agitated in order to permit the wax to escape, and to make the operation complete some device must be used to break up every particle of the comb.

Besides these features, some device must be had for skimming off the wax as it rises, so that when all is extracted the refuse may be immediately removed and the machine recharged.

A machine properly constructed embodying these features will secure all the wax, and do it rapidly and easily.

Providence Co., R. I.

## Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

The 5th annual meeting of the Texas Bee-Keepers' Association was held at College Station, July 25, 26 and 27, 1905.

The meeting was opened at 9 a. m., July 25, by President W. H. Laws, with a few words welcoming the bee-keepers present.

Louis H. Scholl, the secretary-treasurer, was instructed to take down the proceedings, as a stenographer was not obtained in time.

Prayer was offered by Mr. J. M. Hagood.

Mr. W. H. Laws then delivered the following

### PRESIDENT'S ANNUAL ADDRESS

We have met for the purpose of obtaining knowledge of our beloved pursuit, and to disseminate the same among our bee-keeping friends. These annual gatherings are looked to, as they should be, with expectations and delight, where we can again meet, clasp hands, and greet each other as friends—fraternal greetings—men of one pursuit, whose business interests should be mutual and identical. I trust that you are here with a full program, and that every one of you will feel that the success of the meeting will depend upon you—it is yours.

In the first place, we should express our thanks to the various lines of railroads who have so kindly donated passes, making it possible for so many of us living at remote distances in this great State, to be present at this meeting. These railroad companies are awakening to the fact that apiculture in all its branches and the interests of the railroads are identical; that when the farmer and the bee-keeper prosper they likewise prosper; and in order that we bee-keepers, and men of other agricultural pursuits who have met here and are on the grounds by the thousand, representing what is known as the Farmers' Congress, they have issued thousands of passes. They depend upon us to return home and to disseminate to the good of our neighbors the information that we have gained, believing it will result in better methods and increased production, and consequently increased business for their lines.

There are some things in which we bee-keepers of Texas are interested, and to which I would like to direct your attention. We are proud of the very effective and needed legislation on the diseases of bees; and now that an appropriation has been made by our last Legislature to aid in the eradication of these diseases, whenever they should occur, any and all bee-keepers in the State who should know of the existence of the disease, should at once communicate with the inspector of apiaries, who will either appear in person or render the assistance necessary for the eradication of the disease. So far as known there is little if any foul brood in the State, and all precautions are used against its introduction. But when known to exist, the most heroic measures should be used for its eradication.

We are now much in need of a pure honey law. The Bill which met defeat at the hands of the last Legislature, we take, was a good one and for the benefit of all, producer and consumer alike. It should have become a law. The scarcity of honey the present season only opened the door more widely for the vendor of adulterated goods. Indeed, it is so widely

known that adulterated honey is so commonly found on the market of the large towns and cities of the State that the more intelligent people hesitate to purchase unless the assurance is given that pure honey is furnished from a reputable producer.

I do not believe in the existence of trusts to the enriching of the few at the expense of the many, but there should be such organization among honey-producers that we should not come in competition with ourselves. To this end a honey-producers' association should exist and be maintained, and our products handled by economic business methods.

I would call your attention to The Honey-Producers' League, an institution less than a year old, national in character, and it has already begun its work of merit. Any bee-keeper of the United States or Canada may become a member. Let us investigate its merits.

We realize the need of a bee paper edited in the South. Several attempts have been made to meet this want, but unsuccessfully, or a journal would be in existence to-day. The management of our bees in the South being entirely different from the management in Northern latitudes, the reasons and the calls for a Southern bee-paper are many, and we will hail with delight the advent of a journal backed up by an individual or stock company that will have the backbone to come to stay. With such a journal, conducted by a clean, progressive bee-man, and a stock company to perpetuate a live journal with sufficient financial backing, the bee-keepers and advertisers will rally to its support.

Owing to the almost prohibitive prices now being fixed on hives by the large manufacturers, there is a crying demand for factories in our midst that will make use of our native pine and cypress for hive-making. The low prices on honey, and the several successive poor seasons, make it imperative that supplies must be bought more cheaply.

The honey industry of Texas, we might say, is in its infancy, yet this great State produces more honey than any other one State in the Union. Are we a progressive body? or shall we wait until our day is past and others will catch the spirit of progress and do the things that we should now begin?

Lastly, I repeat that the success of this meeting depends upon you. It is yours. Let us enter heartily into all the discussions.

W. H. LAWS.

(Continued next week.)

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 761.)

### PRESSURE OF THE GERMAN WAX-PRESS.

"Will Mr. Root tell us what is the pressure of the German wax-press?"

Mr. Root—I don't believe that I can answer that in pounds. Miss Wilson said a good deal depends upon the woman in keeping bees. A good lead depends on the wax you are pressing, and a good deal depends on what strength you have. One great trouble is, it is a mistake to suppose that a great deal of pressure is necessary; an intermittent pressure is generally better than to squeeze the combs right down. Suppose you fill your press clean up to the top, and then squeeze it down in a solid mass, and consider you have done the job. That is not the way it should be done. It should be squeezed, and turned over, and turned over, and squeezed, if you want to get it all out. Some experiments are going to show that hot water is a great deal better than steam.

Mr. France—Just one thing there. I believe that some of you get a wrong impression about the wax-press. When Mr. Root said, "You fill that up," he won't recommend that, or I have not found that from my experience. You want to put in but a small quantity of slumgum at a time in order to get the effect of the pressure.

Mr. Wilcox—How thick should the cake be at the bottom of the press when you press it?

Mr. France—I should prefer not to have it over an inch and a half thick.

Mr. Reynolds—Dr. Miller, I believe, asked Mr. Hubert Root last year what the pressure was of that press, and he stated that there was between three and four tons. I claim that there is no such pressure, for the simple reason that the cross-piece of the wax-press will not stand it. The one I use bends, and draws the side in on the basket, and it is a hard matter to get the basket out with the slumgum in.

Dr. Miller—Is the bar of wood or metal?

Mr. Reynolds—It is wood. I think it is not right that that should be sent broadcast through the proceedings of the convention as it was last year.

Mr. Meredith—I believe if you take a 10-pound block, and put it over the screw, turning or pressing the wax, that the pressure at which I have used the press, the slumgum would easily raise a 10-pound block. I don't think there are many people who recognize the force that is obtained by the screw process. Possibly Mr. Root could give us some idea. You have seen buildings that have been raised with jacks, and the thread on the wax-press is something like that, which would indicate a large amount of pressure.

Mr. Wheeler—I have used one of those presses and I have had to do away with one of those top sticks. As Mr. Reynolds said, it was too light, and kept bending, and bending, until it was a regular rainbow, and finally we had to put in twice as heavy a stick of oak, 3 by 4 inches, and that works tip-top. The hot steam seems to soften the wood. The first one gave out entirely. After it got a bent shape I turned it over.

Mr. Root—What Mr. Wheeler says is true. We found that out to our sorrow, and I will say we have replaced those, and any one who has had one that has given them trouble, we desire to give him a new one. We put an iron brace under it, and a piece of sheet-metal to protect the wood. I perhaps ought not to say it, but I will say it, that wax-press is something we sent out and we thought it was perfect. There is a great deal to learn about a wax-press. My brother has been three months working on this wax-press, ten hours a day, doing nothing else, and sometimes clear up into the evening, and we have learned this, that great pressure is not necessary. During the last year we changed the pitch of the screw so that it would have less than half the power of the first screw sent out, because the difficulty would be, they would put too great pressure on and break it. Mr. France is right when he says a press should not be full, only enough to make a cheese about an inch and a half thick. Then you can get all out but about five percent of the wax. What we are working for now is to get that five percent.

Mr. Dadant—We have had considerable experience in melting beeswax and old combs. We used to melt old combs by breaking them up fine, soaking them in water, and then rendering them. But the great principle is, if you get the combs well broken, those combs that contain cocoons or the skins of the arva lodge in the cells, and no matter what amount of pressure they will not come out; that is, they will not allow the wax to come out. If you have everything well broken, and well soaked in water, the beeswax will come out sooner or later.

Dr. Miller—That is very good, I believe, but I failed on that.

Mr. Dadant—I never did much of it myself, but I know we did it.

Dr. Miller—I am merely saying I didn't know enough to do it, and I would like to know how.

Mr. Dadant—If you do it in warm weather it will not do it so well, but in cold weather it will do it better. We have used the German wax-press, and I believe we are one of the few who have not broken the iron casting given in the first place. We had customers who bought those through us and who all complained of breaking them. We took it for granted that it was easily broken, and we must be careful, and I think we got the wax out of the combs about as well as anybody could. We put the wax in and put on the pressure, and keep it on all day long. You will find every few minutes, or half an hour or so, you can make another turn with but a little pressure, and keep on getting your wax away from the center. We have the same thing in pressing grapes. You take a large cheese of grape-pulps and press it in a hurry, and the juice in the center has no time to get out; but give it time to press out, as the pressure goes on it gives more room; you press it gradually, and therefore you can get better results with less fatigue to the operator.

Dr. Miller—Do I understand that the metal casting had broken?

Mr. Root—The first press we sent out had a cast iron frame built exactly as they build them in Germany. I supposed if we followed the plan given in Germany we would be perfectly safe. Those who have had experience in making castings will know that sometimes there are flaws in the casting. Mr. Dadant may have had one without any flaws. Those flaws are covered up by galvanizing. We replaced all that we knew about, and sent out the wooden tops.

I sent Dr. Miller one. Then we discovered that the combination of metal and wood—wood protected by a piece of galvanized iron—was better than anything else we could have, and that is what we are now furnishing. It consists of a piece of hard oak, 4 by 3 inches thick; on the inner side of it is a cast-iron brace that is two inches at the widest part, through which the screw passes, and an inch at the farthest point. This brace is made just like ordinary braces—with a rib running through the center to stiffen it. The cast-iron top was a circular piece of cast-iron about three-eighths of an inch thick, with ribs like the spokes of a wheel, the ribs being thicker towards the center.

Mr. Meredith—I would like to say a word, not speaking of pressure as a defect, but from experience possibly in putting on too much power when I have had to let it stand. The bottom of the portion upon which the cage sets being a light piece of metal with rivets around, I have drawn two or three rivets right straight through, and I found that the iron around there has turned something like the fans of a windmill, instead of standing up. I was wondering if that was a common complaint, or just an accident with my machine.

Mr. Root—That is not a common complaint, but in some few instances it has happened. There is one thing about the wax-press I feel chagrined over—that we couldn't build it in the first place so that it would resist these strains. But you can see what the problem was to us, it was making one strain against another, and that strain sufficient to stand all kinds of pressure. When we say the pressure must be right, it may be three or four tons, or four or five tons, they don't quite understand what we mean. In reference to the remark made by Mr. Reynolds, stating that my brother said the pressure would be three or four tons, he probably gave that statement from first experiments then made. At that time we thought great pressure was necessary, but we learned afterwards pressure was not needed, but a light pressure continued, so that the wax could get away.

Mr. Reynolds—Don't you think it should be sent broadcast to the people that that was a mistake?

Mr. Root—This is broadcast here.

Mr. Reynolds—Shouldn't it be put in Gleanings?

Mr. Root—I think I have published it two or three times.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Painting Hives—Feeding Bees— Transferring—Other Subjects

1. What color do you paint your hives?
2. Do you number them? When you put them out in the spring do you put each one on its old stand?
3. Do you put a brick under each leg of the hive and slant it towards the front, and level each hive in the spring with a spirit-level so it will not tip sidewise?
4. Which is best for feeding, granulated sugar dissolved in water or boiled to a syrup of the consistency of honey?
5. Do you ever feed any kind of meal to your bees?
6. Do you make honey-vinegar? If not too much trouble please give me your process.
7. How do you prepare bees for wintering? and where do you winter them, in a bee-house, outdoors, or in a cellar?
8. What time of the day is the best to take off comb honey, or combs for extracting?
9. How can I transfer bees from an old and undesirable hive to a better one?
10. I bought a 60-pound can of extracted alfalfa honey that tasted just like catnip. Is that its natural flavor? It was not like the sample sent me.
11. Do you wear a bee veil and gloves? If so, what kind?
12. Do you label each section of honey?
13. Do you water your bees? If so, how?
14. Do you salt the water?
15. What is the largest number of pounds of honey you have ever taken from a single colony in one season—comb and extracted?

READER.

1. They are not painted.  
2. Each hive is numbered, and when it is convenient each hive is put on its old stand, but for different reasons this does not always happen. For instance, a colony from the out-apiary may have made such a good record the past year that we may want to keep it in the home apiary for the sake of its drones, as most of our queens are reared in the home apiary.  
3. Bricks are excellent, but it is more convenient for us to use blocks of wood to level the stands. Our stand is a very simple affair, each one accommodating two hives. A spirit-level is used to level it from side to side, and it is slanted toward the front.  
4. Boiling does not change sugar; it has been thoroughly boiled; and it doesn't matter whether it is dissolved with or without heat. But the bees take it better when hot.  
5. Some springs we do, and some we don't.

The bees will not take anything of the kind when they can get pollen.

6. Working for comb honey, we have no cappings from which to make vinegar.

7. They are not prepared, further than to see that they have plenty of stores. They go into the cellar just as they were on the summer stands.

8. The time when bees are busiest at work.

9. That depends; if the frames are all right in the old hive, there is nothing to do but to lift them out of the old hive into the new. If the bees are in a box-hive, you can transfer as directed in the bee-books, although nowadays the tendency is to let the bees swarm and empty the old hive 21 days after swarming.

10. Alfalfa honey ought not to taste like catnip.

11. Yes; the veil is an open bag with one end sewed to the hat, and the gloves are hog-skin, when I can get that kind.

12. No.

13. Generally by means of a large crock with sticks of fire-wood in it.

14. Generally not.

15. 300 sections, or a little more than 275 pounds.

### What One Woman Does

In that excellent monthly—Suburban Life—appears an article from a bee-keeper already pleasantly known to the bee-keeping sisters—Miss Frances E. Wheeler. It appears that her pursuits upon her 4½ acres of ground are more diversified than most of us had probably imagined. She not only keeps ducks and bees, but distributes her busy cares among chickens, turkeys, currants, squabs, and dear knows what else.

Obliged to give up her work as stenographer, like many another in her position, Miss Wheeler looked with longing eyes upon a life outdoors amid the growing things of the animal and vegetable world. Could she break away entirely from office-life and risk the chance of making a living among the ducks and bees? But the struggle is best given in her own words:

"It is a simple matter for the rich to respond to the 'Call of the Wild,' but a quite different thing for people of comparatively restricted means, or pinched pocket-books, to find the open sesame to a summer, or life, with Nature. And yet it is not so very difficult. For even the pinched pocket-book,

there are many ways in which the change might be accomplished.

"If one felt sufficiently brave and determined, one might even venture alone to make a living on a little country place, as did the writer.

"I have never learned to swim, but I fancy that the final wrench from the old life and the struggles with the new and unknown work of farming are sensations similar to those when one is flung beyond one's depth and has to kick out and swim, or sink. It is exciting, exhilarating, but—strenuous! One is reminded of Macbeth's 'Suppose we fail?' and Lady Macbeth's scornful—'Fail! But screw your courage to the sticking place and we'll not fail!' We realize that our success depends upon keeping our courage screwed 'to the sticking place.'

"It has been almost 10 years since we began our experiment. There was no investment about it. I had no money. A few old debts collected—perhaps three hundred dollars' worth—gave us the start. For some time it was a sort of scramble. Not much system, but considerable 'method in the—madness,' as some thought it. We did what we could, and what we couldn't do went without doing."

But for the hope that we may have in the near future some account of her doings written especially for this department, further extracts would be given. That one number of Suburban Life makes the year's subscription worth while.

**The Truth About Honey.**—A few changes have been made in the reading of the Comb Honey Guarantee Circular for shipping-cases gotten up by The Honey-Producers' League, so that it will be suitable for bee-keepers to use in their correspondence, putting one in with every letter they write. It is headed, "The Truth About Honey," and is printed on both sides of a light manilla cardboard. It is sent postpaid in lots of 50 for 10 cents, 100 for 20 cents, etc. Every bee-keeper should use it, as it will undoubtedly help to popularize the use of honey.

The Guarantee Circulars for putting in shipping-cases should be used by every bee-keeper who sells comb honey by the case. These circulars are the same price—10 cents for 50 copies, postpaid. Send all orders to the American Bee Journal office.

### Comb Honey Not Machine-Made.

We have a fair supply of the typewritten letter on this subject, which appeared in the Chicago Daily News of June 21, 1905. It is just the thing to have published in every bee-keeper's local newspaper. We mail it for a 2-cent stamp. Better order several copies, and request as many newspaper editors to publish it. It will certainly be a good thing for both the reading public and the bee-keepers.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### WHAT IS A CARLOAD OF HONEY?

How's the best way to get out of a bad scrape? Our Editor having been in position to know about carloads of actual honey on arrival, is very much better authority than I am as to how much is a carload. I seem to have made a certain estimate enormously too large. Suspect I went wrong largely from having looked at the new cars of the Lake Shore, which runs close by my apiary. Capacity is printed on the outside of each car—some of them 50 tons. But probably all the cars which I have seen marked 50 tons or more, were really something else than ordinary box-cars. When I was a boy cars were nearly all of two sorts, "Capacity 8 tons," and "Capacity 10 tons." Since then capacity has been very greatly increased. It is imaginable that the Pacific railroads (over which honey comes largely) may hang back on the capacity of cars. If 10-ton cars are still in fashion with them, they would be very unlikely to let a shipper send 20 tons in a car unless he paid double rates. And I think shippers of honey would generally prefer two cars to double quantity in one car, if charge per ton was the same. I didn't get beyond what can be made to go into a car. A cubic foot is a little less than  $7\frac{1}{2}$  gallons, equal to 90 pounds of honey. If we pack the inside of a car full of square tins of honey, not boxed, and the dimensions are  $26 \times 8\frac{1}{2} \times 7$  feet (1547 feet), we have about 69 tons, of which some 3 or 4 tons would be tin and 65 tons honey. We will consider the 5,600,000 pounds corrected to 2,100,000.

Faith, and do I believe it now? Hardly know. Still a won't-lie-down suspicion that stories are told to influence the market. But the above surely shows how much the mathematical critic needs to be criticised himself sometimes. Page 725.

### CARDBOARD OVER QUEEN-CAGE CANDY.

But about the cardboard over candy, I'm not going to come down quite so far from my high perch. Dr. Miller is thinking of himself, and of the cardboard breeders select and send for the purpose. There is need to consider excited beginners—and the way they are foreordained to bungle things—and the cardboard they will hunt up and use. Some is thin, some five times as thick. Some is soft,

some hard. Some is plain of surface, some with enameled surface. I suppose a sample could be found which even Dr. Miller's bees wouldn't get through in 5 years. Queens are also introduced to weak colonies; and cold nights unexpectedly swoop down. Queens are also introduced to blacks; and if blacks are really so much poorer at worm-hunting, it would rather follow that they are poorer at card-gnawing. Very many queens used to be laid a-top the combs, and we should not ignore the possibility of its being done that way still. That a weak colony on a cold night may draw away from such a cage altogether is a contingency which I think should not be overlooked. But I will cheerfully concede to Dr. Miller's large experience, that in the heart of a colony, and with cardboard of the right kind, and the right kind of bees, there is not much danger. Page 725.

### LATEST SWARMS.

That late swarm of Dr. Miller's—Sept. 22—I was going to take as a record, and so having a certain value; but on reading to the end I doubt whether it was a normal swarm at all. Perchance it had been unprosperously in a tree or some place, and not sufficiently protected. Had merely picked up and all swarmed out from unendurable quarters. If so, going to the nearest apiary and alighting on a post would be just the proper thing to expect. If it had a virgin queen, however, as the latest true swarms usually do, my theory would stand disproved. I think my record for lateness is Sept. 5, or about that time. Page 715.

### OUTDOOR FEEDING OF BEES.

Ernest Root has manifestly improved his outdoor feeding. Putting it up high in the air lets all the bees which fall have a chance to take wing before striking anything. And weakening the feed until they regard it as nectar rather than as plunder is an advance, too. I should hardly feel reconciled to anything that causes masses of bees to form and then drop; but if I understand correctly, comparatively little massing occurred in the last trials. Especially valuable is the experience that two 60-pound cans so worked actually kept an apiary of 300 queen-rearing colonies free from any eager disposition to rob. Page 693.

perature of the main cellar is generally 2 or 3 degrees cooler than the vegetable cellar. If I lifted the curtain occasionally, would this provide the necessary ventilation?

3 In the spring one comb that was not covered by the bees had a little mildew or mold on it. Do you think the cellar was too damp?

4 Could an excess of moisture in the atmosphere be prevented by using lime, as spoken of by Editor Hutchinson in "Advanced Bee Culture?"

5 Do the walls of your cellar ever sweat during winter?

6 Is the humidity thus formed detrimental to the bees?

7 Are midwinter flights beneficial to bees when they are quiet in the cellar?

I have been having quite a little experience in late introduction of queens, and here is something that has happened twice in a very short time; I would like to know whether it is abnormal. As the cases are nearly parallel, I will cite but one of them:

About Oct. 1, I caught and killed the old queen and placed the new queen between the brood-frames. One week later I looked to see if the queen was laying. I found several sealed queen-cells, and feeling somewhat out of patience with them (as I then thought they had killed my choice queen), and as I did not care to continue that hybrid stock, I tore down the cells. When nearly through the hive I found a small cluster of bees on a bottom-bar. I smoked them gently, and was very agreeably surprised to find the queen. I rescued her at once and returned her to the cage with 4 or 5 young bees, provisioned it, and again put it between two brood-frames.

8 Was this the right thing to do? As the queen ought to have been out 3 or 4 days prior to this, and with the presence of several sealed cells, and as not an egg had been laid, I could not think of anything else to do.

About 5 days later I again opened the hive and saw the queen on the top of a brood-frame, between the hive-body and super, surrounded with bees; as they did not seem to be acting hostile I closed the hive at once. I did not use any smoke at the entrance, so the queen could not have been frightened. The queen is now laying beautifully.

9. I noticed in one of your answers that you said that to have a queen mated purely when the yard contains hybrids, the virgin queens or nuclei with select drones should be removed about 4 or 5 miles distant from any other bees. While this old doctrine is all right, I believe the limit is too far removed, unless we can do as E. L. Pratt does—go to the mating yard by trolley.

Last summer about 90 percent of the drones in my apiary were blacks or hybrids, and as I especially wanted to have some purely mated queens, I took some nuclei to the back end of the farm about one half a mile from my apiary. Here I also took about two dozen hand-picked golden Italian drones. The experiment worked beautifully, as every one of the queens was purely mated. Unfortunately, I was not able to continue this experiment long enough to come to a definite conclusion as to the necessary distance. Baby nuclei also worked successfully at this distance. Perhaps a few old bees came home, but not enough to deplete the nuclei.

I have had many disappointments in the bee-business. Foul brood nearly wiped me out of existence once. But the bee-fever is still unbroken. We have had a nice flow of aster honey this fall, so bees are in good shape to winter.

10. Some of our pear-trees are in bloom now, and the bees have been working on them. Is not this abnormal, too?

PENNSYLVANIA.

ANSWERS—1. Yes.

2. If the number of colonies is small in proportion to the size of the room, there will probably be no need of any attention to ventilation. With a larger number of colonies, there might be need to keep the curtain raised at night, or it might be partly raised all the time, provided the main cellar were sufficiently darkened.

3. Hardly worth while to pay any attention to mold if it occurs only on one comb. Dampness, darkness, and warmth make a combination favorable to the growth of mold, but there is a kind of very fine mold that some-

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

 Dr. Miller does not answer Questions by mail.

### Cellar-Wintering of Bees—Introducing Queens, Etc.

As wintering seems to be the great problem with us, I would like to have your advice on the following questions:

Two years ago the number of my colonies decreased from 32 to 6. Last winter was considerably better—I lost but 10 colonies out of 30.

Last fall, after winter had fastened its grip on Mother Earth, I carried 2 light nuclei into the vegetable cellar, which is frost-proof. This cellar has no windows, and the entrance from the main cellar was screened with a heavy piece of carpet. As we had only one real thaw, the walls were dry most of the time. The nuclei were given a flight on Jan. 1, and no dead bees were found on the floor,

and very few on the hive-bottom. Both came through in fine shape, and were replaced in the apiary on March 26, when soft maples began to open, and built up well in proportion to the bees they had.

Of the 10 colonies that died outside, all were much stronger in bees and had more honey; most of these were in chaff hives.

The bees in the cellar were in Danzenbaker hives, deep side of bottom-board up, and bur-lap sacking over the top. The temperature of the cellar ranged from 40 to 44 degrees, but was at 42 degrees the most of the time. The bees were very quiet all winter, only a low hum being heard.

1. Do you think it would be advisable for me to put a number—say half of my colonies—into this cellar this winter?

2. There is no means of ventilation except through the curtained doorway. The tem-

times comes on sealed combs in the cellar that doesn't seem to do any harm.

4. Yes. Raising the temperature will help, too, also admitting fresh air.

5. Yes; at any time when there is a long, cold spell, so that the stone wall becomes very cold, if the air of the cellar is warmed up, or warmer air admitted from outside, the moisture of the air will be deposited on the colder walls, just as it will on the outside of a pitcher of ice-water on a hot day.

6. I don't think it is.

7. Hardly, provided they will keep quiet later on.

8. Yes, unless it would have been better to have done nothing. It is a common thing for bees to start cells when a queen is introduced, and if left to themselves the bees may destroy these cells. At any rate, if the bees did not appear to be hostile to the queen there would seem no need to cage the queen, if indeed there was any necessity to destroy the cells.

9. While you may succeed in a few cases at half a mile distance, even as you may be having drones and queens in the same apiary, if you keep it up long enough you will likely have more failures than you will like. Still, nothing succeeds like success, and if half a mile continues to work with you there's no good reason why you should go further.

10. Decidedly abnormal, and no benefit to next year's fruitage.

### Home-Made Comb Foundation

On page 648, J. E. Johnson speaks of a Reitche-Getaz press, which makes fairly good brood-foundation, and only costs \$1.50 and freight. Where can I get it? The foundation question is a troublesome and costly one to me.

TEXAS.

ANSWER.—It can be obtained of Mr. Getaz. See his advertisement on another page.

### Italianizing Bees—Artificial Increase

I have 10 colonies of black bees, and would like to introduce Italians.

1. What is the best and surest way to introduce an Italian queen?

2. I have tried three different queens, and followed the directions on the mailing cages that they came in, and they got away.

3. I had a strong colony of bees about the middle of the summer, and it cast a large swarm; I hived it, and about 30 days afterward I looked into the hive where the swarm came out, and there was only about 2 quarts of bees in it, and no brood. I looked for the queen, but could not find any. I put in a frame of brood, and they built queen-cells on it, and hatched out 2 queens. I destroyed all the rest of the cells. About a week afterward I looked, and no queens could be found, but one queen had laid about 20 eggs, and they had started queen-cells from them. I destroyed them and sent for an Italian queen, and they killed her. Now, what shall I do next? There is only about a quart of bees in the hive at this writing (Oct. 13).

4. Give me a good way for artificial increase. I have 8 strong colonies.

5. What bee would you recommend for profit?

6. Is the Carniolan a good variety?

7. Does it make any difference if a hive is opened after an Italian queen has just been introduced? I had one that was introduced all right, and layed about a thousand eggs. I opened the hive quite frequently to look at her, but the last time she was gone. What became of her? Do the bees ever kill the queen after she has been safely introduced and begun to lay?

PENNSYLVANIA.

ANSWERS.—1. The surest way I know of is to have frames of sealed brood with young bees hatching out; fasten the queen in a hive with these, and without a single bee except her escort and what are in the combs; keep in a warm place, and in 5 days set the hive on its stand, and for a few days give a very small entrance. Instead of keeping in a warm place you can set the hive over a strong colony with wire-cloth between.

2. Hard to say just why you were so un-

fortunate, but sometimes a colony seems to be of such disposition that it is very hard to get it to accept a queen, although it will accept a queen-cell.

3. There is only one thing to do; break up the colony. That quart of bees is so old that it has no value, especially this time of year.

4. Take from a strong colony two frames of brood with adhering bees and queen, put on a new stand and imprison for three days. A week after the queen was taken away, let the two hives swap places. That will double the number. If you want to make more out of that one colony, you can divide the old colony into two or more nuclei at the time of swapping places, being sure that each has a good queen-cell located centrally where the bees will keep it warm, and then if necessary you can strengthen these nuclei after the queens get to laying by giving them brood from other colonies.

5. Italians are good.

6. Reports vary as to their value. Possibly all Carniolans are not alike in value.

7. Yes, it often happens that opening a hive will make the bees ball a queen, and sometimes kill her, even when she is laying.

## Reports and Experiences

### A Machinist Bee-Keeper

I am very much interested in bees. I am a machinist by trade, live in the city, but keep a few bees for pastime to break the monotony of shop-life; and then I like the honey to eat with warm biscuit. I keep from 3 to 6 colonies, and get from 100 to 150 pounds of comb honey in a season, and lots of pleasure working with the bees.

J. T. HILLERY.

Franklin Co., Ohio.

### Almost a Complete Failure

The past season was almost a complete failure. I obtained about 1200 pounds of honey from 74 colonies, spring count. I now have 84 colonies, and must feed at least 200 pounds or lose heavily the coming winter.

Scott Co., Ill., Oct. 28. P. B. THAXTON.

### Hive-Tool and Bee-Escape Board

In speaking of hive-tools I will try to give a description of one I use, which I find very handy:

Take any old rasp, such as blacksmiths use, sharpen both ends (you can make it any width and length you desire—mine is about 10 inches long); turn one end the same as a garden hoe, making it about  $\frac{3}{4}$  inch deep. Then you have a tool that you can pry off supers or spread frames, cut burr or brace combs, scrape propolis, smash cappings, or cut down thick combs.

Also, I find by my plan of fixing a Porter bee-escape I can clear supers of bees in  $\frac{1}{4}$  the time usually required. I tack 4 strips on the escape-board, leading from each corner to the hole in the escape. Those strips guide the bees to the exit. I had been using this long before I saw any mention of it in the bee-papers.

J. T. JONES.

Allegany Co., Md.

### Expects Heavy Winter Losses

We have had a bad fall here for bees. I think there will be heavy losses until spring comes to us again.

JOHN COCHEMS.

Maanitowoc Co., Wis. Oct. 31.

### Bait-Sections Changing Color

On page 746, W. N. Root wants to know why his bait or draw sections change color, or have a dark or amber spot while the balance is white. If he will examine closely he will find the dark spot in the bait-section is where the honey caddied during the cold

weather. At least, that has been my experience. The past season I used about 35 bait-sections, and every one that I removed from the super contained a dark spot. On examining one I found it was solid honey.

Albany Co., N. Y.

WM. B. LOWE.

### Too Cold for Honey

Last spring my bees came out of the cellar in good condition—every colony alive. Frequent showers in June gave white clover a good start, but it was too cold for honey. During the last of July and part of August the bees did pretty well, but during September they would not work in the supers, but filled the brood-chamber full of honey, so they are in good shape for winter.

C. SCHRIER.

Will Co., Ill., Oct. 27.

### Not An Average Season

The yield of honey this season was slightly below the average, but the fall flow being fairly good the bees are in fine shape for wintering. Brood-rearing is being kept up quite well. This is especially true with the golden Italians and black colonies.

I can't quite like the 3-banded Italians for this section, as they slack up on brood-rearing during the honey-flow, and crowd the brood-nest with honey; and as our honey-flow lasts several months, they are not prepared to keep pace with the goldens, Albinos, and blacks. I think I shall like the Holy Land bees for this section, although I have only tried them this season, and with only one colony.

I am highly pleased with the American Bee Journal, and don't see how I have done without it. It is just what I need, and you may rest assured that I shall continue to read it. One issue was worth the subscription price for a year.

WM. S. MCKNIGHT.

Barbour Co., Ala., Oct. 24.

### CONVENTION NOTICES.

Illinois.—The 15th annual meeting of the Illinois State Beekeepers' Association will be held in Springfield, on Tuesday and Wednesday, Nov. 21 and 22, 1905, in the room of the Board of Supervisors in the Court House. The R. R. Rates will be as follows: All lines in the Western Passenger Association will make an open rate of one fare plus 25 cents for the round trip to Springfield, except from near points where a fare and one third would be less. All lines in the Central Passenger Association will make a similar rate on the Certificate plan, and if not convenient for any attending our meeting to come over the lines in the Western Association, if they will write me I will send them certificates which the Grand Secretary of the I.O.O.F. assures me your local secretary of the same order will gladly sign. The Central Passenger Association Lines are as follows: B. & O. S.-W.R.R.; Big Four Route; C. & E. I. R.R.; C. & H. D. R'y; I. & I. R.R.; J. & St. L. R'y; L. E. & W. R. R.; L. & N. R.R.; Southern R'y (St. Louis Div.); T., P. & W. R'y; T., St. L. & W. R.R.; Vandalia Line; Wabash R.R., east of Toledo.

The good results of this annual re-meeting rest on the members who attend it. Our State gives us an appropriation to publish our report and to suppress foul brood, and it is the duty of every bee-keeper of the State to have a voice in the manner in which this appropriation is used. All bee-keepers are invited to come, and bring their wives. The railroad rates will not be higher than an open rate of one fare and a third for the round trip, and efforts are being made by our Odd Fellow friends to secure a one fare for the round trip. Good hotel accommodations can always be had at reasonable rates.

JAS. A. STONE, Sec.

Route 4, Springfield, Ill.

The Chicago-Northwestern Beekeepers' Association will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to. All who are accustomed to paying their dues to our Association, thereby getting two memberships for the price of one, will please hand the \$1 to the secretary, or mail it to him as usual. The time in the evening will be given to the National, as will also the whole of the two following days. Every one is cordially invited to be present,

# FOR YOURSELF OR AS GIFTS!

**HOWARD M. MELBEE,**  
HONEYVILLE, O.

(This cut is the full size of the Knife.)

## NOVELTY POCKET-KNIFE

(Name and Address on one side—Three Bees on the other side.)

**Your Name on the Knife.**—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the owner, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. It will last a life-time, with proper usage.

**Why Own the Novelty Knife?**—In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and, in case of death, your relatives will at once be notified of the accident.

**How to Get this Valuable Knife.**—We send it postpaid for \$1.25, or club the Novelty Knife and the American Bee Journal for one year—both for \$2.00. (Allow two weeks for Knife order to be filled.)

## A SOLID GOLD FOUNTAIN PEN

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are Para Rubber, handsomely finished. The simple feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

We mail this Gold Fountain Pen for only \$1.25, or for \$2.00 we will mail it and the weekly American Bee Journal for a whole year.

Sample copy of the American Bee Journal free; trial trip of three months (13 copies) for 20c; regular yearly price, \$1.00.

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

## Bargain in Bee-Supplies

On account of removing from the city, I wish to sell at once the list of bee-supplies given below. Will sell the lot at less than one-half the present retail prices as shown by Root's catalog. They certainly are a big bargain.

- 7—8-frame hive-stands
- 2—8-frame wood-zinc boards
- 2—Danzenbaker Hive-covers
- 3—Reversible hive-bottoms
- 9—10-frame dovetailed supers
- 5—10 frame dovetailed winter-cases
- 24—8-frame dovetailed supers
- 9—8-frame dovetailed extracting-supers
- 2—10-frame dovetailed hives
- 3—8-frame dovetailed hives

- 75--M fences
- 1—Danzenbaker bottom and detachable alighting-board
- 10—8-frame hive covers
- 16—Hoffman top-bars
- 500—4x5x1 3/8 sections (new)
- 7—Miller feeders
- 2—8-frame bee-escape boards
- 25—8-frame hives (oew)
- 25—8-frame 2P supers (new)

500 plain sections (new)

**\$40 will take the lot if ordered at once.**

# Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to the past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½ cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less.

R. A. BURNETT & Co.

CINCINNATI, Oct. 6.—Reports from differer parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakenly expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH Co.

INDIANAPOLIS, Oct. 12.—There is a good demand for strictly fancy white comb honey, demand and supply running about even. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.

WALTER S. POWDER.

ALBANY, N. Y., Oct. 29.—Not much change in our honey market this week. Demand is good at 13@15c for clover; 11@13c for mixed; 11@12c for buckwheat. Extracted, white, 7@7½ cents; mixed, 6@6½c; buckwheat, 6@6½c. Beeswax firm at 30@32c.

H. R. WRIGHT.

PHILADELPHIA, Oct. 19.—Honey has been arriving freely in the last 10 days. There are still some small producers who have a few hundred

# Headquarters for Bee-Supplies

Complete stock for 1905 now on hand. Freight rates from Cincinnati are the lowest,

ESPECIALLY FOR THE SOUTH, AS ALL FREIGHT NOW GOES THROUGH CINCINNATI.

## 8 Percent Discount

For Cash Orders Received in

# NOVEMBER

# C. H. W. WEBER

CINCINNATI ... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

pounds, and want to dispose of it quickly and get their money, who are keeping the prices down. We quote: Fancy white, 14@16c; No. 1, 13@14c; amber, 10@11c. Extracted honey rules firm at 5½@6½c for amber; 6½@7½c for white. Beeswax firm, 28c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c.

C. C. CLEMONS & Co.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade.

GRIGGS BROS.

CINCINNATI, O., Oct. 24.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light

amber, 5½@5¾c; in cans, ½c more. White clover from 7@8c. Beeswax, 28@30c.

C. H. W. WEBER.

NEW YORK, Oct. 20.—Comb honey is now arriving very freely and the demand is good for nearly all grades. We quote fancy white at 13@14c; No. 1, 11@12c; amber, 10@11c, and buckwheat, 10c. Extracted in good demand. Arrivals of California are large while from other sources receipts are very light. We quote California at from 5½@7c per pound, according to quality and quantity; Southern in barrels and half-barrels, at 55@60c per gallon. Beeswax firm and scarce at 29@30c.

HILDRETH & SEGELKEN

SAN FRANCISCO, Oct. 25.—White comb, 1-lb. sections, 8@9cents; amber, 6@7c. Extracted-water-white, 5@—c; white, 4½@4¾c; light amber, 3½@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 25@27c.

A rather limited amount of trading has been done during the current week for the reason that apiarists are hesitating to let their honey go at the present figures that buyers seem disposed to offer. The yield in southern California has been more than the average, but the bee-men are expecting to get a good price for it, as reports from other sections indicate a considerable shortage.

Please mention Bee Journal when writing advertisers.

SPECIAL ISSUE of Gleanings in Bee Culture, Dec. 15, 1905

We are pleased to announce that extensive plans are under way for a magnificent Christmas issue of Gleanings in Bee Culture, ready for mailing Dec. 15th. It is planned that this issue shall by far exceed in its wealth of contributed articles, its half tone illustrations, and its cover design, anything heretofore attempted in bee-keeping literature. It will consist of at least 100 pages, and should be kept by every bee-keeper.

Cover

The cover is printed in three colors by one of the best color-printing establishments in the United States. We were not satisfied to attempt this ourselves, and have gone to great expense for the printing of this cover. The design is something unique, and very pleasing indeed. It shows the red clover in its natural colors in all its beauty, and, altogether, will make a bee-keeper's magazine that will compare favorably with any of the literary magazines of the present day.

Half-Tone Illustrations

During the past summer we have had a special artist who has been sent to various points especially to take photographs for us. He has traveled on our account alone the past summer over 4000 miles, and we can promise something very fine in various races of queens, dealers in bees, dealers in general supplies, dealers in special articles for bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

our half-tones for this issue. In this preliminary announcement we are unable to specify definitely the subjects that will be given, but those who are at all familiar with Gleanings for the past year will know that a treat in illustrations is in store for them. We can definitely announce now that some of the prize photographs in our second photographic contest, American and Foreign, will appear in this issue. Our engravings are made by the very finest engravers in the United States, insuring first-class work in every case.

Writers

For this issue we shall have our regular contributors, such as Dr. C. C. Miller, G. M. Doolittle, Prof. A. J. Cook, J. A. Green, and Louis Scholl, besides special contributed articles, especially for the number, by E. W. Alexander, Dr. E. F. Phillips, of Washington, D. C., and others.

Other Features

Not only shall we make the magazine a thing of beauty and special value in its reading-columns, but special attention will be given to making it of value as a reference-book—a sort of year-book for bee-keepers—so that it will be kept for frequent reference throughout the following year. We expect to have all of the reliable advertisers represented in its columns, such as the breeders of bees for bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

Subscription Rates

We are making a short-time offer—a special trial trip of 6 months for 25 cents, which will include this Dec. 15th issue. This one number alone should be worth 25 cents to any bee-keeper. We can not promise to hold this offer open indefinitely, for our cover pages will necessarily have to go to press considerably in advance of the day of publication; and after the number contracted for are sold, we shall not be able to supply additional copies. It is important, therefore, that your subscription be received promptly.

WANTED—25 YOUNG MEN

There is now, and has been for years, a greater demand for experienced bee-help than there are men ready for these places. Each winter and spring we are obliged to disappoint many large apiarists by telling them we do not know where suitable help can be found. The demand is already beginning for the season of 1906.

We have found that many who take our course in bee-culture by correspondence prefer to go into business for themselves, so we still need active young men who have a fair knowledge of the subject—men whom we know something about—who can be recommended for the places frequently offered. We have, therefore, determined to-day to offer a limited course in

BEE-KEEPING BY MAIL

We shall designate this as Course No. 2. The lessons are identical with the lessons in Course No. 1. The time, however, is limited to one year from enrollment. The course may be easily completed in 3 to 4 months. The following is the

OUTLINE OF COURSE

- 1. Definitions of Terms
- 2. inmates of the Hive
- 3. Comb
- 4. Handling Bees
- 5. Transferring
- 6. Building Up Colonies
- 7. The Honey Flow
- 8. Swarming
- 9. Rendering Normal
- 10. Preparing for Winter
- 11. Wintering
- 12. Spring Management
- 13. Bee Diseases—Symptoms
- 14. Enemies of Bees
- 15. Establishing an Apiary
- 16. Queen Rearing
- 17. General Examination

TERMS OF COURSE 2—FULL-CASH PAYMENT

Complete course as outlined, lessons, personal answers to all questions, including the ABC of Bee-Culture (500-page book,) and Gleanings in Bee Culture, (semi monthly,) for one year, \$5.00.

With either the ABC or Gleanings omitted in case you have one, \$4.00.

With both omitted in case you have both, \$3.00.

If a full colony of Italian bees with tested queen is wanted, in either Dovetailed or Danzenbaker hive, we will, for \$10.00 extra, deliver one colony at your express station, at any point in U.S. east of the Mississippi River, or make equal allowance to other points.

ESTABLISHED IN 1861

# THE AMERICAN BEE-PAPER IN AMERICA

# BEE JOURNAL

(Entered at the Post-Office at Chicago as Second-Class Mail-Matter)

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor

CHICAGO, ILL., NOVEMBER 16, 1905

Vol XLV—No. 46

THE AMERICAN BEE JOURNAL is absolutely an independent publication, and not connected with any bee-supply business whatsoever. It stands entirely upon its merits as an educative force in the field of bee-keeping, and as a medium for legitimate advertisers in apicultural or other lines. It is the oldest, and only weekly, journal of its kind in America. Its publishers believe that it deserves to be in the hands of every would-be progressive successful bee-keeper in the land. It is in its 45th year, and to-day is acknowledged to be better in every way than at any time during its long and honorable history.

## Editorial Notes and Comments

### National Convention Postponed Two Weeks—Now Dec. 19, 20 and 21

We have received the following from Secretary Hutchinson:

Another slight postponement of the National convention seems to be unavoidable. The Fat Stock Show, upon which we have depended for reduced rates on the railroads, has been postponed two weeks. The reason given is "the inability of the builders of the amphitheater to secure structural steel for the same," and they don't wish to hold the show out-of-doors, hence the delay. Of course there will be no excursion rates during the first week in December, and, as it would be suicidal to attempt to hold a convention without excursion rates, the Executive Committee has decided to postpone the convention two weeks in order to take advantage of the Fat Stock Show rates. The dates for the convention will now be Dec. 19, 20 and 21, 1905.

The place of meeting has also been changed to Brunt Hall, in the Bush Temple of

with their customary enterprise and liberality, will pay for the use of the Hall. It is only 5 minutes walk north from the Revere House, which will be headquarters for the members. This new place of meeting is in a new building where everything is modern. There are adjoining committee rooms, toilet rooms, good drinking water, and elevator service both day and night.

W. Z. HUTCHINSON, Sec.

Now that the time of holding the National convention is finally and definitely settled, we hope a large number of bee-keepers will find it a very convenient time to get away from home for a few days and attend the meeting. Surely, it is late enough, so that all the fall farm work will be out of the way. The only thing that might prevent attendance would be the chorea—caring for the farm stock, etc.—but doubtless some arrangement can be made for that, so that nothing will suffer while attending the National convention.

The following is the revised

#### PROGRAM FOR THE NATIONAL CONVENTION.

##### FIRST DAY—TUESDAY.

###### EVENING SESSION—7:30 P.M.

Wax-Rendering Methods and their Faults—O. L. Hershiser, Buffalo, N. Y.

Can the Tariff on Comb Honey be Tinkered to the Advantage of the United States Bee-Keeper?—Hildreth & Segelken, New York.

##### SECOND DAY—WEDNESDAY.

###### MORNING SESSION—9:30 A.M.

How Many Bees Shall a Man Keep?—E. D. Townsend, Remus, Mich.

Short Cuts in Bee-Keeping—M. A. Gill, Longmont, Colo.

Question-Box.

###### AFTERNOON SESSION—2:00 P.M.

The Control of Increase—L. Stachelhausen, Converse, Tex.

Migratory Bee-Keeping—R. F. Holtermann, Brantford, Canada.

The Dietetic and Hygienic Relations of Honey—Dr. E. L. Eaton, State Analyst Illinois Food Commission, Chicago.

Question-Box.

###### EVENING SESSION—7:30 P.M.

Contagious Diseases Among Bees and How to Distinguish Them—Dr. Wm. R. Howard, Ft. Worth, Tex.

Experimental Apiculture—Dr. E. F. Phillips, Washington, D. C.

##### THIRD DAY—THURSDAY.

###### MORNING SESSION—9:30 A.M.

The Honey-Producers' League—Can it Help Bee-Keepers?—R. L. Taylor, Lapeer, Mich.

The Business End of Bee-Keeping—N. E. France, Platteville, Wis.

Successful Experience in the Making of Honey-Vinegar—H. M. Arnd, Chicago.

Question-Box.

###### AFTERNOON SESSION—2:00 P.M.

In What Way Can Bee-Keepers Secure their Supplies at Lower Prices?—W. H. Putnam, River Falls, Wis.

How the Producer and Dealer May Advance their Mutual Interests—Fred W. Muth, Cincinnati, Ohio.

Question-Box.

###### EVENING SESSION—7:30 P.M.

What Have We to Hope for from the Non-Swarming Hive?—L. A. Aspinwall, Jackson, Mich.

Poultry Keeping for the Bee-Keeper—Emerson T. Abbott, St. Joseph, Mo.

### Government Distribution of Queens

We have received the following:

WASHINGTON, D. C., Oct. 30, 1905.

DEAR MR. YORK:—I inclose a circular letter which outlines a plan of distribution which is to be followed by the Bureau of Entomology in the future. If you wish to do so you are at liberty to publish it in your Journal, as it may be of interest to some of your readers.

Yours very truly,

E. F. PHILLIPS,

Acting in Charge of Apiculture.

The circular letter referred to by Mr. Phillips, reads thus:

#### DISTRIBUTION OF QUEEN-BEES.

It has been customary in the past for the Bureau of Entomology to distribute a limited number of queen-bees of the more rare varieties to bee-keepers. This distribution is not intended to be general, since that would be impossible; and, to prevent misunderstanding, the following method, to be used in all future distributions, is announced:

It is desired that some of the less common varieties which have proven so good may become more widely known among the bee-keepers of the country, to take the place, in

BUSH TEMPLE OF MUSIC

Music, corner of North Clark Street and Chicago Avenue (entrance on Clark Street.) This was done because it was feared that the accommodations at the Revere House might prove too limited. The Chicago bee-keepers,

so far as possible, of the common black bees and of certain strains of Italian bees which seem to have deteriorated.

Carniolan bees are very prolific and are, at the same time, gentle, and there are records to show that as honey-producers they are excellent. The recently introduced Caucasian bees, which have attracted considerable attention, are the most gentle bees known at the present time, and records of honey-production now coming in indicate that they are excellent. The Cyprian race, which has been criticised on account of its temper, ranks second to none in honey-production.

Of these races, the Carniolans are sold in this country to some extent, and the Cyprians in less numbers; so far no queen-breeder has offered Caucasian queens for sale, and there is, without doubt, an opportunity for a wide sale of these queens, as evidenced by the requests which come to the Bureau of Entomology.

The Bureau can do more toward the wider introduction of these races by inducing reliable men to take up the rearing of pure-bred queens than by a more general distribution. It is not the purpose merely to give away queens, and the future distributions will be limited as follows:

To any experienced queen-breeder who will guarantee to rear queens and mate them purely in considerable numbers for general sale, the Bureau will send, as far as the supply will allow, one high-grade breeding queen, purely mated and carefully tested. In addition, several queens whose matings are not known will be sent for drone-production, since drones are not affected by the mating; all queens, however, will be from good stock, the number to depend upon the supply at hand. The breeder making the request must give evidence of his ability to rear good queens, must agree to offer at least 200 pure-bred queens a year for sale to the general public, and must not ask for them an exorbitant price. It is the opinion of the Department that 20 percent more than the current price for Italian queens would be fair. It will also be expected that in future years the breeders will do their utmost toward the improvement in honey-production, at the same time maintaining the purity of the races. The Bureau will be glad to aid breeders of this class to its utmost ability, but will not aid in any way a breeder who offers for sale or sells crossed hybrids of the various races, except in the case of untested queens, and even in that case, every possible effort should be made to get pure matings.

After this distribution, all inquiries to the Bureau will be answered by giving a list of reliable breeders, including those who have received stock from the Government apiary; and the name of any breeder who knowingly sends out inferior stock will be dropped. It is not the purpose to interfere with the private business of the persons receiving queens, but these precautions are taken to protect the bee-keepers of the country.

No applications for queens under other circumstances will be considered. All applications will be considered in the order of their receipt.

Yours respectfully,  
 Approved: L. O. HOWARD,  
 JAMES WILSON, Entomologist.  
 Secretary of Agriculture.

### That Bee-Tanging Business

The following is from Prof. Bigelow, with reference to an editorial on page 709:

FOUNDED ON FACT OR ON FOOLISHNESS?

EDITOR AMERICAN BEE JOURNAL—

In your issue of Oct. 12, I note that you refer to my discussion in *Gleanings in Bee Culture* as to whether or not noise has any effect on a swarm of bees, or whether the custom known as "tanging" at swarming-time (as practiced for generations by our ancestors) had absolutely no relation to the habits of the bees, but was founded on a forgotten edict by Alfred the Great as to ownership.

It is evident that you got only an imperfect notion of what I am driving at, for you refer to the article as a "sort of defense of the custom." What I had in mind, and what I supposed that I had made clear, has no connec-

tion of any kind with present-day apiculture. It is evident that I am looking at bees so completely from the natural-history point of view, while you and certain other editors are so interested in the practical and manipulative parts of the business, that there is danger of our misunderstanding each other. I will try to make my meaning clearer in the future.

If, for example, I had advanced arguments, in a sportsman's paper, to show that fish have auditory organs, I should be more surprised to see the editor teach, on my responsibility, that it would be possible to attract fish to a net by the use of a bass drum and a cornet, than I am to learn that you and certain other writers think that I am advocating the restoration of the ancient custom of "tanging" at swarming-times. I am advocating nothing of the kind, so far as practical bee-culture is concerned.

To return to the illustration: Every practical fisherman knows, for instance, that fish have an auditory sense, but of what use he can make of that fact is for him to decide. I am not a practical fisherman. I am a student of Nature.

I stated certain facts from my experience that led me to think that the "city chaps" and the funny papers are all wrong in ridiculing the custom. The editor of *Gleanings in Bee Culture* seems not to miss the point, but in an editorial comment cites, from his own experience, facts bearing upon the subject, but you and a writer in his periodical almost ridicule me for "advocating the custom."

What I want to bring out is not ridicule for advocating tanging (when I am not advocating anything), but facts pro or con from the experiences of practical bee-keepers to show what effect, if any, noise and confusion have on a swarm of bees. We know that bees can be influenced by smoke. Can they be driven or influenced by sound, or by light (such as the flashing of sunlight from mirrors), or by confusion in any form. Is there a central or directing leadership, that such noises, light, or confusion, break up?

Let us occasionally stop our talking about the production of honey, and thereby the production of money, and try to know the bee.

Yours very truly,

EDWARD F. BIGELOW.

Fairfield Co., Conn.

Prof. Bigelow says there is danger of misunderstanding each other, which is certainly true, but it is equally true that there is no desire to misunderstand or to misrepresent him. His article in *Gleanings*, page 957, was most assuredly understood as a "sort of defense" of tanging, and there is just as assuredly a misunderstanding of Editor Root's footnote if the latter viewed it in any other light. His opening sentence reads:

"It is possible that bee-keepers heretofore have not given enough attention to the subject of noises of some kind to drown swarming-notes, either of the queen or of the scouts; but from experiments which I have made myself I am satisfied that water from a spray-pump, thrown on bees while in the air, is vastly more effective than any noise that may be made."

However he may have understood Prof. Bigelow, Mr. Root certainly seems to be discussing the efficacy of tanging as compared with spraying.

But Prof. Bigelow's word is sufficient warrant for the fact that he does not advocate tanging, and it is worth while to consider the question he raises in the latter part of his communication. Can any one give facts that have a reasonably certain bearing on the case? Such facts will be welcomed.

### National Convention in Chicago

Secretary Hutchinson writes thus prophetically in the October *Bee-Keepers' Review* about the Chicago convention of the National *Bee-Keepers' Association*, the dates of which

have been changed to Dec. 19, 20 and 21, as the annual Fat Stock Show was postponed two weeks, on account of which bee-keepers will secure reduced railroad rates:

The coming convention of the National, that is to be held in Chicago the third week in December, promises to be well attended and profitable. While its removal to Chicago was a disappointment to the Texans, I have received several letters from them saying that under the circumstances the change was a wise one. Of course, if all goes well, another year we will feel in duty bound to go to Texas; not only this, but we will be glad to go. Since the announcement that the convention will be held in Chicago, I have received many letters from men who are pleased with the change, as it will allow them to attend.

So far as I can see, the convention promises much. Apparently there are no feuds, no opportunities for squabbles and bickerings; the date comes after the busy of the season is over; there will be exceeding low rates on the railroads, and low rates at the hotels; Chicago is the railroad center of a great honey-producing region; the program is not only varied, but it embraces living, practical topics. I predict that the Chicago convention will be a rousing one; harmonious and full of practical discussion; and one from which men will go home feeling that it was good that they had been there.

We trust that all of Mr. Hutchinson's fond hopes for the Chicago convention of the National *Bee-Keepers' Association* will be realized on Dec. 19, 20 and 21. We see no reason why it should not be far ahead of any preceding convention. Surely, as time goes on, and as more experience is gained, there should be a constant progress on the part of all.

Secretary Hutchinson has done his part to make the coming convention the best ever. It only remains for all the bee-keepers, so far as possible, to attend and unite in producing an individually pleasant and profitable convention.

### Fined for Selling Impure Food

A Chicago newspaper of Nov. 4 contained the following item concerning the punishment of some violators of the Illinois pure food law:

GALESBURG, ILL., Nov. 3.—[Special.]—Twenty-two grocers, arrested on a charge of violating the pure food law by selling chemical vinegar, spurious butter, and bogus honey, paid their fines of \$25 and costs each to-day, all pleading guilty. The plea is made by the grocers that the goods were represented to them as pure.

Well, 22 fined in one bunch isn't bad. Let the good work go on. Surely, it is evidence that the Illinois Food Commission is still doing business. The pathway of the adulterator and the seller of adulterated food must be made as rocky as possible. It is time that the common people—all food consumers—were protected from food frauds.

**Comb Honey Guarantee Circulars.**—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before mailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

**Maeterlinck's "Life of the Bee."**—We have a few copies of this book, price, post-paid, \$1.40; or with the *American Bee Journal* one year—both for \$2.00, as long as the books last. It is a cloth-bound book, and has 437 pages.

## Contributed Special Articles

### Methods of Bee-Management in Idaho

BY E. F. ATWATER

**M**R. GETAZ, in his mention of my methods and system on page 727, has inferred a little more (from an article in the Review) than the facts, and two more years of experience have somewhat changed my practice.

About half of our bees are now run for comb honey. We continue to winter them in open sheds facing south, or else pile them up in a long row, and protect the rear and top with tar-paper. In this section (Boise Valley) high winds are rare, and for low average wind velocity there are few places to compare with it. One bee-yard is wintered on the summer stands, as they are in a very sheltered location.

For comb honey we use the 8-frame standard hive, sometimes 1½ or 2 stories high, but mostly 1 story at all times. For extracted honey we have mostly 10-frame Langstroth hives, but the bees are often wintered in 1½ stories, and what strong colonies they contain in the spring!

There are serious objections to the use of a very large frame (Dadant), but if the use of the 10-frame Draper barns could be relied on to control swarming, I would use them. A friend has 80 colonies in 13-frame Dadant hives, but they will swarm at times.

I have 2000 plain, shallow extracting frames hanging on nails, but they have not come up to my expectations. My helpers always despise them.

For comb-honey hives we use Hoffman frames almost entirely, and if I were to begin again, I *think* the Hoffman frame would be best, even for extracting, though I don't know how well they would work in 10-frame hives, where there is no room for the division-board.

For the past two seasons, I am sorry to say that an abundance of empty comb has not prevented swarming as well as it should. Also, with Langstroth combs in the brood-chamber and *shallow* combs above full of worker-comb, the need of a queen-excluder is greatly lessened.

I plead guilty to hauling my extracting outfit from yard to yard, but I hope to have a portable shop at each yard ere long.  
Ida Co., Idaho, Oct. 30.

### Wintering Bees on Solid Combs of Honey

BY C. P. DADANT

**I**HAVE read with interest the article on this subject, on page 744, by Mr. J. L. Byer. I note his experience and suggestions. It is impossible to write on the same subject for years and not find some one whose experience differs from ours, and whose views are consequently opposite. From the different results thus brought to light the reader can gain additional information which book-reading will not give.

Mr. Byer and myself have placed ourselves in different positions at the outset. I wrote about colonies that have become too heavy with honey. He writes about colonies that have not enough, and must be fed, and his method is to feed till the combs are entirely filled. This would be entirely unnecessary here, as the bees do not need so great an amount of honey, and it would be as Mr. H. told him—it would increase the work in fall and spring.

In a state of Nature no colony will have its brood-combs entirely filled—at least this is my experience—unless the queen has failed in her laying during the latter part of the honey crop. Besides, the bees will always keep the space empty in the center, if they keep any empty space at all. When we open a hive at the end of the last harvest we find the outside combs fuller than the others. If the bees enjoyed having the combs on which they cluster entirely filled, they would fill these from the outer ones as fast as the brood hatches. But if the old queen has ceased laying, and a young one has been reared, they will, if everything else is full, fill up the honey cells as fast as the brood hatches. A hive thus filled is not in a good condition for winter, as there is no room for brood. I have invariably found that such colonies would dwindle down and die out. A little space given to a young

queen before the season is too far advanced will induce laying, and the colony will go into winter in better shape.

I have never seen bees winter well with a hive entirely filled by them from the fields, though I am free to acknowledge that it may be mainly from their having failed to breed as late as they should have done; but I am yet of the opinion that full combs are not desirable. Whenever I have supplied a needy colony with combs full to the bottom, I have found that they avoided clustering upon them, and showed their preference for combs in which there was a fairly good space of dry comb under the honey on which to cluster. A very powerful colony will winter anyhow, if it has enough food, but a very powerful colony will never have its combs entirely filled, for it breeds to the end of the honey crop. I saw one instance, years ago, where a colony filled every cell and then dwindled to nothing before the winter was fairly begun.

Mr. Byer relates that he has fed colonies that were needy until the combs were filled to the bottom. In this latitude, if we were to feed a needy colony plentifully, the queen would begin to lay, and a portion of the combs in the center of the hive would be occupied with brood. This brood would hatch and consume enough of the stores to make a fairly good space for the bees to cluster upon at the approach of cold weather, and of course this space would increase as the weather became colder, since the bees begin to consume at once, thus making a sufficient space within a few weeks. But our latitude evidently differs from that of which Mr. Byer writes, for we never have seen five months of winter confinement without a flight on the summer stands. That would mean the failure of a single warm day from Nov. 15 to April 15. The bees here would suffer from overloaded bowels before that time. Perhaps this is due to a greater excitement during mild days, owing to the warmth of the sun which shines hotter here than further North.

I repeat it, I am strongly in favor of placing the bees in the natural condition which they seem themselves to seek—the possibility for them to cluster on dry comb where they can keep the space warm more easily, and breed if so inclined right under the honey. There is no gain in their having more honey than they can well consume during the cold weather, and for spring use the honey of the outside combs, which are usually well filled, is sufficient for all their needs. Yet it is better to have an excess than a shortage, and too much is better than not enough.

#### OLD BEES FOR MAILING WITH QUEENS.

On page 746, Mr. Hasty wants to know why we prefer old bees to accompany a queen that is sent away. I did not want to be understood as wanting *very* old bees. But we want to avoid using young bees that have not yet taken flight, because they consume more honey than the old ones, and are therefore more likely to suffer from diarrhea in a long trip. Bees that have been to the fields are just right. They have become mature, and it takes little to sustain them.

Of course, with sugar feed the age of the bees is of less importance than when honey is used as it was formerly.

Hancock Co., Ill.

### Some Experiences with Bees

BY A. F. FOOTE

**I**N looking over the American Bee Journal for Oct. 12, I came across many things that make me feel as if I must "speak out in meeting." In fact, I feel about the same whenever I read any of those papers.

I had a little experience last summer—something on the line of Dr. G. Bohrer's (page 711), where there must have been two queens in one hive for 20 days, though I actually saw but one. The experience was this:

On July 2, 2 large swarms came out and clustered together. As has been my custom in such cases, I put them all into one hive, putting on 3 supers to give them plenty of room; but they were not satisfied, and on the third day they deserted the hive in a body and all clustered together again, and I put them into hive No. 2, adding 3 supers as before. This time they went to work with a will, and on the 10th day I added the 4th super. On the 20th day after putting them into hive No. 2, fully two-thirds of them came out with a rush, and were placed in hive No. 3, with 2 supers added.

Examining No. 2, I found they had completely filled and capped the first 3 supers, and nearly filled the 4th. I removed the full ones, leaving the partly-filled one, which the remaining bees finished up in good shape and still occupy it—a good, strong colony, too.

Those which I put into No. 3 filled their 2 supers, and, like the others, are now strong in bees and honey.

It looked to me as if there were 2 queens in hive No. 2 during those 20 days. Anyway, they stored nearly 150 pounds of section honey, besides putting enough in the brood-chamber for winter.

I started in the spring with 30 colonies, and increased to 50. The honey season was short, but very brisk, and my harvest amounts to just about 71 pounds to the colony, spring count.

I have never followed Dr. Miller's plan of using bottom starters, but all my sections during the main honey-flow were filled clear to the bottom with barely a small bee-space at the corners. A few sections, near the end of the season, were capped before reaching the bottom. Perhaps with bottom starters these would have been filled also, but I have my doubts.

I am not in favor of filling a lot of supers beforehand in anticipation of a big honey crop, with a liability of having a lot left over unused. My plan is this: I prepare enough beforehand to go around, one super for each colony; then, when the swarming season approaches I go into the shop and begin work folding sections, putting in starters and filling supers, and I am right there ready to attend to every swarm that issues. So I have something to keep me busy between times, and do not have to sit around doing nothing, waiting for the bees to swarm. Even with this method, the sudden closing of the honey-flow the past season found me with about 50 supers on the hives with little or nothing in them.

Capturing swarms after they have clustered has been rather a serious matter with me on account of so many tall trees near my apiary. My swarm-catcher is a light frame one foot square, and the same in depth, lined with cloth. This I fasten to the end of a pole, and to lower a large swarm safely to the ground on the end of an 18-foot pole is rather a tough proposition, requiring the exertions of a strong man. But last summer I hit upon a scheme that makes the matter comparatively easy, unless the swarm is more than 20 feet high. I fastened a pulley at the top of my longest pole, through which a  $\frac{1}{4}$ -inch rope is run, and a bracket at the bottom to fasten the rope to when "fishing" for a swarm up a tree. One end of the rope is provided with a snap to fasten the swarm-catcher.

When ready for business I set the pole under the swarm, pull the swarm-catcher to the top, fasten the rope to the bracket at the bottom, shake the swarm into the box, and let it down "just as easy as falling off a log," and with greater satisfaction. This solves the problem very well when the swarm is within reach of the pole; otherwise a ladder has to be used, which is very much against my "constitution."

Last summer I tried "shooting" a swarm that had clustered nearly 40 feet high. I was skeptical about being able to cut the limb off with a shot-gun, but it came off slick and clean the first shot. Still, that did not help me to secure the bees, for, as I predicted, when they found themselves falling a large part of them broke the cluster and took to wing, while intervening limbs scattered the rest. All then "rose to the occasion," and clustered higher than ever, so I had to resort to the ladder after all.

Several years ago I had a swarm in the air which seemed determined to go to the woods. My wife came to the door and said, "Why don't you take the shot-gun and shoot into them?"

"What for?" I asked.

"Well, you might kill the queen."

"True," I replied, "I might stand one chance in a thousand or two of hitting the queen, but I don't believe it will pay to try."

It is so with "shooting" a swarm; one *might* bring a cluster to the ground in a body, but I don't believe it pays (me) to try.

A few words about assessing bees and I am done. On the assessor's roll here everything supposed to be liable to taxation is printed, but bees and poultry are not mentioned, and are not assessed. I tried once to get my bees insured, but the agent refused to do it. So why should I pay taxes on them?

Mitchell Co., Iowa.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal

## Convention Proceedings

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 567)

As the National Bee-Keepers' Association meets in San Antonio next fall, F. L. Aten suggested that we must have some funds for the entertainment of the guests. Mr. Scholl thereupon read a paper from H. H. Hyde, Chairman of the Committee of Arrangement and Entertainment of the National Bee-Keepers' convention at San Antonio, concerning the expenses of the entertainment. [There was much further reference to this subject in the report, but since the meeting of the Texas convention it has been decided to hold the National meeting this year in Chicago, so we omit that portion of the report—EDITOR.]

