# A PROSPEROUS NEW YEAR.

Begin now to make ready for next season's harvest. Send for our Catalog, lay your plans, order your Supplies, get them ready. By that time you will find you are none too soon.

We have been working all winter to fill our warehouses and stock our branches and agents. We are better prepared than ever to ship your goods promptly.

But don't put off ordering. There may be some unforeseen delay. Glance over the list below and write to our branch or agent nearest you for Catalog.

Root's goods are the cheapest. You cannot buy good goods for less prices, and we have unexcelled facilities for saving you freight.

## BRANCHES.

Chicago, Ill., 144 East Erie Street.  
Philadelphia, Pa., 10 Vine Street.  
New York City, 44 Vesey Street.  
Syracuse, N. Y., 1635 W. Genesee St.  
Mechanic Falls, Maine.

St. Paul, Minn., 1024 Mississippi Street.  
San Antonio, Texas, 1322 So. Flores Street.  
Washington, D. C., 1100 Maryland Ave., S.W.  
Havana, Cuba, Obrapia 14.  
Kingston, Jamaica, 115 Water Lane.

## SUPPLY DEALERS HANDLING ROOT'S GOODS EXCLUSIVELY.

A. E. vB. Fatjo, Santiago, Cuba.  
J. B. Hamel, Cardenas, Cuba.  
Nelson Bros. Fruit Co., Delta, Colo.  
Howkins & Rush, 124 Liberty St., W. Savannah, Ga.  
Walter S. Poudier, 512 Mass. Av., Indianapolis, Ind.  
Joseph Nysewander, Des Moines, Iowa.  
Carl F. Buck, Augusta, Butler Co., Kans.  
Rawlins Implement Co., Baltimore, Md.  
F. H. Farmer, 182 Friend St., Boston, Mass.  
Geo. E. Hilton, Fremont, Newaygo Co., Mich.

M. H. Hunt & Son, Bell Branch, Wayne Co., Mich.  
Geo. A. Hummer, Brazelia, Miss.  
John Nebel & Son, High Hill, Montg. Co., Mo.  
Blanke & Hauk Supply Co., St. Louis, Mo.  
Springfield Seed Co., Springfield, Mo.  
Griggs Bros., 523 Monroe St., Toledo, Ohio.  
C. H. W. Weber, 2146 Central Ave., Cincinnati, O.  
Prothero & Arnold, Du Bois, Clearfield Co., Pa.  
D. M. Edwards, Uvalde, Uvalde Co., Texas.  
Texas Seed & Floral Co., Dallas, Texas.

The following sell our Supplies in connection with their own or other goods.  
**BE SURE TO SPECIFY ROOT'S GOODS WHEN YOU ORDER.**

J. M. Jenkins, Wetumpka, Ala.  
California National Honey Producers' Association,  
Los Angeles, Calif.  
Madary's Planing Mill, Fresno, Calif.  
Smith's Cash Store, San Francisco, Calif.

The L. A. Watkins Mdse. Co., Denver, Colo.  
Vickery Bros., Evansville, Ind.  
Portland Seed Co., Portland, Oreg.  
Lilly, Bogardus, & Co., Seattle, Wash.

There are hundreds of others handling our Supplies, but lack of space forbids our giving their addresses.

# ESTABLISHED IN 1861 AMERICAN BEE JOURNAL THE OLDEST BEE-PAPER IN AMERICA

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

GEORGE W. YORK, Editor.

CHICAGO, ILL., JAN. 5, 1905.

Vol. XLV.—No. 1.

## Editorial Notes and Comments

Volume Forty-Five—1905.

This week begins Volume XLV. How the years and the volumes of the American Bee Journal are piling up! It will soon be a half-century since it began to be. And some of its readers are growing old, but most are simply growing older. Several of the faithful for many years have lately written us that they are "too old to care for the bees any longer", and so "must also stop taking the old American Bee Journal". There is a touch of sadness in all this. And yet a note of joy, too. These dear old readers have been as faithful as their bees throughout all the passing decades, and no doubt will be ready to depart in a few more years for that Better Country

— "the Heaven of rest  
That lieth just over the wall by the tree  
Where the summer-kist apples are best",

as runneth the song, "The Hum of the Bees in the Apple-Tree Bloom".

### Midwinter Flights for Cellared Bees.

There are still questions about wintering in the North that will not down. One of them that was somewhat generally considered settled has been lately opened up again by the assertion of Editor Root, that there is a real gain to take bees out of the cellar in February or March on a warm day, and return them after a flight. H. R. Boardman, whose view is given in the last part of his article on page 495, may be said to represent the majority. Let us compare their testimony:

Mr. Root says in Gleanings in Bee-Culture: "While the bees prior to removal were uneasy, they became perfectly quiet after being put back, and continued so for several weeks after".

Mr. Boardman says: "I used to think it necessary, for the welfare of the bees, to set them out for a flight during the winter, but I now prefer to have them remain in until they are set out to stay".

Not entirely conclusive in either case. Granting the truth of what Mr. Root says, is it certain that the bees would not have been as well off at the beginning of the harvest if left in the cellar till taken out for good?

We might do some reasoning on the case. If midwinter flights are a good thing for outdoor bees, as all agree, why

not for cellared bees? If bees are stirred up to brood-rearing by being taken out, will not that be a damage to them when returned?

But a mile of such reasoning, or rather questioning, is not worth an inch of good, solid testimony from the bees themselves. That testimony ought not to be hard to obtain. When a day warm enough comes in February or March, let part of the bees be taken out of the cellar for a flight, and then returned. Let this be done by a hundred bee-keepers or more; let them note the difference between the bees taken out and those left; let them report, and all the reports taken together ought to give us something a little more reliable than we have had on which to base an opinion. Will you try it and report?

### Kerosene for Driving Bees.

Driving bees out of a super by laying over the super a cloth wrung out of a solution of carbolic acid seems to be much more in favor among our British cousins than in this country. Chas. U. T. Burke says this in the Australasian Bee-Keeper:

"I find more effective a cloth wrung out as dry as possible with kerosene, and placed on top of the frames will hunt every bee out of the supers, and if you are not careful, will hunt the bees clean out of the hives. Be careful and do not let the kerosene cloth remain on for more than a minute at most—30 seconds is quite long enough. The moment this cloth is put on, you hear a buzz, and away go the bees helter-skelter down below, and you can remove as many supers as you like away to your extracting room, and rarely a bee will be found in them."

We should think it very important to be exceedingly brief in this operation, else the honey might take on the odor of the kerosene.

### Why Do They Lie So About Bees?

H. S. Spence sends the following clipping, which for magnitude in the Ananias-and-Sapphira line is well entitled to the blue ribbon:

QUEEN-BEES WORTH \$200.

Just as there are valuable strains in horses, cattle, and other stock, so there are varieties of queen-bees which are worth many hundred times their weight in gold. The most valuable strain is the Italian, and many Italian bee-farmers demand and receive without question prices ranging from \$50 to \$200 for a single queen-bee of a certain kind. Such bees are sent all over the world. The owner of a bee-farm near Ottawa, Canada, goes to Europe annually and brings back with him bees of an aggregate value of thousands of pounds. He is enabled through the agency of an Italian firm to effect an insurance upon the most valuable of his queens.—New York Herald.

Along with the clipping Mr. Spence sends the following

conundrum: "How do you suppose such absurdities get into the papers"?

The answer is not easily given in a few words, although down at the bottom of the whole disreputable business lies the fact that may be given briefly in the words of Barnum, the great showman, "The people want to be humbugged". The papers wouldn't continue to fill up their space with lies if there were no market for them. Knowing this demand, the penny-a-liners are keen on the scent of anything a little out of the ordinary, and with one or two facts, or supposed facts a trifle remarkable, in their possession, they set to work dressing up and magnifying, until one may well ask, "Why do the papers lie so about bees"?

In the present case, the material from which the fabric is reared is probably the following: There was *one* queen which was considered so valuable for breeding purposes that it was valued at \$200 by its owners, although no one perhaps would have given one-fourth that amount for that or any other queen. But that seems to be ground enough for a reporter saying that *many* are sending queens at that price all over the world!

It is not to the credit of the New York Herald that such stuff should be admitted to its columns, and perhaps it is less to the credit of the Cincinnati Enquirer to be willing to copy it.

## Miscellaneous News & Items

General Manager France says the Texas bee-keepers did not understand what he wrote them about the directorship matter. We thought there must be some misunderstanding somewhere. But no harm has been done, as we can see.

W. S. Allan, of Mexico, when renewing his subscription recently, wrote as follows:

"In a late number of the American Bee Journal the question is asked, 'What have you learned in experience during the present year with the bees?' My experience is that the best help in the bee-business is the American Bee Journal."

Mr. S. A. Niver, formerly of New York State, but lately of Chicago and Wisconsin, has taken unto himself a wife. He was married Dec. 26, 1904, at Whitewater, Wis., to Mrs. Alfarata Hull Jahnke, according to an announcement we received last week. We extend our heartiest congratulations to Mr. and Mrs. Niver. But Mr. Niver certainly did surprise us.

August Weiss, of New London, Wis., died Nov. 22, 1904. He had been sick with lung trouble for a year and a half. He was only 42 years of age. Mr. Weiss was well known as a comb foundation manufacturer, having invented a process of his own, we believe. On account of ill health he has not been able to push his business very vigorously the past year or two.

An Old Bee-Keeper and Langstroth.—We have received the following from an old bee-keeper and admirer of Langstroth:

EDITOR YORK:—Advancing years and failing health compel me to give up bee-keeping for a business. Perhaps it will interest you to know that I am probably the oldest apiarist in the United States, having been in the business since 1856, and during all that time old Father Langstroth has been my only guide, and his is the only book that I would recommend to beginners. WM. SALTSIDER.

Frank Rauchfuss, the able manager of the Colorado Honey-Producers' Association, is reported as saying that that organization is a success, and that its members are well pleased. This is encouraging. But it should be remembered that it is an organization separate from the Colorado State Bee-Keepers' Association. The latter is for the discussion and promotion of matters of interest to all bee-keepers, while the former is a purely business or financial institution, conducted only for its members. There is a wide difference in the two organizations, and such should always be managed separately, we think.

Better Than a Calendar.—Mr. S. E. Johns, of Franklin Co., Pa., when renewing his subscription for 1905, wrote as follows:

"I have taken the American Bee Journal for one year, and feel like continuing it, as it is better than an almanac or calendar on account of coming so regularly. It is all right in every respect, and worth five times the small subscription charged for it. In the near future I want to send some new subscribers to it. S. E. JOHNS.

We wish to thank Mr. Johns for his kind words. Yes, and we also want to thank many others for the generous expressions of appreciation they have written us concerning the American Bee Journal. They all help greatly toward pushing on in a good work that, like all other efforts, often has its discouragements.

We hope there may be many who will go out and invite other bee-keepers to subscribe for this Journal. A large number of our present readers have already done so, and with success, but we'd just like to put on our list several thousand more new readers during this month and next. Why can't it be done? Will *you*, reader, try to send in at least *one* new subscription this month? It ought not to be difficult to get subscribers when we furnish 52 copies for only \$1.00.

A Visit to C. H. W. Weber's.—About Nov. 1 the writer visited Cincinnati, and looked in on C. H. W. Weber, and also the Fred W. Muth Co. We had never been in Cincinnati before, so everything was new to us there. We arrived quite early in the morning, and went at once to Mr. Weber's store, where we met him and also his daughter Emma. The son, Charles H., was away on a honey-selling trip, so we did not have the pleasure of meeting him.

The senior Weber worked for some years for the late Chas. F. Muth, whose business he finally bought, and has conducted it ever since. He does a large business in bee-keepers' supplies, bees and queens, honey and beeswax, and also seeds of various kinds. Mr. Weber is one of the leading honey-dealers in this country, especially among manufacturers, his monthly sales being in the neighborhood of 60,000 pounds. He also bottles considerable honey for the grocery trade.

Mr. Weber's son and daughter are his chief assistants in the store, and also in the outside honey-sales.

As most of our readers know, Mr. Weber has perhaps the largest roof-apiary in the world. In it he has about 50 colonies. He also has several out-apiaries some distance from the city.

We are pleased to present to our readers the Weber illustrations on the first page of this week's number. The Weber family are doing a good business in the lines they handle. Their reputation for square dealing is well known. Their advertisement is constantly in our columns, and the space used this year has been considerably increased over that of the past year. If they do not get their share of the honey and bee-supply trade it will not be their fault.

### Honey-Display at the St. Louis Convention.

BY N. E. FRANCE.

TO make a display of honey both attractive and educational, I asked the National Association members in every State to save carefully and separately the various kinds of honey produced in their locality. I sent 250 one-pound friction-top cans to have samples mailed in to me, as express rates were much higher. Many bee-keepers expressed their willingness to help me, but said it was a poor season with them, and there were but few kinds of honey they could secure. Samples to the number of 125 came to my home before I went to St. Louis; others came afterward, and still others were sent to the Endeavor Hotel. A large United States map was fastened to the north wall of the convention hall, then bracket shelves were placed across each State, Canada and Cuba, and on them I put most of the honey in 157 one-pound clear-glass jars, with aluminum screw top.

Some choice comb honey was also donated to help the display, but every comb was badly broken in the cartage transfer between the city and the Endeavor Hotel. The only thing I could do with it was to donate it to the bee-keepers' tables at the restaurant.

Before I got the display all on my shelving, I discovered several samples had disappeared, and not taken by the bee-keepers, either. The display was then placed in a side room, where my two sons kept watch of it for two days, until repacked for home. Many bee-keepers, not knowing this, did not get to see it. I did not get the entire display invoiced in time, but the following is what I saved:

### Evaporating Nectar—How the Bees Do It.

BY G. M. DOOLITTLE.

SINCE the appearance of the article by Adrian Getaz, found on pages 661-3 of the American Bee Journal for 1904, I have been asked several times to give my experience in the matter, some seeming to think it impossible for bees to act as Mr. Getaz says they do, under that part of his article headed "Honey", where he says:

"The bees gather the nectar and bring it home. There they put it in the cells, take it out and put it into their stomachs, put it back, and repeat the operation until the honey is sufficiently ripened. It is then left in the cells until a more complete evaporation has taken place, and then sealed."

This part of Mr. Getaz's article seems to stagger some. One writes, "I never heard of such a thing, nor do I believe it". Another says, "It seems strange that any one would advance such an idea in this enlightened age of bee-keeping. It must be a relic of the dark ages". Still another says, "If such stuff is allowed to appear in our newspapers, our occupation will be gone, for no one will want any honey after the bees have spit it out of their stomachs".

Gently, friends. Such is not reasoning, or showing a desire to know the truth in the matter. All know that the bee carries its load of nectar from the fields to the hive in its honey-sac; and, as far as I know, no one has the least spleen against honey on that account. And if honey is not contaminated by once entering the honey-sac, would it be any more so if it goes into and out of that same sac several times? Perhaps it would have been more wise had Mr. Getaz called this honey-sac by that name, but the same is, in reality, a stomach, and, if I do not err, Prof. Cook has

spoken of the honey, in its ripened form, when coming from that sac or stomach, as "digested nectar". I have always preferred to speak of it as a sac for carrying nectar and honey, and as this sac is used entirely for the purpose of holding honey and nectar, it is as cleanly as if the same was a "thrice washed" vessel used for the storing of said honey after it comes from the hive.

The only point of issue between Mr. Getaz and myself would be that he carries the idea that the field-laborer, when returning with its load from the field, deposits the same in the cells, while all of my observation during the past 30 years says the load of nectar is given to one of the nurse-bees immediately upon the loaded field-bee entering the hive, and, if the same is deposited in the cells before it is evaporated, the nurse-bee is the one to do it. This part is easily proven with an observation hive having only one comb, by watching the loaded bee which comes on the side of the comb next to you. I have sat hours by such a hive during a good flow from basswood, and I never yet saw a bee which had just returned from the field, do aught else with its load of nectar but give it to a younger bee.

This part is also easily proven by those who do not have an observatory hive. Twenty-one days before an expected honey harvest change a black queen for an Italian, or *vice versa*, and 30 to 35 days later take a look at the entrance of the hive at about noon of any pleasant day. Only black bees will be seen returning with their loads. Now look in the surplus arrangement to the hive, where honey is being deposited in the cells, and you will find nearly all the bees there of the Italian race.

"But how is the nectar evaporated?" writes one. "Tell us in the American Bee Journal."

When bees are gathering nectar from the fields they give the same, on entering the hive, to the young or nurse-bees, as I have said above. If no more is gathered than these nurse-bees can hold in their sacs, none is put into the cells. If more is gathered in any one day than their sacs will hold, the surplus nectar is put into the cells by these nurse-bees until evening, and then evaporated down, although this evaporation is going on to some extent during the day. At night all hands join—from the outside laborer with well-worn-out wings, down to bees but a day or two old—when the nectar or thin sweet is taken into the honey-sac, thrown out on the partly doubled tongue, drawn back in again, thrown out and drawn in again, and so on, until by this stirring-up process and the heat of the hive, these small particles of honey are brought to the right consistency, when it is deposited in the cells preparatory to being sealed up in due time.

In order thus to evaporate the nectar, the bees hang loosely or in festoons, so that when the drop of nectar goes out on the partially-thrown-out tongue, it shall not hit another bee, the combs or the hive.

Now, by their great roaring, humming, or whatever we have a mind to call it, the heat is increased in the hive till the nectar is thickened very fast by this stirring up process which is being gone through, as spoken of above. Take a short straw or goose-quill in your mouth and blow a drop of water gently through it out to the end, and then draw it in again, out once more and in again, thus continuing for some time, and you will have an idea of the process, all but the stirring up. This the bees can do better than we can, as it is a part of their trade, and they have the tools to do it with, made on purpose for that very business.

All bee-keepers of any experience can tell whether the bees have been getting nectar of any amount during the day by the roaring they make at night, as bees make this roaring only while reducing their nectar. Let two or three days of rain succeed a plentiful honey harvest, and all roaring will cease with the night of the third day.

Many a night have I watched this process of the reducing of thin nectar to honey, and by the light of a lamp one can see the tiny drops of nectar sparkle as it is thrown out on the tongue and drawn in again. When nectar is coming in slowly you will not be likely to see this process, as it goes on so slow at such times.

All doubtless have observed that when bees are getting honey plentifully, it shakes out of the combs easily, or falls out of its own accord when the combs are turned partly over sidewise, during the afternoon and at night; while in the morning, before the bees go to the fields, not a particle can be shaken from the combs, this going to show that the most of the evaporating of the nectar is done at night.

The economy of the bee-hive is a wonderful study, and the more we study and understand, the more enthusiastic we become, and the more we understand the better our chances of success.

Onondaga Co., N. Y.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Fair Exhibits of Honey Cookery.

"It's sad, Mr. Acklin. Takes a big lot of honey-sweetened pies to win first prize at a State Fair; and then the judges and super-numeraries eat 'em all up. Pshaw! that's not the spirit that conduces to a first-rate Fair. Such an honor should be held for more than the cost of a few pies."

The above remarks by Mr. Hasty, on page 325 (1904), caused me to look the matter up and see just how much money Mr. Acklin was wasting on honey-sweetened pies, etc., and I was astonished at the amount, for if my arithmetic is all right, he took \$110 worth of premiums in all, and \$12 of it was for goodies that he—more likely his wife—cooked with honey, including pie, cake, marmalade, jams, and jellies. Either it must have taken quite a number of each of the five kinds to make a display, or they must have been marked up pretty well in price to make it a losing business, with each display at \$2.40.

But I really think Mr. Acklin deserves a vote of thanks from bee-keepers in general for his efforts in bringing honey and honey products before the people in the way he is doing. That's what will help the sale of honey.

### Making a Scriptural Cake.

"Search the Scriptures"! a lady was heard to observe in a Catonsville car, coming into town. "I have searched the Scriptures this morning from cover to cover and until I was blue in the face, and what do you think I did it for? To find the recipe for a cake!"

"A year ago I paid 5 cents at a church fair for an envelope said to contain a card upon which was printed the recipe for a Scriptural cake. It sounded interesting—it certainly ought to have been good; but when I opened the envelope this is what I read: (Here she fished a card from her portemonnaie, adjusted her glasses, and read the following):

#### SCRIPTURAL CAKE RECIPE.

- 4½ cups of I Kings, iv, 22.
- 1 cup of Judges, v, 25, last clause.
- 2 cups of Jeremiah, vi, 20.
- 2 cups I Samuel, xxx, 12.
- 2 cups of Nahum, iii, 12.
- 2 cups of Numbers, xvii, 8.
- 3 tablespoonfuls of I Samuel, xiv, 25.
- A pinch of Leviticus, ii, 13.
- 6 Jeremiah, xvii, 11.
- ½ cup of Judges, iv, 19, last clause.
- 2 teaspoonfuls of Amos, iv, 5.
- Season to taste of II Chronicles, ix, 9.

"Now", she resumed, "I have had that thing in my possession until I have grown to hate the very sight of it. First I thought it would be fun to look it up, and put it on my dressing table. Then I got tired seeing it there and it drifted to the sewing basket. Next I kept it in the machine drawer to measure the hem for curtains. Finally I threw it in the waste paper basket, but the maid spied it and returned it to me as something of value. In desperation I decided to be haunted no more, but look up the exasperating thing and have done with it. This morning I have looked it up; here is the recipe, and I mean to lose the original card before I return home this day". And she laid it maliciously down on the seat opposite her and deliberately got out of the car, leaving it to haunt some one else, but she also left the key to the puzzle, which, being interpreted, readeth as follows:

4½ cups of fine flour, 1 cup of butter, 2 cups of sugar, 2 cups of raisins, 2 cups of figs, 2 cups of almonds, 3 tablespoonfuls of honey, a pinch of salt, 6 eggs, ½ cup of milk, 2 teaspoonfuls of yeast powder, season to taste with spices.—Baltimore Sun.

See Langstroth Book Offer on another page of this copy of the American Bee Journal.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### LATE HONEY NOT ALWAYS DARK.

Sooner or later somebody will "shoot off his mouth" and say that late honey is always more or less dark. Frank Hinderer's experience, page 778, can be stowed away as ammunition to shoot back at him. Honey as white as honey ever gets, being stored when frost cuts it off. We'll not be able to say that this is very common, I reckon.

### EXTRACTING FROM COMBS CONTAINING BROOD.

I wish to thank Mr. S. B. Smith for his kindly support in the matter of extracting from combs containing brood. You see, sometimes a fellow feels lonesome and skittish when he attacks an old and stubborn evil which has a multitude of defenders. Much the better way to make our champion *feel* that there is somebody at his back, rather than remark at his funeral that you always rather admired the way he sailed into giants and things. Page 779.

### "ENGLISH AS SHE IS WRIT"—"PAWS" HERE.

Here's advice that that editorial scrimmage about good and bad English, and the paws, be allowed to pause before it extends to very many counters. Has been claimed that there exists a being reputed to have claws—and he bewilders, and oft captures, him who pauses among his clauses with a well-worn but always serviceable proverb: "The man who isn't a fool part of the time is a fool all the time". Well, I don't claim to be ministering in his name exactly (critic might say so perhaps), but I incline to parallel his favorite saw. The man who doesn't write bad English part of the time writes bad English all the time—makes it so stupid and inane in its faultlessness that nobody would read it if he could get rid of it. Or, if you prefer to get the thing clear down to hard pan, most of that which is assailed as bad English is not bad—only *different* from the usage of the linguistic Pharisees. The object of language is to make people understand. Do that one thing and pretty much all conducting thereto is *English*, neither more nor less. English is that whereby live people convey live ideas to other live people. Concentrated tincture of grammar-book and dictionary passed from mummy to mummy through a dry-wood stalk—that's not English. Page 819.

### FOUL BROOD AND BLACK BROOD.

And here is something which we do not positively know as yet, but which is valuable as one of the working theories to account (it may be) for puzzling differences in bee-diseases. "Some other microbe, which, in conjunction with *Bacillus alvei*, changes the general character of the disease so that it gives rise to 'black brood'." Page 728.

### SAWING OFF SWARMS ON TREES.

I, for one, regret that so elaborate a set of views illustrating swarming as that of E. R. Root, should show the cluster *sawed off*. The net result of its exhibition will be to confirm a prevalent blunder—evil—nuisance—which is too well established already. Our folks have sawing off "on the brain". Of 1000 swarms which will be cut off bough and all next season, we may be tolerably well assured that 500 could have been taken *easier* by shaking into a basket—to say nothing of the other advantages of so doing. Several hundred of these cuttings off will represent quite an amount of damage done to neighbors' property, with consents very regretfully given—or, worse yet, cut the bough first and ask permission afterward. Full 400 will be more or less shaken off and scattered in the process of cutting off. And 300 will be spilled, in whole or in part, on the road to where they are wanted. Besides this, bees in a basket are much more easily ladled out at just the proper rate as they are wanted. Some 700 of the 1000 swarms will rush around in wrong directions while being hived, simply because too many have been dumped down all in a heap. The cutting off process, when it is a complete success, is a *spectacular* success (that's what ails us,) makes the outsiders

stare; but I take it we are not in the business for the purpose of making people stare. Of the minor reforms which we need this is one of the more desirable ones—that getting a cluster into a basket or other receptacle the first thing shall be recognized on all hands as the *regular* way, and all cuttings off exceptional. Page 787.

MR. DITTMER AS NO. 3.

Foundation maker No. 3, with a year's output of 25,000 pounds—pretty well done for Mr. Dittmer. Some of us maybe would have guessed him down to No. 12 or No. 20. Page 788.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

### Keeping Bees in the Woods—Swarming.

I have 60 colonies of bees that have been very much given to swarming, and as they stung the baby badly last summer I must move them out. I think of putting them in an open place in the woods, near the main road, but hidden from it by low pines and cedars on all sides. They are all in 10-frame Jones hives, frames 13 inches deep and 11 inches wide inside, with one story put on for extracted honey, having 12 or 13 frames the same size as the above, and a zinc bottom-board nailed to it. How will they do in the woods, and how shall I manage without any one to hive swarms? They are packed in large four-hive clamps, and remain in the sawdust packing all summer (and winter).

Ten yards from the woods, at the home yard, the squirrels destroyed several supers full of pollen combs last winter, and gnawed right through top-bars  $1\frac{1}{8} \times \frac{7}{8}$ . Then the Indians often camp in the corner of these woods about 10 rods away, and might learn to steal the honey, or even the bees, and also white hunters that are constantly passing so near.

I have twice tried to keep down natural swarming in the yard by forced swarming, but they only swarmed the more. Last year I made one out of two strong ones, *a la* Langstroth method. Move A to a new stand C, and most of the brood from B in its place.

I have not clipped very extensively any year, but have thought of doing so if I put them in the woods. I usually put on the supers in apple-bloom, having two or three frames of brood in them to coax the bees up. Next spring I think I will put the queen up also, having her clipped, and at least half the brood.

In "Forty Years Among the Bees" (page 188) you say that it is no little work to look through the colonies every 10 days. I got a pointer from a neighbor farmer bee-keeper in regard to this. He remarked that if the hive were tilted back and a little smoke blown in, the cells could usually be seen at a glance by a practiced eye, and this fact was confirmed at our Toronto bee-keepers' convention by Mr. Hoshal. You would probably find a higher stand more convenient, say those same 6-inch boards on edge and on four flat stones, and the Van Deusen clamps to prevent supers slipping off when tilted back too suddenly. ONTARIO.

ANSWER.—A place so surrounded as you describe by timber ought to be a capital place for wintering bees, and the better shelter ought to make up for the possibly shorter hours of work on some days. You are right that there must be careful protection against squirrels, and especially against their getting a *start*. I suspect that a squirrel will hardly begin gnawing where it can smell nothing, although I don't know. If there is danger of their gnawing their way in at the entrance, coarse wire-cloth, three meshes to the inch, would be a good thing.

It was a mistake to try to keep down swarming by *early* forced swarming. The later the better, only so that it is done before the bees swarm naturally.

The Langstroth plan of making swarms by transposing will postpone swarming rather than prevent it.

If you think of putting the queen in an upper story over an excluder, better try it on a small scale, for I'm pretty sure you'll not like it. But clipping should be tried on a

large scale. As you are working for extracted honey, you ought to be able to get along with little or no swarming if you put all the brood in the upper story, giving empty combs, foundation, or starters below, doing this as late as possible without running the risk of their swarming. That would not hinder your putting up one or more frames of brood in fruit-bloom, if you so desire, but leaving the queen below.

While it might be true that with a shallow hive like the Heddon most of the queen-cells could be seen without taking out a frame, it would hardly be safe to trust to it entirely, for too often the bees start cells in places that can be seen only by taking out the frames. You say the cells can usually be seen, but to be safe against swarming we must always see them.

I think you are right that my stands would be better if the boards were on edge instead of flat, but I have no need to clamp supers and hives together, for it is never necessary to tilt a hive back when supers are on.

### Feeding Bees Cane Syrup—Sowing Clovers in Sandy Soil.

1. I have a few colonies of bees, but they do not do very well here at any time. This year they did comparatively nothing. I have been feeding them this fall on pure cane syrup. Is it good for them? I have been told that it would kill them.

2. If it is good for them how should it be fed?

3. Do you think it would pay to sow some kind of clover for them down South on our sandy soil? If so, what kind of clover is the best? I have an orchard of about one acre, and I have been told that clover would do well in it, but it is more dirt land than sandy. I have tried buckwheat, but it does not do well here.

LOUISIANA.

ANSWERS:—1. I suppose you mean the unrefined syrup that has never been made into sugar, which would probably be death to bees for wintering in the North; but I don't know about it so far south as Louisiana. If bees can fly about every week, it is possible they might winter on it all right, but for anything I know it is also possible that it wouldn't do. Will some of the Southern readers tell us about it?

2. It could be fed with any of the feeders, or by the crock-and-plate method, either in the hive or in the open air. For the crock-and-plate method, fill a stone crock (a gallon crock is a good size) with the syrup, tie over it a single thickness of heavy woolen cloth, or its equivalent, as five or six thicknesses of cheese-cloth, lay over this a plate upside down; with one hand under the crock and the other over the plate quickly turn the whole thing upside down, and your feeder is all ready.

3. Try sweet clover, sowing it as early as seeds begin to start, and pack or roll the ground hard after sowing. Some have reported failure with sweet clover in some parts of the South, but you may succeed all right. Possibly crimson clover might succeed.

### Burr-Combs—Brace-Combs—Langstroth Hive Size—Requeening Colonies.

1. What is a burr-comb?

2. What is a brace-comb?

3. What are the exact inside dimensions of a Langstroth 9-frame brood-chamber?

4. One of my colonies was robbed out last month, the hive containing 18 pounds of honey. The bees clustered on the outside of the hive, and remained there two or three days. I noticed that some of them shook violently when crawling over the cluster. I fixed up another hive with some honey, and put them in it, and they seem all right, and defend their entrance well. This colony is so strong it fills an 8-frame hive-body full. Why did these bees get robbed? Do you think them queenless? Why did the bees shake so when crawling? Were they starving?

5. The main honey-flow begins here about the first of May. If I find some of my colonies queenless in the spring can I get queens from some breeder in time to build them up for the flow?

6. In sending queens by mail what are escort bees put in for? To keep up the temperature, or feed the queen? I have heard it said the queen would starve to death in the midst of plenty if the bees did not feed her.

7. Which will drown the most bees, the Simplicity feeder or the Division-Board feeder; or rather, which will drown the least?

8. In 1902 I had 3 colonies of bees; in 1903, 54; and this

year I have 65, and during these three years I have not had a single swarm. What do you think of that?

CALIFORNIA.

ANSWERS.—1 and 2. The terms "burr" and "brace" are used somewhat indiscriminately, "burr" more properly referring to bits of comb built over the top-bar or elsewhere, perhaps without connecting two parts together; and "brace" being used to designate bits built between frames or combs, thus serving to brace them.

3. There is no exact dimension. The size of the frame, outside measure, is  $17\frac{3}{8} \times 9\frac{1}{8}$ , and the hive must be of a size to accommodate the eight frames, usually with additional room for a dummy. Some allow more room than others for the frames; a hive that I have just measured is  $18\ 5\text{-}16 \times 12\frac{1}{2} \times 9\frac{1}{2}$ , and perhaps the majority nowadays are of that size.

4. I'd like to look the ground over before attempting any reply. It seems an extraordinary thing that a very strong colony should be robbed out and then defend itself well after being changed into another hive. I don't know why the bees allowed themselves to be robbed, and if queenless they would be most likely to be robbed after being changed into another hive. That violent shaking was more likely dancing than starving.

5. Yes, if they have not been queenless too long. If the queen was lost so early last season that only a few very old bees are left, it won't pay to fuss with them.

6. The escort bees feed the queen and keep up the temperature, and it is quite possible that they serve an important purpose in keeping up her spirits by their genial company.

7. There ought to be no difference; neither one ought to drown any bees to speak of.

8. I think I'd like to know how you do it. Please tell us.

### Disposition of Foul-Broody Hives and their Contents.

1. Are you acquainted with foul brood?

2. About what time would it do to shake bees on the starters if they have foul brood, that is, how early in the spring? Apple-trees bloom about May 10th or 15th.

3. What would you do with all the supers, one-pound boxes and starters that are in them, also the hives if they are in good condition?

4. What would you do with straight combs from such hives, some of them containing foul brood and others not?

5. I have the "A B C of Bee-Culture," dated 1877. Is this the most up-to-date book I can get for a beginner on this subject?

NEW YORK.

ANSWERS:—1. We are not what you might call intimate friends, foul brood never having condescended to make a personal call on me; still I have a speaking acquaintance from having met it elsewhere.

2. "In the honey season when the bees are gathering freely," says Mr. McEvoy. Unless your bees do a pretty heavy business on fruit-bloom, better wait till the opening of the main harvest.

3. Use them.

4. The safe thing would be to melt them up.

5. There is a 1905 edition of the "A B C of Bee Culture," a 1904 edition of Dadant's Langstroth, and a 1904 edition of Cook's Manual. Dr. Howard's pamphlet on foul brood is devoted entirely to brood-diseases.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

## Convention Proceedings

### THE ST. LOUIS CONVENTION.

#### Report of the 35th Annual Convention, of the National Bee-Keepers' Association Held at St. Louis, Mo., Sept. 27-30, 1904.

[Continued from page 888.]

The President called upon Mr. N. E. France, the general manager of the Association, to address the convention on a subject not named.

#### RECOMMENDATIONS OF THE GENERAL MANAGER.

Mr. France—You see I have been idle all the time since I have been here. In just this kind of idleness, almost night and day for a year, I have been working for you. Our secretary, Mr. Brodbeck, wrote me he wanted a program that would be a credit to us and make this convention the best that had ever been—and I believe it is so far—and I said, I am with you in anything to make the National a success. Assign me any topic you please, and if I am prepared I will accept it, and if I am not I will try to be prepared. That is the secret of success in anything. But it has been one continuous strain, day and night, to get material in shape to make this meeting a success. I wanted to put an illustration before this assembled body that has never before been produced, which would educate them, in the form of this map that I had advertised. To illustrate the point in view, if you would take samples of honey branded "white clover" from the various bee-keepers you would find there is a great variance, and that somewhat affects our market. We do not all judge alike. We are not satisfied unless we all have one and the same price.

There are so very many duties that devolve upon this office that I hardly have time at home to know whether my family are there when I get home or not. This year my father, now past eighty, is not able to superintend the work at home, and the two little boys you saw here with one older, have had the whole care of the house, and between 400 and 500 colonies of bees and twenty acres inside the city, which we pay \$60 taxes on. Men have asked me, "How many colonies of bees have you got?" Honestly, I don't know. We had somewhere about that number in the spring. I have been home occasionally a day. When I get back there is from one to three baskets full of National Association correspondence, and I am right there at the typewriter until I go away again. So I am sorry to say I come before you to represent the National Association without preparation.

There is one thing I have felt from the beginning and that is, this Association has got upon a living basis; like the National Government at the close of the Civil War, it has now opened its doors to an endless growth. When you think of the endless bee-keepers in the United States, and the comparatively few we have in our ranks, what a chance there is for development! Can we interest those who are not members to become a part of us? Our fees are not standing in the way, for they are nearly all coming in now on the half-rate.

The insurance part of the Association has given me a good deal of anxious, careful study. Hours that I should have had for rest have been, many of them, spent with attorneys who have been kind enough to give me their advice gratuitously. Largely coming from our city bee-keepers who get into quarrels with our neighbors not because of the bees but through their different affairs, and finally the bees are brought in connection with it, and as a result they get into a quarrel and then step, as it were, back and say, "I belong to the National Association, I have got into trouble, you help me out." I am sorry those conditions have come about in our Association. I hoped the day had dawned when we would dis-

continue that and allow this Association to develop in these new phases of fighting adulterated honey, and creating a greater uniformity of market among bee-keepers over all the world. There are world-wide things we ought to be doing instead of these smaller and not so important matters.

In the extreme West where last year they had such a bountiful honey-flow this year has been a failure in South California, and much has been the correspondence there to save our National from litigation; the bees were in a starving condition. As a matter of fact if there is anything sweet exposed the bees will work upon it, and the swarms of letters that have been poured upon me in behalf of the bees working upon fruit; and the cries that the bees were injurious to it, have been very great, and it seemed for a time the bees were going to be removed from various cities in California. One test case of that finally came up, and we have carried it through to a success, have gained our point, although it has cost the Association about \$200 for the attorney's bills; yet it has quieted that section of the country.

For those of us who live near neighbors, and our bees, in the spring perchance should spot the neighbor's clothing, how nicely a little donation of honey, friendly given, or paying for the relaundering of the clothing, would settle all that grievance. If our bees go to our neighbor's trough or place where the water is obtained, and they are an annoyance there, sweeten that away with a little kindly donation of honey. If our bees annoy our neighbors in a garden or upon the near highways, you know they can be sweetened in the same way. Oh, I have gone to various places and have compromised it without any litigation, by just bringing the two parties together and having a little honey and new biscuits. Keep together, compromise, keep out of court. Be brothers hereafter.

You have many topics this morning that you would like to have discussed, and to me one of the most vital things to the bee-keeping industry is to keep our colonies free from disease. The subject is to be fully discussed tomorrow, and I hope you will be here. This National Association is in a shape, if you will join hands in union with me, that it can help you get the desired legislation. This Association can help to check largely this cry about the adulteration of honey, either extracted or manufactured, as it was claimed, in comb, but I can't do it alone; and as the editors of your bee-papers the past summer have asked you to swarm in your letters at designated points, I too have been in the same harness and have done the same. I have written those parties and I have asked others to do so, and I believe it has had some of the desired effect.

I issued a little pamphlet on bees and horticulture for the benefit of those who were receiving injury by people spraying fruit-trees, while in bloom. This became alarming in some parts of our country, and many apiaries suffered severely. The little pamphlet has had its desired effect, and I saw, after those were exhausted and many more called for, wherein I had made a mistake. We should have had it stereotyped so that we could issue more without having it all reset. We need more copies. Later on our city bee-keepers got into trouble and we needed some instruction on what the courts say pertaining to their cases. That also I gathered together as best I could, hurriedly, into a little pamphlet, and it has saved our organization from what looked to be expensive suits. It was this little, red leaflet. I hope the city bee-keepers will commit page 35 to memory pertaining to bees and their neighbors. To the new bee-keepers or new members, if there is any part of this literature they have not received, and will make it known, I will see they get it.

You have stood by the Association in her days of need, and in a financial way it looks now as if it were on a basis of permanency. We haven't any great amount in our treasury. We had about \$1,115, I think, at the close of the last year; and, anxious to get this report out early, at the time I closed up that part of the statement here a few days ago it was almost the same amount within a very few dollars—it will be a little shortage on account of this \$200 suit which we will have to meet in California, and there are some other things that may reduce that a little, but the additional membership coming in will very nearly off-set that. I don't believe this Association wants a big amount of money lying idle,

but I do want to see this Association have a treasury we can fall back upon to spread educational literature abroad.

Let us stop this quarrelsome business, and let the money go in some other way. I believe you know the workings of the Association. I am yours for all there is in it, and I want you to stay by the Association.

N. E. FRANCE.

The President announced the committee on National organization to consist of F. E. Brown, California; H. S. Ferry, New York; E. E. Pressler, Pennsylvania; J. Q. Smith, Illinois, and E. S. Lovesy, Utah.

Mr. Reinecke moved, seconded by Mr. Dadant, that a hearty vote of thanks be tendered Mr. France for his excellent work during the past year. [Carried.]

(Continued next week.)

**BEE JOURNAL**  
PUBLISHED WEEKLY BY  
**GEORGE W. YORK & COMPANY**  
334 Dearborn Street, Chicago, Ill.

**IMPORTANT NOTICES.**

**THE SUBSCRIPTION PRICE** of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

**THE WRAPPER-LABEL DATE** indicates the end of the month to which your subscription is paid. For instance, "dec4" on your label shows that it is paid to the end of December, 1904.

**SUBSCRIPTION RECEIPTS.**—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

**ADVERTISING RATES** will be given upon application.

**National Bee-Keepers' Association**  
Objects of the Association.

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

**Annual Membership Dues, \$1.00.**  
General Manager and Treasurer—  
N. E. FRANCE, Plattville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

**PROGRESS**

I publish and recommend to you **THE RURAL BEE-KEEPER**, the best all-around 50-cent monthly bee-journal in America. On trial 3 months for this ad, with 10 cents. Clipped with this publication both for one year for \$1.25; or send us 25 cents for a 3 months' trial and your name and address on a 2-line rubber stamp; self-inking pad, 25c extra. Or send \$1.00 and get **The Rural Bee-keeper** and an **Untested Italian Queen-Bee**. Sample copy free. Agents get liberal terms.

# Reports and Experiences

## Bees as a Nature Study.

The issue of Dec. 1 has a call for an "experience meeting" on the subject of bees as a Nature study. The call comes from Dr. E. F. Bigelow. Personally, this has been a very interesting subject. While honey has always had a special attraction for me, as I know it has had for other "kids", my experiments and observations on the life-history of the honey-bee have been interesting, fascinating and instructive in the highest degree. The Good Book says: "Go to the ant and be wise". I think if the people then had known as much about the honey-bee as we do, it would have said: "Go to the bee and learn many wonderful things". (Possibly it might also have added, and "sweeten up".) Perhaps ants also include bees, as they are related. If so, the above suggestion does not hold good.

The life-history of the bee will furnish a most interesting study for scientific students just as an observatory

# LOST, STRAYED OR STOLEN

The telephone gets the news of your loss all over the country long before you could get to town and get postal cards sent out. You can arouse your neighbors in time to help "catch the thief," besides it's handy on the farm every day, especially in emergencies—when you are in trouble and need help quick.

## Stromberg-Carlson TELEPHONES

are the cheapest telephones because they are the best. They pay for themselves in a short time, remove many of the disadvantages of farm life, and extend the farmer's influence. Make home more pleasant for the wife and children and open up new opportunities for the whole family. Write for book F 80 "Telephone Facts for Farmers." It's free, and full of just what you want to know—how to organize, build the line, etc. Send for book. Address nearest office.

hive is an interesting sight to the average person. It was my pleasure, last summer, to exhibit bees at two county fairs. Also to prepare an exhibit for the Milwaukee Public Museum, where students from the city schools come for Nature study. Nature study here readily adapts itself as an object lesson for mere idle curiosity seekers to most accurate study for scientific observations; particularly for microscopic observations. I need but mention the adaptability of the subject for reading lessons, as the work of most readers that have come under my observation embodies more or less of this subject. I have also found it well adapted for language work, both for information lessons and language drill.

In closing, I want to add a suggestion and caution. Get your information from a reliable, up-to-date beekeeper or some standard books. Considerable interest has of late centered around school libraries. The State superintendent of schools issued a

#### White Clover—Golden Italians— Shipping Queens.

My report for 1904 is about 850 pounds of honey-dew and 1050 pounds of fall honey, all extracted from 34 colonies, spring count.

I am afraid bees will not winter well on account of honey-dew being left in the hives for winter stores.

The prospects for white clover honey are not very promising. We have had an unusually dry fall, and I am afraid the white clover is much damaged. There is about 4 or 5 inches of snow now, and it remains to be seen whether or not it will benefit the clover.

During the past summer a good deal was said about the merits of golden Italians, and somebody asked for the experiences of those who had them. I have kept them since they were first advertised, and nearly all of mine are of that strain. In 1903 my 33 colonies, spring count, produced 8360 pounds of honey, mostly extracted, or an average of 253 pounds per colony. I would like

### SHENANDOAH YELLOW

The corn that has made Shenandoah famous. Has outyielded all other varieties of yellow corn wherever tested. A deep grained 100 day yellow corn, ripe in September. Will outyield, outshell, and outsell any yellow corn you ever grew. The world's husking record, 201 bu. in ten hours, was made in this corn near Shenandoah, Dec. 5, 1913. ## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

to know how much better those so-called long-tongued red-clover bees have done? I find the golden Italians quite as gentle as the 3-banded bees, but the difference is small.

A great deal has also been said about poor queens, and much of the blame has been put on the shoulders of the queen-breeder. When the Italians were first introduced into this country there was no such complaint. All the queens were then shipped in small boxes with from about 50 to 100 bees, enough to form a small cluster to keep the queen warm during chilly weather, and to make their prison a little more homelike. I fully believe the shipping of queen-bees by mail has proved a curse rather than a blessing to bee-keepers.

FRED BECHLY.

Powesheik Co., Iowa, Dec. 13.

### Hail-Storms Disastrous to Honey-Crops.

The honey crop in Prowers County has been only fair the past season, in some parts scarcely any surplus. The hail plays such havoc when it strikes the bloom and nectar-yielding plants that the honey crop can not be counted on until harvested.

Mr. Frank Benton's advice about crossing the Italian with the Carniolan bee, and raising sandy vetch for pollen, would do good if again published.

JOHN S. SEMMENS.

by the Department of Agriculture as speaker.  
There will be two sessions each day. The busi-  
ness of the Ontario County Bee-Keepers' Asso-  
ciation will be transacted during a part of these  
meetings. F. GREINER, Sec.  
Naples, N. Y.

New York.—A bee-keepers' institute, under  
the auspices of the Bureau of Farmers' Insti-  
tutes of the State of New York, will be held at  
Fulton, N. Y., Monday, Jan. 16, 1905. Mr. N. E.  
France has been engaged by the Department of  
Agriculture, as speaker. The annual business  
meeting of the Oswego County Bee-Keepers'  
Association will be held at the same time and  
place. CHAS. B. ALLEN, Sec.,  
Central Square, N. Y.

MORTIMER STEVENS, Pres.

New York.—The Fulton and Montgomery  
Counties Bee-Keepers' Society will hold the  
next meeting at Amsterdam, N. Y., Thursday,  
Jan. 19, 1905, in connection with a bee-keepers'  
institute. Arrangements have been made with  
F. E. Dawley, Chief of the Bureau of Institutes,  
to furnish Mr. N. E. France, General Manager  
of the National Association, as the principal  
speaker, and all are cordially invited to come.  
This will also be the annual business meeting  
of the society. T. I. DUGDALE, Sec.  
West Galway, N. Y.

Nebraska.—The annual meeting of the Ne-  
braska Bee-Keepers' Association will be held at  
the Experiment Station at Lincoln, on Monday,  
Jan. 16, 1905, at 2 p. m. Will you be there and  
favor us with a paper along the lines of bee-  
keeping in which you are particularly inter-  
ested? It is hoped that Ernest R. Root will be  
present for a good talk. Headquarters will be  
at The Windsor Hotel, where cheap rates have  
been secured. This will be one of the first  
meetings in the weeks' series; let us have a good  
one. L. D. STILSON, Sec., York, Nebr.  
E. WHITCOMB, Pres.

New York.—A series of bee-keepers' meetings  
have been arranged for in this State, as fol-  
lows: Canandaigua, Jan. 9, 10; Auburn, Jan.  
12; Syracuse, Jan. 15; Watertown, Jan. 17, 18;  
Rome, Jan. 11; Cortland, Jan. 13; Fulton,  
Jan. 16; Amsterdam, Jan. 19. Mr. N. E. France,  
the general manager of the National Bee-Keep-  
ers' Association, has been engaged to address  
the meetings, by the State Department of Agri-  
culture, through the Bureau of Farmers' Insti-  
tutes, F. E. Dawley, Director. The convention  
at Watertown, Jan. 18, will be the meeting of  
the State Association, at which many of the  
progressive bee-keepers of this and adjoining  
States are expected to be present and take part  
in the discussions. C. A. HOWARD, Sec. W. F. MARKS, Pres.

Michigan.—The Michigan State Bee-Keepers'  
Association will hold its annual convention  
Feb. 23d and 24th, at the Eagle Hotel in Grand  
Rapids. The Eagle Hotel is located at 65 to 71  
Market St., cor. of Lewis St., one block south  
of Monroe St. It will give a rate of \$1.50 per  
day, and furnish a room free for holding the  
convention. The Michigan State Dairymen's  
Convention will meet in Grand Rapids at the  
same time, and advantage may be taken of this  
fact to secure reduced rates on the railroads.  
When buying your ticket, ask for a certificate  
on account of the Dairymen's Convention. The  
secretary of the Dairymen's Association will  
sign this certificate which will then enable the  
holder to buy a return ticket for one-third fare.  
Several associations often thus meet at the  
same time and place, the secretary of one asso-  
ciation signing the certificates for all of the as-

sociations, the same being done with the knowl-  
edge and consent of the railroads—it simplifies  
matters. Grand Rapids is the second largest  
city in the State, easily accessible from the  
north, south, and central parts of the State, in  
the heart of a good bee-country, and, with the  
low rates assured, there should be a large  
crowd in attendance. W. Z. HUTCHINSON, Pres.

**Honey and  
Beeswax**

CHICAGO, Dec. 7.—The market is well supplied  
with all kinds of honey; the demand is of a  
light nature. Fancy comb honey brings 14c,  
but quality as well as appearance is necessary;  
No. 1 sells at 12½@13c; off grades difficult to  
move at 1@3c less. Extracted, choice white,  
7@7½c; amber, 6@7c, with off grades about 5½c  
per pound. Beeswax, 30c. R. A. BURNETT & Co.

NEW YORK, Dec. 7.—Receipts of late have  
been quite heavy, and while there has been a  
fair demand, it has not been up to former years  
and stocks are somewhat accumulating, conse-  
quently prices show a tendency to decline, and  
in large lots quotation prices as a rule are  
shaded. We quote fancy white at 14@15c; No.  
1 white at 12@13c; amber, 11c; buckwheat, 10c.  
Extracted in fair demand at 6@6½c for white  
clover; 5½c for buckwheat; 50@60c per gallon  
for Southern, according to quality. Beeswax  
firm at from 28@29c. HILDRETH & SEGELKEN.

KANSAS CITY, Dec. 22.—The honey market  
here is slow and prices rule low, fancy white  
comb honey selling at \$2.25 per case; other  
grades as low as \$2.00. Extracted from 5½@6½c  
per pound, and in fairly good demand. Bees-  
wax in good demand at 30c. We look for a bet-  
ter market later on. C. C. CLERMONS & Co.

PHILADELPHIA, Dec. 24.—As usual around the  
holidays, there is not much call for either comb  
or extracted honey. Prices remain about the  
same as the last quotations. Some odd lots  
having arrived in the market in the last 10 days  
weakened the price of lower grades. Fancy  
white comb, 15@16 cents; No. 1, 13@14c; amber,  
11@12c. Extracted, white, 7@8c; amber, 6@7c.  
Beeswax, 26c. We are producers of honey and do not handle  
on commission. WM. A. SELSER.

BOSTON, Dec. 22.—During the honey season  
the honey demand has been practically at a  
stand-still. Stocks seem to accumulate rather  
than to diminish. While prices are practically  
as per our last, yet on the whole, the tendency  
seems to be to a lower level. Our market to-

day is practically as follows: Fancy white,  
16c; A No. 1, 15c; No. 1, 14c, with practically no  
demand for No. 2. Extracted, from 6@8c, ac-  
cording to quality. BLAKE, SCOTT & LEE.

CINCINNATI, Dec. 10.—The demand for honey  
at the present time is not good, owing to the ap-  
proach of the holidays, when too many sweets  
are found on the market. On the other hand,  
the trade is well supplied with comb honey,  
that will require a considerable length of time  
to be consumed. We are offering white clover  
extracted honey in barrels and cans at 6½@8½  
cents; amber, 5½@6½c. Fancy comb honey,  
12½@14c. Beeswax, 29@30c. THE FRED W. MUTH CO.

ALBANY, N. Y., Dec. 26.—Comb honey is mov-  
ing off very well considering the heavy re-  
ceipts and cold weather. Prices not as high  
as early fall, as usual, but very good yet.  
Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c.  
Buckwheat, 11@12c; mixed, 10@11c. Extracted,  
dark, 6@6½c; light, 6½@7c. Beeswax, 28@30c.  
H. R. WRIGHT.

CINCINNATI, O., Dec. 19.—Comb honey is now  
coming in more freely, and prices if anything  
have moderated a little. The sales made and  
prices obtained were for No. 1 fancy water-  
white comb, 12@13½c; single cases, 14c. Ex-  
tracted is sold as follows: White clover,  
in barrels, 6½c; in cans, 7½@8c; amber, in bar-  
rels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c.  
C. H. W. WEBER

SAN FRANCISCO, Dec. 14.—White comb, 1-lb.  
sections, 11½@12½c; amber, 9@11c. Extracted  
white, 6@6½c; light amber, 4½@5½c; am-  
ber, 3½@4½c; dark amber, 3@3½c. Beeswax,  
good to choice, light, 29@30c; dark, 27@28c.

The market is quiet. Stocks are not of large  
volume, either here or in the interior, but some  
of the principal holders are urging honey to  
sale, being desirous of effecting a clean-up at  
an early date.

# A PROSPEROUS NEW YEAR.

Begin now to make ready for next season's harvest. Send for our Catalog, lay your plans, order your Supplies, get them ready. By that time you will find you are none too soon.

We have been working all winter to fill our warehouses and stock our branches and agents. We are better prepared than ever to ship your goods promptly.

But don't put off ordering. There may be some unforeseen delay. Glance over the list below and write to our branch or agent nearest you for Catalog.

Root's goods are the cheapest. You cannot buy good goods for less prices, and we have unexcelled facilities for saving you freight.

## BRANCHES.

Chicago, Ill., 144 East Erie Street.  
Philadelphia, Pa., 10 Vine Street.  
New York City, 44 Vesey Street.

## Editorial Notes and Comments

### Getting People to Use More Honey.

This is a subject that should interest every producer of honey. We would like to invite those who have had successful experience along this line, to tell about it. Something should be done to get more people to consume more honey. We have often said that we believed that honey should become a daily food—on every table in the land. It is not so now. We believe if the facts were known, but a very small percent of the American families ever use any honey. And why? We believe it is because so few people know the real value of honey as a food.

Quite a number of people seem to think that honey is good only for a cold—to be taken simply as a medicine! This is a great mistake. Not that honey is not a good remedy for certain physical ailments, but it is a mistake not to use it more regularly as a food. It should take the place, to a larger extent, of sugar, or even certain spreads for bread.

It seems to us that here is a field for some of the best thought that can be brought to bear on it. Why is not more honey used by the ordinary families of to-day? What can be done by bee-keepers to induce them to use it more than they do?

### Shaken Swarms 39 Years Ago.

The Canadian Bee Journal reprints an article by George W. House, which appeared in the Bee-Keepers' Magazine for May, 1880. It gives the *modus operandi* for shaking swarms, which, Mr. House said, they had been practicing for 15 years. That would make the plan at least 39 years old. "There is no new thing under the sun."

### Baby Nuclei for Fertilizing Queens.

Opinions differ as to the feasibility of fertilizing queens with the very small number of bees used in the so-called baby nuclei; but, on the whole, they seem to be gaining in favor. Some think they may be used by professional queen-breeders, but not by the rank and file of honey-producers. There is no reason why the honey-producer, with only a dozen colonies, should not use baby nuclei as well as the man who rears queens for a living, if he is willing to be at the expense of procuring the proper paraphernalia.

Yet, at the Chicago convention, Dr. Miller urged that

these miniature colonies could be used for fertilizing queens—as they had been used by himself—without anything other than the ordinary hives in use, and a few one-tier wide-frames to hold one section each.

The question has been raised whether, in ordinary hands, these baby nuclei would succeed in the cooler portions of the country, early or late in the season. In ordinary hands—indeed, in the most skillful hands—there is likely to be trouble in getting virgins fertilized at any time out of the honey season, even with strong nuclei, and with the honey-producer there is little necessity for it. The experiment can easily be tried by any one, even if he uses only cells obtained from colonies that have swarmed.

### Best Reading-Time Right Now.

No doubt during the busy summer-time many a bee-keeper finds little time or inclination to read his bee-papers or bee-books. He is then rushed with either bee-work or other employment. So the time to read, for many, is during the long winter evenings and perhaps on stormy days.

Fortunate indeed is he who has saved all his bee-papers as they came during the busy season, for now he can simply revel in them, and lay up a store of apicultural information that will help make greater his success with the bees next season.

And the bee-books! Every bee-keeper should have one or more of the best. In any of the complete books will be found answers to a thousand and one questions that every bee-keeper needs to be familiar with in order to attain the largest success.

It pays to become familiar with the experiences and methods of others in the same line of business. Such knowledge may save much useless effort, and often loss, to the one who reads extensively, and is wise in his selections.

### Treatment of Bee-Stings.

Considerable space is taken up with the matter of bee-stings in the Alkaloidal Clinic for November. Not so many remedies are given as may be found in bee-papers, but enough to show that in the medical profession, as well as among the laity, there is a wide diversity of opinion; and possibly those are near the mark who think that no remedy has any efficacy except as a placebo. It appears that in medical text-books salt is given as one remedy for stings, sweet oil as another, also onions. One correspondent advises "to try *Apis mellifica*, say 3x or even 6x". Dr. W. H. Barnett believes in prophylactic treatment, and says:

"I am satisfied that echol, a combination of echinacea and thuja, will prevent the sting of bees from hurting him.

Let him take dram doses every hour for three hours before he commences to work with them. The reason for the faith that is in me is this: They used to hurt me. Last summer I was taking it for a skin disease, and while under its influence I was stung by a wasp on the face and neck. When stung I started to the house to get something to stop the pain and swelling that I expected to suffer with, but instead of pain and swelling as heretofore when stung, there was no more of either than a mosquito or a gnat would have caused."

For the bee-keeper whose time is taken up entirely with bees, working at them as long as he can see in the evening, and going at it again about as soon as he is out of bed, it would not be very convenient to take his dose three hours in advance of work and hourly afterward; although an alarm clock might help out if he had the trick of promptly falling to sleep again. Yet such treatment, if entirely reliable, might be warmly welcomed by some amateurs upon whom the effect of a single sting is severe.

Bee-stings for rheumatism and Bright's disease come in for mention, one man saying: "I do not remember a single person who has kept bees that has been bothered with this troublesome disease". Which merely goes to show that his sphere of observation has been very limited.

The editor is sufficiently up-to-date to say that the poison of the bee is something essentially different from formic acid.

Right in line with the foregoing is the following "scientific note" sent us as a clipping by Dr. Peiro, whom quite a number of our readers know both by reputation and also personally:

"Investigation of the poison of bees has shown M. Phisalix three distinct active principles, one of which produces inflammation and the second causes convulsion, while the third stupefies. The poison is secreted by two glands, the acid one yielding the stupefying and inflammatory substances, and the alkaline one the substance causing convulsions. The observations included the poisoning of a sparrow by the stings of two or three bees. The bird showed weakening within five minutes, then progressive increase of the partial paralysis, which, at last, became a mere trembling, interrupted by periods of somnolence. Death came in two or three hours."

broke with them. He said if they could have been photographed it would have made a great picture.

Mr. Hodges then added that he had had the same thing himself many times when the weather was warm.

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

"The Fort Snelling Apiary" is the name of the bee-yard shown on the front page this week. It is located on the north shore of the Mississippi River, nearly opposite where the Minnesota River empties into the Mississippi River, and near Fort Snelling. It is a beautiful place, and Mr. and Mrs. Acklin have often entertained their friends at luncheon at this apiary. The honey-house and Mr. Acklin are shown in the picture. This apiary is run mostly for extracted honey. Three nucleus hives are shown, but more nucleus hives, colonies, and a bee-cave are to the right and not shown in the picture.

**A Bee and Red Clover Calendar for 1905** has been received at this office from Mr. W. F. Marks, of New York, the chairman of the Board of Directors of the National Bee-Keepers' Association. The outside dimensions of the card-board are 6¼x10¼. The illustration, 5x6 inches, shows a large honey-bee and six red clover heads. This latter is pasted near the top of the card, and the calendar below it. At the upper left-hand corner are shown several white embossed bees on a gold background. Altogether it is a very attractive calendar, and should be in every bee-keeper's home. Perhaps Mr. Marks will offer them for sale.

## Miscellaneous News \* Items

General Manager France, of Wisconsin, called on us last week when passing through Chicago on his way to New York State, where he will speak on bees and bee-diseases at farmers' institutes and bee-keepers' conventions during much of the time this month. It will be a treat for New York bee-keepers to hear Mr. France.