Pres. Laws—At the last meeting of the committee of the Farmers' Congress it was decided that the mornings of each day were to be taken up by the independent sessions of the Congress. The afternoons will be taken up by the general sessions of the Congress in the Assembly Hall.

He also spoke of the delegates to which each session of the Congress is entitled, to vote upon matters of the Congress as per Art. VI of the Constitution and By-Laws of the Texas Farmers' Congress, as follows:

#### ARTICLE VI.

SECTION 1.—*Resolved*, That in all matters of business relating to the Constitution and By-Laws of this Congress, that the vote shall be taken in executive session, and each elector from recognized State organizations shall represent 25 active members from the State organizations participating in the work of this Congress.

SEC. 2.—Recognized district and county agricultural organizations shall have representation not to exceed 5 votes, and one person shall not represent more than one organization. Each district and county agricultural or kindred organization shall be entitled to one vote in executive session for 100 members or less, and one additional vote for each additional 100 members—not to exceed 5 votes for each organization as above provided.

For this the following delegates were elected: W. H. Laws, F. L. Aten, Willie Atchley and J. M. Hagood.

Pres. Laws then concluded the general business by appointing the following committees:

Committee on Program for Next Meeting—Louis H. Scholl.

Committee on Resolutions: Willie Atchley, L. W. Bell, and C. A. Butts.

Committee to Examine and Report on the State Experimental Apiary: W. O. Victor, Udo Toepperwein, J. W. Pharr, J. M. Hagood, T. P. Robinson and W. C. Conrads.

It was made a point for all the bee-keepers to meet and examine the Experimental Apiary at 5 o'clock Wednesday afternoon, and all who wished to go were invited by Mr. Scholl, the apiarist, to attend.

Mr. Hagood asked that the Constitution and By-Laws of the Texas Bee-Keepers' Association be read or given out to the members, as especially the new members desired to know more about the objects and purposes of the Association. The Secretary was instructed to give this information, and he explained the ends and purposes of the Association.

#### CONSTITUTION

##### ARTICLE I.—NAME.

This organization shall be known as the "Texas Bee-Keepers' Association."

##### ARTICLE II.—OBJECTS.

Its objects shall be to promote the interests of bee-keepers; the exchange of thoughts, experiments, etc., in apiculture through the meetings of this Association, and through a closer relation of its members.

##### ARTICLE III.—MEMBERSHIP.

SECTION 1.—Any white person who is in accord with the objects and the aims of this Association may become a member upon the payment of \$1.00 to the Secretary-Treasurer; payment to be made at or before each annual meeting of this Association, or not later than 10 days thereafter. Membership will continue as long as all dues are paid up.

SEC. 2.—Any person may become an honorary member of this Association upon a two-thirds vote of the members present.

## ARTICLE IV.—OFFICERS.

SECTION 1.—The officers of this Association shall be a President, a Vice-President, and a Secretary, who shall be ex-officio Treasurer.

SEC. 2.—The officers shall all be elected annually by ballots of the members of this Association at their annual meeting.

## ARTICLE V.—DUTIES OF OFFICERS.

SECTION 1.—*President*—It shall be the duty of the President to preside at the annual meetings of this Association, and to perform such other duties as may devolve upon the presiding officer. The President shall be ex-officio Vice-President of the "Texas Farmers' Congress."

SEC. 2.—*Vice-President*—In the absence of the President, the Vice-President shall perform the duties of President.

SEC. 3.—*Secretary*—It shall be the duty of the Secretary to keep the records of this Association; to make a report of the annual meetings; to receive membership fees; to make a report at the annual meetings and perform such other service as the Association may direct.

SEC. 4.—The President, Vice-President and Secretary shall form an Executive Committee. Their duties shall be such as usually fall to such officers.

## ARTICLE VI.—FUNDS.

SECTION 1.—The Secretary shall remit to the General Manager of the National Bee-Keepers' Association within two weeks after the annual meeting, the sum of 50 cents for each paid-up member as a membership in the National Bee-Keepers' Association for one year.

SEC. 2.—The Secretary shall receive not less than \$10 annually for his services, and shall receive another sum equal to his legitimate expenses for the benefit of this Association.

SEC. 3.—The remaining funds of this Association shall be expended as the members thereof may direct.

## ARTICLE VII.—MEETINGS.

This Association shall hold annual meetings at such time and place as the members may select by a two-thirds vote at some regular meeting; but if in any event it becomes impracticable to meet at the place selected, because of unforeseen events, then this Association shall hold its meeting at such time and place as the Executive Committee may select.

## ARTICLE VIII.—COMMITTEES.

The President of this Association shall appoint yearly the following committees: On Resolutions and Petitions; a Program Committee of one; and such other committees as may become necessary.

## ARTICLE IX.—GENERAL.

SECTION 1.—This Association shall ally itself with the Texas Farmers' Congress in every way possible, provided that such alliance is never detrimental to this Association.

SEC. 2.—It shall be one of the aims of this Association to secure the passage of a law establishing an "Experimental Apiary" at College Station, together with the appointment by the Governor of an experimenter, who shall be recommended to him by the Bee-Keepers' Association of Texas.

## ARTICLE X.—AMENDMENTS.

This Constitution may be amended by a two-thirds vote of the members present at some regular meeting.

As Secretary of the Texas Bee-Keepers' Association, I wish to extend a cordial invitation to join our Association. Our membership includes the foremost and most extensive bee-keepers of the State. Our objects are, first, to learn as much as possible about the bees and how to secure the largest possible profit from them; second, to aid the beginner in bee-culture, and give him every possible assistance; third, to protect and look after the interests of our members at all times, and especially to secure suitable legislation which shall at all times protect the bee-keeper and his interests.

The beginner in bee-culture—the small bee-keeper—is by no means barred from membership in our Association; on the contrary, we welcome him heartily.

The Texas Bee-Keepers' Association holds its annual meeting each July at College Station, Tex., in connection with the Farmers' Congress. At this time very low rates are granted by all railroads of the State, and the trip to College Station is not only a pleasant recreation and vacation, but in the practical information gained many times repays the amount expended in the trip.

By this meeting once a year the bee-keepers are enabled to talk over all matters of interest, discuss new methods, and, in short, each man profits by the experience of all the others.

We feel certain you would enjoy and appreciate belonging to this Association, especially as the annual membership is but one dollar (\$1.00) per year, and the only other requirements are that the applicant must be a white person and interested directly or indirectly in bee-keeping. This \$1.00 membership fee also includes membership in the National Bee-Keepers' Association. The latter Association includes all the progressive and prominent bee-keepers in the United States and in Canada; is backed by ample funds, and looks after the interests of its members everywhere. For example, if a member of the National Association, who is a poor man,

should be prosecuted for some alleged damage done by his bees, the National Association takes up the matter and fights his case in the courts, with the best legal advice and help that money can procure, and this without costing the bee-keeper a cent. The National Association also detects and prosecutes firms and individuals who adulterate honey or sell imitations of honey, thus keeping up the price of pure honey and thereby benefitting every bee-keeper.

In view of these advantages, do you not believe that \$1.00 invested in membership to the Texas Bee-Keepers' Association would pay you? I assure you the Association will give you every assistance possible. Applications, together with the \$1.00 membership fee, should be forwarded to the undersigned. We trust we may have the pleasure of enrolling your name as a member of the Texas Bee-Keepers' Association.

LOUIS H. SCHOLL.

(Continued next week.)

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 778)

## EXHIBITS AND PRIZES AT CONVENTIONS.

Mr. Swift—I don't want to shut off the wax-press discussion, but a matter has occurred to me that is entirely foreign. I have attended, now, I think, three or four of these conventions—I am not sure which—and this is the only convention I have ever attended where there is nothing in evidence of the object of the convention. You take the Fat Stock Show, and when they have their meeting they have their stock to see and judge; you take the meeting of the Horticultural Society, and the different associations throughout the United States and elsewhere, and they all have exhibitions of their products—something to judge by. The Chicago-Northwestern Bee-Keepers' Association have nothing but a bare room, and these charming (!) pictures to gaze upon, while you are listening to the words of knowledge that come. I think it would be a good idea to have something on the line of our work on exhibition here at the convention. Our Secretary-Treasurer has notified us we are woefully weak in the form of finances. If we join any more associations we probably won't have anything left. If it meets with the approval of the Executive Committee, I would like to make an offer of \$10 to the Association for three prizes for the exhibition of honey at our next convention; \$5 for the first, \$3 for the second, and \$2 for the third—say a dozen sections of comb honey, the quality and character considered, and I will myself be responsible for the premium, if that meets with the approval of the Association.

Pres. York—I think that is a very good idea, and if you wish to put it that way I think the Executive Committee will arrange for an exhibition next year; and if anybody else wishes to say they will give something, or give a premium for something else, we can have that.

Dr. Miller—I will take it out of the hands of the Executive Committee, and move that the offer be accepted with thanks.

Mr. Reynolds—I second that.

Pres. York put the motion, which was carried with applause.

Dr. Miller—I want to suggest one caution. I have been at conventions where we have had a great many things on exhibition, and Mr. Swift doesn't know the danger-point that lies in connection with that. One of the troubles about it was that in an adjoining room, or sometimes in the same room where these articles were on exhibition, the invariable result would be that there would be two or three, or half a dozen, people around those things looking at them and talking about them while the meeting was going on, and unless some steps are taken to prevent that, you are going to do more harm than good.

Mr. Swift—That is the reason I left it to the Executive Committee.

Pres. York—If we meet here next year we can have it in front of the convention.

Mr. Moore moved, seconded by Dr. Miller, that at 4 o'clock p. m. this convention adjourn to meet again next year. Carried.

## SECOND DAY—AFTERNOON SESSION.

At 1:30 the convention was called to order, with Pres. York in the chair.

## PROTECTING HIVES FROM SUN HEAT.

"Should hives be protected from the heat of the sun? If so, what is the best method?"

Mr. Hutchinson—I think where you are producing comb honey, and the heat drives the bees out of the supers, it is an advantage to have the hives shaded. I don't know of anything better than a movable board. You can make a very cheap "board" out of shingles by having a piece across the center of each, and you may nail the butts of the shingles together and make a shade-board 2 by 3 feet. Have the hive face either east or west, and lay that board on top of the hive.

Mr. Kimmey—When it gets hot enough to drive the bees out of the super, you say. Do you know that it ever does

Mr. Hutchinson—Yes.

Mr. Kimmey—Some one has told us if the hives are open; Mr. Doolittle has said there was no need of opening them at all.

Mr. Hutchinson—It depends upon the location. If the

hives are standing in a close place, where the sun could beat down and no breeze pass over, that would make a great difference. If they stood out on a hill where the breeze could blow over, that would make a great difference.

Mr. Meredith—A gentleman I have some dealing with in the bee-business recommended planting grape-vines; that lets the heat of the sun directly on the hives before the leaves come out, and after the leaves have fallen in the fall, and it gave them shade protection in the summer, using the Clinton grape more on account of its prolificness.

Mr. Snell—I think the matter of shade depends largely upon location, as Mr. Hutchinson said; where the apiary is surrounded by a good deal of wind-break the air is more suffocating, and the hives in that case will need shading; where, if they stood out in more of an open place, where there is more circulation of air, they would not become heated up enough so that the bees would cluster out very much and desert the supers.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Hay-Rack for Hauling Bees

Heretofore our bees have been hauled to and from the out-apiaries by means of a rack especially made for the purpose, this rack being placed on a common farm wagon. This fall, instead of this special rack, a common hay-rack was used, covered with boards so as to make a level floor, blocks being tacked down to keep the hives apart. Four hives are placed abreast, the frames running from side to side.

There are two advantages over the old plan. One is that there is not the trouble of keeping a special rack from year to year that has no other use but to haul bees. Hay-racks are always to be had, and the heavy springs can be added. The other advantage is, that instead of 31 hives being hauled at a load, as with the bee-rack, 59 hives can be hauled on the hay-rack.

### Fastening Down a Bee-Veil

I want to tell the sisters about fastening a veil in a very simple and easy manner, the plan, so far as I know, being original "in this locality."

Nothing unusual about the veil itself, just a bag open at each end, one end sewed to the rim of the hat and the other with a rubber cord run through the hem. A safety-pin caught through the edge in front is pinned to the waist. In that pinning lies the whole secret of success. If pinned loosely, or even what would ordinarily be called tightly, there will be opportunity for bees to get under when you are stooping over. But it must be made *very tight*, so that no matter what position you may take there will be no loose place for bees to crawl under.

Try it, and you will find how easily it is done, and how effective it is.

### Poor Report—But Still Hoping

DEAR MISS WILSON:—You asked all the sisters to send in their reports, let it be good or bad. I will send in mine, but it will be *very bad*.

Last spring I had 80 colonies in pretty good condition. The honey crop here was a failure. I got about 150 sections of honey of very poor quality, quite dark. This is the first time I have had an entire failure since I have kept bees. I have always gotten some surplus, if it was only 500 or 600 sections.

I have had to feed the bees this fall for the first time in my experience. I have now only

68 colonies, the moth taking 2 or 3, and I doubled up some. I am living in hopes that next year will be better.

(Miss L. C. KENNEDY.

Sangamon Co., Ill., Oct. 27.

From 80, spring count, to 68 in the fall, with 2 sections of poor stuff to the colony—well, that certainly may be classed as something of a failure. But failures have their uses, too. The successes of future years will always seem just a little brighter for having the failure of 1905 as a background. And there is the true spirit of a bee-keeper ringing out in that last sentence—"I am living in hopes that next year will be better."

Miss Kennedy deserves thanks for her report. Somehow it is always easier to chronicle success than failure. But in one respect the poor reports are of more use than the good ones. "Misery likes company," and we can condole with one another in our failures; and, besides, those who have done well, or fairly well, will feel the more grateful for their success in the midst of failures.

Please let us have reports, sisters, whether of failures or successes.

## Mr. Hasty's Aftershoughts

The "Old Reliable" seen through New and Unreliable Glasses.

By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### "POUND" SECTIONS TO WEIGH A POUND.

L. V. Ricketts is working at a good matter—trying to have pound sections actual pounds. Wish I could fall into his procession; but I fear uniformity of weight is impossible. With me occasional ones are over one pound weight now; and increase of size will bring more of them. It's not easy to get any pay for one or two ounces of extra weight in a section. Hardly right to balance off extra-weight ones against scant-weight ones in the same case, and so push the difficulty onward to the grocer. Every once in a while some one agitates for *decreasing* size. I rather think, Mr. R., that to stand firm against decrease is about the best we can do under the circumstances. Page 695.

### FUMIGATING COMB HONEY.

So Comrade Greiner finds that an ounce and a half of bisulphide of carbon is too little

to kill the "varmints" in a stack of five sets of combs—and kicks about it—and threatens to go back to sulphur. He has found 2½ ounces of sulphur plenty, and perhaps more than a plenty, for the same-sized stacks. Shouldn't wonder if he was right. Page 695.

### WHY FOUL BROOD AFFECTS THE LARVÆ.

An idea of Mr. Dadant's, on page 696, is worth thinking of a second time. That the reason why larvæ take foul brood while adult bees do not, is that the former have as yet no poison, while the latter carry a big dose of a powerful and sufficient antidote. I don't feel positive that poison in the sac provided for it has any effect on the tissues outside. May be it does, however. In fact, it is pretty certainly brought into existence outside before it is put in—and the process may be going on most of the time—with more or less of the chemical escaping into the regions round about.

### Bees and Grapes in Indiana

Considerable has been said about bee-keepers educating the public through communications to the local press, and at least one of the sisters has been doing some practical work in that direction. The Sun-Telegram, of Indiana, contains a well-written article from the pen of Mrs. Helen V. Austin, replying to the sensational statement that over one-third of the grape crop of Indiana had been destroyed by the bees, and that the damage had been confined to that State alone.

To some bee-keepers such statements may seem too silly to merit reply. But not too silly for many people to believe. A sample of what unreasonable things people may believe is thus given by Mrs. Austin:

"An individual undertook to explain to me how it was possible for a bee to puncture a grape. A vague idea was doubtless wandering through his brain of the legend of the Plum and the Curculio. His notion would convulse a bee-keepers' association and cause our Uncle Sam's department of entomology to invent a new bug. Tell it not in Gath, but he said the bee punctures the grape with its sting! 'When ignorance is bliss, it were folly to be wise,' just about the time that the bee convinces this 'foolish Callatian' that the utter and only use and purpose of her sting is for self-defense."

Some of the people in the region where the Sun-Telegram is published will no doubt change their views after reading Mrs. Austin's article.

## MARY'S COSTLESS "HIVES."

There, now! The hives that Mary had didn't cost a cent, and the hive-trust is going to be totally unable to say anything about prices. Page 682.

## THINGS THAT AFFECT THE NECTAR-FLOW.

Hot and cold, wet and dry, wind and calm, are the things mostly thought of in connection with the nectar-flow, or non-flow. But we are a little foolish if we get spunky about it when these manifestly fail to account for the case. Lots o' more things in heaven and earth, Horatio—some of them easy to see, probably some elusive and hard to see. The amount of ozone present in the atmosphere varies greatly, I understand. I think the honey-flow is better when the amount is large, poorer when the amount is small. Also better when the barometer is falling, poorer when it is rising; better when there is some haze in the sky, poorer in brilliant sunshine; better when the breeze is up the slope of the land, poorer when the breeze is down the slope. I may be quite wrong in some of these. East wind has very manifest peculiarities of its own; I'm pretty sure it affects our surplus somehow; but I am not ready to say how much, or how. Possibly also the shine of an

unspotted sun affects delicate matters in a different way from the shine of a sun with lots of spots big and small upon its face. Page 677.

## LARGE APIARISTS AND BLACK BEES.

D. M. M. was a little bold to refer to many of our large apiarists as champions of the blacks. But was not G. W. Y. a little bold also in calling for one? I don't think them better, on the whole, than a good strain of black-Italian hybrids—especially don't think them better for extracted honey—but I do rather think them better for comb honey; albeit I greatly dislike their style of running when handled. One may refuse to keep certain bees because of disagreeable peculiarities, and at the same time claim that they are really the best bees. Page 677.

## CRUSHED DRONES FOR APIFUGE.

A provoking "out" makes me trouble again. Don't know exactly whether the printer man perpetrated it or whether I did it myself in copying. On page 732, about crushed drones for apifuge, read it, "Queer that the juice of alien drones [should infuriate bees when the drones] themselves would be unnoticed." The words in brackets turned up missing before.

shall return to the old hive, you can take a plan that has worked satisfactorily with me. Put your nucleus on the top of the old hive, but of course with no communication below. Then when this upper hive is taken away and its contents returned below, the field-bees of the nucleus will, upon their return from the fields, settle upon the cover of the hive, as nearly as they can on the spot where their home was, and after some consultation they will form a line of march down to the entrance and peaceably unite with the colony below.

2. It doesn't matter whether the upper or the lower story is left, the probability being that into whatever story is left there will be put the best frames of brood selected from both the stories. The frames being well filled with brood, of course there will not be any trouble about what honey may be left. The frames of brood taken away can be used wherever needed, chiefly in building up weak colonies or nuclei, or in forming new colonies.

## Reports and Experiences

### Several Things Endorsed

I endorse the Alexander plan of increase, and the Townsend method of producing comb and extracted honey in the same super, because I originated and practiced these methods successfully before I ever saw them in print. Both methods are conducive to less swarming, and more and better quality of honey.

I also endorse the rules the Australian Bee Societies have made in regard to protecting priority rights. I wish such rules were a written law in this country. No apiary can be less than 3 miles from another without the bees trespassing more or less on each other's territory. Of course, if such a rule were to be made a written law, it should not prevent farmers or others who own sufficient land from keeping enough colonies to stock their land if they so desired. I have "figured out" that if 100 colonies will stock a 1½-mile radius, one colony will stock 45¼ acres. Of course, this is "on an average," and might not be exactly fair to the "favored spots," but, then, things like this would best be worked on an average, even if it did pinch some "favored spot" land-owner.

Tattnall Co., Ga. H. C. BARNARD.

### Worst Year for Bees

This has been the worst year I ever knew for the bee-men in Indian Territory. I didn't get a pound of surplus honey from 300 colonies. Still, I am not discouraged. I am hoping for better times next season. Greatest success for the "Old Reliable."

J. T. HAIRSTON.

Dist. 5, Ind. Ter., Nov. 3.

### Report from Southwest Texas

I live in the center of southwest Texas, adjoining the famed Uvalde County, which is located on a railroad, hence its known fame as a heavy honey-producing county. But this vast stretch of country is sparsely netted with railroads, and we of Dimmit and other counties are ahead of Uvalde from an individual bee-keeper's standpoint. We have the same flora, and not its reputation, hence with Uvalde's railroad facilities, and its heavy honey-producing record, which we, who loaded with wagons from adjoining counties, go to Uvalde and sell or ship from there, give it a reputation which has resulted in that county being settled up with bee-keepers. But that is but one, and there are several counties, with hundreds of locations, a beautiful climate, no snow, no wintering troubles. I leave my bees with 3 and 4 deep supers on the hives the winter through, with bottom-boards raised all around. I haven't time to do otherwise. If I have time, I go fishing,

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

✍ Dr. Miller does not answer Questions by mail.

### Unfavorable Experience with Chaff Hives

I have 30 well-made 8-frame Simplicity chaff-hives, double-wall, with chaff between at sides and bottom. I have had these hives 2 years. Bees die in them worse than in any other hive; also, I get scarcely any surplus honey in them. Some colonies don't gather enough to winter on. What is the trouble? The chaff is well packed between the two walls, and stays there at all times. The super goes off and on as wanted. The hive has an outside protection.

WISCONSIN.

ANSWER.—I don't know what is the trouble. Some claim that the packing prevents the bees getting the immediate benefit of the sun shining on the walls of the hive, thus hindering successful wintering, and if they come out poor in the spring of course that affects the surplus work.

### What More to Read

I get the American Bee Journal, Gleanings in Bee Culture, have read "Langstroth on the Honey-Bee," and have "ABC of Bee Culture" and "Forty Years Among the Bees" almost "by heart." Now, what would you and Miss Wilson advise me to read during the long evenings the coming winter?

ILLINOIS.

ANSWER.—I went into the kitchen where Miss Wilson was trying to turn cream into butter in an ice-cream freezer, and referred your question to her, saying, "What do you advise?" She stopped her intolerable racket long enough to say, "I think he's pretty well up." Then, after whirling the crank a few times, she added, "He hasn't Cook's book." A good suggestion. More than the other text-books, Prof. Cook's "Bee-Keeper's Guide" goes into the natural history of the honey-bee from the standpoint of an Entomologist, and although it may not make much difference as to the number of pounds of honey you get, it will heighten your enjoyment in bee-keeping to understand more about how a bee is put together. Then, if you want to go more fully into that part of bee-lore, you can get Cowan's excellent little work, or Cheshire's larger one. Then you might get sample cop-

ies of the other bee-papers, and perhaps some of them would interest you.

But there's something else you can profitably do aside from reading, and I suspect you are already practicing it without my telling you—just shut your eyes and think—planning out what you're going to do the coming year. Some will tell you that you can do that better with a pipe in your mouth. Don't you believe it. Your thinker will work more clearly without any such fumigation.

### Questions on Management

Adrian Getaz, in his article on "Bee-Keeping on a Large Scale" (page 727), says R. C. Aikin's plan is similar to Messrs. Elwood's and Hetherington's, except in one respect—when they remove the queens they take one or two combs with each, and form as many nuclei. Then 16 days after removal each queen is returned to her former home.

1. What becomes of the nuclei?

2. He furthermore says, "During May some colonies will get so strong that they might swarm. To all such an additional story is given under the brood-chamber. When the flow comes, the additional stories are removed." Does he remove the same one he gave them, or the one they had before giving the additional one? If he removes the one he gave, does it have brood in it? If so, what is done with that brood? If he removes the one they had, doesn't it contain honey? If so, isn't that honey dark when extracted?

DELAWARE.

ANSWERS.—1. I don't know for certain what is done, but I can tell you what might be done. Generally some increase is desired, and these nuclei may be continued where they stand and be built up into full colonies, the queen alone being returned to the old colony, or taken with one or two frames of brood, according to the strength of the nucleus. If it is not desired to continue the nucleus, the whole business may be returned with the queen to the old colony, leaving the field-bees of the nucleus to shift for themselves. Not being very numerous, it doesn't matter such a great deal where they go, and as they return laden from the fields they will be kindly received wherever they attempt to enter. If, however, you are anxious that the whole force

deer-hunting, duck-hunting, or quail-sniping. The people are free and easy. Time is the cheapest thing in Texas—that is, southwest Texas.

"Ah," you say, "I would get more honey if I wintered my bees in but one tight super." I don't know. I averaged 41 pounds per colony of bulk comb in the poorest season we ever had this year, and got 8½ cents per pound for the lot, spot cash. We never have to find a commission man who is honest; our merchants have car-lot customers always waiting for our honey.

Our fall flow this year was great. The bees entirely ignored broomweed—there were too many other good honey-producing plants in bloom, and they reared considerable brood this fall. The honey-flow is still on, and will continue till frost; as the bees will work on the broomweed later.

I have "other fish to fry"—onion culture. I have 3 tenants and my own acreage to attend to, and I attend to my bees but once a year; I attend to swarming, and when that is over (and that is always before the honey-flow ceases, and never after) I take the honey off, and sell the whole product, and don't bother the bees, or they me, till swarming-time again.

Oh, yes, I do have a few empty hives in the fall, and turn their combs into beeswax, but as the weeds are continually blooming all through the summer and fall in this irrigated country, the bees contrive to have brood all the time to rear a queen from.

You bee-men who love sunshine and good returns, no wintering troubles for man, bee, or beast, go to southwest Texas. If you love to hear a railroad whistle or street-car, stay where you are.

CHAS. POLLARD.

Dimmit Co., Texas, Oct. 25.

### One of the Cleanest Papers

While I haven't a bee in the world, I may have some time, and want to keep abreast of the times. I consider the "old reliable" American Bee Journal one of the cleanest papers I ever read; so you may continue to send it until I order it stopped.

McCracken Co., Ky. T. F. McCORKLE.

### Report for Season of 1905

I had 24 colonies of bees, spring count, and now have 46. I took off 983 full sections of honey, and 18 frames for spring feeding, weight 96 pounds. I also extracted 67 pounds from partly-filled sections. E. S. BARBER.

Erie Co., N. Y., Nov. 6.

## "Combed" and "Extracted"

### Second-Hand Square Oil-Cans for Honey

As we have stored and sold from 4 to 8 tons of honey per year for the past 16 years in such cans, without a word of complaint, so far as we know, perhaps our experience will be worth something to the fraternity.

While on this subject I may as well give our whole system of handling this class of cans, as I believe it will prove a great economy in the hands of careful bee-men of the West. The high freight-rates on goods as bulky as 5-gallon cans cased is prohibitive to the use of new cans. We people of the West, in order to play even, in a measure, with the Standard oil people, and the railroads in some way, for making our oil cost us 40 cents per gallon instead of 12 cents, as in Ohio, have to use their cans and cases for our honey.

We use all the gasoline cans we can get hold of, as they are more easily cleaned; but we also use all the kerosene-cans we get, as well.

I have an old scavenger, or a "raggedy-raggedy man," who gathers my cans for me in a local mining town. I pay him 5 cents each for his trouble of collecting and holding

them until I go for them. I sometimes bring home 120 in a load.

### REPAIRING CANS.

When we are ready to make a job of soldering, we remove the oil-caps on the cans by holding them over a hot blaze in our soldering fire-pot, until the solder starts, which operation is quite rapid with a good fire. Next we patch any vent-holes found, and solder on the screw-caps. Last year we got screw-caps from the American Can Co., with 1½-inch mouths and 2-inch base, which exactly fits the cans, and is a good size to fill into. When we find a can with its sides collapsed so that its capacity is small, after soldering it, we straighten it by exploding 1 or 1½ drams of rifle-powder as near the center of the can as we can hang it. It straightens them in a hurry. Tie the powder in a small cloth around one end of a blasting-fuse about 8 inches long; cut a gash in the fuse near the other end, and put in a few grains of powder to "spit" the fuse quickly. Insert this cartridge into the opening in the can the proper distance to bring powder near the center of the can; secure by tying a string to a ring on top of the can. "Touch the button" with a match, and the powder does the rest.

Cans thus treated may not case well for shipment, but are as good for storage for local use as any. A few experiments will teach you the amount of powder to use for different conditions of cans.

### CLEANING THE CANS.

The method we have found the most satisfactory in rapidity and thoroughness is to make a solution of strong soap-suds by slicing up not less than two bars of some good laundry soap (without rosin in it is preferable) to a barrel of water. Add to this not over half a can, or about ¼ pound, of concentrated lye. We can throw a steam-hose into the barrel, and boil until the soap is dissolved. We use a funnel made with the small end a little smaller than the size of the opening in the cans, to allow for expansion of the cool air in the can, and to prevent the hot suds from being blown back in your face while pouring into the cans.

We have a ¾-inch pipe running from the steam-dome of our boiler so we can get dry steam. This pipe has a perpendicular length sufficient to reach to the bottom of a can, with a valve within convenient reach of your hands. Insert this pipe in a can containing the hot suds, until the lower end of it reaches within about ½ inch of the bottom. Suspend the can in this position by a hook fastened to the ring on the can. Open the valve and let in steam enough to boil the suds, and throw it all over the inside of the can. We boil one can and fill another ready to boil, and rinse out the boiled can. We always rinse with two waters—the first time with clean hot water; the last, clean cold water. With this system one active person can clean 100 or more per day.

After draining these cans they are laid in a hot, sunny place on their sides, with the opening nearest the top, to allow the remaining moisture and any odors to escape freely. We clean cans in hot, sunny weather, as the sun is the most effective and convenient form of heat we have found for the volatilizing of the oil odors. We have found the use of concentrated lye in too strong a solution to be unwise. Try a strong solution of it on bright tin, and you will observe that it has a very corrosive effect. Cans thus treated are at once attacked by the acid in honey, discoloring and injuring the flavor of the honey. We leave our cans in the sun about a week, if we are not needing them, then go over them in the heat of the day, when they are hot, and we can easily pick out any doubtful ones by the odor, and leave them for a few days longer. When sunning does not remove the odor, another suds treatment may hasten the cleaning.

Where access to a steam-plant is not possible, the same results can be obtained by the thorough shaking of the hot suds and a longer sunning.—L. B. BELL, of Arizona, in Gleanings in Bee Culture.

334 Dearborn Street, CHICAGO, ILL.

# THIS IS THE 'PHONE FOR FARM FOLKS

In selecting a telephone for the farm line remember that repairs and tinkering cost money and waste time. Use the same judgment that you would in buying a reaper. The cheap telephone, like the cheap harvester, is out of service most of the time. Its talking qualities are not lasting; it soon gets weak, and is liable to cause you trouble all of the time.

## Stromberg-Carlson Telephones

are the standard make for rural lines. Other manufacturers claim their instruments are as good—they like to compare theirs with Stromberg-Carlson—but TIME will not bear out their claims. To avoid trouble, expense and disappointment, pay the trifle more and get the telephone with a reputation. Buy the Stromberg-Carlson—you buy satisfaction. Free book, 80-D, "How the Telephone Helps the Farmer," tells a lot of reasons why it's the phone to buy; gives full description of every part and piece of a telephone; tells how it's made and illustrates where it's made. Write for the book today. Address  
 ROCHESTER, N. Y. STROMBERG-CARLSON TELEPHONE MFG. CO., CHICAGO, ILL.

## American Bee Journal Novelty Pocket-Knife Gold Fountain Pen

All for \$2.75

(This cut is the full size of the Knife.)

### NOVELTY POCKET-KNIFE

(Name and Address on one side—Three Bees on the other side.)

**Your Name on the Knife.**—When ordering, be sure to say just what name and address you wish put on the Knife.

**The Novelty Knife** is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the owner, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

**The Material** entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. It will last a life-time, with proper usage.

**Why Own the Novelty Knife?**—In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and, in case of death, your relatives will at once be notified of the accident.

**How to Get this Valuable Knife.**—We send it postpaid for \$1.25, or club the Novelty Knife and the American Bee Journal for one year—both for \$2.00. (Allow two weeks for Knife order to be filled.)

### SOLID GOLD FOUNTAIN PEN

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are Para Rubber, handsomely finished. The simple feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

We mail this Gold Fountain Pen for only \$1.25, or for \$2.00 we will mail it and the weekly American Bee Journal for a whole year.

Sample copy of the American Bee Journal free; trial trip of three months (13 copies) for 20c; regular yearly price, \$1.00. Address all orders to

### CONVENTION NOTICES.

**Illinois.**—The 15th annual meeting of the Illinois State Bee-Keepers' Association will be held in Springfield, on Tuesday and Wednesday, Nov. 21 and 22, 1905, in the room of the Board of Supervisors in the Court House. The R. R. Rates will be as follows: All lines in the Western Passenger Association will make an open rate of one fare plus 25 cents for the round trip to Springfield, except from near points where a fare and one-third would be less. All lines in the Central Passenger Association will make a similar rate on the Certificate plan, and if not convenient for any attending our meeting to come over the lines in the Western Association, if they will write me I will send them certificates which the Grand Secretary of the I.O.F. assures me your local secretary of the same order will gladly sign. The Central Passenger Association Lines are as follows: B. & O. S.-W.R.R.; Big Four Route; C. & E. L. R.R.; C.H. & D.R.'y; I. J. & L.R.R.; J. & St. L. R'y; L. E. & W. R. R.; L. & N. R. R.; Southern R'y (St. Louis Div.); T., P. & W. R'y; T., St. L. & W. R. R.; Vandalia Line; Wabash R. R., east of Tolono.

The good results of this annual bee-meeting rest on the members who attend it. Our State gives us an appropriation to publish our report and to suppress foul brood, and it is the duty of every bee-keeper of the State to have a voice in the manner in which this appropriation is used. All bee-keepers are invited to come, and bring their wives. The railroad rates will not be higher than an open rate of one fare and a third for the round trip, and efforts are being made by our Odd Fellow friends to secure a one fare for the round trip. Good hotel accommodations can always be had at reasonable rates. JAS. A. STONE, Sec. Route 4, Springfield, Ill.

**Ontario.**—The annual meeting of the Ontario Bee-Keepers' Association will be held in Toronto, Nov. 15, 16, and 17, 1905. The Fruit, Flower, Honey and Vegetable Show will be held Nov. 14 to 18, which is a new venture in its second trial, but we look for a good show. Wm. COUSE, Sec. Streetsville, Ont.

**The Chicago-Northwestern Bee-Keepers' Association** will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to. All who are accustomed to paying their dues to our Association, thereby getting two memberships for the price of one, will please hand the \$1 to the secretary, or mail it to him as usual. The time in the evening will be given to the National, as will also the whole of the two following days. Every one is cordially invited to be present, both at the short sessions of the Chicago-Northwestern, and at the 7-session meeting of the National Association.

HERMAN F. MOORE, Sec.

Park Ridge, Ill.

**N. B.**—Any one paying their dues to the National Association *direct*, will have to pay another dollar to the Chicago-Northwestern, if it is desired to become a member of the latter organization also. Hand your dues to H. F. Moore, the Secretary. H. F. M.

## Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to the past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½c. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less.

R. A. BURNETT & Co.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 23c.

C. C. CLEMONS & Co.

CINCINNATI, Oct. 6.—Reports from different parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade.

GRIGGS BROS.

PHILADELPHIA, Nov. 7.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get the people started, and after they start, the

# Headquarters for Bee-Supplies

**C. H. W. WEBER** CINCINNATI ... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

demand continues for some months. I would say that now is the height of the consumption of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c.

We are producers of honey and do not handle on commission. Wm. A. SELSER.

CINCINNATI, O., Oct. 24.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light amber, 5¼@5½c; in cans, ½c more. White clover from 7@8c. Beeswax, 28@30c.

C. H. W. WEBER.

NEW YORK, Oct. 20.—Comb honey is now arriving very freely and the demand is good for nearly all grades. We quote fancy white at 13@14c; No. 1, 11@12c; amber, 10@11c, and buckwheat, 10c. Extracted in good demand. Arrivals of California are large while from other sources receipts are very light. We quote California at from 5½@7c per pound, according to quality and quantity; Southern in barrels and half-barrels, at 55@60c per gallon. Beeswax firm and scarce at 29@30c.

HILDRETH & SEGELKEN

INDIANAPOLIS, Nov. 7.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades

of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c. WALTER S. POWDER.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet; white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

SAN FRANCISCO, Nov. 1.—White comb. 1-lb. sections, 8@9 cents; amber, 6@7c. Extracted, water-white, 5@—c; white, 4½@4¾c; light amber, 3¾@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 25@27c.

The market is very dull despite the bullish articles in all the bee-papers. Apiarists are now beginning to let go at present prices, as they are beginning to realize that they must accept conditions as they are. This year is no exception to the rule, and it has always been the case that those selling early get the best prices for their honey.

SPECIAL ISSUE of Gleanings in Bee Culture, Dec. 15, 1905

We are pleased to announce that extensive plans are under way for a magnificent Christmas issue of Gleanings in Bee Culture, ready for mailing Dec. 15th. It is planned that this issue shall by far exceed in its wealth of contributed articles, its half-tone illustrations, and its cover design, anything heretofore attempted in bee-keeping literature. It will consist of at least 100 pages, and should be kept by every bee-keeper.

Cover

The cover is printed in three colors by one of the best color-printing establishments in the United States. We were not satisfied to attempt this ourselves, and have gone to great expense for the printing of this cover. The design is something unique, and very pleasing indeed. It shows the red clover in its natural colors in all its beauty, and, altogether, will make a bee-keeper's magazine that will compare favorably with any of the literary magazines of the present day.

Half-Tone Illustrations

During the past summer we have had a special artist who has been sent to various points especially to take photographs for us. He has traveled on our account alone the past summer over 4000 miles, and we can promise something very fine in various races of queens, dealers in bees, dealers in general supplies, dealers in special articles for bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

our half-tones for this issue. In this preliminary announcement we are unable to specify definitely the subjects that will be given, but those who are at all familiar with Gleanings for the past year will know that a treat in illustrations is in store for them. We can definitely announce now that some of the prize photographs in our second photographic contest, American and Foreign, will appear in this issue. Our engravings are made by the very finest engravers in the United States, insuring first-class work in every case.

Writers

For this issue we shall have our regular contributors, such as Dr. C. C. Miller, G. M. Doolittle, Prof. A. J. Cook, J. A. Green, and Louis Scholl, besides special contributed articles, especially for the number, by E. W. Alexander, Dr. E. F. Phillips, of Washington, D. C., and others.

Other Features

Not only shall we make the magazine a thing of beauty and special value in its reading-columns, but special attention will be given to making it of value as a reference-book—a sort of year-book for bee-keepers—so that it will be kept for frequent reference throughout the following year. We expect to have all of the reliable advertisers represented in its columns, such as the breeders of bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

Subscription Rates

We are making a short-time offer—a special trial trip of 6 months for 25 cents, which will include this Dec. 15th issue. This one number alone should be worth 25 cents to any bee-keeper. We can not promise to hold this offer open indefinitely, for our cover pages will necessarily have to go to press considerably in advance of the day of publication; and after the number contracted for are sold, we shall not be able to supply additional copies. It is important, therefore, that your subscription be received promptly.

WANTED—25 YOUNG MEN

There is now, and has been for years, a greater demand for experienced bee-help than there are men ready for these places. Each winter and spring we are obliged to disappoint many large apiarists by telling them we do not know where suitable help can be found. The demand is already beginning for the season of 1906.

We have found that many who take our course in bee-culture by correspondence prefer to go into business for themselves, so we still need active young men who have a fair knowledge of the subject—men whom we know something about—who can be recommended for the places frequently offered. We have, therefore, determined to-day to offer a limited course in

BEE-KEEPING BY MAIL

We shall designate this as Course No. 2. The lessons are identical with the lessons in Course No. 1. The time, however, is limited to one year from enrollment. The course may be easily completed in 3 to 4 months. The following is the

OUTLINE OF COURSE

- |                         |                         |                           |                            |

ESTABLISHED IN 1861 THE AMERICAN OLDEST BEE-PAPER IN AMERICA

# BEE JOURNAL

(Entered at the Post-Office at Chicago as Second-Class Mail-Matter)

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor

CHICAGO, ILL., NOVEMBER 23, 1905

Vol. XLV—No. 47

THE AMERICAN BEE JOURNAL is absolutely an independent publication, and not connected with any bee-supply business whatsoever. It stands entirely upon its merits as an educative force in the field of bee-keeping, and as a medium for legitimate advertisers in apicultural or other lines. It is the oldest, and only weekly, journal of its kind in America. Its publishers believe that it deserves to be in the hands of every would-be progressive successful bee-keeper in the land. It is in its 45th year, and to-day is acknowledged to be better in every way than at any time during its long and honorable history.

## Editorial Notes and Comments

### Disposing of the Honey Crop

This is an old subject, but it never will wear out nor become thread-bare. It is always interesting to the bee-keeper who has harvested a good crop of honey, but who has difficulty in turning it into cash or a profit.

Now, suppose those who have succeeded in realizing good returns on their honey just write us all about it, and we will publish it for the good of all. You need not name the exact place where you sold your honey, but just tell in detail *how* you did it. No one wants to "give away" the location of his best "fishing-hole" nor his "diamond-field," but he can tell *how* he discovered them—the road that led to them. That would not harm him nor lessen his trade, and would be a great help to others who are stumbling along in the dark toward success.

### December Climate of Chicago

We notice that some Southern bee-keepers seem to fear coming to the National convention in Chicago, Dec. 19, 20 and 21, lest the weather be so cold. We have not known it to be very cold here before Christmas. We are sure that no one need to stay away on account of the cold, for the hall where the convention is to be held is a warm one; also the Revere House is a very comfortable place in which to sleep.

Some Northern people didn't care to go to San Antonio on account of the extreme heat that might be found there, though such a thing would not keep us away any more than would extreme cold. Last February, at the Wisconsin convention in Madison, it was about 20 degrees *below* zero; at the National convention in Los Angeles, in 1903, it was 100

degrees *above* zero. That's only a difference of 120 degrees in extremes. And we stood both all right.

But let no one remain away from the Chicago convention on account of the cold. There will be plenty of coal here at that time, as there is now, so that should it be a little cooler than usual no one need be uncomfortable.

The advice for those coming to Chicago at any time is the same as that given to tourists going to Colorado or California, viz.: Take extra wraps along as the weather is liable to be changeable. Be prepared for whatever comes.

### Control of Swarming

Bee-keepers of the younger generation probably do not realize what a thorough revolution has taken place in one respect within the last half century or less. Formerly the number of swarms was considered the thing with which to gauge the failure or success of the season. "Last year was a poor year—hardly a swarm; this year has been fine—lots of swarms." All that has changed, until now the thing most eagerly sought by a large number, if not the great majority, is some method by which swarming may be prevented, or at least controlled.

What is best for one may not be best for another, but the practical bee-keeper is always on the lookout for something better, and any plan that has actually been put to the test by some practical bee-keeper is eagerly scanned. So here is another plan, given in the Bee-Keepers' Review by another very practical man, R. C. Aikin:

"I know of one or two methods that are practical. Unqueening will surely control;

but, some seasons, and in some localities, such as have a second or later flow, it damages the crop from the late flow too seriously. The best plan I know of is to *give big room at all times outside the flow*, and if you have conditions that cause swarming *before* the flow comes, take away brood, or, in some other way, keep the conditions such that swarming *will not* occur, and then when the flow arrives shake out and mass the bees as swarms, hiving on starters. This way makes our swarms when we are ready, and, what is also of equal importance, *when the flow is ready*. When you have 'swarmed' the bees, have queens for such increase as you may make, that not any one is left queenless, and the oldest and poorest queens would best be left with the swarm on the old stand. Put the old hive on a new stand, and let it have a vigorous queen that will fill her hive with brood while there is not enough fielders to clog the combs with honey; this will insure a rousing colony for a later flow, if there is one. So handled, there is no question about results, if there is the nectar to be gathered; you master the swarming so that you can go when you please, and it will get the honey if it is to be had."

### Bees and Grapes Again

We have received the following from Mr. S. T. Crim, of Dawson, Ill.:

EDITOR YORK:—I enclose a clipping from the Illinois State Journal, published in Springfield, Ill. It makes me feel sad to think that the honey-bees have to bear the blame for something they did not do.

I have had a little experience in this. My grapes were all "chawed" up and mashed—the finest bunches—and the bees would swarm on the vine and suck the juice. I am satisfied that it is the little night-owls, or some other night-birds, that do the damage to grapes.

I find that the honey-bee has a great many enemies. I met an old lady on our streets a week or two ago who told me that my bees were eating up her peaches. I told her I was sorry for it. She said the bees ate a hole in a large peach and filled up the hole with honey. I thought she ought not to complain, for she then surely had peaches and honey, which is said to be good for cramping colic!

The next thing we hear will be that the bees are destroying the potato crop.

Now, how are we going to defend the honey-bees when some one wilfully lies about them? October 23. S. T. CRIM.

The clipping to which Mr. Crim refers reads as follows:

#### BEES INJURE GRAPES.

INDIANAPOLIS, IND., Oct. 15.—Bees are to blame for a small yield of grapes in this State. It has been found that over one-third of the grape crop has been destroyed by the honey-makers. Bunches of grapes which were un-

protected have been visited by bees and the juice drawn from the fruit. In consequence the fruit is unfit to be taken from the vines.

The damage wrought can hardly be estimated in dollars and cents. In the southern part of the State, where many of the hills are vine-clad and a few large vineyards are not unknown, the damage has been great.

The local market has felt the effects of the insects to such an extent that Indiana grapes have been not only a scarcity but almost an unknown factor.

Many who foresaw the work of the bees "sacked" their fruit before it began to ripen, and in this way saved much of the fruit from destruction.

It is probably a mistake to attribute the work of puncturing grapes to nocturnal birds. There are enough miscreants to do the work in broad daylight, although so shy as to be not easy of detection. Any one who carefully examines the holes made in the grapes will easily be convinced that the opening looks like the work of birds rather than bees. When freshly made, the hole is not round. Two holes are made at some little distance apart by the upper and lower mandibles, the bird striking the grape with its mouth open; then the closing of the mouth makes another line of opening from one of the first holes to the other. Bees wouldn't be likely to make such an opening.

This sort of defamation of the character of the bee does not come from a malicious desire to lie about it. It is merely a part of "yellow" journalism, that must have something sensational, all the better if true, but if nothing true is to be had, then something false must take its place; anything for the sake of something "yellow." Let us hope that the days of yellow journalism may speedily be found on the wane, and that the reading public may demand truth, and truth only, even about such a defenseless creature as the little busy bee.

LATER.—After the foregoing was written, we received the following from Mr. P. B. Thaxton, of Scott Co., Ill., taken from the Scott County Herald, which seems to fix the responsibility of grape-destruction upon the miserable sparrows:

#### THE SPARROW PEST AND GRAPES.

J. A. Tribrausser, writing to the State Journal at Springfield, says:

I read with interest an article in the State Journal headed, "Indiana Grapes Injured by Bees." I desire to state that I am a fruit-grower in a small way, and my experience has been that the sparrow is the source of the trouble.

These birds pick the grape first and then the bees suck the juice. That is what they did to my grapes this summer. First, they pulled off the peach blossoms; next they ate all my peas and lettuce; when raspberries began to ripen they destroyed them; followed this by picking the summer apples and early peaches full of holes and then ate the sugarcane seed.

As there were thousands of these birds I tried to shoot them, and also discharged fire-crackers under their roost, but still they stay. It is only a question of a few years, if something is not done to destroy them, until they will destroy all the fruit.

I know it is the sparrow that destroys the grapes, because I put mine in paper-bags, and the birds picked holes in the bags and ate the grapes. This I saw them do.

They are here in bunches of thousands, and as no bounty is offered for their destruction, they are increasing so rapidly that they will destroy all the fruit unless they are done away with.

## Miscellaneous News Items

**The Fair Exhibit of Wm. E. Prisk,** of Mineral Point, Wis., appears on the first page. When sending the picture he wrote as follows:

I send a photograph of my honey exhibit at the Wisconsin State Fair. The 4 pillars are all glass, filled with fancy white honey in 4x5 sections. The corners are grained in oak. The arch is painted white. There are 4 kinds of honey in the arch and 4 kinds of packages. In the center of the pillars stands a table with 6-ounce bottles filled with fancy extracted white clover honey, with glass between each tier of bottles. Back of the arch, which can not be seen in the picture, stands two more tables, one with 3 kinds of honey in round pyramids of fancy bottles, and the other table has 11 dozen fancy bottles of honey—12 kinds. Next to the tables are 3 square show-cases on top of each other. The bottom one has 4 deep and 4 shallow extracting frames perfectly filled and capped; the rest of the case is filled with sections from 2 pounds to  $\frac{1}{2}$  pound.

The next case has all the kinds of sections in use. The top case is filled with  $3\frac{3}{4}$ x5 sections; next comes the shipping-cases, 80 in number, of 24 pounds each. You can see part of them. These cases are grained in oak and mahogany, and painted white and blue. The cases are filled with very fine white clover honey.

On top of the cases stands another glass show-case filled with different kinds of comb honey. Back of the cases are honey-cans from 60 pounds to 1 pound. The cans are painted yellow, red and blue. Back of the cans are the bees and sample cases of honey. You can see some of them in the small picture.

In the small picture are the 3 sample cases of comb honey—white, amber and dark. The premiums I received were as follows: First on sample case of white comb honey, extracted honey, amber comb, dark comb, dark extracted; and best and most attractive display of comb honey. Second premium on best and most attractive display of extracted honey.

They say the exhibit was one of the best ever put up. I tried to get a good picture of the exhibit, but all failed. I had about 4500 pounds of honey in the exhibit, about equal parts of extracted and comb honey. Everything was grained; that is, the wood-work, in oak and mahogany, which gave it a fine appearance.

I read the American Bee Journal every week with profit and pleasure, and will some day write an article on the way I secure such fine crops of fancy honey. W. E. PRISK.

We will be pleased to receive Mr. Prisk's article whenever he writes it.

**Mr. Wm. A. Selser,** of Philadelphia, Pa., is one of the most widely known bee-keepers and honey-dealers in this country. He is also a director in the National Bee-keepers' Association. A medical publication in the East, which was interested in bee-sting poison as a remedy, had this to say about Mr. Selser and his work:

Some 15 or more years ago the large manufacturing company in which Mr. Selser was a partner, was forced to the walls through the rascality of some of their selling agents. The failure left him greatly crippled in resources; without business or employment, and for some time without an open door to either. Gradually it came to him that there might be an opening in this line. When once this conclusion was reached, Mr. Selser threw himself into his new occupation with his indomitable energy, studying everything that could possibly be of any advantage, also taking a special course in the chemical laboratory of the college in the chemistry of honey and its

adulterations, afterwards traveling extensively through the United States and Mexico for the purpose of observation. The result has been that he has built up a large and profitable business, and is considered one of the largest apiarists in the country, and an authority upon the adulteration of honey. We will let the story point its own moral.

#### BEE-STING REMEDY—A THRIVING INDUSTRY.

Since the discovery, a few months ago, that formic acid from bees' stingers is a sure cure for rheumatism and lumbago, the demand for the stingers has leaped far in advance of the supply. Chemists and wholesale druggists are placing orders for all of them that can be had, and apiarists are doing their utmost to supply the demand.

Experiments made by the H. K. Mulford laboratories, near Glenolden, proved the efficiency of the bees' stingers as a cure for rheumatism and lumbago.

On the end of the stinger, which is about one-sixteenth of an inch long, is a tiny sac, containing a drop of formic acid. This sac the bee detaches with the stinger after the latter has been deposited in human flesh.

Formic acid neutralizes uric acid, the presence of which in the system produces rheumatism and lumbago. Science has found a way to convert the stingers, with their supply of formic acid, into a serum, which, used as antitoxine or vaccine virus is used, effects a cure. The stingers bring \$8 or \$9 a thousand.

Mr. Selser, who has one of the largest apiaries about Philadelphia, finds himself quite busy at certain seasons of the year filling orders for these stingers. At this apiary there are more than 1,000,000 bees under cultivation.

Mr. Selser has devised a regular system for extracting their stingers for market. Bees, he has discovered, do not like the odor of rubber, and when they detect it will often attack the rubber in a frenzied manner. He is experimenting with a soft rubber blanket or mat, which he places near the hives. The bees smell the rubber, and, attacking the mat, deposit their stingers, pumping into the small sac more formic acid than they are wont to do when attacking a person, or when not generally excited.

After the bees have vented their fury upon the mat it is removed and the stingers are extracted by means of small tweezers, care being taken not to destroy the formic acid pouch. As the stings are removed they are placed in small bottles containing pulverized sugar. These in turn are sent to chemical laboratories, where the formic acid is extracted and reduced to serum.

"The Honey-Money Stories."—The Canadian Bee Journal mentions it thus approvingly:

We have been favored with a specimen copy of a handsome booklet of 64 pages, entitled, "The Honey-Money Stories," published by George W. York & Co., Chicago, and edited by Earl M. Pratt. It is very attractively gotten up, printed on enameled paper, and beautifully illustrated. It contains a variety of short stories, interspersed with facts and interesting items about honey and its use. The idea of the booklet is to arouse interest in honey, and increase its consumption. It will make an excellent gift-book. Single copies 25 cents; 5 copies \$1.

Yes, it would make a nice "gift-book," especially for a person who is not now interested in the use of honey. Christmas will soon be here. Why not order 5 copies and present them to your friends. One copy with the American Bee Journal a year—both for \$1.10; or 5 copies and the American Bee Journal—all for only \$1.60. Send all orders to this office.

### Prices of Honey Then and Now—Why the Difference?

BY G. M. DOOLITTLE

IN the latter '70's a bee-keeper called on me, and soon our conversation turned on the price of honey, as the month of the year was August, and both he and myself had taken off quite a crop of white comb honey. I asked him what he thought the price would be that year, and without hesitation he said 25 cents a pound.

As I had counted on not more than 20 to 22 cents, I asked him on what he based his ideas of prices. His reply was as prompt again, "On the prices which butter is bringing in market."

I said, "What makes you compare prices of honey with butter?" His reply was that he had "been in the bee-business longer than I had," and that "he had noted for the past 20 years that the prices of honey and butter had not varied more than a cent or two in all that time."

He then told me of corresponding prices before the war, and cited me to what I knew of the high prices of the latter '60's and early '70's, when both butter and honey sold from 30 to 50 cents per pound, which I of course could not dispute. And, sure enough, I sold my honey that year at 25 cents. But with the '80's came a change, and the price of butter outran that of honey by 1, 2, 3, 4 and 5 cents, while the difference in price has been widening ever since.

A few days ago a neighbor of mine took his crop of honey to the city where he had sold it a few days before by sample at 10½ cents on an average, he having a crop of over 1200 pounds. And this honey was fully as good on the average as was my crop in 1875, when I was paid 28½ cents per pound for my whole crop. Nor is my neighbor a poorer salesman than myself.

Well, what about the price of butter to-day as compared with the price of 1875?—20 to 22 cents now with 28 to 30 in 1875.

Then in 1875, when I was drawing my honey to the city at 28½ cents per pound, I would stop on my way home and put on a load of coal for our winter's fuel, and the price was \$3.50 a ton. Now with 10½-cent honey I have to pay \$6.45. And I can do no better with these matters, try as hard as I can.

Again, in 1875 I was trustee in our school district, and with honey at 28½ cents per pound I hired a teacher for our school at \$3.50 a week, she to teach on every other Saturday, or 5½ days to the week. To-day, with honey at 10½ cents a pound we have to pay the teacher for this same district \$9.00 a week, and she teaches only 5 days for a week, and a short 6 hours for each day.

But I hear some one saying, "Why don't you sell your honey at home, peddling it out at better prices?" I have sold some in this way at 12½ cents, but an entirely country place will take only a small part of the honey produced by 3 or 4 apiarists residing within 5 miles of each other. Then I must pay \$2.00 a day for any help I must hire to do work while I am peddling, and this would require an average daily sale of 100 pounds to meet the wages of hired help, while this help would not work to nearly as good advantage as I could, so that as far as finance is concerned, it is just as profitable for me to sell at 10½, and draw my whole crop off in a day, as it is to peddle it out at 12½ with a daily average sale of 100 pounds.

But why talk about peddling? In the '70's buyers came to my door seeking the whole crop. Now I am compelled to peddle, and strain every nerve possible to get less than one-half for my crop what I could in the '70's in bulk, while, on the other hand, I still continue to go after my butter, coal and school-teacher, with the butter but little lower, and the coal and teacher costing more than double what they did in the '70's. It costs me 2 pounds of honey to get 1 of butter to-day, while in the '70's it was pound for pound. In 1875, 100 pounds of honey would buy 8 tons of coal. To-day it will take nearly 500 pounds of honey to buy the same. And when it comes to hiring the district school-teacher a still larger proportion of my crop of honey must go. In fact, I do not know of a single item along the line of those I must have to give me a comfort-

able living that is as low in proportion as is the price of comb honey, at the present time. Sugar comes the nearest to it, and in rummaging the ground all over I know of nothing that will account for the difference unless it is this matter of sugar. At wholesale for the two, 2 pounds of granulated sugar can be gotten for 1 pound of honey, and this is about the same as could be done in the '70's.

And the public mind has seemed to change along this sugar-and-honey line, for, contrary to the '70's, I hear people arguing now that with the 10½ cents they must pay for 1 pound of honey they can get 2 pounds of sugar. Then to this sugar they can add 1 pound of water, and thus have 3 pounds of sweet of about the consistency of honey, which (especially where some of the nicer-flavored C sugars are used) they would just as lief have as the honey. And thus they conclude that they can not afford honey, unless, perchance, it is a little as a luxury to put on the table for company. So in this we are having an underconsumption of honey, which, in effect, is the same as an overproduction, which always means low prices.

I would like the opinion of others in this matter.

Borodino, N. Y.

### Luther Burbank and Better Honey Plants and Bees

BY PROF. A. J. COOK

In the Popular Science Monthly for August is a very interesting article on this great savant, by one of the most distinguished scientists of the world, Prof. De Fries, of Europe. It will be wise for all to read it, as it is full of valuable suggestion.

Burbank has originated more valuable varieties of plants than any other man of the world. The traits which have made Burbank so phenomenal in his line of experimentation are—

1st. Vision. He has a quick eye to see valuable characteristics in plant or flower.

2d. He has a great range of experience, which assures him that with enough labor and patience he can emphasize any desirable trait and build up around it other traits which can be introduced by discriminating crossings with other closely allied varieties, or possibly species, and thus may hope to originate almost any ideal, providing this ideal has a basis of fact in existing varieties or species.

3d. He has unlimited patience, and is quite willing to work and to wait. He is said in one case to have destroyed a half million plants, but secured one that he had wished for and planned to secure. Often he destroys hundreds of thousands. Burbank believes that heredity hangs upon all the environments of all the ancestors. The more varied the ancestors the more diverse the environments; the more probable the extremes of variations the greater possibility of desirable varieties. One who has vision to see what is valuable and desirable, to note germs of such in existing individuals, and possessed of infinite energy and patience, may hope and expect a success equal to anything that Burbank has attained. There are realms yet to conquer in these directions.

#### BETTER HONEY-PLANTS.

To the bee-keeper this line of research possesses practical importance in two directions. We need better honey plants and better bees.

What a reputation Wisconsin and portions of New York have attained for their excellence as honey-localities! The basswood that has given this enviable fame is rapidly going. What is to take its place? No doubt red clover is rich with delicious nectar, but is for the most part too deep in the long flower-tubes to make this a good or desirable honey-plant. Some Burbank will yet see some plant like figwort or poinsettia rich with finest nectar, which he will build up into plants excellent for forage.

We must have plants equal to white clover, linden or sage, for honey, and to red clover and alfalfa for hay or pasture. Alfalfa is not perfect as a honey-plant, though it is very superior as a forage plant. No doubt a Burbank could secure a variety that would yield nectar in all places and under most trying conditions of drouth and climate.

#### A SUPERIOR HONEY-BEE.

A few days ago it was my great pleasure to examine the bees on the grounds of the Department of Agriculture, with Dr. Phillips, who has them in charge. I was specially interested in a Caucasian queen. She was large and fine in form

and shiny black in color. Her bees were much like the common black bees, yet were exceedingly amiable. We opened the hive with no use of smoke. It had rained hard nearly every day for a week—and we know such weather is not conducive to storing, and so usually makes cross bees. We knocked against the hive and brushed the bees rudely, even pressing against them with the flat of the hand, yet they made no sign of anger, nor gave any evidence of irritation or wish to sting.

Dr. Phillips is planning to work for better bees. He has in these Caucasian bees all that we can wish for temper; and as they are of the black type, they will doubtless give a very white grade of honey. We will hope and believe that Dr. Phillips will be able to unite with these peculiarities such other desirable traits as the long tongue, activity and industry of the best yellow races. Burbank would affirm that we had in these bees every requisite to success. That it will be possible to keep all the good now found, and even to emphasize this, and by wise crossing and innumerable trials, we may brace these characteristics with others that will fashion the ideal—the perfect bee.

There is one feature of these experiments that is worthy of mention: One reason that Burbank has won his phenomenal laurels in plant-breeding comes from the fact that after crossing he can plant thousands of seeds, and thus try almost infinite experiments, and get results in a very short period. In most cases of breeding in animals the work is slow and results tardy of appearance. With bees the case is different; we can get results with great promptness, and each year may get valuable returns, or at least may push work to completion.

#### RESEARCH FUND.

Just here I have a suggestion that I believe we should press for all that may come of it. It will be remembered that Mr. Carnegie has endowed research with a large endowment. Some thousands of this fund have been wisely handed over to Mr. Burbank, that he may give his entire energy to the work where he has proved himself such a master. There are still thousands more to be granted. Why should not \$1500 or \$2000 be appropriated annually to aid Dr. Phillips in his valuable work of queen-breeding? This would make it possible to give fullest energy to these researches. The object sought is surely worthy most careful research and the best ability and attention.

We have every reason to believe that Dr. Phillips is specially well fitted by temperament, taste, culture and energy to do the work. There is every reason why this fund should be voted. If the two National Associations shall take the initiative they will surely exert a great, if not a telling, influence with the board that is in control of this fund. If such initiative is supported by earnest petition from bee-keepers all over the country, representing every State and, if possible, every county, then truly we may hope for the appropriation and look for most valuable results at Dr. Phillips hands. Let us lose no time in inaugurating this important movement.

## How Many Pounds of Honey Produce a Pound of Wax?

BY ADRIAN GETAZ

HOW many pounds of honey does it take to produce one pound of wax? is a question that has received all sorts of answers from, if I am not mistaken,  $1\frac{1}{2}$  to 30 pounds. The high figures, especially when it comes to 20 or 30 pounds, are certainly in error, as can be easily seen by considering how they were obtained.

The first experiments made were by Huber. He shut some bees in a suitable box and fed them sometimes brown sugar and sometimes honey, and saw the scales of wax produced and some comb built. The honey or sugar fed and the comb produced were weighed.

As an estimate of the honey used in a colony under normal conditions to produce one pound of wax, Huber's figures are useless. Too few bees were used, the temperature was merely that of the room, and therefore much below that of a hive. Each experiment lasted only a few days, and we know that the formation of the wax commences only three or four after the heavy-feeding (honey-flow or artificial feeding) has begun. Only the built comb was weighed, the scales of wax that might have been on the bodies of the bees were neglected.

The first idea that will come to the reader's mind is, How can it be possible that an experiment could be so carelessly conducted? And if the other observations of Huber were not better made, what reliance can we place on his assertions?

But Huber never tried to find out how many pounds of honey it takes to make a pound of wax—he may never have thought of it at all. At the time he was living nearly everybody believed that the wax was gathered on the flowers, or at least on the plants. And all he wanted to prove was that the wax was not gathered outside, but is a secretion of the bees produced from the honey they eat; just like the milk of a cow is a product of the food she eats. Those who have used his figures to prove that it takes 20 or more pounds of hooney to produce one pound of wax are the ones to blame.

Another set of figures, often misused in the same manner, are those of Dumas and Mine Edwards. Their experiments were very carefully conducted—everything, even the bees themselves, was counted, weighed and analyzed. Their sole object was to show, like Huber, that the wax is a secretion and a product of the honey consumed. But when it comes to determine how many pounds of honey it takes under normal conditions to produce a pound of wax, their figures are nearly as objectionable as those of Huber, and for similar reasons, and should never have been used for such a purpose.

Other experiments have been made in a more direct way by feeding confined bees. Most of them are more or less objectionable on the same lines as those of Huber. Even the best can not be considered as reliable. Bees confined, and without queens and brood, will not work like they do under natural conditions. So we may dismiss at once all attempts made in that direction.

#### FRENCH EXPERIMENTS.

Another method to get at it was undertaken and discussed a few years ago by Messrs. Sylviac, Maujean, Devauchelle, and other leading French apiarists, and reported during 1901 and 1902 in the *Apiculteur* and the *Revue Internationale*. The principle is this:

During the first two or three days—perhaps four—after a swarm is hived, quite an amount of comb is built, but only a few bees, comparatively, go to the fields; that is, when neither comb nor foundation is given. The lack of room to put in the nectar gathered forces a large number of bees to remain at home and work at wax-producing and comb-building instead of going to the field. It may be assumed that the few bees which go to the field bring in enough to keep the colony alive, and that the amount of wax-scales that the bees brought in on their bodies is offset by what they may have at the end of three days, or about; that is, before any honey is stored in the combs. It is then taken for granted that the comb built is the product of the honey brought out of the parent hive by the swarm, or at least an equivalent amount. Knowing that the bees of a swarm come out with their honey-sacs full, knowing the weight and approximately the number of bees of the swarm, and also the amount of honey that a bee does carry out when swarming, it ought to be very easy to make a fairly good estimate.

The figures obtained were widely different with the different swarms. Quite a discussion followed concerning their interpretation, the correctness of the assumptions mentioned above, and what corrections should be introduced. The outcome was an estimation of from 2 to 4 pounds of honey for a pound of wax produced under such circumstances.

During the discussion Mr. L. Maupy suggested that, chemically speaking, 100 grams of wax contain about 82 grams of carbon, 13 of hydrogen, and 5 of oxygen. On the other hand, 100 grams of honey contain 28 grams of carbon, 8 of hydrogen, and 64 of oxygen. It follows that to make up the 82 grams of carbon contained in 100 grams of wax, not less than  $2\frac{1}{2}$  or 3 times that amount of honey must be consumed.

So far as the mere transformation of honey into wax is concerned, I think this is all that is needed. But there is the extra warmth needed, to be considered. To make it plain, let us consider a colony having no super. All the warmth needed is enough to keep up the temperature in the brood-nest. But let us add a super. Then this super will have to be kept warm enough to insure rapid production of wax and comb building. And of course an extra quantity of honey will have to be consumed to that end. In very warm weather it might be next to nothing, but in cool weather it might be quite high.

#### HASTY'S EXPERIMENTS.

Some 20 years ago (in July, 1885) Mr. Hasty made an experiment in the same line as the above. A prime swarm was weighed and hived, and the hive placed on a delicate balance at sundown. The swarm weighed 2 pounds and 12 ounces. During the night the decrease of weight was 2 ounces, while during the experiment the average decrease every night was 4 ounces.

The plan was to weigh the colony morning and night, to ascertain the amount brought in; let them work 4 days, then

cut out the comb built and weigh it, weighing the wax, honey and pollen contained separately. This last was done by weighing the comb first as it was, and then the wax after it was rendered. The operation was repeated twice at intervals of 4 days. The number of bees which died during these 12 days must have been insignificant, since the colony weighed as much at the close as at the beginning. The amount of honey taken from the old hive by the swarm, contrary to the general opinion, must have been small, since the colony weighed 7 ounces more after the first 4 days than at the beginning. They could have had but few wax-scales on their bodies when they came out, since more wax was produced during the second period of 4 days than during the first.

One point is somewhat uncertain. The difference in weight between morning and night is assumed to represent the honey gathered during the day. As a matter of fact it is not ripened, and is too heavy to represent ripe honey. But, on the other hand, bees have been eating during the day, and Hasty assumed that one would balance the other. The assumption can not be far from wrong, anyway. A deduction of 2 ounces per day, or rather per night, was made for what the bees consume merely to sustain their life. This was based on the first weighings of the swarm, as stated above.

**FIRST TRIAL.**—Honey and pollen gathered during the first 4 days, 43 ounces. Deduct consumption 8 ounces honey, and pollen cut out 19 ounces, increase of honey in sacs attested by the increase of weight of the swarm, 7 ounces. Remainder, 9 ounces spent in producing 2 ounces and 10 drams of wax, or nearly  $3\frac{1}{2}$  ounces of honey for 1 of wax.

**SECOND TRIAL.**—Gathered 48 ounces. Add to this 6 ounces decrease in honey-sacs. Deduct food 8 ounces, honey and pollen cut out, 35 ounces. Remainder, 11 ounces having produced 4 ounces of wax. The proportion is  $2\frac{3}{4}$  to 1.

**THIRD TRIAL.**—Gathered 48 ounces. Add 1 ounce decrease in honey-sacs. Deduct 8 ounces food, and 33 ounces cut out. Remainder, 8 ounces for  $3\frac{1}{2}$  of wax, or a proportion of  $2\frac{1}{2}$  to 1, or nearly so.—(Cleanings, Aug. 15, 1886.)

#### PROF. BRUNER'S EXPERIMENTS.

Prof. Bruner, at the National Agricultural School at Cordova (Argentina), has made a specialty of wax-production for several years. The wax there is worth 54 cents a pound. Dark honey can be bought in unlimited quantities at 6 cents a pound. Summarily speaking, the process is to feed the bees all they can eat, and cut out the comb produced from time to time. The honey contained is returned to the bees. He says that it takes 68 pounds of honey to produce 10 of wax. That is a ratio of nearly 7 to 1. But this necessarily includes what the bees consume to rear brood and sustain their life as well as to produce wax. Hasty deduces even what they consume to live. In the French experiments related above, the daily food to sustain life was not deducted, but as in Hasty's case, no brood was reared.

Prof. Bruner's description with full details can be found in the *Apiculteur* for February, 1904, page 55. A short description of this process is also in the *American Bee-Keeper* of April, 1904, page 75.

#### COMB, NOT WAX.

Of course for one making wax-producing a specialty, the full 7 pounds, or about, as well as all the other costs, will have to be charged against the price of one pound of wax. But it is not so with the apiarist who would occasionally convert some dark honey into wax. He has the bees already, and whether he produces wax or not they will eat enough to live and rear more or less brood. So in his case, the extra honey consumed to produce a pound of wax would probably not exceed 4 pounds. Four pounds of dark honey to produce one pound of wax worth 25 cents would not be a very profitable operation, after all.

But, hold on. Right here, while preparing this paper, almost an inspiration came to me. The "wax" thus produced by the bees is comb—partially-drawn comb. And as such is fully as valuable, and in many respects preferable to foundation, pound for pound. That means a cash value to the apiarist who can use them of some 60 cents per pound. I say a "cash value," for it may mean a good deal more in honey, at least to the comb-honey man. Many times the honey-flow opens suddenly, and 5, or even as much as 10 pounds of honey a day could be secured if there were combs to receive it. But it takes 3 or 4 days to start the wax secretion, and about that many more to build anything like a sufficient amount of comb. Why not, when there is no flow, convert the dark honey into partially drawn combs in the sections, and use them to secure a large portion of the white honey lost for lack of already built combs?

As much dark honey should be secured as possible. Ex-

tracting combs and supers might be used for that purpose. Then, when the flow is over, convert it into comb, if possible built in the sections, and the following year use these partially-built sections to secure as large a crop of white comb honey as possible. Here the dark honey comes first, so the management is a little different. Knoxville, Tenn.

## Convention Proceedings

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 793)

Next was discussed the

#### PREPARATION OF THE APIARY FOR THE HONEY-FLOW.

Louis H. Scholl said the apiarist begins his preparations the previous fall by having strong colonies of bees, good, prolific queens, and plenty of stores to carry them through the winter and next spring until the honey-flow opens. An early examination for sufficiency of stores and strength of colonies is made in February and March, as soon as warm weather opens. Colonies are equalized by exchanging brood. His divisible brood-chamber hive has given him the best success, as the hive can be manipulated to give the strongest colonies, prevent swarming, and give the greatest yield of surplus honey, which means the most profit for the bee-man.

Willie Atchley begins in the fall previous, like Mr. Scholl, with good queens and plenty of honey. He uses full-depth frames above and below, and finds them the most profitable in his locality. To get bees into the bodies above, he entices them to storing by giving a frame of brood and honey there. He said he has tried nearly all kinds of hives except the Danzenbaker, and finds that he has best results with the regular Langstroth hive.

Pres. Laws said that location has much to do with the preparation for the flow. In some locations swarming is very troublesome early in the season; in others the troubles due to the swarming come later. Therefore, different manipulations are necessary. Labor is the most important consideration in the expenses with the bee-keeper, consequently all extra manipulations are expensive. He believes in getting the bees in shape by giving lots of room and plenty of stores, and this is to be done in the previous fall. Large hives are very essential.

Mr. Aten has little trouble preparing for the honey-flow. He keeps his bees mostly in 3 story 10-frame hives, leaving the winter supplies in the third story. In carrying the honey from the third story down-stairs the bees become accustomed to the combs above.

Willie Atchley has plenty of pollen and honey in the spring to stimulate his bees when the season opens.

Mr. Hagood begins feeding June 15. The honey-flow begins July 1. There is a long dearth between the spring honey and the main flow, so he must feed during June to prepare his bees until they gather the main honey.

T. P. Robinson related the following: Horsemint is periodical in this section, appearing in abundance and yielding a crop of honey once in 5 years, if they have rain so that it comes up in November of the previous year. A bee-keeper has to be a genius if he wants to succeed in bee-keeping in his locality, as most of the land is in cultivation. There are no wild flowers in the spring for the bees to build up on. They build upon the stores that are left them, and when the dearth sets in for 5 weeks before the honey-flow, feeding is resorted to. Cheap brown sugar is used, and the syrup is fed until the flow opens. Horsemint, cotton and mesquite come closely together, which gives a blend so that the product is a good-flavored honey, much in demand. He has trouble sometimes with what he calls "bluberry honey," and asks for opinions as to the cause.

Mr. Aten has had the same trouble in extreme wet weather with weak colonies which perhaps could not take proper care of the honey after it was stored. Honey absorbs moisture, and a weak colony does not keep up the required temperature.

Mr. Hagood says that when the forces of the colony are composed of more old bees than young bees, evaporation

is not kept up sufficiently by the young bees to care for the honey brought in by the old field-bees.

Mr. Robinson stated that to show that honey does absorb moisture if not taken care of by the bees, it could be done by extracting thick honey one evening which would be hard to extract. Some of the same combs of honey left in the extracting-house over night, especially when the atmosphere is cool and damp, will be found to be thin and watery the next day, and can be extracted more easily.

Mr. Laws has had no trouble with such honey except in his baby nuclei, when green honey is given to them sometimes. That leaves the same condition as a weak colony which is not able to thicken or ripen the honey properly. He urges strongly that the bee-keepers let all green or unripe honey remain on the hives, as they lose customers if they put such souring honey on the market.

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 794)

### WIRING BROOD-FRAMES WITH STARTERS.

"Should brood-frames with starters be wired to prevent breaking out of the comb?"

Mr. Hutchinson—Unless the hives are to be moved or shipped by express I don't think there is any necessity for it, simply for use in your own apiary. If they are to be shipped they need wiring. Possibly if you are going to produce extracted honey those wires would be of advantage, especially when the combs are new. After they are old they are not.

Pres. York—Would the bees be apt to build the combs properly over the wires when using only starters?

Mr. Hutchinson—Yes, they will.

Mr. Kimmey—My experience with bees has been limited to the first swarm I had issue. I hived upon simple frames with starters, and I never expressed nor move them anywhere except to carry them in the cellar, and three of those frames broke down; I don't know whether it was from

my awkwardness, or weak combs, or what it was. It seems to me that after that experience I would always wire the frames.

Mr. Meredith—In wiring frames of foundation I have experienced the trouble of the bees gnawing in or around the wire, and to do away with this trouble I use the brush and slightly cover the wires with a little heated wax.

Mr. Becker—In my experience I have never used any wire. I always use half sheets of foundation for every brood-frame, and I have never had any trouble with frames breaking down.

Mr. Hoffman—I won't agree. If they do as I do they will have no trouble. Hive on full sheets of foundation, and put it in the hive, and then you want to wire. But I try, as a rule, to get all the combs drawn before that time. I put them in the top hives and have the bees draw them out, and then I can put them anywhere and they are all right. This wiring is a tedious undertaking for me.

Mr. Horstmann—The comb will not break if properly handled, so there will be no necessity for wiring for the purpose of holding the combs. Take a frame and turn it over, and they are going to work up into it, right up and down; they will never break.

Mr. Colburn—I think it depends upon whether the combs are fastened to all sides of the frames. I have had quite a number of combs where the frames were fastened securely, and I have done almost anything I wanted with them, and yet they never fell out; and then I have had a comb that was not fastened, and it simply tipped out by raising the frame horizontally.

Mr. Hoffman—Wiring foundation gives one so much more work, and that is why I am not so much in favor of it; by wiring you will get a straight comb, and true, and it will not sag, either.

Mr. Horstmann—The question asked is, Is it necessary to wire frames with starters? I say it is not necessary, but if you want to take the frames out of the brood-chamber to extract the honey it will be necessary to have it wired. But answering the question as it is, I consider it is not necessary, because I have handled the frames a great deal and I have never had one break yet, not even bend.

Mr. Hoffman—I don't understand by the question that it means starters. I wouldn't wire them at all.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### Steadfast Honey

The nearest dream recedes, unrealized.

The heaven we chase

Like the June bee

Before the schoolboy

Invites the race;

Stoops to an easy clover—

Dips—evades—teases—deploys:

Then to the royal clouds

Lifts her light pinnace

Heedless of the boy,

Staring, bewildered, at the mocking sky.

Homesick for steadfast honey.

Ah! the bee flies not.

That brews that rare variety.

—EMILY DICKINSON.

### Cleaning Out Unfinished Sections

I wonder why our bees are so contrary about emptying out sections. We first tried putting on the supers of sections with an empty super between the supers of honey to be emptied and the brood-combs. They seemed to be perfectly satisfied with the arrangement, and let the honey remain where it was—at least the most of it. Next we tried putting a piece of burlap between, turning back a small corner of the burlap just so a bee or two could pass at a time. We confidently expected to find those sections beautifully emptied when we next visited them, but

not a bit of it; those bees said, "No, the honey is all right where it is."

Next we tried putting the super of honey to be emptied in front of the hive with a small passage-way connecting it with the hive. Did they empty them? Not they.

Then some one, I have forgotten who, just now, said that if the super of sections to be emptied was put on a colony and when full of bees taken off and carried a short distance and covered so as to allow only a few bees to pass at a time, the bees would protect it against robbers and carry the honey to their own hive. Well, we tried it with just about the same degree of success. Those sections were emptied, but not by the bees of any particular colony. The booty seemed free to all.

Then came Mr. Bevins, on page 680, telling how he accidentally struck on such a fine way of getting his bees to empty his sections.

So, after supers were taken off, a super of unfinished sections was put on No. 32, and it was promptly occupied by the bees. It was then raised up, and a board put between the super and the hive, a small opening allowing a passage from the super into the open air, but there was no communication between the hive and the super. That super stayed there days, and the days extended into weeks, and the honey stayed, too. The unsealed honey was emptied, but not the sealed. At night the bees generally deserted the super (but not always), returning next day; but there was no appearance of robbing by other bees. No. 9 was also tried, but with no better results.

What is the matter with our bees, pray, that we can not induce them to do it when others do? Will Mr. Bevins or any one else tell us?

### Bees Ready for Cellaring

Our bees have not been put into the cellar yet, and to-day (Nov. 10) they are having a good flight. We have had 1 or 2 pretty cold days, the thermometer standing as 22 degrees above zero in the morning, but it has never stayed cold long at a time. The colonies have been weighed and are unusually heavy. They seem to be in fine condition for their winter's nap.

### Bee-Dress for Women

I send you a photo of my apiary and its attendant. This is not intended to compete for a prize, but to show that women can work with as much ease and convenience as men if they haven't too much false modesty.

Of course, the men do not know what a task it is to do outdoor work in skirts. If you wish to know, just try it and see the difference. You are just as liable to be the center of attraction until the strangeness wears away. The hands in the field will stop to look at you and smile, which will likely make you angry, as you are all tangled up in your skirts, and bees stinging you, and no pockets to put your tools in. Then you try to arise from the position you are in, and are compelled to untangle yourself. Gentlemen, try the skirts once, and see if you do not think my plan is all right.

But you know we Western women are quite independent. We can vote, break bronchos, round up cattle, and climb mountains; but you Easterners must not class us with the In-

diana, for we are quite at home in the parlor with our Southern sisters, although we do not use tobacco.

MISS D. GOODALE.

Fort Collins, Colo.

[The bee-dress for Miss Goodale is sensible, convenient, and not unbecoming. It is really a travesty on modern intelligence and the progress of the age in most things that cus-

tom and society demand that woman must be handicapped in the awful way that she is in the matter of dress. Bee-work, especially, demands for woman the same degree of convenience that it does for man, and we must admire the courage that prompts Miss Goodale to cater to convenience rather than to social custom.—ED.]—Gleanings in Bee Culture.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### CLEANING UP UNFINISHED SECTIONS.

That tale of Edwin Bevins is not quite so hard to hold as the tail of a greased pig—though not quite so easy, perchance, as holding a "stick-tight" with a woolen glove. To be feared that neither he nor we can very often succeed in getting that kind of work well started. Not very surprising that it runs after a few thousand bees fully get the idea. It would often be very handy if we could make a colony hold a super against all comers and steadily take out whatever was put in it. Certainly worth experimenting at. Imaginable that there might be occasional success at making a strong and enterprising colony hold two hives, not necessarily near to each other, the one a home and the other a feeder. One idea for experimenting on would be to have a long, low tent, home hive at one end, and feeder hive at the other end; tent to be taken off when they once get fairly started. Page 680.

### INSURANCE COMPANY FOR BEE-KEEPERS.

New and pert notions we mostly incline to call Yankee notions; nevertheless the "Britisbers" sometimes get the start of us. An insurance company, with a lawyer always engaged at special rates, can doubtless scare off most bee-lawsuits, and win a large share of the remainder. Two cents per hive for such service is nearly as cheap as maintaining a defensive association in our style—and the returns are more comprehensive. Our Association, I believe, only *helps*, don't promise all the expenses of defense, and especially not all the damages when a suit goes adversely. New style, nice for "weun's." Hardly looks like a gold-mine for the company. Fear it will be quite a spell ere we find American capitalists that will start such a company. Page 725.

### LICENSE FOR BEE-TERRITORY.

So the Australian colony of Victoria is so far up to date (or ahead of the date) that it licenses apiaries. The editorial on page 726 assumes that it is only on Government lands. That hardly looks consistent with offering the Government "two-sixths" of the fee. One would say that the whole fee would of course go to the Government for privileges on Government lands. But how the Australians

came to consent to such rank paternalism as a license for bees that range over settlers' lands, I don't know. 'Speets it must be an anti-bee movement on the part of the settlers. Anyhow, to pay \$12 80 for 4 square miles of territory is not what most of us would want to do. Some might. Another sign that the law is a hostile one is the way they enforce it. Take pay for a license, and then let the next man pay and locate as near as he chooses! Possibly our brethren there are so disgruntled that they exaggerate a little. But sooner than petition for License in Ohio I think I'd go the whole pig and sign for Prohibition. If officials should get too plenty around certain apiaries that might be named, there might be a little "Local Hoption."

### DISTANCES BETWEEN OUT-APIARIES.

Yes, out-apiaries as near together as the pasture will allow, and out-apiaries as far apart as the exigencies of travel will allow, constitute two quite different ways of doing the thing. Both have decided advantages of their own. Pretty sure to catch a crop somewhere if you spread out far enough. A clever and long electric railroad ought to be nice to string the latter kind of out-apiaries on. Page 727.

### A TREE COLONY OF BEES.

I have had a tree colony, too; but W. W. McNeal's was a much more satisfactory one—more normal. I think mine had the longer career; but his would no doubt have held out much longer than it did if he had let it alone. As it was a whole month, from Aug. 1 to Sept. 1, through several rain-storms, it is quite a record. Page 728.

### BEES STINGING DARK COLORS.

It's a favorite fad of mine that the talk of bees stinging dark colors worse than light colors is mainly imagination and—well, humbug. Fairness seems to call for the notice of McNeal's chicken experience. Apiary fenced with netting and lots of little chickens of divers colors turned in. He finds (says so, anyway) that white chicks are seldom attacked by bees, brown ones more frequently, black ones often stung to death. Pretty strong evidence, must say. Page 728.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

### A Beginner's Questions

Last June a nice swarm of bees settled on the studding behind the granary, and we put it into a cracker-box. The box is 19 inches wide, 19 high, and 26 inches long. It is not more than half or two-thirds full. Do you think they will winter all right if put in a warm cellar?

2. When there is so much empty room in the box will they swarm next summer as early

as a colony that is in a common hive, or will they not swarm at all?

3. Is there anything I can do to force them to swarm? I would like to have them swarm in June.

4. Do you think I should get a bee-book, or is the American Bee Journal enough? What book is the best for a beginner?

WISCONSIN.

ANSWERS.—1. The size of the box will not at all be against their favorable wintering in

the cellar. Try to have the cellar no warmer than 50 degrees, and no colder than 40 degrees.

2. You can tell nothing positively about it, but they are likely to swarm later than if in a smaller hive, and it is possible they may not swarm at all.

3. Yes, you can diminish their amount of room. Next spring, after they get to flying, blow in a little smoke so they will not resent your working with them, and then saw off the lower part of the box. Without seeing it, it is hard to say just how much can be cut away, but you can see how far down the bees come, and cut away all the comb they do not occupy, and cut away the box to match. The bees don't need a fourth of the room in a box 19x19x26, so when you've cut off the lower part there will still be too much room—probably a vacant space at one or both ends. Pack hay or straw into the vacant part, so it will be quite solid.

4. You can't get along without a book. The best books for beginners are "A B C of Bee Culture," "Langstroth on the Honey-Bee," and Prof. Cook's "Bee-Keeper's Guide."

### Wintering Bees—Other Matters

1. I have your book, but as my surroundings are different from yours, I will try to explain as well as I can, then I would like to have your judgment of the best course for me to pursue.

I live on what is called bottom land; 10 rods from my house on the east is a rise in the ground of about 40 feet high; this is then the level of the country. Then there is another drop of 17 feet to what would be called a third level. On the edge of this bank is my cellar or cave, and 6 rods further is another drop of 10 feet to a creek. My cave is 7 feet deep, 10x12, covered with poles and 6 inches of dirt, then a building over that, 14x25 feet. East of that is the well, 14 feet deep, with never more than 3 feet of water, nor less than 1½ feet, not more than 3 rods from the cave. The cave has one door which opens as yours shown in Fig. 7 of your book. It is just wide enough to slip a sugar-barrel through up and down; no other air-holes or windows. With the door shut it is as dark as it can be. It has a gravel and sandy bottom sealed with lumber, and seems to be as dry as any of the cellars.

I had 3 colonies last winter that stood out till in January. When the weather got so cold (25 degrees below zero) I got scared and took them in for about 2 months. One died in the spring; about one-third of their comb was a dry, brown color. They had honey. What was the matter with them? Would this cave be a fit place for bees?

I have 17 colonies now in 8 and 10 frame hives—the 10-frame hives will average 54 pounds each, or, I think, 29 pounds of honey; the 8-frame will average about 22 pounds of honey each—the lightest 14 pounds, and from that to 27; the 10-frames 25 to 35 pounds of honey.

2. I have another plan for wintering. First, lay a floor 10 inches above the ground; on this put 4 inches of straw, sawdust, or forest leaves, whichever is thought best. Place half of the hives on that 3 or 4 inches apart, then pack between them and build up all around them, leaving a space of 4 inches in front, 12 or 14 inches at the back and ends, and pack it full of leaves, sawdust or straw. Of course, I would put a block over the entrance so as to keep it open, but closing it up until it is only ¼x4 inches. Then proceed to put the rest of the bees on top of the first ones, and build up as before; fill in all around them and over them, and put on a good roof, with their backs to the north. What say you of them for safe keeping until spring?

3. Would you advise me to break the seals now and fill the supers with leaves, and also put leaves over them for cellar-wintering? Do you think it would be an advantage in a damp place?

4. I bought a colony from a neighbor who made a box out of 1-inch lumber, 1½ inches larger than an 8-frame hive, and about as deep as a 1½-story hive. A super was put on that, resting without edges on the inside edge of the hive. The hive had no frames,

cross-pieces, nor anything. The super was filled with shallow extracting frames. The bees built to the bottom of the super-frames crosswise, and all other ways. They had plenty of room below without the super, and have it full; it is honey—80 pounds or more. If I should, next spring, after they get to going good, take the lid off the super, turn it upside down with a super on another hive, would it interfere with the queen laying in the upper hive, comb upside down? I mean to put excluders between the super and hive, and have another colony below. My idea is to have the top bees carry in honey in the top, the lower ones carry in honey through below till they put the top queen out of business. I would keep a trap at the top entrance to catch her when she comes out, so she won't take any bees off. I want that hive filled with honey before I cut into it. It is an experiment.

5. To whom can I send a sample of honey to find out if it is honey. I bought 60 pounds of extracted at 7½ cents a pound. It has a funny flavor—something like some kinds of cough syrup, and pretty poor stuff at that. A half-witted fellow came and wanted a lick of honey. I gave him a teaspoon and told him to help himself to the can. He dug out a teaspoonful and said, "That's fine." He lapped it in his mouth and said, "Ah—m, what's been in that can?" Would it cost me anything to have it tested by some one, more than the sending of the sample? If so, how much? I wish to know for curiosity's sake.

ILLINOIS.

ANSWERS.—1. Of course I can not say positively as to the character of your cave, but from your description it would seem to be a good place to winter bees, provided cellaring is your best plan. If I am not mistaken, however, you are in a latitude of 40 degrees, and as far south as that most bee-keepers prefer to winter their bees outdoors. It is probable that diarrhea was the trouble with the colony that died.

2. That will probably work all right. Leaves well packed are excellent, and it may be better not to have so much packing in front. Indeed, it is possible that none at all in front will be better. Then when a warm day comes the sun can get in its work on the front of the hive and start the bees to flying sooner than if packing were in the way.

3. For wintering in a cave, if there is abundant ventilation below there is no need to do anything but leave the corners sealed just as they were on the summer stands. But in a cave or cellar the entrance should be much larger than outdoors. Mine are 12x2 inches.

4. A queen will lay all right in comb turned upside down.

5. You can send it to Wm. A. Selser, 10 Vine St., Philadelphia, Pa. You might write him first and find out the expense, if any.

## Reports and Experiences

### Barbed Wire for Bee-Fencing

I notice in the American Bee Journal, Nov. 2, barbed wire is mentioned as a fence to enclose bee-yards, and it is claimed that it is beneficial, as it does not retard the bees in flight, and permits stock to keep the grass eaten down in front of the hives. Furthermore, it is asked if any one could give any light on the subject.

I will give you my experience of 5 years with this arrangement. I have a number of hives stationed in my yard next to the pasture fence, some 18 inches from the fence. The fence is a 3-wire one, and the bees fly under the bottom wire and are not retarded at all by the wire. The stock keeps all the grass eaten down in front of the hives perfectly, yet some varieties of weeds grow luxuriantly in front of the hives. This grass-mowing by the stock is all right, and always will be a success just so long as the pasture is overstocked, and the stock needs that over the fence for food, otherwise that on the outside will be

sparingly used. It is a success with me since my pasture is overstocked.

The disadvantage with me is that the stock very often knocks off hive-covers, and occasionally turns over a hive. This trouble can be overcome largely by placing the hives a little further from the fence, if not entirely obliterated.

Taking it as a whole, this arrangement is an excellent one. To get the full benefit of this kind of fencing it would be necessary to fence the bees in a pasture, and have the hives in two long rows next to the fence, and leave a walk between the hives. It would be necessary to overstock the pasture where the bees were in order to get the stock to cultivate the bees.

T. P. ROBINSON.

Bartlett, Tex., Nov. 9.

### Improvements in Wax-Rendering

I notice what Mr. Arthur C. Miller says on page 776 about the wax-press, and I think he has hit the nail squarely on the head. Any contrivance that shall cut, and, perhaps grind into small particles, the comb and slumgum, thus allowing the hot water to come into close contact with the wax, thereby liberating it, and enabling it by its less specific gravity to rise to the surface of the water, would, it seems to me, come nearer to perfection than any other wax-press that I've known any thing of.

Will not some inventive genius try his hand at getting up something of the kind, and be among those who make two blades of grass grow where formerly but one grew? I am too old, or I'd try it myself.

Lake Geneva, Wis. WM. M. WHITNEY.

### No Honey-Flow This Year

Bees have scarcely stored enough honey this year to last them until next season. There was no flow this year.

ROY A. BOUTWELL.

Blencoe, Iowa, Nov. 4.

### Honey Crop a Failure

The honey crop was a failure this year in this part of the State. I have 9 colonies of bees, and got no honey the past season.

JOEL DAUGHTREY.

South Greenfield, Mo., Nov. 6.

### A Discouraging Report

The honey season here has been almost worse than a total failure, and very poor last year, having to feed the bees for winter. The prospect is fair to feed some bees this fall for winter. I think, besides, a good many bees in this part of the country starved to death the latter part of summer. I think that bees here generally will go into winter quarters in fair shape, so that I think the prospects are fair for a crop of honey next spring, which will surely be a boon to bee-keepers.

Beeville, Tex., Nov. 7. W. C. NUTT.

### Report of An Astonishingly Good "Crop"

DEAR EDITOR:—From time to time I have read in your paper, but not always with that intense interest that perhaps I should have had, the reports from various bee-keepers about their crops for 1905. I note that some reports are good, some fair, and others very bad—the goodness, badness or fairness depending upon the amount of honey and the price per pound.

I want to submit the report of my crop for 1905, which so far as I have read excels all others.

I have 29 colonies, all in good condition, and nearly all in active work under direct observation. I have spent, this season, about half my time in giving the bees the best care, and have used 300 pounds of sugar. I have harvested 9 sections of honey, a lot of odds and ends showing the work of the bees, 29 "tons" of happiness, and 325 stings.

I have learned much that I never knew before about these wonderful little creatures—and I close the season with the apiary stocked

full of plans, and myself full of ambition to get more happiness and more stings next year, to say nothing of information.

Yet there are old fogies who will tell you that it doesn't "pay" to keep bees!

EDWARD F. BIGELOW.

Stamford, Conn.

[There, Prof. Bigelow has thrown down the gauntlet; is any one ready to take it up?—EDITOR.]

## CONVENTION NOTICES.

### National Convention, Dec. 19, 20, 21.

—Another slight postponement of the National convention seems to be unavoidable. The Fat Stock Show, upon which we have depended for reduced rates on the railroads, has been postponed two weeks. The reason given is "the inability of the builders of the amphitheater to secure structural steel for the same," and they don't wish to hold the show out-of-doors, hence the delay. Of course there will be no excursion rates during the first week in December, and, as it would be suicidal to attempt to hold a convention without excursion rates, the Executive Committee has decided to postpone the convention two weeks in order to take advantage of the Fat Stock Show rates. The dates for the convention will now be Dec. 19, 20 and 21, 1905.

The place of meeting has also been changed to Brunt Hall, in the Bush Temple of Music, corner of North Clark Street and Chicago Avenue (entrance on Clark Street.) This was done because it was feared that the accommodations at the Revere House might prove too limited. The Chicago bee-keepers, with their customary enterprise and liberality, will pay for the use of the Hall. It is only 5 minutes walk north from the Revere House, Southeast corner N. Clark and Michigan Sts., which will be headquarters for the members. This new place of meeting is in a new building where everything is modern. There are adjoining committee rooms, toilet rooms, good drinking water, and elevator service both day and night.

W. Z. HUTCHINSON, Sec.

The Chicago-Northwestern Bee-keepers' Association will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to. All who are accustomed to paying their dues to our Association, thereby getting two memberships for the price of one, will please hand the \$1 to the secretary, or mail it to him as usual. The time in the evening will be given to the National, as will also the whole of the two following days. Every one is cordially invited to be present, both at the short sessions of the Chicago-Northwestern, and at the 7-session meeting of the National Association.

HERMAN F. MOORE, Sec.

Park Ridge, Ill.

N. B.—Any one paying their dues to the National Association direct, will have to pay another dollar to the Chicago-Northwestern, if it is desired to become a member of the latter organization also. Hand your dues to H. F. Moore, the Secretary.

H. F. M.

## TELEPHONE FACTS

We publish a finely illustrated book that is full of telephone facts. It tells all about telephones for farms, the kind to use, how to organize a farm telephone company, how to build the lines and where to buy the best telephones. Free if you ask for Book 80-F.

Stromberg-Carlson Tel. Mfg. Co., Chicago, Rochester, N.Y.

"It is continuous advertising that impresses the public with the stability of a firm."

## Now is the Time to Order

Your Bee-Hives, Sections, Shipping-Cases, Berry Boxes, and Crates for the coming season. By sending us a list of goods wanted, we can save you money.

**SHEBOYGAN FRUIT BOX CO.**

35A1st SHEBOYGAN, WIS.

Mention Bee Journal when writing.

## The Rietsche Press

Made of artificial stone. Practically indestructible, and giving entirely satisfactory results. Comb foundation made easily and quickly at less than half the cost of buying from the dealers. Price of Press, \$1.50—cash with order. Address,

**ADRIAN GETAZ,**

45A1f KNOXVILLE, TENN.

J. G. Goodner, of this State, writes me that he "prefers to pay \$25 for a Rietsche Press than do without it."—A. G.

Mention Bee Journal when writing.

## THIS IS THE LOCK

corner that we have told you about, and as you will see it can't warp nor split off as it passes by and nails firm to the side. Prices right—quality right—workmanship right.

Our discount discounts everything. Postal gets a circular.

**The Wood Bee-Hive & Box Co.**  
LANSING, MICH.

39D1f Please mention the Bee Journal.

## THIS LIGHTNING Lice Killing Machine

kills all lice and mites. No injury to birds or feathers. Handles any fowl, smallest chick to largest gobbler. Made in three sizes. Pays for itself first season. Also Lightning Lice Killing Powder, Poultry Bits, Lice Masher, etc. We secure special low express rates. Catalog sent free. Write for it.  
**CHARLES SCHILD CO.**  
3 Frankfort St. Cleveland, Ohio

## American Bee Journal Novelty Pocket-Knife Gold Fountain Pen

All for \$2.75

(This cut is the full size of the Knife.)

## NOVELTY POCKET-KNIFE

(Name and Address on one side—Three Bees on the other side.)

**Your Name on the Knife.**—When ordering, be sure to say just what name and address you wish put on the Knife.

**The Novelty Knife** is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the owner, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

**The Material** entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. It will last a life-time, with proper usage.

**Why Own the Novelty Knife?**—In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and, in case of death, your relatives will at once be notified of the accident.

**How to Get this Valuable Knife.**—We send it postpaid for \$1.25, or club the Novelty Knife and the American Bee Journal for one year—both for \$2.00. (Allow two weeks for Knife order to be filled.)

## SOLID GOLD FOUNTAIN PEN

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are Para Rubber, handsomely finished. The simple feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

We mail this Gold Fountain Pen for only \$1.25, or for \$2.00 we will mail it and the weekly American Bee Journal for a whole year.

Sample copy of the American Bee Journal free; trial trip of three months (13 copies) for 20c; regular yearly price, \$1.00. Address all orders to

### Honey and Beeswax

CHICAGO, Oct. 5.—The demand for comb honey is about as usual for the season of year. Offerings from the surrounding States are fully equal to the past season, but that from Colorado and the Middle Western States are not. No. 1 to fancy white comb honey sells at 13@14c, with an occasional sale at 15c; the off grades embracing crooked combs, etc., sell at 11@12c; amber grades difficult to place at 9@10c. Extracted, white, 6@7c, according to kind, body and flavor and package; ambers 5½@6½ cents. Beeswax selling upon arrival at 30c if clean; off grades about 2c per pound less,  
R. A. BURNETT & Co.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c.  
C. C. CLEMONS & Co.

CINCINNATI, Oct. 6.—Reports from differer parts of the country give evidence of an almost total failure in the comb honey crop, excepting the points in the North. We are selling this Northern comb honey at from 14@16 cents per pound, by the case. The demand for extracted honey is about equal to the receipts, which are good. We continue to sell amber in barrels at 5½@6c; white clover at 6½@7½c. For beeswax we are paying 30c per pound, cash, delivered here.

(We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)  
THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 23c trade.  
GRIGGS BROS.

PHILADELPHIA, Nov. 7. — The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get the people started, and after they start, the

-BEE ROOT'S GOODS -

At Root's Factory Prices

demand continues for some months. I would say that now is the height of the consumption of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c.  
We are producers of honey and do not handle on commission.  
WM. A. SELSER.

NEW YORK, Oct. 20.—Comb honey is now arriving very freely and the demand is good for nearly all grades. We quote fancy white at 13@14c; No. 1, 11@12c; amber, 10@11c, and buckwheat, 10c. Extracted in good demand. Arrivals of California are a large while from other sources receipts are very light. We quote California at from 5½@7c per pound, according to quality and quantity; Southern in barrels and half-barrels, at 55@60c per gallon. Beeswax firm and scarce at 29@30c.  
HILDRETH & SEGLEEN

CINCINNATI, O., Oct. 24.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the price high. We quote fancy water-white comb honey No. 1 white clover from 14@16c; No. 2 from 12½@14c. Extracted seems to be more plentiful. In barrels, light amber, 5½@5¾c; in cans, ½c more. White clover from 7@8c. Beeswax, 28@30c.  
C. H. W. WEBER.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c;

No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet; white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c.  
H. R. WRIGHT.

INDIANAPOLIS, Nov. 7.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c.  
WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.  
THE COLO. HONEY-PRODUCERS' ASSN.

SAN FRANCISCO, Nov. 8.—White comb, 1-lb. sections, 8@9 cents; amber, 6@7c. Extracted, water-white, 4½@5c; white, 4½@4¾c; light amber, 3½@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 25@26c. The honey situation remains unchanged since the last report. There is a good deal offering, but no business can be done at shipping-points at 4½c for water-white, this being the figure that is generally asked by apiarists. Dealers say that this price will have to be shaded at least ¼ cent in order to induce any speculation. White comb honey is being firmly held at 9c choice basis,

WEEKLY

## THANKSGIVING

BY THOMAS C. HARBAUGH

In the twilight of November  
With its foliage of gold  
Comes again the glad Thanksgiving  
With its customs dear and old;  
And beneath the starry banner,  
As it floats from sea to sea—  
We a happy Nation gather—  
Fears at rest, for all are free.

Not a hand in all this Nation,  
In the East and in the West,  
Bars the mansion or the hovel  
To the kind Thanksgiving guest:  
From the balmy groves of Southland  
To the nodding pines of Maine  
Nature, filled with joy and gladness,  
Spreads the yearly feast again.

We are thankful for the blessings  
That have crowned our cherished land—  
Fruitful orchards, golden harvests,  
Peace and love from strand to strand;  
'Neath November's robes of beauty  
Hidden lies the warrior's sword,  
And the olive branch is hanging  
O'er Columbia's festal board.

Aye, from mountain unto mountain  
'Neath the Union's azure dome,  
To the feast we spread this Autumn  
Bid the absent "Welcome home!"  
'Round the board where all are merry

Let the rarest sunlight play;  
With the love-key of Thanksgiving  
Open every heart to-day.

Thus let hoary age and childhood  
Join their hands with happy glee,  
In the homes beside the wildwood  
And the mansions by the sea;  
For our Union naught can sever—  
'Tis defended by the brave;  
Then let us greet forever  
This fair land our fathers gave.

Spread the table with His bounties—  
Let there be a feast of song;  
Let the voices of the household  
Fair Thanksgiving Day prolong;  
All are welcome to the pleasures  
That it brings to every farm,  
And to-day let hearts be beating  
With impulses glad and warm.

Hail the hallowed Thanksgiving  
That the Pilgrim Fathers gave!  
'Tis their legacy forever  
On the land and on the wave;  
Then, as Freedom's chosen people,  
We our destiny fulfill—  
Let the future's sweet Thanksgivings  
Find us grander, greater still.

—Successful Farming.

### SPECIAL ISSUE of Gleanings in Bee Culture, Dec. 15, 1905

We are pleased to announce that extensive plans are under way for a magnificent Christmas issue of Gleanings in Bee Culture, ready for mailing Dec. 15th. It is planned that this issue shall by far exceed in its wealth of contributed articles, its half-tone illustrations, and its cover design, anything heretofore attempted in bee-keeping literature. It will consist of at least 100 pages, and should be kept by every bee-keeper.

#### Cover

The cover is printed in three colors by one of the best color-printing establishments in the United States. We were not satisfied to attempt this ourselves, and have gone to great expense for the printing of this cover. The design is something unique, and very pleasing indeed. It shows the red clover in its natural colors in all its beauty, and, altogether, will make a bee-keeper's magazine that will compare favorably with any of the literary magazines of the present day.

#### Half-Tone Illustrations

During the past summer we have had a special artist who has been sent to various points especially to take photographs for us. He has traveled on our account alone the past summer over 4000 miles, and we can promise something very fine in various races of queens, dealers in bees, dealers in general supplies, dealers in special articles for bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

our half-tones for this issue. In this preliminary announcement we are unable to specify definitely the subjects that will be given, but those who are at all familiar with Gleanings for the past year will know that a treat in illustrations is in store for them. We can definitely announce now that some of the prize photographs in our second photographic contest, American and Foreign, will appear in this issue. Our engravings are made by the very finest engravers in the United States, insuring first-class work in every case.

#### Writers

For this issue we shall have our regular contributors, such as Dr. C. Q. Miller, G. M. Doolittle, Prof. A. J. Cook, J. A. Green, and Louis Scholl, besides special contributed articles, especially for the number, by E. W. Alexander, Dr. E. F. Phillips, of Washington, D. C., and others.

#### Other Features

Not only shall we make the magazine a thing of beauty and special value in its reading-columns, but special attention will be given to making it of value as a reference-book—a sort of year-book for bee-keepers—so that it will be kept for frequent reference throughout the following year. We expect to have all of the reliable advertisers represented in its columns, such as the breeders of bees for bee-keepers. It will be valuable alike to the advertiser and to the subscriber, and no bee-keeper in the country can afford to miss this issue; neither can any advertiser afford to miss the opportunity of being represented in its columns.

#### Subscription Rates

We are making a short-time offer—a special trial trip of 6 months for 25 cents, which will include this Dec. 15th issue. This one number alone should be worth 25 cents to any bee-keeper. We can not promise to hold this offer open indefinitely, for our cover pages will necessarily have to go to press considerably in advance of the day of publication; and after the number contracted for are sold, we shall not be able to supply additional copies. It is important, therefore, that your subscription be received promptly.

### WANTED—25 YOUNG MEN

There is now, and has been for years, a greater demand for experienced bee-help than there are men ready for these places. Each winter and spring we are obliged to disappoint many large apiarists by telling them we do not know where suitable help can be found. The demand is already beginning for the season of 1906.

We have found that many who take our course in bee-culture by correspondence prefer to go into business for themselves, so we still need active young men who have a fair knowledge of the subject—men whom we know something about—who can be recommended for the places frequently offered. We have, therefore, determined to-day to offer a limited course in

#### BEE-KEEPING BY MAIL

We shall designate this as Course No. 2. The lessons are identical with the lessons in Course No. 1. The time, however, is limited to one year from enrollment. The course may be easily completed in 3 to 4 months. The following is the

#### OUTLINE OF COURSE

- |                         |                         |                           |                            |
|-------------------------|-------------------------|---------------------------|----------------------------|
| 1. Definitions of Terms | 5. Transferring         | 9. Rendering Normal       | 14. Enemies of Bees        |
| 2. Inmates of the Hive  | 6. Building Up Colonies | 10. Preparing for Winter  | 15. Establishing an Apiary |
| 3. Comb                 | 7. The Honey-Flow       | 11. Wintering             | 16. Queen Rearing          |
| 4. Handling Bees        | 8. Swarming             | 12. Spring Management     | 17. General Examination    |
|                         |                         | 13. Bee-Diseases—Symptoms |                            |

#### TERMS OF COURSE 2—FULL-CASH PAYMENT

Complete course as outlined, lessons, personal answers to all questions, including the ABC of Bee-Culture (500-page book), and Gleanings in Bee Culture, (semi monthly,) for one year, \$5.00.

With either the ABC or Gleanings omitted in case you have one, \$4.00.

With both omitted in case you have both, \$3.00.

If a full colony of Italian bees with tested queen is wanted, in either Dovetailed or Danzenbaker hive, we will, for \$10.00 extra, deliver one colony at your express station, at any point in U.S. east of the Mississippi River, or make equal allowance to other points

## Editorial Notes and Comments

### The Minnesota Convention

This convention will be held Dec. 6 and 7, 1905, in the First Unitarian Church in St. Paul. It was announced that there would be no meeting of the Minnesota State Association this year on account of the National convention announced for the same time in Chicago, but now that the National is to be held Dec. 19, 20 and 21, it has been decided to hold the Minnesota convention Dec. 6 and 7.

### False Conclusion from True Premises

The following clipping from the St. Louis Republic, of Oct. 26, has been sent to this office:

#### MAKING OF HONEY.

The bees make the quality of their honey according to the kind of food or flowers from which it is procured. Eminent authorities on bee-culture state that when bees are fed scorched honey the honey in the combs did not suffer therefrom. The same results occurred when granulated honey was fed to the bees. Honey can therefore be adulterated in the combs. Glucose, when fed to bees, is deposited in the combs as glucose, and it has long been known that certain flowers produce honey of a superior quality to that derived from others.

There must be something out of whack in the reasoning machinery of the one who wrote that item. Three things are stated as facts:

1. The quality of honey varies according to its source. Sure.
2. Scorched honey fed to bees will be scorched honey in the combs. Very likely.
3. Granulated honey fed to bees will be deposited as granulated honey in the combs. No proof of that; but for the sake of the argument admit its truth and proceed to the therefore. *Therefore* honey can be adulterated in the combs. O lame and impotent conclusion!

In each of the three cases mentioned, there is apparently no thought that anything but honey is put into the combs, whether it be from one flow or another, scorched or granulated; where, then, is there any adulteration?

Then as a sort of corollary the statement is

made that glucose fed is glucose in the comb; and to give greater weight there is coupled with it the well-known fact that one flower may give a better quality of honey than another.

There is something a little off from the usual slander, that comb honey may be found on the market with never the touch of a bee upon it—entirely artificial—but it is hardly likely the editor of the Republic would have admitted the item if he had stopped to consider the impression likely to be made upon the mind of any uninformed reader who reads the item with its significant heading. It will be something like this: "Honey found on the market in the shape of pretty white combs is likely to be *made* honey, and nothing but glucose."

If the Republic should try feeding glucose to bees, it might find what others have found, that it would have a hard job to get the bees to accept the stuff, no matter what it might be in the comb if they should accept it.

The Republic has shown a disposition in the past to be fair to the bees; will it not do the fair thing now by saying that when honey is found in the comb it is the genuine product of the bees?

### Ants and Bees

The British Bee Journal says: "Ants are so often troublesome to bee-keepers by entering hives and carrying off the bees' stores, that in all good text-books the ant is classed among the 'enemies of bees.'" There are ants and ants. In the North, in this country, the ant can hardly be classed as an enemy of the bee, although annoying to the bee-keeper by crawling over his hands and arms. They seem to make their nests about hives rather for the sake of the heat furnished by the bees, and, as stated in Root's "ABC of Bee Culture," "A good colony of bees is never in danger of being troubled in the least by ants."

There is, however, a large ant in the North, and probably as well in the South, which, although it may not trouble the bees, is espe-

cially dangerous to those who have out-apiaries and frequently haul bees. It burrows into the wood of hive-floors, honey-combing them in such a way that a very little will knock a hole through, causing bad accidents in hauling.

In the South, however, there are ants which destroy queens, and in South America they destroy whole colonies of bees.

### Experiments of the Past Season

Doubtless many of our readers conducted apian experiments of various kinds during the past season, and are now ready to report on them for the benefit of others. We would be pleased to give them a place in these columns, or at least as many of them as we may have room for.

Also, we would like to have honey-crop reports and interesting experience with anything relating to bees, honey and beeswax.

As ye have been benefited by the writings of others, so ought ye to write for their benefit. How about it?

### Making Nominations for the National

A letter has been received from W. Z. Hutchinson, editor of the Bee-Keepers' Review, replying to the editorial on page 773. As it will be no betrayal of confidence, and especially as it is desirable that both sides be fully presented, the letter is here given:

DEAR BROTHER YORK:—Allow me to thank you for the very fair and gentlemanly review of my criticisms regarding the publication of the names of the nominees for office in the National. If all would criticise in the spirit displayed in those remarks of yours, discussion would always be a pleasure.

Still further, let me explain that I had no intention of *blaming* Bro. France, in the sense in which that word is usually employed, for publishing the whole list of those who had received votes. It is true that the instructions of the Directors do not say that he must *not* publish them—it simply says that the two persons receiving the greatest number of votes shall be the candidates, and that their names shall be published in the bee-journals, and the *inference* would be that those would be the only names published.

Still further, the rules do not say that the General Manager shall *not* tell who received the greatest number of votes, but the inference is that he would not. The rules tell what *shall* be done. Bro. France has done

what he was instructed to do, and then has done still more, and my contention is that this *additional* "doing" nullifies the object of the nominations.

I was one of the Directors at the time when these rules regarding nominations were passed, and I can truthfully say that there was no idea or intention of so arranging things as to "keep them in the dark." Personally, I would have no objection to the publication of all of the names that received any votes, also the giving of the number of votes that each man received, and I think that all of the Directors are like-minded—probably the same might be said of all of the members. But here is the point—the one that the Directors had in mind when those rules were framed, viz.: that there might come a time when some undesirable man would be elected to some important office. This man might think, himself, that he was doing his work well, but it would be apparent to every one else that he was not. We could not go to him and tell him that he was not a fit man for the office; that would be too cruel. The proper thing to do would be to elect some other man in his place; but, without nominations how could it be done? The opposition votes would be scattered among a dozen or more candidates. It was for this reason, and this *only*, that the number of candidates was limited to two. The man in office is almost sure to be one of these candidates, and, if there is only one opposing candidate who will receive all votes not cast for the man already in office, there will then be some hope of some time electing a new man to office.

I agree most fully with Bro. York, that when the members of an association are gathered together in convention, and an informal ballot is taken, that it is customary to announce all of the names of those who have received votes, also to state the number of votes that each man has received; but it is also true, just as my Chicago brother says, that the vote for officers in the National Bee-Keepers' Association is somewhat different from the election of officers at a convention. At a convention there is an opportunity to discuss candidates between sessions; besides, when officers are elected at a convention held first in one portion of the country and then another, it is almost universally the custom to elect new officers at each convention. If we are going to elect a new man—if that is practically a foregone conclusion—then I see no objection to announcing the names of all who have received votes, and also giving the number of votes that each receives. In fact, if the officers were to be elected by a plurality vote, as is the case in our National Association, then there is no earthly use of an informal ballot. The way that things have been running in the National in the past it has been almost impossible to elect a new officer when the voting was done by mail.

I agree with my brother, that the old officer *may* be the best, but we wish to be able to elect a new one if we wish to do so, and it was to secure that end that the rules for nominations were made as they were. If they don't accomplish their object—if they have objections that can be remedied—if there is some better way—I, for one, shall be only too glad to see them changed.

As ever yours,

Nov. 10, 1905. W. Z. HUTCHINSON.

The foregoing raises the question: Is it certain that a new man's chances would

always be lessened by the addition of a second new candidate, and equally certain that the old incumbent's chances for remaining in office would thereby be lessened? Suppose Smith to be the old man, and Jones the new. Smith gets 55 percent of the votes, Jones 45 percent, and so Smith continues in office. Now suppose that instead of having only the two candidates there were three, Smith, Jones, and another man, Brown. Is it unreasonable to suppose that whatever votes Brown gets will cut in on the Smith vote much more than on the Jones vote? So, with the three candidates in the field it would be nothing impossible that out of every 100 votes Smith should get 35, Jones 40, and Brown 25. If, therefore, the "only" object of the informal ballot be to get rid of one already in office—and it may be said by way of parenthesis that the object at least *ought* to be more than this—it seems at least possible that in some cases it might be accomplished more easily with two new names than with only one.

The closing sentence of Mr. Hutchinson's letter is in the right spirit, and worth considering. There need be no difficulty, probably, in making a change of plan if any one will suggest what is that better plan. And in this connection it may be well to mention one fault so glaring that some means should be found for its remedy. Mr. Hutchinson, speaking of a man in office whom it is not desirable to continue in that office, says:

"We would not go to him and tell him that he was not a fit man for the office; that would be too cruel."

In just about that cruel position is every member put who in the formal ballot votes for a new man for Secretary. For the ballots are sent to the Secretary to be counted, and it is putting a man in a rather cruel place to say to him: "You must vote for the old Secretary, or else you must walk up to his face and say, 'I want a new man to take your place.'"

It is an easier thing to find fault than to suggest the remedy, but remedies are not generally sought till faults are known, and it is in order for any one to act on either line.

### Carloads or Cartloads of Honey

A little time ago mention was made of the purchase of 70 carloads of honey by the National Biscuit Co. Our genial Afterthinker was taken to task for making it larger than it was. Now a correspondent of the British Bee Journal turns the other end of the spy-glass upon it, and reports "seventy cartloads!" At least, that is what appears under the name of D. M. Macdonald, but possibly he may have a score to settle with the "printer's devil."

**To Foreign Subscribers.**—We wish to repeat a notice that we have given several times before. It is this: None of our special offers made in the American Bee Journal, or anywhere else, apply to foreign subscribers. So whenever we receive a foreign order with remittance we always apply it all on subscription to the American Bee Journal. If our foreign readers would think about it a little, they would quickly see that our special offers would not apply to them, on account of the extra postage to foreign countries. Also, we do not export any queens except to Canada and Cuba.

## Some Expert Opinion

### How Best to Use Convention Time

**Ques. 31—1.** *What proportion of the time of a bee-convention do you think should be taken up with a question-box for the greatest benefit to the average bee-keeper attending?*

**2.** *What proportion for your own greatest personal enjoyment?*

J. M. HAMBAUGH (Calif.)—1. One-fourth.

JAS. A. STONE (Ill.)—1. The larger part of it. 2. All.

MORGAN BROS. (S. Dak.)—1 and 2. At least one-third.

REV. M. MAHIN (Ind.)—1 and 2. The more the better.

E. E. HASTY (Ohio)—Well, at a venture, say about half for both 1 and 2.

ADRIAN GETAZ (Tenn.)—1. About half. 2. All, and the funniest the better.

WM. McEVoy (Ont.)—Nearly all the time. All the time would suit me much better than anything else.

O. O. POPPLETON (Fla.)—1. As much as possible aside from transacting all really necessary business. 2. All.

R. C. AIKIN (Colo.)—1. Three-fourths. 2. Are we so selfish? Can't enjoy helping and seeing others enjoy themselves?

G. M. DOOLITTLE (N. Y.)—Just in proportion to the wants of the greatest number of "average bee-keepers attending."

S. T. PETTIT (Ont.)—1. May be about 20 percent. 2. Whatever suits the crowd. I enjoy seeing any meeting happy in a proper way.

R. L. TAYLOR (Mich.)—1. Sufficient for the answering and discussion of all the questions that can be obtained. 2. Nearly all the available time.

EUGENE SECOR (Iowa)—1. All of it. 2. In National conventions I think it is well to have some leading authorities give papers on important subjects.

C. P. DADANT (Ill.)—Two-thirds of it. I enjoy that part best, and learn more than anything else, for we get the ideas of individuals from all directions, on the spot.

PROF. A. J. COOK (Calif.)—1. From a large experience in conducting Farmers' Institutes, I should say from one-fourth to one-third. 2. I should enjoy what gave the most benefit to all.

MRS. J. M. NULL (Mo.)—According to the character of the questions. Convention time is *always* valuable, and in some cases to furnish a text-book and a journal or two would be economy.

C. DAVENPORT (Minn.)—A large part of it. I have never been able to get away to attend any large conventions, but I think the question-box and short discussions on live topics would interest me most.

N. E. FRANCE (Wis.)—1. Often it is the best part of a convention. If papers are read they should be short, and the discussion follow. 2. Nearly all questions, and when all are free to ask practical questions.

L. STACHELHAUSEN (Tex.)—1. This depends upon circumstances. If some Dr. Millers are in the crowd an all-question-box convention will be a success; in other conventions I have seen a few hours' question-box an entire failure.

J. A. GREEN (Colo.)—I have always gotten the most enjoyment and good from the free discussion and interchange of experience and opinion that is most likely to result from the question-box method. At the best conven-

**One of the Best.**—Mr. F. M. Scott, of Dodge Co., Minn., when sending his renewal subscription for two years, wrote:

"The American Bee Journal is one of the best and most able journals in America."

We would like to have say 25,000 readers just like Mr. Scott, in addition to our present list of honey-folks. We would like to have all who can do so, help us to find them. We offer premiums—good pay—for the work of getting and sending in new subscriptions for the American Bee Journal. Why not ask your neighbor bee-keepers to subscribe?

tions I ever attended, no papers were read. Papers are sometimes valuable in starting discussion, but usually more good can be gotten out of a paper, at far less expense, by reading it carefully at home.

E. S. LOVESY (Utah)—1. About one-third of the time of each session. 2. The same. If there is a lack of interest at the beginning of the meeting the question-box can be used to create a general interest in the whole program.

E. D. TOWNSEND (Mich.)—Personally, I enjoy the question-box the best of anything about a convention, and I can not conceive of anything better for the main part of the time. Did you ever see a convention lag during the question-box session?

E. WHITCOMB (Nebr.)—The question-box certainly is very interesting. One-half of the sessions of our conventions could very profitably be taken up by the question-box. By it

we gain an insight into what our listeners desire us to talk about.

G. W. DEMAREE (Ky.)—1. Speaking from some experience in convention work, I regard the educational feature of the exercises—such as asking and answering questions—the most important of all. 2. Let us enjoy our *duty well done*, rather than *self-enjoyment*.

C. H. DIBBERN (Ill.)—At least half of the time of a bee-convention should be devoted to the question-box, and the more questions on new lines the better. For my own part, I would rather have all the time devoted to short, spicy questions than listen to long, windy essays.

P. H. ELWOOD (N. Y.)—Only a limited time when a committee answers the questions. When you have the whole convention answer, and you have a president equal to the task of directing and changing the discussion at the

proper time, it is a good way to run a convention for a session.

DR. C. C. MILLER (Ill.)—1. All the time that can be spared from necessary business, unless it be occasionally a short paper or talk on a special topic by one particularly qualified. 2. All of it, provided there's a man in charge who wisely directs the discussion; preventing it from being switched off into something of little value, and changing to the next question as soon as all the milk has been gotten out of the coconut.

DR. J. P. H. BROWN (Ga.)—1 and 2. Answers to these questions depend very much. In most conventions of this kind there is too much time wasted by mouthy and "windy" members who like to hear themselves talk, to the exclusion of more experienced and better-informed members who are not blessed with a fluency of words. A *time limit* should always be set to prick the gas-bags and give the modest members a chance.

## December Work In and About the Apiary

BY C. P. DADANT

IF our bees have not been put into winter quarters on the summer stands, but are intended to be put into the cellar, this is the month to do it, and rather early than late. In latitudes further north they are usually put away during November. A change of weather after a warm day is the proper time. If the bees have already been confined for several weeks to the hive by cold weather, they will probably fare as well if they are left outside, as they have already been consuming stores, and their intestines may already be somewhat loaded.

Any good cellar for fruit or vegetables will do to winter bees, provided a corner may be set apart for them and separated from the main cellar by some sort of partition, even if made only of old carpets. There must be ventilation so as to cool the temperature which may become too high, especially if the colonies are strong and numerous. We take them in without the cap or super, and give them both upper and lower ventilation. The hives may be piled on top of each other, using a slat at each end on top of a hive before putting on the next, so that there may be a space between them. We leave the hive-entrance entirely open, and turn this to the wall or towards the darkness, so the bees will not be induced to fly. Darkness is important, and the window, if there is one, should be darkened by a curtain.

A special bee-cellar in which nothing else is kept is certainly desirable, but many bee-keepers can not afford this and yet can well spare room in a good house-cellar.

Nowadays many cellars have a furnace which heats the home. Even such a cellar may be used. We have used one of this description for a number of years with good success, but the bee-room was partitioned off with a 4-inch sawdust partition, so that the bee-cellar could be kept cool while the other part was warm. Such a cellar has the advantage of being very dry, and also of being easily warmed up when the temperature falls too low. But it is the other extreme which is most to be guarded against. From years of experience repeated by others we find that about 40 degrees Fahrenheit is the nearest correct. This may vary a little according to outside temperatures, but the degree at which the bees remain the quietest is correct. A low hum is all that should be heard. When the temperature rises or gets too low the noise increases.

Towards spring a few bees will leave the cluster, from time to time, and fall to the cellar floor after making a vain attempt to escape. Those bees have become restless from some cause, and would disturb the quiet of the others, and it is better for them to die. The loss in this manner will be small.

Nothing is required for the bees left on the summer stands, if they are properly protected. Reducing the entrances according to the requirements of the colony, cleaning the snow from the front, keeping out stock and other outside disturbances will fulfill the conditions necessary for success. Our

main reason for wanting the snow cleaned from the front or alighting-board is that the bees may have a clean place to travel on, if the sun gets warm and the snow melts.

Hamilton, Ill.

## Bee-Supply Prices and the Honey-Market

BY DR. G. BOHRER

ON page 647, Mr. J. E. Johnson discusses the price of bee-supplies and honey, and assumes the ground that in case  $1\frac{1}{2}$ -story hives could be purchased for 75 cents each every Tom, Dick and Harry would be in the bee-business: there being, he thinks, so many of this class now, and that many owners of bees bring their honey to market in the worst possible condition, so much so as to injure the price and sale of honey. He thinks that if the price of bee-supplies was so high as to drive this class out of the bee-business it would be a blessing to any community.

That there is a very great want of true knowledge among a large percent of people who own bees, and that there is also a corresponding amount of inexcusable negligence among them, are undeniable facts; but to attempt to remedy this state of affairs by raising the price of bee-supplies can not, and will not, bring success in either the price of honey or the scientific management of honey-bees, in my opinion; and I will suggest that if the opinion is generally prevalent among bee-keepers, that a bee-supply trust exists, or that there is a secret understanding among manufacturers of these supplies to raise the prices of the same, and thereby enable them to reap an unjust, and, consequently, an undue profit, we, the bee-keepers, when in convention assembled, should select a proper committee and instruct them to investigate the facts in the case and report the result of their investigations, and if it is ascertained that an undue profit has been, and is being realized by our bee-supply men, let us take immediate action by either subscribing stock and starting a factory of our own, or by entering into an agreement with some bee-supply factory that will sell us supplies at a fair price. And mark my prediction, Mr. Editor, we will reduce prices inside of 30 days.

I will also suggest that the goods supplied be of good quality, requiring all bottom-boards, landing-boards and followers to be made of substantial material. This I deem a matter of considerable importance. I have quite a number of hives with bottom-boards too thin to permit bees to be moved in safety; and the detachable landing or alighting boards are so thin that they warp to pieces and break down when a quart or two of bees lie out on them or cluster under them; while the followers or division-boards are worthless after once stuck fast with propolis, as they split to pieces when an effort is made to get them out of the hive. In the last hives I purchased I did not make up the followers, as they were not worth nailing together.

I would also suggest that we state to the public in plain language that a hive shallower than the standard Langstroth hive is not by any means a safe hive for a beginner to use in a climate where there is much zero weather, nor for any one else who winters bees on the summer stands, while in a mild climate shallow hives may answer a good purpose.

In the matter of improving the price and sale of honey, let us ascertain by what form honey can be produced and put upon the market in the cheapest and most wholesome form as food. When this has been done, and we, in our advertising

efforts set forth the facts plainly, the people will make a note of it, and in time there will be a heavily increased demand for honey all over our country.

"But," says one, "Bohrer believes that extracted honey is the cheapest and most wholesome." But people won't buy it through fear of being imposed upon by the artificial-honey vendor. To head off this danger let every bee-keeper use his or her influence for a pure food law, for without it the sale of honey will be held down in the future as it has been in the past, and as it is now being held down. It won't only be so in the case of extracted honey, but in the case of section comb honey as well.

In addition to all this, let us through our agricultural and local country papers tell the public, and repeat our statements if need be, that artificial honey-comb has never been manufactured, and that the probability is that it never can be. Sheets of beeswax with the bottoms or cell-foundations stamped upon each side is the most advanced step ever taken by man in the manufacture of honey-comb, the cell-walls being so thin and delicate that even if molded the mold could not be removed from the cells without breaking them down.

Let us drop the term "artificial comb honey" in our efforts to educate the people upon this subject, it having no legitimate place in the discussion of the real falsehood to be exposed. The term "artificial honey" was manufactured many years before "artificial comb" was ever talked of, so that the latter is the real question at issue. Let us stick to it. I am not unmindful of the fact that comb honey in the form of so-called "formed sections" is regarded the most attractive form in which honey is produced, but I shall again insist that it is not the cheapest or the most wholesome, and consequently not the best. Let us get the people to know what the best form is, and, in time we may hope, with the support of a strong, pure food law, to see the honey-market problem solved.

I am also free to admit that honey, in order to be acceptable among some of our people, must please the eye; and some say that in the comb and section it is the most attractive. Let such as can not admire or like honey in any other shape have it in the comb. But at the same time let us tell the whole truth, and inform everybody that in the extracted form it is by all odds the cheapest, just as palatable, more wholesome, and it will sell in larger quantities than in any other shape.

Mr. A. I. Root placed the honey-section before the public. Every one saw at a glance that it presented honey in the neatest, most cleanly, and most attractive form, and largely drove from the market bulk-comb honey, the comb of which often contained cocoons and pollen. Yet, as Mr. Johnson says, sections sometimes contain the above-named undesirable and objectionable articles. Lyons, Kans.

## Purity vs. Good Working Qualities in Bees

BY G. M. DOOLITTLE

IS it needful to have any of the races of bees in their absolute purity to secure the best results in honey? Please answer this in the American Bee Journal, as very many of the readers will be interested in the matter."

This writes a correspondent. Were I to answer this in the briefest possible space I should say *No*, making it very emphatic. But I take it that the correspondent wishes to know the whys and wherefores of such a decision, when so much has been said in the past in our bee-papers and elsewhere regarding a standard of purity, it being made to appear that the higher this standard the better the working qualities.

In the first place, I know of no race of bees in this country to-day that are absolutely *pure*, unless I except the black or German race of bees; and these have become so mixed with bees of foreign importation that in most places they have ceased to be identical with the bees of our fathers. The best that can be said of any of the foreign bees, so far as they have come under my observation (and I have had nearly all of them; those from whom I had them claiming that those sent were certainly *pure*) is, that they are a thoroughbred, for there is not one of these claimed pure races but what will "sport" to an extent sufficient to condemn all claims for purity. So it is not necessary to have bees in their "absolute purity" to secure the best results in honey, for an absolute purity can not be obtained in this country, unless, perchance, it is the black bee, and we have for years been claiming that the thoroughbred bees of foreign importation, added to which has come the intellectual breeding of American genius, are much better for honey than the black bees of our fathers.

The breeding of American genius has been along the line of better bees as regards *good qualities*, especially the quality

of superior honey-gathering, and the good yields of the present time as compared with a score of years ago, tells how successful they have been. Allow me to illustrate something of this matter from my own experience:

One year during the latter part of May, while changing one colony from the hive it was in to another hive of more recent make, I noticed a fine-looking orange-colored queen with the workers quite evenly marked, and of the same peculiar orange color. A neighbor who kept bees happened along at the time and remarked that he would prefer a darker-colored queen for good business at honey-gathering, and I agreed with him in this decision. No further notice was taken of this colony till about June 25, when the bees were nearly through swarming. This one had not swarmed, but had 60 pounds of section honey nearly ready to come off. On July 3 they gave a fine swarm, which was hived in a new hive. Although the parent colony had none of its queen-cells cut, it never offered to swarm again, and the result at the end of the season was 195 pounds of section honey from the parent, and 114 from the swarm, or 309 pounds from the old colony, all told.