Luna W. Elmore, of Jefferson Co., Iowa, when sending his renewal subscription dollar for 1905, added these appreciative words:

"I can't get along without a good bee-paper like the American Bee Journal. All bee-keepers should read every copy. If one has only one colony of bees, a good bee-paper will help him to give that one colony the proper care."

**A Six-Foot Swarm.**—George Hodges, of Allegany Co., N. Y., sends us the following which originally appeared in the Friendship Register last summer:

Mr. John Todd, who has a large apiary of nearly 150 colonies of bees, reported an unusual sight Tuesday of several colonies of bees that had swarmed and hung to a limb, one swarm after another caught on until the string of bees was nearly six feet long, and so heavy the limb finally

## Opinions \* of Some Experts

### Producing Marketable Comb Honey Without Separators.

20.—Can marketable sections of honey be satisfactorily produced without separators?

EUGENE SECOR (Iowa)—No.

ADRIAN GETAZ (Tenn.)—No.

DR. J. P. H. BROWN (Ga.)—Yes.

C. H. DIBBERN (Ill.)—No, no, no.

REV. M. MAHIN (Ind.)—I think not.

J. M. HAMBAUGH (Calif.)—I think not.

G. M. DOOLITTLE (N. Y.)—Not with Doolittle.

MRS. J. M. NULL (Mo.)—No, not as a general rule.

PROF. A. J. COOK (Calif.)—Yes, but not invariably by me.

P. H. ELWOOD (N. Y.)—I should answer *no*, emphatically.

L. STACHELHAUSEN (Tex.)—I do not know, but I do not think they can.

WM. ROHRIG (Ariz.)—As a rule, I should not. I would use separators.

N. E. FRANCE (Wis.)—Yes, but not all with a profit. Some will be ill-shaped.

R. L. TAYLOR (Mich.)—Markets generally now demand honey produced with separators.

S. T. PETTIT (Ont.)—Not now. Some of us used to do it, but the standard is higher now.

O. O. POPPLETON (Fla.)—Not as a rule. Sometimes one can be successful, but I would not risk it.

C. DAVENPORT (Minn.)—Yes, but with me a good many are bulged, or so uneven that they can not be cased.

C. P. DADANT (Ill.)—Yes, but they are not quite so easily put into shipping-cases. They are usually heavier than the others.

R. C. AIKIN (Colo.)—No, except with strong colonies and in rapid honey-flows; these come about once in 10 years, and about once in a thousand miles. I say *No!*

E. D. TOWNSEND (Mich.)—Yes. Use 1½-inch spacing, full sheets of comb foundation without bait-sections. I have seen bee-keepers that would better stick to the separators.

E. WHITCOMB (Nebr.)—I think not; at least I have never seen any. Sometimes we see them on exhibition at the honey shows, but the judges have a faculty of gently setting them aside.

E. S. LOVESY (Utah)—Hardly, but if the bee-keeper uses full sheets of foundation it will often pass, as it is generally heavier than a full section, but, as a rule, it doesn't give satisfaction.

DR. C. C. MILLER (Ill.)—That depends upon the market. For most markets, and especially for distant markets, separators are a necessity with me. If honey would always come in a flood, they would not be so necessary.

JAS. A. STONE (Ill.)—No. When we were getting honey for display at the Chicago World's Fair, we agreed to take all out of 2300 pounds from one man (who had gotten it without separators) that would crate without the combs rubbing, and he got us only a little over 600 pounds.

JAMES A. GREEN (Colo.)—Yes. It would have to be a very poor article of honey that was not marketable—at some price. But I do not believe it is profitable to dispense with separators. I do not believe it is possible to produce without separators, in a commercial way, that is, on any large scale, honey that can be satisfactorily packed, shipped and retailed. There is certain to be a great deal more breakage, leakage, and consequent loss and dissatisfaction than with separated honey. I have met grocers who declared they would never handle any more honey because of their experience with unseparated honey, and I am sure that if I were a consumer the average unseparated article would tend to discourage my use of honey.

G. W. DEMAREE (Ky.)—It depends upon your market for honey in the comb. In my locality so many people prefer their comb honey packed in buckets and jars, and covered with honey in the extracted form, that it is no trouble to sell all the "out of shape" sections produced without separators, and at a better profit than is realized from the fancy pick. When the impractical fancyites quit writing about "chunk honey" to discourage the introduction of really fancy-packed comb honey, the way will be opened for better profits, at least in a small way in apiary work. Several years ago I shipped to Louisville, Ky., from 100 to 200 buckets of comb honey cut from the section boxes and packed in the buckets (4 to 8 quart buckets) in an upright position, and covered with extracted honey, and the profit exceeded that of my fancy crated sections.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed *free* at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

## Contributed Special Articles

### No. 1.—What is the Best Bee-Hive?

BY ALLEN LATHAM.

CLIMATE, local conditions, purpose, and individual taste have all combined to bring into use a great variety of hives, and few of these hives are without their staunch supporters—supporters so staunch that only the most cogent argument backed up by the strongest of confirmatory facts will persuade them to desert their hive for some other of different style. It is possible, but not likely, that they are using the hive best suited to their needs, and however much a bee-keeper believes in his own hive, he should be ready to listen to arguments in favor of, other hives, and even ready to try for himself the principles of these new hives, so that, should he find them superior to those of his own hives, he can with the least possible delay substitute the better for the inferior.

I used for 17 years a hive with free hanging frames made according to descriptions found in an old edition of Father Langstroth's book. I liked the hive and still use a few, but as I learned more and more of the needs of bees in this climate, I saw more and more weaknesses in this hive. For some three years I studied and planned a hive which I only waited an opportunity to construct and make trial of. My business was so pressing, however, that it was only three years ago that I finally made a hive which involved as many of the desirable points as I could work into it.

That year I had occasion to travel about a great deal, and I was greatly impressed by the vast extent of unoccupied bee-territory. If only I could get small apiaries established here and there to gather the honey which was yearly running to waste, I might add to my income in a most satisfactory way.

But to keep two or three hundred colonies of bees widely scattered in ordinary hives would call for such an expenditure of time and energy that the project would surely fail; and my whole attention was therefore turned to the making of a hive which would run itself eleven and nine-tenths months of the year, and which would require no care beyond the keeping up of the quality of the bees and the removal of the honey. A hive that would be cool in summer but warm in winter; a hive which would have a right entrance the whole year through; a hive which would keep out mice and other intruders; a hive which would be proof against rain, wind and all other elements—one, in fact, which was practically automatic.

Such a hive must be large, and yet small.

I finally built four hives which apparently solved the problem, for they were sufficiently successful to warrant my making 28 more, and their continued success is such that I hope to make many more this winter.

The hives were made double-walled with air-space lined on both sides with many thicknesses of newspaper, and the outside was covered with Paroid roofing-paper. The cover was made to telescope over the whole, and was arranged to nail or screw on. The bottom was made fast and also double. The frames, 20 in number, and measuring 14 by 11 inches inside measure, were closed ends and closed tops, and were hung crosswise of the hive. The inner bottom of the hive sloped from the back to the front, so that there was a space about an inch deep under the front frame, and only a bee-space under the backmost frame. A wedge-shaped strip of wood was nailed on the bottom thick end to the front to serve as a ladder for the bees under the middle of the frames, while either side-wall also furnished easy access to the frames. The entrance was made the full width of the hive and of varying depth. I now make the entrance ¾ of an inch deep and run through it a row of wire nails ⅜ of an inch apart to keep out mice in winter.

The hive has other kinks which I will not take the space here to describe, as I have pointed out its salient features.

Such a system of bee-keeping would not admit of the use of sections, nor would it lend itself readily to the production of extracted honey, and the production of chunk-honey seemed in every way to meet best the needs of the case. The long hive was adopted rather than the tall for

two reasons—it would make a better winterer, and was more stable.

The success of these hives has led me to construct a hive for use in the home yard which should have the essential features of the large hive described above, and yet be arranged for the production of section honey in the regular way. I now have 20 such hives and like them very much. These hives have closed-end frames hung crosswise; are extremely warm and well ventilated; are cheap, made as they are from boxes procured at the grocery; are so constructed as to avoid the objections which many have for frames hung crosswise.

Much of what I have said thus far is largely introductory to that which is to follow. Such an introduction is unparadoxically long, but without it I should find it difficult to make clear all I wish to say. The purpose of writing these articles is to exploit the closed-end frame and the crosswise frame; for these two features combined furnish a subject well worth the most careful attention of every man or woman who keeps bees.

On pages 213, 292 and 468 (1904) will be found queries and answers relating to this subject. If you are interested in this present article you will be repaid if you refer to the pages named. You can gather from page 213 that the objection that most bee-keepers have to a closed-end frame is that it lacks ease of manipulation, and that such is true free if any will question. Why, then, have anything but a free-hanging frame? Simply because the ease of manipulation is a minor factor with most bee-keepers. Truly, I believe that the majority of bee-keepers would be better off if their frames offered many difficulties in manipulation, for I know that much harm is done by needless handling of the frames. The best bee-keeper is he who can get fine results from a colony and not have to loosen a frame from its place for months at a time.

That queen-rearing calls for much manipulation renders the closed-end frame unfit for that branch of bee-keeping; and it is doubtful if the closed-end has sufficient advantages to offset its awkward features in the production of extracted honey; but for the production of comb honey its advantages far out-weigh any objections that can be raised.

That the closed-end frame causes the death of bees in rapid handling is true, but what of the lives of thousands of bees that it saves? And right here let me say that it will not cause the death of any more bees than will the wide bottom-bars which some of our sages are advocating.

The great advantage of the closed-end frame is its power to conserve heat, for it not only makes the brood-nest more snug and free from so much intercommunication of currents of air, but it furnishes an air-space on two walls of the hive. Space which was worse than useless before is converted by this style of frame into actual and valuable use. It is obvious now if it has not been before that the closed-end frame which I speak of is closed to the very bottom.

Frames well made, with smooth and square edges, pressed close together, are not hard to get apart, and after one is used to the handling of them he will find that for all the ordinary needs they are as easy to manipulate as free-hanging frames.

There are other advantages besides that of heat-saving. These frames are right where you want them all the time. If a hive gets knocked over by roving beast or mischievous boy little harm is done, and when it comes to moving hives about a man blesses such a frame.

Many bee-keepers call for a self-spaced frame, and find in the Hoffman what they believe meets their needs. Why any one will use a Hoffman frame is beyond my understanding, for it has practically all the disadvantages of the closed-end frame with only one and a half of the advantages. It keeps frames in place, and it shuts out half of the too-much circulation of cold air. Why in the name of common sense not carry the full width of the end-bar clear to the bottom and get all the advantages?

New London Co., Conn.

## “Shook Swarming” and “Red Clover” Queens.

BY C. P. DADANT.

Having about as many colonies as I can well keep in town (provided they all winter), I am planning to start an out-apiary next season, and I was thinking that it might be a good plan to practice “shook swarming”, and at the same time secure a supply of long-

tongued (red clover) queens, introduce them among the brood and nurses left queenless, thus saving them the two or three weeks' time before they could rear a laying queen of their own. If there are any vital objections, please give me the benefit of your experience. Also, whether you would advise me to invest in so many long-tongued queens—say 15 to 25—or would it be safer to get only a few, and the balance Italians?—G. A. H., Pittsfield, Ill.

Replying to the above query, which reached me a few days ago, I will say to begin with, that I am very much in favor of the method called “shook swarming” by our modern bee-keepers. There is nothing new in any of the manners by which this is done, but the name, although perhaps appropriate, has not “took” my fancy to any extent.

The manner of procedure which I prefer because it is the safest, is to make one “swarm” out of two colonies. I have always been in favor of safe methods, and very much admire an old Italian proverb:—

Chi va piano va sano,  
Chi va sano va lontano.

“Whoever goes slowly, goes safely; whoever goes safely goes a long time.”

The swarm is shaken from a colony into a new hive, including the queen and one comb of brood which is given at the same time. The swarm is left on the parent colony's stand, and the parent colony itself is moved in the place of another strong colony, which is in turn removed to a new spot. If a queen is at once given to the colony from which the old queen has been taken, there will not be much danger of swarming, but in case the bees are noticed building queen-cells a new swarm may be made from the same hive in a few days, and before a natural swarm has had time to issue.

Now as to red clover queens. I have seen very much in the papers about these, and have heard them praised, but I am very skeptical about any one having secured any very positive and lasting traits in a race of bees in the short time that we have had the Italian bee with us. I know of traits which may be fixed quite readily, such as color, but the length of tongue has varied very much. From the very beginning of the importations (and our old bee-keepers will remember that we were once the most active importers), bees have been found that could get honey from red clover; yet, however much I tried I never could secure a positive advantage; that is, secure bees that would show regularly.

There is a time when no bees can work on red clover and I have also seen times when even the little common bees worked on its blossoms. I believe that the length of corolla of the clover bloom depends upon climatic conditions, and that there are seasons when all the bees are able to reach the honey in its bloom.

When we first imported bees we had an old friend living near us who was very much interested in this matter. He was the first to notice that the Italians worked on red clover. But one day he came to me and said the common bees had noticed the others working on the clover and were trying it, too, but could not succeed. I followed him to the field and saw both blacks and Italians at work, and for all the willingness I had to see the thing as he did, I could not help concluding that they were all working alike, and that neither the Italians nor the blacks were making much headway, although they seemed quite busy. This was some 30 years ago, and although we have had some of the so-called red clover queens, I have yet to see a single barrel—even a single 10-pound can—of red clover honey put upon the market. I was once shown a case of very nice honey by a bee-keeper who claimed it was from red clover, but a test of this honey disclosed the fact that it was strongly flavored with basswood, and I concluded that the man was deceiving himself in thinking that he had succeeded in producing red-clover honey.

Yet, we must not discourage the steps that are taken towards red clover bees, for it is a step in the right direction; but I do not think I would rely on the possibilities of stock from any one apiary. On the contrary, if I desired to buy bees I think I should order from two or three different reliable breeders, taking care to secure good, prolific bees without paying much attention to the yellow color, for too many are putting color as the first requisite.

There is no doubt that queens, reared in the South and brought up to our Northern States at the time of swarming, will save much time to the colonies that are divided by shaking or otherwise, and at the present prices it pays better for a honey-producer to buy his queens from the South than to rear them in our northern climate.

Hancock Co., Ill.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### "Lebkuchen" or Spice-Cake.

It's German, and called by the Germans "Lebkuchen", taken from *Praktischer Wegweiser*. Boil a quart of honey in water to which has been added the rind of a lemon. When cooled to milkwarm, add a quart of rye flour and one of wheat flour, besides two ounces of cinnamon and cloves, then a handful of preserved orange-peel cut fine, a heaping tablespoonful of soda, the whole thoroughly mixed.

Knead this dough well upon the board, roll out as thick as the little finger, cut into cakes, glaze with white of egg, put almond meats on top, and bake in tins in a tolerably hot oven. While still hot glaze with powdered sugar stirred thick into water, which immediately dries into a glass-white glazing.

These cakes keep well in tin cans, and are excellent.

### Preventing Second Swarms.

I had one colony of bees in the spring of 1904 that had wintered, and had two swarms in the summer, with 18 pounds of honey. (MRS.) M. E. BARBOUR.

Barron Co., Wis., Dec. 19.

You would probably have had more honey if you had allowed the colony to swarm only once. Of course, it is all right to allow a second swarm if it increase you desire, but if honey, then one swarm is enough.

To prevent a second swarm, remove the parent colony to a new location when the first swarm issues, and place the swarm on the old stand. That will prevent further swarming, for all the field-workers for the next day or two will go to the swarm, thus reducing the old colony so that it will have no desire to swarm again.

### Car of Candied Honey in Paper Packages.

I inclose a clipping from the Portland Oregonian, containing a statement in regard to a shipment of candied honey which is prepared in a new form. I have an idea that this form of honey is not pure. I would like to have your opinion on the matter. If this honey is not pure it is probably made cheap, and would injure our honey market in Portland. Please answer through the American Bee Journal.

We had a very favorable season for honey the past season. We have 85 colonies of black bees. Our honey amounted to 7000 pounds, besides the winter supply, and the largest part of it was No. 1 white clover honey.

Cowlitz Co., Wash., Dec. 22. MRS. L. SCHMITT.

The clipping sent by Mrs. Schmitt reads as follows:

#### CARLOAD OF CANDIED HONEY.

What's sweeter than honey? W. H. Pennington, of Malheur Co., Oreg., thinks it is his candied extracted honey, 25,000 pounds of which has just reached this city under the direction of Woodward, Clarke & Co. People are accustomed to buy honey in jars and tins, and, although the article is sweet enough, it sticks and leaves one's fingers sticky. Mr. Pennington's candied extracted honey is sold in solid blocks in packages weighing 2, 3½, 5 and 10 pounds. It is unlike the yellow, sticky honey made by bees. Pennington's honey is a solid block that can be cut with a knife, and served like butter or cheese. It's newly on the market, and is Mr. Pennington's invention. No jar is required to hold it, for it is sold in bags made of paraffin paper, and is easily handled. It is extracted from the comb in the usual way and left to dry in the cool, frosty, dry air of eastern Oregon. Chemists pronounce Pennington's honey to be absolutely pure.

It is highly probable that the honey mentioned is all right, and just as probable that the editor of the Oregonian is not as well informed about matters apicultural as he might be. No wonder any one, from reading what the editor says, would be likely to imagine that something else than pure honey was under consideration. "It is unlike

the yellow, sticky honey made by bees"—that sounds as if it were something *not* made by bees; and being Mr. Pennington's "invention", it would be something of his compounding. But farther on he says, "It is extracted from the comb in the usual way"; and that settles the matter as to its source, for it would hardly be possible that Mr. Pennington would put an artificial affair into combs merely for the sake of throwing it out again.

Moreover, Mr. W. H. Pennington is the owner of 500 colonies of bees, from which this year's crop was 34,000 pounds, a large part of which has evidently been put on the market in Aikin paper-bags. That honey is all right, and very likely so is the Oregonian editor—when not talking about honey.

### Grows More Interesting.

Mrs. L. Mack, of St. Joseph Co., Mich., writes: "I think the American Bee Journal grows more interesting every week".

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

#### PLAIN SECTIONS VS. SLOTTED OR BEE-WAY.

This time the experts get at the plain sections. As many as 11 out of 25 have the cheek to confess that they have never tried them. With favor 9 regard them, and 7 with disfavor. Only about 3 out of the 9 show anything more than a languid sort of favor; and only 4 of the opposing 7 oppose with vigor. On the whole, it doesn't look much as though an overwhelming boom for the plain section was sweeping the country. Repeatedly said that the main advantage is in getting more sections into the same sized box when packing. Then I should reply: "Great cry, and limited quantity of wool". The opposing arguments seem more important to me. When snugly packed in a case there is serious difficulty in getting hold of one to get it out. As all spaces in the packing case are less, some sections will have to be left out for slight protuberances which would safely go in with the other style of fixtures. Stachelhausen's experience is that it takes chin exercise to make the prospective buyer believe that they are as large as inset sections which are really no bigger—look smaller than they are, to their owner's inconvenience. Page 790.

#### SAINFOIN HONEY.

Our hope of honey from sainfoin in this country is not, according to Mr. C. P. Dadant, very good. Plant itself a failure, for one thing—all except the try, try again. Even in Europe much the greater proportion of territory, if I get the idea correctly, yields scant nectar or none. Just one small province of the numerous provinces of France is greatly noted for its sainfoin honey. Page 790.

#### QUEER BEE-ANTICS AND STAR-GAZING.

That's a worthy observation on page 791, the worker that cuffed the queen after being three times refused in offers of food—and got cuffed in return and went away. A Chinaman in similar circumstances would not cuff Tsi Ann. Bees seem to have got a pretty good blend of the spirit of royalty with the spirit of democracy.

And Robert West will be making us all want to go to Jamaica and see four times as many stars, and all of them four times as big. Reminds one of the Irishman. Days were longer in Ireland, and indade there were more of them! Some reality about the stars. From here we can see Sirius, which is No. 1, but not Canopus, which is No. 2. Also the northern circumpolar has several striking groups, but not even one first magnitude star. The southern circumpolar is just the opposite, few striking groups, but six stars of the first magnitude. One of them that I should take an early opportunity to gaze at is Bungula, much more frequently called Alpha Centauri, which is our nearest neighbor among the stars. The immediate circumpolar is strikingly bare of stars, even more so than the northern one

would be were Polaris blotted out—nothing bigger than fifth magnitude for 12 degrees radius.

#### BULK COMB HONEY MARKET.

Market for bulk comb in danger of being overstocked. One would think so if they are all going at it. Decided limits to the market—and market partly founded on the miserable untruth that sections are fabricated. Customers too enlightened to take any stock in the cry of manufactured comb, and in the habit of buying sections, are not likely to join in a stampede back to chunk honey. Page 792.

#### PRICKLY PEARS AS BEE-FEED.

Who'd a-thought it? Who knew prickly pears were plenty enough anywhere to use as bee-feed? D. C. Milam is one of the pathfinders whose path few people are likely to follow. Page 792.

#### "STRAINED" HONEY AND GIRLISH BEAUTY.

It's a villainous reminder of dark ages—still, with us—that 'most everybody persists so in saying "strained honey". And, Sister Wilson, when we copy recipes that have the vicious phrase in, let's quietly change it and say nothing—as might have been done on page 793. No, I'll take that back. To make a nice girl more beautiful than she already is requires such "pauwerful" influences that it's to be supposed that it won't do to trust commercial extracted honey. Crush a good section and pass it through gauze and have some real strained honey.

#### SUGAR NOT GOOD FOR REARING QUEENS.

"I feed honey—sugar is not fit to rear queen-bees on." This gospel, according to Darrow, sounds to me like good, sound gospel, albeit I am not a safe authority, not being a queen-breeder. Perhaps something would depend upon the condition of the pollen-supply. Sugar syrup *very* inadequate when pollen is scarce, but almost tolerable when abundance of pollen is coming in every day. Page 796.

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Correspondence School in Bee-Keeping.

What do you think of correspondence schools in bee-keeping? Do you think bee-keeping can be learned as quickly in that way as when working with an experienced bee-keeper? ILLINOIS.

ANSWER.—No amount of correspondence can equal in value direct instruction at actual work in the apiary from the same teacher; but for one who can not have this advantage it ought to be worth much to have the privilege of information upon any desired points through the mail; and I suppose something of this kind is meant by a correspondence school in bee-keeping.

### Queenless Colony in the Cellar—Using Unfinished Sections.

1. I put 10 colonies of bees into the cellar Nov. 10, all in fine condition with plenty of stores and bees. Dec. 23 in looking them over I found a hive in which I could see no bees, so I opened it and found about 150 dead bees and no live ones. All of the combs were in good condition, with no sign of any disease, that I could see. On the center of the middle comb there was a moldy spot about the size of a half dollar, on which there were about 50 dead bees. There was about 35 pounds of honey in the 8 frames. (I use the 8-frame hive.)

Out of 11 colonies this one did the best last season, and was a large colony when I put it into the cellar. What became of the bees? My bee-cellar is a small room off from the main cellar. The temperature is from 40 to 45 degrees. Have been troubled with mice to some extent, but there are no traces of them in this hive I speak of.

2. Would it be all right to put sections that are from  $\frac{1}{4}$  to  $\frac{3}{8}$  full of honey, partially capped and somewhat candied, in the supers, then put them on the hives next summer? Would the bees eat it out, or would they fill up the sections and cap them over? CONN.

ANSWERS.—1. If the colony was strong when put into the cellar, I can not imagine any way by which in 6 weeks' time the bees should disappear entirely, unless they should move out in a body and go into

another hive, which is very unlikely. It is rather more likely that although the hive was heavy when put into the cellar, it did not contain such a very large number of bees, the colony having become queenless some time before. In that case the bees that were left would be old, and what were left might come out of their hives and die on the ground during the 6 weeks.

2. It will not be well to put them in supers to put on the hives. If very short of stores, the bees might empty out the candied honey if given early enough, but the probability is that a good deal of it would be left in the sections, and the bees would fill up the empty space and seal over. Yet if you like candied honey for your own table, as some do, it will work all right. If you don't want any candied honey in the sections, you can melt them up, taking care not to over-heat, taking off the cake of wax when cold.

### Putting Bees in the Cellar—Sainfoin and Sweet Clover Seed.

1. I have 11 colonies of bees that I wish to move  $10\frac{1}{2}$  miles. When I bring them home can I put them into the cellar at once, or would I better let them stay out-of-doors and have a flight before putting them in?

2. Where can I find sainfoin seed? I want to try it in this locality.

3. Can I get sweet clover seed in Chicago? I see in the American Bee Journal that a man in Kansas City advertises it, but that is quite a distance for me to send for it. INDIANA.

ANSWERS.—1. Better put them in at once unless you are pretty sure they'll have a flight in 2 or 3 weeks.

2. From any leading seed dealer.

3. Yes, it is always to be had in Chicago, and generally in any large place.

### Disturbing Bees in Winter.

I opened a hive last Saturday in the upper part of which was 6 pounds of honey in one-pound sections. This I took out. All the other sections were empty. In the lower part of the hive were 10 frames all full of fine honey, about 50 pounds. My friend said that I could take some or all of it out and feed the bees with sugar. I tried to take 3 frames out, but they broke, so I left all of it in. I think this did a great deal of harm to the bees. What can I do? The weather is very cold now, and the bees can't fly out. NEW JERSEY.

ANSWER.—It is a pity you made such a mistake as to attempt to take anything from the bees so late as the first week in December with the idea of replacing it with sugar syrup. It's a doubtful step to do that sort of thing at any time, and if done at all should be as early as September. Very likely there isn't anything to be done now. It is possible that the bees are all right on the broken combs just as they are. If, however, you want to do something for them, you might peep in, and if the combs have fallen so as to be packed together, you might raise them on edge, if necessary putting little sticks between them so as to keep them apart about half an inch.

### Wintering Bees in a Repository.

I bought 75 colonies of bees last fall in Langstroth hives, from the widow of a bee-keeper who died last March. I leased the ground and bee-house. Yesterday I began putting them in at 10:30 a.m. and finished at 1:30 p.m. I expected to set them like Boardman's picture in A B C, but it was too warm to remove the bottom-boards, so I set them one above another. And then the cleats on the corners were uneven, so they would not set level side by side. They have only a  $\frac{3}{8}$  x 14 entrance, and I fear it will get clogged with bees. This is my first experience with a winter repository.

Can I go into the bee-house soon with a dim light, pry up the bodies and place inch blocks under the front corners? They are 4 hives deep, and weigh 80 pounds. Or would you depend upon going say Jan. 15, February and March, and cleaning out the dead bees with an iron rod? Half of them have a  $1\frac{1}{2}$ -inch hole in the covers. Their former owner wintered them for 30 years just as I have them fixed. MISSOURI.

ANSWER.—If for 30 years they have been wintered just as they are, and if that wintering has been entirely successful, it would seem a pretty safe thing to continue without change. Yet, on general principles, I should fear that a  $\frac{3}{8}$  entrance would get clogged. Little danger just at first, the trouble becoming constantly worse as winter advances. So it is probably advisable to increase the ventilation as early as some time in January. If you go about it quietly there ought not to be much trouble. A dark lantern, a bicycle lamp, or a common lamp having a paper over the chimney with a hole cut in one side will be good. It's a question which will be best, to pry up the hives just as they stand or to re-pile them, loosening up each one as you pile. If they get too much stirred up, you can wait for them to settle down. Even if it should take you a day or two, you'll sleep enough better afterward to feel that there's little danger of their smothering with clogged entrances.

See Langstroth Book Offer on another page of this copy of the American Bee Journal.

## Convention Proceedings

### THE ST. LOUIS CONVENTION.

#### Report of the 35th Annual Convention, of the National Bee-Keepers' Association Held at St. Louis, Mo., Sept. 27-30, 1904.

Continued from page 10.]

The President called on Prof. Louis H. Scholl, of Texas, to address the convention on

#### SOMETHING ABOUT TEXAS BEE-KEEPING.

Prof. Scholl—I have not had time to get up a paper as I should have done, and, therefore, I have only taken a few notes which I generally put down in this little book. I shall say a few words about Texas, although I do not know whether it will be as a paper would have been. The trouble is I don't know what you all want to know about Texas. We have a State down there, a big old piece of land, and have some bee-keepers in there, and some of them are a pretty good size, not only in the number of colonies, but they grow big, too.

Now, most of you know something about the statistics of Texas in the way of the production of honey. In the last census, gotten out in 1899, we have nothing to show exactly what we have down there, but I have been working on it in the way of getting statistics for our department, and have obtained some figures that are considerably larger than the census reports got out. In getting these statistics I am trying to get a complete name list of the bee-keepers in the State, and in that way I have them report to me the number of colonies they have, the amount of honey produced, and other things, and thus I have gotten at some figures. I may say that we have over 400,000 colonies of bees in the State, and the amount of honey produced by these is only about 5,000,000 pounds, that is, the average per colony is only about twelve pounds, due to the fact that we have so many little one-horse bee-keepers and box-hive keepers, although we have some of the very best you can find anywhere, and some of them with large apiaries and producing lots of honey. Now, figuring on these colonies at that low average we have an output of more honey than any other state, and we claim that Texas is in the lead in the output of its honey product. If that is the case with such a low average, where would Texas be with the average raise, which can be done because we have the country down there. If we improve our bees and everything we can have an output away beyond what we have now, and in that case Texas would simply be away ahead.

Now somebody may be interested in the way I would divide Texas as a honey State: Beginning with North Texas, north of Fort Worth, where we have very few bees, it is a plain, and nothing but cattle there, and very little bee-forage.

In East Texas, where we have our pine forests and oil and rice lands, we have along the low places and rivers a good deal of basswood, quite an abundance of it, and of holly, and these yield a large amount of honey, but the trouble there is the country is not settled up yet and there are very few apiaries located there. Those that are located produce a whole lot of honey, but the great abundance of the honey is of poorer quality.

Take Central Texas, that is the great cotton-belt; there we produce cotton-honey mostly, and there is where we have more of the horse-mint, but of late years on account of the drouth the horse-mint has become scarce, and on account of the boll-weevil, which is one of our greatest evils down there, the cotton crop has been cut short.

Take West Texas, it is a somewhat mountainous portion and there are only some localities that produce honey properly, and sumach is the only honey-plant worthy of mention.

Then South Texas, below Houston, is a low, swampy plain, and rice and things like that are produced more than anything else, and along the rivers and the lagoons and lakes we have the rattan-vine which yields a lot of honey, but it is of poorer quality. It is shipped to the Northern market for manufacturing purposes.

When we go to Southwest Texas we go to a country that I do not think can be surpassed anywhere. We have there almost an unlimited amount of bee-pasture; we have the mesquite tree, the wahea, the cat-claw and many other things; even the prickly pear, with which some of the prairies are just covered, helps us out a good deal in some years.

I have been asked a great many questions about locations in Texas for bee-keepers. I might say that we have many locations in Southwest Texas where bee-keeping could be carried on and large amounts of honey gathered, but most of these are away from the railroads and most of the land is sandy land, and a person would simply have to go out and camp and "bach" out in the woods, and haul his product to the railroad stations about 40 or 50 miles, and run things at long distances. Southwest Texas is not a very good farming country. It is only of use as a cattle country and for bee-keeping. They both go well there. As the railroads are opening up the land, bee-keeping will progress and open up new localities, and the time will come when Southwest Texas, if properly stocked up with bees, will be the greatest bee-country I know of or have any idea of.

I would like to say a few words about agriculture at the Texas A. and M. college. I have had the position as apiarist at the Station and have charge of the agricultural work of the State, and I believe that great good could be done by having such work carried on by the Experiment Station. I would like this so that other States might take up the work as they surely should do. I think much good could be done if they could do so. We have at College Station an apiary of 40 colonies, and a bee-house and all the equipments necessary, besides a good deal of other equipment which is mainly kept there for show and for the use of students, to get them acquainted with the different materials used, and I think we have the best equipped station or experimental apiary anywhere in the world; at least it has been pronounced so by everybody that has seen it or knows anything about it. It was established in 1902, when we received an appropriation from the State Legislature of \$750 to start with; that was for two years; for the next two years, 1904-5, we have received \$900 more, and with this money we have been enabled to establish this apiary and all the equipment, and we have received from the college ten acres of land for the location, with a ravine running through it, all of which makes an ideal location for an apiary. We have put up a bee-house which has been planned and built so that later on it will be used as a plan to be given out to the bee-keepers so that they can copy after it, and build ideal bee-houses for their own use.

We have in this enclosure about four acres of land in two fields put into cultivation for the testing of honey-plants, and we have planted a good many different honey-plants that have been written about, and that we have run across, to see as to their value and whether it will pay or be profitable to plant trees. We have tried as many as forty different kinds for the last two years—forty-one different kinds this year—and we have found only a very few adapted to the conditions of Texas that will be profitable to plant for honey; these at the same time are planted for forage. Besides, many of the experiments that we have carried on show that it would not pay to raise any of these others for honey alone. Further experiments will be carried on along these lines. We have been looking around also for honey-plants or shrubs from further west, from the more arid regions, with the view of planting these in localities where the natural honey-flow is scarce. If we could propagate plants from other localities, in other words, put up an artificial yield of honey, it would increase agriculture and we could have honey-producing localities where no honey is produced now. This will take a good deal of work and time.

In the apiary we have several different races of bees which are tried for different experiments. As we get their results they will be published later.

In the way of experiments we have a good many on

our list. As time goes on it becomes more apparent that some of these experiments must be carried out by people who have some say so, who have some authority, so that after the experiments are made we have something to go by. For instance, when we went through this glucose and sugar feeding mist that comes up every once in a while, if we had some authority on this subject, someone that could tell us just exactly all about it, it would help us out a whole lot. Some of these things are exactly what we are going to do down at the Station. Last night I took some notes on these very things, and we are going to try those. It takes time and money to carry out accurate experiments of this kind. I should say that work of this kind should be carried out at every State station, and if the bee-keepers only will, they can have such work done. It was brought about by our bee-keepers down in Texas. We had our first meeting at College Station in 1901. While down there we made a request for an apiary at the college, and an apiarist, where such work could be carried on. I am glad to say it succeeded, although it took lots of hard work. We secured only a very small appropriation, \$750, but it gave us a start, and now we enjoy having the best equipped experimental apiary anywhere, and are going to try to keep ahead of any that ever comes up.

One of the experiments we have under way is the manufacture of honey-vinegar. In large apiaries there is always a waste of honey, and if we could manufacture that into honey-vinegar, and work up a market for it, and sell it, we could save a whole lot of money for the bee-keepers. Then we have a lot of cheap-grade honey that should not be put on the market, and which, if put on, lowers the price of good honey. We are trying to find out if this cannot be made into honey-vinegar to more profit, and thus save the price of the better-grade honey.

Another experiment we are going to start is along the wax and foundation line. We are going to try to find out the amount of honey consumed to produce wax. While it would not perhaps be profitable to convert the cheap honey into wax, perhaps we could take this cheap honey and have the bees convert it into wax and put it on the market in the shape of wax instead of offering them the lower grades of honey at a cheaper price, thus lowering the price of the better grade. We are also experimenting along the line of rendering the wax of old combs, and along the line of such hives and accessories and other things. At almost every convention I attended last year, something like 14, the question came up as to the best hive, and similar questions; there also comes up the question as to the difference between the regular Langstroth and some others, and the divisible brood-chamber hive. Some of those things will never be settled unless they are taken up by some scientific worker, or somebody who will take accurate note of these things. If a bee-keeper has a hobby of his own he will bring up something, and he will claim his way is the best, and always have a hive of his own that he carries about with him. This is not the case with somebody that has this work in charge somewhere else. He wants to get down to the facts of the case; he does not care what the results will be; what he is after is to get at the fact, and prove it, and he will carry on the work until he is through with it, and then come back and go over it, and then when he gets through he has his results noted, and they are to the point. This cannot be done by the bee-keeper, for a good many reasons; he hasn't the time, and he has hives of his own, and he is not accurate enough. He cannot because he has too many other things calling for his attention. All these things should be taken up by the Station.

Honey-bottling is another one of our problems down there, in other words, putting up honey and preventing it from crystallization. It is quite an important problem, and I don't know yet what we are going to do with it. The majority of consumers prefer honey in a liquid state. We have some honeys there that granulate in a few weeks after being taken from the hive. Before we can put that on the market we have to reliquify it, and maybe it will candy again. Sometimes we have honey on the road and it is delayed, and when it reaches the consumer it is candied, and he does not want "sugar-honey," and it is returned to the bee-keeper. If we could find a way of putting up this honey; especially of putting it up in a fancy way, as some people put it up, and keeping it from

granulating, it will be worth a whole lot.

Besides this there are a great many other problems. The work of managing outyards at long distances with the least amount of labor and attention, and trying to make the biggest amount of money out of our product. We have another apiary at one of the sub-stations and we have made arrangements for co-operative work. Texas is so large, and has such varied conditions, that we have to carry on our work in different sections, which makes it harder for the apiarists at the station. The coming year we will take up work along more scientific lines. We have made a card catalog of almost all of the scientific work that has been done, most of it taken from experiment station records. We did this so that we could see what had been done along these lines before we went ahead. We want to prevent all the repetitions possible.

At the College we have given instruction to the students in apiculture. The College has not been able to put on apiculture as a regular course because the time is taken up by other studies. They have made an elective study of it for senior class students, for the whole State; in this way we have had some State students, but during the spring-time of the College we have a short course in apiculture, and in this way we had 18 short-course students last year who took apiculture, and it prepared them pretty well for the work after they left the College. Besides this, we have students working in apiaries during the season who work under the Student Labor Fund, and in that way they get a good deal of information.

There are many questions that come up that should be taken up by experiment station people. I think an experimental apiary ought to be established at each of the experiment stations of the different States, especially those in which apiculture is carried on to any great extent, and this can be done by bee-keepers if they only go after it. We did it down there, and I think it can be done in other States.

LOUIS H. SCHOLL.

The President called upon Mr. Moe, the representative from Cuba, who was escorted to the platform by Mr. Hyde, after which the President introduced him to the convention.

#### BEE-KEEPING IN CUBA.

Mr. Moe—I did not come here with the idea of making a speech, and you will have to excuse me along any such lines. I came here to get what information I could along those lines of bee-keeping that interest me. You are aware, of course, that the conditions with us are very different from what they are with you in many respects. Your bee-keepers probably have different methods, so do we, and it possibly would not be practicable or wise to tell you all about our methods because you could not take them back home and apply them. I do not read your articles on winter bee-keeping, because they are of no value to me, and possibly for me to go on and tell you about what we do would be of no value to you. What interests me most is how I can produce the mos. honey, rear the best queens, and sell my honey to the best advantage. The question of wax cuts some figure with us. We can produce that perhaps better than you can. When I commenced bee-keeping there I wanted to do it perfectly, according to what you call the right method. I have got into it this far that I am cutting the corners off and going across lots; I am not doing all the fancy wiring and full-sheet foundation work; I found it didn't pay; we get so little flow of honey we have to produce it. I think if you give the matter study and thought you will find that it is all in the location. That is all I have to say, Mr. President.

(Continued next week.)

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

"If goods are wanted Quick, send to Pouder."

## Reports and Experiences

### Good Honey Crop.

The honey crop was fairly good last season. We had 17 colonies, spring count, and 1100 pounds of nice, salable section honey; no white clover honey. Bees went into winter quarters well supplied with honey.

R. A. MARSHALL.

Wright Co., Iowa, Dec. 28.

### Bees All Right So Far.

Bees in New England are all right so far this winter. New Year's day offered a fine opportunity for a thorough flight. The thermometer registered 46 in the shade; there was little wind, and the sky was clear the whole day long. There should be no occasion for severe loss from long winter confinement this year. My own bees seem to be in excellent condition.

ALLEN LATHAM.

New London Co., Conn., Jan. 4.

### Problem of Wintering Bees.

The article by Allen Latham, page 855 (1904), on wintering bees, is a very good one, but I think he left out one very essential part—that of an upward passage. Very likely he has a bee-space above the frames, but many do not have. I have kept bees over 25 years and can not remember losing one colony in wintering. But I have always read several good bee-papers.

I think over one-half of the loss of bees last winter was because the bees

could not get to the honey. Either they were not wrapped and packed properly or there was no upward passage. I positively do not believe it can be so cold they can not move to the honey as fast as eaten, if everything else is all right. IRVING LONG.  
Linn Co., Mo.

### Light Yield of Honey.

The honey harvest the past season was light, taking the county through. From 27 colonies, spring count, I harvested 900 pounds of white comb honey. We got no fall honey in this county, but bees filled the hives quite well for winter. I have just got my bees into the cellar for winter. I increased to 43 colonies, which are in fair condition. JOHN CLINE.  
Lafayette Co., Wis., Dec. 10.

### Marketing Honey—Wintering Bees—Sections.

This has not been as good a honey year as last. White clover yielded very little as it winter-killed last winter badly, and I think the young clover did not produce much. Still I got 2,540 pounds or about 60 pounds spring count, some of it nice basswood. I sell my honey all at home, going over the town of about 3,000 inhabitants about 3 or 4 times every fall, and I find that people will buy who never call for honey at the stores. When they see it they want it, or at least the children do. My wife sells what she can from the house, not like the English woman, on commission; she keeps it all and calls for more when she wants it.

I put my bees in the cellar the 14th of this month. The bottoms of the hives are nailed on. I tier up the 54 hives 3 high in rows, 5 without any special ventilation in a room partitioned off in the back end of my cellar 12x12 feet. I have practiced this for 20 years and my loss has not averaged 5 percent, except when they have been short of stores.

I use the 4 1/4 x 4 1/4 sections, 7 to the foot, 28 in a case. My hives are 19x14, outside measurement, and 9 1/2 deep, so you can see I have no waste room in the hives, nor a lot of traps to look after in the fall or winter. I believe in simplicity and utility. The one-piece square section is good enough for me. Sensible people will soon find out that the tall section fad is more for

looks than to hold honey, and some of the old "honest Johns" will not be slow in comparing weights with them. Honesty is the best policy if a man wants to hold his home market sure.

I think Mr. Hasty is often too hasty. What suits one locality does not suit another. Like the tariff, some want high, some want low, and some none. Some want large hives, some small; some want side room to store in, some top. Give me a hive that my bees can increase in, and give them room on top as fast as they need it, and not a day faster.

WM. CLEARY.

Kossuth Co., Iowa, Nov. 29.

#### Bees in Good Condition.

My bees are in good condition. I carried 2 colonies into the cellar the first of December. They were all good and heavy.

HENRY BRICKER.

Defiance Co., O., Dec. 23.

#### The Pennsylvania Bee-Keepers' Association.

On page 554 of the issue for Dec. 22 I find a report of the first annual convention of the Pennsylvania State Bee-Keepers' Association. I find in Volume XI, pages 108 and 109, that the Pennsylvania Bee-Keepers' Association was organized in the city of Erie, Oct. 1, 1873, at the time of the State Fair. The officers elected for the first year, and who took their respective offices at once were: President, Seth

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Second-hand 60-lb. Cans Cheap

We have a quantity of 60-pound tin-cans (2 in a box) which we have lately emptied ourselves, and so know they are all right. In lots of 20 or more boxes (40 cans) we will sell them at 40c a box. Order at once as they will soon be gone. These are a bargain. Address,

THE YORK HONEY CO.

HENRY N. ARND, Mgr. 101 East Kinzie Street, CHICAGO, ILL.

Hoagland, of Mercer County; vice-presidents, John Sunell, of Dauphin County, and A. J. Lee, of Crawford County; secretary, W. J. Davis, 1st, of Venango County. Among those present, and joining the society, were J. R. Ely, president of the State Agricultural Society, Mr. Ray, of Westmoreland County, P. Morris, editor of the Practical Farmer, Dr. W. H. Eagle, of Harrisburg, and others from the central and eastern part of this State.

The report of the meeting makes very interesting reading, even now after the lapse of 31 years.

Mr. Hoagland reported that his colonies paid him in honey and increase \$80 per colony, spring count, in 1873. James Russell, the treasurer, of course took charge of the funds of the society, some \$16 or \$18. Would it not be well for the present P. B.-K. A. to inquire about the ex-treasurer of the society of 1873? W. J. DAVIS, 1ST. Robertson Co., Pa., Dec. 22.

Fine Weather—Honey Scarce.

The weather is fine so far but dry. There is not much hope for white clover in this part of the country. Honey is scarce now, and prospects are for better prices. A. A. HOUSER. McDonough Co., Ill., Dec. 15.

Honey-Producers' Association Colapsed.

At a meeting of the stockholders of the Central California Honey-Producers' Association, held at Hanford last Monday, it was decided to disincorporate the organization. The cause of this move can not be accounted for in any other way than to say that there was a lack of confidence in the management. The condition of the business for the past year looked bad, and the stockholders did not want to take a chance at being run seriously into

debt another year. At any rate, the benefits received from the organization were very slim. The collapse of the association is of no credit to the man who held the position of manager.—Kingsbury [Calif.] Recorder, Dec. 14, 1904.

CONVENTION NOTICES.

Wisconsin.—The Wisconsin State Bee-keepers' Association will meet in the Supervisor's Room in the Court House, at Madison, Feb. 1, 2, 1905. All bee-keepers are invited to attend. Augusta, Wis. GUS DITTMER, Sec.

New York.—The Jefferson County Bee-keepers' Society and New York State Association will hold their meeting in the City Hall, Watertown, N. Y., Jan. 17 and 18, 1905. The general manager, N. E. France, and other prominent bee-keepers, are expected to speak. Black River, N. Y. GEORGE B. HOWE, Sec.

New York.—A bee-keepers' institute, under the auspices of the Bureau of Farmers' Institutes of the State of New York, will be held at Fulton, N. Y., Monday, Jan. 16, 1905. Mr. N. E. France has been engaged by the Department of Agriculture, as speaker. The annual business meeting of the Oswego County Bee-keepers' Association will be held at the same time and place. CHAS. B. ALLEN, Sec., Central Square, N. Y. MORTIMER STEVENS, Pres.

New York.—The Fulton and Montgomery Counties Bee-keepers' Society will hold the next meeting at Amsterdam, N. Y., Thursday, Jan. 19, 1905, in connection with a bee-keepers' institute. Arrangements have been made with F. E. Dawley, Chief of the Bureau of Institutes, to furnish Mr. N. E. France, General Manager of the National Association, as the principal speaker, and all are cordially invited to come. This will also be the annual business meeting of the society. T. I. DUGDALE, Sec. West Galway, N. Y.

New York.—A series of bee-keepers' meetings have been arranged for in this State, as follows: Syracuse, Jan. 15; Watertown, Jan. 17, 18; Romulus, Jan. 11; Cortland, Jan. 13; Fulton, Jan. 16; Amsterdam, Jan. 19. Mr. N. E. France, the general manager of the National Bee-keepers' Association, has been engaged to address the meetings, by the State Department of Agriculture, through the Bureau of Farmers' Institutes, F. E. Dawley, Director. The convention at Watertown, Jan. 18, will be the meeting of the State Association, at which many of the

progressive bee-keepers of this and adjoining  
States are expected to be present and take part  
in the discussions.

C. A. HOWARD, Sec. W. F. MARKS, Pres.

Nebraska.—The annual meeting of the Ne-  
braska Bee-Keepers' Association will be held at  
the Experiment Station at Lincoln, on Monday,  
Jan. 16, 1905, at 2 p. m. Will you be there and  
favor us with a paper along the lines of bee-  
keeping in which you are particularly inter-  
ested? It is hoped that Ernest R. Root will be  
present for a good talk. Headquarters will be  
at The Windsor Hotel, where cheap rates have  
been secured. This will be one of the first  
meetings in the weeks' series; let us have a good  
one.  
L. D. STILSON, Sec., York, Nebr.  
E. WHITCOMB, Pres.

Michigan.—The Michigan State Bee-Keepers'  
Association will hold its annual convention  
Feb. 23d and 24th, at the Eagle Hotel in Grand  
Rapids. The Eagle Hotel is located at 65 to 71  
Market St., cor. of Lewis St., one block south  
of Monroe St. It will give a rate of \$1.50 per  
day, and furnish a room free for holding the  
convention. The Michigan State Dairymen's  
Convention will meet in Grand Rapids at the  
same time, and advantage may be taken of this  
fact to secure reduced rates on the railroads.  
When buying your ticket, ask for a certificate  
on account of the Dairymen's Convention. The  
secretary of the Dairymen's Association will  
sign this certificate which will then enable the  
holder to buy a return ticket for one-third fare.  
Several associations often thus meet at the  
same time and place, the secretary of one asso-  
ciation signing the certificates for all of the asso-  
ciations, the same being done with the knowl-  
edge and consent of the railroads—it simplifies  
matters. Grand Rapids is the second largest  
city in the State, easily accessible from the  
north, south, and central parts of the State, in  
the heart of a good bee-country, and, with the  
low rates assured, there should be a large  
crowd in attendance.

**Honey and  
Beeswax**

CHICAGO, Dec. 7.—The market is well supplied  
with all kinds of honey; the demand is of a  
light nature. Fancy comb honey brings 14c,  
but quality as well as appearance is necessary;  
No. 1 sells at 12½@13c; off grades difficult to  
move at 1@3c less. Extracted, choice white,  
7@7½c; amber, 6@7c, with off grades about 5½c  
per pound. Beeswax, 30c.

R. A. BURNETT & Co.

NEW YORK, Dec. 7.—Receipts of late have  
been quite heavy, and while there has been a  
fair demand, it has not been up to former years  
and stocks are somewhat accumulating, conse-  
quently prices show a tendency to decline, and  
in large lots quotation prices as a rule are  
shaded. We quote fancy white at 14@15c; No.  
1 white at 12@13c; amber, 11c; buckwheat, 10c.  
Extracted in fair demand at 6@6½c for white  
clover; 5½c for buckwheat; 50@60c per gallon  
for Southern, according to quality. Beeswax  
firm at from 28@29c.

HILDRETH & SEGELKEN.

KANSAS CITY, Dec. 30.—The best comb honey  
is selling at \$2.25 per case of 24 sections, and  
the demand for same is very slack. Extracted  
is moving fairly well, fancy stock selling at  
6½@7c. We look for the market on comb honey  
to improve shortly after the first of the year,  
as the dealers will have the stock that they  
bought for the holiday trade about cleaned up.  
Beeswax in good demand at 30c.

C. C. CLEMONS & Co.

PHILADELPHIA, Dec. 24.—As usual around the  
holidays, there is not much call for either comb  
or extracted honey. Prices remain about the  
same as the last quotations. Some odd lots  
having arrived in the market in the last 10 days  
weakened the price of lower grades. Fancy  
white comb, 15@16 cents; No. 1, 13@14c; amber,  
11@12c. Extracted, white, 7@8c; amber, 6@7c.  
Beeswax, 26c.

We are producers of honey and do not handle  
on commission. WM. A. SELSER.

BOSTON, Dec. 22.—During the honey season  
the honey demand has been practically at a  
stand-still. Stocks seem to accumulate rather  
than to diminish. While prices are practically  
as per our last, yet on the whole, the tendency  
seems to be to a lower level. Our market to-  
day is practically as follows: Fancy white,  
16c; A No. 1, 15c; No. 1, 14c, with practically no  
demand for No. 2. Extracted, from 6@8c, ac-  
cording to quality.

BLAKE, SCOTT & LEE.

CINCINNATI, Dec. 30.—Since our last report  
was published, the price of extracted honey has  
advanced, no doubt acting in sympathy with

the sugar market. We quote amber extracted  
in barrels at 6@6½c; white clover, in barrels  
and cans, 6½@8½c. Fancy comb honey, 13@14c.  
Beeswax, 28c. THE FRED W. MUEH Co.

ALBANY, N. Y., Dec. 26.—Comb honey is mov-  
ing off very well considering the heavy re-  
ceipts and cold weather. Prices not as high  
as early fall, as usual, but very good yet.  
Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c.  
Buckwheat, 11@12c; mixed, 10@11c. Extracted,  
dark, 6@6½c; light, 6½@7c. Beeswax, 28@30c.  
H. R. WRIGHT.

CINCINNATI, O., Dec. 19.—Comb honey is now  
coming in more freely, and prices if anything  
have moderated a little. The sales made and  
prices obtained were for No. 1 fancy water-  
white comb, 12@13½c; single cases, 14c. Ex-  
tracted is sold as follows: White clover, in  
barrels, 6½c; in cans, 7½@8c; amber, in bar-  
rels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c.  
C. H. W. WEBER

SAN FRANCISCO, Dec. 28.—White comb, 1-lb.  
sections, 11½@12½c; amber, 9@11c. Extracted  
white, 6@6½ cents; light amber, 4½@5½c; am-  
ber, 3½@4½c; dark amber, 3@3½c. Beeswax,  
good to choice, light, 29@30c; dark, 27@28c.

There are no heavy quantities offering of  
either comb or extracted, but more than im-  
mediate custom can be found for at prevailing  
values. The demand at present is very light  
and is mostly local.

No. 3.

APIARIAN DISPLAY OF LOUIS WERNER, OF MADISON CO., ILL.,  
USED IN A STREET FAIR.

J. M. HAYNES AND APIARY, OF TAMA CO., IOWA.  
(See page 36.)

# FOR 1905.

We are always studying how to improve our goods. That's why we are leaders. No detail is too small for improvement. No expenses are spared to experiment and build new machinery. There are many advantages in buying Root's Goods. You can't get good goods cheaper; you save freight and time, and you are always sure of the very latest in apiculture. Below are our improvements for 1905.

## Honey Extractors

The honey extractors of 1905 have steel stampings in many places where gray iron castings were used formerly. These stampings are so ribbed and braced that the construction of the baskets will be much stiffer than formerly with no possibility of any of the parts breaking.

## Wire Imbedder

Our new spur wire imbedder is a great improvement over the old one. Although it costs 20 cents and the old one sells for only 10 cents, it is 10 times better. It does very neat, pretty work and the special construction of the teeth with the groove makes it easy to follow the wire during the process of imbedding.

## Perforated Zinc

A complete new set of dies and press have been made during 1904 for turning out perforated zinc, so that our 1905 product will be even better than before.

## Smokers

Some minor improvements have been made in our smokers by which the blast will be increased and the general construction throughout stiffened. A very neat and strong brace is placed in such position that the legs supporting the cup or stove can not be twisted or bent out of shape without crushing the whole smoker.

## Fences

Some of our fences for the supers will be nailed as well as glued. This will enable the user to clean off the propolis by immersing them in boiling water, a fact which will be appreciated by many.

## Root's Automatic Extractor

We have got it at last. An automatic reversible honey-extractor that will reverse the pockets while in motion by simply pressing on a lever. The extractors are no larger than the Cowans, and reverse without bang or slam, provided the directions are followed. They are equipped with street-car hand-brake, noiseless gearing, gearing on top of the reel out of the honey, and out of the way of putting in and removing the combs. We have the 4-frame size all ready for delivery. Six-frame, 8-frame, and 2-frame sizes will be ready shortly. Price will be only \$2.00 above the regular price for 2, 4, 6, and 8 frame Cowan extractors, respectively.

## Wax-Tube

The Van Deusen wax-tube fastener is made of one piece of brass tubing drawn down to a point. It is a much neater and better tool than the one sold last year.

## German Wax-Press

The German wax-press is now so improved that it has a threefold use. First, as a wax-rendering device and press to squeeze out slungum clear of wax. Second, as a press for squeezing honey out of cappings, bits of burr-combs, chunk honey and the like. Third, as an uncapping can for uncapping combs preparatory to extracting. This last feature will prove invaluable because the cappings will drop into the basket, and when the uncapping is done the cappings can be squeezed until they are dry, the honey running out at the spout. Three machines for the price of one. And our price has been reduced to \$12.00.

## Bee-Veil

Our bee-veil for 1905 will have rubber cord sewed in the bottom edge so that the top as well as the bottom will be elastic. If the directions are followed the edge of the veil can be made bee-tight around the waist or coat, effectually protecting the wearer. We will still furnish veils with silk binding and when called for can supply them.

## Cover

The Excelsior cover will look about the same as before except that its construction will be simplified and strengthened, making it better in every way to withstand extremes of hot and dry weather. It will be used on all our hives including the Danzenbaker, as it has stood the test of many years, and for a general purpose cover we know of nothing better.

Ask for our Catalog. A postal brings it.

## Editorial Notes and Comments

### Popularizing the Value of Bees and Honey.

Last week we mentioned having received a beautiful bee and red clover calendar from Mr. W. F. Marks, of New York. Since then we got the following letter from him concerning it, and offering a further suggestion :

DEAR MR. YORK:—Yours of the 5th inst. received. I hasten to say that I am not entitled to *any credit* for the design on the calendar in question. The design is used as a cover for the Red Clover Writing Pad, sold at many stationery and book stores. I only took this means of calling your attention to the design, which I considered very unique and appropriate for bee-culture, and it seems to me it embodies a suggestion that we, as honey-producers and bee-lovers, should be prompt to grasp.

For instance, how can we reach the great mass of the people any quicker and easier than by placing a school writing pad upon the market with an appropriate and attractive cover design, one page devoted to the natural history and importance of the honey-bee, a denial of the comb-honey canard, and the importance of honey as food, etc.?

It seems to me that such a pad placed upon the market would naturally go into thousands of schools, and tens of thousands of homes, and having an intrinsic value, it would be preserved, read, re-read, and remembered by the class we want to reach. We could have such a pad manufactured for us in large quantities, and could dispose of them at wholesale at a price sufficient say to cover expense; in fact, we could, under the circumstances, sell them at less than cost, but that would not be necessary, and certainly not a good business proposition.

Perhaps this suggestion is visionary, but I trust you will not put it aside without giving it careful consideration.

W. F. MARKS.

We believe the suggestion Mr. Marks makes is a good one, and ought to be followed up by the National Bee-Keepers' Association. No doubt there are many other things used by school children that might have printed on them something about bees and honey. We really think that if the Board of Directors, of which Mr. Marks is chairman, would take hold of this matter some of the funds of the National could be better invested than in some other ways that might be recalled. Such expenditure would be along the line of advertising a wider use of honey, and thus would help increase its demand. Whatever increases its demand, if persisted in, will surely help the price of honey, and thus be a benefit to every honey-producer.

Why not put a little thought along the line suggested by Mr. Marks and others, and see if a more extended use of honey can not be secured? There seems to be little trouble

now about producing honey. What is needed is a larger demand or outlet for it. The National Association can do no better, we believe, than to put some of its effort and money in the direction indicated.

### Doolittle's Queen-Rearing Methods.

The following item appears in *Praktischer Wegweiser* :

"The Doolittle American method of bee-culture—also much extolled by many German theorists—appears, according to the *Imkerschule*, not to fulfill expectations; indeed, even Americans themselves are allowing it gradually to sink into oblivion; for them, also, nothing excels after-swarms for queens, quality considered."

Our worthy contemporary, the *Wegweiser*, may say to *Imkerschule* that some one has been fooling it; the Doolittle plan, under different names, and with more or less variation, is more firmly established in this country than ever before. The probability is that if all queen-breeders had to depend upon after-swarms to the exclusion of Doolittle cells, many of them would go out of the business. Indeed, it is getting to be considered more or less of a reproach to have after-swarms at all.

### Illinois Leads in the National Association.

We learn from General Manager France that there are now more members of the National Bee-Keepers' Association in Illinois than in any other State. The others in order follow thus: California, Wisconsin, New York, and Texas. All other States have less than 100 members each. Illinois has over 300. New York State, at one time, claimed to lead in membership, and, if we remember, some one from there thought on that account New York was justified in having three of the twelve members of the Board of Directors. Illinois has only one member on that Board, and we don't know any one in this State that thinks we should now have one-fourth of the Board. Of course, New York is not to blame for having a majority of the Board. They were all duly elected by ballot by the membership. It is simply New York's good luck, or because she has so many able bee-keepers.

### What is Honey?—Definitions and Standard.

This question has often been asked, and has recently come up again. Prof. A. J. Cook, of California, answers it in this way :

I have been amused at the way this question has been answered by several of our bee-keepers. I feel certain that there is but one legitimate logical answer. Honey is the sweet that bees store in the hives. It is impossible to give any other answer. It usually is digested nectar, for its source, for the most part, is from flowers. But no one can know at any time that there may not be an admixture of honey-dew, cane-sugar, possibly filched from some store, or,

more likely, juices from various fruits. In any event, when nectar passes to the bee's honey-stomach, it is so changed that we may well call it "honey", as it is put into the comb.

I have fed pure cane-sugar to bees and have had the resulting honey sampled by experts, and they not only pronounced it honey, but the best they had ever eaten. This kind of honey though would always be too expensive to put on the markets. I notice in the last Bee Journal it is suggested that honey-dew honey is not honey because it is not collected from flowers. I have known such honey to be of rare excellence. Indeed, I believe that not a little of the very best honey often sold as basswood or clover comes from honey-dew. I believe that the secretion of nearly all our aphids will produce a honey of superior flavor and excellence. This is no mere guess, but the result of actual observation for a series of years. A. J. COOK.

Under "Food Definitions and Standards", a circular recently sent out by the Bureau of Chemistry of the United States Department of Agriculture, there were "schedules prepared by the Committee on Food Standards, Association of Official Agricultural Chemists". They referred to "sugars and related substances". Of course honey was included, and the following were suggested as the definitions and standard:

1. *Honey* is the nectar of flowers and saccharine exudations of plants gathered and stored in the comb by bees.
2. *Comb Honey* is honey still in the comb.
3. *Extracted honey* is honey which has been separated from the comb.

*Standard honey* is honey which is lævo-rotatory to polarized light, contains not more than twenty-five (25) percent of water, not more than fifteen one-hundredths (0.15) percent of ash, nor more than eight (8) percent of sucrose.

These suggested definitions and standard of honey were sent out in order to get the opinions of various experts before adopting them, and so were "subject to revision". We are inclined to think that the "definitions" given are fairly good. As to the "standard", we are not chemist enough to say.

Perhaps others of our readers besides Prof. Cook, who have made a study of this subject, would like to express themselves. If so, our columns are open.

## Miscellaneous News & Items

Our Advertisers, we believe, are a lot of most honorable and reliable firms. We are glad to recommend them to our readers. We also believe they are all reliable in their dealings, else they could not get into the advertising columns of the American Bee Journal.

When writing to any of them, we would like to urge you to mention having seen their advertisement in the American Bee Journal. This would help both the advertiser and us. The more business they get from having their advertisements in the American Bee Journal the better satisfied they will be with it, and the more they will advertise in it hereafter.

Scarcely any periodical published to-day could exist if it depended entirely upon its subscription price. So the advertisers are a great help. This journal is no exception to the rule in this regard.

We want the American Bee Journal to be a benefit to its advertisers as well as to its regular subscribers. Their interests are mutual. We would like to bring them nearer together, so that each will understand the other better.

In and through it all, the American Bee Journal desires

to be helpful in every possible way to those who either read it or advertise in it. All we want is the permission to do our part.

Not Quite as Gentle.—In the letter from Fred Bechly, of Poweshiek Co., Iowa, on page 14, he is made to say that he finds the golden Italian bees quite as gentle as the three-banded. It should have read "not quite as gentle".

Temperance Life Insurance Company.—Your attention is called to the advertisement of the Total Abstinence Department of the Security Mutual Life Insurance Company and the National Total Abstinence League. This department has had an experience of nearly four years and a half. The mortality ratio proves, beyond doubt, that abstainers are desirable insurance risks.

The Apiary of J. M. Haynes is pictured on the first page this week. Concerning himself and his apiary, Mr. Haynes wrote as follows when sending the photograph:

I am 55 years old, and have been a farmer all of my life. I have 391 acres of land. As my health failed so that I couldn't do heavy work on the farm, I went into the bee-business. I have 90 colonies under a shed the year around.

The bee-shed is 6 feet wide. The front is 8 feet high, sided down half way. The hives are set at the front, so I do the bee-work behind them under the shed. The shed runs 64 feet north, 68 feet west, and 64 feet south. I use the Langstroth 10-frame hive, with 28 sections in the super. I don't extract any. I let the bees do the work, and I sell the honey.

It was a poor year here for honey the past year. It is worth 19 cents a pound now. J. M. HAYNES.

The Defunct Honey-Producers' Association, referred to in an item on page 30, is thus commented upon by H. L. Weems, of Kern Co., Calif.:

EDITOR AMERICAN BEE JOURNAL:—With only the friendliest and kindest feeling for all concerned, I can not silently see what seems to me, in the clipping from the Kingsburg (Calif.) Recorder of Dec. 14, a gross injustice to the manager of the defunct Central California Honey-Producers' Association.

I was a stockholder in that organization, and suffered as great pecuniary loss as any member in it. Therefore, I believe I am as much entitled to discuss the mistakes of its management as any one. It is true there was lack of confidence. Not in the manager particularly, but among all the stockholders. With but few exceptions each was suspicious and distrustful of his neighbor almost from the very beginning of the organization. Each locality was jealous of every other locality. Each had its own plan for perfecting the organization, and all other plans were radically wrong. There was no spirit of concession or compromise. So that it was impossible to perfect an organization wholly satisfactory even to a majority of the stockholders.

Every meeting was an occasion for prolonged, and in certain instances, acrimonious debate. Every one was honest and sincere in the belief that his view was the only correct one, but suspected the honest motive of his neighbor. On this account it was impossible to secure the adoption of a code of by-laws.

But through all these stormy scenes there was not one who commanded greater respect and confidence than the president and manager of the Association. This is evidenced by the fact that he was elected and re-elected, and his offer to resign afterwards declined. It was through his efforts and sacrifice of time, money and personal interest, more than any other, that the organization lived as long as it did.

It was he who made the interest of every bee-keeper his own personal concern, and sought to reconcile every conflicting interest that arose. It was he who came to the support of the editor of The Recorder, when, as publisher of a bee-paper at Tulare, afterwards the Western Bee Journal, he was fighting against odds for a place among publishers of bee-literature. The support given at this time was loyal to the last degree. It was loyalty itself. The new bee-paper's friends were his friends; its foes, his foes.

The Central California Honey-Producers' Association

is a thing of the past, but its failure to live and prosper is not the fault of any one man. The organization was formed for the express purpose of marketing honey collectively in car-loads through a single head. The stockholders refused to fulfill the purpose of its creation by adopting by-laws and giving the Association control of their honey when ready for market.

Not more than 10 percent of the stock issued was fully paid for, and without any honey to handle it was not surprising that "the condition of the business for the past year looked bad". The only wonder is that any one would expect a business to succeed without cash, credit, merchandise, or other resource to start on. Tall oaks from tiny acorns grow. But it takes time and plenty of sap. Of course, the "benefits received were very slim".

The editor of The Recorder was himself a member of the Board of Directors of the Central California Honey-Producers' Association, and, with the other members of that body, directly responsible to the stockholders for the conduct of its business. If any discredit attaches to the management he should either accept his just share or else make it clear that he was in the minority in all its transactions; in which case it will be hard to make the manager's one pair of shoulders carry it all. H. L. WEEMS.

## California as a Home and for Bee-Keeping.

PROF. A. J. COOK.

MR. BROWN, a long-time bee-keeper of Ontario, Canada, and as long a subscriber to the American Bee Journal, asks me many questions about California. Similar questions have been asked by a good many of late, and though I have replied to such inquiries before, it has been some time since, and the numerous new subscribers that come in each year will certainly find it wholly new. The fact that Mr. Brown, one of our most experienced and intelligent readers, desires further details makes it seem probable that the matter will not be without general interest.

It has been my privilege to live in four of our States—Massachusetts, Illinois, Michigan, and now California. Of these, it seems to me California is incomparably superior as a home. Indeed, if one has pleasant employment, I do not see how he could wish for more than a home in this beautiful Southland. The scenery is certainly all that one could wish. The rugged mountains with their bared cliffs and the ever-varying hues of light and shadow become more and more entrancing as one lives among them. I have heard it said of California, as I have often heard it said of Washington, D. C., that any one who has sojourned here for a short period is never content to live elsewhere. I believe our grand old mountains have much to do in creating this fondness. The climate of California has even more to recommend it. It is always summer. Even this day after Christmas I have been choring around without coat or vest, and with no discomfort. To me the summers are equally pleasant with the winters, and I should regret to feel that I could not always spend my days in this blessed land of warmth and sunshine.

I am also very much attracted to California because of its great variety of fruits. There is not a month of the year that we can not pick ripe fruit from tree or vine. Not only is the variety of our fruit surprising, but its quality for the most part is equally worthy of praise. Of course, in these days of rapid transportation, any table anywhere in our land may always be graced with the finest of fruit, yet there is a pleasure in stepping out and picking it from one's own tree—watching it grow and mature—that I find most delightful. It would take a pretty big inducement to wean me from the splendid orchards of our Southern California.

I should also mention water as one of our great attractions; not its abundance, for that is our great lack, but the fact of the possible absolute purity of our water is to me one of the prime attractions of our regions. Let me take Claremont as an example. Our water is pumped some hundreds of feet. It is received into a covered reservoir with

two separate compartments. From these it runs in underground pipes till we draw it from our hydrants. Thus we see that there is no possible chance of taint, and such dreaded scourges as typhoid fever may surely be barred out. What is true of Claremont may and will be true some day of nearly our whole region.

I have kept the best for the last. I now refer to our people. I doubt if for intelligence and morality they are surpassed anywhere in the world. We might almost be called New New England. And as I have lived in Massachusetts I am free to say that I think the "New" is an improvement. There is a generous responsiveness, a willingness to lend a helping hand among the people of Southern California that one rarely sees. So far it has been a very prosperous country, and it is possible that it is this that has awakened these generous impulses in our people.

But now we come to the other side of the question, the delights of living in this region are so many and so patent that they have been noised abroad. The salubrity, too, of our climate brings many here for health. This may make it difficult at times to secure just the employment one would like. Yet it seems to me that this depends very much upon the person. As for myself, I have often wished that I might be two or three men, for I am sure I could keep each one happily employed. Thus, while I would not wish to induce any one to come here with the certain expectancy for work to their hands and to their living, I have never yet seen willing hands idle. Indeed, there has been a good deal of complaint of scarcity of labor in our orchards. Surely, orchard work is very pleasant, though it is particular work, and I can readily see how by a little carelessness, or want of interest, one would soon cease to find employment. I doubt if there is any more interesting manual work in the world than caring for an orchard. At the same time I doubt if there is any work that requires more painstaking care in every detail. Orchard culture here is intense, carried on in a perfection that is truly admirable. Thus, the slovenly or indifferent worker will surely have trouble to find employment.

I have often written of bee-keeping. When we get a good honey-year we eclipse the world. Enthusiasm, however, will be modified when I state that such years are not oftener than one in three. The second of the three will be indifferent, while the third will be attended by actual absolute failure. Even with this showing our best bee-keepers average 75 pounds per colony per year, and the honey crop of a single season, with some of our apiarists, reaches to several car-loads and to several thousands of dollars.

Mr. Brown asks if we would need to serve an apprenticeship here. I think not. Bee-keeping is much the same everywhere. Here we have no trouble with winters, but, of course, in our years of drouth feeding is strictly in order. The expert bee-keeper would at once see the point, and a little talk with a good apiarist would make him capable of handling his bees profitably. Such men as Hatch, Hambaugh, and others—excellent bee-keepers East—come here and take a front seat at once. I do not think that any one who has made a success of apiculture in the East need fear to try it here. If he selects his location carefully I do not think he could do better in any other part of the world.

If I have not answered Mr. Brown as fully as he wishes, or if any reader of the American Bee Journal wishes more information and will ask specific questions, I shall be glad to answer them as best I may.

Los Angeles Co., Calif., Dec. 26.

## No. 2.—What is the Best Bee-Hive?

BY ALLEN LATHAM.

(Continued from page 22.)

IN spite of all I have said in favor of the closed-end frame, I should hesitate to adopt it and hang it lengthwise of the hive, for it needs to be hung crosswise of the hive, that is, parallel to the entrance, if it is to fulfill its mission. In like manner little is to be gained in hanging frames across the hive, if at the same time they are free-hanging, for crosswise hanging and closed-ends are a pair which must go together—complements which make a whole.

Read what is said on pages 468 and 469 (1904). There you may learn that most of the fraternity are against a crosswise-frame, while, though several are non-committal, only one or two come boldly out in its favor. Permit me to take up the objections as offered and treat them as they deserve.

First, a few prominent bee-keepers say that such a

frame is not in common use, and they wish one which is standard, that is, used by the people. Well, once upon a time it was the custom to take the corn to mill on horse-back, and when the bag was only half full to put a stone in the top to balance the bag across the horse. One day a stupid boy was too lazy (?) to find a stone, and so after tying the bag divided the corn into equal portions, hour-glass style, and thus threw it across the horse. "Here, boy", says his father, "why do you load up in that silly way? Isn't the way your father, your grandfather, and his father before him, carried corn to mill good enough for you? Hustle now and find a stone, or I will put the cane to you."

One says that wax-worms are worse in hives with such frames. All that I can say is that the wax-worm knows a good, warm place when he finds it, and will take it every time, if he can.

It is stated that bees build less even comb. This seems to me quite likely, though I have had many beautiful flat combs built in such frames. At any rate, it is a minor matter since comb foundation is so generally used. It is surely not an objection of sufficient weight to rule out such a frame.

Another says that such frames will call for new supers, basing his suggestion on the supposition that the crosswise frames will be of such size or number that the hive will be of a different size. This does not follow, and hence the objection can not hold.

Too short for brood-combs, says another. Why? My crosswise frames are 10 by 12 inches, and 11 in number, and they seem to work all right.

Too short for outdoor wintering. Yes, indeed, if hung lengthwise and free, but not otherwise. Try it and be convinced.

More frames to manipulate. This objection is made on the ground that the old size of hive-body is still used with the entrance at the narrow end as before, and is a reasonable objection. It is true that more time is taken in going through 12 frames than in handling 8 or 10, but if one handles bees as little as he needs rather than as much as he is moved to, I think that he will find little trouble with the extra number of frames. I find, too, that I handle practically no more, for it is not necessary, as a rule, to handle more than three or more frames for nine out of ten purposes in manipulating frames, and the smaller the frames the easier.

Interferes with free passage of bees. Prove it. If one will study the bees in an observatory hive he will see much that will lead him to believe that this objection is without foundation. The only time when bees need extra passage is when honey is coming in rapidly. At such times supposedly the bees find a readier passage through the hive by traveling on the end-bars. So, once it was believed that the earth was flat. Space will not permit me here to go into details to show that this objection is utterly without weight. I can only deny it with the assurance of one who has seen proof to the contrary.

It gives the bees less chance to ventilate the hive. This objection would condemn the crosswise frame if I had not found a way clear to get around the difficulty. By having the space below the frames about an inch deep in front and decreasing as it goes back till it is a scant bee-space under the last frame, ample opportunity is given the bees to ventilate their hive. Mind you! gives the bees opportunity to ventilate the hive themselves, does not allow Nature to do it the very time when the bees don't want it done; for that is just what the free-hanging frame, which is lengthwise, does.

By far the greatest number of those who answered the query on page 468, raised the objection that such a style of frame would not allow the tilting of the hive forward to let the water out. Well, I always was opposed to this tipping-forward plan, for, to my mind, the hive ought to be level all around, but the water is objectionable, and, forsooth, how can you get rid of it except by tilting the hive? It really ought to make a thoughtful person smile to read this objection. If the crosswise-frame is a thing of value shall we let such a little difficulty prevent our adopting it? In my own hives I simply slope the bottom-board, as will be seen from what I say above in regard to space below the frames, and I have the satisfaction of seeing my hives stand up straight like my house. By the way, why not tilt your house to keep the rain from getting into the front door?

Now it is really unkind to make fun at all, for do we not know that nearly all of those good brothers were asked to answer a question concerning which they had only opin-

ions without experience? Listen to what one who has had the experience says:

"R. C. Aikin (Colo.)—Practically none. I have used extensively such in the past; they are better for nearly every purpose than the long Langstroth frame. They cost a little more, but that is a very small item. First cost is a trifle if it gets better results later. Without a detailed argument, let me say that I *know* short frames are all right for results in breeding, and the super arrangements can easily be adapted."

Thus speaks one who knows. Such a statement should have great weight, and should carry conviction to the extent of causing many to try a few hives the coming season with such frames. New London Co., Conn.

(Concluded next week.)

Conducted by EMMA M. WILSON, Marengo, Ill.

### Paste for Rough Skin.

For rough, harsh skin of arms and shoulders mix a quarter pound of unsalted lard, which has been washed in rain water and then in rosewater, with the yolk of an egg and a tablespoonful of extracted honey. Add enough oat-meal to make a paste. Spread on the arms and leave for an hour.—Chicago Daily.

### Starting in Bee-Keeping.

Here is a clipping from the woman's department of the Chicago Daily News, being a reply to an inquiry, which is remarkable for the wholesome moderateness of the expectations it arouses:

"I kept bees for many years, and at present have about 10 colonies. Twenty-five dollars would buy about 6 colonies at the cheapest. Then it would require about \$15 worth of supplies—that is, supers and sections for the bees to store the honey in, to say nothing of the work. In a very good season they would average about 70 pounds per colony.

"The last three years the bees had one good season. In other words, every third year is a failure. Some winters bee-keepers lose from 30 to 50 percent in bees. To make a living at bee-keeping would require 125 to 150 colonies, which would cost, including all tools, extra hives, supers, etc., \$800 to \$1000, besides a number of years' experience. One can't get enough of that."—A. H. O.

### "Hiving Bees with a Shot-Gun"—Pleasures of Bee-Keeping.

I have been a reader of the American Bee Journal for nearly two years. Having charge of an apiary of from 20 to 40 colonies, my experience with bees has been both interesting and profitable. Our apiary produced 2300 pounds of comb honey, mostly in one-pound sections.

There are many interesting items in the American Bee Journal. The article in Dec. 15th number, on "Hiving with a Shot-Gun", excels anything I ever read in the way of hiving. For marksmanship it is beyond parallel—he must have telescopic vision to be able to give the dimensions of a twig 50 feet from the ground, and to arrange the hive so accurately that the cluster fell in exactly the right place. Verily, this is a remarkable age. Bee-culture opens a field of varied and practical knowledge, the pursuit of which is one of the great pleasures of life.

We anticipate much from our apiary the coming season. I am one of the bee-keeping sisters, although not enrolled as a member. L. FREES.

Davis Co., Iowa, Jan. 3.

Sometimes the written description of a thing makes it appear more difficult than it really is, and it is just possible that if you had been an eye-witness of Mr. Stolley's performance it would not appear so remarkable, although certainly a novice would hardly succeed as he did. I don't know how many hunters there are with you, but "in this

locality" there are many who would scorn to aim at the bull's-eye at so short a distance as 50 feet, as a test of their marksmanship, and they would by no means consider his aim as beyond parallel. You think "he must have telescopic vision to be able to give the dimensions of a twig 50 feet from the ground", but you forget that all he would have to do would be to pick up the said twig and measure it after it had fallen to the ground as the result of his good aim.

It doesn't look as if you or I could squint at a swarm 50 feet in the air and make a correct guess first time as to where the swarm would fall, but by standing straight under it a fair guess might be made. The secret of Mr. Stolley's correct guessing, however, he explains in that phrase, "By taking the proper bearings at right angles". I've seen Dr. Miller do that. He would stand off a little distance, and, looking up at the swarm, would then drop his eye to the ground and estimate where a line would fall that would pass through the point directly under the swarm. He could guess pretty well where that line would be, but he couldn't guess closely how far from him the point should be. However, he'd set the hive somewhere in the line, then he'd go off to one side and estimate a line at right angle to the first line, moving the hive accordingly, and after going backward and forward from one line to the other, he could pretty soon determine just about the right point.

We sisters might sight and cross-sight as well as a man, but when it comes to firing the gun most of us would rather call a man.

## Mr. Hasty's Aferthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### INVITATION TO YOUNG BEE-KEEPERS.

Here's a gold eagle going a-begging—or, say, a roast pig running around squealing for somebody to eat him. Many young people like to write letters, I believe; and they mostly know they are not welcome to write to persons of note and station. If they should do so their letters would receive a hurried glance or two from a secretary, and then be pitched into a big waste-basket; and that would be the last of it. But here is a man of note that asks as a favor that young bee-keepers would write to him. Looks as though he has an attack of bee-fever. He has plenty of chance to read the wisdom of bee-doctors; but he wants to hear the experiences of other patients, especially those who know a good deal less than himself. So if you are under 18, and have been doing something with bees, write and tell him all about it. If nothing new or strange occurred to you that is no bar. The just-what-might-be-expected things are about as welcome as exceptional things are. He reproves us for neglecting the common things of Nature and running all the time after exceptional things. The man is Dr. Edward F. Bigelow, Stamford, Conn., editor of the Nature and Science department of the St. Nicholas Magazine. If he should not have time to write individual answers to all his young correspondents never mind about that. Have faith to believe he reads and enjoys what he has asked for, until a wholesale answer comes in his department of the magazine. Page 804.

### LOSS OF YOUNG QUEEN IN MATING.

Young queens at mating-time often turn up missing from the place where they ought to be. The credit of this is usually given to birds, to dropping into trouble of some kind, water for instance, or to entering the wrong hive. As to the latter, the almost universal assumption has been that they do so by mistake. Adrian Getaz suggests that often there is no mistake about it—hives they try not the ones they would blunder into, if that was it, but distant and manifestly not-like-home places. If I may piece out a hint, they hover near the entrances of one colony after another until they find one where the smell, and the absence of hostile motions on the part of the guards, encourage them to make an attempt; and there they try it for live or die—often killed, occasionally accepted. How is this? I suspect there is a good deal in it. It assumes, of course, that

the queen has, from some cause, a deep-seated dislike to her own proper station. "Baby nucleus" too-muchee, hive too open and drafty, too much syrup and too little honey, bees all of one age instead of properly assorted, nation with no national spirit, are some reasons that occur why a queen of high ambition might want to change. It is quite imaginable that the odor of a queenless colony might be perceptibly different from that of a colony with a queen. But when she doesn't find a queenless one she seems to try the next best one.

I hardly agree with him that a comb of honey presented, in a bucket or otherwise, is always attractive to a swarm. If the bees of the swarm are in a hungry condition (and that often happens) then they are very ready to climb onto a comb of honey. When they are distended with honey already (condition according to that usually described in the books), it has seemed to me that they regard a comb of honey poked at them as a sort of an insult. Pages 807, 808.

### A LONG-TIME OUT-OF-DOORS BEES.

Ten weeks is a long time for a clipped queen and a few dozen volunteer bees to remain homeless out-of-doors. Still, it is possible that Wisconsin is right as to the origin of the little cluster that he found. If so, those bees were miracles of faithfulness and persistence in their attempt to make something out of a hopeless situation. We may well take off our hats to them. They keep one another warm part of the time, and grin and bear the cold and the wet the rest of the time. They take turns at bringing temporary lunch from the fields when there is any to be had, and suck their paws when there is none. Doubtless they often tried to move the dismembered queen to some other location by that bee-panacea, the process of "swarming", but always went back to her when she proved immovable. Page 810.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

### Depth of Supers on Langstroth Hive.

What should be the exact depth of supers used for both comb and extracted honey on Langstroth hive? IOWA.

ANSWER.—Supers vary in depth for the same hive, the depth depending entirely upon what the super is to contain. A super for a tall section will, of course, be deeper than for one not so tall. The depth should be about one-fourth inch more than the depth of the extracting-comb or of the section, together with any addition that must be made for any top or bottom bar that may be over or under the section.

### Effect of Putting Bees on Drone-Combs.

If eight brood-frames were filled with foundation of drone-size, placed on a strong colony during a flow, and after the combs are completed and the honey extracted, and a strong colony with a fertile queen placed on the combs, would the queen lay only drone-eggs, or would the bees change part of the combs or rear workers in drone-cells? OHIO.

ANSWER.—I don't know what your bees would do; but I'll tell you what mine once did. I put a colony on drone-combs, and the queen wouldn't lay at all—the bees just swarmed out. It is possible, however, that in some cases they would stay and work; if so, I should expect them to contract the mouths of the cells to worker size and rear workers in them. I've known them to do that when part of their comb centrally located was drone-comb.

### Running an Out-Aplary.

I have run an out-aplary of 100 colonies of bees for the last 10 years in connection with a farm, but I am giving up the farm and want to go more extensively into the bee-business. I intend to keep the 100 colonies on the farm, but I have a village lot about 2 miles away on which I wish to keep 50 colonies. Would it do to have one with queen-guards on all through swarming-time, keeping all queen-cells cut out and all brood well spread—that is, for producing extracted honey? I would probably not be able to go to the yard more than twice a week. CANADA.

ANSWER.—If you cut out all queen-cells twice a week and keep brood spread, with colonies run for extracted honey, there ought to be

little trouble with swarming. Yet cutting out cells, even twice a week, will not make an entirely sure thing as to swarms. Sometimes a colony, after being thwarted a number of times, will swarm with not a queen-cell in the hive. Even if the plan were always sure, it would be a lot of work to cut out cells twice a week. Shaking swarms as soon as each colony showed queen-cells would probably be as reliable, requiring a visit to the apiary once every seven to nine days. Another way would be still less trouble, and although not entirely successful with all, it is with some, and might be with you. As soon as you find queen-cells in a hive, take the hive off its stand, put on the stand a hive with empty combs, foundation, or starters, find the queen and put her in the empty hive together with the bees that are on the comb with her, and shake into the hive the bees from the other combs, or most of them; cut out all queen-cells, put a queen-excluder over the hive on the stand, and set over that the hive with the brood-combs. The bees will gradually fill the lower story, and at the same time the brood will hatch out above the excluder, and those upper combs will become extracting combs. Another thing that will help to keep down swarming is to allow an entrance to each story; move forward the second story until there is a  $\frac{1}{4}$ -inch space at the back end between the stories, and if you have three or four stories allow a space of the same kind over each one.

### T Tins—Economizing on Hives—Wintering Bees—Sheep in the Bee-Yard.

1. What are T tins, and what are their advantages?  
 2. I have a plan to prevent buying more new hives after securing a desired amount. One usually has a few empty hives in the spring, and I put the first swarms that issue into these, putting the parent colonies on other stands some distance away. When the empty hives are all filled I run the other swarms into the old hives, and continue so during the swarming season. I also take a couple of frames filled with honey from each of these old hives, putting frames of foundation in their places before running in the new swarm. I save the frames of honey for fall use. Please tell me what you think of this plan.

3. A recent number of the American Bee Journal advises bee-keepers to put their colonies into winter quarters having a large number of young bees. How is this done?

4. Some one speaks of having sheep keep down the grass in the bee-yard. Is there not danger that they will tip over some of the hives?

ANSWERS.—1. A T tin is a support of tin which has a flat bottom with an upright central part to give it rigidity; so called because a transverse section is the shape of the capital letter T upside down. Its advantages are that it takes up very little room, and is of great strength.

2. The plan is old, and properly managed may work all right. At any rate, the first part, running swarms into the hives with old combs will work well.

3. If you have none but strong colonies in the fall, you are likely to have plenty of young bees; so double up weaklings. Sometimes it happens that the honey harvest closes quite early, and there is no fall flow to keep the queen laying, so the bees may all be pretty old; in that case steady feeding may make the queen lay.

4. I don't know whether it works the same with others; but in my own experience neither cows nor horses are so bad as sheep about pushing hives off their stands. I suppose they do it by rubbing.

Yes, there's a lot for any of us to learn, and I should feel well satisfied if I could learn how to get 75 pounds of honey per colony each year and increase 50 percent, as you have done.

### Detecting Adulterated Beeswax.

I extract wax, sometimes doing it for other people. Now, suppose I had a lot of comb that originally was of the adulterated brand. The question is, "Has the adulteration been removed by the bees?" If it is still there will a Ferris or any other wax-extractor remove it in part, or, if not, can it be detected by analysis? I pride myself on pure, absolutely pure wax, and hope some time to handle more of it. When I extract a lot of wax, I use a piece of that lot for a gauge, and test other lots as per instructions found in the "A B C of Bee-Culture". I am innocent of any intention to cheat, but I am cheated myself, not by those from whom I receive comb, but from the original makers of the comb. You will see, if I use a piece of that lot, my gauge will test all other lots as pure when they are not. Is there any other way to make myself absolutely sure, outside the alcohol and water test?

ANSWER.—My good friend, you are evidently troubled with a conscience, but in the present case I think the trouble need not be very great. Some years ago the number of those who manufactured comb foundation in this country was very much larger than it is now, those who at that time made it merely for their own use, having found that it was in the long run cheaper to buy it from those who made a special business of foundation-making. This would not be the case unless the purchasers were confident they were buying straight goods. I have bought foundation ever since there was foundation to buy—never made an inch of it myself—and I have no more thought as to its being adulterated than I do of the milk that comes from my own cow. The great bulk of foundation in this country being made by a few establishments that are above suspicion, there is little chance on the face of it for there coming into your hands old combs to be melted up, which combs have been made from adulterated foundation, simply because in the nature of the case there can not be much of such stuff in the country.

Now let us turn aside a minute and consider conditions in Europe. Thousands of Rietsche foundation presses (I think more than 15,000) are in use there, largely because the only way bee-keepers can be entirely sure they are getting pure foundation is to make it themselves: some of the foundation on the market being reported as being composed of only one-fourth beeswax. Now, did you ever stop to think why they object to buying the adulterated article? If it worked all right when given to the bees, they wouldn't know it was adulterated. Indeed, if comb foundation could be made of pure paraffin, and it work just as well as that made of beeswax, I am inclined to think I should use paraffin foundation because of less cost. The reason they object to it is that such foundation can not be used by the bees, being so much out of shape that no bee-keeper would allow it in his hives. So if it were possible that such comb could be used by the bees till old and black, you would probably detect it at first glance as having cells out of shape. I think no one has yet reported that adulterated foundation was worked out into perfect comb.

Answering specifically your question as to your gauge, and the danger of your using an impure article to gauge by, there's no need of your running any risk in the matter. Don't use anything to test by that you are not absolutely sure is pure wax, just as it came from the bees. That's an easy thing; for you can in a very few hours' time, without using any foundation in it, get the bees to build you a piece of comb sufficiently large for your purpose.

### Feeding Bees in an Observatory Hive.

I have a 1-frame observatory hive which I kept in a bedroom window last spring and summer. During a cool and rainy spell in the late summer it was necessary to feed the bees, and I did so very nicely from a saucer on the window-sill for a week or more, when the bees from hives in the garden—perhaps 100 feet from the house—began robbing, and I was obliged to give up the hive entirely, much to my regret.

Can you give me a plan for feeding bees in an observatory hive, and can I keep such a hive in the house through the winter?

NEW JERSEY.

ANSWER.—The best thing is to take a frame of sealed honey, even if you have to take it from some full colony, lift the frame out of the observatory hive, put in the frame of honey, and carefully brush the bees onto it. If such a comb is not available, perhaps Scholz or Good candy can be used. Take a very little best extracted honey, heat it (be sure not to burn it), stir in all the pulverized sugar it will take, then put it on a board and knead in what more sugar you can, making a very stiff dough. Put this candy on top of the frame, or anywhere in the hive where the bees can get at it.

### Rearing Queens—Manipulating Supers and Covers—Queenless Colony—Shaken Swarms—Entrance in Winter.

1. If a colony of black bees that are queenless are given a frame of brood from a colony of Italians, will the blacks rear an Italian queen?

2. How do you manipulate supers and covers to avoid killing bees?

3. How can one tell when a colony is queenless, or is going to swarm, without examining the frames?

4. Do you wait until a colony starts queen-cells before making shaken swarms?

5. How wide an entrance should bees have during cold weather if wintered on summer stands, well protected from north and west winds?

VIRGINIA.

ANSWERS.—1. Yes, you can't tell any difference between a queen reared by a black colony and one reared by an Italian colony, provided the egg is laid by the same queen.

2. About the only thing I can tell you is not to set squarely down a cover or super, but to "play" it down, if I may use the expression. Whether it be a cover or a super, set one end on the hive, then play on the other end, first letting it go down within 2 or 3 inches of its resting-place, then raise it an inch or so, then lower it till it is an inch or so above the hive, raise it an inch or so again, then let it go closer down than before, and keep on letting it go closer each time till you let it down entirely. Each time you let it down a little it will squeeze some of the bees enough so they will get out of the way, and when you finally let it down there will be no bees in the way. It sounds long in the telling; but it is really done very quickly.

3. I can't.

4. Yes, I always do; because, all things considered, that suits best in my case; but in some cases it might be advisable to make a wholesale business of it and shake all as soon as the first make preparations for swarming.

5. Depends somewhat on strength of colony and depth of entrance. A strong colony may have an entrance the whole width of the hive if it is  $\frac{3}{8}$  deep; and in general the entrance may amount to 3 or 4 square inches, with half that for a weak colony.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

## Convention Proceedings

### THE ST. LOUIS CONVENTION.

#### Report of the 35th Annual Convention, of the National Bee-Keepers' Association Held at St. Louis, Mo., Sept. 27-30, 1904.

(Continued from page 26.)

The President called upon Prof. Frank Benton to read a paper, which is as follows:

#### WORK IN APICULTURE AT THE UNITED STATES DEPARTMENT OF AGRICULTURE.

At the meeting of the North American Bee-Keepers' Association, held at Washington, D. C., December 27-29, 1892, Dr. C. V. Riley, then Entomologist of the Department, presented quite a review of what the Department of Agriculture had done, and what he conceived it could do for apiculture. Since it fell to me to prepare all of the data for this article I shall feel at perfect liberty to draw upon it freely in a brief review of what the Department has already done in apiculture. In most instances, however, I shall quote literally from the communication presented under the name of Dr. Riley.

Dr. Riley started out by an allusion to the wisdom of establishing as a part of the government machinery, a Department of Agriculture charged with doing all it can to foster and encourage agriculture in all its branches. He believed that the advisability of this would not be questioned by any one who had made himself familiar with the work of the Department since its organization, first as a mere chair in the Department of the Interior, then a separate Commission, and later a department co-ordinate with the others, with representation in the Cabinet of the President. He believed, and I think with good reason, that, notwithstanding some things in the administration of this great Department might be better if changed, yet on the whole there exist fewer abuses and abnormal conditions in the Department of Agriculture than in any other of the Departments of the government. The great body of workers connected with the Department are earnestly interested in the branches which they represent, and devote practically all of their energies to the furtherance of the work in hand. It has been my lot to be associated in various capacities with these workers during the past thirteen years, and I have come to appreciate most thoroughly the beneficial character of their work, and their singular devotion to it. I can also easily understand how Dr. Riley remarked in his article that "some of the most beneficent and far-reaching work of the Department was done during its earlier history, when its means were limited, and when the field was fresh, and the opportunities relatively greater." He then proceeds to state that: "It has been the desire of almost everyone who has been at the head of the Department to pursue a broad and liberal policy to the end that all the branches of rural economy might receive their due share of attention. He states, then, the fact that must be apparent at once to all, namely, that, "The head of the Department is, however, helpless without Congressional aid and sympathy, and it has too often happened that investigations which promised valuable results have been abandoned because of the failure of Congress to make the needed appropriations." Then, after an allusion to the direct value of the products of bees, and the far greater value which results to the country through the fertilization of our seed and fruit producing plants, Dr. Riley says:

"Fifteen years ago, when I first accepted a position in the Department, there was provision only for an entomologist without assistants or means for any experimental or field work. During the next four or five years I succeeded in impressing the Commissioner of Agriculture and Congress with a sense of the importance of the work to be done in efforts to counteract the ravages of injurious insects, and the appropriations for both office

assistants and field-work increased. But the self-evident advantage of endeavors to protect the farmer from some part of the immense losses occasioned by insects, had to fight its way into recognition. It was not until 1885 that the more important work done in counteracting the ravages of injurious species had sufficiently advanced to justify my giving some attention to apiculture, and the fact that nothing more resulted from the work begun may, to some extent, be laid to the lack of effort on the part of the bee-keepers themselves, i. e., to their failure to take united action, such as would bring home to the head of the Department, and to those in charge of the general appropriations, the needs and just demands of the industry.

"However, that considerable has been done by the Department, and through its agency, for bee-keepers—much more, probably, than most of you are aware of—the published reports of the Department show. These reports, hundreds of thousands of which have been distributed very generally over the land, have surely had their influence in the promulgation of intelligent and humane culture of bees. Beginning about the time of the first edition of Langstroth's celebrated work, or nearly a decade before any bee-periodical had been printed in the English language, the Department reports have from year to year given some notice of progress in bee-culture, statistics of honey and wax production, and on several occasions excellent little treatises on bees and bee management. Notable among these is the article on the nature and habits of the honey-bee, in the report of 1857. I cannot give the name of the author, as only the initials of the Chief Clerk of the Patent Office are attached to it. In 1860, Mr. William Buckisch, of Texas, gave, in an extended article, a review of bee-culture as practiced by Dzierzon and his school. The essay by my old friend, Mrs. Ellen S. Tupper, of Iowa, published in the report of 1865, and covering her theory of bee-keeping, was widely read and frequently quoted, creating much interest in improved methods.

"The introduction of Italian bees into this country is certainly one of the advances in bee-culture which ranks second only to the invention of the frame hive, the honey extractor, and the comb foundation machine. But how many even now know that the Department of Agriculture had anything to do with the matter? Leading text-books on apiculture are silent on this head. The fact is, however, that the first successful importation of Italian bees from their native land to America was made by the Department, and it was almost wholly from this importation that such skillful apiarists as Langstroth, Cary, and Quinby bred and disseminated the race during the early '60's."

It must be remembered of Dr. Riley that he was a man of brilliant conception, and also kept in close touch with popular sentiment and growth in all matters pertaining to agriculture, and that naturally wherever his own field of economic entomology was concerned, he was in the front as to its needs and possibilities. He was not a skilled bee-keeper, nor, in fact, could he ever have been classed as a bee-keeper, but, nevertheless, he had, many years before his connection with the Department, manipulated bees to some extent, and had made some study of methods in apiculture, as well as of the habits of the bees themselves, so that it is not surprising that he was disposed to view favorably, in 1885, the establishing of an apicultural experiment station in connection with the entomological work of the Department. In this he was earnestly supplemented by Mr. N. W. McLain, who was, I believe, an old time acquaintance and an enthusiastic bee-keeper, and who became the first appointee. There was, at the time, no special appropriation for apiculture, nor indeed anything of the kind during the whole of Dr. Riley's administration of the office of entomologist. I mention this to show that all the more credit is due to Dr. Riley in connection with the work then undertaken, and which, though interrupted through lack of funds, he resumed later. The funds to initiate this work, and to continue it for a period, as well as to resume it after the interruption just mentioned, were drawn from the general appropriation for the Division of Entomology, and were diverted by the entomologist himself from the general insect-work to this special purpose in the belief that he was fulfilling both the letter and the spirit of the law which authorized the expenditure of certain sums for the promotion of economic entomology.

Just here I must digress somewhat, lest those familiar

with what has been printed on this subject should call me to account for the above statements, by referring to a biographical sketch of Mr. W. K. Morrison, which is found on page 554 of Gleanings in Bee Culture for July 15, 1898. This article was written by Mr. A. I. Root, and submitted by him to Mr. Morrison himself. Mr. Root says, concerning Mr. Morrison:

"While at Washington he became intimately acquainted with Senator Teller, Secretary Rusk, Senator Plumb, and others. As he still held on to his interest in bee-culture, at an opportune time, as it seemed to him, he was permitted to urge that an appropriation of \$5,000 be made for the benefit of bee-culture in the United States, and he was successful in securing this appropriation. Prof. Cook took hold of it about a year after the money was given, and I do not know but friend Cook had the credit of it, although Mr. Morrison, if I am correct, was the first mover in the matter, and the one who finally secured the enactment."

When the article was submitted by Mr. Root, to Mr. Morrison, including this paragraph, the latter made as a comment, over his own initials, the following statement:

"Besides myself and the secretary, no one knew. Dr. Tinker was the first to know. Secretary Rusk pledged the Senate committee not to spend money on the study of wild bees, but to put the money to practical purposes. Prof. Riley did not like this. Secretary Rusk also pledged himself in writing that I should be the first appointee."

Nothing can be further from the truth than the statements here made. There was no enactment whatever, nor appropriation of \$5,000, nor any other sum for apiculture at the time indicated (1885-87), nor, in fact, was

there ever a special appropriation for apiculture previous to the year 1901. The following table taken directly from the records of this department will show that, aside from the appropriation for general work, the only specific appropriations made were in the years 1887 to 1890, when provision was made for experiments in silk culture.

APPROPRIATIONS FOR THE DIVISION OF ENTOMOLOGY.

Year ending June 30	Salaries	General expenses for entomological investigation	Specific appropriation for silk culture
1884.....	\$7900	\$20,000	.....
1885.....	7900	20,000	.....
1886.....	7900	25,000	.....
1887.....	7300	15,000	\$15,000
1888.....	7300	20,000	25,000
1889.....	7300	20,000	30,000
1890.....	7300	20,000	30,000

It is a manifest injustice also to the memory of Dr. Riley to intimate that he wished to spend the money on the study of wild bees to the neglect of practical apiculture itself. Dr. Riley was eminently a practical man, and the fact that he did divert from the general sum appropriated during a series of years for entomological investigations a certain portion to experimental work in apiculture, is proof of itself that he was disposed in a kindly manner toward this industry, and saw the possible benefits which could result from scientific investigations of problems connected with the industry. I cannot regard as any more felicitous the intimation that the first Republican secretary of agriculture, whose record in other respects is above reproach, should have broken a pledge given in writing.

(Continued next week.)

# I'M TALKING NOW

## Over My Own Telephone

Every farmer should have his own telephone. If he is not near a telephone line he can interest his neighbors and build a line. It doesn't cost much, and the advantages are beyond estimating. The extra profit on one year's crop, sold at the right time, will more than pay his share. A telephone enables him to get the market reports every day—get every market advantage.

## Stromberg-Carlson Telephones

are constructed to meet the conditions that arise on farm lines—don't need expert operators, are *strong* in talking qualities, durably built and are always ready for work, day or night. Our book F 80 "Telephone Facts For Farmers" tells all you want to know. It's free. Write for it and you will soon be "talking over your own telephone." Address nearest office.

# Reports and Experiences

## Bees in Good Condition.

I have now 30 colonies of bees all packed well for winter, with plenty of honey. We sell all our honey around town at 13 cents per section, or two sections for 25 cents, unless they weigh less than a pound, when we sell them at 8, 10 or 12 cents, according to their weight. Or we use them for our own table, or sometimes give them away.

Allegany Co., N. Y. G. HODGES.

## Moving Bees—Cleaning Sections—Black Brood—Honey-Cases—Brood-Frames.

I moved 35 colonies about 300 yards by closing the entrances. I plunked them on an old wheelbarrow, jarred them over the gravel-stones, placed them in position, opened the entrances at once and got out of the way. I don't think a hundred bees came back out of the lot.

I tried wire-cloth for cleaning sections. I made the wood rough and left the propolis on. A heavy paper well oiled, and fastened around the edges of a hive-cover with strips of wood, is good enough here. The same thing with old newspapers underneath, tacked around the body of a hive, is a good winter protection. Let the warm air bring the bees out, not hot sun on the hive.

Black brood appeared in both States along the Delaware River during the summer. And I think the Alley cure is a master stroke, and a fame winner, judging from the experience I had with it. I tried fresh Italian blood, but it was no help that I could discover. Some of these became the worst cases in the lot.

I don't think queens have anything at all to do with disease. I took queens out of diseased colonies and placed them at once in healthy colonies, and no disease followed. I think the claims made for the Italians in many respects are greatly overrated, except that of gentleness in handling.

For 2 years I have made honey-cases 5-row 5 in a row, and notice others in the market this year. They make a fine appearance, and are handy to crate up in even hundreds.

The "Hunsberger A. C. Frame," as it is called, mimics the catalogs, and is simply the

**EDGE-DROP**

**SEED CORN**

"Edge drop" planters are no good unless the seed is of even size and perfect shape. I breed corn with perfect and uniform kernels and I grade all my shelled seed with a specially constructed mill that throws out every uneven, round or thick kernel better than you could possibly do it by hand. Every kernel must be just like every other—even, flat, just right. That means even, accurate planting and a perfect stand. No trouble, no delay. All my shelled seed is screened this way, a feature no other seed man can offer. Samples and catalog free.

### Made Little More than a Living.

The bees in this section of Ohio have made little more than a living. My bees have very little care, and therefore can not be expected to do much for their owner. I sell my honey at 15 to 18 cents per section.

The bees had a good flight on Dec. 27, but the next day the thermometer was 14 degrees above zero, so they will stay in for a while now.

HENRY BEST.

Carroll Co., Ohio, Dec. 29.

### Open Winter—Moving Bees—Queens Fighting.

I enjoy reading the Bee Journal. I get it every Friday and read it first, and in almost every number I find something that is worth the price of my subscription.

My honey crop was very light last year. I will have to feed some. The winter has been very open. So far the bees have flown almost every day. They were out till almost sundown Dec. 1, 1904, something which is not very common in this locality.

I see a good many inquiries about moving bees. I moved mine about 40 rods last spring and there were very few that went back. I stopped up the entrances with grass, putting

three hives on a hand-cart at one time, and had little trouble with the exception of one 2-story hive that was full of bees in both stories. In lifting it over, or rather through, a barbed-wire fence the top wire caught the cover of the hive and lifted it off, and the bees got out on my assistant in such a manner that he had to desert me. So that left me with the hive balanced on the fence, the top off, bees boiling out, no smoker, no veil, no help. Well, I had to take my medicine. It was a pretty strong dose, but I finally got them set down. They were slightly jarred in the operation, and I have not had any rheumatism since. Moral: Don't move bees without fastening the hive top and bottom securely.

Have any of the bee-keepers seen two queens fight, or is it such a common thing that it is not mentioned? It is not common to me, so I will try to tell my experience in that line. I got to the bee-yard about 9 o'clock one morning (it is 5 miles from home), and walking across the yard I noticed a few bees fly up. I looked down to see what called so many in one place, and I found one of the queens that I had clipped. I did not know where she came from, so I took her to a hive that I thought to be queenless, and put her on top of the frames. The bees came up and appeared to be glad of her presence. They seemed to feed her and clean her off. I left them for a few minutes, then went back to the hive, and lifting out the frame I supposed she was on, I found her and an inferior black queen about one inch apart, going toward each other. The black was the quicker of the two. She jumped against the yellow queen, knocked her on her side, and stung her.

FRED TYLER.

10 CENTS A YEAR.

The Dixie Home MAGAZINE, largest, brightest and finest ILLUSTRATED MAGAZINE in the world for 10c a year, to introduce it ONLY. It is bright and up-to-date. Tells all about Southern Home Life. It is full of fine engravings of grand scenery, buildings and famous people. Send at once, \$1.00 a year, postpaid, anywhere in the U.S., Canada and Mexico. Six years, 50c. Or, clubs of 6 names, 50c; 12 for \$1. Send us a club. Money back if not delighted. Stamps taken. Cut this out. Send to-day. THE DIXIE HOME, 24A48t, No. 75, Birmingham, Alabama.

Please mention Bee Journal when writing advertisers.

no honey from them for the past two years, nor have many in the neighborhood secured any. But I will take the American Bee Journal this year yet. I am nearly 83 years old, but I like to read it. CHRISTIAN BLOUGH, Somerset Co., Pa., Jan. 30.

Honey Crop Almost a Failure.

The past year's honey crop has been almost a failure. I started with 39 colonies, increased to 41, and secured about 350 pounds of comb honey. The prospect for next year is very poor on account of the severe drouth last fall. My bees are mostly in good condition for winter. JACOB SEIBOLD, Champaign Co., Ill., Dec. 24.

Doing Well with the Bees.

I have kept bees for two years, and have done very well with them. In 1903 my crop was 239 pounds of comb honey from 3 colonies, and in 1904 I harvested 323 pounds from 7 colonies. The past season was not a very good one in this section of the country. JOHN L. DICKSON, Ray Co., Mo., Dec. 26.

Past Season a Record-Breaker—Bee-Stings for Rheumatism.

I began last spring with 5 colonies of bees. I lost 6 last winter from starvation. The season of 1903 was the worst we have had in 22 years, for bees generally get enough to live on and give their keeper about 25 pounds per colony. The past season was our record-breaker, which comes every 12 or 14 years. Everything had honey in it. I think it is because the summer was hot and dry, and the rest of the years were cold and wet. I got 633 pounds of comb honey, and one of my neigh-

CONVENTION NOTICES.

Wisconsin.—The Wisconsin State Bee-Keepers' Association will meet in the Supervisor's Room in the Court House, at Madison, Feb. 1, 2, 1905. All bee-keepers are invited to attend. Augusta, Wis. GUS DITTMER, Sec.

Minnesota and Wisconsin.—The annual meeting of the Southeastern Minnesota and Western Wisconsin Bee-Keepers' Association will be held in the County Commissioner's Room, County Court House, Winona, Minn., on Tuesday and Wednesday, Jan. 24 and 25, 1905, beginning at 10 a.m. on the 24th. If you can, favor us with a paper on any topic pertaining to bee-culture in which you are particularly interested. A free-to-all question-box will be a feature of the meeting. Fountain City, Wis. JOSEF M. REITZ, Sec.

Michigan.—The Michigan State Bee-Keepers' Association will hold its annual convention Feb. 23d and 24th, at the Eagle Hotel in Grand Rapids. The Eagle Hotel is located at 65 to 71 Market St., cor. of Lewis St., one block south of Monroe St. It will give a rate of \$1.50 per day, and furnish a room free for holding the convention. The Michigan State Dairymen's Convention will meet in Grand Rapids at the same time, and advantage may be taken of this fact to secure reduced rates on the railroads. When buying your ticket, ask for a certificate on account of the Dairymen's Convention. The secretary of the Dairymen's Association will sign this certificate which will then enable the holder to buy a return ticket for one-third fare. W. Z. HUTCHINSON, Pres.

10,000 Plants for 16c More gardens and farms are planted to Salzer's Seeds than any other in America. We own and operate over 6000 acres for the production of our warranted seeds. That you may try them, we make you the following remarkable offer: For 16 Cents Postpaid 1000 Fine Solid Cabbage, 1000 Rare Luscious Radishes, 2000 Rich Battery Lettuce, 1000 Splendid Onions, 2000 Juicy Tender Turnips, 2000 Nutty Tender Celery, 1000 Gloriously Beautiful Flowers. Above seven packages contain sufficient seed to grow 10,000 plants, furnishing bushels of brilliant flowers and lots and lots of choice vegetables, together with our great catalog telling all about Flowers, Roses, Small Fruits, etc., all for 16c in stamps and this notice. Big 140-page catalog alone, 4c. JOHN A. SALZER SEED CO., La Crosse, Wis.

Langstroth on the Honey-Bee Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal. The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work. GEORGE W. YORK & CO. 334 Dearborn Street, CHICAGO, ILL.

**Engravings For Sale**

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and using in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid. Address,

**GEORGE W. YORK & CO.**

334 Dearborn Street, CHICAGO, ILL.

horses got a little over 1400 pounds from 11 colonies. I now have 11 colonies myself.

I want to give my testimony in favor of bee-stings for rheumatism. Eight years ago I had it about as badly as people generally have it. The first attack I had put me in bed for 5 months, and I had never been rid of it since until last winter, when it left me altogether, and for a year or more I have been free from it.

Last year was hard on bees. They were mad all the time, and there was hardly a day that I did not get stung from one to 20 times, and once while hiving a swarm one of my neighbor's boys pulled 34 stingers out of my face and neck, and my hands and wrists were full, too. I never swelled a bit, but the rheumatism left me.

CHARLES W. HOPSEGER.

Skagit Co., Wash., Dec. 29.

**Bees Wintering Well.**

Our bees are wintering well. We are having nice weather, and they have a flight about every week.

There is not much demand here for honey. We have quite a lot on hand yet.

**Honey and Beeswax**

CHICAGO, Dec. 7.—The market is well supplied with all kinds of honey; the demand is of a light nature. Fancy comb honey brings 14c, but quality as well as appearance is necessary; No. 1 sells at 12 1/2@13c; off grades difficult to move at 1@3c less. Extracted, choice white, 7@7 1/2c; amber, 6@7c, with off grades about 5 1/2c per pound. Beeswax, 30c.

R. A. BURNETT & Co.

NEW YORK, Jan. 9.—The market on comb honey is decidedly dull, and while there is no stock of dark and buckwheat to amount to much, all grades of white honey are plentiful, and for the present we cannot encourage shipments. We quote fancy white at 14c; No. 1 at 13c; No. 2 at 11@12c; buckwheat at 10c. Extracted honey is in fair demand, with abundant supplies and a weakening tendency is noticeable in the market. We quote white at 6@6 1/2c; light amber at 5 1/2@6c; dark, 5@5 1/2c per pound; Southern at 5 1/2@5 1/2c per gallon. Beeswax, 29c.

HILDRETH & SEBELKEN.

KANSAS CITY, Jan. 9.—The demand for comb honey still continues light, as most of the retail dealers were stocked up on \$2.25 honey before the holidays, two cars of which were sold here at that time. We look for a better market in the near future, and quote: Fancy comb, 24-section cases, \$2.50; No. 1, \$2.25. Extracted, white, per pound, 6@6 1/2c; amber, 5 1/2@6c. Beeswax, No. 1, 28@30c. C. C. CLEMONS & Co.

PHILADELPHIA, Jan. 9.—The market is unchanged from our last quotations, and trading light. We quote: Fancy white, 15@16c; No. 1, 13@14c; amber, 11@12c. Extracted, white, 7@8c; amber, 6@7c. Beeswax, 26c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

BOSTON, Jan. 9.—The market is without change since last writing. The demand con-

tinues light, and supply is more than ample. We quote: Fancy white, 16c; A No. 1, 15c; No. 1, 14c, with practically no demand for No. 2. Extracted, from 6@8c, according to quality. BLAKE, SCOTT & LEE.

CINCINNATI, Dec. 30.—Since our last report was published, the price of extracted honey has advanced, no doubt acting in sympathy with the sugar market. We quote amber extracted in barrels at 6@6 1/2c; white clover, in barrels and cans, 6 1/2@8 1/2c. Fancy comb honey, 13@14c. Beeswax, 28c. THE FRED W. MUTH CO.

ALBANY, N. Y., Dec. 26.—Comb honey is moving off very well considering the heavy receipts and cold weather. Prices not as high as early fall, as usual, but very good yet. Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c. Buckwheat, 11@12c; mixed, 10@11c. Extracted, dark, 6@6 1/2c; light, 6 1/2@7c. Beeswax, 28@30c. H. R. WRIGHT.

CINCINNATI, O., Dec. 19.—Comb honey is now coming in more freely, and prices if anything have moderated a little. The sales made and prices obtained were for No. 1 fancy water-white comb, 12@13 1/2c; single cases, 14c. Extracted is sold as follows: White clover, in barrels, 6 1/2c; in cans, 7 1/2@8c; amber, in barrels, 5 1/2@5 1/2c; in cans, 6@6 1/2c. Beeswax, 27c. C. H. W. WEBER.

SAN FRANCISCO, Jan. 4.—White comb, 1-lb. sections, 11 1/2@12 1/2c; amber, 9@11c. Extracted white, 6@6 1/2c; light amber, 4 1/2@5 1/2c; amber, 3 1/2@4 1/2c; dark amber, 3@3 1/2c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Market is quiet and not noteworthy for strength. Although stocks here and throughout the interior are light, there is little inquiry, either for shipment or on local account. There is strong probability, however, that the spring trade will absorb the light stocks remaining.

# Bee Journal

45th Year.

CHICAGO, ILL., JAN. 26, 1905.

No. 4.

WEEKLY

"LAKE PHALEN APIARY", AN OUT-APIARY OF H. G. ACKLIN,  
OF RAMSEY CO., MINN.

# FOR 1905.

We are always studying how to improve our goods. That's why we are leaders. No detail is too small for improvement. No expenses are spared to experiment and build new machinery. There are many advantages in buying Root's Goods. You can't get good goods cheaper; you save freight and time, and you are always sure of the very latest in apiculture. Below are our improvements for 1905.

## Honey Extractors

The honey extractors of 1905 have steel stampings in many places where gray iron castings were used formerly. These stampings are so ribbed and braced that the construction of the baskets will be much stiffer than formerly with no possibility of any of the parts breaking.

## Wire Imbedder

Our new spur wire imbedder is a great improvement over the old one. Although it costs 20 cents and the old one sells for only 10 cents, it is 10 times better. It does very neat, pretty work and the special construction of the teeth with the groove makes it easy to follow the wire during the process of imbedding.

## Perforated Zinc

A complete new set of dies and press have been made during 1904 for turning out perforated zinc, so that our 1905 product will be even better than before.

## Smokers

Some minor improvements have been made in our smokers by which the blast will be increased and the general construction throughout stiffened. A very neat and strong brace is placed in such position that the legs supporting the cup or stove can not be twisted or bent out of shape without crushing the whole smoker.

## Fences

Some of our fences for the supers will be nailed as well as glued. This will enable the user to clean off the propolis by immersing them in boiling water, a fact which will be appreciated by many.

## Root's Automatic Extractor

We have got it at last. An automatic reversible honey-extractor that will reverse the pockets while in motion by simply pressing on a lever. The extractors are no larger than the Cowans, and reverse without bang or slam, provided the directions are followed. They are equipped with street-car hand-brake, noiseless gearing, gearing on top of the reel out of the honey, and out of the way of putting in and removing the combs. We have the 4-frame size all ready for delivery. Six-frame, 8-frame, and 9-frame sizes will be ready shortly. Price will be only \$2.00 above the regular price for 2, 4, 6, and 8 frame Cowan extractors, respectively.

## Wax-Tube

The Van Deusen wax-tube fastener is made of one piece of brass tubing drawn down to a point. It is a much neater and better tool than the one sold last year.

## German Wax-Press

The German wax-press is now so improved that it has a threefold use. First, as a wax-rendering device and press to squeeze out slungum clear of wax. Second, as a press for squeezing honey out of cappings, bits of burr-combs, chunk honey and the like. Third, as an uncapping can for uncapping combs preparatory to extracting. This last feature will prove invaluable because the cappings will drop into the basket, and when the uncapping is done the cappings can be squeezed until they are dry, the honey running out at the spout. Three machines for the price of one. And our price has been reduced to \$12.00.

## Bee-Veil

Our bee-veil for 1905 will have rubber cord sewed in the bottom edge so that the top as well as the bottom will be elastic. If the directions are followed the edge of the veil can be made bee-tight around the waist or coat, effectually protecting the wearer. We will still furnish veils with silk binding and when called for can supply them.

## Cover

The Excelsior cover will look about the same as before except that its construction will be simplified and strengthened, making it better in every way to withstand extremes of hot and dry weather. It will be used on all our hives including the Danzenbaker, as it has stood the test of many years, and for a general purpose cover we know of nothing better.

Ask for our Catalog. A postal brings it.

# BEE JOURNAL

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor.

CHICAGO, ILL., JAN. 26, 1905.

Vol. XLV.—No. 4.

## Editorial Notes and Comments

### Lawsuits and the National Association.

The Board of Directors of the National have decided that "in case of litigation hereafter the financial aid extended by the National Bee-Keepers' Association shall not exceed the sum of one-half the expense incurred in such case".

That will allow more attention to adulteration, and possibly the time may not be far distant when something may be done in general advertising of honey. Speed the day!

### Selling Small Crops of Honey.

One of the large honey commission dealers once told us that he did not solicit small shipments of honey. He thought that, for various reasons, such could better be disposed of nearer home, and often so advised when they were offered to him.

But we find there are quite a number of bee-keepers who seem to have no little difficulty in selling their honey in their home or near-by market.

Then, again, there are others who could sell more than they can produce, right in their home market. We would like to invite this latter class to tell how they do it. It is not necessary to tell in what particular town you have worked up a good demand for your honey—simply tell *how you do it*. By so doing you will in a measure repay the debt you owe to others who perhaps have aided you with a description of their methods.

There must be many who have been successful in selling their own crops of honey to private families, and at paying prices. Can we not hear from some of them?

### Worker-Eggs in Drone-Cells.

In the British Bee Journal G. B. asks: "When worker-eggs are deposited in drone-cells do they develop, and, if so, are the resultant workers as large as drones?" To which that journal replies: "A fertile queen never deposits worker-eggs in drone-cells, therefore, the question about 'resultant workers' can not arise".

Ordinarily neither a fertile queen nor any other kind of a queen lays worker-eggs in drone-cells; but in exceptional cases a queen lays worker-eggs in drone-cells, and from such eggs are developed worker-bees just the same as if the

eggs had been laid in worker-cells. A special case may be mentioned: About 30 years ago R. R. Murphy sent to the office of the American Bee Journal a piece of comb containing sealed brood, the comb being unquestionably drone-comb; and notwithstanding the journey through the mail young workers emerged that were not noticeably different in size or otherwise from workers in general.

It has been explained that it sometimes occurs that when a piece of drone-comb happens to come in the middle of the brood-nest of a colony with a vigorous young laying queen, the bees deposit wax on the edges of the cell-walls, making the diameter at the mouth of the cell the same as the diameter of a worker-cell, such cells being then occupied with worker-brood.

### Felt for Winter Packing.

This is recommended in Praktischer Wegweiser as being better than straw or moss covering, and no more expensive.

### Does White Clover Winter-Kill?

Virgil Weaver asserts in Gleanings in Bee-Culture—apparently endorsed by that paper—that white clover never-winter-kills; that in supposed cases of winter-killing the plants die from drouth, such death being in no way affected by the cold. Can it be possible that the general belief is so far out of the way?

### Columbus-Comb of Doubtful Utility.

The new foundation with tin-foil base, made in Germany and called "Kolumbuswabe" (Columbus-comb), was heralded as a great acquisition; but reports of success in using it are singularly lacking. Foerster Klauke, in Praktischer Wegweiser, reports having tried a hive filled with the new foundation, also single frames put in the middle of the brood-nest, but the bees made such bad work with it that he concludes by saying that it has only given him something more for the lumber-room.

### The Bee-Keepers' Experience Meeting.

Personal experiences are nearly always interesting, and often most profitable. Bee-keepers, we think, are famous, as a rule, for their great unselfishness in the line of imparting freely the results of their work with bees. We dare say there is scarcely another vocation in which so many have been so kind and so generous in this regard. We have often marvelled at it.