The queen reared in the old hive proved to be as good as the mother, and both colonies wintered with the loss of very few bees, and consumed very little honey when in winter quarters. Then in spring they built up in good shape for the season's work, and showed the same disposition not to swarm till late, each of the two colonies giving nearly one-third more section honey than the average of the rest in the apiary. From this on I reared nearly all my queens from the old one as long as she lived, and found that the majority of them proved as good as did the one reared the first year; they laying the most prolifically just at the right time to bring their bees on the stage of action in the greatest numbers at a time to take advantage of the honey harvest when on, and these bees were great honey-gatherers. These bees were used as the base for breeding, and were really of no known pedigree of stock.

In order to obtain, if possible, something better still, I began procuring queens from persons who reported *good honey-yields*, believing that with these good yields must come good wintering qualities, etc., as no good honey-gathering could possibly come from bees which were deficient in the other things needed as a basis for the thing sought after. Some of the queens bought did not come up to my expectations, and were superseded as soon as proven. Others proved good, some even better, along certain lines, than what I had, and were used to advance the apiary up to a higher standard as to honey-gathering, I never asking regarding the purity of the stock, as the best honey-producers were what I was after.

By this method of crossing I have bred up a strain of bees which please me as to their honey-gathering qualities, although for yellow bands and golden-all-overs there are doubtless bees more pleasing to the eye. And I am still striving to advance these bees further along the honey-gathering line, and I am on the lookout each year to see where anything can be purchased that gives a prospect of furthering this object. And there are many others in the United States and Canada who are working just as faithfully to secure the best bees for honey-gathering as I have been.

Through this disposition to work for the improvement of stock along the honey-gathering line, on the part of the best apiarists of North America, I believe the day is not far distant, if it has not already come, when the bees of America will be conceded to be the *best bees in the world*, with no especial claim to their purity, or of their race or variety, nor from what country their ancestors came. Borodino, N. Y.

## Convention Proceedings

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 810)

#### THE PRODUCTION OF BULK-COMB HONEY.

Mr. Aten has produced bulk-comb honey a long time. He had to have his cans made especially for the purpose in Austin, with a 4 inch screw-cap opening in the regular 60-pound can. The comb had to be cut very small, which made

these cans undesirable. Since the 8-inch screw-cap was made the comb honey could be packed very nicely, and when unpacked it came out more easily, and looked fine. This made it ten times more easy to sell a crop of honey, and with a larger profit, as a great demand for such bulk-comb honey was soon created. Besides, the adulteration practiced with extracted honey was done away with to a great extent.

He uses the 10-frame hive 3 stories high in the spring, and 4 stories high later. He lets the bees store in extracting combs first, in the beginning of the flow, until these combs are nearly ready to seal, then he alternates combs by adding frames with foundation between them. He claims that the bees go to work so very much sooner in the full-depth supers when treated in this way than when shallow supers are used in the usual way.

Mr. Victor is not in the comb-honey business now. He used deep supers, but would prefer shallow supers if he were in the business. To have the hive full of hatching brood 10 days before the flow is essential. No excluders are used. It is a good plan to have baits above which help to keep the bees from swarming, as they occupy the new room given them. A shallow extracting super put on early is of much value. The bees store the early honey there instead of crowding it into the brood-nest; the young bees get used to living there, and work in the new supers immediately when given them between the shallow extracting super and the brood-nest. In this way an extra amount of extracted and more comb honey is procured. Shallow supers are decidedly preferable, especially during a slow or short flow, as one or two finished supers of honey can be obtained while the deep ones are not filled. Room should be given *before* the flow is on, and not wait till the flow has begun, so that the first honey goes above and not into the brood-chamber.

Mr. Milam remarked that no two localities nor two seasons are alike, therefore much depends upon the successful production of comb honey. For success a fast flow is necessary. Swarming stops as soon as the bees get the whole idea that they will store honey. He uses excluders and prevents brood-rearing in the new combs. Some bee-keepers claim that these are honey-excluders, but he uses them and keeps the queen in one or more 10-frame hives below. One must study his locality, and then the season is as important as the locality. You can not get comb honey from weak colonies. These are run for extracted honey. Shallow supers are better, as a few supers of honey can be produced on weak colonies when it can not be done with larger, full-depth bodies. He does not like to extract from the brood-chamber.

Mr. Laws—The subject of bulk-comb honey production is a very important one, as bulk-comb honey brings us our money. There is a great demand for this kind of honey.

Mr. Butts is in favor of the shallow frame. All those who have tried them continue to use them, and those who condemn them are those who have never tried them. They don't know it all. Weak colonies are not good for producing comb honey, and should be run for extracted. Extracted honey is needed anyway to pack the comb honey with. He does not get enough extracted honey, and has to buy it from others to pack his comb honey. He tried something new the past season in the way of putting up bulk-comb honey. When he heard of the way The A. I. Root Co. put up cakes of granulated honey wrapped in wax-paper, the idea struck him that comb honey might be put up in much the same way. He packed some of it, but did not ship any. Each comb is wrapped separately in a piece of paraffin paper and then packed in the cans. As there is no liquid honey outside of these separate packages, each comb can be taken out individually in a nice and perfect condition. This is a new idea, and may be worth something to the bee-keepers.

Mr. Hagood stated that bulk-comb honey can be produced successfully only with strong colonies of bees. Good, thrifty queens are all-important. The weak colonies should be managed for extracted honey.

Willie Atchley—The bee-keeper must first study his location and acquaint himself with the honey-flows before anything else in order to be successful. Two full-depth hive-bodies are used for the brood-chamber, and the exchanging of combs of brood and honey from below and above; spreading brood to work the queens for all they are worth, to procure rousing colonies by the time of the flow. When it opens, all the hatching brood is crowded into the lower body and the full-depth supers are put on. The bees take possession at once. In my locality swarming stops when the honey begins to rush in, and there is no danger of swarms during the honey-flow with the method practiced. The remaining brood may be used for new colonies, or with which to strengthen others, or the combs may be used over extracted-honey colonies. If I crowd my colonies down into a single brood-chamber by us-

ing excluders, and use only shallow supers, as Mr. Victor and Mr. Milam do, it would take one man for every 100 colonies of bees to keep down swarming. I have had the strong colonies to draw out the foundation and finish a 10-frame full-depth super in 6 days' time.

Mr. Pharr never produced much bulk-comb honey, but he agreed with Mr. Atchley, that one must of necessity "work the queen for all she is worth." Then when the supers are put on, some chunk honey is obtained in a good flow, while extracted is obtained if the flow is light. Bees are loth to go up into shallow supers, and two deep supers of comb honey can be obtained as against three shallow ones. He believes the deep, full-depth bodies are the supers to be used for money, and that is what we are keeping bees for.

Mr. Atchley said that another point brought out in using two full bodies for a brood-chamber in getting rousing colonies of bees, is the ease with which increase can be obtained. When the upper story is removed some brood and bees are left in it, a bottom and cover is put on, a ripe cell or a queen is given, and the newly-made colony is set away on a new stand. This leaves the old colony with the old bees on the old stand in first-class condition for bulk-comb honey.

Mr. Butts winters his bees in two deep bodies, pushes brood rearing in both until the honey-flow, and then shakes them into one below where he places all the brood. When shaking them he handles the bees roughly to cause them to gorge themselves with honey, and as the shallow supers with foundation are added at the same time, they begin comb-building immediately. With deep combs it is hard to get them capped entirely unless you have a good honey-flow.

Mr. Laws handles his bees in deep bodies, two for a brood-chamber, and if one were to watch him he would think that he was trying to do nothing else but to prevent swarming. He scatters the brood throughout two bodies, then compacts it in one at the approach of the flow. Just so the bees are there when the flow comes the bulk-comb honey will be obtained all right.

Mr. Bell tried both shallow and deep supers. If he would use the shallow supers he would use them from the ground up, as he does not like two different depths or sizes of hives in a yard. The first thing is to produce the bees—then there must be the honey, of course.

## Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 810.)

SWEET CLOVER HONEY.

"What are the objections, if any, to honey produced from sweet clover?"

Mr. Horstmann—There is no objection. That is the best honey produced.

Pres. York—The only objection then, is, that we don't get enough of it!

Mr. Colburn—I have heard the suggestion that it was not as good as white clover honey. I have been in localities where I got both, and I confess I like the white best. The sweet clover is very fine—it is very far ahead of anything else in looks, but I don't think the quality is as good as the white clover. If you can get it mixed it is good.

Mr. Becker—I think sweet clover is all right, providing there is no other honey with it. I have had experience with sweet clover. We don't get it pure in our neighborhood. Whenever we take it to Springfield we have to have our sales made before we get there to get rid of it. They don't like it in that locality. I bought some from Mr. York, four or five years ago, when there was no honey at all in our part of the country, not even an ounce, and I took it down to the State fair to make my exhibit, and then sold it out; and the store keepers who sold the honey use to tell me, "Becker, you have ruined my honey-trade." They said, "That isn't honey."

Pres. York—Didn't you get a premium on that honey?

Mr. Becker—Yes. [Laughter.]

Mr. Kannenberg—I think it depends a good deal on man that sells the honey, and how to educate the people to taste the honey. I think if Mr. Becker educates people to get the honey they liked they would eat the same.

Pres. York—Probably there is not enough of it.

Mr. Colburn—I have in my place three differ-

of honey. There is another kind of honey I have had put into sections and supers; I don't know what source it comes from. It is white, though not snow-white like sweet clover; it has a slightly muddy tint. That honey has no more flavor to it than so much sugar syrup. As soon as I discovered it I stopped selling it, because I said everybody that tastes that will swear it is sugar syrup and nothing else. I would like to know if anybody else has had any experience with it. I think it comes about between white clover and spring clover.

Mr. Meredith—Is it honey-dew?

Mr. Opfer—Here is a bottle of sweet clover honey, and I would like anybody in the audience to show better honey than this. It depends a good deal on the man that produces the sweet clover honey in my opinion.

Pres. York—I am satisfied that Mr. Opfer's sample is pure sweet clover honey. I have had lots of it.

Mr. Moore—I would like to say a word on this honey question. I sold to my customers some sweet clover honey in Chicago, seven or eight years ago, and it is only recently I have gotten away from the effects of it. Any one who asks which is best, I say, "There is no best; it is simply a question of what you are used to." This market is used to clover and basswood flavors. They get their honey from Illinois, Iowa, Wisconsin and Michigan, where the preponderance is white clover and basswood. I know a majority will have sweet clover honey. Where they get to like it, it is liked as well as anything else. But this honey question is purely a matter of taste. They want what they have all their lives been used to, and they will absolutely condemn and call impure anything else.

Mr. Becker—As far as sweet clover honey is concerned, I have no objection whatever; it is a very fine honey. But when you take out a section of sweet clover honey there is the peculiar smell to it that is not in any other honey, and

I think that is the part that people do not like. When you taste the honey it is as fine tasting as any honey, but it has that peculiar smell that you can smell in the growing sweet clover a hundred yards off before you reach it.

#### LABELING SECTION HONEY.

"What might be the disadvantage of a label covering all four sides of a section, printed matter being on all four sides?"

Mr. Fluegge—I should think it would be daubed up with honey and get soiled.

Mr. Wilcox—Retail dealers might not like it, and that is a serious objection. They won't want to advertise your honey for you, by distributing it among their customers; they would sooner order direct from the producer.

Pres. York—I take it that the question means printed matter concerning the production of honey, or proof of the purity, and not as an advertising card.

Mr. Wilcox—I see no necessity for any printed matter on comb honey unless your name is on it as a guaranty of purity.

Pres. York—At the St. Louis convention the question was asked whether it might be well to print something right on the wood of the sections by the manufacturers, calling attention to the fact that there is no such thing as manufactured comb honey, or something of that kind. But I doubt if people would stop to read it, anyway. Take the cities where most of the comb honey is sold, the servant girls get it, and I don't think they would stop to read anything printed on the sections. Still, they might.

Mr. Moore—It seems to me if any one wants to put printed matter on it, the carton is the very best method, and you can print them all over, and as much of it will be read as any other printed matter we send out.

(Continued next week.)

## Our Bee-Keeping Sisters

Conducted by EMMA M. WILSON, Marengo, Ill.

### A New York Woman's Report

DEAR MISS WILSON:—As you have requested the sisters to send reports of last season's work, I comply.

I put up 8 colonies last fall, well packed, and also well provided with stores. I lost 3 in wintering, and got a fair crop from the 5—about 175 pounds—mostly white clover, beautifully white, and well filled out. It was taken off in July. I lost 2 swarms and sold 1 nucleus. I bought and introduced an Italian queen from Texas, which proved to be excellent, her bees very gentle, and they cap their honey white. I have 7 colonies now put up heavy with honey, and need no feeding; they are packed in chaff outdoors.

So far my experience is pleasant, but I must tell of my fatal mistake in neglecting to sulphur or fumigate the honey after taking it off. It is a painful experience to find half of such lovely honey ruined by moths. But we learn by our mistakes.

I see Dr. Miller recommends using bisulphide of carbon, 3 or 4 tablespoonfuls for 100 pounds of honey. I shall use it next year.

Poughkeepsie, N. Y. SARAH E. WILEY.

### A Woman Bee-Keeper's Political Prospects

It appears that honors undesired have been thrust upon a bee-keeping sister out in Nebraska—Mrs. A. L. Amos. Her letter declining the nomination for county superintendent of schools appears in the Custer County Beacon. No little time has been spent trying to decide just what part of her letter should be given to the readers of this department, but the whole letter is so bright and interesting that it has finally been decided to give it entire, with apologies to the editor for occupying so much space with something that

is not at all about bees. It thows evident content with a bee-keeper's lot, and at the same time the frankness with which possibilities in the future are mentioned is commended to politicians of the sterner sex. The letter follows:

#### A PATRIOTIC LETTER.

MR. EDITOR:—Will it be considered taking oneself too seriously if I notice for a moment that my name has been mentioned as a possible nominee for county superintendent? Is it something that I should smile over and pass by?

I have been wondering how, secluded in my hermitage here, I could be thought of for a moment in this connection. I, who don't "know the ropes" by which to climb to any office; I, who find my life so full that I have not time to be director in my own school district.

Friends, I thank you for the honor of a passing consideration. I gave to teaching school in this and adjoining counties 10 of the best years of my life. They were pleasant years, too.

I don't say that if called to an office of this kind some time in the future I would not accept and give to it my best effort, but the time now is inopportune. My three little maids need me at home. There is no place like the country for children. Let them grow to be healthy little animals before they are anything else. They are too young for me to think for a moment that I might change the even tenor of my way.

Friends, I find life worth while here! "Far from the madding crowd's ignoble strife." On this farm, the gift of "Uncle Sam," I have achieved some triumphs. The trees have grown large enough to support a hammock and furnish shade overhead, and when the thermometer ranges 90 degrees and upwards, I can lounge a little with book and paper within hearing of the busy hum of in-

dustry from the bee-hives close at hand. There is another of my triumphs. I am not a bee-keeper merely, but a bee-master, since I bend the little creatures to my will, and have shown that honey can be produced abundantly in Custer County.

I have seen apple-trees grow from saplings to great trees, bending with their loads of health-giving fruit. I am very close to Nature here, and "Nature never did betray the heart that loved her."

Friends, I promise you that I will try to grow so that if the time does come when I can leave, and you see fit to call me, I may be ready. But I tell you that I am no politician, and will pull no wires. Withal, I am "a canny Scot," and realize that I might get hold of the wrong one—a live wire, for instance!

This is much for me to write at this season of the year. Success to the other fellow!  
[Mrs.] A. L. AMOS.

**The Truth About Honey.**—A few changes have been made in the reading of the Comb Honey Guarantee Circular for shipping-cases gotten up by The Honey-Producers' League, so that it will be suitable for bee-keepers to use in their correspondence, putting one in with every letter they write. It is headed, "The Truth About Honey," and is printed on both sides of a light manilla card-board. It is sent postpaid in lots of 50 for 10 cents, 100 for 20 cents, etc. Every bee-keeper should use it, as it will undoubtedly help to popularize the use of honey.

The Guarantee Circulars for putting in shipping-cases should be used by every bee-keeper who sells comb honey by the case. These circulars are the same price—10 cents for 50 copies, postpaid. Send all orders to the American Bee Journal office.

**Comb Honey Guarantee Circulars.**—These were gotten up by The Honey-Producers' League, to be put into shipping-cases before nailing them up for market. They are mailed for only 10 cents for 50—practically cost price. Every bee-keeper who has any honey to sell by the case should use these circulars. They will help to inspire confidence in the genuineness of comb honey. Send all orders to this office.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B. Rural, Toledo, Ohio.

### INSPECTORS OF APIARIES.

That was a remarkable and luminous sentence of Inspector France's where he said, "As soon as we can get the people educated I question if we will need any inspectors." And no doubt he would admit also that with people as ignorant and indifferent as some are now, the best of inspectors find it pretty hard to clean up territory. Page 729.

### THE FUNNY MAN'S PRUNES AND HONEY.

The funny man's attacks upon prunes do some good as well as harm—in that some people would never know of the existence of such things as prunes but for the funny man. Results: Curiosity—a trial—a decision that we must have some more. Alas, we can not have that kind of salve for the sore that the funny man has inflicted on us! Folks all know already that there is such a thing as honey, and that it is good; but that funny man at Washington, and others who have followed in his wake, have convinced an awful lot of them—not that honey is not good—but that our sections are not genuine.

Undeniable that that paper on page 743 is a powerful one—also that how to prevent members from using the League's mark to sell poor, unripe honey is a "powerful" problem.

### ALL FULL OR SOME EMPTY COMB FOR WINTER.

More idol smashing, eh? The dictum that a colony needs some empty comb to be a central core for a winter nest is ably attacked by J. L. Byer, on page 744. I prefer to keep Mr. B.'s theory a little separate from his experience. His experience that bees winter tiptop on 5 solid, sealed combs—let that stand without any discount. But it's tolerably plain that the bees themselves (if given their choice) would choose the same honey in 6 combs, and the 4 interior ones one-quarter empty at the bottom front. May it not be that the bees know best, after all? I am not pleading for any great amount of empty comb, but for a little. Neither am I denying that combs with only 3 inches of honey at the top are worse than solid ones. In the bees' own way they can and do form a practically solid central mass by crawling into the cells. With the Byer method they can not do that way to start in with. We may sincerely deplore the scatteration of the winter supply through 10 or 12 big combs without jumping to the con-

clusion that it is the best way to have the cluster widely divided into 4 slices less than half an inch thick.

### DARKER COLOR OF BAIT-SECTION HONEY.

W. N. Root wonders at his bait-sections being darker color than the rest. That they partly fill the bait-section before the white honey begins to come, is, I think, the commonest reason. The fact that old comb can not be quite as white as new helps in the same direction. And I think that dark, old honey moved from below is pretty often put in the bait. Page 749.

### DON'T BE A "PUTTY-HEAD."

Be not pliable as putty; but be open to solid reasoning. This maxim (arranged from R. F. Holtermann) applies at other places besides conventions. Need it at home. Need it very badly when you read the Journal. Page 757.

### CRACKLESS CAKES OF BEESWAX.

It's sometimes advised to let your cakes of wax get as full of cracks as ever they have a mind to get. "Cause why?" Buyers know that pure wax cracks worse than the adulterated article. A lot of fine, uncracked cakes all looking just alike is a look-out warning. If you have a good reputation and sell to some one you are acquainted with, then you may take a little pains to have the cakes look nice. Should doubt a little whether continued dipping during the process of cooling would make quite as nice-looking cakes as the slow-cooling method. Page 759.

### ENCLOSING OUT-APIARY GROUNDS.

Out-apiary ground a rectangle 100x25 feet. Two lengths of board hurdle on the north and same on the south. On the long east and west sides wooden posts well set, and supplied with an extra number of barbed wires. Hives set so near the wires that no grass and weeds can grow between—the whole to be in a pasture lot, that the stock may be intrusted with keeping the entrances clear. Move a board-length and drive in when you bring the bees. Pitch the extracting tent inside. (Look out you don't tear your never-whisper-isms on the barbs as you manipulate.) To drum for another objection, possibly in some cases the land-owner may be less inclined to let you come if you ask to set permanent posts. Page 758.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to DR. C. C. MILLER, Marengo, Ill.  
Dr. Miller does not answer Questions by mail.

### Bees Refusing to Leave a Super for Winter

The first cold spell we had I took the supers off of all my hives but one, and the bees were in the super and on top of the frames, and I could not get them to go down into the hive. Smoking did no good. One very cold day I took the super off, and there were lots of bees in it, also on top of the frames, and they remained there. I believe they would have frozen had I not put the super back. What is the cause of them acting in that manner? We had no swarms the past season. Could it be possible that the hive is so full of bees that there is no room for those that were filling the super? The bees stored no honey to

amount to much since the first of July. They did splendidly up to that time. MISSOURI.

ANSWER.—If the brood-chamber was filled with bees, and the super as well, it was merely because the colony was strong. The trouble was that you operated when it was so cold that the bees would not move. Take them on a day when it is warm enough for bees to fly freely and you will find it another story. If smoke does not readily get them down, you might take out the contents of the super and brush the bees down upon the top-bars of the brood-frames. Another way is to take the cover off, leaving the super bare, then wedge up one end of the super half an inch to an inch, and the bees in the super will find it so chilly that they will go down into

warmer quarters. Of course, it will not answer to do this when it is so warm that robbing will be started, although it will be better for being warm if the work is done late enough in the day to avoid robbing. Likely enough there will be no need to wedge up one end of the super; merely uncovering may be enough to make the bees go down; and if it is very cold, wedging up one end would be just the thing to defeat your purpose, for the open space between hive and super might make the bees in the super shrink upwards rather than downwards.

### Registering a Honey Trade-Mark

How can a trade-mark be obtained for labeling honey when working up a trade?

MINNESOTA.

ANSWER.—A trade-mark is registered by the Government at Washington, D.C., in order to be able to protect it in case of infringement or copying. For the details to be followed in securing such registry, better consult a good lawyer.

### Candy for Winter Stores

As I have some colonies of bees light in stores, how can I make candy out of granulated sugar to carry them through the winter?

INDIANA.

ANSWER.—That's one of the questions that hardly belongs in this department, as the answer ought to be found in your bee-book; but I'll answer it anyhow.

You can make Scholz or Good candy, but the probability is you have not the extracted honey, so all you need to do is to make just plain sugar candy. Into a vessel of boiling water on the stove, stir 2 or 3 times as much sugar, and let it cook until a bit of it dropped into cold water appears brittle; then pour out into greased dishes so as to make cakes half an inch to an inch in thickness. These cakes may be laid on top of the frames and then covered up any way to keep snug and close, so the bees will go up to them; for if too cold the bees will not leave the cluster to reach them, and starve with abundance in the hive. Then promise yourself you'll not be caught that way again, but will have plenty of combs of sealed honey each fall to meet any emergency.

### Killing Drones—Prevention of Increase—Supering—Feeding Bees

1. In killing drones, how do I know when to kill them, and how many to kill? Should I kill them all, or how many should there be in the colony in order to fertilize the queen? Should they be killed in spring and fall?

2. After I get one swarm of bees from each colony next spring, what is the best way to stop them from increasing any more, and store some surplus honey?

3. How often shall I cut out cells and examine the bees in the summer time?

4. Which is better, to put one super on at a time, or two? Why?

5. How can I see which colonies are to be fed in spring, and how much to feed them before they have enough? I have a Doolittle feeder. Is this the best kind?

6. How do I know when to put on an Alley queen-trap in time to catch the swarm, as much of my time is devoted to the field-work and I am not at home very often in the daytime.

WISCONSIN.

ANSWERS.—1. You can kill all you please, and whenever you please, and there will be little danger of there being any too few left. As in most cases you will find that in this case prevention is better than cure, so the best way is to see that there is little or no drone-comb in your hives, and then there will be few or no drones reared. A single drone is all that is needed for each young queen; but when you have done your best at repression you'll find you will still have hundreds left. While you are about the business of preventing drones, it may be well for you to take especial pains to have no drones reared in colonies that are

below the average in character, and encourage their presence in a few of your very best honey-gathering colonies. In that way you will be doing something to improve the character of your stock.

2. When the prime swarm issues, hive it and set the hive on the stand of the mother colony, setting the mother colony close beside it, both facing the same way. A week later, move the old colony to a new place some distance away—10 feet or more. That is all you need do; the bees will do the rest. For the field-bees from the mother colony will all join the swarm, leaving the old colony so discouraged that all thought of swarming will generally be abandoned.

3. About once in 10 days; but remember that cutting out cells will not make sure work of preventing swarming. It will generally only postpone it.

4. One; there is no advantage in two; and the disadvantage that the bees must keep warm empty space unnecessarily.

5. Find out by actual inspection; lift out the frames and see how much honey is present; then give them quite a bit more than you think they need. After they begin flying in spring, 5 pounds of honey may carry them through to the harvest, but if you give them 10 it will not be wasted.

6. Put on queen-traps as soon as you think there is any danger of swarming; in your part of Wisconsin it will probably be about as soon as white clover begins to bloom.

## "Combed" and "Extracted"

### Why Some Bee-Keepers Succeed and Some Do Not

I am asked every now and then why so many people go out of the bee-business every year. In the first place, I do not admit the implied condition of affairs as stated in the question. They say to me that the bee-business can not be a very profitable one or it must have a great many more unusual drawbacks than most other kinds of business. I do not believe the number of those who drop out of the bee-business is any greater in proportion than in many other lines of trade in the mercantile world. It must be remembered that hundreds of people become interested in honey-producing and queen-breeding each year, and they represent all classes and characters of humanity, from the school-boy to the aged invalid. Many of them have made failures in numerous callings of life, hence they are attracted to the bee-business and think it a very easy one; and the result is, another failure to be recorded in the chapter of misfortune. Those who go into the bee-business with this idea seldom succeed, because they are woefully ignorant in regard to the elements necessary to success, and are not willing to give the work the attention and money which it oftentimes needs.

Looking at the bee-business from the view of dollars and cents, it should be borne in mind that capital and experience are necessary for success unless one is willing to start in a small way and is satisfied to wait till the business can be established on a paying basis, which can not be done in one season. I know of no other vocation in which those interested expect as great returns in so short a time, and with so little outlay, as with the honey-bee. They seem to look on it as an easy, get-rich-quick proposition—that the bees board themselves and work for nothing, and they are to take in the proceeds thereof; then if their expectation is not fulfilled they are quite apt to condemn the business because this class of people have failed at it. On the other hand, investigation shows that the man and not the bees are at fault. Many who become interested as queen-breeders, either as a fad or for profit, do so with a very faint idea of what is required to reach the point at which they are aiming. The greatest stumbling-block is their lack of knowledge of the principles of queen-breeding.

This need not be the case, because we can

all learn; but the trouble with many lies in their unwillingness to learn. I know people who take the bee-journals but never read them. I also know others who keep bees and will not take a bee-journal. They either ridicule the idea of any special study being required, or they are too tired mentally to become sufficiently interested. History repeats itself again, and another man goes out of the bee-business. The fact of the matter is, the bee-business is a full-fledged one, worthy of the talent and time of our best men and women, both of whom must have a certain degree of intelligence and business judgment, and, unfortunately, there are many people who get into the bee-business who do not fit this description; and, in short, the bee-keeping fraternity asked what made them go out. If every one who goes into the bee-business were successful it would be utterly impossible for the business to have reached its present magnitude. Make up your mind what your circumstances will permit you to do, and live up to your determination at any cost. Your will-power depends upon it.

Thousands of little bee-plants and a few big ones sprang up with the green of last spring; and thousands of little bee-plants and a few big ones will go down with the same green, under the frost and ice this winter. Whether your little enterprise will hardly survive the gray, cold winter, and be ready and eager to flourish again in the spring, or be steeped in destitution, and be set down as a failure, remains entirely with you. Why not obey conscience and tell the truth? The old adage, "There is no royal road to success," applies to the bee-business just as well as to the other vocations in life.—C. E. WOODWARD, in *Gleanings in Bee-Culture*.

### A System of Comb-Honey Production

To the veterans there may be nothing new in what I am about to tell, but the beginner may get some hints. The system that I am about to describe is one that I followed for years, hence it will be practice instead of theory that will be given.

When the yield comes on from white clover the brood-nests become crowded, and the bees begin to whiten the upper edges of their combs with new wax, I put on the supers with bait-sections saved over from the previous year. As soon as the first super is from  $\frac{1}{2}$  to  $\frac{3}{4}$  full, I raise it and put under it another super with sections full of foundation. When the super last added is about half completed, I raise both supers and put another next the hive. Usually, by the time the third super is half full, the top one is finished, or sufficiently so to be taken off. I would remove it even if one or two sections in each corner were not quite complete. These partly finished sections I would put into a super until I had one full, when I would give it back to the bees.

This method of tiering-up is continued until the end of the season. As the season draws to a close, I am careful about giving too much super-room. If I feel that a colony ought to have more room, I put another super on top. The bees will go on and complete the sections next the hive, just about the same as though the super had not been added on top, and, if the flow does continue, it will overflow into this upper super.

When a colony swarms it is hived in a contracted brood-nest on the old stand, and the supers transferred from the old hive to the new. Only 5 Langstroth frames are used in the brood-nest, or only one section of the Heddon hive, and starters only are used in the frames, a queen-excluder keeping the queen out of the sections. If such severe contraction causes swarming-out, I give a full-sized brood-nest for 3 or 4 days until the swarming-fever has worn off, when the contraction is put in force. The old colony is placed by the side of the swarm for a week and then moved to a new location. Usually this prevents after-swarms, and helps to boom the colony where the sections are. If the swarm comes off early in the season, it is possible that the old colony will store some surplus, otherwise it becomes a most excellent colony for wintering, having abundance of good stores, and a young, vigorous queen.

At the end of the season I unite the colo-

nies that have been contracted. In this way, we get one colony of increase from two colonies, and all of the white honey in the supers where it can be sold at the highest price.—W. Z. HUTCHINSON, in the *Bee-Keepers' Review*.

## Reports and Experiences

### Honey Crop a Failure

The honey crop is a total failure here this year. Some bee-keepers had to feed sugar to keep their bees alive. From 1500 colonies I did not have 1000 pounds of surplus honey. It was the very worst season I have experienced in the 15 years of my bee-keeping.

BERT W. HOPPER.

Rocky Ford, Colo., Nov. 14.

### Amount of Winter Stores

I note what Mr. C. P. Dadant says, on page 759, about 5 to 10 pounds of honey to winter a colony. I would be pleased to winter mine on 10 pounds, but perhaps he means barely to survive the winter. Still, I think it insufficient; at any rate, in any part of New England. Of course, if we have a very light colony it might be all right, but with an ordinary sized one I would not dare to risk it. I have always wintered my bees in the cellar, so I speak from that.

I want at least 20 pounds, and then I find that, when spring comes, before they can gather anything there is very little left, and sometimes I have to feed. Our winters, I suppose, are more severe than Mr. Dadant's, and that may account for it, but that will knock some of our theories in the head where the bees consume 200 or 300 pounds per colony in a year.

In putting my bees in the cellar last fall, I had 6 light colonies that I placed on top of the rest, where I could watch them, and I do not think any one of them had over 10 pounds. About the middle of February I placed a pound section of honey on each, and two of them worked up to it immediately, which showed they were about out; the others came later. With the first two I gave three more sections, and when I set them out the last of March it was nearly gone, and I found no honey in the hive below.

My cellar is under the house, and the bees in a room partitioned off purposely, and always warm, as there is a furnace near by.

Let me have at least 20 pounds of good winter stores for mine; it is none too much in this "locality" where bees are in the cellar from 4 to 5 months; and if they should have a little left, it will all be needed before fruit-bloom arrives. I always think it is safer to err on the right side than to be always wondering if the bees have enough to get through with, or how many I am going to lose for want of stores.

A. W. YATES.

Hartford, Conn., Nov. 7.

### A Variety of Wormwood

I enclose a sprig of a plant which grows all over the mountains in this section. It is in bloom during May, June, and into July. This sample was taken to-day (Nov. 4), and it was in bloom. Bees work on it when in bloom. What is it? Is it a good honey-producing plant?

W. A. PRICE.

Railroad Flat, Calif.

[The plant you send is a variety of the wormwood, I think, but I am not able to tell the species, or whether it is a good honey-plant. As bees generally work where they can get honey, it is safe to say that this is all right; but possibly a little strong, owing to the pungent odor of the plant.—C. L. WALTON.]

## Wisconsin Basswood Sections

### And Prompt Shipments

Is what we are making for our customers.

### CONVENTION NOTICES.

#### National Convention, Dec. 19, 20, 21.

—Another slight postponement of the National convention seems to be unavoidable. The Fat Stock Show, upon which we have depended for reduced rates on the railroads, has been postponed two weeks. The reason given is "the inability of the builders of the amphitheater to secure structural steel for the same," and they don't wish to hold the show out-of-doors, hence the delay. Of course there will be no excursion rates during the first week in December, and, as it would be suicidal to attempt to hold a convention without excursion rates, the Executive Committee has decided to postpone the convention two weeks in order to take advantage of the Fat Stock Show rates. The dates for the convention will now be Dec. 19, 20 and 21, 1905.

The place of meeting has also been changed to Brunt Hall, in the Bush Temple of Music, corner of North Clark Street and Chicago Avenue (entrance on Clark Street.) This was done because it was feared that the accommodations at the Revere House might prove too limited. The Chicago bee-keepers, with their customary enterprise and liberality, will pay for the use of the Hall. It is only 5 minutes walk north from the Revere House, Southeast corner N. Clark and Michigan Sts., which will be headquarters for the members. This new place of meeting is in a new building where everything is modern. There are adjoining committee rooms, toilet rooms, good drinking water, and elevator service both day and night.

W. Z. HUTCHINSON, Sec.

The Chicago-Northwestern Bee-Keepers' Association will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular

## Glass Jars for Honey

We can ship by return freight at the following prices:

- 1/2-lb. Tip-Top Jars—case of 24 doz., \$8.00; 3 cases, \$23.00.
- 3/4-lb. Tiptop Jars—1 case of 14 doz., for \$5.25; 3 cases for \$15.
- 1-lb. Tiptop Jars—1 case of 12 doz., for \$5; 3 cases for \$14.

**Second Hand... Comb Foundation Mill**

We have for sale a 6-inch Second-Hand Comb Foundation Mill. Used scarcely any; good as new. If interested write for price. 50 boxes good 2nd-hand 5-gal. Tin Cans, 2 in a box—10 boxes for \$4.00.

When sending for sample jars include 15 cents each to cover postage, etc.

**YORK HONEY AND BEE CO.**  
(Not incorporated)  
141 Ontario Street, CHICAGO, ILL.

annual election of officers. Any other business coming before the meeting will be attended to. All who are accustomed to paying their dues to our Association, thereby getting two memberships for the price of one, will please hand the \$1 to the secretary, or mail it to him as usual. The time in the evening will be given to the National, as will also the whole of the two following days. Every one is cordially invited to be present, both at the short sessions of the Chicago-Northwestern, and at the 7-session meeting of the National Association.

HERMAN F. MOORE, Sec.

Park Ridge, Ill.

N. B.—Any one paying their dues to the National Association direct, will have to pay another dollar to the Chicago-Northwestern, if it is desired to become a member of the latter organization also. Hand your dues to H. F. Moore, the Secretary.

H. F. M.

#### New York Bee-Keepers' Institutes.

—A series have been arranged to be held in New York State as follows: Amsterdam, Dec. 11, 1905; Syracuse, Dec. 12; Watertown, Dec. 13; Fulton, Dec. 14; Auburn, Dec. 15; Romulus, Dec. 16; Geneva, Dec. 18 and 19. Dr. E. F. Phillips, Acting in Charge of Apiculture, United States Department of Agriculture, will attend and address these Institutes on subjects pertaining to bee-keeping.

Romulus, N. Y. C. B. HOWARD, Sec.

#### Minnesota.

—On account of the change in time of holding the National Convention at Chicago, the Minnesota State Bee Keepers' Association has decided to hold its annual convention as usual—Dec. 6 and 7, 1905, in the First Unitarian Church, in St. Paul.

Mrs. W. S. WINGATE, Sec.

#### The New York State Association of Bee-Keepers' Societies will hold its annual meeting at Geneva, N. Y., at the Nester Hotel, Monday and Tuesday, Dec. 18 and 19, 1905.

New and interesting subjects are to be introduced and discussed at this meeting, and all bee-keepers of New York State should make arrangements to be present. Good and reasonable accommodations have been secured. Headquarters will be at the Nester Hotel.

Romulus, N. Y. C. B. HOWARD, Sec.

#### New York.—A Bee-Keepers' Institute will be held in the parlor of the Central Hotel, Market Street, Amsterdam, N. Y., on Monday, Dec. 11, 1905.

This meeting will be held under the direction of the Bureau of Farmers' Institutes of New York State Department of Agriculture, by the Fulton and Montgomery Counties Bee-Keepers' Society, assisted by the United States Department of Agriculture. Dr. E. F. Phillips, Acting in Charge of Apiculture United States Department of Agriculture, is expected to be present and address this meeting, and a good attendance is much desired.

T. I. DUNDALE, Sec.  
West Galway, N. Y.

# Honey and Beeswax

CHICAGO, Nov. 17.—There has been a steady trade in honey to the small dealers who usually lay in a little stock at this time of the year. Prices are practically unchanged. The fancy grades of white comb bring 14@15c; that which is a little off @12c less; amber grades, 10@12c; dark and damaged lots, 7@10 cents. Extracted, white, 6@7½c; amber, 6@7c. Beeswax steady at 30c. R. A. BURNETT & CO.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c. C. C. CLEMONS & CO.

CINCINNATI, Nov. 24.—The demand for comb honey is relaxing to some extent, owing to the majority of the trade being well supplied. All fears of a comb honey famine have been allayed. We quote fancy white comb honey at 14@16c. Extracted honey is in fair demand. Quote amber at 5½@6½c, according to the package and quality. Fancy white and white clover extracted at 6½@8½c. We are paying 2½c per pound delivered here for choice yellow beeswax. (We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.) THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade. GRIGGS BROS.

NEW YORK, Nov. 17.—There is a fair demand for all grades of white as well as buckwheat, and receipts are about sufficient to meet the demand. Prices are unchanged. We quote: Fancy white, at 14@15c; No. 1, at 12@13c; amber, at 11@12c; buckwheat, at 10@11 cents. Extracted honey: Market is well stocked with California, which is coming along in large quantities. The demand is fair, mostly in

small-sized lots. Prices remain about the same, 5½@6½c per pound, according to quality and quantity. Southern in barrels at 52@57c per gallon. New crop West Indian is now beginning to arrive and is selling at from 60@63c per gallon. Beeswax firm at 28@30c per gallon. HILDRETH & SEGELKEN

PHILADELPHIA, Nov. 20.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get people started, and when they do start, the demand continues for some months. We would say, now is the height of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c. We are producers of honey and do not handle on commission. WM. A. SELSER.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet: white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

INDIANAPOLIS, Nov. 7.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments

of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 16-lb. cans; amber slow at 5c. Beeswax, 28@30c. WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, Nov. 17.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the prices high. We quote as follows: Fancy water-white and No. 1 white clover, 14@16c; No. 2, 12@14c. Extracted seems to be more plentiful, and we quote same in barrels, light amber, 5½@5¾c; in cans, ½c more; white clover, 7@8c. Beeswax, 28@30c. C. H. W. WEBER.

SAN FRANCISCO, Nov. 15.—White comb, 1-lb. sections, 8@9 cents; amber, 6@7c. Extracted, water-white, 4½@5c; white, 4½@4¾c; light amber, 3½@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 26@27c.

The situation remains about as reported before, with very little disposition on the part of dealers to stock up at the present prices. The regular handlers of honey are now busy with other lines and for that reason honey is being neglected. The present asking price is not attractive enough to induce buying from a speculative point of view.

# For 1906

## Gleanings in Bee Culture for 1906

We are bending every effort to make Gleanings the best bee-paper ever issued. 1906 will be the banner year in our history. Beginning with the Christmas number a great change will take place. Frequent new cover designs. New department headings. Better paper. Better printing. More pages. Our excellent staff of contributors will be maintained, and many splendid special articles will be published.

## Half-Tone Illustrations

During the past summer we have had a special artist to take photographs for us. He has traveled on our account alone the past summer over 4000 miles, and we can promise some very fine pictures. Many of the Second Prize Photo Contest, American and Foreign, will appear soon. Our engravings are made by the very finest engravers in the United States. Just this wealth of illustration doubles the value of the paper.

## Advertisements

Gleanings prides itself on the clean class of advertisements it carries. Its subscribers show their appreciation of the fact by their liberally patronizing them. There is no better medium in the United States for those catering to the needs of the bee-keeper. We now print 25,000 copies and yet with our special edition (Dec. 15, 40,000) our old rates hold good which were based on 20,000 circulation. Gleanings gives its subscribers and advertisers full measure, pressed down and running over.

## Subscription Rates

With all those improvements the price will be the same—\$1.00 per year. We make a special rate of 6 months trial for 25 cents to those who have never taken Gleanings. You will find Gleanings listed in all principal club offers. We make many special inducements. In fact, we are just waiting for YOU to do your part.

## Our Bees and Queens

We are running at Medina and vicinity 5 queen-rearing yards, at other points 3 more. We are prepared to furnish our celebrated Red Clover stock, a stock that won a splendid reputation for gathering honey from any source. We are also prepared to furnish bees in nuclei and full colonies.

## Root's Goods for 1906

Our Supplies for this year are of the same quality and standard of workmanship that has characterized our lines of previous years. Our motto is: "Not how much, but how good." In the matter of improvements it is generally conceded that we are the leaders. We are constantly testing out every new device in our own yards and when it has stood the test we place it before the public.

## Our Hives and Sections

Our hives and equipment, both for workmanship and clearness of stock, cannot be excelled and we doubt if they have ever been equaled. So strong is the demand for these goods that there has been a strife in many cases among dealers to get the Root Company's lines because they knew that everything that bears the Root brand is always popular with the customer and always the best that money and brains can produce.

Our sections and frames for 1906 are even better than ever. They are inspected and re-inspected and each inspector is required to put in each box of sections that he passes upon his own inspector's card so that if complaint is made this card will come back on him. As he is anxious to hold his position and if possible get an increase in pay, it is clearly to his interest as well as that of the customer to let nothing but perfect goods pass.

## The Root Automatic Extractors

Our extractors for 1906 in point of improvements and quality of workmanship leaves everything else in the shade. The 4, 6 and 8 frame machines have the finest automatic reversing mechanism that has ever been put into a machine. Even the two-frame models can have the reversing mechanism put on at a slight additional cost; but we do not ordinarily advise buying the two-frame automatic. Steel construction has been substituted for cast-iron wherever practicable.

## Our Catalog for 1906

It will be a great improvement. A pleasing new cover design. Entirely revised and rewritten. Many new illustrations. The new arrangement of matter will be especially welcome by many. Every thing is classified. All Bodies, Supers, etc., together. The prices are under each article described and illustrated, thus doing away with price-tables. Beginning Dec. 15 our catalog goes on the press for the first run of a solid 3 weeks, day and night. If you want a copy of this first edition let us have your name at once.

## Editorial Notes and Comments

### Mice In Bee-Hives in Winter

A mouse will do a lot of mischief in a hive in winter. Not so much the amount of honey eaten, but the tearing down of beautiful worker-combs. Neither would the holes made in the combs count for so much if the bees would fill them up again with worker-comb; but they're just about sure to fill them up with drone-comb. To be sure, the bee-keeper can put in patches of worker-comb, either before or after the bees have filled the holes with drone-comb, but it is a troublesome thing, and so many other things are to be done that it is likely to be neglected, and many a pound less of honey is secured in the harvest because of the honey used in rearing useless drones, and the honey they consume after they are reared.

Plenty of cats will help, and in the cellar traps and poison may be used. In any case, whether in cellar or outdoors, one thing may be done that acts by way of prevention, and indirectly by way of cure. It is to have the hive-entrances mouse-tight. Close them with wire-cloth three meshes to the inch, and they are just as open as ever for the bees, but closed to the mice. Of course you may fasten a mouse in a hive by doing so; but that is better than letting him have the free run of the hive. Most of the time the bees are so nearly dormant that a mouse is monarch of all he surveys; then comes a time of stirring up, and Mr. Mouse runs out of the hive to get out of the way, only to return or enter some other hive when matters settle down. But if the entrance is closed he can not get out of the way, and the bees make it so hot for him that in spring you will find a dead mouse in the hive.

### Missouri Bee-Keepers Waking Up

We have received from Robt. A. Holekamp, Secretary of the Missouri State Bee-Keepers' Association, 4263 Virginia Ave., St. Louis, Mo., some printed matter which has been prepared by him and issued by the Missouri State Board of Agriculture especially for circulation among the bee-keepers of Missouri. It is Mr. Holekamp's aim to keep up this kind of propaganda among the bee-keepers in the

hope that it may induce many who are now using box-hives to become modern, progressive bee-keepers.

The 16-page bulletin contains much valuable information for the bee-keepers of Missouri. Much space is devoted to the treatment of foul brood. The bulletin is illustrated, and should create much interest in bee-keeping in that great and growing State. A copy can be had by applying to Geo. B. Ellis, Secretary of the Missouri State Board of Agriculture, Columbia, Mo.

It is the intention of the Missouri State Bee-Keepers' Association to present a Bill before the next Legislature, providing for inspectors of apiaries; also a Bill providing a heavier penalty for the sale of any article under the name of honey which is not the unadulterated product of the honey-bee.

Every member of the State Association is asked to consider himself a committee of one to form a bee-keepers' club in his county. There is such a club in St. Louis, which has 27 members. Of course, every club member is also a member of the State Bee-Keepers' Association. Monthly club meetings are held. It is expected that not only will the production of honey be stimulated by such clubs, but that the consumption of honey will also be increased.

A larger income is needed by the Association to carry on the work already planned. Taking it all together, the Missouri bee-keepers seem to have made a good start along the line of improving their organization. Much of this is doubtless due to the activity of Mr. Holekamp, who seems to be a tireless worker for the greater progress and prosperity of all the bee-keepers of Missouri.

### "Disagreeable Peculiarities" of "Best" Bees

The subject of black bees vs. Italians seems to be up for discussion again, and as on most subjects each side has its advocates. One of our anti-black readers sends this comment on a remark made by "Afterthinker" Hasty:

MR. EDITOR:—On page 795, I find the following written by the man who thinks after:

"One may refuse to keep certain bees because of disagreeable peculiarities, and at the same time claim that they are really the best bees."

I wonder if Mr. Hasty would have written that if he had done his thinking before writing in place of after. There may, however, be another way of accounting for it. Our "Afterthinker" lives in Ohio, and somewhere in the neighborhood of the time in which that was written there was a very exciting election, and the friends of one Herrick were offering drinks at marked-down prices. Can it be that our usually wary "Afterthinker," temporarily persuaded by bargains in tanglefoot, should have imbibed so much

that his beclouded brain could not discern that "peculiarities," whether "disagreeable" or otherwise, are among the things that can not be counted out in taking an inventory of the qualities that go to make up the character of a bee? If I understand him correctly, he says:

"Blacks are the best bees, but I refuse to keep them because of a disagreeable peculiarity in their style of running when handled." To which I reply, "Yes, blacks are really the best bees, but they have the disagreeable peculiarity that they don't put up as good a fight against robbers and moths as do Italians and hybrids; also that they don't store as much honey as others, and a few other little peculiarities which make me refuse to keep them, although they are really the best bees." ANTI-BLACK.

#### Width of Sections in England

In this country  $1\frac{3}{8}$  inches prevails, in England probably 2 inches. At a meeting of the British Bee-Keepers' Association, reported in the British Bee Journal, the question of adopting a standard width came up. After an animated discussion, the resolution in the following form, "That it is desirable, in the opinion of this meeting, that there should be a standard section recognized by the British Bee-Keepers' Association, namely,  $4\frac{1}{4} \times 4\frac{1}{4} \times 2$  inches," was submitted to the meeting, and carried by a majority of seven.

#### Fastening Foundation in Frames

In this country saw-kerfs to receive foundation in top-bars are generally made only in top-bars  $\frac{1}{2}$  an inch thick or thicker, the kerf being only  $\frac{1}{4}$  inch deep, and not materially affecting the strength of the top-bar. In England top-bars  $\frac{3}{8}$  thick are sawed entirely in two, and complaint is made that the top-bar is thus weakened to the extent of 10 percent. But this gives opportunity for a special plan of fastening thus given in the British Bee Journal:

"My own simple plan is to press the top edge of the sheet between my thumb and forefinger; when thus flattened the foundation slips easily into the saw-cut, and is pushed so far through as to project slightly on the upper side of the top-bar, then run a hot poker along the projecting edge, and the sheet of wax is made perfectly secure."

## Miscellaneous News \* Items

**Canadian Beedom** is a new department of the American Bee Journal this week—or, rather, an old department revived—with Mr. Morley Pettit as conductor, or editor. Mr. Pettit is well known to bee-keepers of Canada, although one of the younger generation of bee-folks. His crop, the past season, was 40,000 pounds of extracted honey. Having produced that amount in one season in Canada should give him the right to speak on bee-culture with at least some authority.

We trust that our Canadian readers will help Mr. Pettit to make their department as interesting and valuable as possible.

**A 20-Page Number** is this week's American Bee Journal. It is our expectation to make it a 20-page paper from now until July 1, 1906, and then 16 pages until Dec. 1. This plan is begun on account of the extra advertising patronage and also extra demand for general reading space during the first six months of the year. Also, from July 1 to Dec. 1 most bee-keepers are very busy with work aside from bee-keeping, so that they have scarcely time to read so much bee-literature.

By the way, the extra pages each week are furnished at no extra charge to the subscribers. We are pretty familiar with the current bee-literature of the day, and, really, we think it would be rather difficult to find a bigger and better dollar's worth of apiarian information than we give in 52 copies of the Weekly American Bee Journal each year.

**The Apiary of Chas. Clarke**, of Chicago, Ill., appears on the first page this week. The year after the Chicago fire the Clarkes located and built at Washington Heights

Some 3000 or 4000 pounds of Mr. Clarke's 1905 Honey Crop, as it appeared in his Honey-House.

The sons have grown up on the old homestead, one a school teacher, one a member of the Board of Trade, and the third the cashier for a large candy company and also a bee-keeper known to many in Chicago. The parents have had a wedded life of 53 years. Mr. Clarke, Sr., has been honored by reappointment as judge in Chicago four successive terms of four years each, and never had a case reversed by the higher courts. He was a professor of geology in the old Chicago University, and an active member of various literary and scientific societies.

Mr. Chas. Clarke has a great many visitors from the kindergarten schools, and his bees have always been on their good behavior when the children are around, and have never stung any of them.

Mr. Clarke is a firm believer in racking up honey in a hot room, for 30 to 40 days, when having any sweet clover in it, as his honey-room will show by the picture herewith.

He is a crank on foul brood, and willing to prove at any time the responsibility of the queen for same. He commenced with 2 colonies in 1895, and his bees had the first dose of foul brood that summer. The third year saw him with 8 colonies, and 7 out of 8 took the disease, which taught him a valuable lesson.

Mr. Clarke generally doubles up his apiary to 50 or 60 colonies in fall.

He is engaged all day at the office, but always finds time to have a good flower-garden, and values highly the reputation of having well-behaved bees by neighbors 50 feet away, never having had a complaint.

Mr. C. imports his own breeding queens, and tries at all times to have quiet stock and good honey-cappers, as he runs for comb honey only, and always marks a hive where the capping is poor, so that he can change the queen, as poor capping for him makes 3 cents a pound difference on the honey. He has seen some poor crops, and has fed up to July 1, and also has had good crops, averaging one year 182 pounds per colony, spring count, and allowed only a very small increase.

Mr. Clarke's family came from a long line of ancestry. The loom for weaving silks is named from his mother's family. It was invented by Sir John Loomes. Mrs. Clarke has in her possession specimens of brocaded silk 200 years old, of great value. The first steam plow was invented by his mother's brother. Mr. Clarke, Sr., came from old intellectual stock, his uncle, Archdeacon Clarke being, as a young man, tutor to the King of Hayti, and latterly Archdeacon of Antiqua, of the West Indies.

Mr. Chas. Clarke, the bee-keeper, has never married, but lives with his aged and honored parents at the lovely old home shown in the first-page picture.

"Eggstra"—Good Eggs are what we received recently—several dozen of them—from Mrs. Dr. C. C. Miller, of Marengo, Ill. When we arrived home one evening we found that quite a large box had come to our house by express. Mrs. York had taken it in, and insisted that we open it before supper, to see what it contained. (A woman's curiosity is simply wonderful, isn't it?) We did so, and there were over 5 dozen of just the finest, largest, brownest hens'-eggs you ever saw. It seemed like Easter-time when we lived on the farm and used to hide eggs in the granary or barn, and then bring them in on Easter morning. But those Marengo eggs are fine, and greatly appreciated by "ye editor" and his good "frau." Thank you, Mrs. Miller.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Canadian Beeedom

Conducted by MORLEY PETTIT, Villa Nova, Ont.

### A Department for Canadians

It is with pleasure that I am undertaking, at the request of "Ye Editor-in-Chief," to say something weekly to Canadian bee-keepers about themselves, and to others about Canadian bee-keeping. We have not the sunny climate of the South in our beloved country—"Our Lady of the Snows"—but we have the sunshine just the same, and we have, what is more than that, the clear, bracing winter air

MORLEY PETTIT

which clears the brain and sets the blood coursing through the veins in a most exhilarating manner. Further than that, it frees the land for a time of insect pests which thrive in the South during 12 months in the year.

### Foul Brood Inspection

Ontario bee-keepers are said to have the best foul brood law in existence; but we are not satisfied, as the Hon. Nelson Monteith, Minister of Agriculture, said in addressing the convention, if we considered we had attained an ideal we should make no further progress. To attain the highest good one must not be satisfied, nor dissatisfied, but *unsatisfied*. Ontario bee-keepers are thus with regard to the Foul Brood Act. We feel fairly sure that we have the most skillful inspector that can be found, but the work is too great for him. Accordingly, a resolution was put through the convention, asking the Minister of Agriculture to pass, at the coming session of the Ontario Legislature, amendments to the Foul Brood Act, whereby the Province shall be divided into three districts, with three inspectors, one to reside in each district. This is to come in force at the next annual convention, and in the meantime the old inspector holds office.

### Canadian Bee-Keepers in Jamaica

Speaking of the South, suggests Jamaica—that bee-keepers' paradise—to which several of our prominent bee-keepers were looking for an escape from the long period in which Canadians are deprived of the pleasure of seeing bees fly and gather nectar. Great stories had become current of

300 pound averages, delightful climate, and the like, until Arthur Laing of Hamilton, R. H. Smith of St. Thomas, and Jacob Alpaugh of Galt, could resist no longer, but made the venture of the trip last winter. The rest of us—more cautious—are now reaping the benefit of their experience. At the Ontario bee-keepers' convention in Toronto, Nov. 15 to 17, Mr. Laing gave his experience.

The advantages of Jamaica bee-keeping, as set forth by Mr. Laing, are principally cheap labor—wages being about 25 cents per day, without board. On the other hand are expensive and inadequate transportation, starvation period during several months in which bees steadily dwindle and fall a prey to the ravages of moths and ants; honey prices about 2½ cents per pound, and an average yield of 25 pounds per colony.

Mr. Laing also mentioned confidentially, fleas, and, if my memory serves me rightly, land crabs, ticks, scorpions, lizards, and other household pets too numerous to mention. In fact, all considered, it was quite evident Mr. Laing came away with a bad impression of Jamaica for bee-keeping.

### Ventilating Hives

It is pretty well established that large hive-entrances are the thing in the honey season; but not so many will admit, or have ever thought of the advantage of super ventilation. I can not remember when my father, S. T. Pettit, did not put 3 or 4 strips ¾-inch square and about 4 inches long lengthwise on the back end of 3 or 4 top-bars in the extracting super. They projected ½ inch, and held up the back edge of the quilt and cushion to admit air to the super in hot weather. That was one of the things I could not get around at first when changing from cushion and gable cover to the flat cover packed with felt paper, which is so much more convenient in migratory bee-keeping.

R. F. Holtermann suggested to me a saw-cut about ¾-inch wide and 3 or 4 inches long in the back of the super a couple of inches down from the top. It is fitted with a galvanized-iron slide for closing in cool weather, and for moving. The bees never use it for an entrance except when the queen gets into the super, and it is certainly a great help in controlling swarming.

### Report of the Middlesex Convention

The annual meeting of the Middlesex Bee-keepers' Association was held in London, Nov. 4. Those present reported a very good season, an average of about 75 pounds per colony, spring count, mostly extracted honey. One member reported 228 pounds of extracted honey from one colony, and 196 sections from a single colony, and neither of these offered to swarm.

Mr. R. H. Smith read an instructive paper on, "Shall We Keep More Bees or Manage those We Have to Better Advantage?" He advocated the latter plan of caring for those we have rather than increasing the number of colonies and decreasing the amount of surplus honey per colony.

Mr. Miller read an interesting paper on "Managing Out-Apiaries Without Help." By the use of hives and implements adapted to his system, he is able to visit each yard every 4 days; the honey can be extracted or taken home to be extracted. He uses the Heddon hive; the colony is examined for queen-cells between the two sections of the hive, the top portion being raised or tipped back by an implement of his own design. If there are signs of swarming the colony is divided.

The subject of producing comb or extracted honey was taken by Mr. Anguish. What he thought to be of more importance was to have strong colonies, then you can produce either, but he did not like to put on sections towards the close of the honey-flow; he would put on an extracting super. Another important point brought out was, that strong colonies ripen their honey better than the weak ones.

An address on foul brood was given by Mr. Gemmill, Assistant Foul Brood Inspector of Ontario. He considered our foul-brood laws very good, as some of the States had copied from them. The disease is on the decrease. He considered it more dangerous with young bee-keepers, who were more likely to have robbing, and spread the disease. A suspected case should be destroyed, or treated in a careful manner by shaking on starters, then in 3 or 4 days shake again on full sheets of comb foundation. Caging the queen will prevent them from swarming out.

Reforestation was discussed, led by Mr. Robb, who

thought that bee-keepers should plant basswoods and honey-locusts.

The sowing of buckwheat for honey alone was not thought advisable, as it requires a warm, light soil and a moist atmosphere, to secrete nectar.

The following are the officers for the ensuing year: President, Morley Pettit; Vice-President, F. J. Miller; and Secretary, E. L. Bainard, of Larubeth.

E. L. BAINARD, Sec.

### Some Mistakes of Bee-Keepers—Pests of the Apiary

BY C. W. DAYTON

NOTICE the mention of "Prevention of Swarming by Inversion," on page 517. This was one of the operations performed with the "Queen-Restrictor," which I described in *Gleanings* in 1889 or 1890. When we first begin to experiment with a contrivance we watch it daily, or even hourly, sometimes. But when we get a large number of the new contrivances in use the colonies increase, and corresponding profits invested in more "irons in the fire," our experiments are liable to be conducted by the "lick and promise" fashion.

I believe the "Inversion" system failed because it was too much labor. During the several years since that time I have looked upon the "Queen-Restrictor" as a waste of thought. But last year when the colonies bred up so strong that they clustered all over the fronts of the hives when there was no prospect of there being a pound of honey for them to gather, I wished then that I had a "Restrictor" for every queen.

#### OUTDOOR FEEDING OF BEES.

On page 553, Mr. Hasty suggests in regard to my outdoor feeding, that I could have exchanged a few full combs from the strong colonies into the weak. So I could have done, but I was very busy at other kinds of work, and supposed if the feed was supplied all the time the strong would get stronger, and the weak would get enough to live and build up somewhat. It seemed that about 50 would not even carry it home. I thought that I could spare no time so much as to raise the covers, and did not go amongst the hives more than once in 10 days. I did not know there were more than a dozen dead until I needed the hives to put swarms in, and that was often not until the swarm was already on a bush. Though there was lack of attention there was no lack of feed put out, and I had 7 or 8 tons of honey to draw on, and it was not used grudgingly.

As it turned out, there were 30 to 40 swarms about two weeks earlier than in other apiaries, and kept nearly one extracting ahead of other apiaries.

Now, attention is usually the cheapest article in the whole apiary management. I have a very large stock of attention, but there was not enough of it where it ought to have been. I think Hasty, Doolittle or Miller ought to have warned me beforehand. As it is, I can not use their advice until it happens again.

We see bees so anxious to rob at sometimes of the year that we take it for granted that they will rob at all times. I had been reading of "short cuts." The "cut" I chose was very "short." One day last January, with the thermometer at 76 degrees in the shade, I went to one of my apiaries of between 60 and 70 colonies, and at about 7 o'clock in the morning put out several feeders of half honey and half water boiled together. I put this feed right in amongst the hives. Then I went into the shop to await developments. I expected to hear the sound of robbery in a few minutes.

Eight o'clock came, and 9, and at 10 o'clock I went to see what was doing. Only 5 or 6 bees around the feed! Said I to myself, "Is it possible that this whole apiary has 'gone up?'" I kicked a hive; a roar of bees came. I kicked another; a roar. Another; a roar. And so on along the line.

"Well," says I, "this shows that bees do not know things all of a sudden and without previous experience." It

took me 4 days to teach those bees to rob and take the amount of feed I expected to give them in 6 hours.

If I had put out feed in that manner in August or September, it would cause such a furor as to cover the hives black with mad bees, which would attack people in the streets and nearest houses within an hour. Since there were 160 colonies in good order when the present honey harvest began, we were somewhat satisfied, having set the mark several years ago not to keep above 120 colonies.

#### SKUNKS IN THE APIARY.

But there may be other mistakes made besides those along the line of feeding. In September, two years ago, it was found that skunks were working about some of the colonies. By the use of poison and traps there were 8 destroyed during the fall. This seemed to clear them out so that there were no more about our apiary during the next season also.

A near-by apiarist having 225 colonies, when I asked him if his bees were bothered by skunks, said he did not care if they were; it would clear out some of the bees and save feed. He lived about 50 miles away, and left the bees in charge of a neighbor, but with no instructions as to skunks. It could be readily seen that there were plenty of skunks about.

As nearly as I have been able to determine, a skunk will work at a colony for 2 or 3 weeks until the colony becomes weak, then go to another hive, and so on for some 6 months or more. In this way a skunk will depopulate 6 to 8 hives during one season. It leaves the colonies too poor in bees to last very long.

Eight skunks would get away with 64 colonies. If undisturbed they will breed the next spring, and in the following fall return with the increase. This was what this apiary went through, between the good season of 1903 and the spring of 1905, when there were 89 colonies left. When the owner was asked how he lost so many, he said by robbing. This bee-keeper fed sugar. I fed honey. He contracted the hive-entrances to  $\frac{1}{2}$  inch. I contracted none at all, and saw no robbing. His loss, figured from our yield, would amount to 10 tons of honey; that is, 135 colonies at 150 pounds per colony. At 5 cents a pound it would amount to \$1000. Just what part is chargeable to skunks is a question. A half pound of beef and a little strychnine would have "settled their hash" in short order.

When skunks cost a bee-keeper \$100 a head, it ought to attract his attention a little. He might stoop to take a few, if for no more than the hide and tallow. It might add variety to life, and set his blood to circulating during an off year.

One day last June a bee-keeper came to my apiary about 7 o'clock in the morning to borrow a smoker. He had set his smoker on a bee-hive while he went into the house to extract. A spark fell out and set the hive on fire and then burned the smoker. He intended to start for the city the same evening, but had 500 pounds of honey to take off his hives to complete his load and give the bees storage-room during his absence. In some apiaries one can extract without smoke, but this apiary is the other kind.

At sunset the smoker I was using tipped over, setting itself on fire, burning the bellows all off. By dark I had a new bellows completed. The next morning I attached it to the barrel in 5 minutes.

Only for a few tanned skunk hides lying around I should have been obliged to make a trip of 30 miles, or wait for the mail to bring a smoker from the city. So I have come to regard the skunk not as a detestable animal, but simply a walking smoker-bellows!

After cutting out the two pieces to form the bellows, the odds and ends are used for hinges and latches to the baby-nucleus hives; a latch for the honey-house door; a strap for the hive-opener; a small part on the back of the neck is of the right thickness for the leather part of the screw-cap honey-gates. But the best of all is a patch of leather on each knee, padded underneath so as to drop upon the knees when examining colonies. This is about as good as a seat, and more handy. The blacksmith wears an apron. An apiarist might wear a part of one. It is very restful to change from the long-continued walking and stooping position. I have sometimes thought that I could do one-fourth more work by these change-about positions, especially in examining brood-chambers and in queen-rearing.

Then the oil of the skunk is useful. It will keep the hinge-end of a jack-knife blade from wearing off round so it will shut up in an unexpected moment and cut a gash in the apiarist's finger. It is good on the cogwheels of the

foundation mill. A clock may run too fast in summer and too slow in winter, and the bee-keeper is continually trying to regulate it. At last he becomes disgusted and throws a good clock away as worthless. Or he takes it to some tinker, who, if he were a bee-keeper, would extract his honey before it is sealed. The clock runs about as long as unripe honey will keep, and then gets back at its same old tricks. Look at the clock, and then at the sun, to tell the time of day. Poor or adulterated oil will harden and retard the speed of a clock in cool weather, and do the opposite in warm weather.

The gun should be kept as bright as a new silver dollar throughout the inside of the barrel. It takes oil. We can not buy oil and be sure of what we are getting every time. While some oil will appear to be all right, it has often been mixed with an adulterant that spreads a tarnish in the gun that shot and powder can not remove. When we aim at a bee-bird that is perched above our hive of best drones, we want the bird to fall instead of flying away unharmed. Bee-birds (not king-birds) will lurk for hours around a baby nucleus in which we may have a dozen hand-picked drones.

#### OTHER PESTS OF THE APIARY.

There are pests as well as climate in Southern California, and rats and gophers are no trivial affairs. If we keep a tank of honey 3 feet from a tree, rats will climb the tree and make a flying jump into it. If we spread a cloth over a tank so that the corners hang down, rats are sure to climb up on the under side and get into the tank. I have known them to carry away a bushel of side-bars to make a nest, and cut large holes through the sides of hives. They delight in carrying away files, bits, nails, hinges, nail-sets, screw-drivers, etc.

When I bought an acre of land in southeast Los Angeles, I set a row of eucalyptus around the outside, then 12 feet inside another row of cypress, inside of which to place my 120 colonies of bees. There were about 300 trees in all. By fall they had all been destroyed by gophers except a dozen or so.