And the "experience meeting" must ever be a place of helpfulness, as each contributes to the general fund of information or encouragement. The bee-papers are really places where are recorded the experiences of those who

have been keeping bees for a longer or shorter time. Some who arise and speak (or write) as in a bee-keepers' convention, have had a larger and perhaps a more varied experience, hence their ability to impart more information. But taking together all that is written (or printed) in any one issue of a bee-paper, it makes a nice "apicultural meal". And where a bee-keeper takes several of the bee-papers (as all should do if they wish to gain every advantage to be had from bee-literature), he will have several such "square meals" during the month.

Now, as ye have enjoyed and been profited by reading the experiences of others, so should ye contribute your experience in return. No one bee-keeper knows it all. But by each adding a little to the general fund of bee-lore, so will all be helped on to success.

### The National Pure Food Bill.

We have received the following, and also a newspaper clipping, from E. Woodall, of Charlevoix Co., Mich., referring to the Pure Food Bill before Congress in Washington:

EDITOR YORK:—I notice the daily press states that the Whiskey Trust has held up the Pure Food Bill which passed the House last session, and is now in the United States Senate on the shelf and no prospects of the Senate taking it up this sitting. Give bee-keepers another jog to write their United States senators, and put it through.

E. WOODALL.

The clipping mentioned reads as follows, sent out by the Associated Press:

WASHINGTON, Jan. 9.—Friends of the Pure Food Bill, passed by the House and now pending in the Senate, and especially members of the International Pure Food Congress, believe the whiskey rectifiers of the country have killed the measure so far as the present session is concerned.

It is asserted that a powerful lobby, representing the whiskey rectifiers of the country, who, according to Dr. H. W. Wiley, produce 85 percent of the whiskey drunk in America, has been on the ground ever since the session began. The rectifiers oppose the bill because it would compel them to label their product as adulterated whiskey.

Why not all bee-keepers write at once to their senators at Washington, D. C., to take up that Pure Food Bill and pass it during this session of Congress? It ought to be done for the best interest of all the people, for all must eat, and should be assured that they are buying pure food.

## Miscellaneous News \* Items

The First Double Number of the American Bee Journal for 1905 is before you. In it is completed the report of the St. Louis convention of the National Bee-Keepers' Association. It is a rather long report, but will well repay a close reading. Especially is the paper by Mr. Frank Benton very interesting, as it gives a careful, though condensed, review of the work done in the interest of bee-keeping by our National Government. We regretted the necessity of dividing his paper, a part of it appearing in last week's number.

Geo. A. Ohmert, of Dubuque Co., Iowa, writing us Jan. 10, had this to say:

I had a \$500 fire the other day, burning farm tools and gasoline engine, but it did not burn any bees.

The weather is pretty cold here, being 14 degrees below zero this morning. Bees in the cellar seem to be all right so far.

GEO. A. OHMERT.

The Washington State Association meets in North Yakima, Wash., Feb. 8, 9 and 10, 1905. Among the subjects on the program are the following:

"How to Market Honey"—Isaac Hayes.

"Food Value of Honey as Compared with Other Principal Foods"—Prof. G. L. Tanzer, Analytical Chemist.

"The Value of Bees to the Orchard and the Time to Cut Alfalfa"—W. S. Lawrence, Assistant Botanist of Washington State Agricultural College.

"What We Should Do at Lewis and Clark Fair"—Legh R. Freeman, editor Northwest Farm and Home.

"How to Start an Apiary"—Robert Cissna.

"Profits in Bee-Keeping"—Prof. F. A. Huntley.

"How State Associations Should Buy Supplies"—Ernest R. Root.

"Bee-Keeping in Eastern Washington"—R. W. Keisling.

"The Irrigator's Bees"—Dr. F. S. Hedger.

"History of the Honey-Bee"—Prof. G. A. Balmer.

"The Various Ways of Marketing Honey"—Anson White.

"Washington Bee-Pastures, and How to Maintain Them"—C. Rose.

"Bee-Keeping in Yakima County"—Hiram H. Cole.

"Bee-Keeping in Western Washington"—Thomas Wickersham.

"The Brotherhood of Bee-Keepers"—Rev. J. P. Berg.

Judging from the foregoing list of papers to be read, any bee-keeper in that region that fails to attend will miss a treat. Such a list may also help other bee-keepers' associations when preparing their programs.

"Bee-Pranks" is the title of a neat 20-page pamphlet just issued by the G. B. Lewis Co. Its preface contains these words: "Compiled from clippings taken from newspapers published all over the United States, and therefore gives as nearly as possible a complete and authentic daily record of common, uncommon, strange and unique happenings in the busy life of the bee during the year just passed". So far as we know it is the only thing of its kind ever published. It certainly is an original piece of work, and attractively gotten up by White's Class Advertising Co., of Chicago. It is mailed for 12 cents in stamps by the G. B. Lewis Co., Watertown, Wis.

Henry Field, Seedsman, of Shenandoah, Iowa, has sent us his annual catalog for 1905. At the top of the first page it reads: "The seeds that yield are sold by Field". This is also a case where a Field is in the field to sell honest and true-to-name seeds. His specialty is seed-corn, but he has many others. His advertisement appears in another column this week.

## Opinions \* of Some Experts

### Which Finished First, Bait-Sections or Sections with Full-Sheet Foundation?

21.—When bait-combs (that is, unfinished sections of the previous year) are used in a super along with sections filled with foundation, which will be finished first, the baits or the sections with foundation?

ADRIAN GETAZ (Tenn.)—The baits.

C. H. DIBBERN (Ill.)—The bait-sections, every time.

R. L. TAYLOR (Mich.)—The sections with foundation, as a rule.

PROF. A. J. COOK (Calif.)—Usually there will be little difference.

P. H. ELWOOD (N. Y.)—With us the baits are usually finished first, unless in the extreme corners of the super.

E. S. LOVEŠY (Utah)—The bait-sections, at least this is my experience.

JAS. A. STONE (Ill.)—Never had any good results from so doing, so I quit it.

C. P. DADANT (Ill.)—There will not be much difference when they are side by side.

N. E. FRANCE (Wis.)—Generally bait-sections, but they will not be as white when finished.

O. O. POPPLETON (Fla.)—It is too many years since I produced section honey to remember about this.

DR. J. P. H. BROWN (Ga.)—Work will always be started in the bait-combs first, and they will usually be finished first.

J. M. HAMBAUGH (Calif.)—This is largely owing to the strength of the colony. The baits will be accepted first, as a rule.

REV. M. MAHIN (Ind.)—I have not had enough experience to speak authoritatively, but I think the bait-sections will be finished first.

DR. C. C. MILLER (Ill.)—Baits, every time, in this locality. Possibly baits might be so objectionable in some way that the bees would prefer the foundation.

G. M. DOOLITTLE (N. Y.)—Depends where baits are placed. If in the center, the baits will be finished first. If baits are in the corners or outside rows, then about alike.

WM. ROHRIG (Ariz.)—I don't know. If I were permitted to guess I should say if the bait-combs were nice clean ones, placed in the center of the super, they would be finished first.

S. T. PETTIT (Ont.)—If the bees are on the weak side, nad the flow slack, the bait-sections. If the bees are in good condition, and the flow good, there will be no appreciable difference.

R. C. AIKIN (Colo.)—Baits, under unfavorable conditions of strength of colony and flow; foundation first when we have rousing colonies, and the nectar just rolls in. Strange, but true.

G. W. DEMAREE (Ky.)—As far as my observation extends the partly-built combs used as inducers take the lead, at least at the start. As to actual finish, my attention has not been called to that point.

L. STACHELHAUSEN (Tex.)—During a slow or moderate honey-flow the bait-combs will be finished first. During a good honey-flow there may be no difference, and sometimes even foundation may be finished first.

EUGENE SECOR (Iowa)—If honey is coming in slowly the baits will be finished first, and if the crop is short sometimes they will be the only ones finished. If the flow is generous the others will be completed as soon.

E. D. TOWNSEND (Mich.)—Bait-combs, if in the center of the super; if in the corners, as we use them, a few of the cells on the outside lower edge of the bait-section will be unsealed when the rest of the super is ready to come off.

JAMES A. GREEN (Colo.)—If the honey-flow is moderate, or only ordinarily good, the bait-sections will be finished first. But in a really good honey-flow the sections having full sheets of foundation will usually be finished first.

E. WHITCOMB (Nebr.)—I have noticed that the new combs with foundation are usually finished first. The bees do dislike to finish up an old last year's job, and the result is never satisfactory to the customer. I have never thought advisable to put unfinished sections back into the hive. If we can not get finished sections it is better to work for extracted honey.

C. DAVENPORT (Minn.)—It depends upon the strength of the colony, the flow, kind of bees, and where in the super the baits are placed. In a good flow a strong colony that has considerable black or German blood will finish sections filled with foundation as soon as they will baits. Although outside the question, I would like to say that these bait-sections are never first-class comb honey when finished.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

### Airing Cellared Bees—Is It Wise to Do It?

BY DR. C. C. MILLER.

ON page 694 (1904), Mr. H. R. Boardman, speaking about bees in winter confinement, says: "I used to open the outside door to admit the fresh, cool air at night to quiet the bees down when they became restless, but I am sure it is a mistake to ventilate in that way. The bees will surely become quiet after admitting the fresh air and lowering the temperature, but they will not stay quiet. It only increases the impulse to rear brood, just the difficulty that already exists".

Mr. Boardman is a man of sane judgment and ripe experience, and his view is apparently endorsed by Mr. Hasty, page 794 (1904). The paper of such a man, with such an endorser, ought readily to pass current as "gilt-edged", and the beginner who cellars his bees might naturally conclude that when a warm spell comes in late winter or early spring it will be unwise for him to open up the cellar, no matter how warm nor how uneasy the bees. Such a conclusion would, I think, be a mistake. Mind you, I don't say I know—I don't know—I think. It is clearly one of those things of which our good Afterthinker well says, page 794: "Manifestly it takes time and brains, and close observation, to reach the hardpan of correct practice".

Mr. Boardman winters bees above ground; I below. That may make a difference; and there may be other differences that make a thing right for me and wrong for him; and there still remains the possibility that I may be wrong in my views and in my practice. In any case it will do no harm to tell why I believe and practice as I do.

Throughout most of the winter the temperature in the cellar is higher than that outdoors. Toward the latter part of winter, however, and especially in spring before cellar-wintering is over, there come warm spells, perhaps only a day, possibly several days, when the outdoor air is as warm as that in the cellar. So long as it is colder out than in, the colder air forces its way into the cellar, making the ventilation constant. When the outdoor air becomes as warm as that in the cellar, there is an equilibrium, and ventilation ceases. Under ordinary circumstances, when these warm spells come, the bees become quite uneasy. I formerly thought it was because the bees were too warm, for the bees were quiet in the cellar at 45 degrees, and noisy during those warm spells when the cellar temperature went up to 48 or 50 degrees. I do not think so now. . . . Since writing that last sentence I have been down cellar, and the thermometer there says 54 degrees; outdoors 27 degrees. The bees are quiet; I think they would be more quiet at 45 degrees, but a furnace does not allow that.

The point I wish to make is, that if formerly, in warm spells, the bees were very noisy at 48 or 50 degrees, they ought to be still more uneasy at 54 degrees if their uneasiness was caused by the heat of the cellar. On such occasions I opened the cellar wide at dusk; the admission of fresh air only made the bees worse for a time, but by morning they were very quiet. That agrees with Mr. Boardman's testimony so far; but he says they will not stay quiet. I would not like to be too positive in such a matter, but I think they remained quiet until another warm spell. He says: "It only increases the impulse to rear brood, just the difficulty that already exists". What made it already exist? The only condition already existing that could start brood-rearing, so far as I can see, was the excitement from foul air or from warm air. Why should removing either of these conditions make the matter worse?

In my case, however, it was a rare thing for brood-rearing to start before the bees were taken out of the cellar for good, and I think the airing of the cellar did not increase brood-rearing. When a warm spell of several days occurred, if I had left the cellar closed I think the situation would have become intolerable. Conditions must be somewhat different with Mr. Boardman, if at such times his bees remain quiet with all closed.

I would at least advise that beginners who cellar their

bees would do a little experimenting before settling down into the belief that the cellar must never be opened for airing while the bees are in it. McHenry Co., Ill.

## Old Comb Foundation as Good as New.

BY G. M. DOOLITTLE.

THE old idea that we must have comb foundation that is just off the mills for use in the apiary seems to be springing up again, if I can judge from my correspondence. One wishes to know if it is a fact that such foundation is better than that a year old, or only some one's "think so". And another writes:

"Would you please let me know through the American Bee Journal if it will be just as well to fasten the foundation in the frames and sections during the winter months, while I have plenty of time, as to do the same just before it is needed, using *new* foundation? If the latter, then I must do the work when I am crowded with the bees, just when I can least afford to spare the time. If I could fix things this winter when I have nothing else to do, having everything in readiness when the bee-season opened, I could do the work at a much less cost to me."

During the years which have passed since I began to use comb foundation I have experimented largely in this matter, and have become thoroughly convinced that all talk about old foundation not being as good as new—about how it becomes hard and dry so that it can not be easily worked by the bees—is a fallacy. To be sure, on these cold, wintry days all foundation does look hard and dry and anything but inviting to the bees, or to myself either; but just wait till some hot day in June or July and then go up to the upper room of your building, where it is stored away, or where the frames are filled with it; yea, open up your surplus arrangement of sections and take a look at it, and if it is not too soft and pliable to handle easily, then your store-room and your experience will be different from mine.

Why I have alluded to an upper room or attic is this: Cold foundation has a whitish, hard appearance, while foundation in a heat of 100 degrees, Fahr., has a yellow, oily appearance, and when it appears thus it is pliable to handle and inviting to the bees. Now take a piece of foundation fresh from the mill, and take it into the cold room, and you will at once say this new is more acceptable to the bees than a like amount of foundation which is from one to three years old, with which you are making a comparison. But take the same new piece into the attic on a hot July day, and hold it by the side of the old, and you will conclude at once that both are alike inviting to the bees.

Again, take the old on some cool day in June, when it looks so uninviting, and lower a frame filled with it down into the center of the brood-nest. Leave it five minutes, then go with a piece of that fresh from the mill (or as fresh as can possibly be to the one who buys his foundation), open the hive and lift out the frame you set in a few minutes before, when, presto! the old and the new have become alike again, and the bees have already begun to manipulate that which is in the frame.

In other words, when placed in the hive the foundation assumes the same yellow, oily, soft, pliable nature after a minute or two that it has in the attic, or when first leaving the mill. And if this is a fact, which, from all of my experiments I know it to be, will any one tell me why it is not just as acceptable to the bees as that fresh and new from the mill? Under these conditions no one can tell the new from the old when the different pieces have been shuffled together, unless some special mark has been placed on one of them.

To show that I am not writing one thing while practicing another, allow me to say that *all* the foundation used in both sections and frames in my apiary during the past 15 years was placed where it is to be used by the bees during the months of December, January, February and March, and both the supers of sections and the hives of frames so filled are stored away for use when the hurry of the summer's work with the bees is on. In this way I have all in readiness, at the "ends of my fingers", for use just when they are needed, so that there need not be even an hour's delay.

This matter of old foundation not being as good as new, is like many another matter which has been started without due consideration being paid to it; and, being once started, it keeps on its rounds through the papers and on mortal lips, going around and around, as on an endless chain year

after year, decade after decade; bobbing up its head again after a quarter of a century has passed, till nearly all the world thinks it *must* be a fact.

### PROVE FACTS FOR YOURSELF.

And now, Mr. Editor, with your permission I wish to say a word or two about taking what any one says or writes as an *established fact*. I am not against any or all heeding what is said or written sufficiently to experiment thereon, for even a theory advanced by some may, and often does, prove a reality when put in practice by others. But no man or woman should be only an imitator of some one else. Set your *own* mind at work, and it will prove to *your own self* what is right and what is wrong, if you will let your hands obey its teachings by way of doing a little experimenting on a small scale.

Don't depend upon what Messrs. Dadant, Townsend, York, Root, Hutchinson, Doolittle, or any one else tells you unless it is right in line with what you want, and proves as they say under *your own* manipulation. If you want something different from what they do, please tell me what there is to hinder *you own self* trying what you want, and then if it proves, after trial, to be just the thing for *you*, tell the world about it so that Dr. Miller, Hasty, Doolittle, etc., can take advantage of your experiments as you have been taking advantage of theirs, and thus shall come a *mutual* benefit to the whole fraternity.

Dadant would never have been a Dadant had he been like a Doolittle, nor a Townsend a Townsend, nor a Dr. Miller a Dr. Miller. Don't be afraid of a little experimenting on *your* part; only take my advice and not go in too heavy at first. Two or three colonies are enough for the first trial, and if such a small experiment tells you you are on the right track, then use more until the thing is proven; when, after that, you can safely devote the whole apiary to the matter. It is needless to sacrifice a *whole* apiary to any single experiment, as some seem prone to think they must if they experiment at all. Onondaga Co., N. Y.

## No. 2.—What is the Best Bee-Hive?

BY ALLEN LATHAM.

(Concluded from page 38.)

THAT the crosswise frame and the closed-end frame should not find favor in Texas or any other locality where the winter is not a serious item should not hold the attention a minute. We, in the North, have another problem on our hands altogether. We have a long, cold winter followed by a lingering spring, and not infrequently we have raw, chilly days in the summer months. The average bee-keeper perhaps gives too little heed to this matter of conserving the heat of the colony, to planning a hive which will meet the needs of the bee as well as those of the bee-keeper. In prosperous seasons bees will give good returns in any sort of rattle-trap of a hive, and in mild winters they get along well, though their keeper (?) has done little to further their comfort. But the bad season comes when only the best colonies pay for their salt, the cold winter falls when only the best-kept colonies see the next summer. It is for such that we must plan.

Does the hive that you keep meet with these requirements? Did your bees winter well last winter? Do you succeed in getting a surplus in the poor season? If you can answer yes with satisfaction then you perhaps will not be interested to better your hive, but if you do not answer yes then study the hive you use.

In a spring free from cold spells, and through a summer of prosperity a hive with its free-hanging, lengthwise frames will beyond doubt hold its own with one in which the frames are closed-end and crosswise. It is during the winter and the spring that the great superiority of such frames becomes apparent.

Think for a moment of the bees on a free-hanging, lengthwise frame in winter. The ends all come to the entrance, and the cold wind is free to go up along the sides of every layer of bees as they lie between the combs. Each inter-comb space is a part of the united interior of the hive. Now consider the closed-end frame. In this case each inter-comb space is a space by itself, which communicates with the rest of the space of the hive only below and through the pop-holes along the edges of the comb. Now set this frame crosswise. Only the first comb is next to the entrance, and any wind to get about the cluster of bees must turn an angle of 90 degrees. It will not do this, because in

order for it to go up it must displace air already there. This it can not do, for there is not a chance for that air to move to get out of the way.

I give my hives ample entrance in winter, for I know that they have, as it were, a storm-door between them and outside. The spaces between the bottom-bars become inside entrances through which a good circulation is going on, but through which no cold, death-dealing winds will mount.

It is to be observed, further, that the free-hanging frames furnish a hive which is the same size throughout the winter, so that the weakened colony in early spring has the same big, cold quarters which the strong colony occupied in the fall. The closed-end, crosswise frame does not work on this principle. It is only so large a hive as the colony is large, for it is small for the small colony and large for the large colony. Each comb is a wall shutting off any space which the colony does not occupy. Extremely weak colonies will build up rapidly in spring in these hives. One season might easily pay for a change of hives in this way alone.

For cellar-wintering one style of frame is probably about as good as another, but after the bees are put out in spring the advantages would be with the crosswise frame. I should therefore assume that in general in the North the use of the frame which I advocate would be most advantageous.

It is only fair to acknowledge that my use of the frame does not cover any great length of time, only three seasons, and it is quite possible that a long use of the same may disclose objections which I do not now see. As the case now stands I see no objections which come anywhere near offsetting the manifest advantages; and I am confident that a fair trial will win many converts to this style of frame. The satisfaction of strong and vigorous colonies in the spring is worth the trial. New London Co., Conn.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### ITALIANS VS. BLACKS AGAINST FOUL BROOD.

I can readily imagine that energetic bees will make a much better flight against foul brood than would a strain of bees lacking in energy. I'm not quite so ready to set it down that Italians resist better than blacks, if a good strain of blacks is chosen. Still it may be so. The tactics of the two races are radically different. The German race is greatly inclined to make a panacea of simple waiting till the conditions of Nature improve; and therefore they do not wear their lives out in vain as badly as Italians often do. Italians incline to struggle under almost all circumstances. It happens, of course, that waiting for foul brood to improve is a sort of tactics that won't work at all—might as well wait for your house a-fire to go out. Maybe Italians perceive this better than the blacks do, or, if not, their natural disposition to struggle comes in play better. Pages 819 and 829.

### INSUFFICIENT AND POOR STORES CAUSE OF WINTER BEE-LOSSES.

L. M. Gulder sized up last winter's great mortality just right when he said, "First, insufficient stores, and second, poor stores". I need not go outside my own yard for examples in evidence. And perhaps this sentence deserves more reflection than it is liable to get: "The basswood honey is gathered only to a limited extent from the blossoms, by far the greater quantity coming from the secretion of the leaves, or, in other words, basswood honey-dew". Wonder if that isn't what is the matter with my basswood honey this last season—too much flavor, and the flavor not as good as it should be. The taste alone, unconfirmed by observations, should not be accepted as proving this, however. I think a plant usually pours in about the same amount of flavoring, whether the nectar-secretion is small or great—that is, scant secretion pretty sure to be strongly flavored, and profuse secretion pretty sure to be lightly flavored. This law comes in splendidly for plants which

have disagreeable flavors. When the secretion is profuse enough their honey will be good. Same in regard to coloring matter; scant honey sure to be dark honey, and *vice versa*. Page 821.

### REMOVING BEE-STINGS WHEN STUNG.

We have again, on page 822, directions for the proper removal of a sting when we get one. I think I can add a suggestion of considerable value, which is for the most part strangely forgotten. It's all right to avoid taking hold of a sting with thumb and finger; it's all right to avoid pressing on it; it's all right to lift it deftly out with the blade of a sharp knife; *but not if extra time is consumed thereby*. Even one second gained in time is of more importance than any variation of the manipulation. A sting is a self-acting squirt-gun in action, and very soon pretty much the entire charge of poison will be driven in; after which all your wise "chenanigan" in removal comes too late. Have it out instantly—in the best way, if that's available, but in the worst way if you must. A large share of the stings which bee-keepers get come when one or both hands are fast. Place the wounded part against the best thing available, and with a rub forcible enough to be sure to take it out the first time, rub it out.

### COMB-HONEY STORY DENIAL ON SECTIONS.

Nice question to decide about, that denial printed on the section. Denial of a bad story about a lady should not be printed on her cheek—else lots of folks will thereby get it for the first time, and adhere to it—and some will view such strenuousness of denial as *evidence of guilt*. If nearly every one already has heard the manufactured-honey story, and already has an opinion about it, a printed denial on every section may perhaps be our best resource. On the whole, I rather think it is, although it will make *some people* believe the lie more firmly than ever. Page 822.

### YELLOW JACKET AND WASP STINGS VS. BEE-STINGS.

Where Wm. M. Whitney says that the sting of the yellow jacket is more virulent than that of the bee, he is on the track of the truth, but hasn't quite captured it yet, it seems to me. I think that the exact facts are that the two poisons are much more materially different than usually supposed, so much so that immunization against either one doesn't count much against the other. I have often noticed this in my own person. I am now tolerably well immunized against bee-stings. Before I was immunized I dreaded bee-stings more than I dreaded wasp-stings. Now wasp-stings affect me much the worse of the two—but perhaps not quite so badly as they originally did. And I think a man *could be* immunized against wasp-stings and not against bee-stings. Then he would dread bee-stings and regard wasp-stings with semi-indifference. Page 830.

## Doctor Miller's Question - Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Making Supers and Hives—Hiving Swarms on Foundation

1. I am going to make 600 or 800 supers for comb honey. What style would you advise me to make? I expect to buy the separators. What size section and style of fence? I am pretty well satisfied with the T super with fence. Do you think I can do better?
2. I am thinking of making one or two hundred hives as follows: The body the same as the dovetailed except that the sides will be of 3/8 lumber. Will make a honey-board for over the frames, and make a deep cover, or cover with rim as deep as the hive-body. Top of cover flat, covered with paper. By making this cover of 3/8-inch material the whole hive will not cost me any more than a regular dovetailed hive, and I figure that it would be very much superior in the way of spring protection, warm supers, etc. Am I right? Do you think such a hive with an additional rim and padded sticks around the bottom, and 4 inches of chaff over the bees, would winter bees well outdoors? You see, I want something that would winter bees outdoors on a pinch, but wherever possible I would winter them in the cellar.
3. Do you advise hiving swarms on starters for comb honey?

NEW YORK.

ANSWERS.—1. It isn't the easiest thing in the world to advise about such things. One's market is to be considered, etc. Other things being equal, it is well to get new supers of the same kind as

those already on hand. It is doubtful that you can get anything better than the T super, provided you know how to use it correctly. The fence should be the T fence to go with the T super, and should be nailed or fastened together in some way besides mere gluing, unless you prefer plain separators. As to size of section, find out which will bring most in your market.

2. On general principles it is a bad thing to make a hive different from all other hives, and I should advise against it unless you feel very sure it will be a great improvement. Even then it is best to go slow, and make a trial on a small scale. If you have never tried such a hive as you contemplate, you can not be at all sure you will like it, and it is not a nice thing to have as many as a hundred unsatisfactory hives reproachfully staring one in the face every time one goes into the apiary. So far as wintering is concerned, your hive ought to be all right, but I have doubts whether you would like it in summer. Honey-boards have been pretty generally discarded.

3. It is so important to have combs of perfectly straight, all-worker comb that it pays to fill the frames entirely full of comb foundation.

### Feeding Bees in the Spring.

I have 3 colonies of bees that I am afraid are short of stores, but if they should live until spring, and it gets warm enough so they can fly occasionally, would it be all right to feed them sugar syrup in feeders on top of the frames, a small amount each day, until the flowers bloom? Would it be likely to start robbing? MAINE.

ANSWER.—Instead of feeding a little every day, better give them a good feast, giving it to them warm as possible, so as to get them to take enough to tide them over a considerable space of time. If you give them a little each day when they can fly only occasionally, it keeps them stirred up and makes them fly out at times when they may be chilled and never get back to the hive. If the feed is given so that no robber can get to it except through the entrance of the hive, there ought not to be much danger of robbing, especially if the feed be given well on in the day.

### Transferring Bees from a "Log" Hive.

I placed a "log of bees" in the cellar a few days since. I had them cut and hauled in a wagon about one-fourth of a mile. They seemed to be all right. They had been in the tree since July last. I see a large number of dead bees at the bottom of the "gum" since being in the cellar. The log is about 4 feet long with a small opening, and I can see empty comb at the top and no bees there. I can see comb at the bottom and lots of bees. I placed a section of honey at the top, and it was untouched for three days. I placed it at the bottom with the same result thus far. Now, when should I transfer them to a regular Langstroth hive? And how can it be done—in the cellar, and when? IOWA.

ANSWER.—No, don't transfer in the cellar; wait till the bees are busy in fruit-bloom. Perhaps it may be better still to wait till the bees swarm, giving the swarm in the new hive, then cutting out the combs from the log hive 21 days after swarming.

### The Best Hive to Start With.

I will quit business the coming summer and locate on a farm. I have already purchased 6 colonies of bees, but I am not versed sufficiently in the bee-business to know what hive would be best for me to get. I was about to get the Danzenbaker, but since reading the American Bee Journal I see in the answers that you also have hives. Have you any for sale? If so, which would be the best and cheapest to get? How far are you from St. Louis? MISSOURI.

ANSWER.—I have no hives for sale, and have no financial interest in any hive. It is likely that the dovetailed hive would suit you as well as any. It is not so much the hive as the management; and I am sorry to say that sometimes claims are made for a hive of some particular make which are not warranted by the facts, and the inexperienced is led to think that if he only has that hive he'll get the honey. I am not far from 300 miles north of St. Louis, but a hive right for this latitude would probably be all right there.

### Sainfoin in Iowa—Getting Bees Out of Full Supers.

1. Will sainfoin grow in northeastern Iowa? If so, is it of any value as pasture for stock? Will it produce much hay, or is it something like sweet clover? If not, will it winter-kill? Would it be any damage to land?

2. What is the best way to get bees out of the supers when removing honey? I removed the cover and then tried to smoke them down. I smoked and smoked, but there were still several hundred in the supers when I took them off. IOWA.

ANSWERS.—1. It grows in Wisconsin and Canada, and most likely it would in northern Iowa. There is no need to fear that it will damage the land. For further information see American Bee Journal for 1904, pages 740, 813, 846, and especially the article by C. P. Dadant, page 790.

2. There are different ways of getting them out. There are times when honey is yielding so abundantly that you can set a super on end on top of the hive and let it stand there till all the bees have run down into the hive; but you must watch closely for the first sign of robbing

or you'll have a picnic. If you have only a single super, put it in a tub, cover over with a sheet, and turn the sheet over from time to time. You can use a Porter escape, thus allowing the bees to go down of their own accord. The bees may be partly smoked down, the supers taken off and piled up 5, 10, or more high, and a Miller tent-escape put on top, allowing the bees to go out at their leisure. You will find particulars in the book, "Forty Years Among the Bees". Do not think of trying to smoke all of the bees out of a super while leaving it on the hive. If you must rush them out with smoke, smoke lively for a minute or two, take off the super, close up and set the super on end on top of the hive, then smoke and brush till the bees are all out.

### Transferring Queen-Cells.

I understand that after a colony of bees is made queenless they will build several queen-cells on one frame. Now I desire to cut these queen-cells out and insert them on another frame of brood that is to be given to a nucleus. Can this be done? If so, will the nucleus after 48 hours accept these queen-cells? MICHIGAN.

ANSWER.—Instead of building cells only on "one frame", under ordinary circumstances the cells will be on several frames. Yet, if you so desire, you can have them built mostly on one frame. Take a frame containing comb that has been just built, the outer edges containing nothing beyond larvæ just hatched, and you are pretty certain to find nearly all the queen-cells on that frame provided the other combs in the hive are old. About eight or ten days after such a comb has been given to a queenless colony the cells will be ready to cut out, and will be accepted readily by a nucleus that has been queenless as much as 48 hours, or even the half of that time. Fasten the cell on a central part of the comb, where you are sure it will be kept warm by the bees. A good way to fasten it on the comb is to take a hive staple, letting one leg of the staple straddle the cell, the other leg being firmly pushed into the comb. If you haven't a staple, two wire nails will do, each an inch and a fourth to an inch and three-fourths long, each nail thrust in slanting so as to hold the cell between them.

### Red Clover Bees—Swarming and Superseding Queens—Making Hives.

1. In a locality where there is an abundance of red clover, would it pay to keep only the red clover bees?

2. How can I get the most increase from one colony of bees?

3. Will bees at any time while rearing brood, if a queen is removed, begin at once to replace her?

4. Will it pay to have new swarms on full foundation in the frames, that is, foundation as large as the frames the bees are to occupy?

5. How soon after a swarm issues can I put it back where it came from?

6. As I expect to make my own hives, how would it be if I make them out of 1-inch pine or basswood, then inside of the main body leave an inch space all around the hive inside, and pack this space with sawdust; then, for winter, make a frame out of about 2-inch material and put this on the frames above the bees, and fill this 2-inch place with sawdust? Would this make a good hive to winter bees in out-of-doors where the thermometer gets to be 12 to 18 degrees below zero? OHIO.

ANSWERS.—1. Yes, it would be better to have in such a locality bees that will work on red clover than those that will not, for they can do just as good work on other plants as other bees. The right way is to breed from the stock that gives you best returns, red clover or no red clover.

2. That's too long a story to tell here. There is no way that will suit every bee-keeper in every locality. Study up general principles; become thoroughly familiar with what is in the bee books and papers, and you can then tell better than any one else just what will be best for you. For some, natural swarming is best; for some, shaken swarms, increase by nuclei or some other way. You will find several pages devoted to artificial increase in the book, "Forty Years Among the Bees", perhaps more than in any other one book.

3. Yes, although there might be an abnormal case where the bees were slow to recognize their condition.

4. I feel so sure that it pays me that I never have a frame that isn't filled entirely full of foundation.

5. You can put it back whenever you like. If your object is to prevent further swarming, it may be well to wait 24 hours. In general, however, it is better to use plans that do not require the returning of swarms.

6. It may work very well, but it would be well to try a few at first to find out before making a large number. You may also find that it will cost more than to buy the stuff ready to nail together.

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

## Convention Proceedings

### THE ST. LOUIS CONVENTION.

**Report of the 35th Annual Convention, of the  
National Bee-Keepers' Association Held at  
St. Louis, Mo., Sept. 27-30, 1904.**

(Continued from page 42.)

#### WORK IN APICULTURE AT THE UNITED STATES DEPARTMENT OF AGRICULTURE.

It was in 1885 that Dr. Riley secured the establishment of an apicultural station at Aurora, Ill., which was in charge of Mr. N. W. McLain. Experiments were conducted during that year and the two following years, under the direction of the Entomologist. There was good work done during this period notwithstanding the severe criticism of certain jealous writers, and I am disposed to agree in the main with Dr. Riley's statement that "there is probably not one of Mr. McLain's critics who would have done more of real benefit to apiculture during the same period and under the same circumstances." I have but to mention among the recorded experiments those conducted by Mr. McLain to determine whether bees could injure sound fruit or not. The results have been very widely quoted and pointed to as authoritative, and the report has done a great deal to prevent misapprehension between fruit-growers and bee-keepers.

For several years following this the Entomologist felt unable to continue the work, but in 1891 a series of experiments were conducted at the Michigan State Experiment Station by Prof. A. J. Cook, assisted by Mr. J. H. Larrabee, under the general direction of the Entomologist. The arrangement, however, did not prove extremely satisfactory, nor did the work done meet, by reason of originality or decisive results, the special approval of the Entomologist. It was shortly thereafter discontinued when the commissions expired.

Meanwhile it had been Dr. Riley's desire to undertake the securing of the giant bees of India, and he had addressed a letter to me while I was abroad offering me a commission to proceed to India and secure these bees. At that time, however, I had started on my way back to my native land, after an absence of 11 years, and his first communication finally reached me while in New York, having followed me up from my last address in Austria. Owing to technicalities, however, Dr. Riley was unable to secure the authorization to send me on this mission, with which it was his intention to couple certain other work, such as the securing of the capriñg insect (*Blastophaga psenes*) which was so much needed for the pollenization of the Smyrna figs in California.

Having become intimately acquainted with Dr. Riley's views on all of the subjects, I can positively assert that he was perfectly willing to undertake continuous and progressive experimental work in favor of the apiarian interests of the country, had the funds of the division of Entomology permitted this. But having been blocked in the first work which he designed me to undertake, he lost much of his interest in taking hold of the problem which presented itself, of establishing on a permanent footing a section for apicultural experimentation, especially as my services could be utilized for the time being in the general work of the Division of Entomology, while at the same time such correspondence as came to the department relative to apiculture was turned over to me for attention.

The changes which followed rapidly after this, resulting in the placing of Dr. Riley's first assistant in the position of Entomologist, and the sudden and untimely death of Dr. Riley himself, somewhat changed the status of matters, and it has only been rather gradually that the importance of practical experimental work, and the need of scientific and systematic investigations in apiculture have been sufficiently impressed upon the authorities to result in a more liberal policy toward this industry. Mean-

while, however, records of interest have been accumulating, thousands of letters of inquiry relative to apiculture and apiarian interests in the country have been answered, and many thousand bulletins treating of apiarian management have been sent to all parts of the country, and even many to foreign countries, in response to requests which come daily for information. It might be said that the department has practically, for a number of years, conducted a correspondence school in apiculture, since every inquiry, of whatever nature, received careful attention, and, if it required, a specific answer giving the best information at hand on whatever topic the inquiry covered. Moreover, large numbers of teachers in the normal college of the District of Columbia, and the public schools of the city of Washington, as well as teachers of nature study in other cities, have been furnished with information and specimens of bees for use in their class work, and numerous demonstrations have been made for the benefits of these teachers, as well as frequently for large classes under them, including the class in the normal school who would shortly become teachers in charge of public schools.

Realizing that it is the constant dropping which wears away the stone, I have, during the 13 years I have been connected with the United States Department of Agriculture never permitted to pass unutilized an opportunity to create in the mind of those in authority there a favorable impression concerning the dignity of apiculture as a pursuit, and the needs of the industry in connection with scientific experimentation. With this I have, however, studiously avoided being obtrusive, preferring rather to use patience and perseverance and bide the opportune moment for presenting the claims of our pursuit. All along I have noted a growing interest in the subject at the department, a feeling, in fact, to use the words of many of the scientific gentlemen connected with the experimental work there, that "there is far more in this business of bee culture than we had formerly supposed." They have also remarked that it needed extended scientific investigation as to the zoological, botanical and chemical sides of the subject, as well as from the practical bee-keeper's standpoint. At last I have the intense satisfaction of seeing this matter duly appreciated, and the proper steps taken to insure the investigations which we all so much desire.

During the years when no special fund could be devoted to apiculture I still continued to do, largely on my own time and at my own expense, some experimental work, particularly with honey-producing plants, which I tested quite extensively during a series of years, with various foreign races of bees, and in regard to methods in queen-rearing and methods in the successful wintering of bees in the open air. My own apiaries were largely devoted to these experiments, without regard to the evident decrease in the honey-yield which must necessarily result. Queens of various foreign races were reared, and certain crosses produced between these races, and sent to certain state experiment stations and to certain portions of the country, where it seemed desirable to test the particular strain in question. Numerous notes and observations for further use in the work when it should be firmly established, were collected from time to time, and plans for experiments and for observations and study of apicultural conditions in all parts of the country were made. During this period the title borne by myself was that of Investigator in the division of Entomology, and later Assistant Entomologist. Finally, in 1901 these efforts resulted in the setting apart of a special appropriation for apiculture of \$2,000, the first and only special appropriation which has been made for this branch. My own title was changed to that of Apicultural Investigator, and my salary, with that of a temporary assistant for a few weeks in the summer, were charged to this fund, which left really but a few hundred dollars for investigations. This small sum was utilized to continue the work already started and to make way for a more permanent organization. Since, however, it was not sufficient for the establishment of a well-equipped apiary, my own personal apiaries were still placed at the service of the Department. Unfortunately, the disposition on the part of legislators seemed to be to make appropriations in the form of a lump sum, rather than specific, so that instead of reaffirming this specific sum, it was absorbed into the general fund of the Division of Entomology in subsequent enactments. The result of this seemed to make it difficult, as there was no mandatory clause regarding the amount to be devoted to apiculture, to secure any definite setting

apart for this work, although the theory of a separate section in the Division of Entomology devoted to apiculture, was recognized, and certain light expenses, together with stenographic services, allowed.

This brings us to the opening of the present fiscal year, July 1, 1904. I have quoted from Dr. Riley's article his allusion to the fact that the work which he began so many years before had to be interrupted, and I have also mentioned to what he attributed this, to some extent, namely: "to the lack of effort on the part of bee-keepers themselves, i. e., to their failure to take united action such as would bring home to the head of the Department, and to those in charge of the general appropriations, the needs and just demands of the industry." In this connection I should like to call your attention to the fact that I had strongly recommended to the National Association which met in Albany the year before, i. e., in 1891, some action looking to the development of a separate section or division devoted to apiculture here at the Department, and that a committee was appointed at the Albany convention which made the following recommendations:

1st. That the Section of Apiculture in the Division of Entomology, Department of Agriculture, be raised to an independent Division.

2d. That in connection therewith there be an experimental apiary established at Washington, having all the appointments necessary to a first-class Apicultural Experiment Station.

3d. That the appropriation for this Division be sufficiently large so that the work may not be embarrassed for the lack of funds.

Had these recommendations been followed up by the proper influence they might long ago, I believe, have been carried out, but the matter rested in this shape for a long time. However, I should not leave the subject without mentioning the substantial encouragement which has been given to the latest effort for development of apicultural work at the Department, and in the first rank I must allude to the efficient aid and influence given by the active chairman of the Board of Directors of the National Bee-Keepers' Association, Mr. W. F. Marks, of New York; and the able editor of *Gleanings in Bee Culture*, himself one of the board of directors as well, Mr. E. R. Root, of Ohio; to the worthy President of the National Association, Mr. J. U. Harris, of Colorado; to W. Z. Hutchinson, editor of the *Review*, and himself a member of the board of directors; to Dr. C. C. Miller, of Illinois, another of the directors, as well as numerous friends who have taken occasion to voice their sentiments with their representatives in Congress to the end that they should support such measures as have been so long recommended and so earnestly striven for during this long period of more than a decade: It is in the end a substantial victory to the apicultural interests of the country, which is not passing but permanent, and whose results I hope will continue and grow long after all who listen to my voice shall have passed away.

Thus, at the date mentioned—July 1, 1904—after long effort and repeated representations to authorities at the Department and legislators themselves of the needs of such general work in entomology, and particularly in the various economic lines grouped under the general subject of entomological investigations, the Division of Entomology was raised to the rank of a bureau, with what is practically a Division of Apiculture. And while the appropriation is still in the form of a lump sum, there is set apart a definite sum for apiculture, which leaves, after the payment of salaries, some \$5,000 for experimental work. I have been allowed two assistants, each bearing the title, Special Agent in Apiculture, and one whose title is that of Apicultural Clerk, and in addition to this, stenographic service.

As my first assistant I have been able to secure Mr. John M. Rankin, of Michigan, a student and experimenter in apiculture, with whom many of the members of the National Association are well acquainted, and whose name is familiar to many others in connection with his former work as State Inspector of Apiaries in Michigan, and before that was in charge of the experimental work at the Michigan State Agricultural College. He is a graduate of the institution just named, and a young man of excellent habits from whom we may expect valuable aid in the general work in apiculture at the Department.

As the second assistant, Mr. Leslie Martin, of Tennessee, an enthusiastic student of apiculture, has been en-

gaged. He is still young but has had several years' experience in practical work with bees, and has already shown perseverance and intelligent attention to the subject.

A civil service examination has been held for the position of apicultural clerk, and we may hope an intelligent assistant will soon be appointed to fill this position.

The Department has granted the establishing of a model apiary of 50 colonies, and through competitive bids the contract has been awarded to a bee-keeper in the State of Maryland. The bees have been delivered and will shortly be located in their permanent place at the Arlington Experimental Farm, connected with the Department of Agriculture. This farm is located on the Virginia side of the Potomac River, directly across from the Department grounds. I believe that the location will be fairly isolated, and thus that any particular race we choose to establish there may be bred, with excellent opportunity for preserving its purity. At the outset the new race imported from the Caucasus of Russia will be established in these colonies for a thorough test, and for the purpose of crossing with other types.

#### THE WORK TO BE UNDERTAKEN.

I shall pass very briefly over this, since my historical review of the development of this as a branch of the work at the United States Department of Agriculture has been rather more extended than I had planned; and furthermore, I prefer that the work we shall undertake, when completed, shall speak for itself, rather than that I should make at the present time many words over mere plans.

The fitting up of a model apiary at the Arlington Experimental Farm, which is under the control of the Department, the building of a bee-house, laboratory, and workshop combined, and getting together of all the necessary implements, hives, queen-rearing outfit, tools, chemicals, etc., for the conduct of experimental work, will necessarily consume a little time. The bees have been purchased in the open market, after bids had been advertised for and received. They have been delivered in good shape, and are now prospering on the wild aster which blooms so abundantly in the latitude of Washington in September and October. This part of our work is, therefore, well under way. We have already taken steps toward the procuring of seeds and roots of certain important foreign honey-producing plants, and have secured the coöperation of the Bureau of Plant Industry at the Department, which is in charge of the introduction of new and valuable forage, seed and fruit crops, as well as the congressional seed distribution, which latter is largely confined to the distribution of vegetable, flower and forage-crop seeds, most of which are already known in this country. The Bureau of Plant Industry will undertake to secure at the suggestion of the Agricultural Investigator, seeds of such important forage and garden crops as have not yet been brought to this country, and which are valuable as honey-producers. We are, therefore, ready to file applications for small quantities of seeds which we shall endeavor to send out with discrimination so as to gain the best results possible with seeds adapted to the region of the applicant. In the aggregate there will be considerable quantities of these seeds, yet anticipating that the demand will also be lively, it is expected that only a small quantity for testing can be sent to individual applicants.

It will be the policy of the Department, in its agricultural work, to coöperate with all State bee-inspectors, whenever any coöperative work is desirable, provided, of course, the sum at the command of the Department for this purpose admits of this. During the first year not a large amount can be turned in this direction, however; but it is to be hoped that in successive years the original purchasing and fitting up of a department apiary having been accomplished, there will be more opportunity to undertake a more thorough investigation of all known contagious bee-diseases.

Naturally, many interested in seeing the giant bees of India and the Philippians (*Megapis dorsata* and *zonata*) tested in their native countries, and perhaps in this country also, will inquire what we shall do about this. Some other, more wise in his own view, and desiring to point his finger and poke fun at ye apicultural investigator, will at once reply: "Oh, that is one of his particular hobbies; assuredly he will let everything else go by and fly off in a tangent on this wild bee (goose) chase." But hold, good friend, not so fast. We are trying to keep a weather-

eye peeled and peer in all directions in order not to allow anything of importance to escape our notice, and in order to be able to estimate at its true worth any possible line of investigation. This being our attitude, all may rest assured that we shall not let any investigation of the great bees occupy either the whole time nor the whole sum which may be devoted to experimental apicultural work. The matter, is, however, a larger one than the mere getting and testing of these bees for their value as direct honey-producers in the United States. It is in itself sufficiently valuable, from a scientific standpoint, to warrant its being undertaken, for this reason alone, at an opportune time. The comparison of the breeding habits, qualities, structure and general life history of these great bees, will afford much that is instructive, and settle long disputed points that all will be glad to have at rest once for all.

There is a further reason for undertaking to find out what we can concerning the bees of the Philippines, namely the opportunity which would at the same time be afforded for studying the possibilities in practical apicultural work in those rich islands which extend over a thousand miles from north to south, or from Boston, Mass., to Savannah, Ga., on our eastern coast; or from St. Paul to New Orleans, in the Mississippi Valley; or again, from northern Oregon to southern California, in the west, and with all variations of mountain, lake and valley, sea exposure, swamp and jungle. Here is a vast field in which at least it is our duty to study the possibilities, and point out, if possible, the way to success. No step will be taken without careful consideration, but action once decided upon will be pushed with all possible speed and energy. But what will we do? Wait and see, and meanwhile give us your advice.

Numbers of queens of valuable races, and select strains of certain races, are being imported and tested. These include the extremely gentle Caucasian bees from the shores of the Black and Caspian Seas in Russia. Cyprians from the Island of Cyprus, which have proven their prepotent value as crossing material; Dalmatians from the Province of Dalmatia, Austria; Italians from the foot-hills of the Alps, in the extreme northern part of the Kingdom of Italy, where the most industrious type of this race is to be found; and lastly Carniolans, from the most elevated districts of the Province of Carniola, in Austria, a type which, by reason of its gentleness, excellent wintering qualities, hardiness, and prolificness, has shown itself of great value in this country, especially in comb-honey production. Daughters of these races, and various crosses between them, will be bred for testing, both here and at numerous stations. We are particularly desirous of securing unbiased tests on a sufficiently large scale to enable us to decide the exact value of each of these for any and all parts of this country.

If it is possible it is proposed to test, more fully than has heretofore been done in this country, the employment of artificial heat in the wintering, and more particularly in the rapid breeding up of bees in early spring. It is certain that artificial heat may be successfully employed to produce such results. The question then arises whether it is at a profit or not, in view of the expenditure of means and time required.

It is likewise believed that there is great room for improvement in the hives and accessories concerned in migratory or pastoral bee-keeping, at least as this system has thus far been practical in this country.

Whenever the experiments and field-work here indicated do not fully occupy the time of the experimenters and office force, there is an indefinite amount of additional work which may be followed up, such as, for example, collecting data regarding the apicultural industry in the United States, first as to the principal honey-producing plants of the various regions; second, as to losses of bees by diseases in wintering; third, as to the races of bees now kept, and their relative proportions; fourth, as to the proportion of frame to box hives now in use; and fifth, as to honey production.

On the basis of the data obtained under the first head, that is, regarding honey-producing plants of the country, it is proposed to map on outline maps of the United States the areas of the principal honey-producing plants, and to determine where and what new plants can be disseminated for the purpose of increasing the pasturage of any given section.

There are still some points in the life-histories of insect enemies of honey-bees that should receive attention and clear elucidation.

A card index of apiarian literature is much needed in the

office-work to furnish ready reference to everything that has been written on a given topic.

Then, naturally, whatever results may be attained, or whatever information it is desired to make public, will have to be put in the form of bulletins, which will require care and time for their preparation.

In all of this work, whether experimental or office-work, the Apicultural Investigator earnestly hopes for the hearty coöperation of the bee-keepers of the country, and is desirous of receiving from any who have in mind a subject of general interest whatever suggestions such persons may feel disposed to give, and all may rest assured that the most careful consideration will be given to any and all propositions of this nature which may be presented. In this connection the remark of the esteemed Dr. Riley must not be forgotten, but should be held as a prophetic warning, namely: "that the reason that nothing more resulted from the work begun under his auspices in 1885 should, to some extent, be laid to the lack of effort on the part of the bee-keepers themselves, that is, to their failure to be unanimous and hearty in their support of the work."

A few words in closing in regard to the present Chief of the Bureau of Entomology, Dr. L. O. Howard. All of those who have the honor of being acquainted with this gentleman will join me, I am sure, in testifying to his high standing as a scientific investigator, as well as to the genial whole-souled nature of his personality. To those who have not met him I would say, that no man is more widely known among the galaxy of distinguished scientists whose homes are in the Capitol city, and in his line of work no man is more highly esteemed. His work in scientific and economic entomology, and his writings in this line have made him known in every country of the world where there is even the slightest appreciation of the labors of the scientific investigator of insect life. He is not a bee-keeper, but he has come in the course of the years during which we have been associated, to know something of the status of this industry and its needs, and I can assure the members of this organization, and through them the bee-keepers of the country, that he is in hearty sympathy, as was his predecessor, with progressive work in the line of investigation and development of the industry in every part of our country. With greater opportunities in the way of funds than were accorded to Dr. Riley, he is able to authorize more work, and it is due largely to his liberal spirit and his ready acceptance of my own recommendations in every particular, that the industry is now upon so substantial a footing at the Department, and that the outlook for continuous practical and scientific investigation in apiculture is now so excellent.

FRANK BENTON.

#### SIXTH SESSION.

At 7 o'clock p. m. the President called the convention to order, and also called for discussion on Prof. Benton's paper.

Mr. Hershiser moved, seconded by Mr. Dadant, that the matter of taking such measures and steps as shall continue the governmental apiary in investigations in the interest of apiculture in the United States be referred to the committee on Legislation. [Carried.]

Pres. Harris—We should not give a paper of this sort mere passing notice, for the reason that Prof. Benton himself has done everything that the bee-keepers could ask of him in his official position. There are many things in that paper that are grand and good, and in the best interests of the bee-keepers of America. For instance, the matter of getting honey-plants and scattering the seed throughout the several States that it may be beneficial to all of us who may be bee-keepers; another matter, that of establishing apiaries where they may experiment in the line of getting queens of the best sort, probably getting longer-lived queens, if possible. As we go along we get improvements in every line in life, as you see here at our door, and each and everyone of you should lend your encouragement and your help to the one who is foremost in this work. I know it was only last winter, and the winter before, through his efforts he has got appropriations. Now that he is going to assist not only the United States but other countries in the development of the bee-industry, we should not pass lightly over these matters but look at them from a careful business standpoint, and then after we see we are right go to our representatives in Congress and in the Senate, because you all have influence—the most humble citizen in life has his influence—and by putting forth that influence in a few years we will get into a different channel from what we are at present, and you will all be proud of the fact that you are mem-

bers of this Association. We will not have to solicit members; they will come and solicit us to join. Up to this time you have had one of the most successful conventions in the history of the Association, and let it go to the world that such papers as have been presented here are doing a world of good for us; it is building up our industry; and let us each and everyone try to help one another, and when we have done this we have done a good thing for the cause.

Mr. Abbott—I ventured to suggest a little change in a paper yesterday, and I will venture to suggest a little change in another one. When a paper is written in an official capacity it ought to rise above everything of a personal character. It ought to overlook any personal preference that one might have. Now, I don't want to be misunderstood. There is only one weekly bee-journal published in the United States, and I don't own any of it or have any interest in it, but it does as much to aid in building up bee-keeping as any other one institution on the top of God's earth. It has done it under the present management, and I believe it has done it under every management. Mr. Benton in his public paper does not recognize the existence of the American Bee Journal, and I object to that part of the paper, and think that he ought not to make reference to other papers as to the great work they have done, and absolutely ignore the grand old American Bee Journal.

Mr. Root—There is one matter spoken of in that paper, and that was with reference to getting senators and representatives to take hold of any matter connected with the Government. When you desire to get an appropriation one man cannot do it, one bee-journal editor, nor two can do it, there has got to be pressure brought to bear from a good many sources and a good many bee-keepers. I remember when this last appropriation was up for consideration I was asked to write to our Senator at the time, and I did, but that didn't go very far. At that time I didn't have the means at my command to bring it to the notice of the bee-keepers in time to do any good, and the result was that our Ohio senators did nothing to help in this matter, but I have learned since attending this meeting that pressure was brought to bear on some of the senators who did have influence, and some work was done, and it was due to that influence that that appropriation was secured in order that we might secure larger benefit for our National work, and if we wish to enlarge the scope of our National work we ought to take hold of this thing and pull.

Mr. Titoff—I should like to say something to you but I cannot do it as well as I should like to because I am not so well acquainted with your language, as I come from a foreign country. I wish to tender to you my thanks for the attention you gave my paper. I was greatly interested in bee-keeping when I was in my own country. I had been reading all the literature I could find in Russia. I have read many articles in Russian which have been translated into that language from the English, and I was very much interested in the reading about bee-keeping in America. Not only we in Russia but all people know that America is a great country. Americans have gone into every business. I became so much interested in bee-keeping in America that I wanted to come myself to see the Americans. I thought about it more and more, and I finally decided I would come to America and if possible take up practical work in the American apiaries and study American methods. When I left my home and my people I did not know one word of the English language. My Russian friends told me that it was very hard to learn English, but I think with hard work I will be able to understand it sufficiently to earn a living in America. When I came to this country I went to the Root company. Before I came here I was in Switzerland, and I think many of you know Mr. Edward Bertrand. I had a letter of introduction to him from a friend at St. Petersburg, and Mr. Bertrand is acquainted with Mr. Dadant, whose name is well known in Russia, and he gave me a letter of introduction to Mr. Dadant and the Root company. I first came to the Root company and I received from them a very kind welcome, and they said they would give me work and I would improve in the English language, for which I thanked them very much. I have the honor to be the representative of the Russian bee-keepers in the convention here. It will give me great pleasure to write to the Russian journals to give them information as to the methods of bee-keeping in America and to tell them that I have received at the hands of the American bee-keepers very great kindness. In my paper which was read at this convention I thought it would be interesting to American bee-keepers to know about the industry in Russia. The paper is not as good as I could wish but I hope you will excuse me for

taking up so much of your time in the reading of it. I thank you very much for your attention.

At this stage Mr. S. Francis of Colorado favored the convention with an instrumental solo.

Mr. Hutchinson—As chairman of the committee on resolutions I beg to report that we have commenced to make poets in our ranks, and it seems that one has cropped up down in Alabama who has gotten out a little volume as a souvenir edition and has made a nice greeting for the Association in the forepart, and he asks the privilege of presenting each one of the members with a copy, and your committee would recommend they be accepted with the heartiest of thanks.

Mr. Hutchinson—We have a resolution made by Mr. Dadant that this convention assert that no artificial comb-honey has ever been or can be produced; that the only successful adulteration ever made has been of liquid honey out of the comb. The committee believes enough committees have been appointed upon this subject, and that enough has been said to cover this ground, and we would recommend that it be not accepted. We have also a resolution here from Dr. Bohrer, upon the appointment of two persons from each State and the Dominion of Canada who shall organize themselves into a legislative committee. This resolution has already appeared in a previous part of the minutes and your committee recommend the adoption of the resolution. [Carried.]

#### CAUCASIAN BEES.

"Has any member had any experience with pure Caucasian bees? If so, what are their qualities?"

Prof. Benton—Something more than twenty years ago my attention was called to those bees in Germany; they had been imported there from the Caucasus. There were such varying reports concerning them that I was not very much inclined to test them at that time, especially as I had my hands full with other races of bees, and furthermore those I saw were not very uniform in their markings. The Germans said of them, I think nearly all, that the bees were extremely doubtful; some said they were quite worthless as honey-gatherers, others told about their great disposition to swarm, and so on, and all that disinclined me to take them up. About two years ago I was out at the apiary of Rauchfuss Brothers, near Denver, and they spoke very highly of these bees. They had received some that came directly from the Caucasus. I was led to undertake to get some bees and have been testing them. I find them good honey-gatherers; they are as I noticed in Germany, rather varying in their markings; they look something like Carniolans that have been dipped in water and then dried, giving them a leaden tinged appearance, yet they are easily distinguished, their bodies are smaller than those of the Cyprian and so tractable that anything one desires to do with bees can be done with them without smoke, without any bee-veil, at any time, early or late, whether getting honey or not; they can be brushed from the combs with the bare hand and you can hammer on the entrance and brush the bees from the entrance and do anything with them, no matter if the propolis snaps, no matter if the time of day is undesirable and you have no bees flying after you in the apiary or about your face; they fly through the air in large circles and return; they do not sting. They can be made to sting by pinching. If you bother them in the fall when wet or cold they might occasionally sting you. I have never had any occasion to use any smoke on them at all. Exactly how they are going to compare with other bees as regards their productiveness I am not quite able to say. I should like to hear Mr. Titoff tell us as to them. Some people here find they are great swarmers, perhaps, but that results from being so prolific; they must be kept in large hives that will give them room to expand and build up.

Mr. Titoff—What Mr. Benton says about those bees is true. I have had my own experience, and I find that the Caucasian bees are better than our common Russian bees. They work early in the morning and late at night; they are very gentle and not cross at all. You can go among them without either veil or smoke. They have only one fault and that is swarming. It is very hard to keep them from that. They make plenty of queen-cells. If you take away the queen-cells today, tomorrow they will make twenty or thirty more. Some people say the Caucasian bees produce honey that is different from that of the common bees.

Mr. Kretchmer—While traveling through Germany

last year I encountered two apiarists who had Caucasian bees. They were represented to me as stingless bees; they were in Berlepsch hives; they stung me twice! They were swarming entirely too much, they informed me, which was perhaps due to the smallness of the Berlepsch hives. They had not proven to be profitable. They said they were not gathering as much honey as the Carniolans. The Carniolan predominates in the greater part of Germany, although some very nice Italian bees can be found. The parties who owned these bees did not seem to be very favorably impressed with them. One said he would not continue them another year unless they proved better than he anticipated.

Mr. Titoff—They will rob worse than other bees.

Prof. Benton—That has not been my experience. I have not had a large number of the pure cult but I have not seen that those pure bees were endeavoring to rob, and I had them among other colonies and I would have noted it at once. I have quite a number of Caucasian queens bred to Carniolan and Cyprian drones, and I formed a very favorable opinion of those crosses, and I am disposed to think that Caucasian males will be most excellent as crossing material with the Cyprian bees to modify the temper of the Cyprian and still retain the excellent working qualities. One reason is that the type is much nearer that of the Cyprian, therefore, I think they will coalesce more readily. I do not believe such a race of bees would serve my purpose, but I do believe in this country, where so many bees are kept in the cities and public highways that such a valuable and fairly productive race would have its place and would make bee-keeping popular, and many of the difficulties in connection with people coming to this Association and complaining that their neighbors are interfering with their keeping bees would be done away with in a great measure.

Mr. Miller—Prof. Benton, you know that the cross of the Italian with the common black bee results in making the progeny crosser than either one. In case of crosses with these Caucasian bees, are the crosses in all cases gentler than the blacks or Italians?

Prof. Benton—Yes. I have been crossing Cyprians and Carniolans for the past nineteen years, various crosses starting sometimes with the Cyprian and breeding to the Carniolan drone, and sometimes with the Carniolan and breeding to the Cyprian drone or the Syrians, and I have crossed them back again and it is invariably my experience that the male had the main influence in both the temper and constitution of the worker progeny. I have taken a pure Cyprian and mated it with the Carniolan and I have bees that are much gentler than the Cyprian. The fact that the Caucasians are gentler and are a fine type to coalesce inclines me to believe if we used the Caucasian males we would have better crossing material to use upon the Cyprian than if we used the Carniolan.

Mr. Muth—I would like to know whether the Caucasian bees swarm more than the Carniolan.

Prof. Benton—I can't say. I hardly believe they would under the same circumstances.

Mr. Hyde—I would like to know how they cap honey, and if they are good comb-builders?

Prof. Benton—They are good comb-builders and cap their honey fairly white. People have told me that they were good workers, good gatherers and storers of white honey, but would not work on buckwheat. I cannot believe that if they would work well in the early spring that they would not be in condition to store buckwheat-honey.

Mr. Titoff—I know nothing about crossing bees with the Carniolan or Cyprian, but some of the Russian beekeepers have crossed Caucasian bees with Russian black bees and they have found that the progeny is more like the pure black or pure Caucasian bees. I cannot answer Mr. Muth's question because I have not had the experience. I think those who have had experience say that the Caucasian bees are greater swarmers than others.

Mr. Kretchmer—Permit me to ask Prof. Benton with regard to the crossing. Isn't it a fact that an Italian queen or a Carniolan queen crossed with a Cyprian drone produces crosser bees than if the reverse were the fact?

Prof. Benton—Certainly. In my experience the Cyprians are the greatest gatherers of honey of any race that I know of, but there are some exceptions to that. If the Cyprian is mated with the Carniolan drone they are more likely still to get more honey than if purely mated,

for the simple reason that the constitution is made hardy and the bees do not dwindle in the spring; they have the tongue-length and energy of the Cyprians with the hardy constitution of the Carniolans.

Mr. Whitcomb—For the last twenty years I have been superintendent of the honey show at the Nebraska State Fair, and every single first premium that has been awarded on comb-honey has been on honey put up by hybrid bees.

Prof. Benton—It has been my idea that we should place these Caucasian queens at the State Experimental Station and a few of them in the hands of skillful breeders in different parts of the country where they might be multiplied and put upon the market. In answer to one of the members, I would say, pick out the gentle bees for honey.

#### QUEEN EXCLUDERS, EXTRACTED HONEY AND SWARMING.

"On 10-frame Langstroth hives shall I use an excluder, not being on the ground in swarming time, for extracted honey?"

Mr. Hyde—I would answer no.

Mr. Andrews—We found in several hundred colonies we put on excluders and it increased the swarming from 50 to 75 percent for extracted honey.

Mr. Holecamp—Did you give plenty of ventilation under the hive?

Mr. Andrews—No.

#### SWARMING AND BEE-TREES.

"How can you hold a swarm of bees when you select the bee-tree?"

Mr. Dadant—I believe I understand what the gentleman means by the question. He thinks after a swarm has selected a tree that you will not be able to hive it because it will go to that tree. I know that a swarm can select a bee-tree and still be hived and abandon the idea of that bee-tree. We had near our apiary a tree with a hole in it and I saw bees at the hole cleaning it out, and I said there was a swarm in that tree, and there was a swarm out at the apiary and I hived those and never saw bees at the tree afterwards.

Mr. Andrews—Did you put brood in that hive?

Mr. Dadant—No, sir.

Mr. Hall—I have had a number of experiences the same as that of Mr. Dadant, and I am satisfied that they can be collected afterwards if they have a place to go. You can change them from where they have already gone to another place and they will, as a rule, stay where you put them. Under some circumstances they won't at all, but they generally will.

Mr. Reinecke—My experience has been if you put a comb or two of unsealed brood in, it holds them very well.

#### IMPROVING BEES BY SELECTION.

"Can any one race of bees be improved by so-called judicious selection?"

Prof. Benton—Yes, every race.

Dr. Bohrer—If it has reference to the working qualities I don't know whether they can or not.

Mr. Dadant—I believe we can improve their working qualities.

Prof. Benton—It does not need to be a matter of belief; it has been done with every race.

#### EXTRACTING UNSEALED HONEY.

"How much more honey can be obtained by extracting before the honey is sealed than if the honey is left in the hives as it ought to be?"

Mr. France—I wish to issue a protest against this idea of extracting unripe honey.

Mr. Putnam—How did Mr. France get his honey sealed this year?

Mr. France—I got it ripened, though it took from the time they gathered it till today, and it is in the hives yet, and it is capped over and the hives are standing three stories high, and they will stay there till spring, and it will be good honey, too.

#### BOTTOM STARTERS IN SECTIONS.

"How do you put the bottom starter in sections?"

Mr. Abbott—The way you put the top one in.

Dr. Miller—Put it in the same way you put in the top one; put in the bottom one first.

Mr. Hall—I am quite satisfied that I have a better way than Dr. Miller has. I have a Lewis foundation fastener. I don't see why any other machine that has a hot plate could not be adjusted to work the same as the Lewis machine. The Lewis machine is reversible. You can adjust it to put in the starter in three-inch sections or four-and-a-quarter. I take that plate out of the machine to the grinding stone and grind it till it has a sharp-cutting edge on each side, not that the edge is intended to cut but in order when you come to let it pass through the foundation it will pass through as leisurely as possible. In the next place I take the base box off which is just below where the hot plate is. I let that down just enough to make a little more room between the bottom of the section where it is in the machine and where the hot plate comes out. I let that down just as much as I want the bottom starter to be in the section. Then I cut a couple of finger-ways out of the head-block. Sometimes the foundation is inclined to fall away from you when you want to take the section from the machine, and by having the finger-way you can put your finger around and touch it slightly and that will hold it from tumbling away from you. You have got the machine all ready for work. Put the section into the machine, put in the foundation just as if you were going to have a foundation in without any starter at all. After it is stuck then insert the hot plate again, and that sharp edge will pass through the foundation so easily that you will wonder how it is done. That will leave the bottom starter standing there. All you have to do is to pull the section off again and turn it end for end, and put it back again and put the balance in there for the top starter and your work is done.

Dr. Miller—I believe I was the first one that started the bottom starter. One of the advantages of the bottom starter is that you are sure that the bottom of the starter will be in the middle. Another reason is that you are sure the section will be fastened to the bottom. In many cases if the honey is not coming in plentifully, especially towards the close of the season, a section will have a passage-way under it, and that bottom starter prevents everything of that kind. In other words, that bottom starter gives you a section fastened in all round. Before I used bottom starters, very often I had the starter swing clear off and fasten on to the separator, and it took me three or four years to find out why. I hadn't sense enough to know it was that bottom starter that held it there and didn't allow it to swing over the side.

Mr. Johnson—Do you save any foundation?

Dr. Miller—No saving of foundation at all.

Mr. Johnson—Do you make the two ends meet?

Dr. Miller—No, there is a space of one-eighth to a quarter of an inch between the two starters, and one of the first things the bees do is to fasten them together. If you put the foundation down near enough to the bottom so that it is fastened to the bottom it is sure to bulge to one side, and by cutting out enough to put two pieces in, the bees will make it fast at the top and bottom without any bulge or bend.

Dr. Bohrer—How wide do you make the bottom piece?

Dr. Miller—Five-eighths of an inch.

Mr. Gill—In answering the question, "Can you save any foundation?" I think you can by using a bottom starter. You can secure very good combs by using a half-inch or five eighths starter at the bottom, about an inch above, because frequently the bees will commence on that bottom and go up to the center. If a person wants to save foundation he can do it by using the bottom foundation, because the bees will fasten those places together where they meet.

Dr. Miller—The question asked me was, do I save any foundation? I say I don't. You can if you want to.

Prof. Benton—As a matter of fact you really lose by the amount that it takes to fasten the bottom starter.

Mr. Gill—You can secure combs fastened well at the bottom by putting on the starter and pulling it right off again, leaving one-half row of foundation cells, there and invert it.

Mr. Hershiser—Dr. Miller, as I understand, says he does not "make both ends meet." I thought he had been a successful bee-keeper! [Laughter.]

Mr. Dadant—Mr. Coppin, of Illinois, has a way of putting in a full sheet of foundation which does away with the trouble in regard to foundation sagging or leaving a space at the bottom. He splits the section in two in the center;

lays two sections side by side on the table or four halves, and lays a sheet of foundation upon them and puts the other four halves on top and fastens them together. That gives a full sheet fastened on all four sides. I never saw such honey as that presented by Mr. Coppin, it was so regular.

Prof. Benton—That practice has been followed in England for many years.

Dr. Miller—There is one objection to that, and that is that the outside of the section shows the split, and it is not so good looking a section.

Mr. Root—The method is English now, and very similar to the one described, only that the section has a groove cut almost through lengthwise and the foundation is dropped in between the grooves and the dovetail fastened together. We are selling annually hundreds of thousands of them to the British trade. We don't sell any of them in this country. I know our bee-keepers in this country would not bother with anything of that kind.

Dr. Miller—As a matter of curiosity will you allow me to say when Mr. Root was so small he didn't know anything about sections, we had the same thing in this country. They were made with that groove in the top-bar. That is the first kind of sections we had in this country, and they were a big nuisance.

Mr. Root—It was a square groove and slot around the section.

Mr. Sampson—This is my plan, if you could see it, for cutting the foundation in the section. I fasten the points together in the center, and I have very good results. The sections are always well filled and I never have any trouble.

Mr. Hall—I have tried in a small way by doing the same thing Mr. Root speaks about. Take twenty or thirty sections and place them together and rip them three quarters of the way through the section from end to end, leaving the bottom part of the section under it and putting them together, leaving that groove, but, as he said, they were a regular nuisance. I can put in 2,000 sections the way I do it.

#### FASTENING SECTIONS IN FRAMES.

Dr. Bohrer—A great many bee-keepers ask me as to what I regard as the best plan of fastening comb foundation in shallow extracting frames. The grooves in most of the frames sent out are very shallow; and there is a wedge that the companies use. What is the best method of fastening comb foundation in shallow frames?

Mr. Hall—Get a common machine oil-can, one that has a good deal of spring in the bottom, put a short snout on it or cut the one off that is already on it. Then have a frame to put the extracting frame into so that there will be a little board just to fit the inside of the frame that will come just half way up or half the depth of the frame, right up to the edge of the groove. You must keep that can filled with a mixture of beeswax, and I put a slight bit of rosin in it to make it a little harder. I put the frame on this other frame, slip the foundation into the little groove, take the little oil-can which is sitting on the foundation fastener to keep it warm. You don't want it too hot because if it is it will melt the foundation, and if it is too cold it will freeze in the nozzle of the can. When you get the foundation into the little groove turn the frame up slightly so that the weight of the foundation will fall into the groove and stay there. Take the can and run down a little drop on the end of the foundation and right down to the bottom. Then tip it the other way and let it run back to cool, and then take it off, and thus continue until it is finished.

Mr. Abbott—We have wedges in all our frames and don't need any oil-can.

Mr. Miller—May I say that it is a matter of locality. Mr. Abbott is entirely right; in proper localities there is nothing better than the wedge; I wouldn't want anything better than the ordinary wedge that is sent out, but other bee-keepers say they do not stay in.

The President appointed the following permanent press committee: J. M. Hambaugh, of California; H. H. Hyde, Texas; James A. Stone, Illinois; Frank Rauffuss, Colorado; E. S. Lovesy, Utah; Prof. H. A. Surface, Pennsylvania; O. L. Hershiser, New York; J. C. Stewart, Missouri; Frank Benton, Washington, D. C.; E. Whitcomb, Nebraska; E. Secor, Iowa; Dr. G. Bohrer, Kansas; F. W. Muth, Ohio, and J. J. Cosby, Indiana.

## REPORT OF COMMITTEE ON CO-OPERATION.

The President called for the report of the committee on honey-organization. Mr. Pressler presented the report as follows:

We, the committee appointed to name the first five directors to form the National Honey Producers' Association, beg to report as follows: Fred. E. Brown, California, chairman; N. E. France, Wisconsin; J. U. Harris, Colorado; W. L. Coggshall, New York, and H. S. Ferry, New York.

Signed: F. E. Brown, H. S. Ferry, E. E. Pressler, J. Q. Smith, E. S. Lovesy, Committee.

On motion the report was adopted.

## COMB OR EXTRACTED HONEY?—HOLY LAND BEES.

"Shall we produce comb or extracted honey?"

Mr. Dadant—Yes, both.

"Give your experience with Holy Land bees."

Mr. Laws—I think this race of bees has been reported as being very cross. I have not found them that way. By judicious treatment they are not so. I think I could find a good many bee-keepers in this audience who will say they are a very quiet race of bees, and they are fine honey-gatherers. They are reported as heavy swarmer. It you give them room enough they will not. The remarks as to the Caucasian bees will very well apply to the Holy Land bees with reference to swarming. I find the objection that has been raised to the Holy Land race of bees has been raised also against the Cyprian bees, and I think those persons who have raised those objections are persons who have not been acquainted with the Holy Land bees. They are fine breeders and they do not breed out of season. In producing comb honey they cap their honey a dark, watery color. They use the least amount of wax of any bee I have seen in the manufacture of their comb. I can pick out a comb of honey that has been built by the Holy Land bees, the capping being so thin and the wax so brittle that it will leave the honey.

Prof. Benton—I would like to ask the gentleman what he calls Holy Land bees? Where do they come from?

Mr. Laws—My importation came about ten years ago from the city of Jerusalem. Since that time there has been another importation. Although I reared 115 daughters from that queen I had to discard her. They came from a sister of Mr. Baldensperger.

Prof. Benton—In regard to the Holy Land bees, it may be remembered that I went to Palestine and Syria, in the year 1880, and remained in that part of the world for several years, and I handled a great many bees in Palestine, and I brought those bees to Germany and also to this country: I pointed out in my work in connection with those bees the fact that southward from Mount Carmel the bees are quite different from those north; and the term "Holy Land" was invented by Mr. D. A. Jones because he thought it would sell the bees, and under the term Holy Land he grouped these two types that are very different, so different they deserve to be called separate races. The first bees that were sold under that name were really hybrid bees, crosses between Syrians and Palestine bees. I insisted on calling those southward from Mount Carmel the Palestine race, and those northward the Syrian race. Confining myself strictly to the race of bees of Palestine I want to speak of some of their qualities which as a race they possess. They are good, industrious bees in a northern climate; they breed out of season and when deprived of their queens are very prone to have laying workers within a very short period, oftentimes before they have time to rear a young queen, and will get all the worker-comb stuck up with brood which is very objectionable. They rear a vast number of queen-cells; I don't know that that in itself is very objectionable, but it inclines one to believe they would swarm very freely, but I think that can be largely overcome. I have found them bad-tempered, all in all, and I prefer to handle pure Cyprian bees to pure Holy Land bees. I have gone on the Island of Cyprus without a bee-veil, or when I had to use a bee-veil, with very little smoke, and I wouldn't attempt to handle either Syrians or Holy Land bees in that way; I couldn't get along with them nearly as well as Cyprians. The bees of Palestine are more nearly like the Egyptians than the Syrians.

## "BABY NUCLEI" IN QUEEN REARING.

"Are baby nuclei advisable for the ordinary honey-producer? Should baby nuclei have brood given them or not?"

Dr. Bohrer—In starting up the colony I always put in brood and I never have very much difficulty. Give them a well-matured queen-cell and they will probably hatch in three or four days, and I never had them leave the boxes, or very seldom; if they did they would generally cluster and I would put them back. I got the idea from Mr. Langstroth in the summer of 1864. He had a number of nuclei at that time. These queen-cells were finished up in large colonies and then transferred to these nuclei swarms.

Mr. Gill—Let the honey-producer buy his queens.

Prof. Benton—I would suggest the honey-producers learn how to rear good queens and rear them well. I believe he should avoid the small nuclei entirely. Give them brood and make them pretty good size.

Dr. Miller—Does Mr. Gill buy his queens instead of rearing them himself?

Mr. Gill—I buy all the queens I can't rear from natural cells. Of those that are produced under the swarming impulse, I use all I can, and if I need any queens out of season or any other time I buy them. I produce honey, and I always want a laying queen under every super, and if I haven't got one I buy one.

Dr. Miller—He said that the ordinary honey-producer should not use certain nuclei because he should buy his queens. I want to know whether he buys more queens than he rears himself.

Mr. Gill—That is pretty hard to tell. I bought more queens this year than I made increase. I use all the best selected stock I can from natural cells that are built under the swarming impulse at the swarming season, and what I can't use I throw away. At any other time of the year if I want a good queen I get one from a man whom I know rears good ones. My bees are being worked for comb honey and I have no time to rear them. I bought last year nearly 300 queens, and this year 200. I think a good queen will pay for itself in ten days in a good colony of bees in producing comb honey. I don't aim to make much increase because I am working for comb honey, and I want big swarms, and I don't want any queenless bees. I have orders for queens all the time I use them that way. If you need a queen it is better to buy than to rear; you can't get along without her.

Dr. Miller—In the first place, as to buying queens in certain times of the year, instead of rearing them myself, I don't believe that a queen-breeder can tell better than Mr. Gill what kind of queen is good for the work. I believe if he will breed from his best honey-producing queens he will get a better queen than he will get from the average queen-breeder.

Mr. Gill—I don't buy from the average breeder; I buy from the best.

Mr. Reinecke—My experience has been that it does not do a queen any good to come through the mails. I have had queens from different breeders, and good ones, and I have found some that were no good, and their daughters were excellent, so it shows that it may have hurt them.

Mr. Gill—I must get up in defense of the queen-breeder; that he can and does send a good queen through the mail, because mine come through the mail, and I buy just as good ones as I rear. I am not prepared in the spring, I am not prepared in August, I am not prepared with my cells at that time, and my bees do not furnish them; I buy them, and I just get as good queens as I can rear. I bought 200 queens last year from a man who took them out of his full colonies in the breeding season and there were no better queens in the United States, but they occasioned me \$200 damage, and I have only two of them left.

Mr. Root—I would like to answer part of both questions. In regard to these baby nuclei for the average honey-producer, with the state of knowledge about baby nuclei now I do not know that the average honey-producer had better fool very much with them. The first and second years we tried them we did not make them work, but the third year we did. I think what we have done others can do. I told Dr. Miller in answer to a question that he must have brood to make them work, but I have found out they work without as well as with. When we come to know more about these little nuclei I believe Mr.

Gill can rear queens, as a matter of economy. I don't say they are any better. It is hard to say whether those little boxes about 3x4 scattered all around the yard, with just a few bees flying about, will be any good, but they will defend themselves, and those queens will be hatched out there and will be just as good as any other queens. Mr. Gill mentioned one important thing, and that was taking queens out of a strong colony in the height of their egg-laying and sending them through the mails, that it was a bad thing to do. We take these baby nuclei, put perforated zinc over the entrance, and send them out, and there does not seem to be any bad effects coming from it. In regard to the question of whether a man should rear his own queens or buy them, I think it varies a good deal according to the conditions. Some seasons of the year it is better to buy them; there are some seasons of the year that the queens do not suffer in the mails.

Mr. Laws: I want to answer both sections of that question in the affirmative. I think it is profitable for the honey-producer to rear queens with the baby nuclei; it is the ideal thing; the great trouble is tearing up the full colony. I went into the apiary a little while back and got there just in time to find virgins hatching out; in fact they had been held back in the cells by the bees; there were eighteen hatched out; we had some of those little babies and I rushed to the hive and we got those virgins and put them in those boxes as fast as they would come out. We put those nuclei in the shade, and after awhile carried them out to a new location and I got about all those queens in. A man is not prepared for queen-rearing with large boxes. If he has large boxes it is a great deal of trouble to carry them around, to get the nuclei home, and to stay after he puts them there. With the small boxes he can put them in the shade, and he can take them and scatter them around in the brush anywhere, and after they remain with the queen for a while they behave like a newly hived swarm. As Mr. Root says, one or two bees at the entrance will guard the hive just about as well as a large swarm, and you will find the queens mated shortly afterwards. I have mated 150 queens with the bees of one hive. You will have the cells built by a populous colony, and you can get the queens all reared at the beginning of the season. We want no brood in those nuclei frames. I state this because I have had considerable experience. I think when we get a little more light on the subject you will think as I do.

Mr. Gill—It is not proper perhaps at this time to state why it would not be practicable with me, but when it comes under the head of swarming or shook swarms then I might explain it. Only I shall say this, that the field we operate, with three of us to work with a thousand colonies, is about eight miles wide and twenty miles long, and we see an apiary today and then we don't see it again for six days, so that it would not be practicable for me. Under the heading of increase I will tell why I buy my queens at certain times.

Prof. Benton—I remember getting a colony of Syrian bees from D. A. Jones, of Canada, and I was transferring them from one of their bee-hives, which is a crock or water-jar; we broke it and cut the combs out, and transferred them into frames, and in doing this we found they had cast a swarm and were ready to cast a second, and in every handful of bees I took out I would find four or five queens. I counted 250 well-developed queens that I took out of this colony. The question was, What should I do with them? I made baby nuclei. I got these queens mated in those baby nuclei. That was very well as far as it went. That was the spring of the year. We could take those queens and send them away, and did so. If we attempted to supply a queen-cell to that nucleus there was all sorts of trouble. My proposition is this: In the long run it would not be profitable. Self-sustaining nuclei that can be fed and bees added to if necessary are valuable nuclei in the long run; they are miniature colonies. They are not for queen-rearing but queen-mating, and having them ready as reserve queens. Those in the long run are more profitable.

Mr. Weber—I commenced it and I found I had perfect success until the robbing time came, and then came the trouble; I couldn't keep the robbers away, and particularly this year. I heard from a party in Texas who had made the same complaint.

Dr. Miller—I would like to ask this question: If one or two hundred queens be mated with the bees of one

colony, if they should all go to the dogs afterwards, where is the difference?

Prof. Benton—You want one or two hundred more, and you have trouble to establish all these colonies, which is no small amount of work.

Mr. Laws—Mr. Benton relates that when he pulled out each handful of bees he would find four or five queens, and in the first place he couldn't hold them because they didn't have feed there. In the next place I believe some one raised the objection that they could not hold these bees without honey; that is right, they have to have feed. If you take a frame eight or ten inches by four or five inches and you have one hundred bees it will last those bees for six months and they will increase and keep up their strength to a certain extent in those little boxes.

Mr. Root—This question of robbing I find can be taken care of entirely by feeding out-doors. It keeps all the colonies good-natured. I didn't believe it practicable to feed out-doors until some one reported it was, and then we began doing it. We fed slowly several gallons a day. We fed those baby nuclei. That removes one of the objections. Those baby nuclei run out and they seem to get a little contrary, but by continuous feeding this will be overcome.

#### SEVENTH SESSION.

On Friday, September 30, at 9 o'clock a. m. the President called the convention to order, after which Mr. Laws, of Texas offered prayer.

Mr. Gill—We have been very profuse in our thanks for everything that has been done for us. I know I was on a little committee and we were thanked, but I believe that the officers of the National have not been thanked, and before I sit down I am going to move that the officers of the National Association be thanked for their efficient services in discharging their duties. There is one National officer who cannot live on votes of thanks and the laborer should be worthy of his hire, and he surely is, and that is the general manager, and I move that the Board of Directors be instructed to devise some means to pay the general manager amply for his splendid work.

Mr. Holekamp—I second that.

Mr. Gill put the motion, which on a vote having been taken, was declared carried.

Mr. Laws moved, seconded by Mr. Holekamp, that a vote of thanks be extended to those who had presented papers before the convention, and also those who had in any way contributed to the entertainment of the members present. [Carried.]

Mr. Stewart moved, seconded by Mr. Laws, that a vote of thanks be extended to the managers of the Christian Endeavor hotel who had placed the use of the Auditorium at the disposal of the convention. [Carried.]

Pres. Harris—I wish to introduce Mr. Adams, Mr. F. W. Hall and his little daughter, Miss Annetta Hall. Mr. Adams himself has put forth a great deal of labor in getting up this little souvenir, termed "Honey Fairies." We should in this life be mindful of our duties, and let nothing escape us that would reward them for what they have done for the bee-keepers' convention, and Mr. Adams will in his own way read to you this introductory greeting, and then Mr. Hall and his little girl will give each member one of these souvenirs so that you may take it home with you. I understand that it has cost Mr. Adams considerable to get up this little souvenir, and I know when you take it to your homes you will appreciate his kind work in your interests.

Mr. Adams—I have heard several say this was the greatest National convention that had ever convened. I have heard very many say that this was the largest Fair that has been held in this world. These two events have come together. We look at them together today. In anticipation of this—I knew it would be so—I thought it was fitting we should have something that would bring the two together and make, as we sometimes use the word, an emulsion, and run them together. This is one of the great events in our lives, and a mile-post we will look back to as long as we live, and which we will never forget. You will find my thoughts better set forth in the verses.

The President then called for a song from Mr. and Mrs. York, who responded by singing "The Wheat and the Tares," the words of which were written by a convict in a penitentiary.

At Dr. Miller's request, Mr. and Mrs. York also sang a sacred selection entitled, "Not Ashamed of Jesus."

On motion of Dr. Miller, duly seconded, a hearty vote of thanks was tendered to Mr. Adams and to Mr. Hall and his daughter in connection with the presentation of the souvenirs to the convention.

Mr. Lovesy—I would like to say a word on the organization question. Contemplate the vast multitude of bee-keepers and then consider the little organization that we have. We have not sufficient organization to reap or receive the benefits we might otherwise get. Consider the aid and support we might get from the State Experiment Stations and the Government which we cannot now use because we are not united and not organized so that we can take advantage of those things. There are many things in the United States we could get if we were organized, but which we cannot get without organization.

Mr. Gill—We have had perhaps enough talk about organization, but I wish to say a few words. I think it was Mark Twain who said: "You don't get anything in this world without asking for it, and then you insist on it." In Colorado we have secured the passage of a number of bills with reference to spraying, and other matters, such as a pure honey law; we have insisted on these things. They can be obtained, but it is necessary first to have merit. Human nature is much the same the world over. If you have something with merit in it they will take hold of it irrespective of politics.

Pres. Harris then called upon Mr. Charles Stewart to present a paper on foul brood.

Mr. Stewart—Your general manager asked me to give you a paper on black brood. Perhaps I should say here that according to our New York State authorities black brood is considered a type of foul brood, and we call it by the name of black foul brood now to make a distinction from the old or malignant foul brood.

### BLACK FOUL BROOD.

Black foul brood first made its appearance in New York State in Schoharie county, among bees bought from a Southern State, and was at first confined to a small area, but soon alarmed apiarists by the great mortality it caused among bees as well as the rapidity with which it spread.

As a rule the germ of disease affects the larvæ before it is capped, and causes it to have more of a yellow cast than it usually has in a healthy state, causing an unusual motion as if in distress. Later it dies and sinks in a shapeless mass in the bottom of the cell, assuming the color of coffee with a little milk added. It now gives off a sour, disagreeable smell, quite different from the glue-pot smell of ordinary foul brood, and unlike foul brood, refuses to be drawn out in a rubber-like string.

The bees seem to recognize the diseased cells and do not cap them, so that a very large percentage of the brood-capped hatches, although an occasional depressed or perforated capping similar to foul brood may be found. The dead larvæ may readily be removed from the cell after it has dried, differing again from foul brood which attaches itself closely to the cell.

The effect of this disease varies greatly in different apiaries, as well as in its effect on individual colonies in the same apiary. This was hard to explain at first until we learned that it proved most destructive in those colonies weakest in vitality. Further research proved that the average vitality was much lower in some apiaries and hence succumbed more readily, just as a man is more susceptible to disease whose vitality is impaired by overwork, improper nourishment, exposure, or from various causes.

A dearth of honey causes the bees either to overwork, or else suffer from lack of nourishment, thus impairing their vitality, and so succumb more readily to disease. To have disease, the germ of that particular disease must in some way be carried to the hive. How the germs were carried from a diseased apiary to a healthy one four or five miles distant puzzled me greatly until I proved beyond the possibility of a doubt that bees from those diseased apiaries could be found in apiaries at least four miles distant, thus carrying the disease with them. Such being the case with apiaries, how much greater is the mixture of bees from hive to hive in the same apiary. This can best be illustrated by citing

the fact that in an apiary with but one badly diseased colony, the colonies on either side of it in the same row will be found diseased, diminishing gradually in the amount of affected brood as we increase the distance from the source of contagion. This also seems to hold good in regard to the hives in the rows both before and behind the badly diseased colony, but to a very much less extent. Black foul brood spreads more rapidly where the hives are close together. The same of course holds good with the spread of disease from yard to yard.

In this paper I have already foreshadowed a method of treatment as follows:

Have apiaries isolated as much as possible.

Do not set colonies too close together.

Keep all colonies strong by having young, vigorous queens rich in vitality. Introduce new blood generously each season, especially that with a dash of Cyprian blood in it.

Shake all diseased colonies on clean frames of comb foundation as soon as discovered, and feed a little sugar syrup for a week to restore their vitality.

If feasible, establish a hospital apiary in some isolated place for the treatment of diseased colonies, from not only your own but also your neighbors' apiaries, moving them at night and treating all at one time, and moving home when cured to give place for a new lot.

By following the foregoing method of treatment with all of its minor details, which cannot here be given, together with a helpful enforcement of a wise foul brood law, a new order of bee-keeping has been brought about in Eastern New York. The box-hive man and the slovenly bee-keeper with his scrub hives and methods has given place to a bright, clean class of bee-keepers, who have a conscious power to succeed even in the face of disease.

This paper, which has been written as I have traveled from apiary to apiary, I feel would be incomplete did I not pay a tribute to those who framed our foul brood law, as well as to the Department of Agriculture, who have made strenuous efforts to carry it out. The bee-keepers of New York State owe much to the wisdom of this law for where once disease blasted men's hopes, and threatened even the loss of their homes, with a legacy of empty hives has arisen fine apiaries where men proudly exhibit their tons of honey.

CHAS. STEWART.

Mr. Holekamp—Is there a difference in this black foul brood from the common foul brood?

Mr. Stewart—The black brood, as I said, appeared in New York State at first and differed materially from the old type of foul brood inasmuch as the brood dies just before it is being capped, and we find very little dead under the capping; while with the black brood the greater percent dies under the capping. Foul brood is stringy and black brood is not, and the smell is different. The spread of the disease also differs; it spreads very rapidly. You will find that it has spread four or five miles away in the course of a few weeks, so that those things mark it as a distinct type of foul brood.

Dr. Bohrer—I would ask if in feeding the bees, after treatment, you add any germicide to the food, such as citric or salicylic acid, or boracic acid?

Mr. Stewart—We have used those things throughout the State and we recommend them to use those if they choose, although we never got any practical results from a germicide fed in syrup. While it seemed to hold it in check we did not want our bee-keepers to rely on that as a cure.

Mr. Cary—I would like to know if the Cyprian bee is more immune from the disease than other bees?

Mr. Stewart—We find that the Italians and some of the newer races of bees will stand the disease much more readily than the old-time blacks. For instance, we find yards where the vitality is very low from some cause, and those yards will become ruined in a single season. I have seen a yard containing 60 colonies of bees with those bees weak in vitality where fifty-nine of them were of this type of bee and one colony of Italians. The whole yard at the end of the season was dead, and the one colony had everything full of honey, and the sections were all filled, I don't know how many sets of them, and they never showed any trace of the disease; and this man being isolated somewhat, and supposing this colony was sure to die with it, let out all the wax in the solar wax extractor, before the bee-inspectors had become

organized. The result was that this colony continued about five or six years and it never showed any sign of the disease. I have noticed those bees that had a dash of Cyprian blood in them seemed to ward off the disease much better.

Mr. Cary—Do you mean in comparison with the Italians?

Mr. Stewart—I am comparing them with the ordinary black bees throughout the country. You will find that farmer bee-keepers and some of those called experts have black bees and rather poor hives, and get started with Italians and they drift back and they have rather a poor class of hybrids, and that class of bees succumbs readily to this disease; we have asked all of the bee-keepers where any disease existed to replace them with either Italians or Cyprians, or even Carniolans, in preference to any of the black bees.

Prof. Benton—How do Carniolans in this list compare with others?

Mr. Stewart—We find the Italians will stand disease a little better than the Carniolans, although we have never lost a whole apiary of Carniolans from this disease yet, that I know of. My personal observation would indicate that some particular strains of Italian bees will stand it a little better.

J. C. Stewart—I would like to cite you a case similar to one you have been describing, where you said the larvæ turned from a white to a yellow color. The larva, we will say about two days before it should be capped over, had begun to swell, and had formed a yellow spot on one side of the larva about midway from end to end and in the center of the body, and that spot begins to enlarge and enlarge until it develops in nearly the whole body of the larva, and this body has swollen so that as soon as you touch or puncture it it will burst and give off a watery substance. Do you consider that black brood?

Mr. Stewart—It is pretty hard to recognize the disease from so meagre a description, but I never found that in black brood. I don't know that I ever came across that particular feature. It would look more as if there were some pickled brood about it.

Mr. Whitcomb—You made some remark about your ability to resist disease. Do you believe one colony has any more ability to resist disease than another, or is it on account of the robbing propensities? Some do not go out and rob so much and the hybrid-black bees are always robbing.

Mr. Stewart—At one time we did lean to that idea, but we soon got our minds disabused. Take the instance I have just cited of the sixty colonies. My friend told me they could see that one colony gathering right in that yard and they showed no sign of the disease.

Mr. Whitcomb—Take it from generation to generation, and you put the honey under the microscope, and you will find that the disease is progressing.

Mr. Stewart—If you talk to the bacteriologist you will find that honey is not a medium for the propagation and growth of bacillus alvei.

Dr. Miller—When black brood was first known it was considered a very terrible thing, and at this later date when they have had a chance to fight it I would like to know how they compare it with our foul brood. You would dread the affliction of the ordinary brood, now could you put it into percent as to your dread of your black brood?

Mr. Stewart—It is pretty hard to compare the two because I have had so much more experience with the black brood than with the foul brood. While we occasionally find a little spot of it in New York State I have found foul brood where it has been in a couple of yards to an important extent for four or five years. If you had black brood in a single apiary of New York State it would largely depend on the weather or honey conditions how fast it would spread. It is a disease that thrives best in a starvation season, when no new honey is coming in pure and fresh from the flowers; and the result is that I am a little at a loss to know how to place a percentage on it, but I should a great deal rather have the old-time foul brood than the black brood.

Dr. Miller—Another question. These two diseases, the scientists tell us, come from the same cause, bacillus alvei. One is puzzled to know why, and yet we know that there are different types of the disease. But if they both come from the same cause, do they merge one into the other? Will there be shades of it from one to an-

other, or are they distinct things, neither one ever changing into the other?

Mr. Stewart—We have never known it to change from one to the other. It always preserves these peculiar characteristics of its own.

Pres. Harris—Is it not a fact that in the insect kingdom as well as the animal kingdom, and you take it among the human family, that the conditions surrounding all diseases have a very great deal to do with it? You find it sometimes in a light form, and other times in a severe form, and it is the condition in which the bees are and the surroundings.

Mr. Stewart—Yes, I believe it is.

Mr. Root—There is one fact that has not been brought out. I would like to ask Mr. Stewart whether he has diagnosed samples of black brood that have been sent to him from other portions of the country as the same as the black brood he has in New York State?

Mr. Stewart—I had a sample brought from Michigan that I was at a little loss to know just what it was, while the sample was a little old, something over a week. It is pretty hard to take a little sample of it home and decide just what it is, especially after it has been out of the hive for a week or more, but I didn't hesitate in pronouncing this similar to our black brood in New York State. Your general manager has handed me a paper that was sent in by another inspector from New York State, and perhaps it would be well to read that. The writer is W. D. Wright.

#### BLACK BROOD (SO CALLED) IN NEW YORK, VS. FOUL BROOD.

Contrary to the result obtained from former investigations and the general belief that the New York beemalady was an entirely new and distinct disease, the recent extensive investigations by New York State, exhibits are expected to prove that the disease prevailing here, is nearly, if not quite, identical with that described by European authorities as foul brood—bacillus alvei.

There is apparently a variation in the exterior characteristics of the former from the latter, such as a greater proportion of the *unsealed* larvæ dying, consequently fewer sealed cases containing discarded matter, sometimes a black or yellow spot on the larva when first attacked, and only occasionally ropiness. In the advanced stages, either is extremely foul, and emits a nauseating stench. Also, either yields readily to the same treatment.

European bee-masters claim that there are two forms of foul brood, viz.: the dry or mild, and the moist or malignant. From their description, I believe the mild form tallies with what we call pickled brood, and the malignant probably the same as our foul brood or black foul brood.

I have observed for several years past, that the pure, three-banded or leather-colored Italians were much less subject to the disease than other races, so that I universally recommended Italianizing with such strains. If this is done in diseased apiaries of black or hybrid bees, before or soon after treatment, the apiarist will stand a much better chance of banishing, or at least keeping the foul brood in subjection.

I was surprised recently, in referring to Quinby's beekeeping, edition of 1865, to find this statement in regard to Italian bees being less affected with foul brood. "Since their introduction into my apiaries, the number affected with this disease has diminished five-sixths." Mr. Quinby also states in his description of the disease, that the dead larvæ were *black*. However, a larger proportion of them was sealed over than in our black foul brood.

I will also quote from Dzierzon's mode of treating foul brood, published in the *Bienezeitung*. He says:

"To prevent the disease from spreading in a colony, there is no more reliable and efficient process than to stop the production of brood, for where no brood exists, none can perish and putrefy. The disease is thus deprived both of its ailment and its subjects. The healthy brood will mature and emerge in due time, and the putrid matter remaining in a few cells will dry up and be removed by the workers. All this will certainly result from a well-timed removal of the queen from such colonies."

This is recommended by the author when but few colonies are diseased, and those discovered early, but it is good practice even at the present day, and in the

treatment of our black foul brood in certain cases, viz.: colonies that we wish to treat by the formalin process, may be unqueened or the queen caged, then after the combs are free from brood, the honey may be extracted, the combs thoroughly fumigated and returned to the bees after they have consumed the honey in their sacs. Also, any colonies that we may wish to brimstone at the end of the season, by removing the queen three or four weeks before the end of the honey-flow we will have no brood in the combs. They could then be extracted, fumigated with formalin and preserved for future use. The best results would be obtained from colonies of fair to good strength, as they would clean up the disease much better than weak ones.

For those who wish to preserve their apiaries as far as possible from the ravages of this disease, and do not wish to use the formalin treatment, the shaking process is recommended, stacking the brood, and shaking the same combs again three weeks later.

In regard to the name of our present malady, I will say that as everything emanating from bacillus alvei is regarded as foul brood, and a further addition to the title seems to be necessary to identify this particular phase of it, we may call it "black foul brood." Because an error was made in the start in naming it black brood, is no reason why that title should be perpetuated.

The name was also very unfortunate for us when it was given, as it upset and rendered void the New York law as far as the prevailing disease was concerned, and necessitated an amendment at the next session of the legislature. However, we are happy to say that matters are gradually becoming righted.

With careful, progressive apiarists, the outlook at the present time is quite favorable, even in districts where the mortality has been greatest, and the business has been conducted at a good profit.

W. D. WRIGHT.

Mr. Root—I would like to make a statement from my knowledge of these two diseases. You perhaps remember about twenty odd years ago we had foul brood at Medina, and we had it very severely, and it was real foul brood; it roped and had all the characteristics, as given in the European journals at the time. Now, this black brood departs itself in a very different way; it is not ropy, has a different odor altogether, is of a watery consistency, and when Mr. Thos. Wm. Cowan, editor of the British Bee Journal, was at our place he examined the foul brood we had there; he had his microscope and looked at the bacillus alvei and said it was exactly the same thing as they had in Europe. Last summer I sent a sample of the foul brood that has been found in our vicinity to the bacteriologists in New York State and after an examination had been made of it a report came back that it was not the same thing as the black brood of New York State. That it was not bacillus alvei. There are some things there that I do not understand. Thos. Wm. Cowan examined the foul brood that I had seen and called it bacillus alvei; these bacteriologists examined that same thing and say it is not the same. I wish in the Department of Agriculture they could investigate that question and have it cleared up; there seems to be a conflict of opinion among authorities.

Mr. Johnson—In the last paper read the suggestion is made of shaking the bees and putting away the comb for three weeks. I would like to ask if it would be safe to use those combs again without purifying or cleansing.

Mr. Stewart—I don't think he wished to convey the meaning that they were to be used again in three weeks, but rather he speaks about stacking the brood and then afterwards when the combs are cleaned out to use formaldehyde on the combs. We cannot be sure of this treatment. In some cases it succeeds, in other cases it fails, perhaps owing to a poor grade of formaldehyde. Our experts have been making some tests of what has been sold on the market and find it is largely adulterated and therefore everybody did not get the same results. In regard to this other treatment we speak of, it is sometimes necessary in order to save the brood of a part of your colonies that are diseased early in the season, while as the honey-flow opens we treat the strong ones and stack the brood on the weak ones, and in perhaps ten days that makes the weak ones strong, and you can shake those and you have bees enough to live and perform the labors of the hive until new brood is hatched.

Prof. Benton—As a comment on what Mr. Root has brought up regarding the taking up of this subject I desire to say, shortly before coming here, I was asked to hand in estimates for the fiscal year for apiarian work beginning July 1, 1905, and in those estimates I included an item of \$1,500 for an investigation of these bee-diseases. It rests with you to see that that goes through. If it is received by the committees and congress, and if it passes we will employ a skilled bacteriologist and let him go to work to straighten the whole matter out. But this year, as Dr. Wiley indicated, there must be a united effort to see we get that in addition to our former appropriation.

Mr. Gill—I want to enter a few words of caution to amateurs in this treatment of disease; our work goes out and it is dangerous for amateurs. Experts will do as they have a mind to, and it is safe to let them, but I would advise any amateur attempting any fad in the matter of treatment, when he has doctored his combs to make them into beeswax, and when he has doctored his honey either to burn or destroy it. All the drugs in the hands of amateurs are not a success. When it comes to the treatment by shaking or driving be sure you do it a second time. The proper media for increase of the germs is in the larvae, the germ itself is in the honey, and the danger lies in the honey. Bury it or burn it up. I am speaking for amateurs alone. I have had more experience with foul brood than I hope I will ever have to have again. I have had to treat from 25 to 150 cases every year, but it is getting less. I have apiaries that are entirely clear from it, and remain so, and then in a year or two up comes some of it. You can have all the law and legislation you wish, but we have got to contend with foul brood, the same as the human family must contend with typhoid fever. I believe there are sections of the country on account of the flora, soil, atmosphere or humidity that are more immune from disease than others. I have seen sections where it seemed hard to spread it, and other places you couldn't keep from having it all the time. But it is safe at all times to the amateur to be sure of what he does. If in the fall you have had a bad case, use fire; in the spring, if you have something worth saving, starve them pretty near to death, then put them on clean combs, then when the honey season comes, the best plan is to turn them into clean, new hives, but be sure you know what to do with those old combs; take care of them, and be careful, and you will be rewarded.

Dr. Miller—Prof. Benton tells us it lies with us to secure so and so. Now, he supposes we common, everyday bee-keepers are smart enough to know all about what that means. I would like to have him say distinctly what he wants us to do.

Prof. Benton—What I mean is simply this, that when the Bill which will go before Congress making appropriations for the United States Department of Agriculture has been reported, when it is in the committee's hands, and then later on when it goes to the House and to the Senate for passage, every member should see that both of his Senators and the Representative from his district are touched up by a short letter to the point, stating we are interested in seeing work that affects our pursuit favorably considered by your committee. You need not say, we want ten or twenty thousand dollars, but simply favorably considered; we wish to see our interests represented, and there are measures included in this Bill in which we are vitally interested; will you give them your support? Merely a touch-up of that sort from all over the country, and particularly any member who is a member of the committee on Agriculture, would affect the purpose probably.

Dr. Miller—That is good so far as it goes. We don't know enough about these things we want to do. Would it be asking too much of Prof. Benton if he would, when some bill comes up of that kind, tell us through the newspapers somewhat distinctly what we are to do?

Prof. Benton—I will do that. There is not only such legislation as that, but sometimes a pure food bill has been before Congress; it is a good thing to have that kept track of, and it is a thing that every bee-keeper is interested in seeing passed, and might influence very largely in matters of that sort. There are sometimes matters affecting the duties on honeys.

Dr. Miller—I think if Prof. Benton will do that it will help very largely.

Mr. Smith—Along this same line, and in view of the

fact of the wide-spread of bee-diseases over the country, and the further fact that most of them are due either to carelessness or ignorance, would it not be a good thing to have a little leaflet issued on the prevention of these diseases? If there is none extant I would move we have a lot of them printed for the purpose of parceling out among our members and distributing, and for our local institutes throughout the country for distribution among the farmer bee-keepers.

Mr. Lovesy—In my experience I have noticed a number of times that foul brood has turned to black brood. Just as soon as the bees commence brood-rearing in the spring I go very carefully and look over the brood; pick off the caps of any I have any suspicion of, and I often find the larvæ in there. If that is the case I know it is going to be foul brood, pickled brood, or black brood, or something of that nature. Then we transfer them and put them into a box on the old stand and starve them for three or four days and put them on starters and feed them up. In this connection in regard to foul brood laws, have something which affects you. Don't have a State law. There is no State in the Union that has any law at all that suits the other States. Our law reads that any five men in any county where the disease exists may petition the County Commissioners and they shall appoint and pay the inspector for the time he occupies in his actual duties among the bees; and it provides he shall visit all bees. He is required to visit every apiary once a year. If there is anything wrong with the bees he attends to it, and if any time through the year a bee-keeper suspects anything wrong with the bees he calls on the inspector and the inspector visits them.

Dr. Bohrer—With regard to getting a new queen in such cases I would deem it entirely unnecessary, because the germ of foul brood is found in the food in the stomach of the bee, and so soon as the food has been disposed of and has passed through the system, the queen is no longer liable to transmit that disease to her progeny. I want to recommend to every bee-keeper with reference to foul brood that his cure be radical and permanent.

Mr. France—Bearing on this same line of foul brood, perhaps I am wrong, but I think not, the father of our authority in the United States from a practical standpoint is William McEvoy, of Canada. I went down to New York last winter more especially to meet him in counsel on this subject than any other, but Jack Frost beat me out, and I failed to meet him. I said, "Be at this convention," but when the critical hour came he could not come.

Mr. Reinecke—Could the disease be carried by imported queens?

Mr. France—This is a question of great importance both to queen-breeders and the bee-keeper himself. Is there danger of foul brood by buying queen bees from abroad? Yes, and no? I would not hesitate to buy all the queen-bees a foul-brood apiary had, and introduce them into my hives, provided when they came every queen was taken out of the cage and put into a new, clean cage, and fed sugar syrup forty-eight hours, and then introduced, and then destroy the cage she came in. It is the food that is in the cage, and not the queen.

Mr. Taylor—I think it is fourteen or fifteen years since I first had foul brood, and I have been a good deal interested in it, and have watched it and have not been terribly anxious to get rid of all of it as I like to see what can be done with the thing. At one time I had a good, strong colony of bees that was queenless. I had another colony that had foul brood well developed, and for the purpose of satisfying myself as to whether there was much danger of getting foul brood from a queen, I took the queen out of the foul brood colony and put it directly into the healthy colony. They accepted her at once—I didn't have to cage her—and no foul brood ever developed from that operation, so that I am tolerably well satisfied that the danger of getting foul brood by means of a new queen is extremely slim.

Mr. Laws—I would like to ask Mr. France why he wishes to feed sugar syrup to the queen and bees in the cage for forty-eight hours before he introduces them.

Mr. France—I would rather you would cut that off and not feed the queen and bees, and isolate her from those bees. It is simply to make her first consume what honey she has within her honey-sac, and then give her a good feeding, the same as with farm stock.

Dr. Bohrer—The disease is no part of her system, but simply what she has been eating?

Mr. France—That is all.

Dr. Bohrer—Do you consider salicylic acid as a germicide a valuable thing to feed with the syrup?

Mr. France—I don't know but it would be good, but I have not known any bad results when we didn't use it.

Mr. Darby—I would like to ask if you don't first introduce the queen to a new escort before you do the feeding?

Mr. France—Let her run into a cage alone first without those bees, to make sure she is partially starved, to get rid of that honey, then give her escorts and some feed.

Mr. Hart—I would like to ask if it is not a good idea to feed the queen when you are treating for foul brood at times when the bees are not doing much?

Mr. France—Yes, a most excellent time. You will accomplish two things at once. Only there is one danger. If you take away the brood it makes them restless and uneasy, unless there is a good deal of feeding done. If there is a little swarming impulse it makes quite a difference. It is difficult to treat foul brood unless there is a natural honey-flow coming in.

Mr. Hart—I would like to ask again if it would not be a better idea not to extract the honey from these two combs, only at a time when the bees were doing well in the field?

Mr. France—Does the queen-bee ever deposit any honey in the cells? If not, what difference will it make what kind of honey she has, whether foul brood or not?

Mr. France—I don't think she does, but sometimes she has an overload, and she may feed it to some other bee that would. There is a little risk there. Keep on the cautious side.

#### REPORT ON NATIONAL HONEY EXCHANGE.

Mr. France presented the report on the National Honey Exchange of America.

Mr. Brown—With regard to this matter I would like to say that, as you see, this is the first step towards our National Commercial Organization, and, as was suggested in the paper read, it is to be a market for all of our product; it is hoped to be the place where those who now consume honey and are seeking the produce from you will come to this organization to buy. It is hoped that it will be so organized with such men at the head of it that every producer will have full and complete confidence in their management of it, and will willingly and freely trust and consign their goods thereto, knowing that they will get exact and just weight and exact and just returns, knowing too that if there be but one organization in the field which will manage and control and handle all this product, it will forever do away with the competition that now exists between localities, which has a tendency as all other competition does, to bear down the prices. Therefore, we expect through this organization to be able to advance to the producer the price of his product, and not necessarily increase it to the consumer. I don't believe this matter will affect the price to the consumer one particle. It will simply save to ourselves and to those who sell and produce the honey that which now goes into the pockets of people that are making themselves wealthy out of what we produce. For the inducement of those who wish to buy stock, the stock is placed at \$25 a share; and we expect, of course, to derive some benefit to be induced to buy stock, outside of this matter of boosting the price of our goods. I can only outline something we are doing in California, having this last winter completed an organization in central California. This organization charges a commission for selling honey—it does not make any difference what that might be—we will say it is five percent—there are our resources and the dividends; after the expenses of the Association have been paid, whatever is accumulated will be dividends. We place our honey upon the market through this channel because we are members and we pay five percent for marketing our own goods through this channel. It takes two percent of the five percent to meet our expenses, then there will be repaid a dividend of three percent back to ourselves on our stock. It can be proportioned to the amount of goods contributed as is done with us in California. Then we do not only get back the dividend or rebate on the goods we contribute but also on the entire gain of the Association. We had put in our

charter a clause giving us an opportunity to manufacture and deal in supplies. That is simply put in there in case, after years of experience and growth, we grow into something of that kind. But the first thing we want to direct our attention to is the market.

Mr. Krebs moved, seconded by Mr. Laws, that the report be accepted.

Mr. Abbott—I rise to a point of order. This Association is discussing and passing action on the business of another Association, which is a stock company, and is to be entirely different from this Association, and it seems to me a strange anomaly that there should be organized inside of this Association another financial Association whose avowed purpose is to crush the business of at least one-fifth of this Association, for one-fifth of the people here are supply dealers. I confess that this is the strangest anomaly that I have ever known to exist in the form of legislation, that, I, as a member of the National Association, a supply dealer, should sit here and help make a Society whose avowed purpose is to crush out my business. I protest.

Prof. Benton—I supposed this was an Association of honey-producers to protect honey-producers' interests, and not an Association of supply dealers.

Mr. Abbott—I have no personal reference to the matter. I believe in the courtesy of this Association being extended to these people to organize this Association, but I claim we, as members of this Association, have nothing to say about how they shall conduct their business. I have no objection to what Mr. Brown has said, or to the presentation of the matter or the organization of those here, but now that it has become a permanent organization I claim it should hold its meetings separate and apart from us.

Mr. Whitcomb—While I have no interest in the sale of honey or supplies, or anything of that kind, yet I do consider when this Association goes into anything of the kind, or gives any countenance to it, it is treading on very dangerous ground indeed. If the people of California or Colorado wish to organize such an Association I have no objection whatever, but I object to dragging the people of Nebraska or Ohio or Missouri into an organization in which they have no interest.

Dr. Bohrer—I do believe we have a right to recommend such an organization as will successfully combat the combines and trusts and such persons as wish to take stock have a right to do so.

Mr. Krebs—I do not see any need of all this apparent opposition. This organization is intended to benefit the producer of honey and not to run in opposition to any class or clique of people. It is simply to get the benefit of the sale of honey at a reasonably good price without having to hunt all over the world to get our prices; it is just simply to regulate prices.

Mr. DeLong—I really think it is the Association's business to procure a market for their product. If we spend the best efforts of our lives in producing a product and then put a great portion of that into the hands of untrustworthy men to handle and dispose of to the consumer, I think we have lost one of the important points of our mission. We seem to be in the condition that we can produce the honey but when we have produced it another class of people comes in that are not in the business at all, and they say, you shall not market your honey. I say we do market it. I say we agree on this exchange and we see the destiny of our product.

Prof. Benton—I think there is a good deal of misapprehension here. For my own part I would not think of going into any such organization as is spoken of if it were designed to crush the supply dealers, because they are a useful set of people, and the supplies of these people must necessarily in the beginning come from these very supply dealers. They are not to be crushed, they are to be encouraged; they can form a part of it as well, and I see no antagonism. I do not see that the National Bee-Keepers' Association is the promoter, or sponsor, or anything of that sort, for the honey-producers' association; this is simply a convenient place to bring forward such an idea.

Mr. Abbott—I agree fully with Mr. Benton. We have got on common ground. I am not offering any objection. In fact I would like to amend the motion that we heartily concur in the movement, and will offer no opposition to it in any way, but my contention is that this is a separate body and we ought not to take the time of this body. I leave it to Mr. Brown himself if I am not right.

Mr. Taylor called for the re-reading of the report which was complied with by Mr. France.

Mr. Taylor moved, seconded by Mr. Abbott, that the report be laid on the table.

The President put the motion, which on a vote having been taken was declared lost.

The President then put the motion to adopt the report which on a vote having been taken was declared carried.

Mr. York then read a paper written by Mr. Poppleton, of Florida, on the subject of "Bee-Paralysis," as follows:

### BEE-PARALYSIS.

Early one season over 20 years ago, while keeping bees in northern Iowa, I noticed that many of my colonies seemed strangely affected, and in most cases seriously so. I examined leading text-books, as well as our periodicals, but could find no reference whatever to anything like it. A sample of the affected bees was sent to Prof. Cook, but it was all new to him. About this time inquiries commenced coming to our editors from various and widely separated localities about this same trouble. It came to be known as the "Trembling Disease," "Nameless Disease," afterwards as "Bee-Paralysis," which is more appropriate, and will probably be its permanent name.

The disease seems to be widespread, not only found in nearly all sections of our own country, but also in foreign lands. There is quite a general belief that it is confined to the South, but this is a mistake, as, with one exception, the most serious loss I have had from it was in northern Iowa. The fact that it is almost impossible to winter a diseased colony in the northern part of our country, prevents its becoming very serious there, and for that reason only it is more common in the South.

Is the disease contagious? If so, how, and in what way is it communicated from one bee to another, and from colony to colony, and, if not, what causes the disease, is one of the important problems yet to be solved. This problem must be solved, and correctly so, before we can fully control the disease. I am not at all sure I am right, but think the disease can be, and is, communicated from diseased bees to well ones. Careful experiments seem to prove that it is not passed along by means of combs, honey or brood, and I now transfer them from sick to well colonies without bad results, being careful not to give any sick, well or dead bees from an infected colony to a well one.

Whether queens can and do transmit the disease to their offspring is one of the points not yet determined, and is, in my opinion, a most important one. Giving a diseased colony a new queen has not with me been a success, yet many facts which have been carefully observed lead one to the theory that queens are largely responsible for the spread of the disease, and it seems to me much more prevalent in certain strains or families of bees. One fall, some years ago, I purchased quite a lot of young queens from one of our best breeders. The following season, nearly all of the diseased colonies in my apiary were those to which one of these queens had been given, over half of them being affected. The breeder whose honesty and truthfulness cannot be questioned tells me that so far as he knew there was none of the disease in his apiary at the time he reared those queens. Another time I obtained two or three queens from one of the noted breeders in this country. There seemed to be no trace of the disease about them or their colonies at first, but part of them, and nearly every colony of their royal daughters were diseased the following season. I had to purge the apiary of every trace of this strain. Same also occurred with another lot of purchased queens, while the descendants of other purchased queens have been free from the malady.

This question of the transmission of the disease through queens, and the fact that when once diseased the colony will continue so after a change of queens, looks as though queens and contagion both aid in spreading the disease, and opens up a wide field for theory and experiments.

The sign of disease is readily seen and recognized. Should any quantity of dead bees be seen outside the entrance to a hive, a few struggling and dying bees will usually be seen among them. If not too badly diseased, well bees will be seen on the entrance-board, tugging and hauling at sick ones, trying to drag them out of the hive. At first glance one may think that robber-bees are being fought, but a little closer observation will show the plain difference between driving off robbers and dragging out sick ones that don't seem to want to go. On taking covers off of hives the sick bees will try to come to the light, and after a little time can be seen crawling on the top of frames. Their motions are slow and laborious as though weak and partly paralyzed. They cannot take wing, but cling tightly by their feet to anything they are on. This tight clinging

by their feet is the surest sign of the disease and very readily noticed.

The disease is exceedingly erratic in its course, sometimes commencing suddenly, sometimes slowly. It may destroy the colony in a few weeks or it may linger an entire season, or it may recover suddenly, with or without some seeming cause for doing so. This last trait has caused many who have seen only one or a few cases to conclude that they have found a sure cure because a colony happened to recover soon after something had been done. This erratic character of the disease has not only led many to wrong conclusions, but makes it much more difficult to reach right ones. Observing scores or even hundreds of cases is necessary before coming to any definite conclusions at all, and we know too little of the disease yet to think we know very much about it at the best. Let us hope that some competent scientist can give us more definite knowledge than we now have.

Several methods of cure have been suggested, nearly all of which I have tried. None have given satisfaction except the use of sulphur. A single application of this has always affected a cure, except in two instances, when a second application was required. The method of treatment was to go to the colony to be treated some time during the day, and remove all the combs containing any eggs or unsealed brood, giving them temporarily to other colonies. In the evening as soon as all the bees are in from the fields, sprinkle all the bees, combs and inside of the hive very lightly with powdered sulphur, trying to get a little on all of the bees. I never measured the amount of sulphur used, but think about a tablespoonful to a small colony. Usually the bees will die off quite rapidly for a few days after treatment, then cease doing so quite suddenly. The original combs of brood taken away, or others, should be returned the day following treatment. Reason for having this brood out of the hive during treatment is because sulphur kills all unsealed brood that it touches. It is very important to observe this point in actual work.

While this treatment has always succeeded with me, yet I prefer an entirely different method. That is, to make a new nucleus with young queen, building this nucleus up into a strong colony by giving it the brood from the diseased colony, a comb or two at a time, as rapidly as it can use them to advantage. A cured colony is always very weak, so much so as to be of little or no value during the season of treatment. A nucleus built up by combs or brood from a sick colony will be in fully as good condition at the close of the season as would be a cured colony, with the added advantage of having a young queen with no known taint of the disease. While a cured colony is not apt to be again diseased, yet my experience makes me very shy about using the queens of such colonies for breeding purposes; and the best way of being safe from danger of that, is, not to keep such queens.

I hear reports of two other diseases known as "bee-paralysis" in the localities where they exist—one of them from California, the other from Wisconsin. Whether these are really types of that disease or are new diseases, is more than I know. The existence of these in our country emphasizes very strongly the need of thorough examination of the different types by competent scientists. I would suggest that our Association formally request the United States Department of Agriculture to take up this work and make a thorough investigation of these diseases.

O. O. POPPLETON.

Dr. Miller moved, seconded by Mr. Laws, that this Association request the Department of Agriculture to make the investigations suggested by Mr. Poppleton.

The President put the motion which on a vote having been taken was declared carried.

Mr. Laws—Is this a prevalent disease in our country now?

Mr. Andrews—We very seldom have a year but we will have from one to five colonies diseased. It never got very extensive with us in southern California.

Mr. Francis—In Colorado we have a great deal of this paralysis. It seems to affect the bees before the honey-flow, and when the honey begins to come in it disappears. But this season seems to be an exception. Nearly all my colonies show it. We have lost quarts and quarts of bees.

As a practical answer to the question as to the commonness of the disease Dr. Miller suggests that the members who are familiar with it arise, and at his response some twenty-five or more stood up.

Mr. Taylor—I have had a little trouble but exceedingly little. I have only had one or two cases. In the spring I had a colony troubled with disease and I removed the queen

and gave the colony a new queen. When I removed the queen I put her in a cage and kept her for a few days till some one came along and wanted a queen. I said, "I have no queens to sell; I haven't any more than I want, but I have a queen here that I have just removed because the colony was diseased. If you want the queen take her along and try her." In the course of three or four weeks my bees were all free of the disease and my friend came back and told me his colony to which he had introduced the queen had contracted the disease; showing that the queen had something to do with the disease.

Dr. Bohrer—How long after the introduction did they contract it?

Mr. Taylor—Four or five weeks.

Prof. Benton—My own experience had been very limited, but it has been reported to the Department of Agriculture from a good many States, principally Texas, Colorado, California, Florida and Pennsylvania. I recall those now, and there are others. It was particularly virulent in Texas, Colorado and California.

Dr. Miller—There is one question that comes up with regard to this which possibly might throw a little light on the treatment of the diseases. In general the disease is not bad. My bees have had the disease many and many a time, and I do not mind it at all; it doesn't amount to anything. Down South it is a very serious thing. Why is it so much worse in the South than in the North?