Before I purchased the land it was planted with pumpkins. A man came along one day and called out (I think he was lately from the East): "What will you take for that patch of pumpkins?" "How much will you give?" "Five dollars," he answered.

When he came to gather them he found them to be merely skins filled with dirt, the seeds and meat having been removed by gophers. I bought lumber and kept a tight fence around the bees until I could learn to protect trees from gophers. I have known a gopher to gnaw a hole through the bottom-board of a hive and completely fill the hive and super with earth.

The aspects of neighbors toward gophers is about the same as the above-described bee-keeper toward skunks. I might continue describing their peculiar antics until it would fill several bee-papers. The main thing to impress upon the reader is that when we see a pile of fresh earth and a gopher's head sticking up beside it, out in the middle of the neatly-dressed lawn or bee-yard, to make it the last time he ever pokes his head out anywhere.

Due respect for the business demands that we learn to steer clear of all difficulties, or, in fact, change many difficulties into advantages. Watch for my article on trap-setting.

Chatsworth, Calif.

## Comb Foundation and Its Uses

BY ADRIAN GETAZ

AT this day the advantages of using foundation liberally are so well known that it is hardly necessary to mention them. In the brood-chamber the advantages of securing straight combs of all-worker. Furthermore, the increased rapidity of brood-rearing (that is, in case of a swarm hived without already built combs). If no foundation is given, or only small starters, the queen is obliged to wait until the combs are built before she can lay any eggs. When full sheets of foundation are given, a day or so is enough to draw out as much foundation as she can fill with eggs. So there is no delay.

In the sections it is still more important to give full sheets. Only a few bees can work at a time on a small starter, so the building up of full combs is delayed. On a full sheet a large number of bees can work at once, draw out the foundation and add to it enough to begin putting honey in it before hardly anything could be done on a small

starter. I want to call the attention of the reader to this point, because it has not been sufficiently emphasized yet.

WIRING FRAMES.

The frames should be wired. The two faces of a sheet of foundation are seldom worked equally on both sides. The side toward the center of the cluster is usually in advance of the other. The result is that the sheet curves outside because the weight of comb honey and brood on the inner side is greater. Nothing but complete wiring prevents this.

Wiring vertically would be a little the best, but it would require a larger number of holes, and therefore more time to make them and pass the wire through. Furthermore, boring holes through a thick top bar would be quite a job. A shoemaker's awl is sufficient to make the necessary holes in a thin end-bar.

It is not necessary to fasten the foundation to the top-bar—it is sufficient to have the top-wire near to it, not more than a quarter of an inch from it.

The wiring is done with thin tinned wire—I think No. 30 is the one advised and sold for the purpose by the supply dealers. In the factories the wire is wrapped around a board of sufficient length (the wrapping being done lengthwise); then the whole is tied at two or three places to keep the wire in place. All the turns of wire are cut in two at one end of the board, and the separate pieces pulled out from the other end and threaded through the holes of the frames. That process does very well when the wire used is in very large coils, because then it does not kink, or not enough to cause trouble. But it is impracticable with wire wound on small spools. No sooner would the piece of wire be drawn that it would assume a shape something like this:

The ordinary apiarist will never need a large coil of wire. A half-pound spool has enough wire to fill several hundred frames. I use something like the figure shown

herewith. On a table, bench, or even a board, I drive a number of nails, as shown. Some are placed so as to hold the frame in place. Three of the others hold the pulleys (P) around which the wire passes. They must be small enough to permit the pulleys to revolve freely. It is better to put a washer under each pulley. I use sash pulleys from which the stems have been taken out. I just happened to have them. Some other apiarists who use a similar apparatus use, instead, empty thread-spools, probably also because they happened to have them.

Another nail holds the spool of wire (W). This spool has a crank which permits revolving it with the hand. The crank is made by nailing a small piece of wood to the pulley; and a nail at the other end of the piece completes the crank. The end of the wire is pulled through the successive holes and around the pulleys, as shown in the foregoing figure, and finally fastened at the last hole (H). The opera-

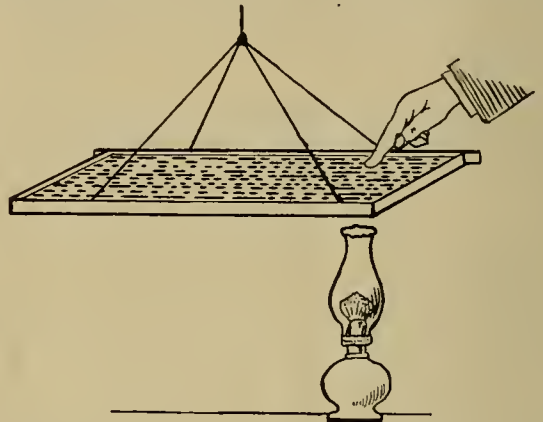

tor then holds the crank (W) with one hand, and with the other he releases the wire from the different pulleys in succession, as shown in the above figure, turning the crank

(W) so as to take up the surplus wire as fast as released. The wire is finally cut and fastened at A.

Looking at the figures and reading the above description impresses the mind as if the process were rather cumbersome. Practically it is not so. A frame is wired in less than a minute.

FASTENING THE COMB FOUNDATION.

Now comes the fastening of the wax to the wire. The Spur imbedder and Easterday fastener will do in a measure, provided the wax is rather soft. I prefer using a lamp, as per Dr. C. C. Miller's method. At least I think the process is his invention.

A string with four hooks is hung to the ceiling. A lamp is placed so that its glass chimney comes within about 2 inches of the foundation. A frame is hung to the hooks, and a piece of foundation placed in on the wires. The frame is then moved slowly over the lamp so as to follow the wire. The heat softens the wax and causes it to stick to the wire. A finger is held on the foundation so as to press it on the wire as it passes over the lamp. The light and wire can easily be seen through the sheet of wax.

FOLDING SECTIONS.

Don't try to fold the sections dry. Too many would break in spite of all the care one might take. The joints must be wet so as to be damp when folded. If the work is done at home, the method of wetting given by Dr. C. C. Miller is the best. Take out of the crate the few side-pieces that hide the joints of the sections—that is, the edges of the sections—and pour hot water in the joints. As the

joints of every row of sections correspond, the water will go clear through and wet all of the sections properly.

I sometimes do the work in the apiary because I can easily take the crate of sections and the box of foundation on my wheel and do the work there under the shade of a

tree. As I have not the facilities necessary for hot-water proceedings, I follow another process. Three small sponges are fastened to a small, flat piece of wood. This constitutes the instrument to wet the three grooves at a time. The wetting must be done on the back of the sections, as shown in the figure. Forty or 50 sections are wet and then folded before they get dry. The process is quicker than one would think when reading the above.

The folding is best done with a Hubbard machine. The next best is a mallet or a hammer with a wide, flat head. The operation is done on a bench or table, the section being folded against a block of wood nailed to the bench, so as to secure a square joint.

**FASTENING COMB FOUNDATION IN SECTIONS.**

In wetting the sections for folding, it is impossible to prevent the water from spreading more or less through the wood and thus dampen more or less the surfaces to which the wax must adhere. Now the wax will not "stick" well to a damp surface, and the foundation should not be put in the sections until they are perfectly dry.

The Parker foundation fastener, and others acting by mere pressure, are not very satisfactory. They will work only when the wax is quite soft. When I need only a few sections I sometimes use the point of a knife or of a screw-driver instead of a Parker fastener, but it is only a makeshift at the best.

The Daisy fastener is all right—it is a daisy, sure enough, except, perhaps, that the plate should be arranged so that the dripping wax should come to the front and help fasten the next piece instead of running off. For small starters, say half sheets at most, there is a still better way. Just put a small tin dish, that you can make yourself, over a lamp or oil-stove. Taking the starter in the hand apply the bottom of it against the dish so as slightly to melt it, then apply it promptly to the section at the right place. The process is even quicker than the Daisy method, but is not practicable with full sheets.

**FULL SHEETS VS. STARTERS IN SECTIONS.**

If only starters are used, I prefer to have them of a triangular form rather than a straight, narrow strip. Exactly how it works I can not tell, but the sections are better filled. At least it seems so to me. But I would advise using full sheets whenever possible. They will be built into combs much faster, and that means more surplus, and, to some extent, less clogging of the brood-nest, and therefore less tendency to swarm.

The next question is, How full—that is, how near the wood along the sides and bottom must the sheet come? Of all the distances about  $\frac{1}{4}$  of an inch seems the worst of all, as far as my experience goes. The bees draw the foundation, and then seem unable to reach properly the middle of the comb and extend it to the wood, something like this:

The best results are obtained by having the foundation reach *within one-eighth of an inch* of the wood. The bees will usually fasten it at once to the wood all around, and then but little bulging will take place—not enough to injure the sections, since the outer surfaces follow the separators.

If a dearth of honey follows putting on the sections, the bees sometimes gnaw out the edges of the sheets instead of fastening them. Fastening all around will avoid that. Furthermore, it is claimed that when the foundation is

fastened all around with melted wax, the comb will never break off from the wood, no matter how far they are shipped. I fasten only at the top.

I have not been able to put in foundation with the Daisy fastener so that it would come within one-eighth or less of the bottom. The hot plate melts sometimes more, sometimes less of the sheet, usually entirely too much. I prefer to use the melted-wax plan. A dozen square blocks just the size of the inside of a section, and half the thickness, are nailed to a board. Pieces of foundation are placed on the blocks, and the sections slipped over. The melted wax (just enough, and no more) is poured then, say at the left-hand corner, and let it run to the bottom corner of each block. To pour the wax, I use a spoon made of tin which has a kind of spout shape with a very small hole (H), permitting the use only of the quantity of wax needed, and yet operate rapidly. If it is desired to fasten all around, the

other corner is treated the same, and then the board turned upside down, and the other two sides fastened in the same way.

**SECTIONS AND SEPARATORS.**

The first 2 or 3 years of my bee-keeping I used bee-way sections with plain separators. Then Oliver Foster began advocating 4-bee-way sections without separators, chiefly on the ground that the bees could cluster better, and therefore secrete wax and build comb better. That is true to a large extent, but it depends upon the circumstances. With strong colonies and quite warm weather the difference does not amount to anything. Under the opposite circumstances it might make all the difference between a crop and nothing. If separators are omitted, use the 4-bee-way sections, by all means. The sections will be built far more evenly and regularly than with the 2-bee-way sections.

I have used the 4-bee-way sections without separators since then until now. I am now replacing them with the fences and plain sections. One reason is that even with the 4-bee-ways the sections of honey are not quite as regular as desirable for the best results. The other is that the plain sections are easier to handle. I don't know whether I can make this point understood or not. In handling sections it is not always possible to keep them perfectly even, sometimes they are little out of line with one another. In such cases a plain section is not liable to damage the next, while the corner of a 4-bee-way section will almost inva-

riably gouge into the next one. Perhaps this figure may help the reader to understand what I mean.

**SOFT AND HARD COMB FOUNDATION.**

The European writers tell us that the soft comb foundation made by the Rietsche press, plaster molds, etc., does not stretch and bulge like the hard ones—that is, the Weed and other hard-rolled ones. The explanation given is that in the hard-rolled, compact foundation the wax is in an abnormal condition, and that the heat of the hive causes the wax to expand back to its normal condition, and thus cause the bulging and stretching.

Recently it has been asserted that by heating the hard foundation as much as possible, and keeping it at that point a few moments (I suppose 10 or 15 minutes) it becomes as soft as the molded foundation, and stretches or bulges but

very little when put in the hives. This kink is certainly worth a trial, anyway.

#### PRICES OF BEE-SUPPLIES.

□ Much has been said lately about the prices of supplies being too high. That may be. But as long as the demand practically exceeds the supply, the prices will be stiff. If the honey-dealers were short, and running after us to get honey—my, my, how the prices would go up!

Well, if the price of hives is too high, make them your selves—that is all there is to it.

Right here we need some clarifying, as Hasty would put it. As a matter of fact we are making them already, the dealers furnishing us only the lumber dressed and cut. So, after all, the question is whether we shall buy from them or order our stuff at the nearest wood-working establishment. The box-making concerns are likely to give the best satisfaction. To say that nobody but the bee-supply men can cut the lumber just right for hive-making is mere bosh. The assertion that a precision like clock or gun work is required constitutes also a considerable stretching. The chief points are the length of the frames. These must fit each other, and be the same for all the hives. If necessary the end-pieces must be nailed a little in or out, so as to preserve the exact inside length.

Of course, the so-called dovetail corners should be abandoned, and plain corners substituted. The frames should be plain, wood frames. The best, easiest made, and

cheapest, are those hanging with nail on a tin strip. Small notches on the tin will hold the frames at the right spacing, and at the same time permit the apiarist to push them aside

to take them out, or hold a queen-cage or queen-cell between them.

The stuff for frames should be ordered in long strips. For reasons too long to explain here, a short stick cut to length costs nearly as much as a strip 8 or 10 feet long. With a miter-box the apiarist can, in a short time, cut enough pieces to make all the frames he needs. To avoid danger of splitting the wood when nailing, the pieces can be clamped in a small hand-vice while driving in the nails.

Knoxville, Tenn.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bees Flying at Low Temperatures

Bees seem to chill quite easily when separated from the cluster, and yet they sometimes fly at quite a low temperature. On the morning of Nov. 14 the thermometer stood at 14 degrees in the shade. When it got up to 26 a very few bees could be seen flying. Evidently that was warm enough for them. Bees will be seen flying out in small numbers at a much lower temperature when they have been long confined; and many such bees come out only to meet their death. But Nov. 14 there was no pressing need of their coming out; there had been no long confinement. Indeed, they had flown the day before, and not only the day before but for 4 consecutive days immediately preceding. But there were two things that specially favored their flying—the sun was at its brightest, and the air its stillest. A day or two later not a bee was stirring when the thermometer was considerably higher; probably because there was something of a breeze from the north-west.

### The Sisters and the National Convention

In putting the date of the National convention Dec. 19, 20, 21, if that is to be its date, the sisters do not seem to be taken into account. Christmas comes on the Monday following, and what chance will there be to prepare for it if those who are to make the preparation are expected to be at the convention? Very likely some of the brothers will say that from the 21st to the 25th there are 4 days, and ask how much more than 4 days are needed to prepare for Christmas. Little they know about it. They are accustomed year after year to sit down to the Christmas table groaning under its load of good things—I confess I never heard a table groan, but it sounds well to say it that way; the groaning is generally done afterwards by those who have stuffed themselves with the good things—they sit down and enjoy it all, with little thought as to how much time, thought, and labor it has all cost.

But there are no 4 days about it. If the convention closes Thursday night, the return home will be Friday—maybe Friday afternoon, maybe Friday evening—depends on the distance. At any rate, no sister will be in best shape to pitch right in the minute she takes off her Sunday clothes, so little or nothing will be done Friday; Sunday doesn't count, and there you are with Saturday the only day for making any previous preparation for Monday's gorge.

No, my good brother, it isn't all cooking, either. There are to be family gatherings—aunts, uncles, cousins, and all; and everything about the house is to be made spick and span. "No need of that if the house is already in decent order?" Now see here, who wants to be thought any poorer housekeeper than any other of the relatives? So the house must be overhauled from top to bottom, no matter how lately it has been done. At any rate, they all do it, and that's all there is of it.

"Not very much about bees in all this?" To be sure there isn't; but some of the sisters will feel better to have their minds spoken for them.

SISTER BERTHA.

Sister Bertha, there's much truth in what you say; but there are two sides. The great matter that overrules all other items in getting together a large number at a National convention is the matter of railroad fares. A chief consideration in having the convention held at the given time and place was that at that time and place very low fares could be had. The Fat Stock Show—the biggest thing of the kind on earth, we are told—gave the low rates. Then a large number of bee-keepers would want to attend the Fat Stock Show anyhow, even if no sisters should be of that number.

When the date was first set, it was 2 weeks earlier; no

trouble about Christmas then. But the building for the big show could not be completed in time, hence the postponement of a week. What else could be done but to postpone the bee-keepers' convention for the same length of time?

So we mustn't be too hard on the brothers.

There is, too, another item that counts for something, and for which the sisters are alone to blame. The proportion of them in attendance at conventions is so small that it ill becomes us to make much clamor about preparations being made just to suit our convenience. Let the sisters attend in large numbers, and no doubt their needs will have full consideration. At any rate, the particular chain of circumstances that made the trouble this time is not likely to occur again in many a long year.

## Mr. Hasty's Aftershoots

The "Old Reliable" as seen through New and Unreliable Glasses.  
By E. E. Hasty, Sta. B. Rural, Toledo, Ohio.

### ADVERTISING ADULTERATED HONEY.

No, we haven't got so far yet in the bad path of adulteration as publicly to advertise alleged candied honey at 3½ cents. Yet we have more call to improve than to brag. And when we get our door-yard a good deal cleaner than it is now, perhaps our shining example will move the Germans to clean up their door-yard, too. Page 758.

### WELL-RIPENED COMB HONEY.

A month in a hot room, *a la* Doolittle, is excellent for the honey before sending it to market. But the same time *on the hive* is still better; and *at some few apiaries* the conditions are such that the honey can well enough be left on the hive as long as you choose. That is, there are lots of bees and hives, but yield per hive always small. A suggestion of this kind is likely to raise something akin to a riot among many of our brethren. So wedded to the orthodox teaching that sections must be taken off the minute they are sealed—else the immaculate whiteness so much admired will be sullied. Truth. Not the only truth. And I think it is not by any means a hopeless task to get customers intelligently to prefer quality to looks. My experience with customers indicates this. And the experience of many grocers with the snow-white article is such that they get disgusted with selling honey, and quit keeping it. Small grocers, whose trade takes quite a while to carry off even one case, are especially liable to drop off this way. Here's a way of killing off the honey market that is not often talked about. I have had the pleasure of having a city grocer ask me what was the reason my honey kept in so much better order than the immaculate sections we have been talking about. Page 759.

### LEAVES FOR WINTER PACKING.

I see C. P. Dadant speaks favorably of leaves for winter protection. I am getting weak on them. Haven't kept the mathematics of the thing, but it seems to me that in an extra-severe winter a larger percentage of the colonies under leaves die, as compared with the colonies under chaff. Page 759.

### UNLUCKY 14—NUCLEI SWARMING.

So 14 is an unlucky number now, 'cause Mr. Day had 14 colonies and somebody stole 1 and left him with 13. Mr. D.'s experience that 2-frame nuclei swarm after a while, when swarming gets to be the rage, is not a thing to be surprised at. Page 763.

### NOMINATIONS FOR THE NATIONAL.

I was interested in the discussion about nominations on pages 773 and 774. Logically, our Boss holds his own pretty well; but practically, the Review's main point impressed me the most. The object desired is to avoid re-electing the old incumbent *except when a majority really and earnestly desire a re-election*. If they do, the Review's plan will not do him any serious injustice. As it is, he is as sure to get the largest number as he was under the old

plan to get the election. Then on the formal ballot the floating vote goes to him and elects him. Name one other name beside his, and hide the fact which has the most supporters, and we have done the most which can in fairness be done (it seems to me) to secure rotation—if that is what is wanted. If not, whence all these tears?

### AN AMERICAN IN GERMANY.

Glad Prof. Cook can reside in Berlin and yet prefer America, and think lovingly of it every day of his life. Page 774.

### THE "OUTS" AND THE "INS."

So the heavy fellows of New York were shy of a Honey-Producers' League with the honey-producers left out! What new thing is this in the world, that the outs should be suspicious of the ins? Page 775.

### BLACK BEES VS. ITALIANS.

And so able a brother as Allen Latham "doubts greatly whether any one can demonstrate that the black bee is inferior to the Italian in keeping out the "moth." There you have it, good and hot. Sam's daughter just as strong as Sam's son. 'Spects it's good for the worshippers of the 3-banders to see how much depends on the color of the glasses with which one looks at a thing. As for me, I'll be propitious and chime in with Mr. L. Blacks get a worse reputation than they deserve for worm-hunting on account of their greater disposition to *quiescence* or summer hibernation. During such a period moth-larvæ may get more or less start in out-of-the-way crannies; but, pshaw! there's no danger of their triumphing over the colony. The sleepy disposition will be thrown off, and the fighting clothes pulled on, long before that happens. Italians incline to keep up extreme activity whether they are making anything at it or not. It's at least a legitimate subject of inquiry whether they really gain or lose by this, as compared with the quiescent tactics in lengthy times of dearth.

Interesting to see that Mr. Latham has been trying to rear choice black queens. He finds them hard to get mated, when Italians mate all right. His solution—that Italian virgins fly slowly, while black virgins fly too swiftly to be overtaken—I doubt some whether that solution is the right one. Still, perhaps it may be. Page 775.

## Doctor Miller's Question-Box

Send questions either to the office of the American Bee Journal,  
or to DR. C. C. MILLER, Marengo, Ill.  
Dr. Miller does not answer Questions by mail.

### Requeening—Fertilized Queens—Wintering Bees

1. When is the best time to requeen?
2. If I buy a queen of a responsible breeder, will she be already fertilized?
3. What is the best way to winter bees here—the coldest weather is about zero—to put straw around the hives, or put them in a dark cellar with no ventilation but a door?

KANSAS.

ANSWERS.—1. A good many think it is as well to leave the matter of renewing queens entirely to the bees. Others prefer to take the matter into their own hands and replace each queen when she has done two seasons' work. Possibly, however, you mean the best time in the year to introduce a queen. Not till the season is well under way; and special circumstances must decide whether it is better to operate in the harvest or near its close.

2. Yes.

3. As far south as 39 degrees in Kansas bees will likely do better out-doors.

### Managing Swarms—Feeding in Winter

1. I have read in the bee-books that when the first swarm issues to hive it and set the hive on the old stand, putting the old hive as close as you can beside it, then a week later move the old hive some distance away. Now,

when I hive the first swarm, should I set the hive of the parent colony beside the swarm as soon as the swarm is in the hive, or should I wait until dark? And when I move the parent colony away, should I do it when bees from both hives are in the field at work, or should I wait until night when all are in their hives?

2. Is there an insect that works on honey when taken off? If so, how can it be prevented?

3. My neighbor gave me some colonies of bees that are very light, and have not enough honey to last them the first part of the winter. I know they should have been fed early, but what is the best way now to feed them through the winter, and what? or must I lose them? They have plenty of bees.

IOWA.

ANSWERS.—1. If, when you set the swarm on the old stand, you leave the mother colony at some distance until night, you will be likely to get more of the bees with the swarm than if you at once set the old hive beside the swarm; but the thing will be evened up a week later. It will make more difference which way you do when you make the shift a week later. If you make the change after dark, there will be no change felt till the next day, and then the feeling will come gradually as each fielder leaves the hive and fails to return. If you move away the old hive at a time of day when bees are afield, and especially at a time when the young bees are at play, not only will you get the fielders to leave the old hive and join the swarm, but all the young bees at play as well, making the depletion greater than if you made the change after dark. So it will be a little better to make the shift when the bees are out at play.

2. I don't think of anything but ants likely to get the honey in this country, and you can shut out the ants or destroy them in their nests.

3. Don't think for a minute of losing those bees for want of food. If you have no combs of sealed honey, make cakes of candy as directed in your bee-book; or even feeding thick sugar syrup in a Doolittle frame-feeder or in a pepper-box feeder would be better than to let them starve.

### Bees and Tobacco Odor

As I keep about 15 colonies of bees I would like to have your advice. I have built a basement cellar this fall, in which I intend to keep my bees through the winter, and I am also raising tobacco. I would also like to use the same basement in which is the tobacco crop. Do you think that it would hurt the bees any to have the tobacco in the same room through the stripping—about a week's time. There might be some dampness and strong smell from the tobacco.

WISCONSIN.

ANSWER.—It isn't a good thing for people to live in the smell of tobacco, but I think the bees would stand it for a week. But there must be some arrangement to keep the bees darkened during that week.

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 825)

#### HOW TO PRODUCE EXTRACTED HONEY.

A. H. Knolle says there is good sale for extracted honey. Last year the demand was greater than for comb honey. If more was produced more of it would be sold, and it would cut out the cheap-syrup trade more than if comb honey was produced.

Mr. Robinson is an extracted-honey man. He builds the colonies up in two hive-bodies. He claims that old combs are detrimental to the production of first-class extracted honey, therefore he continually replaces them, working the old combs into the brood-chambers. He runs colonies three stories high during the honey-flow. During the winter he leaves an extra extracting super on the hive.

Mr. Butts uses full-depth supers for extracting.

Mr. Bell favors the full-depth over the shallow supers, as he has used both.

#### THE PRODUCTION OF SECTION HONEY.

H. A. Mitchell, who was on the program for this subject, was not present. He is the only extensive section-honey producer in Texas at present, and he produces annually much of this kind of honey. It is of the very best quality, and mainly from basswood. The honey is produced in  $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{3}{8}$ , narrow, 4 bee-way sections. This gives a thin comb with a large surface. He has won several premiums and a gold medal on his honey.

#### BEST AND SAFEST WAY OF INCREASE.

Mr. Laws said the best time with him to make increase is right after the honey-flow. He manages all his colonies for the honey-flow, and at the time of its close he makes the increase, either right after or while he is making his last extracting. He sees after taking off the combs of honey from the hives himself, while the boys take it to the extracting house. If he wishes to increase about 25 colonies in an apiary of 100, he has that many hives ready on new stands. As he comes to combs in the extracting supers which contain brood, he places them with the adhering bees into these prepared hives. Several combs of brood and honey are thus given to each, no attention being paid as to which hive the bees are from. A ripe queen-cell is then given and the nuclei are built up. Nearly every bee-keeper can have an abundance of cells at that time.

Mr. Atchley stated that it is easy to make increase in his locality, as there are fully 9 months in the year in which the bees are breeding heavily. The question with him has been, which is the *safest and cheapest* way of increase, as he sells many bees. He drives up to an apiary where he has his colonies in 2-story hives, taking with him 100 empty single-story hives with covers and bottom-boards. Then he draws one comb of brood and one of honey from each strong colony to make one nucleus. These he places in a hive until he has a load, when they are hauled off to a new location, so that the bees do not return to the old stands and so the bees from the old apiary do not molest them. Here each is given a virgin queen and they are built up with foundation. If there is no honey-flow it is easy to feed them, as there are no other bees to bother these small colonies off by themselves. They are not near to the apiary to be tantalized by the bees from it.

Mr. Milam said, as he stated before, that there are no two seasons alike. In an average year in his locality, April 1 is the best time for increase. The best flow comes April 15. He takes the old queen and all the bees on the same comb, gets two other combs of brood and bees, placing them in a hive on a new location. The old hive is given a queen-cell. He has about 15 to 18 combs of brood to a hive. The bees swarmed very much this year at the 1st of April, which made it a good season for increase. By removing the old queen, March 15, and dividing the colony into 1-frame nuclei, adding full combs of brood from time to time to build them up, he is enabled to increase 1,000 per cent in 2 years.

Mr. Atchley said that Mr. Milam's way of making nuclei is a good one, but a novice may lose from one-third to one-half of them if practised in the old yard.

Mr. Bell has studied the subject of increase thoroughly. While Mr. Atchley's way is a good one, it is not the safest. He bursts a strong colony half in two, simply dividing it. He dwelt for some length upon the Alexander method of increase, given in the bee-papers some time ago. All the brood is placed in an upper story above an excluder. The queen is put below on empty combs. In 10 to 11 days there are plenty of cells above, and the brood is in such condition that there is no danger of any loss. The upper story is set on a new stand, and in 2 weeks 2 colonies with a good queen in each is the result. The old queen is thus given a chance to do good work.

Mr. Atchley thought that his own plan was the best and safest for the novice, as the bees were taken away to themselves, where they could be properly taken care of. Besides, his method does not interfere with the colonies run for honey. He always increases from the strongest colonies with young queens, and never from colonies with old queens.

Mr. Victor keeps a colony from swarming after the bees have the "fever" by spreading the brood and placing between each comb a frame with foundation. The other brood-combs are placed in another body, arranged in the

same way and set above the first, or the extra brood is used for increase.

Mr. Laws practices the "shook swarming" plan on such colonies. The colony is shaken into a new hive with only starters in the frames. The brood and some of the bees are set on a new stand for increase. He has had trouble about getting the bees to remain after shaking. If a comb of unsealed brood is given, queen-cells are started on it and the bees abscond to the woods. This they also do if sealed brood is given. A frame of honey keeps them. He favors the "shook swarming," both for honey and increase.

Mr. Aten advises that not more than 2 colonies be made from 1. He does not like the idea of dividing it into 10. It is so easy for a beginner to figure these things out on paper. For instance, a start is made with one 10-frame colony. This is divided into 10. Each one of these produces 100 pounds of honey—and failure is almost certain.

From the audience: "It would teach them a good lesson." (Laughter.)

Mr. White, in referring to the Alexander method, cautioned bee-keepers against placing the queen below the excluder on empty combs during cool or wet weather. There is danger of the bees clustering around the brood above, and leaving the queen below unprotected, where she may be chilled and succumb, or be injured so that she may become worthless.

If Mr. Victor wants increase for the same season's use, he makes it by removing the unsealed brood and the old queen to a new stand. This leaves the sealed brood and the old bees on the old stand, leaving it in an ideal condition for the honey-flow. For increase for future use he practises the method as outlined by Mr. Atchley, except that he gives more combs of brood and honey, 2 of each to a new hive. In 15 days he examines them to see that all have laying queens. Dividing a colony into 10 or so is too risky, as the danger of bees deserting the new hives is too great.

(Continued next week.)

### Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 826.)

THANKS TO MR. ROOT.

Mr. Moore—I move that we present to Mr. E. R. Root, towards his expenses, the sum of \$5. Now, inasmuch as he has absolutely refused to accept anything, and says he will donate this sum to our foul brood fund; and inasmuch as our whole assembly was greatly entertained and interested by his exhibition of last night, I move you a vote of thanks be given to Mr. Root for his very fine exhibition of last evening.

Mr. Kannenburg—I second that motion.

The President put the motion, which was carried unanimously.

EXPERIENCE WITH ALFALFA HONEY.

"Has any one had any experience with alfalfa honey, and with what success?"

Pres. York—I don't know whether it means producing alfalfa honey, or handling it, or eating it, or what. I would say it is very good to eat.

Mr. Becker—I want to say I don't know anything about its production. I know that alfalfa won't produce honey in our locality. But alfalfa honey as a honey I have sold on the market, and I think it is equal to white clover, or next to it, none excepted. It sells readily; everybody likes it. And there is another thing about it, there are a great many persons that cannot eat honey, but alfalfa they can eat in great quantities. I would advise those that handle alfalfa honey, or sweet clover honey, if the store-keepers will not sell it, to mix it with some darker honey, for instance with heartsease or even buckwheat. Buckwheat I have not had for a good many years, but I use heartsease and Spanish-needle. Invariably in my locality they say this alfalfa honey looks too much like sugar; it hasn't the color of honey. I sell a great deal of it every winter. When I get this honey at this time, and I am out of other honey, I go around and get some Spanish-needle and heartsease honey, and heat it all and melt it in order to produce a different color of honey. Alfalfa is too light a color to sell in the stores. But as to alfalfa, it outsells almost any other kind of honey.

The regular stenographer, Mr. Angus, having to leave for his train at this time, Mr. Hutchins kindly reported the balance of the session as follows:

PAPER PAILS AS RETAIL PACKAGES FOR HONEY.

Mr. Abbott—A man in Colorado expressed to me a paper pail full of alfalfa honey. It reached me in good condition, and was of fine quality. It stood around in the office two days, when, by that time, it had all been eaten. If we could get hold of something like this to put up honey in for retail, it would be a fine thing.

ALFALFA HONEY CANDIES READILY.

Mr. Wheeler—When we mention alfalfa honey we are advertising a Colorado product; we ought to advertise our own honey. I have found that alfalfa honey candies very readily.

Pres. York—I have found that alfalfa candies very readily, and comb honey of this variety ought to be sold before cold weather comes on.

IS PURE ALFALFA HONEY HARD TO GET?

Some members expressed their doubts of the possibility of getting pure alfalfa honey. They thought it was largely mixed with sweet clover.

Mr. Abbott—I have been eating sweet clover honey for 20 years, and I don't think you can fool me with it. We get some honey from the West that is not all alfalfa, but I have no trouble in getting water-white alfalfa honey.

A bottle of honey, supposed to be sweet clover, was then passed around.

Pres. York—I have handled tons of sweet clover honey, and I should say that this is a sample of pure, sweet clover honey.

Mr. Snell—I get no surplus from alfalfa, but we have sent for some of the bacteria with which to inoculate the soil, and are hopeful of better results.

HAS ALFALFA HONEY SPECIAL MEDICINAL QUALITIES?

Pres. York—I have never heard that alfalfa honey possessed any special medicinal properties. I believe that basswood has been given that distinction.

Mr. France—I have sold my dandelion honey at an advanced price because of its supposed medicinal qualities.

Mr. Abbott—I suppose that all honey has medicinal qualities if it is used rightly. It is peculiarly effective in bronchial diseases.

WHAT IS AN UP-TO-DATE APIARY?

Mr. Horstmann—Where all of the hives are of approved pattern, the weeds and grass kept mowed, where there is an extractor used, and everything kept neat and clean.

Mr. Wilcox—I suppose that no old straw hives are used, and everything is kept neat.

SHEEP FOR KEEPING DOWN GRASS IN THE APIARY.

Mr. Reynolds—Sheep sometimes knock over the hives.

Mr. Wilcox—I don't know as I would at all times turn in the sheep, but, in the honey season, it seems to me it would be all right.

Mr. France—In procuring a site for an out-apiary, I select a pasture. The stock soon learns to work in the apiary at night. If hogs go into the yard, I want the hogs to have rings in their noses.

CAN HONEY-VINEGAR BE MADE AT A PROFIT?

Mr. Meredith—Waste honey can be used profitably for that purpose.

Mr. France—We can get a good price for honey-vinegar in our home market where we and the vinegar are known. I would advise the use of waste honey from washing cappings, the washing of dishes that have contained honey, etc.

Mr. Wilcox—If we have honey that will sell at 4 or 5 cents per pound, can it be made into vinegar with profit?

Mr. France—I think not.

Mr. Hoffman—Give the process for manufacturing vinegar.

Mr. France—Make a solution of honey and water that will float an egg, then let it stand until it has turned to vinegar. That is all there is to it. There are quicker processes than this—those that expose it to the air more thoroughly than this—but it will not pay the ordinary bee-keeper to bother with them.

(Continued next week.)

### CONVENTION NOTICES.

#### National Convention, Dec. 19, 20, 21.

—The Fat Stock Show, upon which we have depended for reduced rates on the railroads, has been postponed two weeks, so the date for the convention will now be Dec. 19, 20 and 21, 1905.

The place of meeting has also been changed to Brunt Hall, in the Bush Temple of Music, corner of North Clark Street and Chicago Avenue (entrance on Clark Street,) 5 minutes walk north from the Revere House, Southeast corner N. Clark and Michigan Sts., which will be headquarters for the members.

W. Z. HUTCHINSON, Sec.

The Chicago-Northwestern Bee-keepers' Association will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to.

HERMAN F. MOORE, Sec.

New York.—The annual convention of the St. Lawrence and Jefferson Counties Bee-keepers' Association will be held at Watertown, N. Y., Dec. 13 and 14, 1905.

GEO. B. HOWE, Sec.,

Jefferson County Association.

Black River, N. Y.

New York.—The annual meeting of the Oswego County, N. Y., Bee-keepers' Association will be held at Fulton, N. Y., Thursday, Dec. 14, 1905. Dr. E. F. Phillips, who is furnished by the Agricultural Department, is expected to be present and address the meeting.

MORTIMER STEVENS Pres.

CHAS. B. ALLEN, Sec.

Central Square, N. Y.

New York Bee-keepers' Institutes.—A series have been arranged to be held in New York State as follows: Amsterdam, Dec. 11, 1905; Syracuse, Dec. 12; Watertown, Dec. 13; Fulton, Dec. 14; Auburn, Dec. 15; Romulus, Dec. 16; Geneva, Dec. 18 and 19. Dr. E. F. Phillips, Acting in Charge of Apiculture, United States Department of Agriculture, will attend and address these Institutes on subjects pertaining to bee-keeping.

Romulus, N. Y. C. B. HOWARD, Sec.

The New York State Association of Bee-keepers' Societies will hold its annual meeting at Geneva, N. Y., at the Nester Hotel, Monday and Tuesday, Dec. 18 and 19, 1905. New and interesting subjects are to be introduced and discussed at this meeting, and all bee-keepers of New York State should make arrangements to be present. Good and reasonable accommodations have been secured. Headquarters will be at the Nester Hotel.

Romulus, N. Y. C. B. HOWARD, Sec.

New York.—A Bee-keepers' Institute will be held in the parlor of the Central Hotel, Market Street, Amsterdam, N. Y., on Monday, Dec. 11, 1905. This meeting will be held under the direction of the Bureau of Farmers' Institutes of New York State Department of Agriculture, by the Fulton and Montgomery Counties Bee-keepers' Society, assisted by the United States Department of Agriculture. Dr. E. F. Phillips, Acting in Charge of Apiculture United States Department of Agriculture, is expected to be present and address this meeting, and a good attendance is much desired.

T. I. DUNDALE, Sec.

West Galway, N. Y.

## Honey and Beeswax

CHICAGO, Nov. 17.—There has been a steady trade in honey to the small dealers who usually lay in a little stock at this time of the year. Prices are practically unchanged. The fancy grades of white comb bring 14@15c; that which is a little off 1@2c less; amber grades, 10@12c; dark and damaged lots, 7@10 cents. Extracted, white, 6@7½c; amber, 6@7c. Beeswax steady at 30c. R. A. BURNETT & Co.

KANSAS CITY, Oct. 9.—The honey market here at present is very strong at \$3.25 per case for No. 1 and fancy white comb in 24-section cases; amber and other grades selling for less according to quality. Extracted in good demand at 6½c. Beeswax, 28c. C. C. CLEMONA & Co.

CINCINNATI, Nov. 24.—The demand for comb honey is relaxing to some extent, owing to the majority of the trade being well supplied. All fears of a comb honey famine have been allayed. We quote fancy white comb honey at 14@16c. Extracted honey is in fair demand. Quote amber at 5½@6½c, according to the package and quality. Fancy white and white clover extracted at 6½@8½c. We are paying 28½c per pound delivered here for choice yellow beeswax. (We wish to call the attention of the producer to the above honey quotations, who mistakenly expects to receive these prices for his product. The above are our selling prices.) THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade. GRIGGS BROS.

NEW YORK, Nov. 17.—There is a fair demand for all grades of white as well as buckwheat, and receipts are about sufficient to meet the demand. Prices are unchanged. We quote: Fancy white, at 14@15c; No. 1, at 12@13c; amber, at 11@12c; buckwheat, at 10@11 cents. Extracted honey: Market is well stocked with California, which is coming along in large quantities. The demand is fair mostly in

# C. H. W. WEBER

CINCINNATI  
... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

small-sized lots. Prices remain about the same, 5½@6½c per pound, according to quality and quantity. Southern in barrels at 52@57c per gallon. New crop West Indian is now beginning to arrive and is selling at from 60@63c per gallon. Beeswax firm at 28@30c per gallon. HILDRETH & SEBELKEN

PHILADELPHIA, Nov. 20.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get people started, and when they do start, the demand continues for some months. We would say, now is the height of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c. We are producers of honey and do not handle on commission. WM. A. SELSER.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet; white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

INDIANAPOLIS, Nov. 7.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments

of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c. WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, Nov. 17.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the prices high. We quote as follows: Fancy water-white and No. 1 white clover, 14@16c; No. 2, 12@14c. Extracted seems to be more plentiful, and we quote same in barrels, light amber, 5½@5¾c; in cans, ½c more; white clover, 7@8c. Beeswax, 28@30c. C. H. W. WEBER.

SAN FRANCISCO, Nov. 22.—White comb. 1-lb. sections, 8@9 cents; amber, 6@7c. Extracted, water-white, 4½@5c; white, 4½@4¾c; light amber, 3½@4 cents; amber, 3@3½c; dark amber, 2½@3c. Beeswax, good to choice, light, 26@27c; dark, 25c.

Plenty of honey is now offering at the appearing quotations, but very little trading is being done, as dealers generally are of the opinion that lower prices will prevail. The quality of the receipts has been good so far this season and would indicate that the crop is quite large.

# AMERICAN BEE JOURNAL

45th Year

CHICAGO, ILL., DECEMBER 14, 1905

No. 50

## Officers-Elect of the National Bee-Keepers' Association for 1906

President C. P. Dadant.

Vice-President Geo. E. Hilton.

General Manager N. E. France.

Secretary W. Z. Hutchinson.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY  
334 Dearborn Street, Chicago, Ill.

IMPORTANT NOTICES

THE SUBSCRIPTION PRICE of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

THE WRAPPER-LABEL DATE indicates the end of the month to which your subscription is paid. For instance, "dec 15" on your label shows that it is paid to the end of December.

SUBSCRIPTION RECEIPTS.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

ADVERTISING RATES will be given upon application.

National Bee-Keepers' Association  
Objects of the Association

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

Annual Membership Dues, \$1.00  
General Manager and Treasurer—  
N. E. FIANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

The Honey-Producers' League  
(INCORPORATED)

OBJECTS:

- 1. To create a larger demand for honey through advertising.
- 2. To publish facts about honey, and counteract misrepresentations of the same.

MEMBERSHIP DUES

1. Any bee-keeper may become a member by paying to the Manager an annual fee of \$1.00 for each 20 (or fraction of 20) colonies of bees (spring count) he owns or operates.

2. Any honey-dealer, bee-supply dealer, bee-supply manufacturer, bee-paper publisher, or any other firm or individual, may become a member on the annual payment of a fee of \$10, increased by one-fifth of one (1) percent of his or its capital used in the allied interests of bee-keeping.

GEORGE W. YORK, Manager,

# AT CHICAGO

Our branch is located at 144 E. Erie St. It is in charge of Mr. R. W. Boyden. We keep at this branch a very complete stock of our bee-supplies. Shipping there very frequent carloads of goods, you can get from Chicago any special supplies with very little delay. On regular supplies we can save you both time and freight.

Mr. Boyden is thoroughly familiar with our line of Supplies, and is also a born bee-keeper. He knows the city. We trust our friends will feel perfectly free to ask his services in any way. Mr. Boyden will be present at the National Convention, and stands ready to accommodate you.

## Our Line for 1906

### OUR HIVES AND SECTIONS

Our hives and equipment, both for workmanship and clearness of stock, can not be excelled, and we doubt if they have ever been equalled. So strong is the demand for these goods that there has been a strife in many cases among dealers to get the Root Company's lines because they knew that everything that bears the Root brand is always popular with the customer, and always the best that money and brains can produce.

Our sections and frames for 1906 are even better than ever. They are inspected and re-inspected, and each inspector is required to put in each box of sections that he passes upon his own inspector's card, so that if complaint is made this card will come back on him. As he is anxious to hold his position and if possible get an increase in pay, it is clearly to his interest, as well as that of the customer, to let nothing but perfect goods pass.

### THE ROOT AUTOMATIC EXTRACTORS

Our extractors for 1906 in point of improvements and quality of workmanship leave everything else in the shade. The four, six and eight frame machines have the finest automatic reversing mechanism that has ever been put into a machine. Even the two-frame models can have the reversing mechanism put on at a slight additional cost; but we do not ordinarily advise buying the two-frame automatic. Steel construction has been substituted for cast iron wherever practical.

### OUR CATALOG FOR 1906

A great improvement over last year. Entirely revised and rewritten. New cover. New cuts. Every article is classified. No price-tables to confuse. The price of each article is directly under the description or illustration. The first edition is now on the press. If you wish a copy of this let us have your name *now*.

## December 15th Gleanings

When this issue of the American Bee Journal reaches you our Splendid Christmas Issue will be ready for mailing. Without doubt the finest bee-magazine ever printed. Three-Color Cover. 100 pages of matter. Many beautiful halftones. Extremely valuable articles. We have a limited number of copies which we will sell at 10 cents each. Better send 25 cents *now*, and we will send the Magazine for 6 months' trial, and include this number, or, better still, send \$1.00 for the year. You will find Gleanings in all principal clubbing lists.

## Editorial Notes and Comments

### National and Chicago-Northwestern Conventions Next Week

Next Tuesday evening (Dec. 19) the National convention will begin its annual sessions in Brunt Hall, Bush Temple of Music, corner of Chicago Avenue and North Clark Street, Chicago.

The Revere House, corner of North Clark and Michigan Streets, will be the hotel headquarters of the convention.

Also, at the Revere House, next Tuesday, at 2 p.m., will be held a business session of the Chicago-Northwestern Bee-Keepers' Association.

It is hoped that there may be a large attendance of beekeepers at all the sessions of both Associations.

### Treatment of Bee-Slanders

Clippings sent in by different persons show that the yarn about the ruin of the grape crop by the bees in Indiana has been widely copied outside that State as well as inside. While items of this kind are always welcomed at this office, it does very little good to refute slanders upon the bee in these columns. The readers of the American Bee Journal do not need informing in this direction; the people that do not read bee-papers are the ones that need informing. The place to do the most good is where the harm has already been done—in the newspapers which contain the slanders. If each bee-keeper who finds in his paper some incorrect utterance regarding bees would at once send to such paper a correction respectfully worded, such correction would generally be received in a kindly spirit, and much good would result. On page 794 an instance is given. Let others be ready to help on the good work.

### Influence of Larval Food

During the past few years there has been much interest among Australian bee-keepers regarding what seemed a sort of mysterious disappearance of bees, whole apiaries being almost entirely swept away. Mr. R. Beuhne has been an especial sufferer, and, as reported in the Australasian Bee-Keeper, he now thinks the trouble may be traced

to the pollen consumed. Not that the pollen is at all poisonous to the older bees, but that it is so deficient in the right kind of material that larvæ fed upon it are deficient in stamina, and succumb easily to adverse conditions, both in the cell and after emerging from it. Mr. Beuhne says:

“Dr. Cherry demonstrated by scientific reasoning that ill nourishment of the larvæ resulted in lack of vigor, and impaired vitality in the perfect insect. It is not a question of quantity of food, but one of quality, a deficiency of nitrogen. As bee-keepers, we know that a deficiency in quantity of larval food is corrected at once by the worker-bees in restricting brood-rearing, or, should it occur suddenly, by throwing out eggs and even larvæ. We have no proof, however, that bees can discriminate as to the quality of the pollen, and even honey. In fact, we do know that they sometimes have recourse to substitutes; they occasionally store flour for pollen, and fruit-juice for honey, both of which decompose in the combs under certain conditions of atmosphere. Assuming, however, that bees will use these substitutes only under stress of circumstances, which would be evident even to the bee-keeper, and leaving them therefore out of consideration, the report of the analysis of pollen we have received from Dr. Cherry shows that the percentage of protein, that is nitrogen, in a digestible form is very variable in different kinds of pollen, ranging from 27 percent down to 17 percent.

“As you all know, all larvæ under normal conditions are supplied by the nurse-bees with all the food they can absorb, and in the case of queen-larvæ with a surplus, so that deficiency in quality could not be made good by additional food. Taking the best sample of pollen and the worst, that with 27 percent of protein and that with only 17 percent, we find the larvæ consuming the latter get more than one-third less protein in the same quantity of food than the former, resulting in feeble resistance to disease-germs in the larval stage, and weakness, predisposition to disease, susceptibility to cold, and premature wearing out of the perfect insect.”

### Raising the Price of the American Bee Journal

We have received the following from one of our interested readers:

MR. EDITOR:—Replying to your call for suggestions that will make the American Bee Journal more helpful to its readers, I venture one or more that possibly may not occur to all others, because their bearing is indirect rather than direct.

I take it for granted that any editor and publisher who has been in the business as many years as you have, and has studied as you appear to have done to cater to the wants of his readers, has dreamed out a number of things that he would like to do, and could do if he had an unlimited bank account on which to draw, without caring how much of it came back again.

So, instead of hinting at this thing and that which you may have already thought of, or which may be suggested by others, my suggestion is that you put more money into

the Journal, and thus be able to carry out some of your dreams for improvement. Truly an original thought!

"Can't put into it more than you can get out of it?" Just about what I thought you'd say. Well, then, you must get more out of it.

"How?" The simplest thing in the world; *ask more for it*. Instead of having the subscription price one dollar a year, make it a dollar and a half.

Now, look here; before you dismiss that suggestion with a wave of the hand, and the curt reply that you can't get enough subscribers at a dollar, and if you asked a dollar and a half your list would drop so low that sure failure would follow, just give me the floor long enough to make a few remarks.

Your subscribers are possessed, no doubt, of a considerable degree of selfishness, as people in general are, and they probably have no desire to pay more money for the simple purpose of having you get more. But even admitting their selfishness—and I may say by way of parenthesis that bee-keepers as a class will compare quite favorably with mankind in general in the matter of unselfishness—they are at the same time an intelligent lot, and they understand that it is true economy to pay a higher price for a really good article rather than a lower price for something not so good. So a large proportion of them would be willing to put more money into the American Bee Journal if they can get the worth of their money.

Indeed, they would no doubt be willing to pay a good bit more for the said Journal if they were sure it would never be a whit better than it is now—at least many of them would—and the proof lies in the prices that many of them do pay now for other bee-papers. Fifty cents or a dollar a year for a paper that comes once a month. That makes each number cost  $4\frac{1}{2}$  cents or  $8\frac{1}{2}$  cents. Take the smallest amount,  $4\frac{1}{2}$  cents. If they are willing to pay that for another paper, why do they not pay it for yours, each number of which contains as much matter, and at least of as good quality? Simply because you do not ask it. Let us see: If they should pay  $4\frac{1}{2}$  cents for each of the 52 numbers of the American Bee Journal, that would make \$2.16 a year. If they are paying to others at that rate, why not to you? Still more willingly ought they not to be willing to pay a little less than three-fourths of that, making it \$1.50 a year?

They would do so all the more cheerfully because they understand that any publication that depends for its patronage upon a special class must necessarily be at a higher price, as witness the price of journals for the different professions, trade journals, and church journals. Also because there is now an upward tendency of prices in general, and a number of the literary monthlies have raised their prices.

Please don't understand that in the foregoing I am moved by an unusual amount of altruism. Simply as a business proposition I want more value, and as a matter of common honesty I'm willing to pay the price.

A CONSTANT READER.

Really, there is no getting away from the arguments advanced by "A Constant Reader" in the foregoing.

He also hits the nail squarely on the head when he says that we are desirous of improving the old American Bee Journal still more. And the only thing that prevents doing it to the extent we would like to do is the "limited bank account." Any one who knows even a little bit about publishing a bee-paper knows it is no bonanza. But we are not looking for bonanzas or riches. What we want is to do a straight, honorable business, and make a fair living at it—and at the same time be a help to others. But if prices of labor and materials continue to increase we will be *compelled* to raise the subscription price of the American Bee Journal, and say nothing about improving it.

We think it is no egotism for us to say that the American Bee Journal is the cheapest bee-paper in America today, and its contents second to none. We believe the best bee-keepers would endorse that statement. Then it ought to have the largest circulation of any of the bee-papers. Why it hasn't is doubtless because it is published at so low a price as to prevent pushing it adequately, and also because it has not some larger side-line of business with which to

boost it up—such as manufacturing bee-keepers' supplies, as several of the other bee-papers have back of them.

But we do not wish to raise the subscription price of the American Bee Journal if we can possibly avoid it. No doubt most of our readers would willingly pay the increased price, but why not, instead, turn in and help increase its list of regular readers sufficiently, and thus insure its price remaining at one dollar a year? Many charges, or expenses, are fixed, whether the circulation be ten thousand or thirty thousand. For instance, the cost of office help and rent, typesetting, engravings, etc.—these and some other expenses are just the same on ten thousand copies as on fifty thousand. So if we could greatly increase our number of readers, it would help wonderfully.

How many will send in at least *one new* subscription with their own renewals for 1906? Perhaps some can get several new readers for next year.

## Miscellaneous News & Items

**Result of the National Election.**—We have received the following from the chairman of the Board of Directors of the National Bee-Keepers' Association:

LAPHEER, MICH., Dec. 4, 1905.

FRIEND YORK:—Below I give you result of the vote for the election of officers of the National Bee-Keepers' Association for the coming year:

Total vote for President 876. C. P. Dadant has 724, O. L. Hershiser 149; Surface, Hutchinson and Harris, 1 each.

Total vote for Vice-President 810. Geo. E. Hilton has 685, Dadant 91, Marks 8, Green 6, York 4, Hutchinson 4; Laws 2; Coley, Holekamp, Stachelhausen, A. C. Miller, Elwood, Rohrig, McIntyre, Chantry, Putnam and Crane, 1 vote each.

Total vote for Secretary 889. W. Z. Hutchinson has 763, Jas. A. Green 111, Geo. E. Hilton 2; Laws, Stone and York, 1 vote each.

Total vote for General Manager 878. N. E. France has 852, Wm. Rorig 23, Frank Rauchfuss 2, and Hutchinson 1.

Total vote for Directors 2560. F. Wilcox has 491, C. A. Hatch 490, E. R. Root 466, E. W. Alexander 444, M. H. Mendelson 333, Walter S. Ponder 288, Geo. W. York 6, Dr. J. Rick 3; Laws, Kochen, Muth, Hutchinson, A. C. Miller, 2 each; and Dittmer, Crane, Hasty, Abbott, Brown, Green, Acklin, Putnam, Weber, Chantry, Coggshall, Hershiser, Moore, West, Voight, Selser, Lathrop, Fouch, Rorig, Surface, Wall, Holekamp, Holterman, McIntyre, Stone, Denman, Phillips, Rauchfuss and Aikin, 1 each.

C. P. Dadant is elected President; Geo. E. Hilton, Vice-President; W. Z. Hutchinson, Secretary; N. E. France, General Manager; and F. Wilcox, C. A. Hatch and E. R. Root are Directors.

Yours,

R. L. TAYLOR,

Chairman Board of Directors.

**Lightning Bug and Honey-Bee.**—H. D. Talladay of Michigan, sends us the following, which is amusing, at least, and will serve to give variety if nothing else:

"But the queerest friendship of this sort that ever came to my knowledge was 'tween a lightning' bug an' a honey-bee. The first I noticed of it was one June arternoon, 'long to'rds dusk, when I see a black bug, 'bout half 'n inch long on one of my bee-hives, which, on lookin' closer, I found to be a lightning' bug or firefly, as some folks calls 'em.

"Pretty soon a bee lit close by an' crawled to'rds the bug, as I thought to drive it off; for, you know, bees will pitch into an' kill any intruder that gits into their hives, even a strange bee. Wall, sir, the bee, instid of tryin' to drive it off, atcherly rubbed up against the bug, kinder caressin' like, an' fin'ally dropped a small drop o' honey, which the bug went to eatin', and when he's et all he wanted they both flew away together.

"Wall, of course, I was surprised, an' I was curious to

## Directors-Elect of the National Bee-Keepers' Association

FRANKLIN WILCOX

C. A. HATCH

ERNEST R. ROOT

see what would happen next; an' in a little while back they both come, the bee goin' into the hive an' the bug lightin' on the outside. Bimeby the bee come out, an' off they went agin; an' when they come back this time it was dark, an' I'm dumb'd if the lightnin' bug warn't on ahead an' lightin' the bee to the hive!

"Wall, they kep' this up for several nights; but I noticed that the bee was losing flesh, an' in about a week he was nothin' but skin an' bone. So much overtime was tellin' on him. One evenin' he fell to the ground exhausted, an' in a few minits he expired.

"The lightnin' bug took on awfully, an' crawled 'round and 'round his dead comrade an' acted almost frantic. He flew on to the hive an' jest sot there an' moped, refusin' to eat a mouthful, an' in a few days he follered his friend.

"I thought some at the time of tryin' to cross the two insects an' raise a bee that could work night an' day; but I didn't. An' I s'pose if anybody tried it now the unions would raise a rumpus, so I guess I won't bother."—New York Press.

Mr. Thos. J. Stanley, of the firm of Thos. C. Stanley & Son of Minzanola, Colo., called on us recently when in Chicago. The Stanleys are perhaps the largest handlers of comb honey in the United States. Through their management this season they undoubtedly saved Eastern bee-keepers a good deal of money, by buying up and holding much Western comb honey that might have been dumped on the honey centers like Chicago and cities further east, and thus cause a weakening of prices. Instead of that, however, honey prices have not only been sustained, but advanced a little over last year's prices. This should put things in good shape for the crop of 1906.

Mr. Stanley says that carloads of comb honey in the West average 30,000 pounds.

He also reported that Colorado's honey crop was practically a total failure this year. His firm runs about 2000 colonies in 5 or 6 apiaries, and not only got no honey, but had to feed for wintering. Surely it has been a very discouraging season for Colorado bee-keepers.

plus honey, I am able to secure about that amount from every colony in the apiary having that number of bees; while a colony having 30,000 bees will give a yield of 50 sections. If I fail to secure the 60,000 bees in any and all colonies, it is not the bees that are to blame for this state of affairs, but myself; and the bee-keeper who cannot bring each colony up to the standard of 60,000 at the beginning of the best honey-flow, will not meet with as good success as will the one who can.

Then, the bee-keeper who fails to make the colony with 30,000 bees give nearly half as good results as the colony with 60,000, will not meet with the success that he might were he able to do this. I have been years studying on this matter, and this study has shown me that colonies which I pronounced "exactly alike" on June 1st would not be so at the time the honey harvest was at its best. The trouble was that I did not have the knowledge that I should have had regarding the working force of my bees at all times, nor of the amount of brood in each hive, which was to give this working force at the time of the honey harvest.

For instance, the colony which I called my best on June 1st might become one of the poorest by July 10th, at which time the main honey-flow from basswood would be on. This, as a rule, would come about by one queen not keeping up her laying capacity as well as another, or, in other words, she would not be laying her maximum number of eggs from 30 to 50 days before the arrival of this main honey-flow. Let me try to illustrate what I wish to bring out.

Near me lives a man who is interested in fancy poultry,

### Difference in Honey Results of Colonies

BY G. M. DOOLITTLE.

A BEE-KEEPER called on me a few days ago, and in our conversation he brought out the idea that it was impossible to have the colonies in any apiary give anywhere near the same results in honey. He said that some of his colonies gave a surplus of only 10 pounds of section honey, while others produced from 50 to 75 sections, well filled. I told him that I thought this could be remedied to quite an extent, but he seemed to doubt it; and as I have many letters on this subject, perhaps it would be well to have a little talk on the matter through the columns of the American Bee Journal.

I used to find things very much as this man and others claim they do at this time, but of late years I have succeeded in making each colony produce nearly like results; that is, if one colony contains 60,000 bees and gives 100 sections of sur-

and the demand for eggs from his stock comes in the spring. The eggs to be used for breeding purposes; and the prices which he gets at that time are almost fabulous. Being there a few days ago, he came from his chicken-house with two eggs from his spring pullets. I ventured the remark to him, the same as the ordinary barn-yard poultry keeper would do. "Quite lucky that your pullets have begun laying thus, right on the eve of the high winter prices for eggs, as eggs are worth about 3 cents each at the grocery now, and will be still higher before the holidays."

He gave me a glance which told me that he thought I did not know much about keeping fancy poultry (and he was right), and said, "I am using every effort at this time of the year, through feed, etc., to keep these pullets from laying now, for those which lay when eggs at the groceries are the highest are not apt to lay much in the spring, when I can sell my eggs at ten times as much, egg for egg, as I can during the winter months."

This set me to thinking regarding the bees, and reminded me that the queen which bred too prolifically "out of season" was not the one which gave the best results when the honey harvest was on.

I have often noticed that a colony which wintered extremely well, so that the queen goes to breeding very rapidly in the early spring, does not equal the one which comes out in an average condition, but commences brood-rearing in earnest about May 20th to 30th. The reason is that by June 10th the queen in the stronger one ceases to be as prolific as the other, or becomes like the man's hens do which are laying prolifically in mid-winter; they giving few eggs in the spring, just at the time when his eggs bring him the best price.

So the early strong colony spends all its best force at producing bees prematurely, bringing them on the stage of action too early to take advantage of the main honey harvest, while the queen ceases her prolificness just in time so that what workers there are store their first honey in the brood-combs, thus crowding the queen down to less and less room, with very little honey in the sections.

It has been noticed by very many, and many times, that if the bees are allowed to get the start of the queen so as to make any general storing of honey in the brood-chamber before entering the sections, during the first of the honey harvest, such a colony will not give the best results in section honey. And for these reasons I work as does my poultry-fancying neighbor, to discourage all extra-prolific brood-rearing, except at the time when such prolific breeding will bring the bees in just the right time for the main honey-flow, be that from white clover, basswood, or buckwheat, or all three.

Then when the harvest arrives, if I find colonies which do not have a hive more than half full of brood, dummies are put in to take the place of the combs containing no brood, and in this way I am enabled to make the colony containing only 30,000 bees produce nearly half as much section honey as does the one which has come up to the honey harvest in the desired condition.

The colony given to early breeding can in a measure be restrained by allowing it a scanty supply of stores, and contracting the room in the brood-chamber with dummies till the time comes for the rush of brood, when it will "rush to the rescue" when you wish it to do so by filling out the hive with combs having a liberal supply of honey in them.

Those given to late brood-rearing can be hurried along, when the right time comes, by giving a frame of brood from one which "has run a little too fast," together with stores sufficient to make them feel in a prosperous condition, thus bringing all up to the right point just at the right time, and when best to take advantage of the main honey-flow when it is on.

It is the attending to such items as these in bee-culture that gives the best success.

Borodino, N. Y.

## Black Bees—A Reply to Allen Latham

BY HARRY LATHROP.

MR. ALLEN LATHAM, on page 775, has given expression to thoughts that have doubtless occurred to many bee-keepers. I know I have often remarked at the persistency of the black race, and wondered if they would not have proven as profitable in a honey-gathering way as any other strain if the same care had been bestowed on them. I have had experience with them for over 20 years, generally having a few of them in one or the other of my yards. While occasionally a colony would do as well as any of the others,

they never seemed to average as well. They were more often found with small brood-chambers, queens that were poor layers, and gave evidence many times of being what they really were—a run-out race.

Two years ago I purchased a whole apiary of black bees and brought them here. I ran them one season, and that was enough for me; I want no more black bees in my business. This season I sent to one breeder and procured breeders for queens, and to another for queens from which to rear drones. It is my ambition to rid this apiary of the last vestige of black blood next year.

As I said before, I have had some black bees right along, and tolerated them, but when it came to having a whole yard, after having worked for years with Italians, I simply could not endure them, and I think that were I compelled to breed only blacks or quit bee-keeping, it would be quit.

I do not object to them so much on account of their being cross; they are not so much crosser than the others, but in my practice I clip queens every spring. It is an easy matter to find and clip Italian queens, but a hopeless task to start in on a yard of blacks.

I favor the leather-colored Italians. They are good workers, queens are easily located; in fact, any and every manipulation is made with comfort and dispatch. I fully agree that by proper care the black race might be made equal to any for honey-gathering qualities, and we all like the way they cap their comb honey, but they are so disagreeable to work with that I think very few having had experience with them would wish to increase the stock.

There is another reason why black bees are undesirable: A cross between the black bee and the pure Italian results in a good worker, but the crossiest bee on earth, unless it be the Cyprian.

I have had hybrid colonies that were better than any others for work, but such fighters that it became a serious matter to get their honey away from them.

I believe in enjoying life as you go along, if possible, therefore the black bees and their crosses should be ruled out, as they make life more or less miserable for those who must work with them. On the other hand, the Italian race of bees, with proper care, are good workers, prolific, beautiful, and kindly disposed. After a great many years of active work, during which time they have been on trial by nearly all the more prominent bee-keepers, they are deservedly the most popular race of bees to-day. Bridgeport, Wis., Nov. 14.

## Honey Marketing and Publicity

BY JAMES WILCOCK

THE article appearing on page 743 is the best that I have seen; and please allow me to state that there is room for the sale of hundreds of tons of honey in this country; that is, honey of first-class quality, but the people here seem to have a great prejudice against American honey—they seem to think it is all adulterated. I have tried to persuade them that it is an impossibility to manufacture comb honey; in fact, you can scarcely sell comb honey, but of good extracted honey you can sell any amount. I have never had any difficulty in selling my honey. I put it up in 1-pound glass jars, and fix a label on them, and by putting on that label, if my honey was not pure, I should render myself liable under the Food and Drugs Act, to a fine of from \$20 to \$100.

I could sell now, right here in this country district, a ton of honey in glass jars before Christmas.

Now, Mr. Editor, will you allow me to give The Honey Producers' League a little advice? And if they will only take it, I have no hesitation in saying that all the ripe American honey of good flavor need not wait long for a good market.

As Mr. Green has said, establish your brands, or your trade-mark, and let there be a central place fixed for The Honey-Producers' League, say at Chicago, with branch places at Omaha, Kansas City, and St. Louis, and let all the honey that bears its trade-mark be thoroughly examined by experts appointed in those places to examine the honey, and all honey that is not ripe and of good flavor let it be excluded.

Advertise in all the leading papers in this country as to the purity of your honey, and let there be samples sent to all the leading stores in the United States and England, and you will soon find that your honey will not have to be glutted away the same as it has been in some of your markets.

Thanks to Mrs. A. L. Amos (page 763), for her letter

seems to me to be pretty straight. Either Nebraska, Iowa, Missouri or Kansas, are the States I have selected to settle in, and I only want to know the best places for my object. I hope to be with you within the next 12 months.

Lancaster, England.

Conducted by MORLEY PETTIT, Villa Nova, Ont.

### A Peculiar Fall in Ontario

This has been a peculiar fall in Ontario, and a hard one on bees. Since about the middle of October there has not been a good flying day except in the most southern parts of the Province. All signs seem to fail. The weather does everything but what well-ordered weather would be expected to do. One day bears every indication of approaching cold, rough weather; the next will be fine and bright, but not quite warm enough for bees to fly. These days are most trying. Uncomfortable from long confinement the bees grow restless—some fly out and are lost, and all consume more stores and fill up faster than they would in more steadily cold weather.

While putting bees into the cellar last week, we found in some yards they were spotting around some entrances, and covers were spotted considerably from their last flight. Of course, this can not be helped, but it will be a warning to give bees extra attention during the winter.

### Four Days Putting Bees into Cellars

Four days of putting bees into cellars under private houses give plenty of varied experiences in that line. While at the Toronto convention, in November, I arranged with R. F. Holtermann to "change works," as the farmers say, and secured the assistance of J. H. McCauley, another enthusiastic bee-keeper. The following Monday (Nov. 20) we went at it. The first cellar, near Brantford, is stone with cement floor, all in one room. I had partitioned off with boards a room for the bees separate from the fruit and vegetables. The stairway is broad enough for two to walk right down with two hives on a hand-barrow. We three put the 112 hives in and blocked them up from the bottom-boards behind, in about 4 hours, although we had a long distance to carry them. The windows of this cellar will be banked with straw, and a 4 inch pipe run from near the pipe of the cook-stove in the room above.

Supper finished, we started out in the darkness to drive about 8 miles through *mud*. Ye city or sand dwellers have no idea what mud-roads are. All the way we were harassed by the thought that the next lot—18 hives—had to go through the cellar window! Next morning was bright, with indications of a flying day.

Cellar No. 2 is under a large brick house, and has three compartments—first, vegetables; second, furnace; third, bees. With no outside stairway there was no way out of it—through the window they must go.

We got another man, and with two outside to carry to the window, and two inside to pile up and block up, things went merrily.

To help matters, as the temperature rose slightly outside, a cool breeze from just the right direction kept the cellar cool. The bees came from an outside temperature just too cool for flying, into a cooler cellar air. This lowering of temperature was just the thing to keep the bees quiet, although even then they were lively enough before the cellar was full. That job was done in about 3 hours, and we voted the window *better than a stairway*.

Cellar No. 3, about 7 miles further on, had a regular maze of doors and passages through which the bees had to be carried. We could not use the window, as it was too small. It meant hard lug, lug, and stooping to preserve brains from joist all too low for such prominent Canadian bee-keepers!

However, we finished there in time to get a start at the next cellar, 3 miles further on, before noon Wednesday.

By that time the bees were flying just a little, so we waited till 2 o'clock, then went at them. The weather was not ideal—too warm; but that is one of the disadvantages of managing several apiaries. Things must be done when the time comes, with much less regard to weather conditions than the small bee-keeper can observe. To make matters worse, the help we were counting on failed, and one man alone in the cellar found it pretty heavy work handling those 12-frame Langstroth hives with a rousing, strong colony of bees in each.

That night we drove 9 miles to a sleeping place, and 5 miles the next morning to the last cellar, almost in sight of Lake Erie. A drier cellar you never saw. It is in the buck-wheat country, where there is sand clear to the bottom of things. Hives can sit flat on the ground, and when you pick them up the sand is dry underneath. The cellar-floor is perfectly dry sand.

By 4 o'clock Thursday we had finished the job. Next day it rained all forenoon and we were glad the bees were in. Six hundred colonies put into 5 cellars, and more than 40 miles of bad roads covered between Monday noon and Thursday, 4 p.m., we considered not bad work.

### Hints for Beginners

In bee-keeping there is ever going on the great battle of the survival of the fittest. There is perhaps in no other branch of agriculture, to the same extent, the dropping out of some, and fresh members being drawn in, as there is in bee-keeping. There is still too common the impression that bees look after themselves, and too little is being done to check that impression. Until this is done there must be the constant change of bee-keepers and great loss to individuals and the community at large, and we are also bound to have inferior goods put upon the market to the injury of that market. Let me, however, say that the excellence of product is not gauged by the number of colonies a bee-keeper keeps.

Every bee-keeper is interested in the safe wintering of bees, for to-day we do not know where foul brood exists, and there is a particularly dangerous time in the spring. Colonies may have perished, which, unnoticed by their owner or any one else, are robbed out by strong colonies in the neighborhood. These hives may contain foul brood, and the honey robbed will be sure to be fed to the larvæ in the robbing colony, and the disease spread. We are then interested in our neighbor, and that neighbor may be a long distance from us.

I am not opposed to more bee-keepers, but I want them to realize before they enter into this branch of apiculture that it is a business, and should be pursued in business-like ways. It would, in my estimation, also be better to direct our attention more to reaching out to secure better markets, to educating the people to know the difference between good and inferior honey, and to educating all in the direction of producing a better and more uniform article. This undoubtedly can be done, as it undoubtedly has not been done in the past to any great extent.—R. F. HOLTERMANN, in the Canadian Bee Journal.

Send questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

Dr. Miller does not answer Questions by mail.

### Keeping Combs Until Next Season—Finding Queens and Requeening

1. I have had bad luck with my bees. The moths got in and killed 2 of the colonies. I don't think they would have gotten in if it had not been for the bees having paralysis. I have only one colony left, but I expect to get some Italian bees next spring. If I get a full colony the hive they come in would be all right. But what I want to know is, how can I fix the hives and frames that the bees died on so as to save them to put more bees in next summer. I have 3 hives with frames, and would like to fix them so they will do to put more bees in.

2. I sent for a queen the past summer. I took all the frames out of the hive, but I could not find the old queen, so I put the new queen in and they killed her. If I take an empty hive-body and place it with the entrance close up to the entrance of the hive I want to requeen, then put a queen-trap at the entrance of the empty body, cover the empty body half over, then take the frames and shake the bees into the empty body, would the plan work all right?

MISSOURI.

ANSWERS.—1. You will find it a difficult thing to keep the combs safe until swarming-time next year. Keep them out-doors where they will freeze, but closed up so that no mice can get into them. The freezing will kill all the larvæ of the bee-moth, and it is not likely that the moth will lay any more eggs in them till well along in the season next year. But you can make this a little more sure by taking them into a cellar when freezing weather is over.

2. If I understand correctly, your object is to find the old queen, and you propose to shake the bees into the empty body with a queen-trap at the entrance of this empty body, expecting the bees to pass out through the trap and crawl to the close-by entrance of the old hive, the queen being held in the empty body by the trap. Very likely it would work all right; but it might be just a little better to modify the plan a little. Fasten your trap at the entrance of the old hive. Lift out all the frames with adhering bees, and put them in an empty body close by. After all the frames are taken out of the hive, make sure that the queen is not in it, if necessary brushing all the remaining bees out of the hive upon the combs. Now lift one of the combs, shake and brush all the bees from it upon the ground in front of the old hive, and as soon as you have all the bees off the comb put the comb in the old hive. Proceed with all the combs in the same way, brushing all the bees in front of the trapped entrance, and putting the brushed combs into the old hive. The bees will crawl into the hive through the trap, and Madam Queen will be found trying to get in the same place.

### Rearing Queens on an Island

In rearing queens, would it be to any advantage in order to get them purely mated, to keep them out on an island about a quarter mile from shore? MINNESOTA.

ANSWER.—Yes, it would make a difference, just how much difference depending upon the number of colonies on the main land, and perhaps some other things, such as the prevailing direction of the wind. I think a half mile of water would do a good deal more to isolate them than a half mile of land.

### Effects of Inbreeding in Bees

Does the honey-bee degenerate through in-breeding? If so, what is the result?

1. Will they differ in color from Italians? If so, what color?
2. Are they larger or smaller?
3. What effect will it make in handling?
4. How will it affect in honey-producing?
5. How will it affect their swarming?

CANADA.

ANSWERS.—Indiscriminate inbreeding among bees, as with all other animals, is likely to result in deterioration, the bad qualities becoming intensified. With intelligent control the result may be the other way.

1. Inbreeding ought not particularly to affect color. Blacks inbred would remain black, and yellow bees yellow, although there might be a slight tendency toward dullness in color.

2. Smaller, if anything; although you would probably not notice any difference in size after many years of inbreeding.

3. Any change in temper would likely be toward crossness, yet not certainly.

4. The chief effect would probably be most noticeable in this direction, the bees becoming less vigorous and active.

5. Any change in this direction would be likely toward more swarming.

Now, please understand that all these answers are more or less in the nature of guesses, and I shall be very thankful if any one better informed will "call me down" and straighten me out. There is also a possibility that some may have a misunderstanding of this whole matter. When

inbreeding is under consideration, it should be understood as referring to breeding kept down within a pretty narrow circle. If you had a few colonies on your place for a term of years, and there were no other bees within 10 miles, you would have inbreeding. If others all about you kept bees, there would be little chance for inbreeding, and the outcome of your leaving your bees to themselves year after year would be different in different cases. If other bees about you were better than yours, yours would, at least for a time, be likely to improve, and *vice versa*. If you start with pure Italians in almost any location in this country, you are likely to find black blood working in from the bees around you.

### Bee-Paralysis—Cellar—Wintering

1. Is there a remedy to prevent bee-paralysis in the spring?

2. Will camphor prevent it if I put a small piece in the hive?

3. Will paralysis affect bees that are wintered in the cellar as quickly as those wintered outdoors?

4. Do I have to remove the bottom-boards or the cover in the cellar?

IOWA.

ANSWERS.—1. There have been a great many remedies, first and last, offered for the cure of bee-paralysis, but none of them has seemed to prove successful in different cases unless it be the sulphur cure, which you will find given in back numbers of this Journal. Some sprinkle the sulphur over the bees, after removing the brood, and some say they have succeeded by merely keeping plenty of sulphur at the entrance for the bees to crawl through.

2. It will probably have no effect whatever.

3. There is probably no difference.

4. That depends upon how much ventilation is afforded without the removal. My covers and bottom-boards are taken in with the hives, just as they were on the summer stands, but then there is a space 2 inches deep under the bottom-bars, and an entrance the full width of the hive 2 inches deep. Without any such provision for ventilation it is better to remove cover or bottom-board.

Mr. Hasty's  
Afterthoughts

The "Old Reliable" as seen through New and Unreliable Glasses.  
By E. E. Hasty, Sta. B. Rural, Toledo, Ohio.

### EXTRACTING ALL THE WAX.

If I understand Arthur C. Miller, he thinks the principle of taking wax-material down under boiling water and giving it a lively handling right there is the winning principle if we are ever to get all the wax. More pressing can not, from the nature of the case, result in a solid cake of refuse with no remaining wax filling up interstices. Quite likely he's right; and I'll take back the gravamen of what I said against page 583. Mr. Ernest Root (most competent of confessors) confesses, on page 777, that 5 percent of the wax is left in the pressed cake. Well, what say to a dasher-churn of stoneware with wire-screen cover, sized correctly to go right into the boiler—squatly of shape, and right to be covered an inch or more in the water, all except the dasher-handle? Begin the process much as usual in a tall wash-boiler. Boil, stir, dip out wax, etc. When not much more can be had on that line put the remaining slush in the churn. Sink it, and churn away vigorously for a long time. Nothing to hinder pressing it afterward to see whether any more will come out. Page 776.

### COLOR OF BAIT-SECTIONS.

I hardly understand Wm. B. Lowe, page 780, whether the dark spot in his bait-sections was discolored comb, or whether the old honey was still there, more or less candied. If the former, is worthy of some study to find out what made the old honey discolor the comb. If the latter, I guess it's only just what might be expected. They are liable to leave it and put new honey around it. If you must needs put on honey in a bait-section, at least don't have more than two to a hive. Uncap it; be sure it is not candied much; and

try hard to put it on when the bees are hungry. I once, when even greener than now, put on a lot of sections I had no market for—not as baits, but thinking the bees would keep it better than I could, and faintly hoping they would take it out and rejuvenate it. Queer looking stuff when I took it off the second time. Dingy, and fired full of empty cells here and there.

#### WHAT ABOUT BOILING SUGAR?

In Miss Wilson's answer, No. 4, page 778, we read, "Boiling does not change sugar." Say, rather, Boiling gently for a short time changes sugar but little. I think the chemists claim that boiling does greatly change sugar if you boil it long enough and furiously enough. Or did I dream that?

#### ORANGE TREES AND APPLE TREES.

Hello, orange tree! If you are a champion tree you are good evidence that the orange does not grow as big as the apple. Nobody would be surprised at an apple-tree of your size. (Outside of No. 46.)

#### THE GOVERNMENT AND CAUCASIAN QUEENS.

That Government circular on the free distribution of Caucasian queens is admirable. At last Uncle Sam seems to be doing himself proud in helping apiculture.

Now, most of us don't want Caucasian bees. The bees we have are the bees we want. Scarce a glimmer of a chance that Caucasians will make more beautiful sections of honey than select Germans do, or store extracted honey swifter than select Italians, Carniolans or German-Italian hybrids. Many of us would like a few to tinker with and be interested in. But to all people keeping bees in cities and towns they are likely to prove a very great boon—if something near equal to those named above. Neighbors will be at peace if they are assured that a new kind of bee that pretty nearly *can't be made to sting* is the only bee kept. And a host of would-be amateurs can with Caucasians improve their minds and their health.

The grand trouble is that unsupervised breeders will send out hybrids largely; and hybrids are quite unlikely to be very gentle. Thanks—a thousand thanks—to Uncle Sam for undertaking to supervise. Let's all support him in a hearty and vigorous sort of way. Let's say, Don't buy a Caucasian queen unless the breeder has the Government indorsement. I would like to go further, and add this much more: Don't buy one unless bred entirely out of reach of any other bees. Pretty severe to limit prices to Italian prices plus 20 percent. I hope that on further consideration a minimum of \$2.00 will be allowed, when bred in totally isolated localities. Or if allowed to send out queens just beginning to lay at tested-queen prices, that would be about as good. And the queens from such a location would be practically tested queens. Page 789.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bee-Keeping for Women in California

Under the above caption Mrs. J. B. Ames writes to the California Promotion Committee's publication as follows:

"Actual experience has proved bee-keeping to be a profitable as well as a healthful occupation for women in California. The ready market for comb and extracted honey removes all difficulties in disposing of the product of the busiest of all animals, and the mild climate permits the outdoor work necessary for the care of the bees during a long and pleasant season. The woman who would keep bees, either to supply her household needs or with a view of earning a living, has but to understand and apply the two following very simple essentials to the profitable keeping of bees. They are: first, that the animal life be properly nourished; and, second, that nature be so assisted by intelligent methods of keeping and reasonable care as to give best results to the keeper. But these essentials may be supplied here in California with a minimum expenditure of work and money. So many localities furnish abundant food for the bees that the question of feeding them

is solved for the keeper, while by an intelligent selection of location and methods of handling the best results are easily obtained. There being no winter problem in California, it is not necessary to carry the bees with six months' supplies in the cellar. A bee-keeper in Wisconsin writes:

"On April 12th I took out the last bees. From then till the 22d we had heavy frost and cold weather. On the 26th and 27th the weather is so unfavorable that one day they work and the next day they have to lay up again on account of high winds and cold."

"We in California have but to read this from an Eastern beekeeper to appreciate the advantages of California's wonderful climate for bee-keeping. In fact, it has been the writer's experience that the bees not only stay on the same stands, but also gather nectar every month in the year, so that in the early spring they are in good condition to work and increase. All the work attendant upon the keeping of bees can thus be readily done by women, and the prevailing wholesale prices of 10 cents per pound for comb and 5 cents for extracted honey yield a handsome profit to the industrious bee-keeper.

"That there is room and that there are abundant opportunities for engaging in bee-keeping in California is shown by the present problem of disposing of the annual increase. And why should not women take up this industry since it is so pleasant and profitable an occupation for women? At present it is largely confined to farmers' wives and daughters, who already have many duties to perform, but the pleasant nature of the work bids fair to attract women who will be able to devote their attention and energies to developing the industry on a larger scale.

"It is a well-known fact that honey-bees will select a home in a hollow tree and there not only attend to all their natural wants and provide for an increase, but also lay up a surplus of honey. Climatic conditions in California are so favorable that it only remains for man to turn them to his benefit. Here there is no expense for feed, for the bees feed and care for the young, thus relieving the keeper of much care, so that there is no need to interfere with the increase except at the swarming season; then to provide new homes for the new swarms, where they can thrive and work and produce that delicious food, the value of which, I trust, will some day be fully realized by rich and poor alike.

"Although California's output of honey in 1905 will be the largest in many years, it will be quite insufficient to meet the extraordinary demand caused by the short crop in other States. One State usually leading in honey-production will produce hardly a fourth of a crop this year, while another is nearer to a honey failure than it has been for 20 years. Here is women's opportunity in California to enter this profitable business, which has always been to the writer a pleasant one."  
—Rural Californian.

The foregoing glowing recital of California's advantages will make some of the northern sisters green with envy. And yet any one who tries a season or more in California and the same length of time in a more northern locality is likely to find some advantages in the bleaker region, as, for instance, the matter of prices; and we will be generous enough not to envy, but to congratulate our sisters of the more sunny region.

There seems to be some sort of a slip in the statement that 1905 gives an unusually large yield in California, reports in general indicating just the opposite.

### A Honey-Gargle

Pour a pint of boiling water on 25 to 30 leaves of common sage. Let the infusion stand for half an hour. Add vinegar sufficient to make it moderately acid and honey to taste. This combination of the astringent and emollient principles seldom fails to produce the desired effect. The infusion must be used as a gargle several times a day.—McCall's Magazine.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

Amerikanische Bienenzucht, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Convention Proceedings

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 847)

#### THE KIND OF HIVES FOR ALL KINDS OF HONEY.

Udo Toepperwein said that it depends largely upon locality as to which hive should be used. He would not begin to discuss this subject, because it would be impossible for him to finish it. He uses the regular 10-frame, dovetailed hive with the shallow Ideal  $5\frac{3}{4}$ -inch-depth supers, and that is the hive mostly sold by him. He said the greatest demand is for these shallow supers, and he believes from this that most of the bee-keepers are using this super now. This could be told from the orders that come in for them.

Mr. Atchley remarked that if shallow supers are used they should be used from the ground up, to prevent having different depths in a yard.

Mr. Pharr would use one kind of live-body throughout, and if he should adopt one he would use the  $5\frac{3}{4}$ -inch super all the way through, 8 or 10-frame, according to the length of the honey-flow. If this lasts only a few days, he would use a small brood-chamber; if a long time, then he would use a large brood-chamber. But he thinks that the  $5\frac{3}{4}$ -inch depth is decidedly the best for producing all kinds of honey.

Mr. Aten would use the  $5\frac{3}{4}$ -inch if he were to use shallow supers, and would use them throughout so that all would be interchangeable.

Mr. White thinks that conclusions as to which super is most popular could be arrived at by the manufacturer or supply dealer, from the number of orders calling for them. Especially can this be depended upon when the orders come from experienced bee-keepers. He had been asked by many to make this size for them in orders sent to him. Many who began with others are changing to this type of super.

Before adjournment, Mr. Toepperwein said a few words in regard to the bee-keepers' exhibit at the International Fair at San Antonio, which begins Oct. 21, and closes Nov. 1. This year there are about \$300 offered in premiums, and the bee-keepers are urgently requested to exhibit.

#### THIRD DAY—JULY 27TH.

The first number on the program was,

#### THE LATEST METHODS OF QUEEN-REARING.

Mr. Pharr exhibited his small frames and mating-boxes that he uses. The small combs on which the queens are mated are in frames of such size that 6 of them just fit inside of a regular Langstroth frame. In this they are kept to be built out in the hive ready for use. His small mating-boxes hold 1 such comb, and are painted different colors to prevent the returning queens from entering the wrong box. A virgin queen, 3 to 5 days old, is put in with about 50 to 100 bees in the warm summer, and with from 150 to 250 when the weather is cooler. No brood is needed in the small combs. If sealed brood is given it is not considered detrimental, but there is no benefit in having it at all.

Only one queen is mated with such a nucleus, when all are hauled home, the bees thrown together and made into a large nucleus. This is built up into a full colony. The small boxes receive new bees for the mating of the next queen. If more than one queen is mated with the same lot of bees, 50 per cent of the second lot of queens will be lost. It is cheaper to take new bees for each mating.

Mr. Bell asked, when the zinc queen-excluding slot is turned over the entrance after she is mated, to prevent the queen from absconding with the bees, do the bees ever abscond and leave the queen behind?

Mr. Pharr replied that they do not. Sometimes a queen is so small that she can pass through when they all leave. In this case the bee-keeper should be glad that she

is gone, as such a queen is not fit to keep for any use whatever. Such small queens should be killed as soon as found.

Mr. Laws asked if 50 to 150 bees were enough, or if a teacupful of bees would be better.

Mr. Pharr said that it depends upon the weather, otherwise he could see no difference.

Mr. Bell—What percentage of queens are mated in a favorable season?

Mr. Pharr—From 75 to 90 per cent. During dry weather, with harsh winds, from 50 to 75 per cent. I prefer the small nuclei over the old-fashioned 3-frame nuclei.

Mr. Victor has not given the latest methods the time and attention that he should. He is an extensive shipper of bees and nuclei, and has loaded for shipment over 2,600 colonies and nuclei in the last 3 years. These went to Colorado and other places. The nucleus hive that suits him well is a 10-frame hive, partitioned off into 4 parts in such a way that one-quarter of the hive in each corner is occupied by a nucleus. The bottom-board has strips on it which are so arranged that the 4 parts of the hive are separate from each other. An entrance to each part is provided for at each opposite corner of the bottom-board. A large auger-hole covered with screen-wire part way up the hive, covered with a wooden button on the outside, is used to regulate the ventilation of the nucleus. This gives him good, permanent nuclei, and 75 per cent of the queens are mated throughout the season.

Mr. Laws dwelt for some length upon the method he practises, known as the "Baby Nucleus" plan. It is much like that described by Mr. Pharr, except that he uses somewhat larger combs and more bees in his mating-boxes, which he did not consider would make much difference. The greatest destruction to the colonies of bees in a queen-rearing apiary is caused by the making of the required nuclei. He prefers the little ones, as so many more can be made with the bees from one colony. New nuclei can be formed with each mating. With the old 3-frame nuclei it takes sometimes a week or even a month before the bees can be made to accept a new queen. This causes a loss of time and a loss of bees. The queen-breeder wants to leave his queen-rearing yard in as good shape at the end of the season as a honey-yard after the crop is harvested. He does not think it necessary to have brood in the mating-boxes, and cannot see why the Eastern and Northern bee-keepers should need it. A comb of honey works best with him. The difference between the old and the new plan is that from 200 to 300 queens can be mated at a time with the bees from one colony with the new plan, while 25 colonies are required for this number with the old one.

Last season he was very successful by using double wire-screens above a brood-chamber, over which he used another chamber which was partitioned off by solid boards into three nuclei. Auger-holes at opposite sides and at one end served as entrances to the different parts. A second screen and another body thus partitioned was used above, making, with the chamber below, 7 nuclei in all. A cell is given to each, and the queens are successfully mated. The same combs can be used again to mate a second lot, but it is better to start with a new lot of bees. The removal of the queen from the lower chamber is not necessary, as the queens are mated just the same above, there being no communication between the different parts. He thinks this the best plan for the honey-producer. When he unites all the bees from the different parts above he simply takes a new hive, places it on the stand from which the colony has been removed, and shakes all the bees in front of it. They are handled rather roughly, and smoked quite thoroughly. A queen is turned loose with them and allowed to enter the hives.

Mr. White remarked that the bees being cut off from those below by the double screen puts them in a queenless condition. It is conceded that any part of the bee-hive to which the queen cannot get is queenless, and they will start cells. Therefore, it is an easy matter to introduce cells to the nuclei made after Mr. Laws' plan.

Mr. Laws stated that the nuclei above did start cells when left alone; even when he drew out the screen, separating the bees before queen-cells would be started above. This would be done with a queen below, and sometimes a virgin from above would go below and kill the queen there, even a young and prolific one.

Mr. Pharr said that if a single wire-screen is used the bees from below tantalize the virgin queens above, and

only 50 per cent of them are mated. With the double wire-screen there is no trouble.

Mr. Atchley experimented much with different methods of queen-rearing. He has lost much sleep over the matter. His whole aim was to arrive at a method by which more and better queens can be produced in all seasons. Most of the orders for queens are received when none can be mated successfully in the baby boxes. On this account he uses both the old and the new method. The baby nuclei worked all right during the honey-flow and swarming-time, but the larger 3-frame nuclei must be resorted to when the dearth sets in later. Both kinds are used throughout favorable seasons, so that one or the other can be depended on. If everything is favorable the queens are drawn from the baby nuclei and the others are left until last. The most essential thing with a queen-breeder is plenty of colonies, lots of bees and plenty of honey. Unless he has these he would better stop queen-rearing.

#### MATTERS RELATIVE TO THE FARMERS' CONGRESS.

Upon the request of Prof. Connell the question was put before the bee-keepers' section of the Congress whether it should be retained at College Station for future meetings, or whether, on account of the inadequateness at the College to care for the delegates properly, the Congress meetings should be removed to another place. This was left for the discussion of the members, and that the delegates appointed should be instructed how to vote at the executive meeting of the Congress at the night session. After a lengthy discussion it was moved that the meetings be retained at College Station, and the delegates were instructed to vote to that effect.

Prof. Connell also called attention to the fact that each section of the Congress must elect an executive committee-man to meet with the Executive Board of the Congress at its meeting. Mr. W. H. Laws was elected.

The reports of the committees were then called for.

#### ON RESOLUTIONS.

*Resolved*, That the thanks of this Association be extended to the railroad officials of Texas for courtesies shown the members in enabling them to attend the Farmers' Congress.

*Resolved*, That the thanks of the Association be extended to the Board of Managers of the A. & M. College for the use of the grounds and buildings.

*Resolved*, That we extend the thanks of the Association to the Galveston News, for the manner in which they have reported the proceedings of this meeting.

Willie Atchley,  
C. A. Butts,  
L. W. Bell, *Committee*.

#### ON THE EXAMINATION OF THE EXPERIMENTAL APIARY.

We, the committee chosen to inspect the experimental apiary at College Station, have given the apiary a thorough inspection, and heartily report same in excellent condition. The equipment is entirely adequate for apiarian management and educational purposes. The hives are of different construction and for that reason afford ample opportunity to investigate them so as to show the best to use in practical apiculture. We therefore recommend the management as practised by Prof. L. H. Scholl. If the students have been benefited as the apiary suggests, the State has been entirely justified in placing the apiary here for educational purposes.

W. O. Victor, Jas. W. Traylor,  
T. P. Robinson, J. M. Hagood,  
John W. Pharr, *Committee*.

On motion both reports were put to a vote and carried.

(Continued next week.)

### Report of the Chicago-Northwestern Bee-Keepers' Convention, held at Chicago, Ill., Nov. 30 and Dec. 1, 1904

(Continued from page 847.)

#### SAMPLES OF HONEY.

As a drawing card for the National convention that was held at St. Louis, Mr. France collected pound-samples of different varieties of honey from different States. After

securing them it was impossible to display them, as outsiders kept slipping in and carrying them off. It was quite interesting to see how the same variety of honey differed in different parts of the country. Mr. France had with him, and placed upon exhibition, small samples of the varieties of honey that he had gathered.

#### "BRICK HONEY."

Mr. Root exhibited a sample of candied cut up as they cut it up into "bricks," and surround the packages with paraffined paper, with parchment paper over that. It can be sold only in a local market, as the public in general does not understand about the candying of honey, and, if kept over until warm weather, it will become too soft; in fact, only such honey as candies hard can be used.

Mr. France—Have you tried Southern honey?

Mr. Root—No, we have not.

Mr. Kimmey—How will it be next summer?

Mr. Root—It will be soft. As I have said, it must be sold while the weather is still cold. I would not advocate it for use away from home.

Mr. Duby—I have calls for candied honey here in Chicago.

Mr. Moore—There is no trade in candied honey here in Chicago, unless it has been worked up.

#### HOW SHALL WE BEST MARKET COMB HONEY?

Mr. Abbott—It depends upon the locality.

Mr. Becker—My plan is to put the honey up in an attractive package. I make three grades. There is a first and a second grade, and then the culls. Sell in the home market if possible. A home market is lasting, once it is established. Shipping honey without loss from breakage is an art. I have bought lots of honey from Mr. York, and never yet had a particle of loss from leakage in shipping.

Mr. Reynolds—An agent, or seller of honey, sometimes makes sales, and gets the start of some other seller, by showing that his honey is of light-weight—that is, the sections do not quite weigh a pound each, and there is more profit in their sale.

Mr. Becker—I have seen that done, but I always sell by weight.

Mr. Moore—I found, in Indiana, merchants who were selling 2,000 or 3,000 pounds of honey each year. I found that they did it by keeping it in sight—put up in nice show-cases. Sell honey close at home, then it will not be smashed.

Mr. Duby—I have sold as much as 1,000 pounds of honey at a fair, and I find it an excellent place to advertise.

Mr. Meredith—At Mill Park, where there were excursions from schools, I have sold as much as 400 pounds of honey in one day.

Mr. Wilcox—First decide at what price honey will sell. Put it up in the best style. Sell it near home. If not possible, then put it in the hands of commission men.

Next came an address by Prof. E. N. Eaton, State Analyst of the Illinois Food Commission, on

#### FOOD FRAUDS AND FOOD OFFICIALS.

Again I have the privilege and the honor—and I assure you it is a privilege and an honor—of appearing before the Chicago-Northwestern Bee-Keepers' Association. I believe I feel as much interest in your Association, its members and its meetings, as I would had I as large an apiary as Mrs. Stow, or as much knowledge of the bee as Dr. Miller, instead of no knowledge of the ways of the bee except as a warrior, and no earthly possessions in that line—not even a bee in my bonnet. Last October I read before the National Association a paper on "Food Frauds," laying special stress on the misrepresentation of comb honey, and the damage such misrepresentation has done to the sale of that commodity.

Mr. York has suggested that I bring the same subject before this Association, inasmuch as there are many in attendance at this convention who were unable to get to the National, and the records of that convention will not be available for some time.

Many years ago Dr. Wiley, now chief chemist of the United States Department of Agriculture, stated that comb honey was being made artificially, comb and all. That story went the rounds of the press, and, despite frequent denials, appears in papers to this day, even in such reliable publications as the Ladies' Home Journal, the Chicago Tribune, and the Philadelphia Press. When cornered Dr. Wiley claimed that the statement was "a scientific pleasantry," and that the bee-keepers—simple children of Nature—were too obtuse to see the joke. The public and the public press, however, took

it as seriously as did the bee-keepers, and consequently Dr. Wiley's reputation as a joker suffered a serious relapse.

There have been many variations of "the Wiley lie," as the statement has been referred to by bee-keepers. State Food Commissions have said that bees entered the conspiracy, and were fed glucose to produce honey. Other Food Commissions contented themselves with repeating the original lie without variation. But all had the same effect—to prejudice the public against the purchase of pure comb honey, and, to a certain extent, of honey of all kinds. I need not tell an association of bee-keepers that such stories are made out of whole cloth. They are in fact lies—however, not malicious lies, as I doubt not they largely come through ignorance. As to the remedy I would infringe on the copyright of President Roosevelt, and suggest *publicity*. Every food commissioner and chemist should do his part to correct the false impression which has been made, and I assure you in behalf of Commissioner Jones and myself, that we will do our part.

Another matter in which the bee-keepers have of late evinced much interest, is the chemical composition of honey. Owing to the fact that the word "glucose" has two or three meanings chemically, and an entirely different meaning commercially, there has been much confusion among bee-keepers, as to whether or not glucose is a normal constituent of honey.

In taking up this matter I wish to call your attention to a pamphlet just received, defining honey and setting standards for the same. The pamphlet is a part of a report from a committee of standards of the Association of Official Agricultural Chemists, and as their standards have been recognized by the United States Secretary of Agriculture, they become important and authoritative. The standard and definition of honey are as follows:

"1. *Honey* is the nectar and saccharine exudations of plants gathered, modified, and stored in the comb by honey-bees (*Apis mellifica*). It is levo-rotatory, contains not more than twenty-five (25) percent of water, not more than twenty-five hundredths (0.25) percent of ash, and not more than eight (8) percent of sucrose.

"2. *Comb honey* is honey contained in the cells of comb.

"3. *Extracted honey* is honey which has been separated from the uncrushed comb by centrifugal force or gravity.

"4. *Strained honey* is honey removed from the crushed comb by straining or other means."

My quarrel with these standards is in the definition for honey, which I maintain is too sweeping, and incorrect.

Strictly speaking, honey—commercial honey—should be limited to the nectar of flowers. Louse honey, or honey-dew honey, or pine-tree honey, are not, and should not be, sold to consumers for honey. Again, honey is not nectar nor saccharine, but a manufactured product, made by the bees, changed from its original condition.

There is, of course, such a thing as honey from bumblebees and no doubt other bees, but the only honey of commerce is produced by the honey-bee, and to this bee the definition properly should be restricted. I would therefore suggest that the definition for honey be that suggested by me to the National Association of State Food Commissions, which is this:

Commercial honey is the nectar of flowers, transformed, and stored in a comb by the honey-bee.

As these schedules are subject to revision, it might be wise, if the Association looks at this matter in the light that I do, to take some action, preferably by resolution.

A word as to the condition of the Illinois honey markets in regard to purity, and I am done: Before the Illinois Food law became operative fully 33 1-3 percent of the extracted honey on the market was adulterated. Since then the adulteration has grown less, until last year, when we found seven samples of adulterated extracted honey out of 28 samples analyzed. However, in all but one case, the adulterant was cane-sugar, and in several cases it was impossible to tell whether it had been intentionally added or fed to bees. This year, while only a few samples were analyzed, none have been found adulterated. It seems that adulteration of honey with glucose is almost a thing of the past.

E. N. EATON.

Mr. Moore—Isn't the change of cane-sugar to grape-sugar the same as that made by the bees?

Prof. Eaton—I think not.

Mr. Kimmey—Can chemical science make honey?

Prof. Eaton—No.

Mr. McCain—I supposed that the nectar was changed to honey while in the sac of the bee. Isn't that true?

Prof. Eaton—I am inclined to think that the change is begun in the sac.

Mr. Abbott—This question of nectar and honey has been threshed over again and again. When the nectar is put into a cell I think it is still nectar. I don't agree with Prof. Cook, that honey is partly-digested nectar. Cane-sugar stored in the combs is still cane-sugar, and will remain such, Prof. Cook to the contrary notwithstanding, and I want Prof. Cook to know that I say this. I would like to know if Prof. Eaton agrees with Prof. Cook.

Prof. Eaton—I must admit that I got most of my information on this subject from Prof. Cook, and I am inclined to agree with him.

Mr. Kimmey—If I feed the bees 20 pounds of honey or sugar, and then find only 14 pounds in the combs, let me ask where the difference has gone to?

Mr. Moore—It has been used up in household economy. Prof. Cook has said that if we feed sugar to the bees, honey will be the result. If this is true, then what kind of honey is it?

Mr. Wheeler—The matter of honey-dew is important. If there was any honey-dew in our honey we might be accused of adulterating our honey.

Mr. Root—Mr. Selser and Prof. Eaton agree exactly as to the proper definition for honey, but this point raised by Mr. Wheeler is really most important. Suppose I am a beginner, and I unknowingly put honey-dew upon the market, there is danger of prosecution, in which injustice will be done.

Prof. Eaton—I might say that I do not agree with Prof. Cook in every point. One point is that I do not believe that when bees are fed cane-sugar the result is true honey. It would be lacking in the natural flavor of true honey. In regard to the best definition for honey I think that practical bee-keepers are the best judges as to what this definition should be. The matter is really important, however, as decisions in important suits may turn upon the definition that the courts are guided by.

It was moved by Mr. Moore that the chair appoint a committee of three to look after this matter of securing a proper definition for honey. Dr. Miller, C. P. Dadant and E. T. Abbott were appointed.

Upon motion of Mr. Horstmann it was voted the Association pay the Secretary \$20 for his services.

#### DEFINITION AND STANDARD FOR HONEY.

In reply to a question, Prof. Eaton said that he considered 25 percent of water in honey was a high percentage for a standard. About 22 percent is as much water as was ever found, but he thought it better to be safe, and put it at 25 percent. Eight percent sucrose is also a high percentage. He had no objections to offer to the standard as proposed for honey.

Mr. France—I suppose that these standards will become authority. If they do, and the proposed definition is also made authentic, then I am ready to quit bee-keeping. My honey this year would be pronounced adulterated if judged by the proposed definition.

Upon motion of Mr. Moore, a vote of thanks was given Prof. Eaton for his paper. Thanks were also tendered the proprietor of the Revere house for his courtesy and kindness in furnishing a room for the meeting. Mr. Root was also remembered with a vote of thanks for his entertainment with the stereopticon.

The convention then adjourned to meet at the call of the Executive Committee.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

Why Not send in some new subscriptions for the American Bee Journal? Samples free for the asking.

## Reports and Experiences

### Pure Food Law for Iowa

To day I had a conversation with Hon. E. J. Sankey, Decatur County's representative in the Iowa State Legislature, on the subject of a pure food law. Iowa has no pure food law, but Mr. Sankey read to me the provisions of a Bill which was introduced at the last meeting of the Legislature. He thinks it will be passed at the coming session, either in its present or in an amended form. The Bill as it now stands provides that the Dairy Commissioner shall perform the duties of Food Commissioner. Mr. Sankey thinks another man should be named for the last-named work. I think he is right.

In the absence of a pure food law, Iowa is made the dumping ground for the adulterated products of all kinds, wherever made. I will venture to ask the honey-producers of Iowa to labor with their representatives for the enactment of a pure food law at the coming session of Iowa's Legislature.

Leon, Iowa, Nov. 24. EDWIN BEVINS.

### Very Light Honey Crop

The honey crop in this part of the State (Jefferson Co.) was very light this year. I keep most of my bees in Vernon County, and the crop there was a total failure. I had to feed 600 pounds to keep my bees through the winter. There were two causes for that failure: 1st, very cold and wet weather during the white clover bloom; 2d, a hitherto unknown bug killed all the basswood blossoms. Every cluster had at its base some white scum the size of a pea, and in the middle of it was a white bug with a yellow stripe on each side. The buds began to wilt when about half developed. Does any one know any thing about that bug? To give an idea of the damage done, I may say that I know some of the beekeepers who a year ago secured over 150,000 pounds of honey, this fall had to feed their bees for winter.

Lake Mills, Wis., Nov. 16. GUSTAVE GROSS.

### Handling Bees—Bottom-Boards

I would not like to be without the "Old Reliable." I am always glad when Friday comes, because I get the Journal regularly on that day. I do not think it has missed since I have been taking it.

This is my second year with bees; I have no trouble in introducing queens. I mate them in the miniature hive, or baby nuclei, as it is called. I had one mated, and when I found her laying I don't think there were more than 2 dozen bees with her, and she is a fine queen.

Our bees swarm from the first of April until June. I had one swarm to come out July 21. I hived it on empty combs, and now they have their hive full of honey.

The season here was too wet and cool in the spring and summer. All the honey I got was stored in September. My best colony stored 60 pounds of comb honey, which I sold at 20 cents per pound—\$12.00. My next best colony was a prime swarm, which gave 53 pounds.

I like bees, and would rather work with them than to eat when I am hungry. I see a great deal said about handling bees. Some ask how to smoke them, and how much to smoke. I smoke them until I subdue them, if they are cross, much or little smoke. A. I. Root said one time he had some bees to run him. I never ran yet, and I am no expert at handling bees, but when I want to handle them, I handle them. Just the same, I generally have on a veil, and most of the time with only my undershirt and overalls on, and sleeves rolled up. If one gets its business-end into me, I simply rub out the sting and go on. Run! oh, no, I think I would be a coward to let as little a thing as a bee run me. I am not afraid of them in the least, and I can't see

why one should be, for they are as harmless as a dove.

Bees are flying to-day—temperature 72 degrees. How is that for winter? Bees can fly here every month of the year. I winter them on the summer stands in single-walled hives. Bees are in good shape for winter, with plenty of sealed stores.

I make my own hives, and buy frames and sections. I see a great deal about hive-making. I can make them a great deal more cheaply than I can buy them, and they answer all purposes. If they do, why are they not just as good as a factory-made hive? I make a bottom-board which, to my notion, is ahead of anything I have seen. Mr. Root says it won't do, but I say it will do. It is thus: I take two pieces 20 inches long by 1x4 wide; one piece 12 inches long, 1x4 wide; one piece 12 inches long, 1x3 wide; one piece 1x12x4 feet long; this board goes between the two side rails within  $\frac{3}{4}$  inch of the rail in the rear. You can have the board  $1\frac{1}{2}$  inches in front to close up. Two nails are driven through the side-rails in the rear to hold the bottom in

place. This gives an incline to the front of the hive for all debris to go out with a rush. If this is not all right I can't see why it is not.

I would like to hear from some one on the bottom-board question. Since writing to Mr. Root about it last year, some one has patented a board the same as mine, only he leaves the bottom loose, so he can pull it out, and Mr. Root recommends it, if I mistake not. If I am wrong, I beg pardon.

Dr. Miller and Mr. Doolittle, what do you say about the bottom-board business?

W. C. EDGEWORTH.

Little Rock, Ark., Nov. 6.

### Geranium or Crane's-bill

A weed or bush of some kind came up under the edge of the porch on the south side of the house, in August, and is just now in full bloom. The stalk branches out and has a bunch of flowers at the end of each branch. Each blossom contains a drop of nectar the size of a BB shot, but it is rather cool now

**A \$4.00 Clock for \$2.50**  
With the Weekly American Bee Journal 1 year—all for only \$3.

### THE BEE-HIVE CLOCK

Only \$2.50, f.o.b. Chicago, by express. Weight, with packing, about 4 lbs. Ready for delivery Dec. 15.

We have had made specially for our readers, a bronze-metal Clock, called "The Bee-Hive Clock." It is about 8 inches wide at the base, about 10 inches high, and deep enough at the base to stand firmly on a mantel or elsewhere. It is a beautiful piece of work, and would be both ornamental and very useful in any house, and particularly in a bee-keeper's home.

The clock part itself is warranted for 3 years to keep good time. So it is no plaything, but a beautiful and needful article for everybody.

Clocks like "The Bee-Hive Clock" usually sell in the stores at from \$4.00 to \$5.00 each, but having them made for us in large quantities enables us to offer them at \$2.50 each by express, or with the Weekly American Bee Journal a year—both for only \$3.00. Either Clock or Journal would make an ideal gift.

We expect to begin filling orders by Dec. 15, 1905, so the Clocks will arrive at destinations in time for Christmas, if so desired. Here is something that surely is appropriate for bee-keepers—"The Bee-Hive Clock." Better get your order in quick—first come first served out of the first lot of Clocks.

☞ Sample copy of the Weekly American Bee Journal free.

Send all orders to

**GEORGE W. YORK & CO.,**  
334 Dearborn St., CHICAGO, ILL.

### How to Get "The Bee-Hive Clock" FREE

Send us 5 New Subscribers to the Weekly American Bee Journal for one year, at \$1.00 each, and we will send you this beautiful "Bee-Hive Clock" FREE (excepting express charges). Or, send us 4 New Subscribers (at \$1.00 each) and 50 cents—\$4.50 in all. Or, 3 New Subscribers (at \$1.00 each) and \$1.00—\$4.00 in all. Or, 2 New Subscribers (at \$1.00 each) and \$1.50—\$3.50 in all.

Remember, we expect to begin to fill Clock orders Dec. 15, so as to have them reach those who order in good time for Christmas.

and the bees do not bother it. I enclose one of the flowers, and would like to know its name. The bush has thorns resembling those of a blackberry briar. H. P. GANNAWAY. Ft. Smith, Ark., Nov. 4.

[The flower belongs to the geranium or crane's-bill family, and has undergone some changes so that I can not identify the species. It is a flower that has no doubt escaped from cultivation.—C. L. WALTON.]

**Poor Honey Crop**

The honey crop is very poor this year. The bees have not stored enough honey for themselves since the middle of July. Large winter losses are expected here.

HARRISON BLEVINS.

Cowgill, Mo., Nov. 16.

**Gaucasian Queens**

The gentlest bees known. Send in your orders early; \$1.00 to 15.00. Texas Queens in February; all good honey-gatherers. Rotten wood, 75c a barrel. Address, A. HINES, Care Phoenix Hotel, St. Louis, Mo.

**Very Low Excursion Rates for Christmas Holidays**

to all points on the Nickel Plate Road between Chicago and Buffalo. Dates of sale Dec. 23, 24, 25, 30 and 31, 1905; and Jan. 1, 1906, with limit returning Jan. 3, 1906. Rate one and a third fare for the round-trip. Individual Club Meals ranging in price from 35 cents to \$1.00, and Mid-Day Luncheon 50 cents, served in Nickel Plate dining cars; also service a la carte. No excess fare. Chicago city ticket offices, 111 Adams St. and Auditorium Annex. Depot, La Salle and Van Buren Sts. The only depot in Chicago on the Elevated Loop. 40—49A3t

**The Best Fruit Paper**

is The Fruit-Grower, published monthly at St. Joseph, Mo. The regular subscription price is a dollar a year but if you will write for free sample copy and mention this paper, you will receive a proposition whereby you may secure it one year WITHOUT COST. Every one who has a few fruit trees or a garden, should read

Every issue is handsomely illustrated and from 32 to 64 pages a month are filled with interesting matter pertaining to fruit-growing and gardening. The first four issues of 1906 will be handsome special numbers devoted to the following subjects: January, The Horticultural Societies; February, Spraying; March, Gardening; April, Small Fruits. Any one of these numbers will be worth a dollar to you. We publish the "Brother Jonathan Series" of fruit books. Send your name and BRO. JONATHAN learn how to secure these books free. Fruit-Grower Co., 107 S. 7th, St. Joseph, Mo.

Mention Bee Journal when writing.

Rex Book, The Veterinary Guide, is an exhaustive treatise just off the press. It contains 160 pages and more than 150 illustrations, with an attractive cover. It treats from the experienced Veterinarians' point of view nearly every subject that could possibly be of interest to the owners of Horses, Cattle, Hogs, Sheep and Poultry. Any reader of the American Bee Journal can secure a copy free by sending to The Rex Company, 800 So. 16th St., Omaha, Nebr. The book weighs nearly a pound. Mention the American Bee Journal when writing.

**GROCERIES**

AT WHOLESALE PRICES

FREE This catalogue will save you money on your grocery supplies.

FREIGHT PAID

What do your groceries cost you a year? Will you buy them of us if we can prove that we will save you from 10 per cent to 20 per cent and pay the freight? That certainly is an amount worth saving; it is worth the trouble of asking for the proof. Get our large Grocery List and compare our prices with what you have been paying. Then put us to a greater test—send us a trial order and compare the goods and the prices. If we do not save you big money, send the goods back at our expense. The grocery bill is the biggest part of the family expenses. We will cut it almost in the middle and guarantee everything we sell. We can do this because we buy in immense quantities—carloads and trainloads—and we give you the benefit of our ability to buy cheap; in fact we can sell to you at just about the figure your local dealer would have to pay. We save you his profit and the freight besides.

To save still another 10 per cent, become a member of the Co-operative Society of the National Supply Co. We'll tell you how to get this extra 10 per cent discount, if you will write for full information. An easy way to make money.

If you want to save money get our catalogue and learn just how cheap you can buy groceries from us. Catalogue is ready and lists everything in the grocery line. We send it free.

Co-operative Society of the National Supply Co., Lansing, Mich. and Chicago, Ill.

**American Bee Journal Novelty Pocket-Knife Gold Fountain Pen**

All for \$2.75

(This cut is the full size of the Knife.)

**NOVELTY POCKET-KNIFE**

(Name and Address on one side—Three Bees on the other side.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the owner, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. It will last a life-time, with proper usage.

Why Own the Novelty Knife?—In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and, in case of death, your relatives will at once be notified of the accident.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or club the Novelty Knife and the American Bee Journal for one year—both for \$2.00. (Allow two weeks for Knife order to be filled.)

**SOLID GOLD FOUNTAIN PEN**

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are Para Rubber, handsomely finished. The simple feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

Worker

Queen

Drone

3/8 size

We mail this Gold Fountain Pen for only \$1.25, or for \$2.00 we will mail it and the weekly American Bee Journal for a whole year.

Sample copy of the American Bee Journal free; trial trip of three months (13 copies) for 20c; regular yearly price, \$1.00. Address all orders to

**GEORGE W. YORK & CO., 334 Dearborn St., Chicago, Ill.**

**CONVENTION NOTICES.**

**National Convention, Dec. 19, 20, 21.**  
—The Fat Stock Show, upon which we have depended for reduced rates on the railroads, has been postponed two weeks, so the dates for the convention will now be Dec. 19, 20 and 21, 1905.

The place of meeting has also been changed to Brunt Hall, in the Bush Temple of Music, corner of North Clark Street and Chicago Avenue (entrance on Clark Street,) 5 minutes walk north from the Revere House, Southeast corner N. Clark and Michigan Sts., which will be headquarters for the members.  
W. Z. HUTCHINSON, Sec.

The Chicago-Northwestern Bee-Keepers' Association will hold a social session at the Revere House, Dec. 19, 1905, at 10 a.m. At 2 p.m. the same day will be held the regular annual election of officers. Any other business coming before the meeting will be attended to.  
HERMAN F. MOORE, Sec.

**New York Bee-Keepers' Institutes.**  
—A series have been arranged to be held in New York State as follows: Amsterdam, Dec. 11, 1905; Syracuse, Dec. 12; Watertown, Dec. 13; Fulton, Dec. 14; Auburn, Dec. 15; Romulus, Dec. 16; Geneva, Dec. 18 and 19; Dr. E. F. Phillips, Acting in Charge of Apiculture, United States Department of Agriculture, will attend and address these Institutes on subjects pertaining to bee-keeping.  
Romulus, N. Y. C. B. HOWARD, Sec.

The New York State Association of Bee-Keepers' Societies will hold its annual meeting at Geneva, N. Y., at the Nester Hotel, Monday and Tuesday, Dec. 18 and 19, 1905. New and interesting subjects are to be introduced and discussed at this meeting, and all bee-keepers of New York State should make arrangements to be present. Good and reasonable accommodations have been secured. Headquarters will be at the Nester Hotel.  
Romulus, N. Y. C. B. HOWARD, Sec.

The 10th Annual Chicago Show of the National Fanciers' and Breeders' Association will be held Jan. 22 and 27 (both inclusive) 1906. The most prominent of the breeders and fanciers of poultry, pigeons, cats and pet stock of all kinds have already signified their intention of being in attendance with an entry of their finest specimens. The best incubators and brooders of the country will be shown in operation. Foods and supplies and appliances pertaining to the great industry which this enterprise represents, will compete for the favorable attention of the crowds. Premium lists with classifications, rules, list of judges and apportionment of same, and all necessary information to exhibitors and patrons, will be issued about Dec. 15, 1905. The mailing list includes 20,000 names, and it is the purpose to send to all interested, yet some may by mistake be missed. All such and those deserving specific information should write to Fred L. Kimmey, Sec., Room 500, 325 Dearborn St., Chicago, Ill.

Mention Bee Journal when writing.

### Honey and Beeswax

CHICAGO, Dec. 6.—The trade in best grades of white comb honey has been fair, yet retailers taking only small quantities at a time. This honey brings 14@15c; other grades are difficult to place at from 1@3c per pound less. Extracted selling at 7@7½c per pound for white; amber 6½@7c; dark 5½@6c. Beeswax, when clean and of good color, 30c. R. A. BURNETT & CO.

CINCINNATI, Nov. 24.—The demand for comb honey is relaxing to some extent, owing to the majority of the trade being well supplied. All fears of a comb honey famine have been allayed. We quote fancy white comb honey at 14@16c. Extracted honey is in fair demand. Quote amber at 5½@6½c, according to the package and quality. Fancy white and white clover extracted at 6½@8½c. We are paying 2½c per pound delivered here for choice yellow beeswax. (We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)  
THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade. GRIGGS BROS.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet; white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

PHILADELPHIA, Nov. 20.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get people started, and when they do start, the

## C. H. W. WEBER

CINCINNATI OHIO

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

demand continues for some months. We would say, now is the height of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c. We are producers of honey and do not handle on commission. WM. A. SELSER.

INDIANAPOLIS, Nov. 7.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 5c. Beeswax, 28@30c. WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, Nov. 17.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the prices high. We quote as follows: Fancy water-white and No. 1 white clover, 14@16c; No. 2, 12@14c. Extracted seems to be more plentiful, and we quote same in barrels, light amber, 5½@5¾c; in cans, ½c more; white clover, 7@8c. Beeswax, 28@30c. C. H. W. WEBER.

NEW YORK, Dec. 6.—The demand for comb honey continues to be fair for all grades. Prices practically remain the same. We quote fancy white at 14@15c; No. 1 at 13c; No. 2 at 12c, and buckwheat at 10c per pound. Extracted honey is in good demand, especially California honey with large supplies. We quote white at 6½@7c; light amber at 6c; buckwheat, extracted, at 5½@6c per pound; Southern at 50@60c per gallon. Beeswax firm and steady at 29@30c per pound. HILDRETH & SEGELKEN.

SAN FRANCISCO, Nov. 23.—White comb, 1-lb. sections, 8@9 cents; amber, 6@7c. Extracted, water-white, 4½@4¾c; white, 4¼@4½c; light amber, 3¾@4 cents; amber, 3@3½c; dark amber, 2¾@3c. Beeswax, good to choice, light, 26@27c; dark, 24@25c.

The honey market, as has been predicted, has declined quite materially this week. Water white can now be bought at 4½c in the South, and even at this figure there is little buying. The Hawaiian honey crop has been a very large one this season, and has been an important factor in regulating the price of amber honey. A great deal of the Hawaiian honey has been shipped direct to England, where it is largely in use in the manufacture of various kinds of foodstuffs. California bee-men are being forced to a realization of the fact that honey is produced in so many different parts of the world that a failure of crops in one small district does not necessarily mean higher prices.

**85c for 15 NAMES** For names and P. O. of 15 farmers and 15c of stamps taken - we will send for 2 yrs. the Farmer's Call - reg. sub. price 50c a year. F. C. is a wkly., 25 yrs. old, 1,300 pages a yr. Sample free. Farmer's Call, Quincy, Ill.

## To My Wife in Heaven

BY REV. L. L. LANGSTROTH

Wife of my youth—I dream of thee,  
Arrayed in bridal form;  
I hold in mine thy trusting hand—  
Hail! happy marriage morn!

To God we vow our glad "I will"—  
Thy soft, responsive voice—  
Of twain made one by wedded bands—  
And I, with thee, rejoice.

Sweet, loving wife—God's gracious gift—  
And art thou all my own?  
This plighted hand I'll closer clasp—  
Dear Lord! I wake alone.

Ah! silent lips, whose law of love  
So gently swayed my will,  
When trusting in thee, heart to heart,  
We were united still.

Weeping lasts but a night, dear wife;  
Joy cometh with the light;  
But for a moment darkened days,  
Then where there is no night,

Both shall be present with the Lord,  
Grievings and partings past;  
Soul knit to soul by Heavenly bands  
While lengthening ages last.

**LAST CALL FOR NAMES TO ENTER ON OUR MAILING LIST FOR OUR NEW BEE-SUPPLY CATALOG**

This Catalog is better than ever. It is valuable, not merely for the listing of Supplies and the economy in prices, but also for the valuable hints to bee-keepers contained therein.

This Catalog has been nearly a year in preparation, and as a handy book for the average bee-keeper it has no equal. Send your name in at once; we begin mailing right after Jan. 1st.

In the meantime write us for prices on any Supplies that you may want. Better still, let us quote you prices for any delivery on next summer's Supplies. We can do work cheaper at this time of the year than is possible during the rush season.

JOHN DOLL & SON, Power Bldg., Minneapolis, Minn.

# AT CHICAGO

Our branch is located at 144 E. Erie St. It is in charge of Mr. R. W. Boyden. We keep at this branch a very complete stock of our bee-supplies. Shipping there very frequent carloads of goods, you can get from Chicago any special supplies with very little delay. On regular supplies we can save you both time and freight.

Mr. Boyden is thoroughly familiar with our line of Supplies, and is also a born bee-keeper. He knows the city. We trust our friends will feel perfectly free to ask his services in any way. Mr. Boyden will be present at the National Convention, and stands ready to accommodate you.

## Our Line for 1906

### OUR HIVES AND SECTIONS

Our hives and equipment, both for workmanship and clearness of stock, can not be excelled, and we doubt if they have ever been equalled. So strong is the demand for these goods that there has been a strife in many cases among dealers to get the Root Company's lines because they knew that everything that bears the Root brand is always popular with the customer, and always the best that money and brains can produce.

Our sections and frames for 1906 are even better than ever. They are inspected and re-inspected, and each inspector is required to put in each box of sections that he passes upon his own inspector's card, so that if complaint is made this card will come back on him. As he is anxious to hold his position and if possible get an increase in pay, it is clearly to his interest, as well as that of the customer, to let nothing but perfect goods pass.

### THE ROOT AUTOMATIC EXTRACTORS

Our extractors for 1906 in point of improvements and quality of workmanship leave everything else in the shade. The four, six and eight frame machines have the finest automatic reversing mechanism that has ever been put into a machine. Even the two-frame models can have the reversing mechanism put on at a slight additional cost; but we do not ordinarily advise buying the two-frame automatic. Steel construction has been substituted for cast iron wherever practicable.

### OUR CATALOG FOR 1906

A great improvement over last year. Entirely revised and rewritten. New cover. New cuts. Every article is classified. No price-tables to confuse. The price of each article is directly under the description or illustration. The first edition is now on the press. If you wish a copy of this let us have your name *now*.

## December 15th Gleanings

When this issue of the American Bee Journal reaches you our Splendid Christmas Issue will be ready for mailing. Without doubt the finest bee-magazine ever printed. Three-Color Cover. 100 pages of matter. Many beautiful halftones. Extremely valuable articles. We have a limited number of copies which we will sell at 10 cents each. Better send 25 cents *now*, and we will send the Magazine for 6 months' trial, and include this number, or, better still, send \$1.00 for the year. You will find Gleanings in all principal clubbing lists.

## Editorial Notes and Comments

### Father Langstroth's Heretofore Unpublished Poem

The front page this week will, we believe, be admired and also appreciated by every reader of the old American Bee Journal. The poem was written and sent to us by Father Langstroth himself, in August, 1895, just a month or so before his death. We have kept it all these years, and now, at this Christmas convention season we publish it with the excellent full-length portrait of the great, loving and beloved Langstroth, whose name and memory are revered by every bee-keeper who knows anything at all about the interesting history of American bee-keeping.

As we read his tender lines to his wife, who had preceded him, we get a glimpse of his loyalty and devotion to one whom he adored throughout the long years of wedded bliss, and whom he expected soon to meet and greet in "The Better Land."

Langstroth! Some day there should be written a volume containing a detailed account of the life and work of Lorenzo Lorain Langstroth, for the benefit of the world of bee-keepers, for to his invention of the movable frame all who to-day are enjoying profits from the honey-bee owe their success.

### Shall We Take More than One Bee-Paper?

The effort is constantly being made to have the American Bee Journal so comprehensive and instructive that it shall, as nearly as possible, contain all that is necessary to keep its readers fully abreast of the times, so that they will not need any other bee-paper. The same, no doubt, may be said of other bee-papers. Please notice, however, that phrase, "as nearly as possible"—it is advisedly spoken. When all possible effort has been made, it still remains true that some other paper may contain something of so much value that its knowledge might well be worth the year's subscription. The editor of Gleanings well says:

"If any one keeps bees for the money he can make out of them, he ought by all means to take not only one journal but two or three of them. Gleanings does not pretend to cover the whole field of apiculture. The personal bias of an editor, even though that bias be unconscious, may cause him to emphasize certain developments of bee-lore to the

total neglect of all others. As I look over our exchanges I can see fields that they are covering that Gleanings is not; and, conversely, I can see fields that we are covering that they do not.

"W. L. Coggshall, perhaps the most extensive bee-keeper in the world, once said to me that he could not afford not to take all the bee-papers published in the United States and that, moreover, he could not afford not to scan every page after they came into his hands."

Even if nothing entirely new were to be found in other papers, it sometimes happens that the same truth presented in different words appears in a different light to the reader, so that it is almost like the reception of a new truth. "Keep more bees" is likely to be good advice. Equally good is the advice, "Take more than one bee-paper."

### A Western Convention on Wheels

Editor Aikin, in Irrigation, suggests that if a number are going to the Chicago convention from Colorado, they might get together on the same train, "and so have a convention all the way through." These traveling conventions have proven very pleasant on other occasions, and have some advantages over the more usual kind. But it is somewhat cheaper to "hire a hall" than a railroad car.

### Prevention of Granulation of Honey

An item in Praktischer Wegweiser says honey will remain liquid if put in tin or glass vessels and then allowed to stand 5 or 6 days in the sun in a solar wax-extractor. Whether this proves an entire success or not, one can easily believe that the tendency will be in that direction. More than one case has been reported of section honey kept in an attic, where the fierce heat of the summer so cured it that the zero weather of the following winter had no bad effect on it.

### Caucasian Bees—Various Opinions

Reports as to a new race of bees are generally more or less contradictory, and there is no exception in the case of the Caucasians, unless it be that accounts are more contradictory than usual. Ratings vary all the way from worthless to the very best. As to their appearance, little has been said beyond the fact that they are so like blacks in appearance as to be difficult of recognition. The following description, written by "Swarthmore," in the American Bee-Keeper, is therefore of interest:

"Caucasians are very dark, inclined to vary a little, striped with narrow brownish bands, with a cast of brownish hairs, somewhat like the Carniolans. The workers are quite small, but very active; the drones are as black as your

shoe, much smaller than Italian or Carniolan drones; the queens are not large, quite dark, with bronze or copper-yellow spots on their under sides; very prolific. Both queens and workers are quite nervous under manipulation, but do not run off the combs nor pile in knots, as do the blacks. Caucasians are exceedingly gentle, and will submit to manipulation, almost to actual abuse, without resentment. They seldom require much smoke—the breath often only being needed to open their hives and to drive them back. Yet they are alert in defense against robbers.”

Driving them back with the breath seems to work in a peculiar manner upon Caucasians. Blowing the breath upon other bees is likely to be the signal for a prompt attack upon the blower.

### Shipping Carloads of Comb Honey

Mr. Leo F. Hanegan, manager of the St. Croix Valley Honey-Producers' Association, referring to several statements made recently in the American Bee Journal about the number of pounds in a carload of honey, etc., writes us as follows:

GEORGE W. YORK & CO.—

*Gentlemen*:—Regarding the amount of honey to a carload, I will say that our experience is that 1000 to 1500 24-section cases of comb honey make a fair load; in fact, all that we feel safe in piling in one car. We have shipped

brought out some points relative to this carload question, and asked for discussion of the subject, but received no response.

Shipping comb honey in carload lots is the safest and most satisfactory way to move it a long distance, and this subject should have its place in the bee-papers, as well as how to produce honey.

I am sending you a copy of the American Bee-Keeper referred to above, and will furnish the engravings used therein if you wish them.

Glenwood, Wis., Oct. 19.

Yours truly,

LEO F. HANEGAN.

We take the following extracts from the article referred to by Mr. Hanegan as having appeared in the American Bee-Keeper, which was written by its editor:

Some time ago, Mr. Leo F. Hanegan, manager of the St. Croix Valley Honey-Producers' Association, sent a photograph showing a side-tracked car which his Association was loading with comb honey. Some correspondence in regard to their method resulted, and considerable interesting information was secured.

In the first place, a clean, dry refrigerator car is ordered, though, of course, no ice is used, but a clean, dry car is important.

The accompanying drawing will illustrate the manner of loading about 1200 24-section cases, making a good load. The car in the sketch contained 1100 such cases, and represented a cash value of about \$2900, f.o.b. at loading point.

LOADING A CAR WITH COMB HONEY, IN WISCONSIN

1963 24-section cases in one car, and over 1650 in another, but, if we were correctly informed, the honey did not arrive in as good condition as it should have done.

In the Western Freight Classification the minimum car of comb honey is put at 30,000 pounds. There is no use to load over that amount. Taking out case tare and straw leaves about 25,000 pounds net of honey. Our largest car recently shipped cost the buyer \$5000, f.o.b.

Yes, 1200 24-section cases make a good car, and all that need be put into one car.

A box-car will do, but a refrigerator car is tighter when sealed, so that dust can't get in in transit. Also, a refrigerator car is heavier and better built, and, therefore, rides easier, and ordinarily will hold all that should be put into one car.

In the American Bee-Keeper for June, 1905, the writer

About 3 inches of straw upon the floor is used; at the ends 15 inches. Between the tiers about 6 inches of straw is securely packed, with only enough at the sides to make the shipping-cases fit snug and tight. The straw should be clean, and oat-straw is preferred.

Where a full carload is to be shipped, the cases are packed 10 high; but if a less number the tiers are not made so high, as they should be so loaded as to meet at the middle of the car.

It should be noted also, that the cases pitch forward toward the middle; and that the "break joints" thus add to the solidity of the aggregated weight.

Unless the buyer specifies other method of loading, this plan is always followed, and upon each end and each door of the car a caution card—"Handle with Care"—is tacked. That is, cases are loaded from each end, and the meeting-

place solidly packed with oat-straw, which packing comes well above the tiers of cases.

Over the joints of tiers in the drawing may be seen the ends of stout cleats or beams crosswise of the car, which serve to hold down the cases. These, however, are used only over the joints of the 3 end rows, though our artist has tried to make things doubly safe by using them throughout the length of the car.

Mr. Hanegan further advises that before loading a car with comb honey one should be sure that it has no "flat wheels," as "a flat wheel will make mush of a load of comb honey in short order."

HARRY E. HILL.

Mr. Hanegan says further, in a letter to us, that the cases do not stand as sloping as represented in the smaller engraving. By loading thus he feels that honey will stand more rough handling than by loading in any other way. He has loaded very large cars where the honey was packed solid, with some 12 inches of straw in each end of the car. The honey in cars packed thus, however, did not arrive in as good condition as when packed with straw between every few tiers of cases.

Mr. Hanegan very kindly offers to furnish any further information that may be desired by our readers. We shall be pleased to hear from other honey-producers who have had experience in shipping carloads of honey. This is a very important subject, and one that specialists in comb-honey production will need to consider more and more as the years come and go, and as their interest in bee-keeping increases.

## Miscellaneous News & Items

A Merry Christmas to every reader of the American Bee Journal is our wish.

**He Reads Two B's.**—A North Carolina bee-keeper was asked lately what he was reading. His reply was: "Two B's. The Bible and a Bee-book."

**The National Convention for 1905** will be almost closed by the time the majority of the readers of this number of the American Bee Journal receive it. We expect to publish a full report of the proceedings in these columns as soon as possible after the convention. The program as prepared by Secretary Hutchinson is given below.

**Samuel Dysart**, of Franklin Grove, Ill., wrote us as follows on Dec. 4:

I have taken the American Bee Journal almost continually since it was published by Wagner, in Washington,

D. C., which must be nearly 50 years ago. I kept bees then, and I have them now, and desire to keep company with what I call my little friends as long as I can look after them.

With kind regards to all lovers of the honey-bee, I am  
Yours respectfully,  
SAMUEL DYSART.