Mr. Poppleton—I had the disease fully as malignant in the North—in northern Iowa—as I ever had it in the South. The first winter it came the old bees continued dying all the time and continued for several months with no new brood being reared. Of course, with the old dying all winter, before the spring comes, there are no bees, and the disease cannot be distributed further. I know of no other reason why it has been so. The only difference in the South is with the weather; there it continues year in and year out and there is no interval of brood-rearing.

Mr. France—I found another trouble that so closely resembled bee-paralysis that some of us may get conflicting ideas. I found it in Wisconsin, and by reports I learned that there is the same thing in Missouri, Illinois and Iowa, and straight on through to New York, and almost at identically the same time of the year. The characteristic points of it are, first, we see a colony that is unusually strong, and in three days' time it has depopulated from half to two-thirds of all the bees, both young and old bees leaving home. On close examination out in the grass from two to six and sometimes twenty feet away we find here and there a bee running as if something was after it. It comes to a blade of grass and tries to climb it and makes an effort to fly and falls down again. With paralysis there is more of a tendency as it travels to travel slower, and more with a shaky motion to the body. These do not seem to have time to shake. The seriousness of it is, it simply depopulates the whole hive, so much so that in an apiary a little way north of me there was at least a half or more of all the bees, in three days' time, gone, just at the opening of the honey-flow. It recovers itself in a few days, as fast as the brood can hatch out, and it re-appears again right in the basswood flow. After finding it in some of those northern yards I returned to my own bees confident they were all right, but I found it very much all through, and I kept on going, and going, and seemingly there was no limit to it in our State. It was the same thing. Before I got around the circuit it was all over with. The first yard I went to I understood Mr. Benton sent a man out there to investigate, but by the time word could get to him and the man was sent out there, it had quit. But we will be on the alert and watch for it. To say what caused it I could not say anything in particular. I took a bee and put it under a glass, and I could not see any parasitic trouble, and I am at a loss to know what to call it, for I hardly feel like calling it paralysis.

Mr. Davis—I did not rise when asked because my bees didn't have the trouble just as you describe it, but Mr. France has described the trouble that I find in my apiaries in southern Iowa. I didn't know what caused it.

Prof. Benton—There is one point perhaps that Mr. France has failed to mention. That this case in Wisconsin could not be ascribed at all to spraying. As Mr. Rankin was in western Michigan, I requested him before coming to Washington to go across to Wisconsin to see what he could there. He arrived a little late; the disease seems to disappear so suddenly. He investigated the surroundings, and was confident it was not due to spraying. It was not foul brood; it was not ordinary paralysis, but there were such peculiar conditions we should have to conclude it was some form

of paralysis. There is where we have to take it up another year and make a thorough investigation to see the cause of it. He could only make one single suggestion, and that is a mere idea that entered his head, that possibly between pear-blight and this disease there is some connection, because pear-blight was abundant about this apiary that was so largely affected. If any one is situated to make observations of that I shall be glad to report on it another year.

Mr. Hart—I would say our fruit-men do their spraying in February and the early part of March, and this paralysis comes on between August 30 and September 10. We have what has been spoken of by Mr. France, and also in addition to that when the bees die they seem to be full of sour watery stuff.

A Member—I have had some trouble in Colorado, and Prof. Benton's suggestion that it might be pear-blight in connection with paralysis reminds me that the worst trouble I had was with bees located in a pear orchard which was badly affected with blight. I hadn't thought of connecting the two diseases, but perhaps that had something to do with it. It occurs with me usually about the first of May and continues until October. Mr. France's description of the disease is identical with my experience. I have eradicated it in some few cases by changing the queens, but I don't think it is a reliable remedy.

Mr. France—in reply to Mr. Benton, I also looked after the spraying conditions north of me. Now in my own locality I had four pear-trees and that is all I know of, within several miles of my apiary, and there were none near my out-apiaries, and they were fully as bad as the others. About twenty miles almost directly west of this yard in Wisconsin where Mr. Rankin went, it was fully as bad, and there are no pear-trees in that vicinity. I question if we dare attribute it to that. I don't believe spraying has anything to do with it.

Mr. Root—Mr. France describes exactly what I have seen in various parts of the country, and what I have seen in our own locality, but usually after the honey-flow. I have seen one other peculiar symptom accompanied with it, that was that the bees would be tugging at their abdomens with their hind legs, and after struggling for some time they would separate the abdomen from the rest of the body, and they would be running around in that way. I have seen them come down in the air, head over heels, in that way, and apparently had made the separation in the air. I have seen the separation take place on the sidewalk, and I have watched them actually dismember themselves, apparently as if in a good deal of pain. I sent a few specimens to Mr. Benton, and if I remember rightly, Prof. Wiley found a slight trace of poison. Whether they had gathered anything that poisoned them or not I cannot say.

Mr. Poppleton—Mr. Laws was asking about the prevalence of the disease. You cannot pick up a single volume of any of our bee-papers but what you will find reference to it. I get letters from different States in the Union asking about it. Mr. Ford lost his entire apiary, and another gentleman down in Florida almost went out of business. It is scattered universally. The form I speak of is exactly identical with what I had in Iowa. I think Mr. Benton tells me they call it the "May disease" in Europe, because it is more prevalent then. It is spoken of in the Australian journals. It cost me 10,000 pounds of honey one year; it costs me a little something every year; it is costing now a great deal. It is exceedingly erratic in its operations. You cannot tell anything about it; it seems to respond to one kind of thing at one time and to another at some other time. My own impression is that one of the worst troubles is through the queen, and I have entirely refrained from ordering a queen from outside of my apiaries, because of the danger of bringing it in. Not with the queens themselves, but their progeny. The more experience we have with it the more we know we don't know about it.

Mr. Krebs—I have talked with a very prominent bee-keeper of Texas on the subject of paralysis, and he told me he could not figure it out in any sense, and all he did for it was simply to wait until the honey-flow commenced. It is a spring disease, and when the honey-flow comes it passes off. It will come back the next spring in some cases and in others it does not.

H. Stewart—There are many here vitally interested in the subject of foul brood, and in a private interview with Mr. C. Stewart, of New York, he has outlined a treatment that has not been touched upon at all and if we ask him he would take the floor and describe his treatment. It is a treatment to be carried on this fall.

Mr. Whitcomb—Among swine-breeders there are about twenty or thirty different kinds of diseases which we at-

tribute to cholera. Among cattle we know they go out and get something that kills them. We attribute all these diseases that bees are heir to, to bee-paralysis which we do not attribute to foul brood. Now we need to understand ourselves and define what it is. I have had two cases. In the first case I superseded the queen, and she built up the finest colony I ever saw. The next had shown symptoms of cobaltic poison, and I went over to a friend and found he had left some honey in the cellar, and the flies were there and he had given them fly-poison. Sometimes they bring in poison from the fields. We don't know anything about it.

Mr. Poppleton—The idea that it comes on just before the honey harvest, and goes away just as soon as it is over, is only partly true. There is always more of it just before the honey harvest; when the honey-flow fairly commences it lessens, but some will carry it right straight through the honey harvest. There is not any one rule to follow at all. There is one disease that is known universally as bee-paralysis.

C. Stewart—Perhaps in giving that treatment I ought to say sometimes the question is brought up about changing the hives. We treat those bees right in the same hive, providing you don't leave any comb or honey there. Some of our people have gathered up the refuse from a hive badly affected with black brood and sent it to our bacteriologist at Cornell University, and he was unable to obtain a culture from it, showing there were no living germs after it reached him. With reference to the treatment I was asked to give, it is, at the end of the honey season when all brood-rearing has ceased—depending on where you are located—when there is no brood in the hive you can take all the combs from the diseased hive and give them a clean set of combs from some healthy hive, and when the spring comes you will find that the disease has disappeared, there being no brood there to continue the disease, and there being no honey except what little they take in their honey-sacs with them, and that being consumed before the brood is reared again you will find the colony in nice shape.

Mr. Poppleton—The most important point in my entire paper not one has touched on, and that is the method of curing bee-paralysis by transferring the brood and building up another healthy colony. I think that will be far more satisfactory. It has the advantage of ridding the apiary from all signs of the disease.

Pres. Harris—It is almost utterly impossible for me at this time to name a committee of two from each State interested in bee-culture, but through the bee-papers, it may be well at no distant date to take this up and correspond with both the president, and the others and make suggestions and I will then forward the committee to the Manager and he will notify these people who have been appointed, so that they will be ready to do their duty.

Mr. Haines—I would like to have some of the experts explain the treatment of pickled brood.

C. Stewart—I am not so well posted on that as I am on black brood. We have a disease near Syracuse that differs a little from the old-time pickled brood that was pickled in its own juice. This seems to have dried down, and when the proper time comes for the larvæ to be capped over it simply straightens out in the cell and the head turns black, and to distinguish it we call it "neglected brood," because we find a great deal of it in the time of a drouth, when honey is coming in very slowly. We find apiaries badly depleted to a great extent; that is the most trouble we have had with pickled brood in New York State.

Mr. Davis—I think pickled brood troubles only black-German bees. I have been troubled somewhat with it. I don't think it is serious at all. It is like the bee-moth. By introducing the Italian bees it will disappear almost entirely.

Mr. Haines—I have to differ from the gentleman on that. I have as good an Italian queen as you would wish to see; there are two colonies that swarmed from it last year and they are both affected with it. Mr. France examined some yesterday from St. Clair County, and pronounced it pickled brood, and he says it will dwindle down until there is no brood at all. That is my experience. I don't say we have much foul brood, but we are just as bad off with pickled brood.

No. 159—I was badly scared over this business this year, myself. I found it in one of my apiaries and in very bad shape; found it had depleted two-thirds of the combs in the hive; the colony would be affected all over and in perhaps a very bad shape, two-thirds of it would be entirely destroyed. I wrote to the President of our National Association and he told me that they needed protection and feed. I went to

work and contracted the entrance to my hives. I had them on the Miller bottom-board and the entrance wide open. I contracted the entrance and fed liberally, and the disease has entirely disappeared. I also went to an apiary where there were Italian bees, and I narrowed the entrance to those hives, and shut them down where they were warm, and fed them with sugar syrup, and the disease has entirely disappeared.

No. 152—In my experience with this pickled brood I believe it to be black brood in its incipency. From the causes given by most of the experts on pickled brood they tell us that it becomes so by being neglected. I found it in Colorado with a little honey, and I found it in medium colonies with a little honey, and in those that have plenty of honey; I found it in the honey-flow and I found it in the very strongest of colonies, exactly what Mr. France showed me yesterday, and said it was pickled brood, and he gave me a very severe look when I told him it was black brood. I followed a case down from just one or two cells of so-called pickled brood in the apiary till you could see it develop into the most malignant case of black brood in all stages, from very few cells to others entirely dead from disease. I think the locality must have something to do with it.

J. C. Stewart—This gentleman stated that his bees recovered after they began to feed. I would like him to state if the bees had plenty of honey in the hive at the same time?

No. 159—Yes, but it was sealed honey.

J. C. Stewart—I believe bees can uncap honey about as well as anybody else. I had thirty cases of this pickled brood at one time in New York. I had it once last year and again this year; about five cases this year; and at no time have my bees been short of feed, and I have not fed anything to help them get rid of the disease, nor did I kill a single queen, and for three years previous to that I fought foul brood, hammer and tongs, night and day, in fifty or sixty colonies. I know it has no connection with foul brood whatever. I know these thirty colonies have had pickled brood, and they got well and I never lifted a finger to help them in any way.

C. Stewart—I don't think you will find that pickled brood will ever develop into black brood or foul brood. The conditions that prevail may be as favorable to the development of black brood as of pickled brood.

Mr. Rhees—I have had some experience with pickled brood. Some four or five years ago I got quite alarmed. Invariably they got low during the season. I came to the conclusion that pickled brood was simply the death of the larvæ. I understand it is caused by some life that grows in the matter that is decaying. Nearly all diseases are caused by some kind of life. I believe when the conditions are favorable to pickled brood they have it. When feed is poor or the weather cold, or the bees cannot get water, or something that is needed to feed this young larvæ, it dies. When conditions are favorable in the hive the percentage of deaths is small, and the bees pull them out before we ever see them at all. I believe the larvæ die in our colonies; if the larvæ are removed immediately we do not see any pickled brood. If they die in large quantities we commence to be alarmed at the situation. In some instances where the vitality of the queen is very low and a colony gets to the hives, and the brood is already started, the bees get behind and they cannot catch up, and the disease will finally kill the colony in some instances. I do not believe pickled brood is contagious in the same sense as foul brood. The only way we can cure it is by keeping the vitality above it, and the conditions of the bees good.

Pres. Harris—As your presiding officer I do not know that in my life I have ever felt prouder to preside over a deliberative body of ladies and gentlemen than I have this one. It has been one of the most harmonious meetings I have experienced in all walks through life. We are all stars in the universe, some shine brighter than others. We may not all walk on paths of flowers, some of us have thorns in those paths and walks in life, but by our goodness, and by casting aside our selfishness, we live to better the conditions of one another. I should say to you here that the saddest time I have is when I say good-bye to those I have been associated with, in a meeting of this kind, and when today I say farewell to you, it is not a farewell forever, because I expect to meet many of you again. But before next year many of those who are here—I hope not—will go over to their last Home on the other side of the river, and I hope before you leave you will have a hearty hand-shake, you will come in touch with one another and get down to that point in life where good Christian people get—while I may not be one of them, I believe in it—that you may assemble together and do unto others as you would have them do unto you. That is the proper thing in life. Do not, when you go away from here, fix up your little slates for the next officers; look at this from

a sincere standpoint; do your duty. If anyone writes you a circular, use your own judgment, and then in the future you will have an organization that will not go on in a selfish channel for one or two cliques that may be there, but for the whole interest, for the whole bee-fraternity of the United States. Always bear this in mind, and you will have done a good thing in life. I want to say another word in conclusion. Do not forget our bee-papers, that you may get proper education. They do much to upbuild our industry.

Mr. Taylor—If there is no other business I move the convention adjourn *sine die*.

The President put the motion, which on a vote having been taken was declared carried, and the convention adjourned at 12:30 o'clock p. m., Sept. 30.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### An Elder Sister's Experience—Robber-Cloth.

I am 70 years old and my sister is 60. When I started with the bees I expected to interest the younger members of the family, but have failed in that. Three of them are away from home, and the one that is left has more than enough to do, for in the summer months, when we have to work the most with the bees, we have tourists with us, and then in the hot season my strength seems to fail me. Last season I was so slow in my work with the bees that three of the children of our visitors got stung.

Only one colony came through the winter in good condition, but it did splendidly. It built up fast, and was very strong, being four stories high. I got more honey from that colony than I had taken from the 5 before. They were so orderly, so well-behaved, so intent on their own business, so watchful for enemies.

But how was I to get to the bottom of the "castle" for queen-cells? I meant to divide it into 3 and give each a queen-cell, which would have been an easy enough thing to do if I had had an assistant, for I could hardly lift one of those frames full of honey and bees. I took away the full combs of honey, and the frames containing brood I put into a new hive. But when I got to the second story they just seemed to say, "Hands off! you shall go no further". So I shut them up with full supers of empty combs, and without a single queen-cell; and, what was worse still, when I went to take away the full supers the bees had taken possession, and were transferring the honey into their hive. I had been far too slow, but they had not. They were masters of the field, and knew it, too. When I objected and brushed them off the combs, they were very angry. However, they took care of the new colony and sent a nice swarm into it, making it almost as strong as itself.

I have been too "careful and troubled" like Martha, being seldom free from "bees in my bonnet". I am trying now to free myself from this. I may keep one or two colonies on the let-alone plan until I see if my strength comes back. In the meantime I must rid myself of carking care and "be careful for nothing".

Muskoka, Ont., Dec. 10.

A SISTER.

After the interesting experience you have had it is greatly to be hoped that returning strength may allow you to keep in the ranks. Indeed, when the true virus of bee-fever is in the veins one is not likely ever to be freed from it. Are you sure that interest in the bees is not the very thing to preserve and increase your strength? It's the other cares, the indoor cares, that are the carking ones, and the care of the bees helps one to let go of the others. At 70 quite a number are still active in the business, some of them producing their thousands of pounds of honey.

When taking away those full combs of honey it would have been an excellent thing to have used a robber-cloth to throw over the combs, thus preventing the bees from getting started to rob. When once they get thoroughly started robbing it makes them furious, and they act like so many little demons, demoralizing the whole apiary. The best way is to watch out that they do not get the least start, and a robber-cloth handy to throw over any exposed honey is a big help in that direction.

**Reports and Experiences**

**Enthusiastic About Bees.**

I am only a "small potato", but I am getting mighty enthusiastic about bees. I lost all I had last winter, but I bought 8 more colonies and increased to 39 strong colonies, which I have in the cellar where they seem quite comfortable.

The cellar is one built specially for them, and, of course, to my mind it is just right. I studied Miller, Bingham, Doolittle, Root, and others, and then made one to suit my surroundings and myself.

I was very sorry not to be able to meet with the Chicago-Northwestern Association when they held their annual convention, as I had hoped to do, and see with my own eyes, and shake hands with and talk to some of the noted bee-keepers of whom I have read with so much interest. But with us farmers business is always pressing at that time (or any other), so I shall be content for another year to read what they write in the bee-papers.

Berrien Co., Mich., Dec. 6 E. L. HALL.

**A Fortunate Beginner—Successful Season with the Bees.**

Last spring a man bought 2 colonies of bees from me, and increased to 6, securing 600 pounds of honey. How's that for a beginner? I have induced him to subscribe for the "Old Reliable". He has the bee-fever all right, and I think will be a good bee-keeper in a short time.

I had 13 colonies spring count, increased to 19, secured about 200 pounds of comb honey and 2000 pounds of extracted. The best colony stored 275 pounds. This is a good strain of bees, and I expect to breed from them in the spring.

The bees are wintering well so far. They had a good flight yesterday.

A. J. FREEMAN.  
Neosho Co., Kans., Dec. 31.

**Cellar-Wintering of Bees.**

Last spring I had 80 colonies left out of 87 which I put into winter quarters in the fall. I sold 40 of them and built up to 45 colonies,

### JOHN DOLL & SON,

Power Building,

MINNEAPOLIS, MINN.

Please mention Bee Journal when writing

but secured only 832 pounds of comb honey. The past season was not nearly so good as that of 1903, as in that year I had 37 colonies in the spring, increased to 87 colonies, and secured 4210- $\frac{1}{2}$  pounds of comb honey.

I put the bees into the cellar Nov. 25 in good condition. Last winter I left 15 colonies out-of-doors as I had not room for them in the cellar. I lost 1 out of the 15, 1 in the cellar, and 5 from spring dwindling. I use the 10-frame dovetailed hives.

My plan in wintering is to nail the bottoms on the hives, leaving a  $\frac{3}{8}$  entrance. I keep the dead bees away from the entrance with a wire hook, and the cellar is as dry as a powder-house. We have the bees, vegetables, etc., all in the same cellar, and I keep the thermometer as near to 45 degrees as I can.

It has been very dry here for two months, but we had 5- $\frac{1}{4}$  inches of snow on the 11th, which I think will be a help to white clover.

I live in a town of 800 inhabitants. I have my hives arranged from 6 to 8 feet apart in straight rows, all on stands 4 inches high, with 10-inch alighting-boards. I do not allow any weeds or grass to grow 2 inches high.

E. B. PRITCHETT.

Warren Co., Iowa, Dec. 15.

### The Problem of Wintering Bees.

Under this heading the American Bee Journal publishes an article in the issue of Dec. 22. From the experience I have gained during the last few years I can only say that the writer deserves great credit for the practical hints he gives to bee-keepers concerning ventilation. His advice can not be neglected by bee-keepers, without loss on their part. The bees must be kept warm, but they must also have plenty of fresh air, and how to combine these two is to solve a problem that is very important, especially to young bee-keepers. Before I knew how to prepare bees for winter

## SALZER'S SEEDS

**Beardless Barley**  
The barley of your dreams; no beards; easy to harvest; always big yielding. Mr. Wells, of Orleans Co., N.Y., threshed 121 bu. per acre. You can beat this in 1905 if you try.

**National Oats**  
The marvel and wonder in oats. Will yield for you on your own farm from 150 to 300 bu. in 1905. Try it.

**Billion Dollar Grass and Teosinte**  
The two greatest forage plants of the century. Billion Dollar Grass will produce 12 tons of magnificent hay and Teosinte 80 tons of green fodder per acre. Catalog tells about it.

**Look At These Yields**  
Speltz, 80 bu. grain per acre, and 4 tons of hay besides.  
Macaroni Wheat, Rust Proof, 80 bu.  
Victoria Rape, 40 tons of green food per acre.  
Pea Ool, 25 tons.  
Earliest Sweet Cane, 60 tons green food.  
Potatoes, 800 bu. per acre.

Now such prodigious yields pay. You always get them when planting Salzer's Seeds.

**Onion Seed 60c**  
a pound, and other vegetable seeds just as low. We are the largest Vegetable Seed growers in the world, operating 5000 acres.

**\$10.00 for 10c**  
We wish you to try our great Farm Seeds, hence offer to send you a lot of Farm Seed Samples, fully worth \$10.00 to get a start, together with our great seed catalog, all for but 10c postage, if you mention this paper.

**John A. Salzer Seed Co. LACROSSE WIS.**

Please mention Bee Journal when writing

I had great losses, therefore I will explain how I winter them on their summer stands.

In the fall when cooler weather comes—after the first frost—I select a day which is not windy, for bees do not like to have their hives opened on a cool and windy day. I lift the cover slightly, and blow in sufficient smoke to make the bees leave the top-bars. Then I place over the top-bars a wire screen large enough to cover them well. After doing this I place an empty box on top of the hive filled with excelsior (very fine shavings) about 6 inches deep, or enough to shut off the cold air. The boxes I use for this purpose are the same as those I use for hiving bees, and are about 9 inches high. The best cover to use on the box is board strips nailed together, leaving between each strip about 1/4-inch space, through which dampness which is caused by the sweat of the bees, may escape. Then the roof is placed over all. The box is placed on the hive and fastened on 4 sides with small staples. To drive them in with a hammer is not advisable. They can be pressed in when the holes are pierced with an awl. The joints between the top-bars and the hive can be daubed with a little mortar if necessary.

A hive prepared in this manner needs only a small entrance; if the temperature goes below zero, 1 1/2 x 3/4 will be about the size. Under certain conditions more space is advisable. This will ventilate the hive well, and dispel all moisture, and in the spring the bees will be found in a healthy condition with no moldy combs, which I found so often before using this method. When bees are prepared for winter in this way the excelsior in the box must remain dry, and if it gets wet from exhalations it indicates that the flight-hole should be enlarged.

BRO. ALPHONSE VEITH.

Spencer Co., Ind.

**Getting Unfinished Sections Filled.**

When I have unfinished sections at the close of the honey season I put them on good, strong colonies and feed extracted honey, and they fill them up. It pays to feed honey rather than sugar.

DR. J. ARCHER.

Santa Barbara Co., Calif., Dec. 14.

**Laboring Under Difficulties.**

I put 8 colonies of bees into winter quarters in 1903, but they all died before spring. I then bought a colony, but it was very weak. By August it had built up pretty strong and swarmed. I fed it about a pint of syrup a day until fall. One large swarm came to me, and I bought a few colonies. I also had another old colony in the spring which was strong, but did not swarm until August. I fed it and kept it at work all the time. When the first super was about half full I put another one under it, and so on, and in the fall I had nearly 100 sections filled.

I now have 7 colonies in good condition for winter.

A. S. BEILER.

Lancaster Co., Pa., Dec. 16.

**De Luxe Comb Honey.**

On page 19 of Gleanings in Bee Culture for this year, Mr. Titoff has given us something of more than usual importance. I, for one, believe there is altogether too much labor and expense attached to the production of comb honey in small sections. Improvement in methods ought to be in the direction of simplicity and economy, but the tendency has been too much the other way.

Mr. Titoff makes a very strong point when he says that much more honey will be produced in a given time by the use of shallow frames than with sections. I know that the work of producing fancy honey in sections is fascinating. It is nice work when one has only a few colonies, but only a few of the larger bee-keepers in the country will bother with sections at all.

I can see one point that was not mentioned directly in the article referred to. The boxes could be used over and over again for honey. Sections are never used the second time, and very few shipping-cases are saved for a second shipment. I say, let us make a fair trial of

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**  
334 Dearborn Street, CHICAGO, ILL.

the tin boxes. The package that bee-keepers adopt and use is the one that will please the public.

It is our fault, not the fault of the trade or of the consumer, that any sections lighter than 1½ pounds were ever put on the market. The half-pound section has been advocated, but the craft had a little too much good sense to be drawn in on that fad. I hope to hear from others on this question.

Crawford Co., Wis. **HARRY LATHROP.**

[The article referred to advocated bulk comb honey put up in tin boxes with fancy illustrations printed on them. It is an idea much in vogue among bee-keepers in Russia.]

—EDITOR.]

### Wintering Bees—Nice Weather.

My crop of honey for 1904 was 11,000 pounds. Sixty-three colonies have been in the cellar since the first day of December, and 63 are packed in wheat-straw on the summer stands, besides the 20 colonies at the out-yard packed. I had not the room in the bee-cellar for all, so I divided them by two as an experiment, or rather because I had to. I am now digging a new cellar, to be ready for another season.

We have had most beautiful weather all the fall and thus far into the winter, except two or three little cold-snaps. The last has just ended, being much the worse. Some three days of high wind, and oftentimes a blinding snow-storm with zero temperature, and for awhile 15 degrees below, made one think of "homestead" times.

The bees had a splendid flight yesterday, and a light one the day before, and it bids fair for another to-day. There are a few snow-drifts left from the recent storm.

Sioux Co., Iowa, Jan. 1. **F. W. HALL.**

### Poorest Season in 35 Years.

I have been familiar with the appearance of the inside of hives of bees for the past 35 years, and I never saw such poverty-stricken hives and combs after the end of July as the past season. This is a little hard on one who depends upon his bees and sale of honey as a sole income.

I have taken 450 pounds of extracted honey from 80 colonies, from extracting-supers, and the light hives need that amount, or more, distributed among them to-day. I must get to feeding in earnest. I have already fed 150 pounds of granulated sugar syrup.

**WALTER HARMER.**

Manistee Co., Mich., Dec. 30.

### Late Brood-Rearing—Bee-Stings—Overhauling the Hives.

Would it not be well to try to get brood reared, say as late as the last of September, so that there would be a considerable number of young bees to go into winter quarters that would not die before spring? And how can this be done?

Some one asked why there are so many dead bees in front of his hives so early in the season. Dr. Miller said he didn't know. May it not be that they died of old age? If the greater part of the bees die this way before March, brood-rearing will be delayed because there will not be sufficient bees to protect it, and the result will be weak colonies in the spring.

Of course with such full colonies in the fall more honey will be required to keep them through the winter. But what if it does take an extra frame of honey, these late-hatched bees will become producers next spring.

I notice accounts of some peculiar effects of bee-stings are given in the Journal. I read some months ago of a man who became insane from the effects of being stung. Recently I read of a man who, after eating quite freely of honey, was seized with severe cramps, from which he died.

The best local remedy I can use for stings is turpentine. Have several vials of it scattered about. Apply immediately after scraping off the sting.

Does the overhauling of the brood-chamber,

### PROGRESS

I publish and recommend to you **THE RURAL BEE-KEEPER**, the best all-around 50-cent monthly bee-journal in America. On trial 3 months for this ad, with 10 cents. Clubbed with this publication both for one year for \$1.25; or send us 25 cents for a 3 months' trial and your name and address on a 2-line rubber stamp; self-inking pad, 25c extra. Or send \$1.00 and get **The Rural Bee-keeper** and an **Untested Italian Queen-Bee**. Sample copy free. Agents get liberal terms.

### Putnam Makes Good Bee-Hives

And sells them at reasonable prices. New catalog now ready. Address, **W. H. PUTNAM,**

### 10 CENTS A YEAR.

## The Dixie Home

MAGAZINE, largest, brightest and finest ILLUSTRATED MAGAZINE in the world for 10c a year, to introduce it ONLY.

It is bright and up-to-date. Tells all about Southern Home Life. It is full of fine engravings of grand scenery, middle-class and famous people. Send at once. 9c a year, postpaid, anywhere in the U.S., Canada and Mexico. Six years, 50c. Or, clubs of 6 names, 50c; 12 for \$1. Send us a club. Money back if not delighted. Stamps taken. Cut this out. Send to-day. **THE DIXIE HOME,**  
24A48t No. 75, Birmingham, Alabama.

**BEE-KEEPERS!** Send me your orders for **BEE-SUPPLIES** for next year's use, and get the discount: Oct., 6 percent; Nov., 5 percent; Dec., 4 percent. The above discount does not apply to honey-packages. Send for catalog. **W. J. MCCARTY,** Emmetsburg, Iowa  
44Etf Please mention the Bee Journal.

## Sure Healer

For old sores on horses or cattle, such as scratches, cracked heels, collar sores, or any old or new cuts. Every farmer has the remedy at home. Will send recipe for 50 cents, coin or stamps. Address, **G. FRITZ,**  
4A1t Box 17, PROCTOR, MINN.

**EGGS** From 70 Varieties of Thoroughbred Fowls given as premiums for getting subscribers to 25 leading Poultry Journals, etc. Address, **SUBSCRIPTION AGENCY,** Fricks, Pa.

**Concerning Incubators.**—There are several good incubators on the market and they are offered at very reasonable prices, in fact they are so very low that we are surprised that every family raising poultry does not have one. But there is one machine that seems to be in a class all by itself, and all on account of one feature, and a most important one, too—a removable chick-tray and nursery. After the chicks are hatched they drop into the chick-tray below the eggs, and when the hatch is all over this tray can be pulled out like a drawer and the little chicks carried to the brooder without hand-

ling. By taking out this tray the whole interior of the machine is exposed. Every nook and corner is in sight and can be thoroughly, quickly and easily cleaned. The incubator referred to is the Gem, made by the Gem Incubator Co., box 52, Dayton, Ohio. They have a new, large and profusely illustrated catalog that is free for the asking, if you mention the American Bee Journal. Send a postal to-day.

## The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

GEORGE W. YORK & CO.

Chicago, Ill

Please allow about two weeks for your knife order to be filled.

when bees are working in the sections (to cut out queen-cells, for example), cause any considerable lessening of the amount of honey stored? I suspect it does. The matter ought to be looked into, for in some methods to prevent swarming there is considerable monkeying with the brood-combs.

Allen Co., Ind., Jan. 3. D. MCCARTHY.

### Golden Italians — Feeding — Long-Tongued Bees—Plain Sections.

I notice that a good many people condemn the golden Italian bees. I have one colony that is a beautiful golden in the summer-time, and it is the third swarm that issued from the parent hive. I intended to put them back, but they had a fine queen, and as they were few in numbers I thought I would let her have them and see what she would do. I hived them on two empty combs, and fed them. In a few days she began to lay, and in a short time they were a good-sized colony, and to-day they are hustling to keep up life. When the first swarm issued from this colony I took 4 frames, bees and all, from it to rear queens from. After all this she filled the 4 empty frames and the bees stored about 36 pounds of good section honey, and the swarm which issued from this colony has the hive full of honey and a good winter's supply of bees, while the parent hive filled only 24 sections. Give me all golden Italians like the 2 I have and they will gather the nectar fast enough.

I use 8-frame dovetailed hives and Hoffman frames, and have no trouble in handling the bees. The hives have handholes in the sides, which I prefer to cleats, as I can stack them up close together, so that mice, or bugs or anything of that sort can not get in them. I have a few of the old Langstroth hives, but don't like them. They are too deep and the covers too heavy.

I put supers on top of the hives for winter, and if I have to feed I fill sections with comb

# A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

## How to Use the Holder.

**DIRECTIONS.**—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired bevel by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on a steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

in them with syrup, giving these to the bees. This plan has given good satisfaction. I use 1 part sugar 1 part water, and 1 part honey. I let this mixture stand for 10 or 12 hours, stirring well and warming it a little at first, so that it will dissolve nicely. When the sections are ready I lift the covers from the hives, set in as many of them as I think best, and close the hive. The bees soon get used to this and after they have been carefully handled a few times they do not fly out.

I have 2 colonies of long-tongued bees, and they are good ones. They do work on red clover, for I and others have found them working on it. With a glass we could see them putting their tongues down deep into the tubes of the red-clover blossoms. As we watched them work we could plainly see them lick the nectar out of the blossoms instead of sucking it, as a great many say they do. They may suck up syrup or honey, but they lick out the nectar first.

I have 54 colonies of bees. I have been a bee-keeper for 12 years, but have not entered into it so extensively before. In 1903 I started in the spring with 6 colonies, and put 34 into winter quarters. In April, 1904, I had 16, and increased to 54, which were in good condition for winter.

If I were to begin over again I never would use anything but plain sections, because they are easily cleaned and packed, and are neater. The holders are plain and easily cleaned and made.

I sell all of my honey at home, charging 15 cents per section for comb and 10 cents per pound for extracted. I also get 32 cents per pound for all the beeswax that I sell near by.

We are on the highest point between the Illinois River and the Mississippi, and we have lots of white and sweet clover, but the flow the past season was about 1/2 what it was the previous year.

A. N. COOKE.  
Henry Co., Ill.

## No Rain in Southern California.

Southern California is still without rain enough to do any good, and it looks now as though we are to have another dry year. Bees are still being fed, but their owners are getting a little tired of it.

G. F. MERRIAM & SON.  
San Diego Co., Calif., Dec. 19.

## Great Demand for Extracted Honey

I am now running 49 colonies for comb honey, but I am going to fix up 10 or 12 more for extracted honey, as the demand for this article is so great that I can not fill my orders from drip honey or from broken comb.

In 1903 I had nearly 6000 pounds of comb honey and this year I secured about 2000 pounds. Both of these years my honey was all sold before Dec. 1, and people were asking for more. I sell all of it direct to the consumers, as the store-keepers will not buy any unless it is almost given to them.

I have 49 colonies of bees in good condition in the cellar, and hope for a good season next year.

CHAS. LUEBKE.  
Rock Co., Wis., Dec. 25.

**Honey and  
Beeswax**

**CHICAGO, Dec. 7.**—The market is well supplied  
with all kinds of honey; the demand is of a  
light nature. Fancy comb honey brings 14c,  
but quality as well as appearance is necessary;  
No. 1 sells at 12½@13c; of grades difficult to  
move at 10c less. Extracted, choice white,  
7@7½c; amber, 6@7c, with off grades about 5½c  
per pound. Beeswax, 30c.

R. A. BURNETT & Co.

**BOSTON, Jan. 9.**—The market is without  
change since last writing. The demand con-  
tinues light, and supply is more than ample.  
We quote: Fancy white, 16c; A No. 1, 15c; No. 1,  
14c, with practically no demand for No. 2. Ex-  
tracted, from 6@8c, according to quality.

BLAKE, SCOTT & LEE.

**KANSAS CITY, Jan. 9.**—The demand for comb  
honey still continues light, as most of the re-  
tail dealers were stocked up on \$2.25 honey be-  
fore the holidays, two cars of which were sold  
here at that time. We look for a better market  
in the near future, and quote: Fancy comb,  
24-section cases, \$2.50; No. 1, \$2.25. Extracted,  
white, per pound, 6@6½c; amber, 5½@6c. Bees-  
wax, No. 1, 28@30c. C. C. CLEMONS & Co.

**CINCINNATI, O., Dec. 19.**—Comb honey is now  
coming in more freely, and prices if anything  
have moderated a little. The sales made and  
prices obtained were for No. 1 fancy water-  
white comb, 12@13½c; single cases, 14c. Ex-  
tracted is sold as follows: White clover, in  
barrels, 6½c; in cans, 7½@8c; amber, in bar-  
rels, 5½@5½c; in cans, 6@6½c. Beeswax, 27c.  
C. H. W. WEBER

**PHILADELPHIA, Jan. 9.**—The market is nu-  
changed from our last quotations, and trading  
light. We quote: Fancy white, 15@16c; No. 1,  
13@14c; amber, 11@12c. Extracted, white, 7@8c;  
amber, 6@7c. Beeswax, 26c.

We are producers of honey and do not handle  
on commission. WM. A. SELSER.

**CINCINNATI, Dec. 30.**—Since our last report  
was published, the price of extracted honey has  
advanced, no doubt acting in sympathy with  
the sugar market. We quote amber extracted  
in barrels at 6@6½c; white clover, in barrels  
and cans, 6½@8½c. Fancy comb honey, 13@14c.  
Beeswax, 28c. THE FRED W. MUTH CO.

**ALBANY, N. Y., Dec. 26.**—Comb honey is mov-  
ing off very well considering the heavy re-  
ceipts and cold weather. Prices not as high  
as early fall, as usual, but very good yet.  
Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c.  
Buckwheat, 11@12c; mixed, 10@11c. Extracted,  
dark, 6@6½c; light, 6½@7c. Beeswax, 28@30c.  
H. R. WRIGHT.

**SAN FRANCISCO, Jan. 4.**—White comb, 1-lb.  
sections, 11½@12½c; amber, 9@11c. Extracted  
white, 6@6½c; light amber, 4½@5½c; am-  
ber, 3½@4½c; dark amber, 3@3½c. Beeswax,  
good to choice, light, 29@30c; dark, 27@28c.

Market is quiet and not noteworthy for  
strength. Although stocks here and through-  
out the interior are light, there is little inquiry,  
either for shipment or on local account. There  
is strong probability, however, that the spring  
trade will absorb the light stocks remaining.

**NEW YORK, Jan. 9.**—The market on comb  
honey is decidedly dull, and while there is no  
stock of dark and buckwheat to amount to  
much, all grades of white honey are plentiful,  
and for the present we cannot encourage ship-  
ments. We quote fancy white at 14c; No. 1 at  
13c; No. 2 at 11@12c; buckwheat at 10c. Ex-  
tracted honey is in fair demand, with abundant  
supplies and a weakening tendency is notice-  
able in the market. We quote white at 6@6½c;  
light amber at 5½@6c; dark, 5@5½c per pound;  
Southern at 52@55c per gallon. Beeswax, 29c.

Gentlemen:—Your catalog is fine. SOUTHWESTERN BEE Co.

## BEE PRANKS.

We take pleasure in presenting to the public the first edition of our little book entitled "Bee Pranks". This pamphlet is compiled from clippings taken from newspapers published all over the United States, and therefore gives as nearly as possible complete and authentic daily record of common, uncommon, strange and unique happenings in the busy life of the bee during the year just passed.

The chief value we claim for the book is the undisputed fact that nowhere else will or can be found as varied a collection of interesting events in the life of this little insect, anecdotes, humorous as well as serious, mingled with practical information.

In this modern age there are few events of importance which are not chronicled in the newspapers; they seldom appear anywhere else and are read only in that section of the county local to the paper in which they appear.

At no little expense have we been able to gather together news items pertaining to the bee which have appeared in almost any and every paper published far and wide. You will agree with us many are wonderful, some sad, some humorous, but all interesting. They are not fiction, but chronicled facts.

We shall be pleased to send this book postpaid to any address for 12 cts. in stamps, or WE WILL GIVE IT FREE for the names and addresses of 5 bee-keepers in your vicinity. THEY ARE GOING FAST and this offer holds good only while they last.

**G. B. LEWIS CO., Manufacturers of Bee-Keepers' Supplies**  
Watertown, Wis.

# American

# Bee Journal

45th Year.

CHICAGO, ILL., FEB. 2, 1905.

No. 5.

SOME APIARIES LOCATED IN THE GREAT SOUTHWEST.  
(See page 84.)

# FOR 1905.

We are always studying how to improve our goods. That's why we are leaders. No detail is too small for improvement. No expenses are spared to experiment and build new machinery. There are many advantages in buying Root's Goods. You can't get good goods cheaper; you save freight and time, and you are always sure of the very latest in apiculture. Below are our improvements for 1905.

## Honey Extractors

The honey extractors of 1905 have steel stampings in many places where gray iron castings were used formerly. These stampings are so ribbed and braced that the construction of the baskets will be much stiffer than formerly with no possibility of any of the parts breaking.

## Wire Imbedder

Our new spur wire imbedder is a great improvement over the old one. Although it costs 20 cents and the old one sells for only 10 cents, it is 10 times better. It does very neat, pretty work and the special construction of the teeth with the groove makes it easy to follow the wire during the process of imbedding.

## Perforated Zinc

A complete new set of dies and press have been made during 1904 for turning out perforated zinc, so that our 1905 product will be even better than before.

## Smokers

Some minor improvements have been made in our smokers by which the blast will be increased and the general construction throughout stiffened. A very neat and strong brace is placed in such position that the legs supporting the cup or stove can not be twisted or bent out of shape without crushing the whole smoker.

## Fences

Some of our fences for the supers will be nailed as well as glued. This will enable the user to clean off the propolis by immersing them in boiling water, a fact which will be appreciated by many.

## Root's Automatic Extractor

We have got it at last. An automatic reversible honey-extractor that will reverse the pockets while in motion by simply pressing on a lever. The extractors are no larger than the Cowans, and reverse without bang or slam, provided the directions are followed. They are equipped with street-car hand-brake, noiseless gearing, gearing on top of the reel out of the honey, and out of the way of putting in and removing the combs. We have the 4-frame size all ready for delivery. Six-frame, 8-frame, and 2-frame sizes will be ready shortly. Price will be only \$2.00 above the regular price for 2, 4, 6, and 8 frame Cowan extractors, respectively.

## Wax-Tube

The Van Deusen wax-tube fastener is made of one piece of brass tubing drawn down to a point. It is a much neater and better tool than the one sold last year.

## German Wax-Press

The German wax-press is now so improved that it has a threefold use. First, as a wax-rendering device and press to squeeze out slumgum clear of wax. Second, as a press for squeezing honey out of cappings, bits of burr-combs, chunk honey and the like. Third, as an uncapping can for uncapping combs preparatory to extracting. This last feature will prove invaluable because the cappings will drop into the basket, and when the uncapping is done the cappings can be squeezed until they are dry, the honey running out at the spout. Three machines for the price of one. And our price has been reduced to \$12.00.

## Bee-Veil

Our bee-veil for 1905 will have rubber cord sewed in the bottom edge so that the top as well as the bottom will be elastic. If the directions are followed the edge of the veil can be made bee-tight around the waist or coat, effectually protecting the wearer. We will still furnish veils with silk binding and when called for can supply them.

## Cover

The Excelsior cover will look about the same as before except that its construction will be simplified and strengthened, making it better in every way to withstand extremes of hot and dry weather. It will be used on all our hives including the Danzenbaker, as it has stood the test of many years, and for a general purpose cover we know of nothing better.

Ask for our Catalog. A postal brings it.

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor.

CHICAGO, ILL., FEB. 2, 1905.

Vol. XLV.—No. 5.

## Editorial Notes and Comments

### “Bee-Keeping in the Southwest.”

Over a year ago we had some correspondence with Prof. Louis H. Scholl, of Texas, concerning the preparation of a series of articles on bee-keeping in his section of our great country. Finally, about two months ago, he wrote us that he would now have the time to write them, and in this issue will be found the first one under a heading of his own selection, “Bee-Keeping in the Southwest”. Our Southern readers especially will be interested in Prof. Scholl’s articles, though they will be profitable for all.

### Punic or Tunisian Bees.

The character of these bees is a live topic nowadays among the correspondents of the American Bee-Keeper, the editor having received “numerous comments, aggregating nearly 100 pages of manuscript, together with lots of letters from those who have tested this race of bees”. Whether they be good or ill-tempered, there can be no denying their ability to stir up ill temper among the disputants, for the editor says that much of the matter must be rejected “owing to its somewhat vindictive tone”.

### Nominations for Officers of the National.

Wm. M. Whitney, of Wisconsin, does not favor the plan of selecting for candidates the two having the highest number of votes for nomination. He also says :

“It seems to me that as many States prominent in bee-keeping as possible should be represented on the Board of Directors, and it might be well for each State organization to indicate in some way the wish of the members in each locality ; but voters to exercise their own free will in making choice of candidates for any office to be filled.”

Perhaps it would be a good idea for State organizations to take a vote on nominations, provided the members are also members of the National, and yet it would be only a duplication if such members also sent in votes for nominations to the General Manager according to the present custom.

The idea that the nominees should, so far as possible, fairly represent the different sections of the country is based on that jewel “fair play”. Some might say to increase the number of directors so that each State could be represented. But that would make the body a very un-

wieldy affair, say others. Indeed, some of the Board say the number is now too great for rapid expedition of business. There is perhaps never an actual meeting of the Board with all the members present, and the business is chiefly transacted by mail. Would it be an improvement to return to the smaller number of previous years? Could or could not three or five members do the business as satisfactorily as twelve or twenty? These, and other questions, are fair subjects for discussion.

One thing that makes it less important that many different sections should be separately represented is the fact that the interests of the different sections are generally identical. Protection against unjust litigation is the same in Maine as in California, and the same may be said of adulteration and other matters. However, we believe that it would be an advantage to have the members of the Board of Directors in as many different parts of the country as possible.

### Drone-Brood Exempt from Foul Brood.

Something which has perhaps not been heretofore mentioned on this side the water is given in the British Bee Journal, which says :

“It is a curious fact that dead drone-larvæ, even when taken from a hive affected with foul brood, never show the marked characteristics—either in color or ropiness—such as are seen in worker-brood from a diseased colony. It would almost seem as if the bacillus does not propagate or thrive in the former as in the worker-larvæ. Anyway, we can only record the fact as we have found it, after an experience probably as great as that of any one in this country.”

### A Question-Box Convention Program.

That’s the kind the Chicago-Northwestern is. Not a single paper was read at the last meeting. It was simply question after question, and one lively discussion following another. Such program is very easy to prepare, and when once “ignited”, and the “flames” properly directed or controlled, it makes just the liveliest and warmest kind of a meeting of bee-keepers.

Such program has many advantages, and scarcely any disadvantages. The secretary is not overworked in preparing it before the meeting. Every one present has only to hand in any question that he desires to have discussed, when it is read, and the opinions thereon are forthcoming at once.

It also furnishes an ever fresh and sometimes surprising program. No one knows what is coming next until the next question is read by the presiding officer. Often the questions are so interesting that several members want to give their experiences in concert. Then the president or chairman needs only to say which person can have the

floor first, when the life of the shorthand reporter is saved—or at least he (the reporter) is saved from a useless attempt to write down a senseless jabbering.

We wish to commend the question-box program to other conventions of bee-keepers. We believe the Chicago-Northwestern is the only one that uses it practically exclusively. The old Northwestern that met annually in Chicago for so many years previous to 1891, never had any other kind of a program. It also never had but one president during its existence. And he was Dr. C. C. Miller, the original question-box-program man. He still helps as a member to make the Chicago meetings so interesting and practical.

Some members of the Chicago-Northwestern Association attribute its very successful meetings to its special kind of program. But it has no patent on it. Other conventions can copy if they so desire, without being in any danger of infringement proceedings.

## Miscellaneous News \* Items

The British Bee-Keepers' Association has 332 members. For the year 1903 its income was \$2150.

Sir A. Conan Doyle as a Bee-Keeper.—It is reported in the British Bee Journal that the author of "Sherlock Holmes" is to cease writing after this year, retiring to some quiet country place where he will "go in for bee-keeping".

Mr. P. B. Ramer, secretary of the Fillmore Co., Minn., Bee-Keepers' Association, wrote us Jan. 20 as follows:

"We have just closed the third annual meeting of our Association, and each one excels the former ones in the interest taken. Our Association is proving to be a permanent good to the bee-keepers of this section. Those who fail to attend bee-keepers' meetings do not realize what they are losing."

The Paid-in-Advance Subscriber.—A country newspaper speaks of a man who always paid for his paper a year in advance. As a reward he was never sick in his life, never had a corn on his toes, or the toothache; his potatoes never rot, the frost never kills his pears, his wife never scolds, and he has succeeded in serving three terms on the school-board without being criticised.

We do not know whether such happy results would follow paid-up subscribers to the American Bee Journal or not, but it wouldn't do any harm for many others to try it.

The Michigan State Convention will be held at Grand Rapids, Feb. 23 and 24. We have received the following for publication from W. Z. Hutchinson, president of the Association:

### PRIZES ON HONEY AT THE COMING MICHIGAN CONVENTION.

As an encouragement to attend the coming State convention of bee-keepers at Grand Rapids, and, at the same time furnish some valuable object lessons to some of the members, the following prizes have been offered:

For the best 10 pounds of comb honey, quality and manner of putting up for market to be considered, A. G. Woodman, representing the G. B. Lewis Co., will give \$3.00 worth of supplies; for the second best lot, a Bingham brass smoke-engine worth \$1.75. Mr. Woodman also offers similar prizes for the best 10 pounds of extracted honey, quality and manner of putting up for market to be considered.

M. H. Hunt & Son offer \$3.00 worth of supplies for the

best 10 pounds of extracted honey, quality and manner of putting up for market to be considered; a Jumbo Corneil brass smoker as a second prize; and a Bingham honey-knife as a third prize.

The A. I. Root Co. offers a complete Danzenbaker hive nailed and painted, ready for use, value \$3.10, for the best 10 sections of honey produced in a Danzenbaker hive; for the second best lot, a copy of the "A B C of Bee-Culture", worth \$1.20; for the third best, one year's subscription to *Gleanings*, worth \$1.00.

In addition to the above, the Bee-Keepers' Review will give a year's subscription to the Review to every man who wins any of the other prizes.

It will be seen that a bee-keeper with a nice case of comb honey, or 10 pounds of fine extracted, might, considering the reduced rates on the railroad, come 100 miles and receive prizes enough to pay all of his expenses. Come and bring your honey. If you don't bring it you may be chagrined to see a poorer lot than yours take first prize.

It may be of interest, also, to know that the National Biscuit Co. will make a display of their goods that are made with honey.

All being well, we expect to be present at this convention, and hope to meet many friends of the American Bee Journal. Not having been invited to offer any prizes accounts for the omission of the American Bee Journal from the foregoing paragraphs.

Some Southwestern Apiaries are shown on the first page this week, the originals of which were kindly sent to us by Prof. Louis H. Scholl, who begins a series of articles this week on "Bee-Keeping in the Southwest". The following are brief descriptions of the pictures as noted on the back of each photograph:

1. M. A. Salazer's apiary on the Nueces River, La Salle County, opposite a beautiful lake. Catclaw, mesquite, guajilla, white-brush and others are the sources of honey.

2. Where fine honey is produced—mesquite, catclaw and guajilla. Bottom-boards not present in this yard. Hives on rims, and earth the floor. Works all right there. Dry, you know.

3. 180 colonies kept by W. B. Morse and wife on the "waheah" plains of southwest Texas, which brought in much cash.

4. Apiary of J. N. Long, of Frio Co., Tex., where Mr. Sbisá used to get his honey; 140 colonies owned by a man who makes his own hives and fixtures, and who has made some money out of the business.

5. Another apiary in southwest Texas. Just moved to the new location. Some 80 colonies, and the "rims" still lying on the ground, just taken off, with screws. Mesquite and persimmon trees in the yard, and other honey-plants.

6. 360 colonies in one yard—the most I ever saw in one place in Texas. On the banks of the Nueces. Thousands of acres of guajilla, mesquite, and cacti in the distance.

7. A southwest Texas apiary with mesquite and white-brush all around—honey-yielders—and the bees have only to go over the fence and fetch it into the hives.

A Very Successful Meeting of the Kansas State Bee-Keepers' Association was held in the State Capitol building at Topeka, Jan. 10 and 11. A bill was prepared which will be presented to the Legislature, asking for a law to appoint foul-brood inspectors for the different counties. The old officers were all unanimously elected as follows: President, Dr. G. Bohrer; vice-president, E. W. Dunham; secretary, O. A. Keene, of Topeka; and treasurer, J. J. Measer.

A Queen-Bee Free as a Premium.—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

## Contributed Special Articles

### No. 1.—Bee-Keeping in the Southwest.

BY PROF. LOUIS H. SCHOLL.

**B**EE-KEEPING in the Southwest differs very much, when taken as a whole, from Northern bee-keeping. Other methods and systems of management are employed. The methods of procedure in the beginning of the season are different from those practiced in the North, and so as to the outcome at the end of the season's work. All this is due to the difference in conditions, the change of climate, with entirely different seasons and another variety of honey-yielding flora. The seasons are not like those of the North; the winters are shorter and the summers longer, and there is quite a difference in the temperature.

#### THE LENGTH OF THE HONEY-SEASON.

The question has often been asked, as to how long the honey season lasts throughout the year in the Southwest; that is to say, from the time the bees begin to work on the earliest blooms until they stop working on the latest ones. To this my answer has often been, that it depends a good deal upon locality, but in my own locality at home (Brazos County), 13 months would be about right! This has, however, nearly stunned the questioner in every case; yet this is really true, for if we begin with the first appearance of the bloom of our mistletoe, which begins often about the first of December, lasting well into January, it is followed by many other flowers more or less all through the entire season. The last of these upon which the bees work, and which ends up the season, is cotton. This blooms from the latter part of June until frost, and often this does not come until in January. So I have seen bees work on cotton as late as that, and as they had begun in the months of December a year before, it can easily be figured out. In other words, the flow extended into three different years.

This, of course, does not occur every year, for sometimes the seasons are shorter, and the winters colder, yet the bees fly more or less the year around, and are only kept in the hives for several days at a time by cold weather.

Neither will anybody surmise that the above would mean the length of the honey-flow, or that there was a continuous honey-flow during this entire length of time. Not at all. While there is some honey coming in more or less all the time, yet the real honey-flows for the surplus are much shorter, and mostly far between.

#### THE TIME OF THE PRINCIPAL HONEY-FLOWS.

During early spring there are, in my immediate locality, a great many early bloomers that yield both honey and pollen in abundance for brood-rearing, and colonies build up strong and become very populous very early in the season, if the right kind of hives and management are used. There must be plenty of room, and in such shape as will be most essential for the colony. This is simply mentioned here because without it the colonies would not become most populous, no matter how good the early spring bloomers and the yield.

If rains have been plentiful the previous fall so that the mesquite tree, and all other trees and shrubs, have accumulated an abundance of sap upon which they thrive during the following season, then we may expect a heavy flow from the mesquite early in the season, in April. Unless a late frost injures the bloom, or a late spell of cold weather hinders the secretion of nectar, or keeps the bees in the hives, we may expect a good crop of surplus honey, especially if the weather and other conditions are favorable. The flow lasts from a week to ten days, and often from 25 to 100 pounds of surplus honey per colony is stored. This shows the importance of having the strong colonies referred to in a previous paragraph.

This refers more to central Texas. In southwest Texas this flow is preceded by a good and a heavy flow from cat-claw. Occasionally, however, this is cut short by late cold weather on account of its earliness.

Farther west, guajilla (pronounced "waheah") covers the country over thousands upon thousands of acres of pas-

ture-land, and it yields an early and abundant flow of nectar. This honey is of a water-white color, and the flavor is one of the mildest produced in the State. It has also achieved quite an extended reputation, and the supply is not equal to the demand, the most of the crop being already sold before produced.

In central Texas, again, the mesquite flow in April is followed closely by a flow from horsemint in May. This, when abundant, yields great crops of honey, as high as 700 pounds being once taken from one colony as the product from this source alone. On account of several dry years of late, and a scarcity of seed produced during that time, horsemint is not as plentiful as in former years when it grew so thick over all the prairies that it was often impossible to walk through it.

Where horsemint is not so plentiful, in many localities the prairie marigold (*Gaillardia pulchella*) follows the mesquite, and sometimes together with horsemint, both coming in May. This, however, is a darker, golden honey, while the others are all of light color. There is no trouble about selling it, however, especially in the extracted form.

In June the second flow from mesquite is of much importance, especially when the early April flow has been light, which is often caused by a previous dry fall. Then the June flow is the heaviest, while, sometimes, it is very light when the early bloom yielded well. Thus, it will be seen that there are two distinct blooming periods of the mesquite tree, two months apart. During the latter ripe beans will be seen together with the flowers on the same tree.

Soon after this cotton begins to bloom, from June 15 to July 1, and lasts until frost late in the season, sometimes yielding heavily and at other times only slowly, depending a great deal upon the weather and atmospheric conditions. From this plant the nectar is not only gotten from its flowers, but there are nectar-glands on the underside of the buds and on the ribs of the leaves which secrete pure nectar.

Sumac yields well in August and September, and extends pretty well over the entire State, hence it should not be omitted here.

In south-central Texas the main flow is from the rattan-vine, which is very abundant especially in lowlands and in the bottom-lands of the large rivers. In early spring this is preceded by many bloomers; along the rivers by willows mostly, and many vines, and by different kinds of oaks and other plants on the uplands, which mostly yield much pollen, and thus aid in building up the colonies.

The rattan blooms in April, and from this source a large amount of honey is procured. It is, however, of an inferior quality to that produced farther west from other sources. It is almost entirely put up in barrels and goes to Northern markets for manufacturing purposes in the large bakeries of biscuit companies.

The yield being so abundant, which makes the crops procured large, results in bee-keeping being carried on quite profitably by the bee-men in that part of the State, even if their product does not rank so well in grades.

In east Texas the flora is entirely different from that already mentioned, and adapted to the more western and those of the arid regions. Here are forests of pines, and many other trees, and among them in many places are linden, or basswoods, and holly, which yield much honey, and large crops are obtained by the few bee-keepers who are located in this range. This part of the State is not yet well settled, hence there are not many bee-keepers, but the number is increasing. The main flow from basswood begins about May 10, sometimes earlier or later.

Besides those mentioned here it will be remembered that there are many other honey-yielding plants that fill in between and help out admirably, sometimes yielding some surplus. Those mentioned are only the principal ones—those from which the great bulk of the crop is obtained.

This will give the reader some idea of the main honey-flows, and how they follow each other. They all come from a natural source except cotton, which is the only cultivated one. Later on, when irrigation is resorted to more, we will add alfalfa.

Brazos Co., Tex.

(To be continued.)

## Cellar-Feeding of Bees—Mailing Honey Samples.

BY C. P. DADANT.

MR. DADANT:—You advise me to feed candy if I have to feed in the cellar. Now, why not feed honey in the comb, if we have it?

Why not feed sugar syrup if we do not have honey? What do you think of sending samples of honey by mail to advertise honey for sale?—W. D. N.

**I** ADVISE the feeding of sugar candy in the cellar, for two reasons: The first reason is that it is much the easiest way of feeding. If you have the hives piled in the cellar you can still feed candy without disturbing the bees, if the hives are separated from one another only by a 2-inch block. Raise the oil-cloth and lay the cake of sugar candy over the cluster. This may be done without any stir. The bees will reach the candy from the underside, and will perhaps ultimately cover it entirely. It is the nicest way to feed in confinement.

The second reason is that candy excites the bees less than any other food. Candy has so little moisture—they are so slow in absorbing it—that it does not create any excitement. When you give them combs or liquid honey, or even granulated honey—which is really the next best feed to candy—you are likely to excite them more or less. If you want to give them combs, you must either put them in the hive or lay them over the top, and this is more difficult than giving a small cake of candy, which, if rightly made, will last them longer than honey, and will keep them in better shape. Besides, the cake of candy is in more compact shape than combs more or less filled with honey.

And as to syrup or liquid honey, besides the difficulty of giving these to colonies that are piled up on top of each other, there will be more excitement in the hive when the food is reached by the bees. It is very important to avoid causing any unnecessary stir, in the cellar especially, during the winter cold weather, and from past experience it is not to be doubted that sugar candy of good quality is by far the best food.

Yet, if sealed combs of good clover honey are in reach, and can be laid on the top of the combs above the brood without disturbing the bees, this would be a very good method of feeding; but if there is any probability that these combs will be needed during spring to help the bees in brood-rearing, I would by all means retain them and put them away, using the candy until the bees are out of the cellar.

In addition to the gain of leaving the bees undisturbed, it is also more convenient to make sure of the amount of food consumed when sugar candy is used, for the size of the lump can be noticed at any time at the top of the combs, while, if the comb of honey has been emptied by the bees, it will be difficult to make sure of it; and removing it to give another will be sure to disturb the bees greatly.

#### SENDING OUT SAMPLES OF HONEY.

Now about sending out samples of honey. I believe this would prove more of an expense than the returns would justify. It is well enough to send samples of honey to prospective buyers, but to send the samples broadcast would, I believe, cost more than the circumstances would permit. Yet there may be a way to send samples that would prove inexpensive. Our method has always been to melt the honey and put it up in a small vial about  $\frac{3}{4}$  of an inch in diameter, and with an opening the full size of the vial, for more easy filling. We then put the vial in a block of pine in which an auger-hole has been bored of about the size of the bottle. This is also corked, and then wrapped in paper before mailing. In this way we have never had any trouble.

Granulated honey may perhaps be put up in a cheaper way, but unless it is put up in a water or honey tight package, it is likely to soil the mail-matter should it be exposed to heat. Sometimes the mail-sacks are laid in close proximity to a stove, and very thick granulated honey might in an occurrence of this kind change to the liquid form and leak out, unless put up properly. On the other hand, so many people have no knowledge of granulated honey that it would hardly be the right thing to send samples of granulated honey without a lengthy explanation, which would perhaps not be sufficient. We have always found it necessary to explain the condition of granulated honey in person until the customer is familiar with it.