We are very glad indeed to hear from the older readers of the American Bee Journal, which was started by Samuel Wagner, in January, 1861, so it is not quite 50 years ago. Occasionally we receive a letter like the one from Mr. Dysart, although we suppose there are not very many among our subscribers who took the American Bee Journal when it first started, and have continued ever since. If it were possible to get them all together in one group, we would like very much to have a photograph taken of them to use in the Journal.

**Considerate Bee-Keeper.**—Mr. E. Brubaker sends us the following clipping:

A thoughtful bee-keeper was greatly harassed by the question ever uppermost in his mind, "Have I any right to rob these bees of their honey?" After a long time he settled the question this way:

"I used to feel mean about robbing the bee-hives, but after thinking the matter over I see now I am right. If it wasn't for me taking the honey, all of them bees would be out of work the whole of next summer."—Boerne Post.

But "all of *them* bees would be" dead by "next summer." So his considerateness for the bees was all wasted. But he doubtless got the honey for it, anyway.

**Mr. Thos. Wm. Cowan**, editor of the British Bee Journal, who has been spending some months in California, wrote us from Vancouver, B. C., recently:

DEAR MR. YORK:—We are just starting East, and hope to reach London before Christmas, so as to be with all our family again. We have much enjoyed our visit, and were pleased again to see our friends. We have met friends all along our route, and have had a hearty reception.

Yours truly,  
THOS. WM. COWAN.

We trust that Mr. and Mrs. Cowan may arrive in London again safely, and in good time to enjoy the holiday season with their family and old-time friends in the homeland.

**The Minnesota Convention** was held Dec. 6 and 7, in Minneapolis. We expect to publish a report later. The officers elected for the ensuing year are as follows:

President, Dr. L. D. Leonard, of Minneapolis; 1st Vice-President, Scott La Mont, of Jarretts; 2d Vice-President, J. M. Doudna, of Minneapolis; 3d Vice-President, J. W. Murray, of Excelsior; Secretary, Rev. C. B. Blaker, of Richfield; and Treasurer, W. S. Wingate, of Minneapolis. Executive Committee, H. G. Acklin, of St. Paul; Rev. J. H. Kimball, of Duluth; and Wm. Russell, of Minneapolis.

**Why Not** send in some new subscriptions for the American Bee Journal? Samples free for the asking.

### PROGRAM FOR THE NATIONAL CONVENTION.

#### FIRST DAY—TUESDAY.

##### EVENING SESSION—7:30 P.M.

Wax-Rendering Methods and their Faults—O. L. Hershiser, Buffalo, N. Y.

Can the Tariff on Comb Honey be Tinkered to the Advantage of the United States Bee-keeper?—Hildreth & Segelken, New York.

#### SECOND DAY—WEDNESDAY.

##### MORNING SESSION—9:30 A.M.

How Many Bees Shall a Man Keep?—E. D. Townsend, Remus, Mich.

Short Cuts in Bee-Keeping—M. A. Gill, Longmont, Colo.  
Question-Box.

##### AFTERNOON SESSION—2:00 P.M.

The Control of Increase—L. Stachelhausen, Converse, Tex.

Migratory Bee-Keeping—R. F. Holtermann, Brantford, Canada.

The Dietetic and Hygienic Relations of Honey—Dr. E. L. Eaton, State Analyst Illinois Food Commission, Chicago.  
Question-Box.

##### EVENING SESSION—7:30 P.M.

Contagious Diseases Among Bees and How to Distinguish Them—Dr. Wm. R. Howard, Ft. Worth, Tex.

Experimental Apiculture—Dr. E. F. Phillips, Washington, D. C.

#### THIRD DAY—THURSDAY.

##### MORNING SESSION—9:30 A.M.

The Honey-Producers' League—Can it Help Bee-keepers?—R. L. Taylor, Lapeer, Mich.

The Business End of Bee-Keeping—N. E. France, Platteville, Wis.  
Successful Experience in the Making of Honey-Vinegar—H. M. Arnd, Chicago.  
Question-Box.

##### AFTERNOON SESSION—2:00 P.M.

In What Way Can Bee-keepers Secure their Supplies at Lower Prices?—W. H. Putnam, River Falls, Wis.

How the Producer and Dealer May Advance their Mutual Interests—Fred W. Muth, Cincinnati, Ohio.  
Question-Box.

##### EVENING SESSION—7:30 P.M.

What Have We to Hope for from the Non-Swarming Hive?—L. A. Aspinwall, Jackson, Mich.

Poultry Keeping for the Bee-keeper—Emerson T. Abbott, St. Joseph, Mo.

## Contributed Special Articles

### Honey Markets—Bees and Pollination— Cleome

BY PROF. A. J. COOK.

SINCE coming to Europe I have been surprised at two things: First, the apparent scarcity of honey as an article of food; and, second, at the high price which it brings in the market.

As to the first point, let me say that though I have been in all the British Isles—England, Ireland, and Scotland—in France, Belgium, Holland, and now in Germany, yet not in a single case, either at hotel or pension, has honey been put before us. Several times I have called for it, only to be told that there was none at hand. I had been told that in Europe honey was as invariably a table article as is butter in America. True, this was said of Switzerland, and as yet we have not feasted at the boards of the Swiss. But so far as I have seen and tasted this incomparable sweet, the best of all the carbohydrate foods is most marked by its scarcity in all European hostleries. I would that honey might be known and tasted, yea, freely eaten by all who crave this delectable food.

Again, honey is very high in all the countries where I have visited. I ask for it at the groceries, only to be told, in case it is to be had at all, which very often it is not, that it is, in Britain, from  $\frac{3}{4}$  to 1 shilling—that is, 18 to 25 cents per pound; in France and Belgium, a franc or more, which is 20 cents; in Holland about the same, while here in Berlin it takes a mark (about 25 cents) to get a pound of comb honey.

It is unfortunate that our splendid comb honey cannot reach the consumer at a price that he can afford to pay, even though he be a laboring man, earning his daily bread by the sweat of his brow. Such men are often—very often—God's best servants, and so most deserving his best bounties. Surely, it ought to be the good work of our associations so to plan that such wholesome food as honey shall reach the eater at a price that he can afford to pay, even though he be a humble member of society.

If our associations could so plan that enough of the middle men would be eliminated so that prices would remain within the reach of the day-laborer, a great blessing would be wrought. I believe that the American bee-keeper could live and thrive if extracted honey could always be sold at 6 cents per pound, and comb honey at 10 cents per pound. Can we not fashion machinery that will carry this to the table at a 50 percent advance—say 9 cents for extracted and 15 cents for comb? What a boon it would be could the world's poor get these, and even better rates on second-grade honey! I hope our associations, such as have been organized in some of the States, as well as the National Association, will hammer away on this proposition till results come that will bless the producer and the consumer alike.

I am also rather surprised to learn how away-behind the European honey-producer is in the way he puts his honey into the market. True, I have seen some fine, clean sections, but for the most part, when I have called for honey I have been offered an article that would find no buyers at all in the marts of our own cities. This, I believe, is true all along the line. We do our work better and practice methods that are far more brainy than are those used here. In getting from Europe such masters as the Dadants, and Grimms, I believe we have secured the very best that Europe has to give. The rank and file of those who hold the plow—all those who work in manual-labor pursuits—read and study far less than do our farmers, orchardists, and bee-keepers. Their ways are away behind ours, and their methods are surprisingly not up-to-date.

#### BEEES AND POLLINATION.

I am surprised to find how few in Europe, especially in Britain, depend solely upon bees for their support. I am told, by reliable authority, that only one person in all the British Isles is exclusively a bee-keeper. It is said that he is constantly facing the "wolf at the door," yet there are hosts of small bee-keepers, who keep a few bees. Thus the number of bees is greater than in many sections of our own country. I believe the good that comes to

European agriculture from this redundancy of bees is far from being appreciated. Bees do a grand work in cross-pollinating the flowers of orchard, garden and field. They help tremendously in increasing the productivity of crops by this necessary work. Speed the day when every section of the United States shall be as populous in bees as is the best stocked countries of Germany, Switzerland, and Austria.

#### YELLOW CLEOME.

A subscriber from Arizona sends me flowers of what we may well call the "Arizona Bee-Plant," or yellow cleome. He says it often yields very abundantly of nectar, and barring the fact that it often fails utterly as a honey-plant, he would regard it as one of the very best honey-plants of the world. He adds that the years of failure are in the majority.

This is a close relative of the famous Rocky Mountain Bee-Plant, or we may well call it the Colorado Bee-Plant. The latter is pink, while this Arizona one is yellow.

This is known to science as *Cleome lutea*, or yellow cleome. It is also closely related to the other cleome, or spider-plant. I mention both the other plants in my "Bee-Keeper's Guide," but not this one. It deserves a place in the list.

It will be remembered that, years ago, in the '80's, when I experimented under the auspices of the U. S. Government, to determine if special planting for honey was practical, I used *Cleome integrifolia* as one of the plants. I found, just as our friend says of this Arizona bee-plant, that it very often failed to give any honey at all. I drew the conclusion,—and I see no reason now to change the verdict,—that special planting for bees is not a practical proposition. Often the results will be nothing, and thus the balance will be on the loss side of the ledger.

We may well plant sweet clover and the mints by the roadside and in waste-places; we may well plant lindens, tulip trees, etc., along the highways (eucalypts or acacias, if in the arid regions); we are wise to encourage farmers in sowing alfalfa, alsike, buckwheat, etc.; but I do not believe it will ever pay to use good land to produce plants that are only valuable for honey.

Were I to locate an apiary, I should like, if possible, to be close by large orchards, to have the early stimulative effects of orchard bloom. For like reasons I should like to have abundant soft maples in the East, and many buck-thorns in California. Above all, I should wish hard by the basswoods and white clover in the East, and sages and wild buckwheat in the West. Berlin, Germany.

### Economy of Wintering Bees in the Cellar

BY C. P. DADANT.

I FIND the following from the pen of Dr. Miller, in *Gleanings in Bee-Culture*:

"C. P. Dadant says in the *American Bee Journal* that 8 or 10 pounds is a fair estimate of the honey consumed by a colony wintered in the cellar, and nearly double that by a colony on the summer stand in a cold winter. According to that, for the labor of carrying in and out one would get about 8 pounds of honey for each colony. Good pay. At the same time, I'd be glad to feel sure that the cellared colony is just as well off in all respects."

This item has called my attention to the fact that I have perhaps not explained my meaning sufficiently. I did not mean to say that the amount stated would carry a colony from crop to crop, but only through the real winter—the time when bees are kept in the cellar. My experience has been that the colony wintered out-of-doors has in the meantime produced a larger quantity of brood than the colony wintered in the cellar; that when the cellared colony is taken out, it has to get accustomed to the changed conditions and has to begin to breed, and that it, in the end, spends a goodly portion of the savings in catching up with the other, wintered out-of-doors.

I have often heard Canadian bee-keepers say that their bees breed in the cellar, at the end of winter, but I have seen very little of this in our latitude. Different conditions cause different results. We do not leave our bees so long in the cellar here, as they do at the North. We cannot, for as soon as the warm days come the difficulty arises of keeping them quiet. That is why we have ceased wintering bees in the cellar, although there is occasionally a season when we would be glad to have them indoors.

But we are unable to foresee cold winters. Many a man has tried to predict the future weather. Many a man has said that the bees, the animals, the corn, even, prepared for a cold winter when it was coming. I believe this is all a mistake. Neither the insects nor the plants know more about the future than we do, except that through years or centuries of natural selection, those succeeded best and survived that bent themselves to the changes of seasons.

Some farmers say that the corn has a heavier husk when a hard winter is coming. I wondered how this could be, until one season I was told by two different farmers of great experience that the winter would be hard, and that it would be mild, for the one said, "The corn husks are heavy," and the other said, "The corn husks are light."

I can see very plainly that Dr. Miller understands the situation in regard to cellar-wintering fully as well as I do, for the last remark he makes, "I'd be glad to feel sure that the cellared colony is just as well off in all respects," indicates that he realizes the difference in conditions at the time when the hive is taken out of the cellar. If I were as far North as Dr. Miller, I believe that I would winter my bees in the cellar every winter. One winter or even a half-dozen winters are not sufficient to decide the question. But for years we tried cellar-wintering side by side with outdoor wintering, placing sometimes an entire apiary, sometimes only a portion of it, in the cellar prepared purposely for them, while other apiaries remained entirely out-of-doors.

After all these trials I have come to the conclusion that it is as well to risk outdoor wintering in this latitude. But with small hives, or weak colonies, short in stores, and a good cellar in easy reach of the apiary, I would still recommend cellar-wintering. A little south of us, or below the 40th degree, I believe cellar-wintering should be discounted, while north of this latitude it is probably more profitable to winter the bees in the cellar.

I wish, in closing, to thank Dr. Miller for the remarks made, as these have called my attention to the possible misunderstanding I caused. If there is a bee-keeper whose opinion I value above all others, it is Dr. Miller, for he has a very extensive practical experience, and never advances a thing unless he is sure of it. He never jumps at conclusions, and never supports that which he has not proven correct.

Hamilton, Ill.

## Best Bee-Hive—Something About It

BY G. M. DOOLITTLE.

A SUBSCRIBER to the American Bee Journal writes: "Will you describe the best bee-hive, and tell us something about it, as I wish to make some hives the coming winter."

This is a hard question to answer, for nearly every person keeping bees believes he or she has the *best bee-hive* in existence, and when I say that the number of different bee-hives in use reaches into the scores, if not into the hundreds, it will be seen how difficult it would be to do as requested.

Probably the hive most in use (unless, perchance, it is the box-hive) is what is termed the "Langstroth." Then next in order comes the Gallup, Quinby, Danzenbaker, Hoffman, Simplicity, Heddon, American, etc., nearly all of which are only a modification of the Langstroth to suit the different notions of different persons using them and putting them before the public, for there is scarcely a frame hive today but what embodies more or less of the Langstroth principles, especially as to bee-space and the frame principle.

With the progressive bee-keeper the box-hive is a thing of the past, although there are a few using them which do quite a good business with them, by having the combs built to slats along the top of the hive, with a movable top-board so that the surplus boxes or sections can be set right over the combs. With the farmer bee-keeper—one who never thinks of handling the frames or even looking inside of the hive—a box-hive so arranged would probably be as good for him as the best frame hive ever made. But such a one could not be considered a progressive bee-keeper.

Excluding, then, the box-hive, we have a simple box arranged for bee-spaces and containing frames as the best hive, letting him or her who uses it make said box and frames of any dimensions which they may choose.

As "my notions," away back in the early seventies, led me to prefer the Gallup form of the Langstroth frame, I will briefly describe how this hive is made, so that anyone can make it, or a modification of it, as he pleases.

Get lumber 12 inches wide and  $\frac{7}{8}$  of an inch thick, planed

on one side (or both, as you please), and saw it into lengths so that when nailed you will have a box without top or bottom 12 inches deep, 12 wide, and 18 inches long, inside measure. Before nailing, on the upper inside edge of the two long boards rabbet out a space  $\frac{1}{2}$  inch deep by  $\frac{3}{8}$  back, for the frames to rest on, and on the bottom edge of one of them cut out a piece 12 inches long by  $\frac{3}{4}$  deep, for an entrance.

A plain board of the right size, with two pieces of 2x4 stuff nailed on the under side near two edges of it, running crosswise of the grain, constitutes the bottom-board or stand for the hive. If it is preferred, the hive itself can be made without the entrance cut in it as above; and, if so, then cut out strips from the  $\frac{7}{8}$  stuff  $\frac{3}{8}$  thick, and after cutting them the right length, nail them to three sides of the upper side of the bottom-board, when the fourth side, not having one of these strips nailed to it, will constitute the entrance, which can be contracted to any desired dimensions by using entrance-blocks, giving an entrance of  $\frac{3}{8}$  by 4 inches for winter and early spring, up to the whole width of the hive for summer.

The frames are made of stuff sawed  $\frac{3}{4}$ -inch thick from an inch board, and cut to the right length so that when nailed together the outside of the frame will be  $11\frac{1}{4} \times 11\frac{1}{4}$  inches square. The top-bar to the frame is to be long enough to project  $\frac{3}{4}$  of an inch at each end, so as to hang on the rabbet prepared in the upper part of the side boards of the hive for them. Hang the frames in the hive so 12 of them fill it, and the proper bee-spaces will be given, according to my views, as I prefer a space  $1\frac{1}{2}$  inches from center to center of the frames, having tested the matter for years.

Make the surplus part of it to suit your notion, with or without a honey-board, and with or without a cap or hood. If you use a cap or hood, then the cover can be a board of the right size to cover the top, or the same can be of enameled cloth, quilt, canvas, or anything you may choose, with the cap or hood filled with leaves, chaff or sawdust above the cover for wintering. Where no cap or hood is used, then a cleated board, water-proofed in some way, should be used as a cover, the same being a cover for the hive and the surplus arrangement, as well, when that is on.

In the above we have the best bee-hive principle in existence, and one which can be made in any conceivable shape to suit the desires of the most fastidious, and yet the word "LANGSTROTH" suggests all there is of it, and carries the minds of all who delight to honor the Father of Modern Apiculture back to the time when this noble man (who passed to his heavenly home a few years ago), spent hours, days and years of toil and study in inventing this principle, that we, his apicultural children, might profit and enjoy that which he wrought out for us.

At the out-apiary I use the regular Langstroth frame, and 10 of these to the hive. Where an apiary is worked on the "shook-swarming" plan, a large hive seems to give the best results; and an out-apiary cannot well allow natural swarming.

Borodino, N. Y.

## Convention Proceedings

### Report of the Texas Convention

BY LOUIS H. SCHOLL, SEC.

(Continued from page 865)

Mr. Aten, in behalf of the bee-keepers, asked for a statement concerning the work of the experimental apiary.

Mr. Scholl went over the ground since the establishment of the apiary, and what had been done. He also gave an outline of the experiments contemplated, together with other work now under way, and some of the problems that are to be solved, as follows:

DOES ALFALFA PRODUCE HONEY IN TEXAS WITH OR WITHOUT IRRIGATION?

With the advent of irrigation in the arid regions, will Texas ever be classed with the Western States that produce enormous amounts of alfalfa honey annually?

It is the general belief that alfalfa is a good honey-producing plant, but no satisfactory data to that effect in Texas has been obtained. Investigations of this subject

therefore would be highly valuable. If, as irrigation and the growing of alfalfa advances, the honey-yield is relatively increased, many localities for the location of new apiaries will be opened, and it will mean thousands of dollars to this State.

#### AMOUNT OF HONEY TO MAKE A POUND OF WAX.

To determine definitely the amount of honey consumed by bees in making 1 pound of wax.

It is claimed by some apiarists that from 12 to 24 pounds of honey are required to produce one pound of wax. Others claim this to be too high, and give 7 to 8 pounds of honey to one of wax.

#### SWARMING.

Careful study and experiments with proposed methods of controlling and preventing swarming. In connection with this, manipulations of the brood-nest and combs to stimulate additional brood-rearing and added surplus production.

If this can be overcome in the College apiary it should be possible to produce a fair crop of surplus honey annually in an average season with 20 colonies, a greater number exceeding the supply of the locality.

#### LENGTH OF LIFE OF DIFFERENT RACES OF BEES.

A test of different races of bees to determine the comparative length of life of the individual bees in these different races: Holy Lands, Goldens, Three-banded Italians, Cyprians, Carniolans, and Blacks.

Get all colonies ready and of the same strength, and dequeen and introduce a queen of a different race and color. Subtract the days between dequeening and requeening.

#### RACE OF BEES FOR TEXAS.

Race of bees adapted to the varying conditions in different parts of Texas.

Queens of selected races to be reared at the College and distributed among experienced apiarists in different parts of the State, who will take careful note of observations and report to the Department. A reasonable amount of cost is to be charged for such queens, in half-dozen lots, which will contribute to the income of the apiary and yield results at the same time.

#### QUEEN-REARING.

Experiments in queen-rearing. 1st. To determine the quickest and best methods of rearing good queens; and 2d, an attempt to determine method of controlling the mating of queens, or mating in confinement.

Would naturally come under No. 6, in rearing the selected queens and getting them purely mated.

#### DISEASES OF BEES.

Investigation of foul brood, black brood, pickled brood, and bee-paralysis, to determine needed facts regarding the same, as method of infection, resistance of germs and spores, etc.; method of treatment in eradication, fumigation, etc.

Not practical without a well-equipped bacteriological laboratory, but which can easily be established with material already in the Department.

#### DISTANCE BEES RANGE.

How far may bees travel to gather honey profitably? How far should bees range to secure the maximum amount of honey (with most profit) from a given territory?

A valuable factor in locating apiaries, as on the Brazos river, to determine whether bees can be profitably located on high bank on the College side of the river in comparison with those located on low land nearer the honey-producing territory which is subject to overflows.

#### HONEY-PLANTS OF TEXAS.

A study of the honey-plants of Texas and of the territory surrounding College Station.

(a) Card cataloging above honey-plants as already under way.

(b) Listing distributions of honey-plants of the State on area maps of Texas.

(c) Making a complete herbarium collection of Texas honey-plants.

(d) Making a complete card catalog according to their blooming periods, with the length of blooming periods, importance of honey or pollen, and their distribution.

#### HIVE TEMPERATURES.

Testing various styles of hive-covers to determine their resistance to heat, by the use of thermometers, making close observations during the hot season.

Ascertaining the difference in temperature existing in hives placed in direct heat of the sun, with and without shade-boards, compared with several in the shade.

#### FOR FUTURE EXPERIMENTS.

Experiments that might be taken up later, but necessitating a location of better honey-production than is possible at College, could be made possible by having established an out apiary in the Brazos river bottom, about 10 miles from College. Valuable data on the following could be obtained by locating such a yard.

(a) Establishing outyards; the selection of the location; best arrangement to make with the land-owner in regard to permit to locate, rent, and hiving of swarms.

(b) Best method of moving bees to outyard; placing and arrangement of hives.

(c) Management of outyards, with a view toward the largest amount of profit with the least amount of time of labor and expense.

(d) Best race of bees for outyards; the best for the largest yield of honey; a comparison of different races for such.

(e) Hives. Best for honey-production; best for manipulation to prevent swarming.

(f) Prevention of swarming, to increase the yield of honey and profits, to decrease amount of labor and expense; and to prevent loss of swarms where no person is present to care for them. This can be accomplished to a great extent by the right method of management with the right kind of hive, and the right kind of race of bees.

There are also other matters under consideration for experiment, and these will be taken up as time permits. The above is simply an outline that was written out some time ago, and it may be changed from time to time, as best suits the time and the favorableness of the seasons.

LOUIS H. SCHOLL.

It was moved and seconded that a vote of thanks be extended to Mr. Scholl for his kindness and generosity towards the bee-keepers.

Mr. White thought that the Texas Bee-Keepers' Association should give Mr. Scholl such help and encouragement as would enable him to carry out the work at the College apiary. Much good could be done if the bee-keepers put all heads together, and he believed that the bee-keepers ought to help him.

Mr. Aten moved that a committee be appointed to consult with the proper persons in regard to having experimental work done at the experimental apiary, and concerning other matters pertaining to the apiary. The motion was seconded and the following committee was appointed: F. L. Aten, W. O. Victor, C. A. Butts, and W. H. Laws.

J. F. Teel related some experiments with different kinds of honey-plants that he has conducted. These included alfalfa, buckwheat, and clovers of all kinds. Alfalfa yields some honey during the heat of the day, buckwheat yields until 9 or 10 o'clock when dewy mornings prevail, but few of the clovers, however, amount to anything with him.

#### ELECTION OF OFFICERS AND MEMBERS' REPORTS.

The election of officers for the next term resulted as follows, each one being unanimously elected, the secretary-treasurer of the Association being re-elected for the eighth time: President, F. L. Aten of Round Rock; vice-president, Willie Atchley of Beeville; and secretary-treasurer, Louis H. Scholl of College Station.

On account of lack of time the minutes of the last meeting were not read, and a committee was therefore appointed to inspect and report upon the books of the secretary-treasurer at the next meeting. This committee consists of Willie Atchley, C. A. Butts, and J. F. Teel.

The total number of colonies represented by the members present who reported to the secretary was 7,550 colonies. The Texas honey crop thus far was short, but prospects were good in most localities, while not so good in others.

The members reporting, the number of colonies, the amount of honey obtained to date, and prospects at present, are as follows:

F. L. Aten of Round Rock—200 colonies. Bees in fine

condition. Finest flow on he ever saw. Bees do not notice loose honey left in the yard.

J. M. Hagood of Enloe—80 colonies. Gloomy prospects. Bees weak. Cotton poor, but may have flow yet. Has had flow as late as October.

J. W. Traylor of Enloe—80. Gloomy prospects. Too much rain.

T. K. Ray of Indian Gap—50. Bees in 3 places, 1, 3 and 7 miles from home. Took less than 100 sections. Prospects better, as cotton is coming in.

T. P. Robinson of Bartlett—180. Two yards. Hives 6 feet apart. Some nuclei. Excellent honey-flow.

Miss Meta Hillje of Alvin—4. Flow just commenced, and favorable.

W. C. Lanford of Whittville—30. Have done no good. Prospects better. Cotton blooming. Has several kinds of bees.

Willie Atchley of Beeville—1,100. Poor flow and poor prospects.

Huber Laws of Beeville—12. 250 pounds of honey. Prospects poor.

Louis H. Scholl of College Station—240. Five apiaries in different parts of the State. Too wet in early spring, and too dry later. Everything burned up. Then floods in Brazos bottoms. Poor prospects, but a good flow from cotton now.

J. F. Teel of Van Alstyne—175.

J. B. Salyer of Jonah—150.

Z. S. Weaver of Courtney—275.

G. W. Cantrall of Uvalde—130.

W. H. Laws of Beeville—1,400. 900 colonies private, and 500 in partnership. Honey season past. Too much rain. Poorest season in years.

W. H. Madely of Rogers—200. 1,900 pounds of extracted and 600 pounds of comb honey taken. 3,000 pounds on hives. Still storing honey from cotton.

E. Blechschmidt of Knippa—120. Ten 120-pound cases of comb honey taken. Splendid prospects.

W. A. Breeding of Beeville—100. Bees in very good condition, and some honey on hives.

D. C. Milam of Uvalde—600. 24,000 pounds of honey. One-third extracted, the rest comb honey. Prospects good for fall flow.

W. C. Conrads of New Braunfels—85. 40 pounds average per colony. Prospects poor for the fall.

W. H. Sessions of Rice—12.

Udo Toepperwein of San Antonio—800. All in good shape, but not much honey. 9,000 pounds. Very good prospects.

W. O. Victor of Hondo—100. Sixty 120-pound cases of honey. 400 queen-rearing nuclei. Prospects uncertain.

Sam Madely of Navasota—110. One barrel of extracted and 350 pounds of comb honey taken; more to take. Prospects very good.

C. A. Butts of Normanna—350. 3,000 pounds of honey. No prospects.

J. W. Holland of Rice—12.

H. D. Simmons of Hutto—160. 60 pounds per colony. Good prospects with cotton and other yielders.

R. V. Sauer of Brackettville—110. 2,000 pounds of honey. Good prospects.

W. H. White of Blossom—60. Prospects gloomy. Too much rain.

Hugo Sattler of New Braunfels—95. 40 pounds of extracted honey on an average. Very good prospects.

J. W. Pharr of Berclair—60. No prospects. Bees in good condition.

M. P. Hill of Berclair—70. 1,300 pounds of honey—100 sections. No prospects.

L. W. Bell of Beeville—500. Very good prospects.

LOUIS H. SCHOLL, Secretary.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

The "Old Reliable" as seen through New and Unreliable Glasses.  
By E. E. Hasty, Sta. B. Rural, Toledo, Ohio.

#### TANGING OF BEES AT SWARMING-TIME.

We should let up now on Prof. Bigelow as to the tanging question. He's all right now, whatever he may have felt about it at one time. He expressly disclaims advocating the old practice—and is not that abundantly sufficient? There is plenty of room for the like of Prof. Bigelow. We should joyfully make room for more of them if we could get them—men that care almost nothing for crops of honey, but are boiling over with interest to find out what are the absolute facts in regard to that lovable, hate-able, wonderful, biology-explaining, paradoxical, wise, fooling, tantalizing creature—the Honey-Bee.

After all, our main spite against tanging is that it has become a sort of badge to distinguish between those who know something about bees and those who don't know a thing yet as they ought to know. Tanging is felt to be like shouting with a megaphone. We are all fools at this ranch. But of course the pure scientist would like scientifically to *know* whether an unearthly racket does have any power to confuse bees, and make them yield to man's wishes when they otherwise would not. I confess I am not able to tell him. I incline to think the affirmative is true to a *certain very small extent*. It's certain the influence is not great—not nearly enough to pay the keeper of a big apiary in swarming-time for spending intensely valuable time at beating a pan. Popular faith in it largely owing to the fact that *time seems shorter* when we are skipping around doing something jolly than it does when we are just doing nothing, and waiting in a distressed tension of mind. There seems to be no way to settle it scientifically except to observe and record concerning thousands of swarms with tanging and thousands of swarms without, and then figure out the shaving of difference. Such a process reminds one of the process by which astronomers prove toward what point in space the sun is moving. That's important—and our question here is so unimportant that so far no competent person has felt like spending the enormous amount of time required. Page 790.

#### HEADING OFF SWARMING IN IDAHO.

So a brother in Idaho, whose name we know not, runs bees on extra-large frames, and 13 of them in a hive, hoping to head off swarming; but still they will swarm sometimes. Make a note of it. One suspects that the wording has got wrong somehow where Mr. Atwater says he produces comb honey in 8-frame hives kept one-story at all times. Page 791.

#### NATURAL CONDITIONS IN THE FALL.

Thanks to C. P. Dadant for his defense of natural conditions in fall in preference to having all combs completely solid with honey.

Too young bees eat themselves into diarrhea on a long trip, eh? That is quite comprehensible. Thanks. Page 791.

#### TWO QUEENS IN A HIVE—HIVING HIGH SWARMS.

The evidence given by A. F. Foote, that a big double swarm kept both their queens for 20 days is rather opinion than evidence, as 20 days is plenty of time to rear a young queen. With my bees such swarms are pretty apt to kill all their queens. Even when they go to work and store honey like everything they turn up queenless in the end.

And Mr. F. suspects that when conditions are such that sections are not joined to the bottom-bar bees would sometimes bob them off in the same way (as nearly as possible) with a bottom starter there all right. I think he is correct in that—that is, for *some* of the sections, not for as many as otherwise would be finished with a bee-space clear across the bottom. And the Foote improvement of the swarming-taking box and pole is noteworthy. Fix the pole to be stationary, and run the box up and down by a cord and pulley. Good—if you succeed at all with that style of doings. Some brethren (of which I am one) vote the whole

scheme a failure and a nuisance. Who wants to waste time hiving a *part of a swarm*? Bees so fanatically attached to their chosen spot that a large fraction of them refuse to be wheeled away from it. Page 791.

#### WHITE ASSOCIATION MEMBERS IN TEXAS.

So the Texas B.-K. Association thinks it worth while to ordain that members must be white persons. Wonder if they ever suffered, or were in danger of suffering, from persons not white getting too thick. Page 792.

#### MISS WILSON AND BUTTER-MAKING.

And Miss Wilson tried if she could make a little dab of cream come butter by agitating it in an ice-cream freezer. Enterprising. And we care enough about our department conductors to like to get side views of their personality. Many big churns in common use (those depending mainly upon the gravity of the cream to do the agitating) strike me as sadly and needlessly helpless when cream takes a notion to say, "I won't!" as it often does. "Any old thing" of a churn is tip top when cream in dutiful mood says, "I will." Page 795.

## Canadian Beedom

Conducted by MORLEY PETTIT, Villa Nova, Ont.

### Be Prepared for Next Bee-Season.

It is a common misconception among those outside the profession that bee-keepers have nothing to do through the winter months. Even many bee-men themselves look forward to the time when the bees are winter-packed, with the idea of being free from all care with regard to them. A summer occupation it is to them. Well, there is something in it. Bees do not require to be fed night and morning, and tended like other stock on the farm, but they need attention, nevertheless.

In the cellar the ventilation requires a certain amount of attention to regulate for changes of temperature. The dead bees require to be cleaned from the hive-entrances, and the floor swept up occasionally. Outside, snow must be cleared from the entrances, and, if possible, covers removed on bright, sunny days to let the packing dry out. All, of course, with as little disturbance to the bees as possible.

But this is a small part of the work. The man who would make the most of the short summer season will make all possible preparations before that time comes. There are certain supplies required to be got ready each year, and they should be provided for as soon as possible after the close of the honey-flow. At that time all is fresh in the mind, and it is much easier to decide on what is required than it will be later. The apiarist knows best then how much of his time the bees have taken, and can form the best idea of how much increase, if any, he desires to make the following season. He can make out his list of requirements—hives to accommodate the required increase; extra supers, if needed (every hive should be allowed at least two supers); frames, sections, foundation, etc.

Increase can be made most profitably by nuclei and ripe cells or queens. At the present price of queens I would advise the specialist honey-producer to patronize the specialist queen-breeder. Of course, there is always some risk of their being damaged in the mail, and on this account, largely, we use good, ripe cells in forming nuclei whenever they turn up in the course of our examinations for swarming impulse; but we find very little time, indeed, for queen-rearing. Queens ordered in quantities can generally be secured at reduced rates, and they should be ordered *now*, to insure their delivery when wanted. The order should be so arranged that a few will come each week, on a certain day of the week, during the swarming season.

Objection is made to investing money in supplies which may not be needed this year. This can not be avoided without running the much more grave risk of seeing the hives overcrowded with honey, the bees idle and swarming, and no supplies ready. We always make it a point to be ready

for the worst—I should say, the *best*. Figure on wintering all the bees we have put into winter quarters, and securing the highest average yield of honey we have ever had. Then buy supplies accordingly.

There are always some cans and barrels left over at the end of the season, but they are good stock for another year. Plenty of storage is the great essential. As far as possible let this storage be the packages in which the honey is to be sold. Don't count on keeping honey in milk-cans and crocks, to be laboriously dug out and melted up before selling. Arrange to run the honey directly from the extractor through a strainer into the package in which it is to be sold.

Another point in preparedness, which very many bee-keepers are prone to neglect, is in the matter of reading. The bee-papers have been coming regularly through the busy season, hastily glanced over, and laid away, with a promise to read them more carefully in winter. It is winter now. What about those bee-papers?

I knew a farmer once who was a great student. He read early and late on science, history, philosophy, until he came to be considered an oracle by his neighbors, and to the outside world a recognized authority on many subjects outside of *farming*. I would rather be well versed in the line of business from which comes my daily bread.

### Possibility of Dark Honey or Sugar Syrup in the Brood-Chamber Going into Sections

"York County Bee Keeper" hits the nail fairly on the head in the following, taken from the Canadian Bee Journal:

"At present quite a controversy is going on over the line relative to the practice of feeding sugar syrup. Mr. Boardman practices feeding just previous to the clover-flow, so that the brood-chamber will be full and all clover honey go into the supers. In a late issue in the American Bee Journal, Editor York advises bee-keepers to make their hives heavy for winter by leaving plenty of sealed combs of dark honey, arguing that the dark honey thus placed will really be equal next season, pound for pound, with light honey.

"Commenting on this, Editor Hutchinson, in the Review, asks bee-keepers to see how much of this dark honey will go into the sections, intimating, of course, that there is not much likelihood of dark honey, or sugar syrup either, going into the supers. Seems to me Mr. Hutchinson is treading on dangerous ground, for surely any practical apiarist knows that if a brood-chamber is full of any kind of honey or syrup (provided the colony has a prolific queen and swarming does not take place), quite a large percentage of this honey or syrup will find its way into the surplus apartments. This is something that any one can test for himself, and if the novice has colonies to go into the clover-flow with the brood-chamber full of buckwheat honey, he may decide that while experience, if a good teacher, it is sometimes a little expensive."

### Bees and Alsike Clover

The Hon. Nelson Monteith, Minister of Agriculture, is a bee-keeper. Being a fruit-grower, and seeing the importance of bees to fruit, he became a bee-enthusiast on that account. As to their importance to alsike and buckwheat, the evidence keeps piling up. A few years ago a man came 4 miles to me to have me put bees on his farm for his alsike. He gave a free house for extracting, and board for the men while working at the bees. In the fall he had a good crop of alsike seed, and we had a good crop of honey.

Mr. J. L. Byer, in the Farmers' Advocate, gives *his* experience thus:

"In addition to growing quite an acreage of alsike clover each year ourselves, we also handle considerable seed for a well-known Toronto firm. Coupling this with our interest in the business from a bee-keeper's view, I suppose there is no exaggeration when I say that we practically know the acreage and individual yields of the different fields of clover within a radius of 3 miles of us each year. In seasons that the acreage is limited, there does not appear to be so much difference in yields, as far as distance from the apiaries is concerned; accounted for, no doubt, by the fact that when pasture is scarce the bees forage over a much greater extent of territory in search of nectar. On the other hand, in seasons when there is a large acreage, the yields

invariably decrease, after a distance of a mile or more is reached.

"While yields of 7 and 8 bushels to the acre are not uncommon in fields near the bees, we have yet to hear of such turnouts of clover any considerable distance from the apiaries. For 7 years our clover has yielded from 6 to 9 bushels to the acre; our nearest neighbors have done about the same. Others living 1½ miles and more from any bees, have had in the same years from 2 to 5 bushels to the acre. As the soil is practically the same in both cases, same methods of culture practiced, etc., I am at a loss to explain the difference, if the bees are left out of the question. These statements will be vouched for by nine out of every ten farmers growing alsike. In fact, I could name men who 10 years ago would laugh at the idea of the bee as something necessary in alsike-growing, who to-day are the most anxious to have bees near their clover-fields. One in particular comes to my mind, who, 2 years ago, offered to haul an apiary from 15 miles away to his place, so that he could have the benefit of them when his clover was in bloom.

"Just a short time ago, while in conversation with that well-known agriculturist, Mr. Simpson Rennie, of Toronto, I remarked that the beet-sugar industry would not prove very tempting to the farmers who are growing alsike. He said, 'We can't all grow alsike; we haven't got the bees.' He was very emphatic about the matter, and stated that neighbors of his had tried again and again to grow alsike for seed, and had always failed. In the section referred to there are probably not half a dozen colonies of bees in the neighborhood. Surely, the testimony of such men should bear some weight.

"Last, but not least, the opinion of the large seed firms should be considered. As they annually handle thousands of bushels of the seed, they should know what they are talking about. I think, without exception, they will say they get the most seed, and of the best quality, from growers who are in close proximity to bees."

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Hearty Holiday Greeting

to all and singular of the cherished sisterhood. May your Christmas turkey be just the right shade of brown, and may your pies not run over in the oven. May your bees winter successfully, and may you have a good time expecting a big crop of honey next year—whether it comes or not.

To the many who have helped during the past year, by their contributions and by their kind words of encouragement, sincere thanks are due, and are hereby given. Closely coupled with the feeling of thankfulness for the favors of the past is the Oliver Twist feeling of a desire for "more." Perhaps the most interesting hour of the day, "in this locality," is about 9 o'clock in the morning, at which hour the rural delivery man comes along, and when the day's budget is brought into the house the first question always asked by a certain person is, "Anything for me from the sisters?" If any of the sisters are at all solicitous for the happiness of that "certain person," they can make sure to increase it by letting her hear from them often.

Don't wait for some great thing to tell; tell us about the little things. Tell us of your successes, and, equally, tell us of your failures. If you haven't a pen handy, use a pencil. Never mind if you don't know just where to put the commas and other marks—they're good at that sort of thing in Chicago.

Postals and postscripts permitted.

Success to all of you. EMMA M. WILSON.

### For Our Consolation and Encouragement

DEAR MISS WILSON:—I send a short poem written by a dear friend of mine, whose life is a living epistle of the love of Christ. She signs herself "Sister Ruth." (Not her real name.) It seems to me that some of us bee-keepers may be consoled by reading this poem. So many of us fail

of the prosperity and success we had worked and hoped for. As I see in the American Bee Journal, from time to time, poems on other subjects than bee-keeping, I would be pleased if you would have this poem published in the Sisters' corner.

SARAH E. WILBY.

Poughkeepsie, N. Y.

#### Blessed are Ye That Fail

Sometimes I've wished we might these words enroll  
Upon the pages of God's Holy Book,  
Then, kneeling down by each discouraged soul,  
Could simply point to them and whisper, "Look!  
'Blessed are ye that fail.'"

For none fail unless they first have striven;  
'Tis he who toils all night, and naught doth take,  
Whose heart with dark despair is keenly riven;  
And so I wish 'twas written for his sake—  
'Blessed are ye that fail.'"

Is it not written? Not these words we find,  
But surely in God's Book we read the thought—  
He treasures up the motives of the mind,  
And blesses as the will within us wrought,  
Tho' outwardly we fail.

Christ came to heal our broken-heartedness;  
And who so sore as he who toils in vain?  
Whose best endeavors seldom meet success,  
E'en tho' he try, and try, and try again?  
Then blessed ye that fail.

Aye, blessed, for the very striving leads  
The zealous soul into the realm of loss,  
Made holy by the One whose loving deeds  
Seemed to have ended on the cruel cross.  
Aye, blessed ye that fail!

God is too wise to let us oft succeed,  
For then we would not keep our lowly place,  
And so He lets us feel our constant need  
Of His supplies of patience and of grace—  
Thus blessing those who fail.

Then, weary one, look not upon the main,  
And mourn the wreck of all your toil and care;  
If yet upon some broken piece you gain  
The haven safely, and are welcomed there,  
Blessed are ye that fail.

SISTER RUTH.

### Bee-Keeping and Other Things at "Clovernook"

DEAR BEE-KEEPING SISTERS:—So our good Chieftainess thinks you will be interested in hearing some more about "Clovernook," in addition to the clipping she printed recently from that fine magazine, *Suburban Life*.

Well, we began business with some 50 colonies, and a fine outfit for extracted honey, and a nice, large, roomy beehouse, all of which was on the place, and later on we bought from the proceeds of our honey.

At first the colonies dwindled to 31, but by experience (rapidly acquired in a fiery furnace of stings and disappointments) I promptly and speedily ran them up to 80 colonies, the present limit of our pasturage, and we work each year to keep the apiary at about that average.

I have always believed our bees were the very backbone and sinew whereby Clovernook has succeeded in building up a lucrative plant, even if through many difficulties.

And I must confess that after having had considerable experience in ducks, chickens, turkeys and squabs, besides fruit-raising, during the 10 years' work here, surely bees are away and ahead my most satisfactory branch, from every standpoint but one.

I can't make a living from my 80 home colonies, and I can't add out-lying yards to the plant, for there is no way of visiting them. I'm afraid of breaking my neck in learning to use a bicycle, though in days of yore how I used to ride horses, and skate and dance! During those times a broken neck never bothered me; but when one knows what it would mean to a little, aged mother, I tell you it makes a difference.

I've had three horses—two were ruined, and one I sold to keep her from being ruined, and when she went a vow was mentally registered that Clovernook would never shelter another till time evolved for us as something masculine in hired help that was reliable. Suffice to say this *rara avis* is still "on the wing;" he surely has not yet settled down on Clovernook.

Such being the state of affairs with us, something else had to be added to bees if we were to live independently, and "tuck away" some odd pennies in the "Emergency Stocking." And so, after a brief, exciting, hard trial of "chickens and squabs for broilers," we've settled down now in peace to my bees and duck-raising—with, as a side-issue, about 100 White Wyandotte hens and 8 White Holland turkeys for eggs and breeding stock; though, to be sure, there are a few other odds and ends by which we pick up a few extra pennies. For instance, our apples brought us this fall \$36 in cash, besides having all we could use; from our currant patch we cleared on the jelly about \$100. Of course, we have lovely down from the ducks, netting us about \$100 per season, and the guano that brings \$1 per load. And from the bees, the vinegar and beeswax.

I hope I have demonstrated clearly that it was not by preference that I resigned confining myself strictly to bee-keeping, and why forced by circumstances into the very much more complex paths of poultry-raising. I will, however, in defense of the last, say this: Besides our living expenses and lots spent in general repairs and improvements, there is invested in houses, incubators, brooders, and other poultry appliances, some \$2000, all of which we have raised right here, ourselves. Also, that to-day, with two good helpers, Clovernook can yield us annually between \$2000 and \$4000. We are now equipped for it, and can do it.

Realizing my own limitations, and that there must be others scattered through our land who suffer from similar restrictions, is the reason why I urge that for those, bee-keeping in connection with another rural occupation, may work very successfully in the production of a fair income and independent livelihood.

The little cut at the head of this shows my bee-house, with a lovely good friend and brother standing in the doorway, and my man "Pete," with his barrow and tin carrier filled with combs, starting for the bee-yard. That white splotch between the hives is a flock of my ducks. They refused to "spread out" and have their pictures taken nice, but just "bunched up together" and made themselves disagreeable. "F. E. W.," yours truly, stands at one side equipped for business, with straw hat, bee-veil, big apron, and bee-smoker.

Some time you shall have a picture of my dear ducks, a good one, if it will be allowed in a bee-paper, and I will describe our indoor rigging of the bee-house; but guess you have had enough of Clovernook for this time.

Clinton Co., N. Y.

FRANCES E. WHEELER.

## Doctor Miller's Question Box

Send questions either to the office of the American Bee Journal, or to DR. C. C. MILLER, Marengo, Ill.

☞ Dr. Miller does not answer Questions by mail.

### Bees Dying Seemingly Without Cause

I went to one of my out-yards of 303 colonies the last week of October, and all were in fine condition, with lots of old stores, and the woods all turning white with aginaldo and various other good honey-producing flowers. So I pitched in, and in a few days I put on 185 supers; then my business called me in other apiaries, and it was 4 days before I went back to put on some more supers, and to my surprise I found the bees carrying out other bees and kill-

ing them after getting them out. So I thought I would wait and see how this would turn out. Three days later I went back and found the whole apiary still at the killing, and dead bees from ½ inch to 2 inches deep in front of the long rows of hives, and the bees that remained alive seemed so scarce in November that they have suspended business in the way of storing honey. Some of these same hives had lots of bees hanging out in front and at the bottom when this trouble began, and now I can't see one pass out or in oftener than one or two a minute. It can't be on account of hunger, for they are all quite heavy, and with lots of good, healthy brood, which I fear may get chilled if we should have a cool night.

In my home yard of 225 colonies, only 2½ miles from the fatal yard, I never saw bees do better. I also have another yard of 400 colonies about 6 miles from the fatal one, and they are doing well, too. Can you point out a remedy or a preventive if I should have any more of this kind of trouble? As I have told you in a previous letter, I have handled bees for many years, and this is a new wrinkle to me.

Our weather is quite favorable (Nov. 30), and our prospects are flattering for lots of honey this season.

CUBA.

ANSWER.—I don't know enough to make even a guess at the cause or cure, so submit the case to "the constituency," begging that any one able to help out will be kind enough to do so.

### Late Gathering of Honey and Pollen

About Oct. 1, I found a small swarm of bees on a bush. I took pity on them and put them in an old hive on 3 empty frames, and put some old boxes of honey in the bottom, then closed the entrance all but a bee-space.

In about a week I looked at them and they were building comb, and, to help them out, I put in 5 full frames of capped honey, practically every cell full. I soon discovered that they were gathering pollen every pleasant day, and they are still at it, although we have had one snow-storm and several freezes. The pollen is bright orange in color, and tastes like the pure stuff.

1. Where do they get it?

2. Why do they gather it so late, when not another colony in my yard does?

Last Wednesday (Nov. 22) the bees were coming in loaded, and working hard. It rained hard all day yesterday, but it has cleared up again, and I shall watch them close, and see just how late they will bring it in. They have brood, eggs, and larvæ in all stages. I have a good cellar all ready for my bees, and shall put them in as soon as it seems necessary. Bees here have all been breeding so late that they must be in fine condition for winter, and we look for good results next year. Our surplus was pretty light this year.

IOWA.

ANSWERS.—1. I don't know. More than that, I don't know where my own bees get pollen so late in the season that there is no longer anything in bloom that I know of, but of course something is in bloom, for there's no question as to the loads of pollen. I must modify that statement enough to say that I do know of one thing that has not ceased to bloom from early spring, and is still showing blooms more or less imperfect in December—dandelion. The late pollen carried in by the bees, however, doesn't look exactly like dandelion, yet the lateness of the season may account for a little difference in color.

2. It is not improbable that the combs you gave them contained no pollen. Your other colonies have a good stock of pollen on hand, and feel no great need to hustle for more, but this colony, if it is without pollen, is in a somewhat desperate condition, for without pollen no brood can be reared either fall or spring. Having a fanatic desire for pollen, no wonder they skirmish around lively for it when other colonies show little care for it.

### Making Candy for Winter Feeding

What is the best way to make candy? I have fed syrup, but did not get it done until late, and I am afraid the bees will be short of stores before spring. I winter them in the cellar.

IOWA.

ANSWER.—You will not be far out of the way if you make it just as you would make any candy for the children, only you must be more careful about scorching it, for

although burnt candy doesn't hurt children seriously, it means death to bees if given for winter stores. For every 3 pounds of sugar take a pint of water. When the water is boiling hot, sift in the sugar slowly, stirring it as you sift

it in, so it will not burn on the bottom before it is dissolved. Try it from time to time, and as soon as a little of it dropped into cold water becomes brittle, take off and pour into greased dishes, making cakes 1/4 to 1 inch thick.

# A FRESH HATCH EVERY DAY

By a simple but effective mechanical arrangement and a new application of nature's laws the "CONTINUOUS" HATCHER makes it possible to keep up a continuous hatching of chicks from one machine—a FRESH HATCHEVERY DAY. Removing chicks from machine and replacing them with fresh eggs does not interfere with or retard process of incubation. This is possible with no other incubator. One

## "CONTINUOUS" HATCHER

will hatch as many chicks as several ordinary incubators. Simple, effective, sure. Free catalog tells how. Write for it today. Hatcher Incubator & Mfg. Co. 3127 N. Jefferson Ave. St. Louis, Mo.

Mention Bee Journal when writing.

# Glass Jars for Honey

We can ship by return freight at the following prices:

1/2-lb. Tip-Top Jars—case of 24 doz., \$8.00; 3 cases, \$23.00.

3/4-lb. Tiptop Jars—1 case of 14 doz., for \$5.25; 3 cases for \$15.

1-lb. Tiptop Jars—1 case of 12 doz., for \$5; 3 cases for \$14.

## Second Comb Foundation Mill

We have for sale a 6-inch Second-Hand Comb Foundation Mill. Used scarcely any; good as new. If interested write for price.

50 boxes good 2nd-hand 5-gal. Tin cans, 2 in a box—10 boxes for \$4.00.

When sending for sample jars include 15 cents each to cover postage, etc.

# Reports and Experiences

## Bees in the Cellar

I put my bees into the cellar Oct. 28, but it warmed up again, so I think I made a mistake by putting them in so early. I had 65 colonies, spring count, and got about 2000 pounds of honey from them. We have about a foot of snow here now. CHAS. J. MILLER. Long Prairie, Minn., Dec. 2.

## Results of the Past Season

I have put 63 colonies into winter quarters. They did fairly well the past season, as I got 3500 pounds of honey from them. I run for comb honey only. I don't lose very many colonies in winter, as I winter them on the summer stands packed with chaff cushions, and have a row of evergreen-trees on three sides to protect them from the cold winds, and it works very nicely. EDW. MCCOY. Lima, N. Y., Dec. 8.

## Bees Did Poorly

Bees did not do well here this year. There was no horsemint in the spring, nor broomweed in the fall—nothing but cotton to work on; while this was a fine quality of honey, it amounted to only about 35 pounds per colony, on an average (two-thirds comb). This country is nearly all under cultivation, consequently cotton is our main honey-plant. I came out in the spring with 35 colonies, hived 18 prime swarms, and now have 31. I lost heavily in early summer.

I sold what honey I had to spare for 10 cents per section, and 75 cents per gallon for extracted. One thing is strange to me, if I were to ask \$1.00 a gallon for honey I don't believe I could sell a single gallon; but after I sold what I had to the merchants here, they had no trouble in getting \$1.25 and \$1.50 per gallon for it. F. R. KNAUTH. Granger, Tex., Dec. 4.

## Bee-Keeping in the South

I will try to say something relative to apiculture in the South. I can not understand, except in a meager way, what bee-keepers in the North mean by "wintering bees." I have been told that it is very cold there, that you have snow and ice, and that you have to protect your bees in order that they may live through, and then many are lost, and you have "spring counts." I don't know what this means. I never saw but one snow in my life of any importance, and it was 4 inches deep on a level, and lasted one day. The thermometer showed 12 degrees above zero. Half the winters here the mercury never reaches as low as 12 degrees. I have seen several winters where the mercury never fell below 28 degrees. Three times in my life I have eaten watermelons on Christmas, and once I consumed one in February of the previous year's crop. Isn't this delightful for the apiarist?

Twice in my life I have seen the mercury as low as 2 degrees above zero. I had on so much covering that I could not turn over, and still froze on the edges. I had to cover up my head to save my nose. When I arose the next morning I "smoked" all over like a leaky stove, and my knees quaked like a bone-yard. I thought that I never would get into my pants, and when I did they seemed to be entirely too thin, much more so than usual. This was fearful on me, but never seemed to bother my bees. I beg pardon for the above digression. Here in Texas we leave our hives just as

they were when we last "robbed" them; at least I do. I extract out the last honey the last of October, or by Nov. 15, and return the combs to the hives just the same as if I were expecting another honey-flow. No further attention is paid to the bees except to walk through the yard occasionally to see if none of the covers have blown off.

The bees bring in pollen every month in the year. I have seen them toddling in rapidly on Christmas day, laden with pollen. I never made any investigations to see whether or not they brought in any honey. Cotton and mesquite are my principal honey-bearing plants here in Bell Co., Texas, and from them we get enormous yields, sometimes.

As yet I never have had any disease among my bees except paralysis, and that not serious; and I have operated bees 20 years. From what I can learn, foul brood is practically unknown in the State. It is honey here with practically no labor attached. Last year (1904) I put in 26 days' work, all told, for operating and "robbing," and hired one hand two days, and took off over 9000 pounds of honey. Nearly half this time was consumed in transferring a few colonies and straightening combs and building up weak colonies, the weak ones being those that I had found. We have as many colonies in the spring as we do in the fall—never lose one except through failure of the queen. T. P. ROBINSON. Bartlett, Texas.

## Imbedding Wires in Comb Foundation by Heat

MR. EDITOR:—While thanking Mr. Adrian Getaz for his desire to credit me with the invention of the plan of imbedding wires in foundation by the use of heat, I must disclaim all right to such credit. The credit belongs to one of the sisters, Miss Emma M. Wilson, who first conceived the idea of using a lamp or gasoline stove to heat the wires. Then I think it was The A. I. Root Co. who varied the plan by using electricity. Not every one can conveniently use electricity, but a gasoline stove, oil stove, or a lamp, is easily accessible.

The illustration on page 842, shows an improvement that I suppose is the invention of Mr. Getaz—having the frame supported by wires suspended from above. That's easier than to hold the frame in the hand, and the proper distance from the lamp is thus automatically gauged.

One who has never tried it may think that there is danger of spoiling the foundation by melting it. As a matter of fact the heat of the lamp has very little effect on the wax, and it would work just as well if no direct heat touched the wax. Remember that the wire is under the wax. The wire is one of the very best conductors of heat, wax one of the poorest. So the wire becomes heated immediately, and a slight pressure from above melts its way into the wax before any other part of the wax has found out that any heat is present. C. C. MILLER. Marengo, Ill.

**Farm and Stock** is an illustrated monthly magazine in the interest of COAN BREEDING, Cultivation and Live Stock. # \$4.60 FOR THIS "ECONOMY" BOILER AND FEED COOKER

The "Economy" Feed Cooker is the best built cooker on the market today. It is constructed so as to get the very best results from the smallest amount of fuel possible. The kettle is well and strongly made of the smoothest cast iron, and has a handle on each side so that it can be removed from the casing instantly. Will last a lifetime. The casing, or jacket, is one continuous sheet of cold rolled boiler steel, supported at the bottom by a heavy wrought iron band. This cooker has the largest fire door of any made, and is the strongest, most serviceable feed cooker ever sold at such a price, freight paid. Made in seven sizes to suit every need; furnished with hinged cover, elbow and one length of pipe with damper. We guarantee this cooker for one year. Send money with order today, or write for our large 1,000-page catalogue giving other sizes and thousands of money-saving bargains for the farmer and his family.

If you want to save 10 per cent on everything you buy, we have a plan you should know about; it will save you from \$150 to \$250 a year. Only costs a stamp to find out all about it.

The object of this Society is to save money for its members. For full information let us tell you how we do it. Co-Operative Society of the National Supply Co. Lansing, Michigan Chicago, Illinois

**Bargain in Bee-Supplies**

On account of removing from the city, I wish to sell at once the list of bee-supplies given below. Will sell the lot at less than one-half the present retail prices as shown by Root's catalog. They certainly are a big bargain.

- 7—8-frame hive-stands
- 2—8-frame wood-zinc boards
- 2—Danzenbaker Hive covers
- 3—Reversible hive-bottoms
- 9—10-frame dovetailed supers
- 5—10-frame dovetailed winter cases
- 24—8-frame dovetailed supers
- 9—8-frame dovetailed extracting-supers
- 2—10-frame dovetailed hives
- 3—8-frame dovetailed hives

- 75—M fences
- 1—Danzenbaker bottom and detachable alighting-board
- 10—8-frame hive covers
- 16—Hoffman top-bars
- 800—4x5x1 3/4 sections (new)
- 7—Miller feeders
- 2—8-frame bee-escape hoods
- 25—8-frame hives (new)
- 25—8-frame 2P supers (new)

500 plain sections (new)

\$40 will take the lot if ordered at once.

For further particulars, address, MISS M. A. CALDWELL, Morton Park, Ill.

**FRUIT BOOKS FREE**

## Honey and Beeswax

CHICAGO, Dec. 6.—The trade in best grades of white comb honey has been fair, yet retailers taking only small quantities at a time. This honey brings 14@15c; other grades are difficult to place at from 1@3c per pound less. Extracted selling at 7@7½c per pound for white; amber 6½@7c; dark 5½@6c. Beeswax, when clean and of good color, 30c. R. A. BURNETT & Co.

CINCINNATI, Nov. 24.—The demand for comb honey is relaxing to some extent, owing to the majority of the trade being well supplied. All fears of a comb honey famine have been allayed. We quote fancy white comb honey at 14@16c. Extracted honey is in fair demand. Quote amber at 5½@6½c, according to the package and quality. Fancy white and white clover extracted at 6½@8½c. We are paying 28½c per pound delivered here for choice yellow beeswax.

(We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.)

THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¾c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 28c trade. GRIGGS BROS.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet; white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

PHILADELPHIA, Nov. 20.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get people started, and when they do start, the

ROOT'S GOODS

AT ROOT'S FACTORY PRICES

demand continues for some months. We would say, now is the height of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c. We are producers of honey and do not handle on commission. W. M. A. SELSER.

INDIANAPOLIS, Dec. 15.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 6c. Beeswax, 30@33c. WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, Nov. 17.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the prices high. We quote as follows: Fancy water-white and No. 1 white clover, 14@16c; No. 2, 12@14c. Extracted seems to be more plentiful, and we quote same in barrels, light amber, 5½@5¾c; in cans, ½c more; white clover, 7@8c. Beeswax, 28@30c. C. H. W. WEBER.

NEW YORK, Dec. 6.—The demand for comb honey continues to be fair for all grades. Prices practically remain the same. We quote fancy white at 14@15c; No. 1 at 13c; No. 2 at 12c, and buckwheat at 10c per pound. Extracted honey is in good demand, especially California honey with large supplies. We quote white at 6½@7c; light amber at 6c; buckwheat, extracted, at 5½@6c per pound; Southern at 50@60c per gallon. Beeswax firm and steady at 29@30c per pound. HILDRETH & SEGELKEN.

SAN FRANCISCO, Dec. 6.—White comb, 1-lb. sections, 9@10 cents; amber, 7@8c. Extracted, waterwhite, 4½@5c; white, 4½@4¾c; light amber, 4@4½ cents; amber, 3¾@4c; dark amber, 3@3¾c. Beeswax, good to choice, light, 26@27c; dark, 24@25c.

Honey is being offered more freely at appearing quotations than for some weeks past, and it now appears that growers are awakening to the fact that they can not force prices any higher by holding their honey. At these figures there should be a good profit to the bee-men and a small margin to jobbers. Hawaiian extracted ambrs is selling at 2½ cents, at primary points, but it is not likely that California apiarists have anything to fear from competition, as their crop is all marketed in England.

# A Complete Establishment

We say that we can supply **EVERYTHING** for the bee-keeper. It is a **LITERAL** fact. Anything from bees to books, or hives to honey-boards. The completeness of our factory is not realized by most bee-keepers. Below we give the main Departments of our business. Read them over and then we are sure you will understand when we say **EVERYTHING** for the bee-keeper, we mean it.

## WOOD-WORKING DEPT.

This department occupies the 3 floors of the main building of the factory. It is equipped from top to bottom with the best machinery that brains can invent and money buy. Every detail in hive-making has been carefully figured out. Immense sheds covering acres of ground protect the lumber piles so that shrinkage is reduced to almost nothing. This accounts for the accurate fitting and clearness of stock of Root's wooden wares. The entire factory, light, and machinery power, is furnished by a great, 400 horse-power engine, and a 100 horse-power dynamo.

## WAX-WORKING DEPT.

We are leaders in buying wax and selling the famous Weed Process Foundation. Our Wax Department is furnished with tanks for refining, machines for sheeting, all sizes of mills, automatic papering machines, etc. Over 150,000 pounds of foundation is made, boxed and shipped all over the world every year.

## TIN SHOP

Here are made the thousands of smokers that bear the Root trade-mark of excellence. Here are made the cans for extractors and uncapping-cans. Machines for cutting honey-boards; presses for stamping tin and iron into various forms.

## MACHINE SHOP

Equipped with the most expensive machinery and manned by skillful employees. We make our own metal parts and much machinery for other factories. Powerful iron presses, iron cutting and drilling machines are in evidence everywhere.

## APIARIES

We have scattered in and around Medina 5 apiaries devoted exclusively to bee and queen rearing, supplemented by 5 more in New York, Pennsylvania and Cuba, and we control the product of several other large queen-breeding establishments. Our queens are bred with scientific care. We test every device we make before it is introduced to the public.

## SHIPPING DEPT.

Two railroads run their cars to our doors. From a dozen to 20 men are kept busy loading and packing the 175 to 200 carloads we ship every year, besides the thousands of less than carload shipments. Eight express trains a day. With large warehouse packed full and a great factory it is a little wonder that Roots have gained a reputation for promptness in filling orders for the hundreds of things in their catalog.

## PRINTING DEPT.

Two large cylinder presses; 3 platen presses; paper folder, trimming, cutting and stitching machines; skilled typesetters, printers, book-binders—all help to turn out semi-monthly the large issues of Gleanings in Bee Culture; the five to ten thousand A B C books every year; together with our 500,000 supply catalogs, not speaking of the numerous other catalogs, booklets, labels and all varieties of printing. Two carloads of paper required for our annual catalog, a half carload for our Christmas Gleanings alone.

## BRANCHES AND AGENTS

Eight branches with large stock in all great centers. Numerous jobbing agencies and hundreds of smaller agents place our goods at your door at factory prices, with freight charges and time taken in shipment reduced to the lowest possible point. We wonder if the bee-keeper ever thinks of the many hands and brains that plan for him? Of the hundreds of thousands of dollars, and the hours consumed to make and deliver his supplies?

## OFFICE

The office is the brain of the factory. Here are the executive, editorial, advertising and book-keeping heads. Here the thousands of details are cared for. Root's office is as modern as you can find anywhere. Six typewriters are kept busy; adding machine, copying machine, vertical letter files, card indexes, etc.—everything to care for the half million dollars worth of business we do yearly. We have every interest of the bee-keeper at heart. We are working for your good, for your prosperity means ours.

The Compliments of the Season to Our Friends All Over World.

Our Catalog for 1906 is ready. Write for a copy if you want it now.

THE A. I. ROOT COMPANY, Medina, Ohio

ESTABLISHED IN 1861 THE AMERICAN OLDEST BEE-PAPER IN AMERICA

# BEE JOURNAL

(Entered at the Post-Office at Chicago as Second-Class Mail-Matter)

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor

CHICAGO, ILL., DECEMBER 28, 1905

Vol XLV—No. 52

## Editorial Notes and Comments

### A Happy New Year

to every reader of the American Bee Journal—throughout all of 1906—is our wish.

### The Annual Index in January

Owing to the meetings of the National Bee-Keepers' Association and the Chicago-Northwestern Bee-Keepers' Association last week in Chicago, it was impossible for us to get out the usual annual index for 1905 that we have published for years in the last number of the American Bee Journal for the year. We will, however, put it in some number for January, in such form that it can be removed and placed back with this number for binding purposes.

### Massachusetts People as Honey-Eaters

Burton N. Gates says in the American Bee-Keeper, "Honey consumed in Massachusetts is one-fourth State product," and 200 tons are imported from other States. That would make 66 tons produced in the State, and 266 tons in all consumed, or some 530,000 pounds. That looks like a good deal of honey, but when it is divided up among the 2,805,000 inhabitants, it figures out only about 3 ounces as the yearly ration for each man, woman, and child in the State. Surely, there can not be very much stomach-ache in Massachusetts as the result of over-eating of honey.

### Size of Winter Hive-Entrances

A wide gulf exists between views entertained in Ohio and in Canada. The editor of Gleanings says:

"An entrance 4 inches wide and  $\frac{1}{4}$ -inch deep we have found to be quite sufficient. This will usually keep reasonably clear. I should prefer an entrance only one inch wide, but there is a liability that the bees will clog it up."

In the Canadian Bee Journal, page 219, "York County Bee-Keeper" says that after experimenting with entrances of different sizes, he is convinced thoroughly that for his locality a fair-sized entrance is necessary for best results, and this winter nearly every one of his colonies will go into winter quarters with entrances equivalent to 5 square

inches. The editor thinks small winter entrances are regular death-traps for strong colonies, having made experiments with them that he has no desire to repeat, and says he has had best results with full-width entrances  $12 \times \frac{3}{8}$ .

One would think that if there is any difference, smaller entrances would be needed in Canada than Ohio, and when such a wide difference of views exists as to demand an entrance  $4\frac{1}{2}$  or more times as large in the colder country, one can but wish that the Canucks and the Buckeyes would fight it out to a finish, so that one might know what is the best practice in this really important matter.