Hancock Co., Ill.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

## Convention Proceedings

### Report of the Washington State Convention.

On Wednesday morning at 10 o'clock Pres. Jesse W. Thornton called the Washington State Bee-Keepers' Association to order at the City Hall in North Yakima, Wash.

Mrs. Legh R. Freeman was made secretary *pro tem.*, and read the minutes of the previous meeting.

Mrs. Susan Thornton, the treasurer, was at her desk and received the annual dues from a number of old and new members.

Article II of the Constitution was so amended as to read: "The object of this Association shall be the promotion of scientific bee-culture by forming a strong union among bee-keepers, the purchase of supplies, the marketing of honey, the necessary legislation, and the protection of the industry".

J. P. Berg, chairman of the committee on the purchase of supplies in carloads, reported that they were still investigating and getting bids from the different manufacturers. He requested that all persons that are members, or who desire to become members, report to him at once at North Yakima, the quantities of supplies that they need.

Interesting discussions were participated in by Bert Stewart, Robert Cissna, H. H. Cole, Isaac Hayes, J. P. Berg, W. P. Clark, P. A. Gildea, Legh R. Freeman, the president, secretary and treasurer, at the end of which the president appointed Legh R. Freeman, Isaac Hayes and Bert Stewart to secure space at the Lewis and Clark Exposition, and to interest the bee-keepers' associations of the States of Oregon, Idaho, and California to co-operate with the Washington Association in making a grand display of honey, bees and the by-products, and preparing literature and circulating it; and seeing to it that a booth is arranged at which the public shall be feasted on honey, hot waffles, etc.

The president also appointed Mrs. Susan Thornton, P. A. Gildea, H. H. Cole, Anson White, Robert Cissna and W. P. Clark a recruiting committee for the purpose of securing as many new members as possible throughout the State. The committee will solicit membership among business men who may be disposed to contribute one dollar for the purpose of aiding in making a display at Portland.

After a recess for lunch the secretary read letters from the various firms quoting prices for supplies, and the committee was instructed to proceed with its work.

Isaac Hayes and Legh R. Freeman were directed to prepare a paper to be read at the annual meeting of the Yakima County Horticultural Association in February, showing the advantages of bees in the orchard, and the proper time to cut alfalfa with reference to securing the nectar in the blossoms, and also the feed-value of alfalfa if allowed to bloom.

The president was instructed to assign various members subjects which they are to reduce to manuscript and read at the February meeting; and he is to arrange for toasts and responses at the banquet which will follow the three days' session. At this banquet honey is to be served in many ways that will tempt the appetite.

MRS. LEGH R. FREEMAN, *Acting Sec.*

### Co-operation at the Minnesota Convention.

The Minnesota Bee-Keepers' Association held its annual convention at the First Unitarian Church in Minneapolis, Dec. 7 and 8, 1904.

After an invocation by Rev. J. H. Kimball, George W. York, Ernest R. Root, Fred and Bessie Dittmer, and a representative from the G. B. Lewis Co., were introduced.

The minutes of the 1903 meeting were read and approved.

As considerable interest of the meeting centered in a Committee on Co-operation, appointed in 1903, and an amendment to the Constitution proposed by this committee, a brief report of the proceedings is here given, so far as they related to the subject of co-operation.

That part of the minutes of the 1903 meeting, referring to the appointment of the committee, read as follows:

"The appointment of a committee on co-operation was objected to, and the president named a committee with the understanding that it is a separate organization, and not a part of the Minnesota Bee-Keepers' Association."

The avowed objects of this committee were to investigate the subject of honey-prices, with a view to their betterment by means of co-operation, and to obtain, if possible, a reduced scale of prices on apiarian requisites.

At the proper time the chairman of the Co-operation Committee made his report, but the president ruled that, on the showing of the minutes read and approved, the committee had no standing, and their report could not be heard. On this rule being objected to, it was sustained by a vote of the convention.

Shortly after their appointment it seemed that the Co-operation Committee was being opposed, and in order to ascertain its status, the chairman wrote to the secretary of the Association, asking for a copy of the minutes of the 1903 meeting referring to the appointment of his committee. The secretary wrote as follows: "The only reference in the minutes of the annual meeting to the Committee on Co-operation appears to be the following: 'A committee on organization was appointed as follows'. Then follow the names and addresses."

As there was thus a considerable difference between the actual minutes and those read at the present meeting, W. R. Ansell moved an amendment of the minutes to make them agree with the notes taken at the 1903 meeting. By arrangement, consideration of this motion was deferred till a later stage in the proceedings.

Meantime, an amendment of Article II of the Constitution, notice of which had been mailed to all members, was proposed by Mr. Ansell, and seconded by F. A. Gray. Article II says: "The object of this Association shall be the promotion of scientific bee-culture by forming a strong band of union amongst bee-keepers".

As proposed, the article would read: "The object of this Association shall be the promotion of scientific bee-culture, and of the general interests of bee-keepers, by forming", etc.

Mr. Ansell said: "This amendment would seem necessary from the action of the Executive Committee in deciding that co-operation is inconsistent with the objects of the Association, which, according to Article II, are of a purely scientific nature. It even seems necessary in order to legalize our present program, where such papers as 'Poultry as an Adjunct to Bee-Keeping', 'Insuring Bees', 'Selling Honey Through Grocers', 'Honey Exhibit at the State Fair', etc., find place. The Committee on Co-operation has gone to considerable pains and expense, and has succeeded in making arrangements with a certain manufacturer of supplies for prices ranging from 25 to 30 percent less than the retail prices of some others. And now we are told that the Association can have nothing to do with co-operation, because co-operation is not 'scientific bee-culture'. I hold that an association of this sort, whatever it is nominally, is not in practice a purely scientific society, and that it should be able to initiate any sort of work which is in the general interests of its members. In other words, it is to legalize its past and present action that this amendment is sought, and not to revolutionize its character."

Messrs. F. A. Gray, S. Lindersmith, Wm. McEwen, H. V. Poore, and Mrs. J. B. Thompson, and others, spoke in favor of the amendment. Dr. Jaques, Wm. Russell, Rev. J. H. Kimball, and others, spoke in opposition.

After Scott Lamont had pointed out that the amendment, if carried, would entail an expense of \$25, both motions for the amendments, respectively of the minutes and of the Constitution, on being put to the meeting, were lost.

A MEMBER.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Cords of Helpfulness—Influence of Locality.

DEAR MISS WILSON:—Please accept my personal thanks for your most welcome and appreciated card of New Year's greeting to our bee-keeping sisters. The cordial, appreciative, encouraging words of good cheer struck a responsive chord in our hearts. I'm sure all who read your words felt in very truth that it would be a treat indeed to meet face to face with our chieftainess, and clasp hands and have a good old-fashioned chat with these ladies, who, during the past year, have helped to make our corner of the American Bee Journal so very interesting and helpful.

This is a great age in which we are living. I suppose there has never been a time when the individual, as an individual, was of so much account, or received so many helps to make life seem worth living. It is an age when the brotherhood of man is accepted as a fact, and acted upon in its deepest, most affectionate, and sympathetic sense as never before. Many cords are stretched out to draw us—even the most isolated—into a close, familiar touch with each other, and the great work of regeneration steadily goes on about us.

One of these cords is this department of ours, in which we catch glimpses of each other's lives and interests and experiences, as we would in no other way. We, who are in the heat of the battle, know so well what our sisters' victories mean, and at what a price they are bought. And as we read, words of praise and encouragement spring unbidden to our lips, and if they sometimes fail in expression at the pen-point, it is only because life is too strenuous and its duties too arduous to allow the time. I have thought, after reading suggestive points in some of our sisters' letters, that it would be a good plan to write on a convenient pad the comment or question it gives rise to, and when a leisure hour comes to "talk it out". It seems as though this would be a good scheme, one which most of us may adopt, and one that would be helpful and encouraging to you.

Another cord is the photographs of those whose writings and advice have helped us over many hard spots. It is very pleasant to know how they look. It brings them very near, and our personal interest and liking receives a decided impetus. Though we know that, like our genial Dr. Miller, they are "younger and better looking" than the cuts show, we view their pictured faces with complacency, and feel proud of so nice-looking, intelligent, and refined a body of representative apiarists.

I have felt that in caring for our bees we do not sufficiently take into consideration the locality. We frequently read of work being done in yards which would not be practicable in our own. There is a great variety of climate in American apiaries, and it seems as if we do not always get as much benefit from advice, instruction, and our bees as we would could our atmospheric and climatic scale be our guide. It is quite a help to know where our writers live, and what kind of weather they have to adapt their apiaries to. In one respect I find myself out of harmony with many of our bee-yards. It is in regard to our fall work. Practically we have thus far in our work been unable to do any of the manipulating for winter that others find so important.

Our yard is situated near the north end of Lake Champlain, about 8 miles from the Canada line. Our supers are on for the buckwheat bloom until the frost kills it and most other bloom, and from then until snow flies there is an almost unbroken sequence of leaden skies above us, and high, cold winds over us, which sweep down from the Adirondacks or over the lake from the mountains of Vermont. The temperature is very changeable, a drop of 40 degrees in an hour being quite a common occurrence. As a rule, we have to hustle off our supers with chilly fingers, the honey out of the combs before it congeals, and make the hives warm and tight in a hurry.

There is scarcely a single day after that till the following spring when it is safe to open the hives and make any examination as to the condition of the interior. If it is attempted more harm than good follows, as great risks are

run in starting the bees to robbing and in chilling the brood. Therefore, I do all the manipulating for the year before the supers go on, and use only the honey from the supers, never taking it from the hives. Usually only one or two colonies die in the cellar, though I sometimes lose quite a number from spring dwindling. I even up the food in the spring, and do not find that any honey is wasted. The period from fall to spring bloom is a long one, and the weather much of the time, even then, is unfavorable for flights.

I had a rather strange experience in our apiary the past fall that I will try to describe, and get your advice about, when I write again. I wish you individually, and our sisters collectively, a Happy New Year, and many of them.

Clinton Co., N. Y., Jan. 5. FRANCES E. WHEELER.

Thank you very much for your encouraging words. I assure you they are most thoroughly appreciated.

Your suggestion about the use of a pad is an excellent one, and I sincerely hope that many of the sisters will put it in practice. While reading jot down a memorandum of this or that, and then, when you have the leisure, write out the thoughts and send them in for our department.

It is true localities differ, but I never knew before that there are localities where there are no warm days after buckwheat frost.

### A Champion for "Our Sister Bee-Keepers".

My sister Mary's bees is asleep in the cellar. They don't try to sting, nor even buz. She gives us honey on our bred insted of that rancid packt buter. My, but it's sweet! I like it. Mary used to say we needed a "Woman's Bee Magazine", until one column of "Old Reliable" donned the femal atire. Now she wishes so many more women with ether scientific or practical education would write for Mis Wilson that you'd hav to enlarge her space. Pa's ben readin' it, too. He says in thes days when so meny men refus to suport a family, lots are mean enuf to find fault if a woman takes the job; and meny wimen are ferful of havng bond-chains riveted on them by matrimony, so worthy wimen are compelled or choose to ern their own living, and it is plesing to see some one come to the front and advocate woman's rites in apiculturn with so much practical ability as Mis Wilson is doing it.

I've ben reading all the papers, too, and I think pa's rite. She keeps her field clear of pretentius "weeds". Not only us little boys does she lug out, but if a big "Hasty" man, not easy caut, gets in she gets after him with her pointed cane, and big bitin' and "Eaton" dog, with his doggies and "Doggetts", and chases him back into his own big field. Ha a-a! as he gits over the fence with his ears hangin' he glances back and thinks aloud, "I'm lickt".

Womantown, Dec., 1904.

JOLY JO.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### NEW "HEADS" MAKE HIS HEAD SWIM.

My "head" swims, Miss Ayebejay. Hardly got reconciled to the one you gave me last before you whisked away my honey-knife and dealt me a new caput. Hence, this inclination to "put a head" on somebody. Momentarily expecting to open the Journal and find myself reading up and down like a Japanese conundrum.

### SELECTING LARVAE FOR QUEEN-REARING.

Only about 15 of the experts seem to be competent on Ques. 19. It is quite important to know whether there is serious danger of too old a larva being chosen queen by a colony suddenly made queenless; yet few of the respondents cover exactly that point. At least 9 of the 15 allude to the great variability of the age chosen. Only about 5 out of the 15 express confidence that newly-hatched larvae will be chosen usually. More would have done so had they covered that point perhaps. The true inwardness of this difficult

question depends upon another question still more difficult. For the first 48 hours of life is the food identical for young worker and young queen? I suppose a good many would answer: Practically, yes—and therefore it makes no particular difference whether the young queen is "elected" at hatching or at 48 hours old. I take it that another good many (and with some hesitation I will cast my lot among them) entertain doubts about that. Still possible that the young worker 3 hours old, and the young queen 3 hours old, may not be fed *exactly* the same food. Page 837.

### BEE-CRANKOSITY.

(Abstract noun.) A disease. Sometimes becomes chronic; and has been known to persist 30 years. Page 838.

### THE EYES OF BEES AND HOW THEY WORK.

Prof. Cook does quite as well for us in giving us the generalities about bees' eyes as he would have done in going into minute matters. As he hints, two kinds of eyes so diverse suggest difference of function. But it seems no one stands ready to prove that yet. And as to *what* the difference of function is, if any, few even propound a working theory that sounds plausible. That animal eyes are round, and insect eyes much elongated I should guess is merely the natural result of the inevitable smallness of the latter. The laws of optics demand a space between lens and focus that easily can be had in a large eye of any shape, but in a minute eye only by elongation. Interesting to find that general structure, even to the humors, is similar to animal eyes. I had somehow got the idea that the sections of a compound eye were empty like telescope tubes. And so the *retina* shows more decided differences than the other parts do. Prof. Cook alludes to the apparent fact that bee-vision is not keen. I have often thought of this. The fact that hungry bees will never rush to food on the *sight of it*, as pigs or chickens do, seems to be proof positive on that point. On the other hand, a bee on the war-path sees well enough (and quickly) to discriminate between clothed surfaces and bare skin, and to select eye-lids, and lips, and ear as favorite places to sting. Or will much of this turn out to be super-sensitive smell? Sight hardly suffices to select the thin places of a glove in preference to the thick places, and bees will do that nicely. It seems the observers have it *almost* proved that each section of a compound eye has *fractional* vision instead of operating as an independent eye. Each facet takes a part of the object, and the optic never puts the parts together. Curious. I'll guess that the overlapping of images doesn't do much harm, and that the fractions are not put together quite as sharply as the sections of a patchwork quilt. Page 838.

### SHOOTING SWARMS OFF TREES.

My inner consciousness tells me, Mr. Stolley, that no man alive can *always* tell the spot where a shot-off branch will fall. Swings hither and yon before it starts; and the amount and direction of the swinging depends upon too many things—the completeness of the severance for one. Have the hive all ready and near by. Bring 'em down first; and then set the hive just at the most promising spot. Of course, Mr. S. is thinking of blowing completely away an inch or so of the branch. Perhaps he can do it—sometimes. The tall trees that most bother me are basswoods; and sometimes the bees break the limbs off themselves and fall. Alas, it's the exceptional and not the usual luck for a cluster to form where it has clear way to drop to the ground without lodging into something! Page 838.

### SAWING OFF SWARMS—A CORRECTION.

My attack on the habit of sawing off swarms has a bad "out" either in my copying or in the printer's work. Not true that so many as several hundred in each thousand cause damage to the neighbors. What I was trying to say was that several hundred cause damage to the trees; and that several *dozens* cause damage to neighbors' trees. Page 7.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Bee-House Bees Exercising in Winter.

Is it best to open the doors of the bee-house on fine days for the bees to exercise? It is perfectly dark when the door is closed.

MICHIGAN.

ANSWER.—If the construction is such that the bees will easily find their way back to their hives, they may be allowed to fly; otherwise not.

### When to Clip Queens' Wings.

When is the proper time to clip queens' wings? VERMONT.

ANSWER.—Your desire for a speedy answer suggests that you may be thinking of clipping in winter. Don't do it. Neither should you do it on the day bees take their first flight in the spring. But any time after that before swarming-time, on a day when bees are flying and gathering from flowers.

### Moving Bees a Short Distance.

I have 6 colonies of bees, and want to move them this winter about 300 yards, over in a young orchard. Can they be moved without the bees leaving the hives next spring when they begin to fly? Will they go back to the old place where they were last year, or will they take to their new places where I intend to put them this winter? I would not want to lose the bees by moving them. OREGON.

ANSWER.—Move them at a time when they have had no flight for a long time and there will be no trouble, especially if the old spot is changed as much as possible in appearance.

### A Method of Preventing Increase.

I have kept bees on the farm for 14 years. I aim to keep down swarming as far as possible, by hiving the prime swarms on old stands. I have 50 colonies now, and don't want any more increase. What will probably be the result if I hive prime swarms on the old stand, and break up the old colonies, and about eight days later unite it with the prime swarm? Or can you suggest a better plan? SUBSCRIBER.

ANSWER.—Your plan may work all right if you don't mind the loss of brood. Here's a plan that would not result in loss of brood, if you don't mind the trouble: When a prime swarm issues kill or remove the queen, returning the swarm, and a week later destroy all queen-cells but one. Better still, put your ear against the hive each evening, beginning a week after swarming, and when you hear piping destroy all cells the next morning.

### Hives, Sections, Supers, Etc.

I would like to have a catalog of bee-supplies describing the hives, sections and frames that you use, and where they can be had, with prices. Which is the best arrangement for honey with the least trouble and manipulation, to keep bees with outdoor wintering, where the temperature goes as low as 30 degrees below zero? I have been thinking of making box-hives of 2-inch lumber, 2½ feet deep, 12 or 14 inches inside measurement; fit them up with frames, with supers to suit, and interchangeable with 2-pound sections. WEST VIRGINIA.

ANSWER.—Taking the last part of your letter first, I should advise against you making more than one or two hives, such as you describe, till you're sure you'll like them. I doubt whether you will. Two-inch lumber will be expensive and unwieldy without corresponding advantage. Very likely you think the heavier lumber will be warmer for winter; but you can have the extra warmth more easily with some kind of outside packing, if it's nothing more than corn-stalks piled around, and you will find the thinner walls better for summer. If the cold is so continuous that there is seldom any chance for the bees to fly in winter, it would be worth your while to try at least a colony or two in the cellar. You see it isn't so much the severity of the cold as its continuousness that is to be considered. If the temperature goes down to 30° below zero every two weeks, and if the bees have a chance to fly every two or three weeks, they'll winter outdoors all right. If it never goes below zero, but keeps somewhere in that neighborhood without a chance to fly for five months, then they are better in the cellar.

I'm sorry to say that I don't know of a catalog that has every-

thing in it just as I use it, but any catalog will contain what I use with just two changes that you can have made to order. I dislike having anything but regular goods, but when I think any one thing out of the regular order is decidedly better for me than regular goods, I feel obliged to make the change. One of the things is a plain cleat on each end of the hive 1½ x ½, and as long as the full width of the hive. It is away ahead of short cleats or hand-holes for handling the hive, and it strengthens the weakest place in the hive—the thin part left by the rabbet. The other is the Miller frame, which you can have made to order. You'll get nearly the same thing if you order the regular staple-spaced frames. I feel very confident you'll like the full cleats, but you may not like the Miller frame as well as I. It makes as little trouble with bee-glue as any self-spacing frame I know of.

As before said, by ordering specially these two changes you can get from any catalog the things I use, which are: The 8-frame dove-tailed hive (unless you pay very close attention to your bees the 10-frame may be better for you, especially if you winter them outdoors), the T super, the common 4½ x 1½ section, with plain wooden separators. Yes, there is one other thing, too, that is different from the catalogs, but it is not so important in my estimation as the other things, and that's the bottom-board. It is just the plainest kind of an affair, a box open at the front end and two inches deep. You will find them in the catalogs as much as ¾-inch deep, but for winter two full inches is none too deep. In summer the extra depth may be filled up with a piece of board, or in any other way.

It just occurs to me that if you get a regular 10-frame hive it will be without a dummy. I don't believe I could stand that; for the dummy is of the greatest importance in getting out the first frame; so in that case I should probably use 9 frames and a dummy thick enough, or, still better, two thin ones.

I thank you for your kind words.

### "Shook" Swarms and Out-Apiaries.

1. I want to start an out-Apiary of about 12 colonies next spring for the production of comb honey. I would like to practice the shook-swarm method. What would be best to shake the bees on, empty combs, starters, or full sheets of foundation?

2. When would it be advisable to practice the shook-swarm method, when they have the frames mostly full of brood, or would they have to have queen-cells started, as I can not visit the out-Apiary but once in a week?

3. Would I have to put a frame of brood in the empty hive with the shook swarm?

4. I practiced the shook-swarm method a little last summer, but some of them would swarm out again the next day. What was the cause of that?

5. Now, if I want to produce extracted honey would it be necessary to have a queen-excluder above the first story, or let the queen have full access to the hive? WISCONSIN.

ANSWERS.—1. Empty combs are probably best, and full sheets of foundation next.

2. Wait till queen-cells are started, at least the earlier ones. As the season advances you can shake without waiting for queen-cells, provided you are sure you want them all shaken.

3. Not sure. Perhaps it would be well to give one frame of brood to be taken away at next visit.

4. I don't know. Possibly it was hot in the empty hive, and they swarmed out just as a natural swarm often does under the same circumstances. A frame of brood may hold them.

5. You can do either, depending upon circumstances. If all stories have combs just alike, use an excluder; if combs in the upper story are widely spaced and well built out, an excluder may not be necessary. It is said the queen will not trouble so much if extracting frames are shallow.

### What is Honey?—Honey Inspectors.

Dr. Miller, you, like Solomon of old, are called on to solve all hard and knotty questions. In these days of adulteration and pure-food laws, a farmer with an apiary is likely to be "jerked" for selling his own production. His milk, cider-vinegar, and buckwheat flour must be inspected. And now the big honey-producers are forcing a honey-inspector, and I would like to know what honey is, and all that is honey.

Long ago, before sweets were manufactured, honey was given to man; all the liquid, viscid sweets that the bees gathered and stored in waxen cells and capped over was honey, pure and unadulterated honey, and was good food for man. We know there are as many kinds of honey as there are sources from which it is gathered.

Please explain honey so that we need not fear to feed our bees and get "jerked" for it. ILLINOIS.

ANSWER.—My good friend, if Solomon didn't know any more about things in general than I do about bees, he was something of a slouch in wisdom, after all. Certainly, I don't feel competent to the task of saying in a few words just what honey is. It will hardly do to say it's any liquid substance that bees store in cells, for it ought not to include sugar syrup. No more will it do to say that nothing is honey except that made from nectar gathered from the flowers by the bees, for with that restricted definition I wouldn't dare to guarantee as pure a single pound of any honey I might produce. Some kind of a definition should be framed that would include anything sweet stored by the bees without being fed by man, possibly; and possibly that isn't right. Sealed proposals for a satisfactory definition may be sent postpaid to this office!

## Reports and Experiences

### Bees Wintering Well,

We have now 10 colonies in S-frame, dove-tailed hives. To-day being a fine day we looked through them and found them all in fine condition, strong in bees, and with the exception of two all had plenty of stores. Until Christmas we had fine weather, but now have had a few cold days but no snow yet and bees can fly almost daily. C. H. KOENTZ.  
Cleburne Co., Ala., Jan. 21.

### Weight of Sections—Farmer Bee-Keepers.

One Sunday morning I had a caller to whom I gave a section of honey. He ate it all and went to church. A young man asked a grocer if he would give him as much honey for 25 cents as he could eat. The grocer agreed, and this man ate 2 sections, and said he could eat one more, but he didn't want to be "hoggish".

I sold 2 shipping-cases of honey to a large family in our village. One weighed 23 and the other 24 pounds. One of the boys said to me: "My brother—8 years old—can eat 2 sections at a time."

Last fall I sold extracted honey to a country woman. She saw comb honey on the table and said: "We can't afford to buy comb honey, for one section would not be enough. We are 5 at our table."

I write this because in the Colorado convention report appeared something to this effect: that 12 ounces would be enough in a section; people want honey on the table but once. Are the millionaires the greatest honey-consumers?

Years ago I wrote to the American Bee Journal that selling honey by the piece for a

## DRUM CORPS & BANDS

Get our Catalogue of Drums and Band Instruments before you buy. It illustrates an elegant line of Drums,—drums for the little boy, the big boy and the Drum Corps,—every drum a "rattling" bargain. Fifes and Bugles to match the drums. A fine line of Band Instruments and "Everything Musical"—right from headquarters. Music for every sort of band and every occasion—we have it all—sheet music, band books, orchestra music, and instruction books for all instruments.—A request brings a big lot of samples, and our catalogues put you in touch with bargains you cannot duplicate elsewhere. Power Building,

MINNEAPOLIS, MINN.

Please Mention the Bee Journal when writing Advertisers\*\*\*

pound, even if it does not weigh it, is not right, and I will always say so. I think it does injustice to all bee-keepers.

I sold 23 pounds of extracted honey to a family formerly living at Milwaukee. They had to pay 14 cents per pound there. I think some dealers take too large a profit.

I read Mr. Bartz' article on honest weight with great interest, but when I read Mr. Haasty's "Afterthought"—about Mr. Bartz with his 17 ounces—it made me so angry I thought I would never read Haasty's "Afterthought" again.

A question arose in the Wisconsin State Association, "Shall we encourage farmers to keep bees?" It was answered, "No, they spoil the honey market", and every bee-keeper ought to keep less bees so as to increase the price of honey. When one kind of grain or one kind of cattle, etc., becomes too cheap, the farmers sow or raise less of that kind.

I always got 10 cents per pound for my extracted honey, but for the last year-and-a-half I sell it at 8 cents because a farmer sold his extracted for that price. I sold 1,000 pounds or more last year and most of this to farmers, but if all farmers kept bees, should we sell this honey to dealers for 6 cents per pound?

I got about 85 pounds of comb honey per colony, spring count, last season. I have all my bees in 10-frame hives.

WM. DUESCHER.

Brown Co., Wis., Jan. 11.

**Winter Confinement of Bees.**

I have 33 colonies of bees, and have worked to prevent swarming, succeeding pretty well. I work for both comb and extracted honey.

I have wintered bees in the cellar for the past 25 years, and they always come through good and strong. I do not believe taking them out early does them any good, and I

**THE BEST THERE IS.**

Bee-keepers, like all other fair-dealing people, want the BEST of goods, the BEST of service in filling their orders, the BEST of prices and the BEST of everything connected with getting their Supplies; the VERY BEST that can possibly be given for the money is necessary to give entire satisfaction and what all should have.

To absolutely please bee-keepers in filling their wants has been our constant aim for eight years, and while we do not boast about ourselves we are sure that we are excelled by nobody. If you are not already a customer don't fail to write to us and tell us your wants.

**C. M. SCOTT & CO.**

1004 E. Wash. Street, INDIANAPOLIS, IND.

have left them in sometimes over 5 months. It is not the length of confinement that injures the bees so much as a poor quality of honey for winter stores.

I took the American Bee Journal long before Mr. York became the publisher of it, and I think I must be the oldest bee-keeper in this State. I have kept bees for 36 years, and in that time lost all but one colony. In the course of 10 years I again lost all but one. I built up each time from the single colony. If I live till spring I will be 79 years old.

Linn Co., Iowa, Jan. 9. D. C. WILSON.

**Rains in California.**

We have just had more rain in the nick of time. If there comes as much in February and more in the last of March there will be a crop, either large or small, according to the amount of rain in March. In this locality about one-half, or more than that, of the colonies, are dead. But there are enough left.

C. W. DAYTON.

Los Angeles, Co., Calif., Jan. 17.

**"The Survival of the Fittest."**

April 1, 1903, I had on hand 84 colonies, and produced 4000 pounds of comb honey and increased to 148 colonies. I left these unpacked on the summer stands all winter, knowing that they would survive a common winter with very little loss. But, alas! the uncommon winter caught them and they starved and froze to death with from 10 to 30 pounds of honey in their hives.

May 10, 1904, I took inventory of stock and found I had only 7 queens and about 3 quarts of bees left. This now constituted my entire

stock of bees and queens, occupying 7 hives. I could not buy any to make up for the loss, but nursed these remaining stalwarts tenderly. They responded to my care most nobly. For, by Sept. 15, 1904, I had extracted 1400 pounds of honey and increased to 20 strong colonies of bees. This is a clear case of the survival of the fittest, in my estimation, and I will be greatly surprised if I have not a sturdy, hardy and profitable lot of bees, being the progeny of the survivors of the severe winter of 1903 and 1904.

J. T. HAMMERSMARK,  
Tuscola Co., Mich.

### Is Pickled Brood Contagious?

All of my bees in an apiary of 51 colonies had pickled brood except one colony of Italians. I fed honey to all the diseased colonies. I let a neighbor have some combs from one of these diseased colonies, and the colony

**Honey and  
Beeswax**

CHICAGO, Jan. 24.—The trade in honey is not  
large and the offerings on the contrary are  
quite liberal. This makes an easy market for  
the buyer. Fancy white comb, 12 $\frac{1}{2}$ @13c; No. 1,  
12@12 $\frac{1}{2}$ c; off grades, 10@11c. Extracted, white,  
6@7c, according to flavor, quality and package;  
anything off about one cent lower; amber  
grades, 5 $\frac{1}{2}$ @6 $\frac{1}{2}$ c. Beeswax, 29@30c.  
R. A. BURNETT & Co.

BOSTON, Jan. 9.—The market is without  
change since last writing. The demand con-  
tinues light, and supply is more than ample.  
We quote: Fancy white, 16c; A No. 1, 15c; No. 1,  
14c, with practically no demand for No. 2. Ex-  
tracted, from 6@8c, according to quality.  
BLAKE, SCOTT & LEE.

KANSAS CITY, Jan. 9.—The demand for comb  
honey still continues light, as most of the re-  
tail dealers were stocked up on \$2.25 honey be-  
fore the holidays, two cars of which were sold  
here at that time. We look for a better market  
in the near future, and quote: Fancy comb,  
24-section cases, \$2.50; No. 1, \$2.25. Extracted,  
white, per pound, 6@6 $\frac{1}{2}$ c; amber, 5 $\frac{1}{2}$ @6c. Bee-  
wax, No. 1, 28@30c. C. C. CLEMONS & Co.

CINCINNATI, O., Dec. 19.—Comb honey is now  
coming in more freely, and prices if anything  
have moderated a little. The sales made and  
prices obtained were for No. 1 fancy water-  
white comb, 12@13 $\frac{1}{2}$ c; single cases, 14c. Ex-  
tracted is sold as follows: White clover, in  
barrels, 6 $\frac{1}{2}$ c; in cans, 7 $\frac{1}{2}$ @8c; amber, in bar-  
rels, 5 $\frac{1}{2}$ @5 $\frac{1}{2}$ c; in cans, 6@6 $\frac{1}{2}$ c. Beeswax, 27c.  
C. H. W. WEBER

PHILADELPHIA, Jan. 9.—The market is un-  
changed from our last quotations, and trading  
light. We quote: Fancy white, 15@16c; No. 1,  
13@14c; amber, 11@12c. Extracted, white, 7@8c;  
amber, 6@7c. Beeswax, 26c.  
We are producers of honey and do not handle  
on commission. W. M. A. SELSER.

CINCINNATI, Dec. 30.—Since our last report  
was published, the price of extracted honey has  
advanced, no doubt acting in sympathy with  
the sugar market. We quote amber extracted  
in barrels at 6@6 $\frac{1}{2}$ c; white clover, in barrels  
and cans, 6 $\frac{1}{2}$ @8 $\frac{1}{2}$ c. Fancy comb honey, 13@14c.  
Beeswax, 28c. THE FRED W. MUTH Co.

ALBANY, N. Y., Dec. 26.—Comb honey is mov-  
ing off very well considering the heavy re-  
ceipts and cold weather. Prices not as high  
as early fall, as usual, but very good yet.  
Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c.  
Buckwheat, 11@12c; mixed, 10@11c. Extracted,  
dark, 6@6 $\frac{1}{2}$ c; light, 6 $\frac{1}{2}$ @7c. Beeswax, 28@30c.  
H. R. WRIGHT.

SAN FRANCISCO, Jan. 4.—White comb, 1-jb.  
sections, 11 $\frac{1}{2}$ @12 $\frac{1}{2}$ c; amber, 9@11c. Extracted  
white, 6@6 $\frac{1}{2}$  cents; light amber, 4 $\frac{1}{2}$ @5 $\frac{1}{2}$ c; am-  
ber, 3 $\frac{1}{2}$ @4 $\frac{1}{2}$ c; dark amber, 3@3 $\frac{1}{2}$ c. Beeswax,  
good to choice, light, 29@30c; dark, 27@28c.  
Market is quiet and not noteworthy for  
strength. Although stocks here and through-  
out the interior are light, there is little inquiry,  
either for shipment or on local account. There  
is strong probability, however, that the spring  
trade will absorb the light stocks remaining.

NEW YORK, Jan. 9.—The market on comb  
honey is decidedly dull, and while there is no  
stock of dark and buckwheat to amount to  
much, all grades of white honey are plentiful,  
and for the present we cannot encourage ship-  
ments. We quote fancy white at 14c; No. 1 at  
13c; No. 2 at 11@12c; buckwheat at 10c. Ex-  
tracted honey is in fair demand, with abundant  
supplies and a weakening tendency is notice-  
able in the market. We quote white at 6@6 $\frac{1}{2}$ c;  
light amber at 5 $\frac{1}{2}$ @6c; dark, 5@5 $\frac{1}{2}$ c per pound;  
Southern at 52@55c per gallon. Beeswax, 29c.

# The ABC of Bee Culture.

Probably no other bee-book in any language has had the immense sale the ABC of Bee Culture has enjoyed. The last edition, bringing its sales up to 100,000, is just from the press; and so rapid are the sales that frequently editions have been exhausted before the new ones could be taken from the press. Of the last 3 or 4 editions, so great has been the demand that anywhere from 1500 to 2000 copies have been ordered before these editions were even off the press. The secret of its large sales may be in part explained by the testimonial below.

It contains over 500 double-column octavo pages, bound in cloth, half morocco, or full leather, to suit the taste of the purchaser. It is not an ABC in the sense that it is written for beginners only, but an exhaustive cyclopedia for the veteran as well, covering every subject relating to the practical management of bees. Its rapid sales have made it necessary to revise it at least once in two years, and sometimes oftener. Neither time nor money is spared to bring it clear up to date in every department of our rapidly advancing pursuit; and so extensive have been the changes that many of our customers get a new copy as fast as each new edition is issued.

The whole work was originally set up in standing type, so that it is very easy to add new matter or change old, blending the whole into one complete treatise. The latest edition, that for 1905, was revised and rewritten after the reviser had traveled some 10,000 miles among bee-keepers in various parts of the United States to study the methods and practices in vogue among the most successful honey-producers. Photos were taken by him and the major part of all the material gathered has been incorporated in this volume. The articles are prepared in such a way that they fit every locality in the United States. The subject of Swarming, for instance, has been modified to fit the peculiar conditions as they exist in Texas, California, and the far West, as well as in the Eastern and Central States of the North. The chapter on Wintering now applies to every locality in the country. Then there is a special article on "Location", and its bearing upon methods and practices in different parts of the United States. Besides the methods of management of the bees themselves, the general subject of preparing the crop for market and selling the same is exhaustively considered in its various phases.

Some of the new subjects that have been incorporated in the new edition are the following: Beginning with Bees; Bees as a Nuisance; Bees, Stingless; Bellflower; Black Brood; Foul Brood; Canada Thistle; Canded Honey; Encalyptus; Gloves for handling Bees; Guajilla; Log-wood; Marigold; Orange-blossom Honey; Organizations of Bee-Keepers; Overstocking; Profits in Bees; Queen-Rearing; besides a large number of changes, more or less extensive, important ones, too, in nearly all of the older subjects.

## AUTHORSHIP.

The book was originally written by A. I. Root, who, as far back as 1877, saw the need of a work of this kind. There are still quite a number of the articles remaining written by himself; but ill-health, together with interest in other things, made it necessary for him to drop the work he had so grandly started. The general work of revision and keeping the book up to the times has devolved on his son, E. R. Root, who has probably written two-thirds of the work as it now stands.

## The Need of Bee-Literature.

BY G. C. GREINER.

During the 30 years of my bee-keeping I have been a constant reader of at least one bee-periodical; at times two, and even three, have been my regular visitors. I always supposed that by keeping in close touch with the writings of our most prominent experts, any bee-keeper would be enabled to keep up with the times. This is one reason why I never, until recently, owned one of our standard text-books on bee-culture. Accidentally, for that is all the reason I can assign for it, I ordered a short time ago a copy of the "ABC of Bee Culture", and I must confess I was surprised in more than one way.

When I opened the package I was favorably impressed with its outward appearance. Neat and tasty in its general make-up, it would be a desirable addition to the most scrupulously selected library, especially as its contents are in harmony (as I afterwards found) with the outside.

The next pleasing feature was the point of expense. Comparing the size of the book, its workmanship and the amount of reading matter it contains with the price, it is well worth the money the publishers ask for it; it is within the reach of any moderately-stocked-up pocket-book.

But its contents struck my fancy more than anything else. The way it is written—encyclopedia style—makes it an index by itself, so that any subject desired can be readily found. In looking over its pages I find that it is not only an indispensable guide to the beginner, but it is a great help to the veteran of many years' experience. It covers the ground com-

pletely, from the first rudimentary principles to the most scientific observations and discoveries of the present day, thus making its perusal interesting as well as instructive to the readers of all classes.

Under the impression of a little overrated self-estimation we are sometimes inclined to think that we know all that a text-book of this kind contains, or at least all that is of any importance to the successful management of our business. This is an illusion. We may by years of experience and study become experts in certain lines, but we are not above improvement and progress. There are many good hints found in the "ABC of Bee Culture" which, if heeded and applied to practical use, would benefit any bee-keeper in a more or less degree.

On the other side, I can not say that I agree in every particular with the writers of the book, and this is only natural consequence. During so many years of toil and labor we form certain habits, become accustomed to certain ways and appliances, that it would be a great hindrance to break off and follow somebody else's instructions. But in my opinion, if the beginner would take the "ABC of Bee Culture" for his guide, and follow its directions to the letter, his way to success would be open.

In closing this little sketch I would not miss mentioning one more fact. The book is profusely illustrated; every department has its share of descriptive illustrations, and the scenic representations at the front and in the back part are exceptionally fine. It is a pleasure to look them over.

La Salle, N. Y.

Price, in cloth, postpaid, \$1.20; in half leather, \$1.75; in full leather, \$2.00. If sent by freight or express, deduct 20 cents from any of the above prices.

For sale by all dealers in bee-keepers' supplies, also by all publishers of bee-journals, and many agricultural and other periodicals; also by book-stores and others.

## Editorial Notes and Comments

### Young Queens and Afterswarms.

The Canadian Bee Journal takes this Journal to task after this good-natured fashion:

It is a relief to find that the "Old Reliable" gets "mixed" a little sometimes, too. We were rather amused at a statement which appeared in its pages recently, that when second swarming is contemplated by a colony, "only one" young queen is allowed to emerge and go with the swarm, "the others being guarded in their cells by the workers", to follow in rotation with subsequent swarms. The theory is very interesting and beautiful, very much like the "sting trowel" theory of a few years ago. Our Canadian bees certainly do not exercise so much care and forethought. A number of young queens are often found in second and afterswarms, which would be an evidence that the cells are very poorly guarded, if at all.

Good Canadian, haven't you become a little "mixed" in your reading? The paragraph to which you probably refer is found on page 500 of the last volume, where it is said, "If further swarming is contemplated, only one virgin is allowed to emerge". You have evidently read into it this meaning: "When an afterswarm issues only one virgin is allowed to emerge, and the others are kept in their cells till after the swarm has issued". Please read again what is said, and see if you have any warrant for such an interpretation.

You will not find a word said about queens being guarded in their cells after a swarm has issued, nor at any other time except when further swarming is contemplated; and you will find more than one queen released when further swarming is contemplated, no matter if one or five swarms have already issued. You say, "A number of young queens are often found in second and afterswarms". To be sure there are, if no further swarming is contemplated; but did you ever see a number of young queens in a second swarm, and then a third swarm issue? When you put your ear to a hive the evening before a second swarm issued, did you ever hear more than one queen piping? "But you saw a number of virgins with the swarm the next day"? Ah, yes, but they were not contemplating swarming, then; they were actually swarming.

Whatever Kanuck bees may do, you may rest assured that the rule with Yankee bees is to allow only one queen to be free in a hive so long as further swarming is contemplated.

### Foul Brood vs. Bee-Pest.

In the British Bee Journal W. H. Harris urges that the name "bee-pest" should be given to the disease now called "foul brood". W. Woodley wants "bee-brood pest". That might do better in England than here. If foul brood were the only disease to which bees are subject, or even the most severe disease, it might do to give it one of the names mentioned, just as the loose term "the plague" is sometimes used to designate some disease particularly destructive to the human family. But in the course of time England is likely to follow the fashion started in this country, where among bees there are other diseases that might be called pests, at least one of them being rated as more destructive than foul brood.

Mr. Harris thinks "foul brood" misleading because mature bees are liable to be affected by the *Bacillus alvei* as well as the brood. Yet the disease of the brood is the prominent thing. Moreover, a name once established has a claim to continuance just because of its established usage. If a more appropriate name can be given—well; but it will hardly be "bee-pest" or "foul-brood pest".

### Flour as a Substitute for Pollen.

F. W. Penberthy says in the Australian Bee-Bulletin:

"I found only 10 percent of the brood capped when fed on flour alone for a month; the larvæ thrive all right until the third or fourth day from the egg, and then a large percentage disappears before being capped."

Has anything of this kind been noted by those who have used flour or any other substitute for pollen? But are there many localities with a whole month of weather fit for feeding, and yet no natural pollen yielding?

### Close Spacing for Worker-Combs.

A correspondent of the British Bee Journal asks whether it is an infallible rule that bees will build only worker-comb in frames spaced  $1\frac{1}{4}$  inches from center to center, and the reply is: "Quite infallible if done at the proper time, viz., when hiving the swarm". Can any of our readers report experience in this matter?

### Prices of Hives—Are They Too High?

The following clipping from the apicultural department of *The Farmer* has been sent to this office by Mr. A. T. Dockham, of Todd Co., Minn., with the request for an opinion thereon:

QUES.—What are bee-keepers to do for hives and bee-supplies if prices remain where they are now? Does the advance in price of lumber warrant the present high prices of hives?

ANS.—Bee-keepers will be compelled to make their own hives. Hives may be made by any one who understands how to handle tools. There is no patent at the present time on any of the standard hives, so

that any one can make them from the material in which his locality abounds. At the present prices of honey bee-hives must be cheap. Expensive hives and complicated fancy implements are a hindrance of apiculture. The system of bee-keeping must be simple, cheap and efficient. The Department of Agriculture at Washington, in its report last January, stated that bee-keeping in the United States was yielding 100 percent profit annually on its investment. This statement, and not the advance in price of lumber, caused supply-dealers to double their prices. A sort of union or trust sprang up. A few, however, have withdrawn and are again quoting supplies nearer what they should be. Look up the advertisements of supply-dealers and find out where you can do best.

Part of the foregoing is truth, and a good deal of it is error, according to views entertained "in this locality". Bee-keepers will not be compelled to make their own hives so long as they can buy them for less than they can make them. The probability is that the case is very exceptional in which a bee-keeper finds he can make a hive cheaper than he can buy one at present prices. If he can, of course that is his privilege. If he can make them as cheap as he can buy them when making only enough for his own use, it follows as the night follows the day that by making them on a larger scale he can make them for still less, in which case there is no law to prevent his making to sell to others.

But is it true that "hives may be made by any one who understands how to handle tools"? The average carpenter or cabinet-maker is generally supposed to understand how to handle tools, but give him an order to make a hive, and see if it will be satisfactory. Exactness of measurement beyond that to which he is accustomed is demanded in the making of a hive, an exactness more easily attained where expensive machinery is carefully adjusted to cut pieces by the thousand, than where each piece is separately measured and cut by hand.

It is true that no patent stands in the way of making a hive that most bee-keepers would prefer.

The statement that a report emanating from the Department of Agriculture should cause manufacturers to double prices is rather amusing as a specimen of logic. Do the supply manufacturers depend upon reports from Washington to estimate the profits of bee-keeping? Could they not give those Washingtonians points in the matter? Suppose, however, that the Washington estimate could be relied on as absolutely correct, what should be its effect? Would it not be a lowering rather than a raising of many previous estimates of profits, and should that not lower rather than raise prices?

In any case, how much do the profits of bee-keeping influence the price of hives? If it should be found that the earnings of a woodchopper were 1500 percent of the amount invested in his ax, would that at once send the price of axes skyward?

But is it true that prices have doubled? Will The Farmer give a single instance of a case in which any manufacturer lists a hive at double the price at which it listed it at any previous time?

The closing sentence is good advice, although hardly in keeping with the first statement. Reading advertisements is good business, and the man who watches them closely need have little fear but that competition will keep prices somewhere within reach. If there is "a sort of union or trust", and if it is a fact that "a few have withdrawn" from that union, it seems quite clear that the union has not the power to crush competition, and hence can not be expected to hold prices above a somewhat reasonable figure.

Judging from the way some other editorial opinions that have appeared in this Journal have been construed, we doubt not that some of our readers will conclude that the foregoing opinion is wholly in the interest of the bee-supply manufacturer. But we really believe that any bee-keeper who has the sense and ability to make a hive as good as, and cheaper than, he can buy of the manu-

facturer, will go ahead and make it, no matter what any one says about it. This is still a free country, we understand, and there is no law against any bee-keeper making all his supplies, if he so desires. No one is *compelled* to patronize the bee-supply dealers. But we notice that about nine-tenths of the bee-keepers of this country seem to be glad to patronize them.

Truly, we don't believe there are any bee-keepers that would want to see all the reliable bee-supply dealers and manufacturers shot just yet. They are a necessity to the best success of bee-keeping in any land. Scarcely any one will disagree with us on that, we think.

#### Using Strong Language.

Referring to Editor Root's expression, "A stick claws the contents over", Editor Abbott upholds it as giving strength, saying:

"Claw" means "to scrape, scratch or dig with a claw, or with the hand as a claw", and "stir" would not be a strong enough word in this case.

If two darkies got into a fight and one "clawed" the other's eye out, you would not think of saying that the fellow had his eye "stirred" out. Stir would be tame. You might stir syrup, but you must claw beeswax refuse.

"In this locality" one would not say an eye was stirred out, nor rubbed out, nor coaxed out, nor a whole lot of other things, because those words don't mean the thing that was done; more likely it would be said the eye was punched or gouged out, because those words convey the right idea.

So we are to understand that "claw" means the same thing as "stir", only stronger. You stir mush, so long as you go slowly, and when you go fast enough you claw it. You stir up strife if you get two men to jawing each other; if you get them to blows then you claw up strife. The general principle seems to be that when you want to make your language stronger, just use another word that doesn't mean what you're trying to mean!

## Miscellaneous News \* Items

The Wisconsin Convention held at Madison last week was fairly well attended considering the 20-below weather. We were present and enjoyed both the convention and meeting the good bee-keepers of that cold region. The following were the re-elections of officers: President, N. E. France; vice-president, Jacob Huffman; secretary, Gus Dittmer, of Augusta; and treasurer, Franklin Wilcox.

**Two Indianapolis Bee-Supply Dealers.**—Last fall we visited some of the bee-supply manufacturers and dealers, among them being Messrs C. M. Scott & Co. and Walter S. Ponder, both of Indianapolis, Ind.

We called on Mr. Scott first, and found him located in a very good store filled with a stock of supplies made by the G. B. Lewis Co. Mr. Scott also deals in honey, and is developing a large trade in it. While we were there he was handling considerable honey, as it was just at the beginning of the honey-dealing season.

After leaving Mr. Scott's establishment we looked up Walter S. Ponder, who handles the A. I. Root Co's brand of supplies. Mr. Ponder is also a honey-dealer, and has lately taken up the manufacture of peanut butter. He has all the necessary machinery for making a very fine article, and will mail a sample of the butter to any one upon re-

ceipt of 6 cents in stamps. It is put up and sold in tin cans through the grocers. Mr. Pouders' office and store are models of neatness and order.

Mr. Pouders and Mr. Scott are young men, and both are by honorable dealing and energetic efforts building up a business that will endure, and from which they deserve, and doubtless will receive, a good financial return. We heartily wish each of them the fullest realization of their highest anticipations.

On the front page are shown these two Indianapolis hustlers, with pictures of their store fronts as well.

\*\*\*\*\*

The Annual Meeting of the Worcester County Beekeepers' Association was held in Worcester, Mass., Jan. 21. The following officers were elected: President, F. H. Drake; vice-president, Burton N. Yates; secretary-treasurer, C. R. Russell, of Worcester.

Arrangements were made for a banquet to be held Feb. 24, to be followed by an address by Mr. Arthur C. Miller, of Rhode Island. A broad invitation was extended to all beekeepers, and especially to the Massachusetts State Association. Mr. Miller has been heard before, and the mention of his name should be enough to draw a large attendance. We understand that Massachusetts beekeepers are looking forward to a prosperous year.

### Proper Care of Hives and Combs After a Winter's Loss of Bees.

BY G. C. GREINER.

TO select the above heading for the subject of an article at this late hour may seem a little out of date, and I admit it is, but we have never passed a winter yet without some losses, light as they may have been, neither can we tell what this winter may have in store for us, so that the following suggestions may be just in time for next spring.

The unusual heavy loss of bees last winter brought the old saying of "A blessing in disguise" fresh to our minds again. It does not require a great deal of imagination to see the benefit of these occasional clean-outs, especially if it is the "other fellow" who lost all his bees and we escaped unharmed. We all know if bees never died, it would not be many years before the country would be so overstocked with bees and their products that bee-keeping as an occupation to provide a comfortable living would be a thing of the past. But Providence and the expert's experience comes to our rescue. The former to cause an unfavorable season for unprotected or improperly prepared colonies to survive the winter, and the latter to enable the professional bee-keeper, by a better knowledge of the necessary requirements for wintering, to escape these heavy losses. And this is not all, for even if the experienced bee-keeper has met with heavy losses, he sees some points which he can turn to his advantage.

Whatever the number of dead colonies may be when spring opens, we have that many hives and sets of combs left, and if rightly managed they can soon be stocked up again, and the winter's loss thus replaced. It is the care of these depopulated hives and combs concerning which I wish to make a few remarks.

As soon as we find any colony missing, its hive and combs should have a thorough cleaning out, and the sooner this is done the better. The dampness, decaying bees, and other foul stuff, which we generally find in hives of dead colonies, soon spoil a set of combs, or greatly impair their value; they mold, become befouled, and smell badly in a very short time, and when used later on are so offensive to a swarm that their use may be the cause of absconding, for which we imagine we can assign no reason.

The best way, and one which requires least handling, is to have an empty hive to start with. Set this near the hive to be cleaned, either in front or behind, but near enough so that a frame can be taken from one and put into the other without being obliged to take many steps. Then open the hive to be cleaned, take out the first comb, sweep off all adhering bees, scrape all brace and burr combs from the top-bar and hang in the empty hive. A wing will do the former, and a strong-bladed jack-knife ground very blunt but sharp is excellent to do the latter.

After all combs are treated likewise, then the empty hive should be thoroughly scraped all over the inside, and especially both sides (side and bottom) of the rabbet. A hive that has been in use for many years is generally more or less covered with chunks of propolis, and a good scraping makes it as habitable as a new one. I use square pieces of thick glass for this purpose, which I cut myself from broken double-glass window-lights.

The combs should not all be placed in one hive; it is better to leave one out and give the rest that much more space between them. Close-hanging combs are a great inducement for the wax-miller family to set up house-keeping, but they keep very shy of widely-spaced combs. Besides, a little more space gives better circulation of air, and keeps them purer. Then, to insure free circulation, the full entrance of the hive should be left open, provided with a wire-screen to keep out all intruders, and the top of the hive left open as much as possible without allowing the bees to have access to the combs.

When the hives and combs have thus been taken care of they may then be kept until swarming-time, to be used for the increase. But in this case a few points must be taken into consideration:

It requires constant vigilance to keep the combs from the ravages of the worms, for as soon as warmer weather approaches they are sure to make their attacks. The seclusion of the dark hives offers them an excellent opportunity to engage in their destructive work, unless the hives are frequently examined by the apiarist. If the shop or honey-house is provided with sufficient open frame-racks to store all surplus combs, they are more easily kept from destruction when stored in this way.

Another point, which should not be overlooked, is the fact that combs exposed to the atmosphere any great length of time become stale; the wax seems to lose its flexibility, and the bees are more or less inclined to object to their use. It is therefore advisable to manage in some way to have them occupied again by the bees as soon as possible.

A good opportunity to use any surplus combs offers itself when the colonies are in proper shape and the season far enough advanced to begin the spreading of brood. A side comb may then be taken out, the brood spread, and one of these extra combs inserted, which, if circumstances are favorable, will be stocked up with eggs in a very few days.

I have always found it a good plan to give the combs of dead colonies a thorough looking over before using them again, and the chance to do this may be considered one of the little gains brought about by the winter's loss. Every comb, before it is used as above stated, is first shaved down, uncapping fashion, to the thickness of the frame (or less). No matter about the honey—if it contains any all the better; if not, the edges of the cells are shaved off just the same. But we must remember that it requires a very thin, sharp uncapping-knife to trim empty combs. Then the comb is exposed to the bees for cleaning out. For this purpose I always keep a hive or two with two or three extracting supers each, a little distance from the apiary, filled with that many sets of so prepared combs (I use the same frame above and below).

After the combs are all cleaned out I move them to the honey-house and replace them with a new supply. In this way I always have a lot handy to busy myself with on stormy days, or whenever I have any leisure time.

The next operation is to look them over. If they contain any drone-comb it is cut out and patched up with worker-comb, or, if they are not attached to the bottom-bars, a strip is fitted in there to fill the opening. We know from experience that the space between comb and bottom-bar is many times a very annoying feature, and if we can, by a little fixing up, dispose of these loopholes and catchalls, I think the time of looking them over is well spent. But I will say right here, that, try as we may, some colonies will not accept our engineering. Instead of finishing the work we have laid out for them, they finish it the wrong way by gnawing the little strip all out again. Nature's instinct—to leave a necessary passage below the combs—seems to keep the upper hand of them; and this is not

strange, for they are laboring under the impression that the bottom-bar constitutes the bottom of the hive. In this case we have to let them have their own way, and patch up again whenever it is convenient. Niagara Co., N. Y.

## Bees, Birds and Fruit in California.

BY C. W. DAYTON.

FIVE years ago last July a man came into my honey-house, and while I was filling his pail with honey, casually remarked with a smile: "Mr. Williams, up there, who owns the big orchard, is badly worked up because of the bees working on his apricots, and is making all kinds of threats".

"Is that so? I did not know that 'cots were ripe yet," I answered.

"Yes, they are ripening pretty fast. I suppose on account of the four or five days of hot weather we have just had. I was up there yesterday and got some."

As he stepped out of the door I remarked, "I guess I also will have to go up and hit Mr. Williams for some apricots some time to-morrow".

About 10 or 11 o'clock I called on my wife for the largest pail in the house, as I was going after some 'cots, and, I assure you, it was not slow in forthcoming.

Near the side of the orchard I inquired of a picker where I could find Mr. Williams, and was directed up a road toward the middle of the orchard, where I found him and some 50 or 75 boxes of fruit from which he was sorting out the occasional mutilated ones which had been mistakenly thrown in.

"Good morning, Mr. Williams. I came up to get a few 'cots. You seem to be getting an abundant crop of fruit this year."

"Good morning, sir; good morning. Yes, we will get a good deal of fruit if we succeed in getting it off the trees before the bees do."

"Indeed", said I, "it does look that way."

"May I inquire your name? I do not remember having seen you, although I am acquainted with nearly all the neighbors around here."

"My name is Dayton, but I am quite commonly known as the honey-man, but possibly bee-man would be easiest for you to recollect."

"Dayton—Dayton", he repeated; "I do not remember having heard your name."

"I live a quarter of a mile below the post-office, and own those white hives you may have noticed; and since I have more bees than any one else about here, I suppose most of these in your orchard came from my hives."

"Well—yes; I believe I do remember the place; and—how many apricots did you wish to get, Mr. Dayton?"

"I guess I will take the pail full."

"When he had poured out of one of the boxes of marketable fruit enough to fill the pail about one-third, I said to him, "That will do of that kind, Mr. Williams. If it will be agreeable to you, I would prefer to fill up the pail with those which the birds have pecked".

"Birds!" he exclaimed. "We have not seen any birds around, as I know of."

"Well, I always supposed the mutilation of fruit in this manner was the work of birds."

"John—JOHN!" called he, to the spokesman of a band of five or six Chinamen, "have you seen any birds in the orchard?"

"Nope—na, no any." After a long pause, he added, "Yick, yick. Two four, six placee" (meaning nests). "Ober'im cook 'ouse. Us eat 'im 'fore'efix 'im wing out. Muchee gone".

After a good laugh by several bystanders had subsided, I ventured, "If you will listen closely, Mr. Williams, I think you can hear a chatter of birds in that row of eucalyptus along the side of the orchard". After listening a moment, he said, "Yes, I wouldn't wonder if there were a thousand birds up in those trees".

As he turned around to fill my pail from the box of mutilated apricots, which were lately sorted out, I interrupted him with, "Mr. Williams, if it would still be as agreeable to you, I should prefer to go out and pick the mutilated ones from the ground and trees".

"He said, "Yes, take your pail and pick up as many as you want. We do not consider them as worth anything".

As I started out, thinking that he might conclude that I possessed about as much "cheek" as my bees, I returned, "That is, from your standpoint; but from my position

they are worth even more than the marketable ones, and I shall be quite as glad to pay for them".

When I returned and had paid for them, he gave vent to his curiosity by saying: "If it is a fair question, I should like to know the reason why you prefer the mutilated apricots?"

"Well, Mr. Williams, there are several reasons instead of one. Had these in my pail not been mutilated you would have picked them for market, partially green, several days ago. And, again, if the bees had not removed the fermenting portion wherever it occurred, they would now be entirely spoiled. Also, they are the largest and sweetest in the orchard. As you well know, the earliest and largest apricots grow low down on the tree. Their blossoms came out earliest, last February, and by the last of March were the size of hickory-nuts, while those which are beginning to ripen out towards the ends of the limbs could scarcely be seen. They did the most of their growing during the moist weather of winter and spring; and they grew to the limit, so when hot summer began there was not much else to do but hoard up sweetness for the time of ripening. Being down in partial shade their skins are tender, while those more exposed are thick-skinned and tough, like soggy potatoes; while those in the pail are so mealy and tender that they can readily be broken into a bowl of milk, together with two slices of bread and one-half pound of granulated honey; just make a meal."

"Well, I declare", said Mr. Williams, "I don't think I should kick very hard against a dish like that myself. Guess I'll bring out the children to-morrow and have them pick a box of that kind. Those that I have always taken home were out of the market boxes, but our folks did not seem to care much for fruit."

"As to these mutilations which the bees are working at, some were mutilated yesterday morning, but more of them the morning before, and considerable several days ago."

"Now, most persons think that bees choose the sweetest, but in my experience this is a mistake. Sugar is sweeter than honey, and yet they choose the honey. They are attracted to fermented juices in preference to unfermented. In fact, a person can prove this to his satisfaction by simply walking out amongst these trees. We often see a cluster of bees which entirely hides an apricot, and if we attempt to examine it it will be found to be so rotten that it can not be handled, while the freshly mutilated ones on the trees are scarcely noticed by the bees."

"Those which were picked into this morning are still sweet, but those of yesterday, after being exposed to the sun, and then the dew falling on them during the night, are now beginning to ferment, and if you should taste of such a one you would say that it is gone beyond all hope of redemption. But not so with the bees. When a bee alights on a mutilated apricot, or peach, or fig that is still sweet, it does so by mistake, and thrusts its tongue in only long enough to taste, then runs all over the apricot to see if there is not another opening; and, if not, it goes to another apricot, and so on until it finds one of the right flavor, or, sourness."

"An apricot, or peach, or fig does not ferment all through at once, but only at the exposed and ragged edges of the mutilation, and if there is not more mutilated fruit than the bees can manage, they will remove the fermented portion just about as fast as it forms, so that a mutilated apricot will be eatable so long as a remnant remains. To maintain that bees bite into fresh fruit while there is decaying fruit lying about, is as unreasonable as to say that a rooster continued to jump up against a cornstalk with the hope of once in awhile knocking a kernel out of the ear, when the ground around about was strewn with better corn already shelled."

"But if you should walk along beneath those trees over there, Mr. Williams, those birds would become as hushed as a flock of quails; because they may mistrust you had come to demand the return of your fruit. Those birds are like domestic fowls—they want their breakfast as soon as it is light enough to see, and this is some two or three hours earlier than any one comes into the orchard to work; and, besides, it is difficult to see the birds working on fruit, because they are enough like quails to put out sentinels. These are the red-breasted fellows which perch on the top-most twigs and appear to be singing, but, in reality, are only chirping to their brothers and sisters which are creeping from branch to branch among the leaves in the densest part of the trees, selecting the tenderest and sweetest apricots. If you get within ten rods they chirp out that a suspicious biped is stalking down through the orchard at an unusual time of day, and the birds begin to sneak out singly

from the far side of the trees and go to the far side of the orchard or to some secluded place; but the sentinels continue to chirp on even until you begin to disappear under the outer branches of the very tree they are perched upon."