### Interstate Pure Food Law

Of the 27,000 words of President Roosevelt's message, one paragraph is of special interest to bee-keepers. It is this:

"I recommend that a law be enacted to regulate interstate commerce in misbranded and adulterated foods, drinks and drugs. Such a law would protect legitimate manufacture and commerce, and would tend to secure the health and welfare of the consuming public. Traffic in foodstuffs which have been debased or adulterated so as to injure health or to deceive purchasers, should be forbidden."

Whether any action will be taken upon the President's recommendation remains to be seen. There is a big lot of money invested in businesses that a law of that kind would not help, and there is the conservative Senate on the watch against doing anything too rash in the interests of the common people. But we will wait and see, and in any event President Roosevelt deserves thanks for doing his part in this particular matter.

### Getting Rid of Ants

We often receive requests for directions for getting rid of ants. Here is one taken from The Garden Magazine:

A few years ago the ants took possession of my yard and built mounds or "ant-hills" all over it. I tried all kinds of remedies, among them Paris-green, London purple, corrosive sublimate, white hellebore, borax, tobacco, kerosene (or, rather, gasoline) and chloroform. With exception of the last two, all were used as solutions or mixtures in water. The solutions were gradually increased in strength till they killed plant-life with which they came in contact—but they didn't kill the ants. Chloroform gave them a brief vacation only, while gasoline killed not only the ants, but all the plants near by whose roots were affected in the least degree, seemingly, by the oil.

Finally, I found a cure for the pest in a mixture of Persian insect powder in water— $\frac{1}{4}$  pound in a gallon of water. The mixture does not injure plants, though one thorough application destroys the ant-nest. Use pure powder, for much of the powder sold is badly adulterated, and hence of

little value. Use freshly-made powder, for unless kept dry and in air-tight containers after being made, it loses gradually its insecticidal powers.

Put a quarter of a pound of good powder into a watering can (or other vessel with spout, from which a small stream can be poured) and add a little water; stir until powder is thoroughly wet, and then add the balance of the gallon of water.

Keep stirring the mixture while using, and pour the mixture slowly into the tunnels of the ant-hill till they are all filled. In my experience one application destroys the colony.  
H. S. JEWETT, M. D.

We suppose the Persian insect powder mentioned can be bought at any good drug-store.

#### A New Wax-Extractor

Arthur C. Miller, who is so often a disturber of existing opinions, believes that there is an objection to the wax-press, because the pressure, while pressing out the wax, at the same time has a tendency to hold it where it is. So he has invented a wax-extractor that works on the principle of keeping the mass as loose as possible, stirring it up repeatedly in the hot water. The following description of his extractor is given by him in the American Bee-Keeper, a patent being applied for:

"It consists of two cans, one within the other. The outer can, shown in the cut, has a conical cover with an outlet pipe for the wax, a faucet for the withdrawal of water, and an inlet for water. Through the top of the conical cover passes the shaft which moves the inner mechanism. The inner can has a perforated bottom and top, the latter being removable. Within this can and attached to it are parts of the grinding apparatus, and attached to the shaft which passes through the middle of the can are corresponding parts.

"The method of operation is simple in the extreme. After removing both covers hot water is poured in until the can is one-half to two-thirds full. Then comb is put in until the mass is up to the top of the can, then the covers are replaced, hot water added through the funnel on the cover, and as soon as the fluids reach the apex of the cone, the wax begins to flow out. The crank is then turned for a few minutes, more water is added, and more wax escapes. Where the water appliances are convenient, a small but steady stream of hot water may be allowed to flow in, and the wax will flow as steadily out. When all of the wax has escaped, the faucet is opened, some of the water drawn off, covers removed, the inner can (which contains all the refuse) is taken out, emptied, and returned to its place, and the process repeated. It will be observed that it is thus necessary to use but a little fresh water with each change. Furthermore, it is not necessary to have the extractor on a stove. When it is used in the open air or in a cool or unheated room, it is advantageous to have the extractor protected with a jacket or wrapping of cloth or paper to conserve the heat."

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

## Miscellaneous News & Items

**Dadant Methods of Honey-Production.**—Beginning with the first number of the American Bee Journal in January (next week), Mr. C. P. Dadant will commence a series of articles, giving in minutest detail the very successful methods of honey-production practiced by himself and his late lamented father for so many years. These articles will be illustrated, and will be worth dollars and dollars to the readers of the American Bee Journal who wish to make money in bee-keeping.

Be sure to renew your subscription promptly (if not already renewed for 1906), so as not to miss any of Mr. Dadant's valuable articles.

**Apiary and Home of R. F. Wutzke.**—The following was sent us by Mr. Wutzke:

Owing to the sudden changes of weather the past season, my bees could take but little advantage of the heaviest honey-flow.

At the beginning of last spring I had only 2 colonies. My intention being to increase my apiary, I immediately purchased 25 3-frame nuclei, each of which became a strong colony.

I have just counted my colonies, and found I have 65, from which I obtained 410 pounds of honey. I have to-day (Nov. 8) just completed a new landscape containing ten times the area of my present apiary, which I expect to occupy next spring.  
R. F. WUTZKE.

**The Apiary of J. M. Buchanan.**—When sending the picture shown on the first page, Mr. Buchanan wrote thus:

I am mailing you a photograph of my apiary. I have about 30 colonies of Italian bees, and a few Caucasians, and shall give the latter a thorough test next season.

Bees winter here on the summer stands with no protection. I am running for comb honey exclusively, and sell all I can produce at 15 cents per section.

J. M. BUCHANAN.

**The Bee as an Emblem.**—Mr. C. G. Chevalier, of Maryland, wrote us as follows recently:

GEORGE W. YORK & Co.—The clipping herewith is from the Philadelphia Press, concerning the use of the bee as an emblem by Emperor Napoleon. Many of your readers will no doubt be interested in reading the translation of Book IV of Virgil's Georgics, written in the year 31, B. C. The subject of the fourth book is the management of bees; their habits, economy, polity, and government are described with the utmost fidelity, and with all the charm of poetry.

Virgil first describes a beautiful location for the apiary, then follows with advice as to the kind of hive most desirable. After giving some information regarding the treatment of swarms, the present-day reader will be astonished to learn that he instructs one to clip the wings of the "kings" (which we now know to be queens).

While we know that many of Virgil's ideas are erroneous, as illustrated by the above paragraph, as well as by his statement that they cull their progeny with their mouths from leaves and fragrant herbs, still the whole article is full of good advice even to the modern bee-keeper, and the reading of this chapter will surely be a pleasure to any one interested in apiculture.  
Yours truly,  
C. G. CHEVALIER.

The clipping referred to by Mr. Chevalier is as follows, being a reply to the question, "Can you give the reason for Napoleon using the bee as an emblem?" sent to the Press by one of its readers:

"When it was decided in 1804 that the First Consul should assume the title of Emperor, the dignity to be hereditary, Napoleon had elaborate searches made into the stately ceremonials of royalty. Much pains were taken to ascer-

tain the court etiquette that prevailed under the ancient regime. It was already known that the original symbol or insignia of royalty in France was the bee. This preceded the fleur-de-lys. In fact, many heraldic authorities held the opinion that the fleur-de-lys was only a conventionalized form of the bee with outspread wings. In adopting an imperial emblem, Napoleon went back beyond the fleur-de-lys of the monarchy and restored the bee for the device of the Empire."

**National Legislation to Suppress Bees.**—Certain people of a certain Iowa town seem to have had a hard time to get their names in the newspapers, so they hit upon the plan to petition Congress to prohibit the flight of bees in their little burg of Defiance. The Chicago Record-Herald of Dec. 10, contained the following account of the efforts of certain "otherwise" people to wipe out bee-keeping:

The people of Defiance, Iowa, have petitioned their Congressman to draft a Bill, or to use his influence in the promulgating of legislation to rid the country of the common honey-bees running at large. Congressman Smith has been very much amused at the unique request, which came to him in the form of a petition signed by 125 voters, residents and citizens of the village. The petition reads as follows:

"We, the undersigned citizens and residents of Defiance, Iowa, and vicinity, realizing the great damage done each year by reason of the common honey-bee roaming about and running at large in our cities and towns, by their continual biting and sipping of the precious fruits and beautiful flowers, to say nothing of their constant buzzing about one's ears from early morn till late at night, and their frequent stinging, do hereby earnestly and humbly pray you, as our representative, to prepare and introduce, and use your best efforts to have passed, a very stringent law forever prohibiting the running at large and roaming about our public streets, in our cities and towns, and especially the town of Defiance, all honey-bees of whatever variety or species. By so doing you will not only be rendering a great public service, but will place us under great obligations to you."

The much-bothered and overworked Congressman replied that he knew of no part of the national federal Constitution delegating the power upon Congress for the enactment of such legislation, and assured his constituents that if he ever found any clause of the Constitution of the United States authorizing such a law as that petitioned for, he would first insist upon the power being exercised by prohibiting house-flies from running at large on his premises. He also added that in case the State of Iowa first drafted and passed such a law he would rest assured that he would feel safe to visit Shelby County without being stung.

We wish here to thank several of our readers who kindly sent us clippings of the above item in various forms. Of course, it is all very amusing to bee-keepers, and doubtless served its purpose for the Defiance population.

### Selling Honey Direct to Consumers

BY J. L. STRONG.

IN 1869 I took the first honey with the extractor. This I thought would be appreciated by the consumer, but, to my surprise, I could not induce any of my neighbors to try even a pound of it. So I put it in Mason fruit-jars and left it with my grocer, with the same result, until about Christmas, when I took them home. This was very discouraging, as I only had two jars to sell, and from that time to this there has been very little comb-honey used on our table, while the extracted has been in demand nearly every meal.

I now have a trade that enables me to sell my entire crop to the consumer. I am an economical man, and do

not sell 10 cents' worth in a 5-cent bottle, to be thrown away as soon as empty; too much work for the producer, and too much waste for the consumer. It is all right for the city trade, as there are a few of the wealthy class who care but little for a few cents cost, if the article pleases the eye. This class of consumers buy but little honey.

I prefer to put up honey in pails—something that will be of value after the honey is used. These pails are of different sizes, holding from 5 to 25 pounds, and cost about one cent per pound of their capacity. I give the customer the privilege of returning the pail if he wishes to do so, in case he lives near. If at a distance, and he does not bring anything to put the honey in, then I quote price of pail and honey, and give him first price of pail when returned.

Now as to how I have worked up a trade from nothing to the entire crop from 200 colonies:

I often meet one who asks, "How are the bees doing?" I tell him in as few words as possible. I also tell him what I have to sell, and quote prices, and if I have time I give a short talk on the values of honey as a food and a medicine. In this way I often interest several and take orders for several dollars' worth of honey from different ones.

I also have a "honey list"; this consists of the names and addresses of those who have bought honey, or will be likely to do so in the future. Then when I have honey to sell I quote prices on a postal card to each name on the list, and tell how it is put up. For this trade I use 60-pound square cans, screw top, while the honey is liquid; and after it has candied, lard cans, with loose top, do better, because it can be easily crated for shipment, and when received the cover can be taken off and the honey dug out without cutting the can or melting the honey. The second-hand lard can costs 16-2-3 cents each, and holds 75 pounds net of honey.

The prices at which I have sold extracted honey have been from 7 to 15 cents a pound; the latter when we have had a short crop, to save some for medicine, as they expect me to have honey at all times, and they have not been disappointed.

The past season I have sold at 8-1-3 cents, while I was extracting, but now at 10 cents; and as I have but 200 pounds left, I will sell the balance at 12½ cents.

There is but little sale for chunk honey in our market, as the broken comb is objectionable. We can sell section honey if nice, but only in small quantities, and not at enough higher than extracted to pay the difference in cost of production.

I have sold six 60-pound cans in one order this season, probably to be divided among his neighbors.

My crop this season was 2,000 pounds of extracted, and 350 pounds of comb honey—all gathered in the month of June from white clover, and it was fine.

Clarinda, Iowa.

### A Consideration of Nectar and Honey

BY ADRIAN GETAZ.

THE nectar gathered by the bees on the flowers, and the fully ripe honey, are really two different things.

The nectar contains about three-fourths of its weight of water, the remainder being sugars. Of these, the largest part is cane-sugar—the same kind as constitutes the white granulated sugar bought in the stores. The others are like those found in the fruits and the corn syrup—they are usually called inverted sugars. There is also an excessively minute quantity of essential oils which give the different kinds of honey their peculiar taste, color, and, perhaps to a slight extent, odor.

On the other hand, the ripe honey contains only one-fourth water, or about that proportion. And nearly all the sugar is now inverted. A small proportion of mineral matter, probably due to the pollen, is also found. Some formic acid has also been added by the bees. To that acid is due the peculiar taste common to all honeys, and also its keeping qualities.

During the transformation a considerable change of taste or flavor has taken place. The nectar has only an insipid, indifferent taste. An eminent writer calls it a "silly taste." The taste of the honey need not to be described here, as all the readers of this paper know it.

## THE TRANSFORMATION.

There is no doubt that a part of the water contained in the nectar is separated and rejected by the bees at once, during the gathering and the time of going back to the hive. Some analyses of the nectar gathered during the day have shown such a large loss of water that there is no doubt that a part of it must have disappeared before reaching the hive. A few years ago a French apiculturist undertook to feed his bees out-of-doors. He made a syrup of sugar and water in about the same proportions as found in the nectar of the flowers, and placed the feeder at a distance of about a hundred yards from the hives. The ground and the grass over which the bees were flying was wet all the time with the water ejected by the bees. That water was tasteless, showing that a complete separation had taken place. A report of the experiment is found in the American Bee-Beeper for August, 1905, page 162. In the early editions of the "A B C of Bee Culture," A. I. Root states that when the bees were gathering nectar heavily from a patch of honey-plants near by, he could see, in the morning, by placing himself on the path they were following, the ejected water as a kind of mist from their bodies. Other cases have been observed.

During the following night the nectar is handled by the bees; that is, they take it in their honey-sacs, and out and in again, and finally deposit it in the cells. During the process more water is eliminated, and formic acid and probably other substances contained in the bees' saliva are added. The honey is not ripe yet. Gradual changes occur slowly under the influence of the heat of the hive, and after some weeks, more or less, the nectar has become honey. Its composition has changed completely; it now contains only about one-fourth water, and nearly all the sugar has been inverted. The consistency has become like a syrup, while the original nectar was nearly as limpid as water. The taste has become rich, sweet, and delightful.

## THE HONEY-FLOW.

Important questions are, What are the atmospheric conditions which produce a honey-flow? What may be the influence of the nature of the ground on the honey-plants? or what other cause may exist?

There is no doubt that the richer the ground, and the better adapted to the honey-producing plants, the more nectar will be produced. The European writers say that more nectar is produced on limestone ground than on others, excepting a few plants that do not prosper on limestone land.

The temperature has a marked effect. Buckwheat, for instance, will not yield nectar unless the nights are cool. On the other hand, the tropical plants require a very high temperature. Each plant seems to do the best at a certain temperature.

The most important condition for a heavy honey-flow is an abundant moisture in the ground. The plants are constantly pumping water from the ground, most of it having been absorbed through the leaves, some helping to form the leaves, branches, fruits, etc., and the nectar. When the supply of water begins to run short, the growth of the plant is retarded, and soon the flow of nectar ceases. Later the leaves begin to wilt during the day, but recover during the night. If the drouth continues they fail to recover, and finally the plant may die entirely, or at least the portion above the ground.

When the effects of the drouth begin, the flow of nectar occurs in the morning only, some time before ceasing entirely. During the night no absorption of moisture takes place, but the water contained in the ground continues to ascend. This, helped by what the dews furnish, enables the plants to produce nectar for a few hours in the morning. I have often seen the hives almost empty of bees in the early part of the day and then at perhaps 9 or 10 o'clock, or later, all the bees come back and hang at the entrances in big bunches until night.

Some of the plants blossom only in the morning, and their blossoms last in some cases only a few hours. Such, of course, necessarily yield only in the morning.

A cause of mistake is that the bees work in preference on the flowers or other sources of sweet substances that yield the most. Very often we read that such or such plant yields nectar in a certain locality but not in another. The probability is, at least in most cases, that there was some other plant in one of the localities that yielded more than the one considered.

Some plants require much less moisture than some others to grow and produce nectar. Those with long roots will resist the drouth much longer than those with short roots, being able to reach whatever moisture may remain deep in the ground after the surface has already dried up completely. The trees will, of course, resist the longest, and depend chiefly on the amount of water stored up deep in the ground during the winter, while the plants, especially those with short roots, depend on the summer rainfall.

## HONEY-DEW.

All the honey is not gathered from the flowers. Some of it comes from the juices of broken fruits; some from the cider mills; some from the watermelon rinds thrown away; some from the confectionery shops. Any sweet, anything containing some sugar, inverted or non-inverted, is gathered by the busy bees.

A large portion is honey-dew. There are different kinds of honey-dew. Some plants have, besides the nectaries in the flowers, some in other places, usually at the base of the stems of the leaves. These extra-nectaries produce a real nectar like that of the flowers. The pear-trees, cotton, and cowpeas, are the most conspicuous examples.

The real honey-dew is seen in drops on the leaves of several kinds of trees, oaks, ashes, hickories, etc. Not only the leaves but the ground around and under the trees is sometimes completely bespattered with it.

It might be thought at first that the honey-dew is secreted by the leaves themselves, but it is on the upper surface only, and in drops here and there. If it was a secretion it would be all over the leaves, since their structure is the same all over. Again, if it was a secretion it would reappear after the drop is wiped off, but it doesn't, showing, therefore, that the drops have fallen on them.

If we look at the under side of the leaves we will see here and there some small green insects of the kinds known as plant-lice or aphides. If now we climb the trees we will find them by thousands on the young twigs and new leaves about the top of the tree—enough of them to account for all the honey-dew-produced. At least that is the report of all who have done any climbing.

It is not necessary to climb trees to see how the honey-dew is produced. Plant-lice are found on many plants and bushes. Those on the rose-bushes are the easiest to observe. With a cheap magnifying glass they can easily be examined. They suck the sap of the leaves and twigs with a tongue similar to that of the bees. This sap constitutes their food, and what remains is ejected through two tubes, situated at the other end of the body. The quantity produced is astonishing. Bees of all sorts, wasps and ants are seen helping themselves even to the extent of sucking it from the ejecting-tubes.

Occasionally, some kinds of scales and other insects are numerous enough to produce some kind of honey-dew. This is usually of the worst quality possible.

The regular honey-dew from plant-lice is, in my locality, at least, of tolerably fair taste. Its color is like a light amber honey to which some ink might have been added. It is much darker in some years than others. In mountainous districts we get some honey-dew from the firs and spruces. This is very white and has a strong, resinous taste. This resinous flavor disappears in the course of four or five months, in the sealed comb honey as well as in the extracted.

Honey-dew contains only inverted sugars.

Knoxville, Tenn.

## Work in the Apiary for January

BY C. P. DADANT.

THIS is the month when there is the least work in the apiary. Our attention consists only in trying to keep the snow from the alighting-board. Yet in the very coldest weather we allow it to remain there, even if it obstructs the entrance, because it is a warming blanket which intercepts the wind and permits the air to sift through. I used to think that hives that were snowed under were in danger of smothering. This opinion was changed very materially when I visited the apiary of a box-hive bee-keeper some 25 years ago and found that his hives were entirely lost in the snow. The location of

some of them was indicated only by a slight elevation—a sort of mound of snow. These hives were lying close to the ground and the spot was well sheltered, so that the snow had gathered there. It was a warm day and I suggested to the owner that it might be well to give the bees some air. We did, and I believe we did them more harm than good, for many of the bees had a flight and were lost. I do not think that they needed it. Their hive was so well protected that they did not feel the changes of temperature as they must have felt them after we liberated them.

In our movable-frame hives, which are up from the ground and have more or less upwards ventilation through fissures in the cover, I believe that there is not the least danger whatever of having the bees smothered by leaving them buried in the snow, or by doing as one of our oldest bee-keepers does—covering them up with snow, when it is plentiful and the weather down to the zero mark.

He holds that the more they are sheltered by the snow, the better they fare, and this is very probably correct as long as the cold days continue.

But there is a reverse to this. It is when the snow melts and changes to ice. If the hive has no upward ventilation or fissures through which air may enter, the entrance and lower joints may be frozen entirely fast, when the question of smothering would be a matter of only a few days.

Again, if warm weather comes and the snow melts off, it becomes necessary for the bees to take a flight. They think so, at least, for they begin to worry and seek the entrance. It is at this time that the cleaning off of the snow from the entrance proves useful. If the hive is sheltered with snow from all sides, but the alighting-board is clean, the bees are sure to find a dry spot when they come out.

But why not keep them confined when the snow is on the ground? Well, you may try it if you choose, but the trials we have made at confining bees on warm days have always been disastrous. They fret and worry, and if they are loaded with feces they are often compelled to discharge them within the hive. We have concluded that it was a mistake to confine the bees, even in snow-time, if it is warm enough for them to fly. Yet, if they have not been long confined, and the snow is deep, and the weather rather doubtful for a flight, they may be induced to remain quiet by sheltering the hive from the rays of the sun for the few warm hours. A very good plan, if you use movable roofs over the top of the hives (and this should be done), is to turn the roof on edge, in front of each hive for the time of their flight. This keeps the sun's rays off and they will not worry. But if it is warm enough for them to fly, and they insist on coming out, then turn this roof completely over, on the snow, in front of the alighting-board, and you will have a good dry spot on which they may alight without settling down on the snow, for the bee that alights on the snow in January, unless it be an exceptional day, is seldom able to regain its hive.

The prevention of mice is important. When the entrances have been worn to a sufficient size to admit of mice, they may be reduced with a metal strip that will cut the height of the entrance to about one-fourth inch.

The colonies in the cellar will keep quiet this month. An occasional glance at them will indicate their needs. Darkness, sufficient air, and an even temperature of about 40 degrees, will insure absolute safety. It is pleasant, when the north wind is roaring during a cold January night, to go down into the cellar and listen to the gentle murmur of the bees, which will delight our ears again next May by their hum, while they fly about the blossoms and help the fertilization of our fruits. Hamilton, Ill.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

## Convention Proceedings

### Report of the Worcester Co., Mass., Conventions

The Worcester County Bee-Keepers' Association began their winter series of meetings Nov. 11, 1905. The first meeting of the season was of an informal nature, reports from different bee-keepers in this vicinity being heard.

The season was not, as a whole, a very profitable one. The average amount of honey was about 30 pounds; 589 pounds was the largest amount reported, and that from a small apiary. One of our heaviest bee-keepers works almost entirely for increase, and does not aim to produce much honey.

Only one bee-keeper reported any diseased brood, and that from a district that has had trouble before.

The matter of holding an aparian exhibition in the near future was brought up and left in the hands of a special committee.

James Wheeler was announced as a future speaker, likewise Arthur C. Miller, of Rhode Island, who has spoken to us several times before.

These topics were suggested as suitable ones for future meetings:

"Honey, its composition, uses, and value as food," "History of bee-keeping from Greek and Roman times up to the present date," "History and methods of artificial increase," "History and methods of queen-breeding," "Anatomy and structure of the bee and relations to the colony," "Bee tongue, its lengths and parts, and relation to red clover," and "Methods and difficulty of wintering."

The following is something further concerning the meeting of Nov. 11, 1905:

There is money in the production of wax, for pure, unadulterated beeswax is in great demand, and jewelers and people in many other lines cannot get along without it, and will pay from 50 to 75 cents a pound for it gladly. Not nearly the amount of beeswax consumed in this country is supplied by bee-keepers of the United States, and much of it comes from Mexico and the West Indies.

Much interest is being manifested by people of the county in the keeping of bees and the production of wax, and at the close of yesterday afternoon's meeting five new members were admitted to the Association. These were Fred Rich, S. H. Cheney, E. C. Putnam, C. H. Harris, and Hon. Ledyard Bill.

The meeting was called to order by Pres. F. H. Drake, of East Brookfield. It was well attended, between 40 and 50 members and guests being present. Charles R. Russell was the speaker of the afternoon, and talked on

#### WAX, ITS DISCOVERY, FORMATION, USES, ADULTERATIONS, AND PROPER WAYS OF EXTRACTING.

After his talk, Mr. Russell and Arthur C. Miller showed how wax is extracted. Mr. Miller used a machine of his own invention, while the speaker used the Ferris wax extractor.

The lecturer also showed how pure wax is tested in benzine and alcohol and water, having several jars and bottles on exhibition.

To make his statements regarding the great market for wax even more emphatic, Mr. Russell read a letter which he received from E. F. Phillips, acting in charge of agriculture in the United States Department of Agriculture at Washington. This was in answer to a letter written by Mr. Russell, and was as follows:

"I am unable to give you an estimate of the amount of beeswax produced in the United States annually, because I have no information on which to base the estimate. You may be interested, however, in knowing that in 1903 the importation into this country amounted to 488,576 pounds, valued at \$127,220. Wax was imported to a large extent from Mexico and the West Indies, and the importations for 10 years back show a very decided increase.

I am sorry that I can give you no information as to the domestic production of wax.

"You may be interested in some things which were found by the bureau of chemistry of this department. Samples of comb foundation were examined from all over the United States and no adulterations were found. However, three samples were received from Canada which were not pure and, it is claimed, that a considerable portion of the comb foundation used in Europe contains paraffin or cerasin.

"Not long ago I was talking to the chemist who has charge of the beeswax analysis in the bureau of chemistry, and he said it was a very difficult matter to be perfectly sure of adulteration in wax. He showed me a cake which had every appearance of being pure beeswax and of a very decided odor, which is so characteristic. He said that an analysis of this showed that it was pure cerasin, and that the odor had been given to it by the use of some chemical. It contained absolutely no beeswax, but had a melting point exactly the same as that of pure wax. All manner of substances are used in adulteration, including not only paraffin, cerasin, and similar waxes, but also such things as starch.

"It is then certainly to the interest of bee-keepers to watch this adulteration very carefully and to run down all cases of adulteration that can be found, and thus increase the value of pure wax, which now brings such a low price."

It was announced that the committee appointed to consider the apiarian exhibition had decided that next fall would be the best time for such a fair. It will take as long as that to complete all plans for such an exhibition.

Mr. Russell said in part: "I have often wondered why someone did not volunteer to give us a little talk on wax, and by wax I mean beeswax, not the vegetable production.

"Wax, you know, stands second to honey among bee-products. Before I am through talking I am going to try to show: First, what wax really is, when and by whom discovered, how formed; second, mode of extraction; third, uses of wax; fourth, value of wax, amount produced, tests for purity, and the like.

"First, what is wax? All bee-keepers and others perhaps have watched the bees entering the hives with their hind legs covered with large masses of colored matter which we have learned from various sources was pollen. We have also noticed the different colors produced, most generally some shade of yellow, or orange, although crimson, green, or even black, may be seen. This pollen was considered by the ancients to be wax and was called by Reamur, a French natural philosopher of the early part of the thirteenth century, 'crude wax.'

"This opinion was overthrown by the discovery of a French peasant in 1768 that the substance used in the construction of a comb emanated from between the rings of the abdomen. Even at this early date there were bee-keepers' associations, and I found that this peasant was a member of one of these societies. The real discoverer of wax, however, is disputed.

"In 1769 Francois Huber, a blind bee-keeper of France, assisted by a faithful servant, repeated the discovery of the French peasant, and experimented in a manner that has made his name famous.

"On the abdomen of the bee there are 12 plates, 6 on a side. I will quote from authority: "If the abdomen be elongated there will appear extremely smooth and delicate expansions upon which plates of greater or less size and thickness may be discovered. These pale, yellow, tender discs are 8 in number, 4 on a side. The contour of the membranes determines the form of the wax scales which are molded upon their surface as the secretion passed from the glands beneath."

"We have not come to the point where we are ready to answer that important question, 'What is wax?' Cheshire says: "Wax, like every secretion, vegetable or mineral, is at first a liquid. It is derived from the blood by cell-action, and then transuding the structureless membranes, assumes the solid form of the scale." He further says: "Wax is not chemically a fat, yet it is nearly allied to the fat in atomic constitutions."

"Langstroth says: "Wax is a natural secretion which is produced by bees, as cattle produce fat by eating. The first condition indispensable for bees to produce wax is to have the stomach well filled." Nearly all authorities tell us that wax is formed after gorging or overeating.

"It takes about 24 hours for a bee's food to become transformed into wax. It is more noticeable in young

bees than old, working on the general supposition that it is more difficult to fatten an old animal than a young one.

"These wax scales are so small and light that 100 of them hardly weigh as much as a kernel of wheat. That these scales also differ from the wax of the comb has been readily shown. The scales are carried to the mouth of the bee and there masticated with a salivary secretion, imparting to it the quality of ductility.

"Two experimenters have stated that bees use about 7 pounds of honey to produce one pound of wax. You can readily see, therefore, that feeding for wax is not profitable.

"Under my second head, 'Mode of extracting wax,' I can speak more from my own observations and experiments. There are many ways and devices for extracting, but the prime factor of them all is heat. The solar extractor, I thought at one time, was the best thing that could be invented, but when a spare day came to me, and that day was cloudy, and I had a lot of old comb on hand, I concluded I must try something else. My solar extractor was made similar to all others. It is not successful at all times in this climate, for the sun's rays are not hot enough excepting for a comparatively short time. There is another serious objection to the solar extractor. You cannot use in it old comb filled with cocoons.

"The Ferris extractor has been a great help to me, although the first time I used it I ran against two or three snags. The Ferris consists of an outside boiler, an inside basket and a screw press. One thing I like about the extractor, you can put in a whole frame and clean it off in a short time."

Mr. Russell stated that his principal objection to the Ferris extractor was that one must take time if he wanted to get the wax from the center. The invention of a new extractor by Mr. Miller does away with that, and Mr. Miller demonstrated how it worked.

Mr. Russell said further:

"Under my third head I am going to mention briefly the principal uses of wax. Wax enters largely into the make-up of candles. Several authorities state that the Roman Catholic church prefers candles made of pure beeswax, while one authority says: 'It is prescribed to priests to use exclusively wax produced by bees.'

"The women are very familiar with waxed threads, but there are so many adulterated pieces sold that they wonder sometimes what they are using. Floors are polished with waxine or something that contains wax. Wax also enters into ointments. Sculptors and painters have a use for wax.

"Bee-keepers, of course, are at sea unless they have wax for foundation starters for frames or sections. Nearly every farmer uses wax; that is, if they do any grafting at all. In many cabinet shops, in shops where wooden patterns are made, pure wax is used to fill up cracks, cover up screw-heads and preferred everywhere for finished work. There are a thousands and one uses for wax, and sometimes one is led to ask, Is wax second to honey? Ought it not rather to be placed first in commercial importance?

"Fourth and last, we have the value of wax, amount produced, tests for purity, and the like. It is impossible to get at the actual value and the amount of wax produced.

"There are several vegetable waxes used in adulterations. Japanese wax is obtained from the small-stone fruits of several species of rhus cultivated in Japan. This rhus is akin to our stomach.

"Then there is the myrtle-berry wax, obtained from the fruit of the myrica.

"Carnuba wax is an exudation on the surface of the growing leaves of the carnuba palm, which flourishes in tropical countries of America.

"Palm wax is also an exudation found on the stems of two other South American palms.

"Other adulterations are: Parffin, a product of distillation of many organic substances.

"An American petroleum contains very little paraffin, cerasin, a gummy substance, starch, tallow and other greases. It is a matter of fact if you want to adulterate anything, adulterants can be readily found.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Some Proper Questions for Sister Bee-Keepers to Answer

If you were to meet one of the bee-keeping sisters, what are some of the things you would like to ask her, supposing you thought it would not be considered impertinent? Perhaps something like this:

"How many colonies did you have last spring, and how many in the fall? How much honey did you get, and was it comb or extracted?"

You wouldn't think it impolite to be asked those questions, would you? Well, suppose each sister sends in the answers. You may be sure it will make interesting reading. As the advertisement writers say, "Do it now, before you forget it."

### Getting Unfinished Sections Emptied

On page 810 I noticed an item by one of our bee-keeping sisters, stating that she could not get her bees to empty honey-sections. Here is my experience:

I take the supers which have not well-filled sections and place on top of the hive, next to the brood-frames, and scrape or puncture the cappings, and you may be sure the bees will empty the sections quick enough.

St. Ansgar, Iowa.

(MISS) ANNIE KNUXTON.

Yes, that works well in many cases, but for some unknown reason it can not be depended upon in this locality. The bees will clean up the cells that are punctured, but that's as far as they will go. Perhaps if they were scarce of honey in the brood-chamber, the case would be different. Thank you, all the same, for telling us about it.

### Honey Drops

Blend  $\frac{1}{3}$  cup of extracted honey or rich maple syrup, 1 teaspoon butter, 1 egg, well beaten,  $\frac{3}{4}$  cup of flour, sifted with  $\frac{1}{2}$  a teaspoon of baking powder and a pinch of salt. Drop by teaspoons on a tin, and bake in a quick oven. These proportions will make about 20 cakes. Icing may be of maple or fondant.—Good Housekeeping.

### Converting Wax-Scrapings into Marketable Shape

How can I convert the wax-scrapings into marketable shape? I have a large quantity that I have accumulated by scraping the sections (after removing the honey), and in other ways.

MRS. C. D. WIGGIN.

It is hard to get beeswax into anything but marketable shape if you get it separated from the combs at all, for no special refining is needed. Indeed, some comb-foundation makers prefer to get it without any attempt at cleansing such as is done with acid. If you have a large amount of wax to render year by year, the best thing is to get a wax-press. Probably, however, the amount you have would hardly call for that outlay. A solar wax-extractor costs much less, although it does not make as thorough work in getting out the wax, especially with old, black combs. The solar has the advantage, however, that you don't have to trouble with any fire-heat, the sun doing all the heating. But, of course, it will work only in hot weather. You can make a solar extractor yourself, if you have any turn in that direction. All that is needed is a box covered with glass, and in it something to hold the combs to be melted, with a vessel to catch the wax. Another plan that will work any time of year is thus given in "Forty Years Among the Bees."

"An old dripping-pan (of course a new one would do)

had one corner split open, and that made the extractor. The dripping-pan is put into the oven of a cook-stove with the split corner projecting out. The opposite corner—the one farthest in the oven—is slightly raised by having a pebble or something of the kind under it, so that the melted wax will run outward. A dish set under catches the dripping wax, making the outfit complete. Of course, the material to be melted is put in the pan the same as in the solar extractor."

It is well to have some water in the pan that catches the wax, and if the shape of the cake of wax does not exactly suit you, you can melt it over again in another vessel with quite a little water in it. The vessel should be flaring outward, so the cake of wax will come out easily, and the vessel should not be iron, which will darken the wax, but tin or some other substance. When the cake of wax has cooled enough to be no longer liquid, but while yet pretty warm, scrape from the bottom the impurities that have settled there. Some wax will be scraped off with the rest, and this can be melted over again.

### Noted Sisters Interested in Bees

It is pleasant to note that among those prominent in advancing the interests of bee-keepers are some of the sisters in conspicuous positions. In England the Baroness Burdett-Coutts has for a long time been looked up to as the special patroness of bee-keepers, and in Austria the empress is said to hold the same position. In our own country no less a personage than Miss Helen Gould, it seems, has found time to leave the care of her millions for a few days to look after the interests of birds and bees. A belated item in the papers gives it in this way:

"Miss Helen Gould has consented to visit Warsaw in August as the guest of Col. Isaac Washington Brown, the "bird and bee man" of Rochester. He has conducted a campaign for the better treatment of birds and bees for several years, and Miss Gould, who became interested in him, has provided means for him to carry his work forward. She will remain several days at Warsaw, conferring with him."

## Mr. Hasty's Afterthoughts

The "Old Reliable" as seen through New and Unreliable Glasses.  
By E. E. Hasty, Sta. B. Rural, Toledo, Ohio.

### FARMERS AND BEE-KEEPING.

H. C. Barnard, on page 795, seems to figure irresistibly that a farmer with 80 acres of land has only the *absolute right* to keep 2 colonies of bees. Many farmers—even many that don't want to keep a bee at all—would dislike to admit that.

### SECOND-HAND OIL-CANS FOR HONEY.

If I was a honey-buyer I should refuse to buy honey in second-hand oil-cans at any price whatever. (Can be cleaned; but practically many of them certain not to be.) If actual buyers take the same view, and I think some do, it behooves us to protest the second-hand can serpent whenever and wherever he raises his ill-smelling, greasy head. Vide page 796 This very writer "gives the practice away," if you will only weigh his language closely.

Incidentally, it is interesting to learn that the railroads and the Standard together make the people of Arizona pay 40 cents a gallon for 10 cent oil. Of course, two prices would abundantly pay for transportation; but human greed and what-you-going-to-do-about-it can demand *four* prices. If misery loves company, honey-men out there can console themselves a little.

### THE EDITOR'S BACK-YARD APIARY.

Glad to see the Editor's apiary—for the Editor's sake. And real nice, too—with that kind of niceness that does not touch sensationalism anywhere. Page 801.

### ABOUT A LADY BEE-KEEPER'S COSTUME.

What a "dialogue" we should have (as the school children phrase it) if we could boil down all the comments lady

readers will make on that costume which appears on the face of No. 47! Possibly somewhat like that below:

MRS. BLUNT—I like it; so there, now.

MRS. TARTE—If that's a woman, I would rather meet a man; and if it's a man, I would rather meet a woman.

MISS DUBLIN—Jist yez kape away from there and yeadent mate eyther of them.

MISS BOSTON—A secret longing to get into trousers is, I fear, at the bottom of it, rather than any real need of such a garment.

MISS EDINBURG—Whole nations of men wear skirts from choice; and it really seems to me that women might get along with theirs, if they tried intelligently, and with no hankering for male attire.

MRS. BINTHERE—When men wear skirts they mostly don't wear them long, nor puffed out, nor exaggerated in any way. I didn't know my apiary dress hindered me until I was told. And Brother Bill says he would much rather wear my rig than the one in the picture.

MRS. GOODSOUL—I keep away from bees. If I was obliged to go among them I'd wear 'most anything in which I could feel safe.

And the Afterthinker puts on wisdom like a garment, and adds that lady bee-keepers have several lines of costume open to them, according to personal inclination. One course is to make the clothes they already have the basis, and modify them as little (or as much) as is really needed. Have the underclothes of firm material, and offering no passes of Thermopylæ for the enemy to march through. Have a big pocket, or more than one—else a belt with danglets. Have the skirts the opposite of full, and as short as the proprieties seem to allow.

□ Another course is to have a special costume decidedly different from that worn in the kitchen, and still not nearly so revolutionary as the one shown. Room for lots of genius and invention in this middle course.

Probably some would prefer to take man's suit exact, neither less nor more, put it on after entering the apiary and change before going away. This has the important advantage that strangers passing by do not stare.

If you do choose the fourth course, and follow the "pictur," how would it do to go a little further? Sew two big slippers to the bottom. From the knee up have them enough fuller that moderate skirts could easily be tucked in. Then don't take off the costume, but jump into them. And when somebody threatens to heave in sight, jump out of them again. Too warm some days—and—and—roaring lions and escaped lunatics sure to pass by on the other side.

#### AIKIN'S WAY OF CONTROLLING SWARMING.

So Aikin's favorite method of control is big room before the flow, and shake the most of them just as the flow begins. Looks good. But he also masses his shaken swarms to some extent, and that would hardly do for the strain of bees I have at present. Page 805.

#### GRAPE-PUNCTURING AND BIRDS.

I think past judgment about grape-puncturing was that most is done by small, swift, sly birds, and just at the peep of day, when few people (at that time of the year) have their observation clothes on. This measurably explains the incorrect suspicion that it must be night-birds. Night-birds all flesh-eaters and insect-eaters, I believe. But the sparrow (seen to tear open bags and eat the grapes within) seems to hold the first place in atrocity. Page 805.

Conducted by MORLEY PETTIT, Villa Nova, Ont.

#### Hershiser Bottom-Board

O. L. Hershiser, of New York State, showed at the Ontario convention at Toronto, a bottom-board which is specially constructed for moving and wintering bees. It consists of a box 3 or 4 inches deep, with wire-cloth in the sides, and a block to close the front. For moving bees I would not exchange it for the Holtermann portico, as I con-

sider it too much machinery to carry under the hive, with not enough advantage to make its use profitable.

Its great advantage in cellar-wintering is the deep space for dead bees, and the fact that a live bee can not fall to the floor with the dead one she is throwing out. It provides the necessary bottom ventilation, and at first sight would be pronounced an excellent invention. But here is the difficulty: We find it is not practical to confine bees to the hive while in the cellar. Weak colonies and nuclei may be confined without serious loss. Though I doubt that. But where strong colonies are so confined there are sure to be some bees that fly to the screen, try to get out, and make noise enough to rouse the whole cellar. This is no theory, but has been proved in my experience.

#### Bee-Keeping as a Business

The following from an old Farmer's Advocate is apropos the subject of studying and mastering one's business:

"We often hear bees are an interesting study. They certainly are, and the more we study the more interesting they become—and the more profitable. There's the point. While few succeed in a distasteful occupation, not many are in business for reasons other than the desire for board, clothes and extras.

"The difficulty with bee-keeping is that it is not taken seriously enough. The idea is held and taught by all except the few who know differently, that bees are no trouble at all, and every one should have a few in the garden. What is the result? The honey market is in the condition in which the butter market was a few years ago—crowded with inferior goods put up in miserable shape. Those who see honey at our leading exhibitions, and then contrast it with what is taken in "trade" and sold by dealers generally, will appreciate this.

"Progressive bee-keepers welcome others to their ranks, if these new men give promise of being equally progressive. Those entering upon any new undertaking must carefully count the cost, else they fail. The financial expense in this case is practically nothing, and after the first cost the bees should, of course, pay their way or get out.

"Then there is the pasture. Twenty-five colonies to the square mile is probably the outside limit for average localities in Ontario in average years. Now consider carefully that the heavy work in bee-keeping comes at precisely the same time of year and day as in general farming. If the farmer or his son can spare time to produce a No. 1 grade of honey, he will be well repaid; if not, he would better let bees alone."

#### Bisulphide of Carbon for Fumigating Combs

"A York County Bee-Keeper" tells in the Canadian Bee Journal about using 5 ounces of bisulphide of carbon in a box holding 600 Quinby combs. He says:

"About Oct. 10, an article appeared in the American Bee Journal from the pen of that well-known apiarist, Mr. F. Greiner, of New York, in which he stated his preference for sulphur instead of the bisulphide, on the grounds that such large quantities of the latter had to be bought to be effective. Mr. Greiner said that it was estimated that one ounce of the drug was necessary for every cubic foot to be fumigated. According to that, the big box of combs should have had more pounds than I had used ounces, so it was with some trepidation that I hastened to have a look for (possibly) moths and grubs galore. However, an examination showed everything to be in splendid condition; not an egg had developed since I had last looked at the combs in August, and the grubs that were then present were all dead and as black as tar. Surely, the bisulphide on the other side of the line must be adulterated nearly as badly as those basswood hams we used to hear of. No, thank you, as long as 5 ounces of bisulphide of carbon will effectually fumigate 600 combs, I have no use for sulphur and its sickening fumes."

To this Editor Craig adds this comment:

"We think Mr. Greiner can not have used the drug properly, else he would have had better results. We must remember that the fumes of the bisulphide of carbon are heavier than the air, and therefore their tendency will be to descend or fall. The drug must, on that account, be placed above the combs, and in a broad, shallow vessel of some sort, giving as much surface as possible for rapid

evaporation. Then, again, the fumigating box should be as air-tight as possible to prevent the fumes escaping, although we have had very satisfactory results from simply piling the extracting supers with combs, one above another, seven or eight high, and placing a saucer with 3 or 4 ounces of the bisulphide inside a rim on the top, and covering all with a hive-cover. The stuff is cheap—is sold ordinarily at 10 cents a pound—so that there should not be much temptation to adulterate it."

## Doctor Miller's Question Box

Send questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.  
Dr. Miller does not answer Questions by mail.

### Three-Frame Nucleus and Queen

1. If I buy a 3-frame nucleus with queen, can I have the queen's wing clipped by the one from whom I buy? If so, will she come through with the nucleus all right? Can I thus secure a queen that will be in breeding condition?

2. Will a 3-frame nucleus give me any surplus honey the first year?

IOWA.

ANSWERS.—1. Most assuredly. A clipped queen will stand the journey just as well as an unclipped one, and will do just as good work afterward. Some shippers prefer to clip before sending, one reason for it being that a beginner sometimes buys a queen and tries to introduce her where another queen is present. The new queen is killed, and when the young bees hatching out show the wrong color the purchaser thinks he has been swindled, whereas the shipper was not at all to blame. If the new queen is clipped he will know she was killed when he finds a queen with whole wings.

2. Maybe, and maybe not. If you get it tolerably early, and the season is good, and especially if there is a good fall yield, you ought to get some surplus honey.

### Running Out-Apiaries and Managing Swarming

I want to run three bee-yards, but can't do it with all of them swarming all the time. All the increase I would want would be one swarm from each strong colony. I thought of seeing the bees about once in 10 days. If they swarmed I would take a new hive with one-half inch starters of brood foundation in the frames and set it on the stand of the old hive, taking out a frame with the queen from the old hive and putting it into the new one, and also shake part of the bees off in front of the new hive; then put the old hive in another place for a day or two, and give it a sealed queen-cell or a queen. What do you think of this plan? Will the bees do any good in that way? Will they store honey? If my plan is not a good one, please tell me what you would suggest for running an out bee-yard where one can not be there all the time.

MISSOURI.

ANSWER.—Yes, your plan will work, for it is practically the shake-swarm plan used by so many. You will find, however, that if you fill the frames half full of foundation you will have an undesirable amount of drone-comb. If you don't want to fill all the frames with foundation, instead of filling each frame half full, it will be better to fill half the frames full and put only shallow starters in the others. Give at first the frames with starters, for the bees are likely to build worker-comb at the start, and then when they have those frames filled, add the frames that are filled with foundation.

### Full Sheets or Starters of Comb Foundation in Sections and Brood-Frames—Oilcloth or Super-Cover in Winter

1. What grade of foundation do you use for frames and for sections? I used a few frames the past season, and 6 sheets weigh one pound. Next season I expect to get 30 hives more, and want to use full sheets of foundation, and

would like to know if lighter sheets would do as well as the heavy grade.

2. Will bees winter as well in the cellar with oilcloth on as they would with a super-cover without oilcloth and no super?

3. If I put in each hive 4 or 5 frames with starters, the rest full sheets, and 3 or 4 days afterward take out the full sheets so the starters will be filled with worker-comb, where should the starter frames be placed, in the center or at one or both sides of the center, when the full sheets are returned? I like full sheets; that does away with a lot of tramps (drones), but it costs a good price for foundation, so if anything more in this line you can give would be thankfully received.

NEW YORK.

ANSWERS.—1. For sections, thin super. I haven't bought any brood foundation for some time, but have used heavy brood and medium brood. The weight of foundation for brood-frames depends chiefly upon the support given. If no wires or foundation splints are used, it should be very heavy. Well supported by wires or splints, there seems no reason why something quite light would not do; and the thinner the foundation the less it costs to fill a frame.

2. Probably yes, although in a cold cellar the cover without oilcloth might be better.

3. In the center if not wholly filled; if filled it doesn't matter.

### Questions Concerning Winter Conditions

Are any of the following eight statements untrue? If so, which, and why? They concern winter conditions:

1. In a painted hive in good repair there will be no large openings except the entrance, and the bees will always so completely propolize all cracks as to make the hive wind-proof, water-proof, and light-proof, except at entrance.

2. A telescope cover, which is merely a sheath of some sort, and not made air-tight around its bottom edges, can not be said to furnish a dead-air space around a hive, since the wind will blow up underneath somewhat, and heat from the walls of the hive, if these walls have any heat, will cause a current of changing air in the air-space, and if the walls have no heat the air-space would be useless. The only advantage of such covering will be to break the force of the wind against the upper part of the sides and over the top of the hive, and, by preventing rapidity of wind currents, will reduce the rate at which will be removed the heat of the top of the wooden walls and the top of the hive, if they have any heat.

3. As wax is a non-conductor, or poor conductor, of heat, a comb of bees conveys practically no heat along its edges, supports, or parts of contact of the comb or frame to the hive-walls. The hive-body, therefore, has no heat derived from the contact with the frames.

4. As the cluster in winter covers only half the frame-space, the walls of the hive are too far removed from the cluster to derive heat directly from the cluster of bees.

5. The air below the cluster and around the outside combs containing the cluster is practically identical with the temperature of the outdoor air.

6. The air above the cluster contains some heat radiated and rising from the cluster, and is lost by transmission to the cover or top.

Therefore—(a) Protecting the sides and bottom of the hive-body has no direct effect on the heat of the cluster.

(b) Protecting the top of the hive prevents the top losing the heat arising from the cluster.

(c) A telescope cover protecting more than the top, and the quarter-inch space above the frames is useless, and since it prevents quick action of the sun on the hive-walls in temporarily or slightly sunny days, thus interfering with the warming-up and drying-out process, such telescope cover is a damage, not an aid, to the bees.

7. The end to be sought is to keep the cluster as dark and quiet as possible until the heat of the outside air penetrates through the entrance and rouses the bees; also to keep the air in the hive as quiet as possible without stopping suitable ventilation. Could not this be best accomplished by a full-width summer entrance covered entire, except one-quarter of an inch at one side for egress, with fine-mesh screen to keep out mice, and, on warm days, robber-bees, said screen being backed by one thickness of burlap cloth, thus eliminating largely the effects of the wind and light, and rapid change without stopping slow ventilation?

Conclusion: Should not telescope covers and chaff hives be discarded for wintering, merely covering the top

of the hive and the first inch of the sides, and using porous cloth at the full-width entrance?

8. The foregoing is all based on the statement recently printed in italics, that "The air within the hive and surrounding the cluster is very little higher than that outside the hive." Has any experiment proved this statement, or is it an assumed fact?  
INDIANA.

ANSWER.—You are getting things down pretty fine, and I don't know enough to be any too positive about some of them, but I can at least say how they look to me.

Statement 2 may or may not be true, according to the different interpretations put upon it by different persons. Some will read it through, and then add a *therefore* something like this (and I rather understand that to be your *therefore*, too): Therefore, any part of a telescope cover more than an inch below the top has no practical effect in keeping a hive warm. While it is true that so long as the telescope cover is open below there is no dead-air space, yet there is an approximation, and such a cover is quite different from leaving a hive entirely uncovered, just as stock will discover the shelter of a clump of trees or bushes in a cold wind.

Statement 5. I think that if you will put a thermometer in a hive, you will find that the air in the hive is quite a bit warmer than that outside during zero weather.

Statement 6 will hardly hold. It says practically that no heat is lost from the cluster except that which is lost by radiation directly upward. Doesn't heat always radiate equally in all directions? Neither is radiation the only means by which the heat of the cluster is lost. The likelihood is that very little heat is lost by radiation compared with that lost by convection, and convection affects the

lower part of the cluster at least as much as it does the upper part.

You say that the outside wall prevents the heat of the sun from getting in during warm days. Aren't you just a bit in danger of clashing with yourself there? For if the outside wall is a bar to the passage of heat inward on a warm day, is it not equally a bar to the passage of heat outward on a cold day?

Is there not just a little bit of clash between statements 7 and 6? In 7 you want the cluster to remain quiet until the heat of the outside air penetrates "through the entrance," while in 6 you apparently want it to penetrate through the walls of the hive, for you say the telescope cover interferes with warming up.

Your scheme of closing the entrance with wire-cloth and burlap might work all right, only wouldn't there be danger that a quarter-inch entrance-hole would get clogged with dead bees?

Statement 8 is just a bit indefinite, the expression, "very little higher," being so elastic that one person might understand it to be many degrees more than another. Yes, the French scientist, Gaston Bonnier, and perhaps others, have told us just what difference there was between the temperature in and out a hive, but I can not give the figures. Of course they would vary according to conditions, and you can try it as well as any one else. At any rate, there is so much difference that it would hardly be safe to conclude that the walls of a hive are of no value in the way of protection.

I believe you are quite right that it is of more consequence to protect well above, but as to the rest—well, I don't know.

# Some Good Clubbing Offers

A good many subscriptions to the American Bee Journal should be renewed at once. We wish to call special attention to the clubbing offers below, which we are sure will commend themselves. The American Bee Journal one year and your choice of one of the following:

## CONVENTION NOTICES.

**Nebraska:**—The annual meeting of the Nebraska State Bee-Keepers' Association will be held on Wednesday, Jan. 17, at 2 p. m., at the Experiment Station Building of the Nebraska State Farm, at Lincoln, Neb. The meeting will be of interest to all bee-keepers. E. Kretchmer, of Iowa, will read a paper on "Bees and Fruit;" H. F. Smith, Assistant in Department of Entomology of the University of Nebraska, will read a paper entitled, "The Relation of Robber-flies and the Honey-Bee."

A general discussion will give all present an opportunity to discuss subjects of interest. Lincoln, Neb. LILLIAN E. TRESTER, Sec.

**Colorado:**—The Colorado State Bee-Keepers' annual convention will be held in the Chamber of Commerce Building, Denver, Jan. 30, 31, 1906. This will be during "Farmers' Week," when many farmers' organizations will be in the city holding conventions. We are assured of low railroad fares from all points of the State. We are planning for our usual good convention. R. C. AIKIN, Sec. Loveland, Colo.

## Reports and Experiences

### Very Poor Honey-Year

This has been a very poor year with us—in fact, the poorest since we began in the bee-business, and that was in the early '90's. No nectar in flowers and millers make a bad combination for a bee-keeper.

Dexter, Mich. K. H. WHEELER.

### Good Prospects in Cuba

Up to this date the honey crop in Cuba has been very good. Aguinaldo is a wonderful bloomer. Good colonies have already given 150 pounds of extracted honey.

Palacios, Cuba, Dec. 10. M. C. ENGLE.

### More Black than Italian Drones

I notice considerable discussion lately about pure Italian bees sporting, or going back to blacks. One writer thinks that blacks are swifter on the wing; but even that will not account for it all. In my opinion they have not found the right solution yet. One of my neighbors, with 6 or 8 colonies, rears more drones than I do with 50 colonies, and they are just the ones that always have black bees.

A modern bee-keeper reduces the drone-comb to the minimum, but the farmer bee-keepers have a host of drones. The old queen is hived in an empty box or an empty modern hive, and if he helps any it is the second swarm. I have rendered a good many box-hives of combs for small bee-keepers this fall, and it is surprising the amount of drone-comb I found. A slipshod bee-keeper rears more drones in a few colonies than a good bee-keeper in a hundred. IRVING LONG. Marceline, Mo.

### Dead Wrong About the Sparrow

MR. EDITOR:—I have been reading about the bees doing so much damage to grapes, in the American Bee Journal. Well, any red-headed man can see the absurdity of such a statement. That sparrows will gladly sip the

# GROCERIES

AT WHOLESALE PRICES

FREE This catalogue will save you money on your grocery supplies.

FREIGHT PAID

What do your groceries cost you a year? Will you buy them of us if we can prove that we will save you from 10 per cent to 20 per cent and pay the freight? That certainly is an amount worth saving; it is worth the trouble of asking for the proof. Get our large Grocery List and compare our prices with what you have been paying. Then put us to a greater test—send us a trial order and compare the goods and the prices. If we do not save you big money, send the goods back at our expense. The grocery bill is the biggest part of the family expenses. We will cut it almost in the middle and guarantee everything we sell. We can do this because we buy in immense quantities—carloads and trainloads—and we give you the benefit of our ability to buy cheap; in fact we can sell to you at just about the figure your local dealer would have to pay. We save you his profit and the freight besides.

To save still another 10 per cent, become a member of the Co-operative Society of the National Supply Co. We'll tell you how to get this extra 10 per cent discount, if you will write for full information. An easy way to make money.

If you want to save money get our catalogue and learn just how cheap you can buy groceries from us. Catalogue is ready and lists everything in the grocery line. We send it free.

Co-operative Society of the National Supply Co., Lansing, Mich. and Chicago, Ill.

## American Bee Journal Novelty Pocket-Knife Gold Fountain Pen

All for \$2.75

(This cut is the full size of the Knife.)

### NOVELTY POCKET-KNIFE

(Name and Address on one side—Three Bees on the other side.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the owner, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. It will last a life-time, with proper usage.

Why Own the Novelty Knife?—In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and, in case of death, your relatives will at once be notified of the accident.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or club the Novelty Knife and the American Bee Journal for one year—both for \$2.00. (Allow two weeks for Knife order to be filled.)

### SOLID GOLD FOUNTAIN PEN

Finally, we have found a good Fountain Pen that is reasonable in price. The manufacturers of this pen say that if you pay more than \$1.25 for other fountain pens, it's for the name.

This pen is absolutely guaranteed to work perfectly, and give satisfaction. The Gold Nibs are 14 kt., pointed with selected Iridium. The Holders are Para Rubber, handsomely finished. The simple feeder gives a uniform flow of ink. Each pen is packed in a neat box, with directions and Filler.

Worker

Queen

Drone

3/8 size

We mail this Gold Fountain Pen for only \$1.25, or for \$2.00 we will mail it and the weekly American Bee Journal for a whole year.

Sample copy of the American Bee Journal free; trial trip of three months (13 copies) for 20c; regular yearly price, \$1.00. Address all orders to

GEORGE W. YORK & CO., 334 Dearborn St., Chicago, Ill.

nectar from the broken berries is no doubt correct, and no wonder, but that is not the question that sends such a glow under my linen collar.

In deprecating the statement regarding the bees immediately follows a cold-blooded accusation against the "sparrow pest." Now, that is not the square deal I am accustomed to find in the usually considerate American Bee Journal. I feel this is an oversight—Don't believe the Editor was at home when the poor birds were called hard names. The little sparrow has a hard row to hoe, at best, without bearing the stings of malice heaped upon it by inconsiderate persons who constantly instigate their persecution and death. Let us all carefully investigate and give the little fellows a fair show. What have they done? Great good and but little harm, the latter only incidentally, as we all do. If the millions—nay, billions of insects which the sparrows destroy every year were allowed to mature and bear their kind, life would long since have been a hideous nightmare, and vegetation a thing of the past.

It is within my easy recollection when Eastern parks were made desolate by myriads of what are known as "inch worms"—the little caterpillar that fed so ravenously upon the leaves of the elms in particular, and all other trees in general. How they spun from ground to tree-tops in thousands, having a special predilection for resting on the fair, bare shoulders of the ladies reposing under the shade of some monarch trees. Soon the dames arose and left in disgust.

Since the considerable introduction of Mr. and Mrs. Sparrow, you can sit in the parks all day with never a vision of the crawly things.

Fate has ordained it that every long-eared amateur must dwell upon the vicious nature of everything living, of which they know little or nothing. What they do not know is, of course, not worth considering. Could they but think and observe they might have divined the real purpose sparrows have of pecking into fruit—not wantonly to destroy it, but to find the luscious little worm that is snugly nestling in that grape, or that peach, or that curculio-punctured plum. Just as the "yaller hammer" thrusts his strong bill to the core of a red-cheeked apple for the codling grub in its seed-bed, or as the robin steals off with the early-matured cherry, with its fat little wiggler waiting to develop and take its flight, so does Mrs. Sparrow persistently investigate for opportunities to find Palmer House fare for her ravenous fledglings. How can the birds help doing some harm in their effort to do great good?

By all means give the boys a chance to study bird-life around them, that they may learn of the beauty and usefulness of the birds they try to destroy because of the ignorant superstitions acquired from those whose opportunity for truthful study has been denied them.

Chicago, Ill.

EM DEE.

### FRUIT BOOKS FREE

Send your name and address at once and you will receive by return mail sample copies of the BEST FRUIT PAPER and full particulars about the "Bro. Jonathan Fruit Books," which may be secured free. FRUIT-GROWER COMPANY 412 SOUTH 7TH STREET, ST. JOSEPH, MO.

## The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 75 cents; or we will send it with the Bee Journal for one year—both for only \$1.50. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further blinding is necessary.

# A \$4.00 Clock for \$2.50

With the Weekly American Bee Journal 1 year—all for only \$3.

The  
Finest  
  
Gift  
You  
Could  
Make  
to  
Anyone

Ought  
to be  
in the  
Home  
of every  
Bee-  
Keeper  
in the  
Land

## THE BEE-HIVE CLOCK

Only \$2.50, f.o.b. Chicago, by express. Weight, with packing, about 4 lbs. Ready for delivery Dec. 15.

We have had made specially for our readers, a bronze-metal Clock, called "The Bee-Hive Clock." It is about 8 inches wide at the base, about 10 inches high, and deep enough at the base to stand firmly on a mantel or elsewhere. It is a beautiful piece of work, and would be both ornamental and very useful in any house, and particularly in a bee-keeper's home.

The clock part itself is warranted for 3 years to keep good time. So it is no plaything, but a beautiful and needful article for everybody.

Clocks like "The Bee-Hive Clock" usually sell in the stores at from \$4.00 to \$5.00 each, but having them made for us in large quantities enables us to offer them at \$2.50 each by express, or with the Weekly American Bee Journal a year—both for only \$3.00. Either Clock or Journal would make an ideal gift.

Here is something that surely is appropriate for bee-keepers—"The Bee-Hive Clock." Better get your order in quick—first come first served out of the first lot of Clocks.

# BEE=BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**Farm and Stock** is an illustrated monthly magazine in the interest of CORN BREEDING, Cultivation and Live Stock. Price \$1 a year, but for a short time will be sent a year on trial for 10c and names of ten farmers who grow corn. Farm & Stock, 228 Charles, St. Joseph, Mo.

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

## Honey and Beeswax

CHICAGO, Dec. 6.—The trade in best grades of white comb honey has been fair, yet retailers taking only small quantities at a time. This honey brings 14@15c; other grades are difficult to place at from 1@3c per pound less. Extracted selling at 7@7½c per pound for white; amber 6½@7c; dark 5½@6c. Beeswax, when clean and of good color, 30c. R. A. BURNETT & Co.

CINCINNATI, Nov. 24.—The demand for comb honey is relaxing to some extent, owing to the majority of the trade being well supplied. All fears of a comb honey famine have been allayed. We quote fancy white comb honey at 14@16c. Extracted honey is in fair demand. Quote amber at 5½@6½c, according to the package and quality. Fancy white and white clover extracted at 6½@8½c. We are paying 28½c per pound delivered here for choice yellow beeswax. (We wish to call the attention of the producer to the above honey quotations, who mistakably expects to receive these prices for his product. The above are our selling prices.) THE FRED W. MUTH CO.

TOLEDO, Oct. 17.—The honey market remains firm, with good demand, and prices the same as last quotations. Fancy white comb brings 15c; No. 1, 14c; fancy amber, 13c; buckwheat, 13c. Extracted, white clover, in barrels, 6½@6¼c; amber, in barrels, 5@5½c; in cans, 1c to 1½c higher. Beeswax in good demand, 26c cash, 23c trade. GRIGGS BROS.

ALBANY, N. Y., Nov. 8.—Our honey market is in healthy condition; demand good; receipts about equal to demand. Prices are not quite as high as last year, but the tendency has been to work off the honey before cold weather, and we think the crop has come forward more than usual this season, which is a good sign. We quote: Fancy white clover, 15c; A No. 1, 14c; No. 1, 13c; buckwheat, fancy, 13c; A No. 1, 12c; No. 1, 11@12c; straight buckwheat is wanted in this market. Extracted, quiet: white, 7½c; mixed, 6½c; buckwheat, 6½c. Beeswax scarce at 30c. H. R. WRIGHT.

PHILADELPHIA, Nov. 20.—The demand has been very good for honey in the past 10 days. In fact, it takes a little sharp, cool weather to get people started, and when they do start, the

**C. H. W. WEBER** CINCINNATI ... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

demand continues for some months. We would say, now is the height of the honey season. We quote, in a jobbing way: Fancy comb, 15@17c; No. 1, 13@15c; amber, 12@13c. Extracted, fancy white, 7@8c; amber, 6½c. Beeswax firm at 28c. We are producers of honey and do not handle on commission. WM. A. SELSER.

INDIANAPOLIS, Dec. 15.—There is a tendency for higher prices on best grades of honey. The demand for strictly fancy white comb honey exceeds the supply. Demand for lower grades of comb honey not good. Numerous shipments of honey arriving, but no one producer seems to have very great quantities to offer. I quote fancy white at 15@16c; No. 1 in poor demand at 12c, and amber dull at 10c. Best grade extracted brings 8@9c in 60-lb. cans; amber slow at 6c. Beeswax, 30@33c. WALTER S. POWDER.

DENVER, Nov. 11.—No. 1 white comb honey, per case of 24 sections, \$3.35; No. 1 light amber, \$3.00; No. 2, \$2.50@3.00. Extracted honey, 6½@7 cts. per pound. Supply is light and we could make quick sales of consignments at above figures. We pay 24c for clean, yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASSN.

CINCINNATI, Dec. 18.—The nice weather holds back the demand for comb honey. Crops seem to be exceedingly short and producers in the West keep the prices high. We quote as follows: Fancy water-white and No. 1 white clover, 14@16c; No. 2, 12@14c. Extracted seems to be more plentiful, and we quote same in barrels, light amber, 5½@5¾c; in cans, ½c more; white clover, 7@8c. Beeswax, 28@30c. C. H. W. WEBER.

NEW YORK, Dec. 6.—The demand for comb honey continues to be fair for all grades. Prices practically remain the same. We quote fancy white at 14@15c; No. 1 at 13c; No. 2 at 12c, and buckwheat at 10c per pound. Extracted honey is in good demand, especially California honey with large supplies. We quote white at 6½@7c; light amber at 6c; buckwheat, extracted, at 5½@6c per pound; Southern at 50@60c per gallon. Beeswax firm and steady at 29@30c per pound. HILDRETH & SEGELKEN.

SAN FRANCISCO, Dec. 6.—White comb, 1-lb. sections, 9@10 cents; amber, 7@8c. Extracted, waterwhite, 4½@5c; white, 4½@4¾c; light amber, 4@4½ cents; amber, 3½@4c; dark amber, 3@3½c. Beeswax, good to choice, light, 26@27c; dark, 24@25c.

Honey is being offered more freely at appearing quotations than for some weeks past, and it now appears that growers are awakening to the fact that they can not force prices any higher by holding their honey. At these figures there should be a good profit to the bee-men and a small margin to jobbers. Hawaiian extracted amber is selling at 2½ cents, at primary points, but it is not likely that California apiarists have anything to fear from competition, as their crop is all marketed in England.