"Well", says Mr. Williams, "I will bring out a cot and blankets and stop here nights and see what is going on in the orchard in the early morning."

I have not seen Mr. W. since, but as he has allowed some bee-keeper to keep an apiary in his orchard throughout the past and one other fruit season, it can be pretty certainly guessed what his conclusions were.

Los Angeles Co., Calif.

## Convention Proceedings

### Report of the Nebraska State Convention.

The annual meeting of the Nebraska State Bee-Keepers' Association was held at the State Farm Experiment Station building Monday afternoon, Jan. 16, 1905. In the absence of the president, E. Whitcomb, who has not missed a session in ten years, the meeting was called to order by the vice-president, L. H. Trester. C. E. Lewellyn was chosen chairman of the meeting.

Much interest was shown by all bee-keepers present, and many questions were fully discussed in regard to the care and handling of bees. The treatment and possible cure of foul brood was discussed at some length. Though this disease is not found in many apiaries in Nebraska, it is the pest of the bee-keeping industry, and all wide-awake bee-keepers are ever on the alert to avoid its spreading.

The climatic influence on bees brought forth many points of interest. A bee-keeper from California mentioned the fact that alfalfa honey in California was almost tasteless, while Nebraska alfalfa honey was more delicious in flavor. This is probably due to the kind of nectar secreted in the flowers in different climates.

The one question of great importance to the bee-keeper was how to produce the most honey with the fewest number of bees. This question seemed best settled by resorting to artificial swarming, that is, to make it possible for the bees to swarm when the bee-keeper desired, and avoid allowing them to swarm when the bees took a notion. Too much swarming will dwindle a colony, and when the honey-flow is on the colony may be too weak to gather enough honey to last them through the winter. During the past season the air seemed to be filled with runaway swarms flying in many directions. They would lodge under the siding of residences, hang in trees, on bushes, go into old boxes, and often in hives that were set to catch these stray swarms. This not only shows the prolific inclination of the busy bee, but the neglect of the bee-keeper in allowing his new swarms to escape and be gathered up by others, or to be wasted by taking quarters where they will be of no profit to any one.

The industry of bee-keeping is only in its infancy in Nebraska. The past year has been the most prosperous in the history of bee-keeping in the State. The display made at the State Fair last year was a sample of the products, and many were surprised at the fine display of both quantity and quality. The growth of this industry is noticeable, and, notwithstanding the abundant crop, honey is still held at a fair price; the demand for it is growing each year, and the bee-keeper is inspired to put forth another effort and produce a supply equal to the demand.

The meeting, on the whole, was full of interest, and many new members were taken into the Association. Bee-keepers throughout the State would profit by making a great effort to attend these meetings, as subjects are discussed which will help them as no other means can.

At the close of the discussion the following officers were elected for the coming year: President, C. E. Lewellyn; vice-president, L. O. Westcott; secretary and treasurer, Miss Lillian E. Trester, of Lincoln.

Next year the Association expects to have a honey exhibit, and all bee-keepers of the State are expected to bring something of interest to the meeting at that time.

Through the columns of the American Bee Journal we wish to tell the bee-keepers that they are missing something

when they fail to meet the brother bee-keepers and enter into the discussions brought out in these meetings. If you are not already a member of the Nebraska Association, write to the secretary at once, and enroll yourself either as a yearly or life member, and then plan to be present at the annual meeting next year, both to receive and give help.

LILLIAN E. TRESTER, Sec.

### Feeding Bees in an Observatory Hive.

On page 40 is an inquiry by "New Jersey," in regard to feeding bees in an observation hive, and I am moved to give my method, which has proved very successful.

Get or make a small box 4 or 5 inches square, and about 2 inches deep, with movable cover. Cut a round hole in the cover of a size to take in a pint Mason jar inverted, on the principle of the Boardman feeder. Bore a  $\frac{3}{8}$ -inch hole in the end of the hive, which is in the room, half an inch from the bottom. Bore the same size hole in one side of the box, then match the holes together and screw the box to the hive. Of course one must either have a special cap for the can, or else break out the porcelain lining and punch holes in an ordinary cover, or you can put a small saucer in the box and feed in that.

ELLA C. SHEPARD.

Middlesex Co., Mass.

### Busy, but Storing Nothing—Other Difficulties.

I have had a few colonies of bees for five years now, and have tried to do my best for them, from no experience and with only the guidance of books. May I tell you just what I did this year, and will you criticize?

First, I have only alfalfa, fruit-blossoms and honey-lucust for them. There may be a few wild flowers, but nothing in any quantity. We have a good deal of hard, south wind in the spring and summer, and the mercury goes to 110 degrees sometimes, but for three months usually above 95 degrees at midday. When I started with the bees I was told that the wind would be a serious difficulty, so I have put the hives on the north side of a high mulberry hedge, so that they are well shaded and protected from wind. Another hedge, 50 or 60 feet north, protects them from north winds in winter, and I leave them there all winter. So far as I can judge they have always wintered very well.

For the season of 1904, this is their history: I reduced to two colonies in the fall of 1903. April 1 I took out the winter packing. They seemed vigorous and busy. I had in May two swarms from each colony, all nicely settled in the hives with full frames of comb, mostly empty. Alfalfa blooms, and the first crop is ready to cut usually by May 15 or 20. All went well, alfalfa blooming freely, never more so, I think. The bees seemed busy, and I looked for much honey. They continued all summer to seem busy. The largest, strongest colony, to my surprise, swarmed in July. I looked through the hives about once in two weeks, and all was well, as far as I could tell—plenty of brood and bees, but almost no honey. The three latest swarms stored none at all; the two early in June should have done so, I thought. I took off in all about 100 pounds of honey, almost none of it first-class. I have no method of manipulation except to try to keep them supplied with queens, and to feed in the fall if there seems to be the least chance of shortage; in fact, I have always fed some. The two queens for the original colonies were bought in July, 1903, and the young queens are their offspring. I bought leather-colored Italians, and they looked like fine ones. I had to feed strongly last fall; the hives were very light. What do you think could have been the cause? One year I had 200 pounds of comb honey from one colony—a swarm of May 15, a double swarm, I think. That is, two that looked like separate swarms alighted on the same tree. I gave them two hives, but they all went into one.

I shall be very much obliged for any criticism and sug-

gestion. I take the American Bee Journal, and have the "A B C of Bee-Culture" and the Langstroth book; the little "Amateur Bee-Keeper", and the Agricultural Department's book by Mr. Benton. I am very much interested, especially as I am the pioneer in this neighborhood. But I don't feel justified in enlarging until I can manage better. Of the five years when I have had from 2 to 12 hives, I have never had an altogether successful year. The year I spoke of as having so much from one colony, I had only 250 pounds from the 4 other colonies.

I notice in some of the pictures that the hives are set two together, and then a space, usually very small. What is the reason for that arrangement? How often should one look through the hives in the working season, after the swarming-time? I have a good deal of annoyance with propolis, where the bees work slowly. Is that usually the case?

My hives are the dovetailed 8-frame, 6 inches off the ground. I have never known of any suggestion of moths or foul brood here.

With queens of the age of mine, would you destroy them this spring, or use them the coming season—the two originals of July, 1903, I mean?

Clark Co., Kan.

(MISS) HELEN PERRY.

Sometimes bees seem busy—indeed, are busy—when they are not getting a bit of surplus. There are times when, for some hidden reason, little or no nectar is to be had, although flowers are plentiful. There may be enough nectar to keep the bees a-field, but it is all used up for brood-rearing.

There was nothing very unusual about that strong colony swarming in July. They were strong in brood and bees, and with just a little more nectar coming in than was needed for daily use, bees are as likely to swarm as when it comes in a flood. That very strong colony could be storing at least a little when the weaker ones were living from hand to mouth.

It looks a little discouraging that you have not had what you consider an altogether successful year, but there's that crop of 200 pounds from one colony which many would envy you. The other 4 colonies giving a total of 250 pounds could not be called so very unsuccessful. From the whole 5 colonies you had an average of 90 pounds. Do you call that very bad?

As you gain experience you will no doubt be able to avoid weak colonies, and to bring up all so as to come nearer an average of what your exceptionally strong colonies do now.

Setting hives in pairs, as you speak of, saves room. Suppose you place your hives singly, 6 feet apart from center to center; you can just as well put a pair where each single hive stands, for the bees will not make the mistake of going into the wrong hive of a pair. Then it's sometimes convenient, when opening a hive, to have the other hive to set things on.

After the swarming is over there is usually no need to go through a colony at all except to see that it has a laying queen.

Yes, bees bring in more propolis when honey comes in slowly, especially late in the season.

If those two 1903 queens are doing good work, better let them alone.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

#### BABY NUCLEI AND QUEEN-BREEDERS.

My idea, Mr. Pharr, was that queens reared in the baby nucleus were never better, but usually a trifle poorer, than those reared in old established ways. Grant that much, and that I was thinking not at all of queen-breeders, but only of queen-users, and it is easy to see how I came to say that our craft would be better off with the invention suppressed. I can see that it may increase somewhat the profits of the Southern queen-breeder—and it looks like I was wrong in ruling him outside the phrase "our craft". Page 843.

#### HONEY CANDY FOR WINTER FOOD.

"Important if true" are the facts about bee-candy which E. L. Bussey gives on page 843. Half sugar and half *comb honey* (so as to get the wax) makes a pliable and tip-top winter candy; while half sugar and half extracted makes a hard article.

#### SAINFOIN'S UPS AND DOWNS.

So sainfoin has stood three Wisconsin winters, and bees visit it eagerly. Two improbables. Good. Sainfoin seems to be a football; a few weeks ago it was badly down, and now it is up. Page 846.

#### DEFINITION OF HONEY.

Natural and proper to agitate for a precise definition of honey, but the difficulties in the way are great. The most rigid definition practicable will let in some honeys that are entirely unfit to eat. The moment we exclude anything the bees gather from natural sources we are confronted with large quantities of a fairly edible substance that is partly honey and partly not honey. Also a large fraction of the crop in most apiaries—the bee-man himself doesn't know whether it's honey or not. As to mean flavored stuff of bark-louse origin, or from half-decayed fruits, 'twere much better to call it honey and shut it out of market than to call it something else and permit it to kill off customers under its own proper name. Page 851.

#### GOVERNMENT ADVERTISING OF HONEY.

A person must be hard to please if not pleased with the offer of government aid in advertising honey coming through Prof. Benton—50,000 copies of a good-sized pamphlet for circulation entirely free. Page 853.

#### HONEY LEAFLETS FOR GENERAL REPRINTING.

Mr. Woods made a good shot when he warned us about a danger in getting up a leaflet or statement to be copied free by local editors. Unless very wisely drawn and quite brief it will be cut down before printing. And unless very close supervision is exercised the editor's utter lack of bee-lore will play havoc right there. Mere pleasantries, and puncencies and wonders will be retained; and the most important things of all will turn up missing. And when the editor feels obliged to summarize a long paragraph with a sentence, queer mistakes will be printed as official truth right from fountain-head. Page 854.

#### ILLINOIS AND WISCONSIN SISTERS.

So Illinois and Wisconsin more than balance 39 other States—when it comes to furnishing lady members of the Association. Page 856.

#### HIVE-ENTRANCES IN OUTDOOR WINTERING.

Allen Latham inclines to be the apostle of wide entrances for outdoor wintering—and predicts more losses for bees not so arranged. Last winter my conceit was that the colonies with extra-wide entrances suffered quite a bit worse than the others. This time I contracted all the very wide ones; and some I let be that had grown very small by sinking into rotten bottoms. Maybe now I shall dance for it. Page 855.

#### BUTTER AND HONEY AS A BREAD-DIP.

The Arab (or anybody else for that matter) might do worse than have a warm mixture of butter and honey to dip his bread in. Page 869.

#### DEEP FRAMES FOR EXTRACTING.

The editorial hits it squarely where it pokes hard at deep frames used for extracting. Oft green honey at the bottom of the frame when it is rather necessary to extract, and the honey above is ripe and all right. I use such frames, and like them, on the whole—and mean to keep on using them—but a sorely weak spot was found. Page 869.

#### SMOKE BEES LIKE A SENSIBLE PERSON.

As you indicate, Mr. Dadant, it serves him right; and his sin finds him out—the fellow who is proud of his ability to open hives without smoke. The bees do not indeed sting *him* very much; but they are needlessly made angry, and sting the neighbors all around. And the net result is joint efforts to get the bees moved, when it never would have been thought of had he used smoke like a sensible man. Page 807.

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Prevention of Swarming.

1. Having a few colonies, and very little time to watch for swarms, if I prepare an empty hive with shade, bee-entrance guard, frames and starters, and place it directly in front of and facing the same way as the parent colony, but so close up to the old hive that the bees will have to pass back and forth through the new hive to the field, is it likely, when swarming, they would take up their abode in the new hive? or would not such a plan be practical?

2. Not desiring any increase, if in five days after a swarm issues I destroy all queen-cells in the parent colony, and place it with a queen-excluding honey-board on the super of a new hive, will the brood, when hatched, unite with the bees in the lower chamber? or would not such a plan be practical? OHIO.

ANSWERS.—1. The plan has been tried by a good many, but not with satisfaction.

2. It will not do well for comb honey, but may be all right for extracted. If you destroy the cells five days after swarming it may be well to repeat the process after another five days.

### Transferring Bees—White Clover—Overground Cellar.

1. We have some bees which we got out of a bee-tree. They have no honey, and only 3 little pieces of honey-comb. We have fed them thus far. They are in a block sawed from the tree. When can I transfer them, and how? The hollow in the block is about the size of a gallon measure, and we can't leave them in it if it gets down to zero for two or three weeks.

2. How shall I feed them? Could I put them in a room?

3. How many colonies of bees can be kept in one yard?

4. I want to sow some white clover seed in the spring. Will it bloom the first year?

5. Can I sow it on timothy stubble, or will the ground have to be broken?

6. What other kinds of plants are good for bees? I have never kept bees, but am just buying some.

7. Next year I want to make a cellar on top the ground. I am going to make it with a double wall and fill in between the walls with dry sawdust, and make it so it won't freeze inside. Could I keep bees in it the same as they do in an underground cellar through the winter? ILLINOIS.

ANSWERS.—1. I don't transfer before fruit-bloom. Your bee-book will give you instruction for transferring, although with only 3 small pieces of comb there will be little more to do than to dump the bees down in front of an empty hive and let them run in.

2. You can put comb honey or candy in close up to the bees. It will hardly do to keep the bees in a room, but it will be a fine thing to keep them in a dark cellar.

3. That depends upon the pasturage within a mile or two. In most places not more than 75 or 100.

4. Not enough to count on.

5. It will grow almost anywhere, and with any kind of preparation.

6. There are hundreds of honey-plants, but none, perhaps, that will pay to sow for honey alone. It might be worth your while to try sweet clover, alsike clover, and buckwheat.

7. It will be all right if you keep it dark and steadily at about 45 degrees, but it will be easier to do that if it is at least partly underground.

### Winter Transferring—Size of Hive to Make, Etc.

I started with a lot of box-hive colonies last summer, and have about 40 in the cellar. I am a rural route mail carrier, and work my spare time towards getting a supply of good standard-size hives for bees in the spring. Several of the old hives cost me only 50 cents each, some \$3.00, but some are nearly destitute of food.

1. Would it do to take some of the box-hive colonies that are in danger of starving into a warm room this winter, and transfer them to good frame hives, using only the good combs, and contract to the size bees will occupy, placing candy between the frames or on top? Or would it cause the bees to be over-excited, flying themselves, and when again confined in the cellar without a cleansing flight, to become listless and sick?

2. Will it injure colonies to have the top of their box loose (not sealed); as, for instance, the dovetailed hive and a flat, loose cover (in cellar ranging from 42 to 45 degrees)?

3. Is it any advantage to have hives crowded full of bees in the fall before putting into the cellar?

4. I got several swarms from friends who wanted to kill them and take the honey, and after driving them in my forcing-box I united them in 8-frame hives rich in stores. What would you do to two of

these when the bees hang outside of the hive in the cellar, and continually make a humming noise as if uncomfortable? The hive, bees, and bottom-board weighed 69 pounds when put in Dec. 9. I have raised the cover one inch for more ventilation; it helped only little.

5. Do you recommend, when one starts with all new hives, to make the brood-body 2 inches deeper (Dadant fashion), with telescopic covers? or what hive do you recommend?

6. Will it pay me, when transferring a number in the spring, to use full sheets of foundation instead of the old combs from box-hives?

7. What are tulip-trees, also called poplar or whitewood? Have we any such tulip-trees here in the Mississippi region? (Can it be cottonwood-trees?)

8. If I make my own hive-bodies, what kind of frame would you advise me to buy for practical bee-keeping? GRUNDY Co., IOWA.

ANSWERS.—1. Don't transfer in winter. Those box-hives, most likely, have no bottom; if they have bottoms, pry them off. Turn the hives upside down, put candy between or on the combs, and leave them upside down as long as in the cellar. When I had box-hives I wintered them upside down in the cellar.

2. Not a bit; unless the entrance is very large it will be all the better to be a little open at the top.

3. I suppose it might be possible to have colonies too strong, but there isn't much danger in that direction. It's an advantage to have them very strong.

4. If raising the cover an inch quieted the bees a little, raising it more ought to help more. Try 2 inches, or even taking the cover off entirely. Possibly the cellar may be too close.

5. I don't like to advise. It won't cost you a great deal to try a few of the regular size of Langstroth frames and compare them with the deeper, and see which is best for you.

6. Better transfer all the straight worker-combs, unless you allow the bees to swarm first (which may be better), in which case you'll give the swarm on full sheets of foundation, and then break up the old colony 21 days later. Then it will be a question whether to melt all old combs or to save the best.

7. No, they're not cottonwood; they have a beautiful blossom that looks like a tulip.

8. Most likely the regular size Langstroth, 17 $\frac{1}{2}$  x 9 $\frac{1}{2}$ ; unless, indeed, you should prefer the deeper frame, as mentioned in Answer 5.

Don't you worry about my understanding your questions. If being a Scandinavian makes you write so neatly and express yourself so clearly, I wish a lot of bee-keepers would turn Scandinavian.

### Membership in Bee-Keepers' Organizations.

If I unite with a bee-keepers' association in an adjoining State, said association uniting with the National in a body, will I go into the National as a member on the same basis as the other members?

BEE-KEEPER.

ANSWER.—I don't know that there is any formulated law upon the subject, but the law of custom in such cases rules. No geographical lines govern strictly the membership of bee-keepers' societies. A bee-keeper may find it convenient to join a State association in an adjoining State, and if received as a member he is entitled to the same privileges as other members. If for any reason a bee-keeper in Canada should elect to unite with a society in the Southern States which unites as a body with the National, it is his privilege so to do, and it is the privilege of such society to accept him, and he will be accepted as a member of the National the same as others.

### Handling Foul-Broody Colonies—The Rietsche Press.

1. I am a beginner in the bee-business, and my bees had foul brood last fall. They are the common black bees, and into all colonies that did not show foul brood I put Italian queens last fall. I have some of the old foul-broody colonies left yet, and my thought was to put them on starters and then on full sheets of foundation in the spring, very early; but I see that you do not think I can do so before the honey-flow.

I have a few colonies of bees that I bought, and would like to move them home early in the spring. What can I do to get rid of the foul brood and save the bees in the spring? I want to know if I can not shake them on starters before the honey-flow and feed them? Can I not rid them of the foul brood in that way, and give the bees to other colonies of the Italian race?

The colonies I wish to move home are free from foul brood.

2. I want to put in some more Italian queens in the spring. Would you advise putting them in before the honey-flow? The earlier I can do it the better, on account of the foul brood, I suppose. Those I wish to move home are common bees.

3. If I am careful in handling the foul brood, can I not save the brood-frames that contain such disease, by scraping or boiling them?

4. Do you know anything about the Rietsche press for making foundation? NEW YORK.

ANSWERS.—1. It is possible that you might, early in the season, feed the bees regularly in such a way as to make it take the place of a honey-flow, but it is hardly advisable. Bring those bees home—they'll be just as safe as the healthy colonies already there—then treat the diseased ones in the honey-flow. Do what you can to avoid having any of the diseased colonies robbed, for that's the special danger. If a foul-broody colony becomes queenless or very weak, there is danger that the healthy colonies will rob it and carry home the disease. So break up any that are in any danger of being robbed, and be very, very careful not to expose any of the combs with diseased honey. You

Speak as if you thought of giving the bees from the diseased colonies to the healthy colonies. Don't do that; they'll take the disease with them.

2. The earlier the queens are put in, the earlier, of course, will be the change to Italians; but it costs more for queens early, and you mustn't count on changing the blood to drive out the disease.

3. Yes.

4. Thousands of Rietsche presses are in use in Europe, one reason being that so much of the foundation on the market there is adulterated. In this country there is no trouble about buying pure foundation, and although a few years ago a number had machines to make foundation, nearly all buy now. It is possible, however, that by using leisure time for it, some would do well to use the Rietsche press.

## GOOD LUCK TO PLANTERS OF SALZER'S SEEDS

### ALFALFA CLOVER

We are headquarters for Alfalfa, the kind yielding 7 tons per acre; Salzer's Alsike Clover, hardy as oak, yielding 5 tons of magnificent hay per acre. We are the largest growers in the world of Mammoth Red Clover, of Crimson Clover, of June Clover, Timothy and all sorts and varieties of grasses.

### TEOSINTE AND BILLION DOLLAR GRASS

Greatest green food on earth, yields 80 tons per acre, should be planted on every farm in America, enormously prolific. Billion Dollar Grass yields 7 to 14 tons hay per acre.

### SALZER'S NATIONAL OATS

Greatest Oats of the century, yielding in forty States from 130 to 300 bushels per acre. Every farmer in America can have such yields in 1905. Salzer positively guarantees this. Often 80 strong, heavily laden stocks from one kernel of seed! That is the secret of its enormous yield. Straw strong, stiff, stands like a stone wall. Nothing ever seen like it before.

### HOME BUILDER CORN

So named because 50 acres in 1902 produced so enormously that the product built a beautiful house. See Salzer's Catalog. It is the earliest, big-eared and heaviest Yellow Dent Corn on earth, yielding in Indiana, 157 bushels; in Ohio, 160 bushels; in Tenn., 198 bushels, and in Mich., 270 bushels.

### SPELTZ AND MACARONI WHEAT

Speltz is the greatest cereal food on earth, yielding 80 bushels of grain and 4 tons of hay per acre. Macaroni Wheat, doing well on all soils, yielding 80 bushels per acre. Hanna Barley for arid, dry soils, yields 75 bushels per acre; and Salzer's Beardless Barley, 121 bushels.

### ONION SEED, 60c. A POUND

Largest stocks of Vegetable Seed. Prices low!

### FOR 10c. IN POSTAGE STAMPS

and the name of this paper, we will send you a lot of farm seed samples, fully worth \$10.00, to get a start, together with our mammoth 140 page brilliantly illustrated catalog, painted from nature, alone worth \$100.00 to every wide-awake farmer.

## Reports and Experiences

### Long Confinement in Winter Quarters.

My 85 colonies of bees were in winter quarters 155 days, or 5 months and 5 days without a single flight, the winter of 1903-04, and all came through the winter except one colony. I never lose any sleep over the bees wintered out-of-doors, and seldom have any loss, while many around here have lost 75 percent and some all of their bees. After long experience I have about decided that if bees are properly put away for winter they can just curl up and wait till spring comes. At least some of my best colonies were hard to waken in the spring. CHAS. MITCHELL, Ontario, Canada, Jan. 17.

### Yields for 1903 and 1904.

In 1903 I had 3 colonies in the spring, increased to 5, and got 700 pounds of comb honey, most of it in brood-frames with 1-inch starters.

In 1904 I had 4 colonies in the spring and got 300 pounds of honey, 250 pounds of it in sections. To-day I have the small number of 4 colonies and wish I had 25. I will buy more if I can get them at a price that is right. I am to work on a farm for monthly wages, and keep the bees where I worked last year, and as soon as wages and bees will permit I shall work a farm for myself. That's the best kind of freedom.

I can not do without the American Bee Journal as a matter of business and pleasure. Last year was the first season I was ever a subscriber to it, but for 5 years before that I was in a family that took it. So I have had more than one year of pleasant reading on the subject of bees. ELMER E. PORTER, Winnebago Co., Ill., Jan. 16.

### Ventilating Bee-Cellars—City Bee-Keeping.

I noticed in one number of the American Bee Journal a lengthy article regarding the ventilation of bees in winter quarters. From my personal experience I can offer some hints that might be interesting to some readers.

It is perfectly natural for bees to have good fresh air. If not furnished to them, you are denying Nature, and to deny Nature to so great extent is disastrous.

In a basement or cellar having 50 colonies or more, bring a stove pipe (or smaller, say from 3 to 6 inches as the case requires)

### SHENANDOAH YELLOW

The corn that has made Shenandoah famous. Has outyielded all other varieties of yellow corn wherever tested. A deep grained 100 day yellow corn, ripe in September. Will outyield, outbell, and outsell any yellow corn you ever grew. The world's husking record, 207 bu. in ten hours, was made in this corn near Shenandoah, Dec. 8, 1903. Send for free catalog, photographs and samples of this and other varieties of corn. \$5.00 worth of seeds free on club orders. Ask about it. HENRY FIELD, SEEDSMAN, BOX 50, SHENANDOAH, IOWA THE EAR SEED CORN MAN

**WALTER S. POUDER,**  
513-515 Massachusetts Ave., INDIANAPOLIS, IND.

through the cellar window, continue it down the side of the wall and across the cellar bottom, leaving at every 4 or 5 feet a 2-inch hole on top in the pipe to deliver fresh air. Then, continue a like pipe across the ceiling with small openings like the long pipe, and if convenient, lead it to some chimney or flue, otherwise run it up on the outside of the building a height of 6 feet or more.

By doing this you will procure perfect circulation of fresh air. By holding a lighted match at any one of the intake holes in the pipe, you will nearly extinguish the light by the draft.

It is a small expense to fit up this way. One-half the cost of one colony of bees will pay for the pipe.

Of course you will get some condensation in the intake pipe, and water will form, but by slanting the pipe and leaving a drain it will amount to practically nothing.

The pipe can be preserved by getting two quarts of asphaltum, worth say \$1.00 per gallon. Make a trough long enough for a length of pipe to lay in, and submerge each pipe. When this is dry rust will not penetrate. It is useless to bring in a pipe or leave a window open, thinking you can get an equal distribu-

Cut this out. Send to-day. THE DIXIE HOME, 24A48t No. 75, Birmingham, Alabama.

Bees For Sale

85 colonies, mostly pure Italians, Moore's strain. All in fine shape and wintering nicely. Will sell all or in lots of 5 colonies. Reason for selling: too much other work. Write for prices and any further particulars. H. E. JOHNSON, Græettinger, Iowa.

Please mention Bee Journal when writing advertisers.

tion of fresh air. You have in some manner to deliver the fresh air to the bottom, and have a good ventilation at the top, in order to procure perfect results.

The way I came to get interested in bees was this: Last summer, while in Minneapolis, a swarm of bees came in from the country, I suppose, and settled in a tree in front of the house. I hived them. Shortly I became very much interested in their workings. Later I bought 3 more colonies and a quantity of extra hives, supers, and all necessary tools for handling them. For wintering I built a closet under the basement stairs, and ventilated it as described. I find I have perfect fresh air, and enough for a person to live in. I have been in the electric business for nearly 20 years, and find the study of bees is almost equal to the modern use of electricity.

I am away from my home all day, and am not able to watch the bees very closely during the swarming season. I am a little afraid the city authorities will, in the summer-time, object to my keeping live stock in the city. To prevent any annoyance to my neighbor and not knowing where they may alight when they swarm, will some one explain in detail the best course for me to pursue?

I do not expect to make any money out of my limited chance for keeping bees, neither do I ever expect to see my money already invested in bees, but as the encyclopedia says, some people have been studying bees for 2000 years, and are still studying them. It must be a grand study. G. M. JONES. Hennepin Co., Minn.

The Hoffman vs. Closed-End Frames

MR. EDITOR:—On page 22 Mr. Allen Latham says it is beyond his understanding how any one can use a Hoffman frame. He says:

"Why any one will use a Hoffman frame is beyond my understanding, for it has practically all the disadvantages of the closed-end frame with only one and a half of the advantages... Why in the name of common sense not carry the full width of the end-bar clear to the bottom and get all the advantages?"

Lest some beginner may be misled into thinking that the change from the closed-end frame to the Hoffman was not a step in advance, it may be well to answer Mr. Latham's question:

The advantage of the closed-end frame over the loose-hanging frame is that it is warmer, and that the spacing is automatic. The disadvantage is that it kills bees. In the estimation of a large number, the advantage of the warmth is overbalanced by the disadvantage of the killing, leaving the advantage of automatic spacing still to its credit. In the Hoffman frame the end-frame is closed less than half its extent, making less than half

the warmth and at the same time less than half the killing of bees. To the minds of those who think the prevention of killing of more consequence than the saving of warmth, that gives the Hoffman the preference over the closed-end frame, while it has still all the advantage of self-spacing. Mr. Latham seems to have these things in mind, at least part of the time, but singularly enough closes his eyes to the killing disadvantage in the closing question. To be entirely fair, his question should have been, "Why not . . . get all the advantages, and also all the disadvantages?" The answer is that the full advantage of self-spacing is left in the Hoffman, and the other advantage of the closed end is overbalanced by its disadvantage.

Speaking of the closed-end frame, Mr. Latham says:

"And right here let me say that it will not cause the death of any more bees than will the wide bottom-bars which some of our sages are advocating."

Which one of our sages is advocating a close-fitting bottom-bar? Or does he mean that they kill bees in some other way? Will Mr. Latham kindly explain? LEARNER.

### Season's Results—Wintering Bees.

I saved only 27 colonies out of 105 packed in dovetailed chaff hives last winter. I bought 26 more colonies last spring, paying \$145 for them. Most of them were in pretty good hives.

So I began in the spring with 53 colonies, many of them being weak. I increased to 112 colonies, and 8 nuclei, and harvested 7400 pounds of honey, nearly 4000 pounds being in 1-pound sections, and the balance extracted. I have sold about \$850 worth, and have about 200 pounds on hand.

I have 103 colonies in chaff hives on the summer stands, and 8 colonies and 8 nuclei in

# Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.**

334 Dearborn Street, CHICAGO, ILL.

Dear Sir:—I have tried almost everything in the smoker line; 3 in the last 3 years. In short if I want any more smokers your new style is good enough for me. I thank the editor of Review for what he said of it. Those remarks induced me to get mine.

FRED FODNER.

## Engravings For Sale

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and using in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid. Address,

**GEORGE W. YORK & CO.**

334 Dearborn Street, CHICAGO, ILL.

a new cellar 22x30 feet, under my dwelling-house.

This is my first experience in cellar-wintering. I had the heaviest loss last winter in my 25 years' experience.

Bees are wintering well so far. They had a flight Dec. 27, and also New Year's day.

B. W. PECK.

Ashtabula Co., Ohio, Jan. 10.

### Severe Winter—That Bee-Calendar

My bees are getting along first-rate in the cellar, with the thermometer at 35 to 40 degrees above freezing point. They seem quiet, and have lots of honey and also air enough, as I raised the entrance one inch, and the hives are nearly two inches lower at the entrance than at the back end. The blocks I raise the hives with will nearly make the hives level again, and the bottom-board will have nearly two inches fall from the rear to the entrance, which gives the dying bees a good chance to roll out.

This is a severe, cold winter so far, with nearly two feet of snow in the timber, and from 8 to 10 feet on the prairie in drifts. The thermometer was from 20 to 30 degrees below zero. The timber is frozen so hard that it is impossible to get an ax that will stand it.

I think all bees on the summer stands in this locality will die for want of honey. Even if they have lots of stores in the hive when it is so cold they can not crawl from one frame to another to get it. Where combs are long enough and filled with honey there is no danger of the bees starving to death.

Tell that inventor of the bee-calendar to hurry up a little. I want one.

B. F. SCHMIDT.

Clayton Co., Iowa, Jan. 26.

### Fastening Foundation in Sections.

I wish to ask the comb-honey producers if any one of them has had trouble in fastening foundation to the sections. I had a good deal of trouble the last two seasons. The wood is very hard, and polished so highly that I find it impossible to make all of them hold. After the foundation is on two or three days I have to go over the yard and replace quite a large number. I use a Parker and a Clark fastener, and have put some on with melted wax. The melted wax holds the best, but is too slow.

The wood that the sections are made of is very hard, and when finished is as smooth as glass. I asked the manufacturer to leave the inside without sandpapering, but he told me that his machinery was made for polishing both sides, and could not be changed for one lot.

Now, if other bee-keepers have had the same trouble, why not join in asking to have them polished only on the outside? I would like to hear from others on the subject.

P. D. JONES.

Livingston Co., N. Y., Jan. 16.

### Small Honey Crop—Encouraging Outlook.

The honey crop the past season was the smallest in many years, especially when the matter of the enormous nectar contents of the blossoms is taken into consideration. The cause of the small yield was the great loss of colonies a year ago, or rather last spring.

Owing to the long-continued cold winter which prevented the bees from having a flight, and many of them from reaching the honey, (even though there was an abundance in the hive), some of the colonies starved to death, but the most of them died from disease. Colonies that apparently came through last winter in good condition, failed to build up to strong colonies before fall.

I lost all of my bees, and it served me right, for I failed to pack them—other work which I thought more important, preventing. Of course I was waiting for that "good day" which never came. Had I packed them, even though they could not have taken a flight afterwards until spring, I think I would have saved some of them, for up to this time in an experience of 20 years I never lost one colony that I had properly cared for. But I did not

### CONVENTION NOTICE.

Michigan.—The Michigan State Bee-Keepers' Association will hold its annual convention Feb. 23d and 24th, at the Eagle Hotel in Grand Rapids. The Eagle Hotel is located at 65 to 71 Market St., cor. of Lewis St., one block north of Monroe St. It will give a rate of \$1.50 per day, and furnish a room free for holding the convention. The Michigan State Dairymen's Convention will meet in Grand Rapids at the same time, and advantage may be taken of this fact to secure reduced rates on the railroads. When buying your ticket, ask for a certificate on account of the Dairymen's Convention. The secretary of the Dairymen's Association will sign this certificate which will then enable the holder to buy a return ticket for one-third fare.

W. Z. HUTCHINSON, Pres.

want to disturb them until a warm day, and so I was in the "blasted hopes" column.

Well, not to be outdone, I bought one colony from a neighbor, and it superseded its queen just when it ought to have been rearing bees—and I let it—so of course I got no white honey from it. But I took enough bees to form a nucleus, which I supplied with a golden Italian queen, and the result was two good colonies.

I also sent for a 2-frame nucleus with what was to be a red clover queen, which I got home on May 6, and which stored 60 sections of honey, 40 of them white honey, and besides the lower story was filled with honey.

As I did not care for colonies, I did not try to increase. It cost me \$7.00 to commence as told above, and I got, all told, 125 pounds of extracted and comb honey, and have 3 extra-strong colonies, which had a good flight on New Year's day, so I look for them to come through all right.

I think the reason so many of the colonies lived through and failed to build up was that the queens were diseased. I know of quite a number of bee-keepers who took the best care of their bees who lost all. Had the winter been a mild one, their success would have been "luck". The colonies which did build up stored a large supply of extra-fine white honey, but not much fall honey.

The outlook for the coming season is extra good for those who have bees. The big yield the past summer will cause an increase of bee-keepers.  
GEORGE SPITLER.  
Crawford Co., Pa., Jan. 16.

166 SOUTH WATER ST. CHICAGO, ILL.

**The Emerson Binder**

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

**GEORGE W. YORK & CO.,**  
324 Dearborn Street, CHICAGO, ILL.

**CHICAGO, Jan. 24.**—The trade in honey is not large and the offerings on the contrary are quite liberal. This makes an easy market for the buyer. Fancy white comb, 12½@13c; No. 1, 12@12½c; off grades, 10@11c. Extracted, white, 6@7c, according to flavor, quality and package; anything off about one cent lower; amber grades, 5½@6¼c. Beeswax, 29@30c.  
**R. A. BURNETT & Co.**

**BOSTON, Jan. 9.**—The market is without change since last writing. The demand continues light, and supply is more than ample. We quote: Fancy white, 16c; A No. 1, 15c; No. 1, 14c, with practically no demand for No. 2. Extracted, from 6@8c, according to quality.  
**BLAKE, SCOTT & LEE.**

**KANSAS CITY, Jan. 9.**—The demand for comb honey still continues light, as most of the retail dealers were stocked up on \$2.25 honey before the holidays, two cars of which were sold here at that time. We look for a better market in the near future, and quote: Fancy comb, 24-section cases, \$2.50; No. 1, \$2.25. Extracted, white, per pound, 6@6½c; amber, 5½@6c. Beeswax, No. 1, 28@30c.  
**C. C. CLEMONS & Co.**

**CINCINNATI, O., Dec. 19.**—Comb honey is now coming in more freely, and prices if anything have moderated a little. The sales made and prices obtained were for No. 1 fancy water-white comb, 12@13½c; single cases, 14c. Extracted is sold as follows: White clover, in barrels, 6½c; in cans, 7¼@8c; amber, in barrels, 5¼@5½c; in cans, 6@6¼c. Beeswax, 27c.  
**C. H. W. WEBER**

**PHILADELPHIA, Jan. 9.**—The market is unchanged from our last quotations, and trading light. We quote: Fancy white, 15@16c; No. 1, 13@14c; amber, 11@12c. Extracted, white, 7@8c; amber, 6@7c. Beeswax, 26c.  
We are producers of honey and do not handle on commission.  
**WM. A. SELSER.**

**CINCINNATI, Dec. 30.**—Since our last report was published, the price of extracted honey has advanced, no doubt acting in sympathy with the sugar market. We quote amber extracted in barrels at 6@6½c; white clover, in barrels and cans, 6¼@8¾c. Fancy comb honey, 13@14c. Beeswax, 28c.  
**THE FRED W. MUTH Co.**

**ALBANY, N. Y., Dec. 26.**—Comb honey is moving off very well considering the heavy receipts and cold weather. Prices not as high as early fall, as usual, but very good yet. Fancy white, 14@15c; No. 1, 13c; mixed, 12@13c. Buckwheat, 11@12c; mixed, 10@11c. Extracted, dark, 6@6½c; light, 6½@7c. Beeswax, 28@30c.  
**H. R. WRIGHT.**

**SAN FRANCISCO, Jan. 25.**—White comb, 1-lb. sections, 11½@12½c; amber, 9@11c. Extracted white, 6@6½c; light amber, 4½@5½c; amber, 3¾@4¼c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.  
Market is quiet and for other than choice water-white is lacking in firmness. High-grade honey is in light supply, but there is no scarcity of amber stock. Three lots of Hawaiian Island honey, aggregating 523 cases, arrived the current week.

**NEW YORK, Jan. 9.**—The market on comb honey is decidedly dull, and while there is no stock of dark and buckwheat to amount to much, all grades of white honey are plentiful, and for the present we cannot encourage shipments. We quote fancy white at 14c; No. 1 at 13c; No. 2 at 11@12c; buckwheat at 10c. Extracted honey is in fair demand, with abundant supplies and a weakening tendency is noticeable in the market. We quote white at 6@6½c; light amber at 5¼@6c; dark, 5@5½c per pound; Southern at 52@55c per gallon. Beeswax, 29c.

## The Colorado Apiarian Exhibit at the St. Louis World's Fair,

The Colorado Apiarian Exhibit at the St. Louis World's Fair last year was without doubt the most attractive of its kind there. It was in the excellent hands of Hon. G. W. Swink, of Otero Co., Colo., and we are much pleased to present a good picture of this fine exhibit, as shown above.

The display consisted of comb honey in one-pound sections, and extracted honey in bottles from  $\frac{1}{8}$  pound to 10 pounds each.

There was also a large pyramid of beeswax 2 feet in diameter at the base, 4 inches at the top, and 8 feet high, which weighed 700 pounds. There were very fine specimens of solid beeswax in the forms of horses, roosters, lions, fish, World's Fair buildings, besides bricks of beeswax and many other novelties in wax.

Among other things in comb honey was some fine brood-frames solidly filled with the whitest of alfalfa honey, besides 5 large stars of comb honey, and 5 beautiful samples of different designs built in glass, weighing from 20 to 60 pounds each. These were indeed most ingenious, and attracted considerable attention.

This beautiful apiarian display from Colorado won the Grand Prize on honey and beeswax, also 4 gold medals, 7 silver medals, and 5 bronze medals.

Mr. Swink certainly deserves great credit for the interest he took in preparing and installing this large and attractive exhibit. No doubt it will result in calling the attention of the world to what Colorado can do in apiarian products.

# Correspondence Course in Bee Culture.

Last fall we announced this course and made a special offer to students for early enrollment. We have secured quite a number of students, but nearly every one of these wants to continue his own bee-keeping so that we find ourselves without a sufficient number to recommend to parties wanting help in their yards.

We have inquiries now for help from a number of States—California, Colorado, Florida, Idaho, Illinois, Pennsylvania, Michigan, and other States. See what one of our students says :

THE A. I. ROOT Co., Medina, Ohio.

LA COSTA, TEXAS, Jan. 28, 1905.

Dear Sirs:—I am very grateful for the 1905 edition of the "A B C of Bee Culture". I am highly pleased with your instructions in your Correspondence Course. It brings out points the amateur could never find by reading bee-books as it gives the essential parts in rotation so to explain them understandingly. It is like having a teacher or trying to study off-hand. Saving so much time and getting the foundation started right is half the battle. I hope to be an expert bee-keeper some day. Should I fail I certainly could not blame you. Everything bearing your name is first-class. May you ever prosper and live long to instruct us. With best wishes, Yours truly, W. R. HESSKEW.

Send for our prospectus, or, better still, send us your order with \$10.00, for which we will send you :

**Complete Course of 17 Lessons.  
Gleanings in Bee Culture 1 Year.  
1 A B C of Bee Culture.**

We give in addition personal answers to as many questions as the student desires to ask, either on bee culture, locations, help, honey markets, or, in fact, any subject relating to bee-keeping. We know where many good locations are yet untouched ; where the good honey markets are ; who is needing help, and hundreds of other things that the bee-keeper wants to know. We can't tell you these things unless you ask. If you have hesitated to ask us, thinking we could not well afford to give time to answer your questions, enroll in our Correspondence Course. Never mind if you have been a bee-keeper for 20 years. If you do not need the lessons, the information we can give you by mail on a variety of topics will more than pay you. Let us show you one case :

A party became interested in bee-culture a few years ago and set about to build up a large apiary. He succeeded remarkably well, but paid little or no attention to the honey markets, his time being taken up with other matters. The third season he produced a very large crop of honey (150,000 pounds) and being unacquainted with the markets, he sent it for sale to a large city, to a house no more familiar with the honey markets than he. It appears that they sold it at any price they could get, for he told us later that the information we gave him of another market would have saved him over a thousand dollars on the one sale. (He hadn't asked us for it, but learning of the situation we wrote him, but too late ; the sale had been made.) Perhaps the American Bee Journal readers think they would not be benefited. We assure you there are dozens of ways in which you can be helped.

Here is what one of our customers thinks of our "A B C of Bee Culture", which is included with the course :

"After looking through the 1905 'A B C of Bee Culture', just received to-day, I told Mrs. C. I would not take \$25.00 for it if I could not get another copy.—P. F. CONKLIN, Elmira, N. Y."

**The New Edition (1905) "A B C of Bee Culture" is \$1.20, postpaid, if ordered alone.**

And another customer speaks thus of Gleanings in Bee Culture :

Dear Sir:—You ask if I have found "Gleanings" a good investment, and I can truly say the investment has not only been good, but very good. Although I do not keep bees for profit at this writing, but hope to at some future time, will say that I am trying to learn all I can about the subject, and "Gleanings" adds more ideas to my limited store of knowledge than any other publication I receive. All the departments treated in this semi-monthly paper are very interesting to me, and I get anxious to see its pages when the date arrives for its appearance.

Yours truly,

DANVILLE, N. J., Dec. 12, 1904.  
RALPH P. FISHER.

**Don't you think \$10.00 is a small price for what we are offering you ?**

**Gleanings (semi-monthly, 52 pages) is \$1.00 per year if ordered alone.**

**THE A. I. ROOT COMPANY,  
MEDINA, OHIO.**

ESTABLISHED IN 1861

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor.

CHICAGO, ILL., FEB. 16, 1905.

Vol. XLV.—No. 7.

## Editorial Notes and Comments

### A Reminder—Order Bee-Supplies Early.

When we were in the bee-supply business we had two kinds of summer sympathy. One was for the bee-keeper who suffered for the lack of bee-supplies when they were so sadly needed in order to take care of the swarms and the harvest of honey. The other kind of sympathy was for the overworked bee-supply dealer who was almost killing himself in trying to fill orders promptly, and yet at times could not get the goods from the manufacturers fast enough in car-load lots to fill his accumulating orders.

But much of this suffering could be avoided if many more bee-keepers would send in their orders for supplies about two months before they are really needed in the apiary. This should give both dealer and manufacturer ample time to fill such orders, no matter how many of them there might be.

"But", the bee-keeper says, "I don't know just what will be needed two months later." Of course, you don't know exactly, but you can estimate near enough so as to have on hand practically all that will be necessary when the honey season comes. Fortunately, bee-supplies are not perishable like apples and pumpkins, so if an extra supply is on hand they will keep until another season. It sometimes costs the bee-keeper more to be without supplies when they are needed than it does to have a little extra money invested in a surplus stock of supplies.

### Closer Touch of National Officers and Members.

Just when and where a certain subject can be most profitably discussed, and just what subjects can most profitably occupy the time of a convention or the space in a bee-paper—these are questions not easily settled in all cases by hasty thought. Evidently something of this was in the mind of one of the officers of the National Bee-Keepers' Association when writing as follows:

"MR. EDITOR:—It has occurred to me that there ought to be closer touch between the members of the National and its officers than at present exists. It is not pleasant to have an occasional hint thrown out that there is some kind of a 'big four' trying to run the Association without regard to the best interests of the members. Such a thing can not be too severely condemned, and if it exists those who know thereof should not stop at hints, but speak out very plainly, giving names and specifications. The officers of the National are not—at least should not be—autocrats; they are servants of the Association, chosen to be its representatives and do its work. So far as I have had an opportunity to judge from being one of them, I believe that at least most of them have no other desire than to have done just what is best for the general interests of the membership, and if there has been any clique that has had a controlling power in influencing action, I have not known of it.

"But however united the Board of Directors may be in desiring to do just what is best for all, they are in one respect badly handicapped. They have never an opportunity for a full meeting in person, and living long distances apart the discussion of any matter by mail must necessarily be tedious, and to some extent unsatisfactory. The point, however, that I have more particularly in mind just now, is that in

their deliberations they ought to have the fullest opportunity for full and free consultation with the membership at large.

"Two ways occur in which this may be done: At the annual convention, and in the columns of the bee-papers. If the latter will permit it, there are distinct advantages in that way. Conference in the convention can occur only once a year; in the columns of the bee-papers from 12 to 52 times. A matter needing immediate early attention may have to wait nearly a year for the convention, and only a week or a month for the paper. Then, the paper reaches a larger number of members than is to be found present at the annual meeting. It costs much less—provided space in the papers is not paid for—no small item. The question is, Will space be accorded?"

"Without particularizing others, one subject upon which light is needed—although it may not be referred to the Board, it is one of general interest—is that of incorporation. Will it be good or bad to have the National incorporated?"

There is little doubt that any of the bee-papers will cheerfully give space for the discussion of matters that may come within the province of the National. Indeed, that's what the papers are for, to discuss matters of general interest to bee-keepers. Every bee-keeper should feel at liberty to take the initiative, and to suggest anything that he thinks ought to be acted on by the management of the National. At the same time it should not be forgotten that space is not unlimited, and it must always be left to each bee-paper to decide for itself what is and what is not worthy of publication.

### Sawdust for Smoker-Fuel.

This is the way it is used by S. E. Miller, editorial writer in the Progressive Bee-Keeper:

"Grab a handful of green grass and stuff it down on the grate to keep the sawdust from sifting through, fill the fire-cup to within an inch of the top with sawdust, then drop about a teaspoonful of kerosene on top of the sawdust and light it with a match. Let it burn this way and do not close the top for several minutes, or until it has a good start. Then place another handful of grass on top of the sawdust to act as a spark arrester, and close the smoker and it is ready for business. The grass in the bottom keeps the sawdust from sifting down through the grate, and that on top keeps the sparks from flying out. The grass on top will not burn for quite awhile, and when it does, and the smoker begins to throw sparks, put on a fresh supply of grass. As it burns from the top downward instead of the reverse, it will burn a long time before being exhausted."

### Incorporation and the National Association.

Entire unanimity of sentiment regarding the advisability of incorporation for the National does not seem to prevail. One member expresses himself on this wise:

"I understand that it will cost only \$10 to incorporate. When an incorporated concern was misrepresented in the Ladies' Home Journal there was a prompt, distinct, and unqualified retraction and apology. When bee-keepers were misrepresented in the same Journal, no surprising degree of agility was displayed in making a retraction, and when it did come it could by no means be said that it was so unqualified as to leave nothing more to be desired. If I understand the thing correctly, the difference was due alone to incorporation in the one case and the lack of it in the other. If the National had been incorporated, would we not have gotten back the full worth of our \$10 in the different treatment we would have received?"

On the other side of the question, "To incorporate or not to incorporate", another member writes thus:

"The only reason for incorporating the National Association is that we might be able to make trouble. Other bodies incorporate to avoid the individual responsibility of the members, but the only reason that I have heard, up to the present time, for our incorporating is that

we might be able to sue somebody. Now, it is my candid opinion that the National Association can find better use for its money than to spend it in lawsuits. The more you have to do with lawsuits the more you will wish you had not had anything to do with law. Here is the point: If we should sue any paper for damages, we would have to prove the damages first. The question would then arise, "Who has been damaged?" And we would have to prove that the National Association, as such, had been damaged. We could not appear in court representing the entire bee-keeping industry, whether we are incorporated or not incorporated. All we could do would be to represent the members of the incorporation, and we would be very upt to find some trouble in proving that the individual members had been damaged a fixed amount."

### Cleansing Wax in Salt Water.

In Praktischer Wegweiser it is recommended to boil wax in salt water, watching carefully that it does not boil over. Two or three boilings are said to make the wax clear. The proper quantity of salt is not given.

## Miscellaneous News & Items

The Michigan Convention will be held Feb. 23 and 24, at the Eagle Hotel in Grand Rapids. All being well we expect to be present. Since publishing the notices of prizes offered, on page 84, we have been invited to participate, and would say that the American Bee Journal will "give a year's subscription to every man [or woman] who wins any of the other prizes". We hope there will be a good exhibit of honey.

The York Honey Co. is now entirely in the hands of Mr. Henry M. Arnd, who has been the manager of the company since it was formed last spring. We have disposed of all our interest to Mr. Arnd, as per agreement dated Feb. 1, 1905, which also includes, for a specified time, the privilege to use our registered honey-labels, and also the name "York", in the business or firm name. We wish Mr. Arnd the fullest measure of success, as he certainly deserves. Bee-keepers can rely implicitly upon him for an honorable and square deal every time.

Mr. H. S. Ferry, of Westchester Co., N. Y., has sent us a sample of the Ferry hive-opener and also the Ferry bee-brush. Each is attached to a small chain, at the other end of which is a metal eyelet to slip over a button, which insures its presence when once buttoned to the operator. The metal hive-opener is about 4 inches in length, and one end is in the form of a ring. At the other end is a sort of tomahawk, which can be used as a tack-puller, screw-driver and little hammer. The bee-brush is made double, so that bees from both sides of a comb can be swept off with one motion. Both of the articles are ingenious, and doubtless will be offered to bee-keepers through the bee-supply dealers.

The Illinois Bee-Keepers' Bill has been introduced in the State Legislature and referred to the proper committees. The following is a copy of the document:

#### A BILL.

AN ACT making an appropriation for the Illinois State Bee-Keepers' Association.

WHEREAS, The members of the Illinois State Bee-Keepers' Association have for years given much time and labor without compensation in the endeavor to promote the interests of the bee-keepers of the State; and,

WHEREAS, The importance of the industry to the farmers and fruit-growers of the State warrants the expenditure of a reasonable sum for the holding of annual meetings, the publication of reports and papers containing practical information concerning bee-keeping; therefore to sustain the same and enable this organization to defray the expenses of annual meetings, publishing reports, suppressing foul brood among bees in the State, and promote the industry in Illinois:

SEC. 1.—Be it enacted by the people of the State of Illinois represented in the General Assembly: That there be and is hereby appropriated for the use of the Illinois State Bee-Keepers' Association the sum of \$1200 per annum for the years 1905 and 1906, for the purpose of advancing the growth and developing the interests of the bee-keepers of Illinois; said sum to be expended under the direction of the Illinois State Bee-Keepers' Association, for the purpose of paying the expenses of holding annual meetings, publishing the proceedings of said meetings, suppressing foul brood among bees in Illinois, etc. Provided, however, that no officer or officers of the Illinois State Bee-Keepers'

Association shall be entitled to receive any money compensation whatever for any services rendered for same out of this fund.

SEC. 2.—The Illinois State Bee-Keepers' Association shall appoint at each annual meeting a State inspector of apiaries for one year, or till his successor is elected and qualified, who may, if necessary, appoint his own assistants. Said inspector, or inspectors, shall, when notified of the existence of the disease known as foul brood among apiaries, examine all such as are so reported, and all others in the same locality, and ascertain whether or not such disease exists, and, if satisfied of its existence, shall give the owner or person who has the care of such apiaries full instructions as to the manner of treating them. Within a reasonable time after making such examinations the inspector shall make another examination thereof, and if the condition of any of them is such as in his judgment renders it necessary, he may burn all the colonies of bees and all the comb necessary to prevent the spread of the disease. Such inspector shall, before burning, give the notice provided for in and otherwise proceed pursuant to the provisions of Sec. 3 of this Act. The inspector shall make, at the close of each calendar year, a report to the Governor and also to the Illinois State Bee-Keepers' Association, stating the number of apiaries visited, the number of those diseased and treated, the number of colonies of bees destroyed, and of the expenses incurred in the performance of his duty. Said inspector shall receive \$4.00 for each day actually and necessarily spent in the performance of his duties, and be reimbursed the money expended by him in defraying his expenses, provided that the total expenditures for such purpose shall not exceed \$700 per year.

#### SALE OF DISEASED APIARY, ETC.

SEC. 3.—Any owner of a diseased apiary, of honey made by or taken from such an apiary, or appliance taken from such an apiary, who shall sell, barter, or give away any such apiary, honey or appliance, or bees from such an apiary, expose other bees to the danger of contracting such disease, or refuse to allow the inspector of apiaries to inspect such apiary, honey or appliances, shall be fined not less than \$50, nor more than \$100, or be imprisoned in the county jail not less than one month nor more than two months.

SEC. 4.—That on the order of the President, countersigned by the Secretary of the Illinois State Bee-Keepers' Association, and approved by the Governor, the Auditor of Public Accounts shall draw his warrant on the Treasurer of the State of Illinois in favor of the Treasurer of the Illinois State Bee-Keepers' Association for the sum herein appropriated.

SEC. 5.—It shall be the duty of the Treasurer of the Illinois State Bee-Keepers' Association to pay out of said appropriation, on itemized and receipted vouchers, such sums as may be authorized by vote of said organization on the order of the President, countersigned by the Secretary, and make annual report to the Governor of all such expenditures, as provided by law.

Every bee-keeper in Illinois is requested to write his senator and representatives now in Springfield, urging them to support the above Bill. It should be passed promptly on account of its great need by the bee-keepers of this State, and also by reason of its modest and excellent requirements.

The two committees are made up as follows:

SENATE APPROPRIATION COMMITTEE:—Gardner, chairman; Hughes, McKenzie, Townsend, Pemberton, Mueller, Juul, Barr, Hamilton, Lundberg, Evans, Hall, Curtis, Templeton, Campbell, Hull, Powers, Burton and Cunningham.

HOUSE APPROPRIATION COMMITTEE:—Trautman, chairman; Shanahan, Pendarvis, Kerick, Lindly, Taggart, Dudgeon, Monroe, Rodman, Drew, Miller (of Clark), Glade, McGuire, Smejkal, Hardin, Arnold, Gaunt, Oglesby, Kittleman, Keck, Russell (of Iroquois), Pogue, Coyle, Heini, Pedersen, Zaabel, Echols, Rose, Donahue, Loy, Grace, Harris, Coleman, Cooke, Rapp, Finnan, Hearn, Witt, Lurton, Schafer, Wilson and Craig.

Rootville's Latest Rootlet.—Last week Tuesday we received the following announcement of the arrival of another boy in the family of the editor of Gleanings:

FRIEND YORK:—An 8-pound boy came to our house last Sunday morning. Both mother and boy are doing finely. He seems to be a very healthy and strong child; hardly ever cries, and sleeps and eats just as any good, strong boy ought to. Sunday morning after, I tried to put on two different collars, and they were both too small; and, finally, when I did get one on it was a tight pinch. I have heard of swelled heads, but never heard very much about swelled necks. I suppose I've got 'em both. E. R. Root.

P. S.—LATER.—Just bought a new hat. Had to.

So Editor Root's head swelled so that it extended down into his neck. Sort of "got it in the neck", too. Well, well, it does beat all how certain happenings affect certain people. Suppose Grandpa Root is also putting on "A. I. R.s" just now.

Congratulations to all of 'em.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

## An Experiment with Alfalfa in Illinois.

BY J. E. JOHNSON.

ONE year ago last spring (April 28) I plowed about one acre of ground, then harrowed it twice, after which I sowed 10 pounds of alfalfa seed and 100 pounds of infected soil from the Illinois Experiment Station; that is, soil taken from one of their successfully inoculated alfalfa fields. I again harrowed this little field twice. The weather was fairly favorable, and in two weeks the alfalfa was up, and made a good stand.

The first year I clipped it twice, and let it lay on the ground. Tubercles did not begin to form on the roots until about August or September, and the alfalfa did not look very thrifty. In one corner of this patch the white clover came up pretty thick, and at least half of the alfalfa plants in this corner died out entirely, and very few tubercles formed on these remaining plants.

In 1904 the alfalfa continued to improve except in the corner where the white clover was, and as it began to bloom I visited it frequently. One fine morning in the latter part of June I found that the bees were coming in great numbers from that direction, and the steady, though strong, low hum indicated that a great honey-flow was on. The bees would alight on the ground and alighting-board in front of the hive and rest. Everything seemed to indicate that one of the greatest honey-flows I had seen was at hand; and as there was a steady stream of bees from that field of alfalfa, I at once went to investigate.

Sure enough, there were the bees, but all were coming from or going to the basswood timber down by the creek about half a mile away. A close examination proved that not one honey-bee could be found on that alfalfa. But there were thousands of bumble-bees very busy on it. In fact, I never knew before that there were so many little bumble-bees in this neck of the woods. They all seemed to be about half the size of the old-fashioned Mr. Bumble, with whom I was so well acquainted in my childhood days. Why these bees preferred alfalfa to such a flow from basswood I am not able to say.

Well, in a few days I cut the alfalfa for hay, and it made fine hay; even the hogs would clean up a whole forkful of the dry hay, and both horses and cows like it.

In about four weeks it was in bloom again, and I could find honey-bees working on it every day, but there did not seem to be any great yield of honey; but it yielded some, I suppose, and when it was in bloom again in late fall the bees would work on smartweed until about 10 o'clock, then they would turn their attention to the alfalfa.

The alfalfa has seemed to improve gradually in thriftiness, and its roots are now 3 or 4 feet long in some places, and it has a fair supply of tubercles, but not as many yet as it should have; but in this corner where the white clover got started, there the alfalfa plants have very few tubercles, and some none at all, and the alfalfa looks spindling.

I have observed and studied the actions of this little field of alfalfa very closely, and I feel confident that there is an antagonism between the bacteria of alfalfa and those belonging to white clover. Not that there is a declaration of war between them, but that the presence of great numbers of white clover bacteria has an unfavorable effect on the action of the alfalfa bacteria, I am pretty positive.

It is a well-known fact among bacteriologists that the product of one species of bacteria is often unfavorable to another, and prevents its rapid propagation. For instance, persons having a certain contagious disease are found to be immune from certain other contagious diseases, and can not contract them, even though thoroughly exposed. There is a little white clover here and there all through this field, and in order to smother it out I let the alfalfa stand, and did not cut it the third time. It produced some seed

I neglected to say that I gave this land a light dressing of manure before I sowed the alfalfa. I also applied lime to a part of it, which gave it a little aid, I think. And to part I applied wood ashes, and that little spot on which I applied ashes far outstripped the other, and a much greater abundance of tubercles can be found on the roots in that

spot. For lack of ashes I applied ashes only to a spot about 10 feet square. Possibly the soil lacks potash.

I think perseverance will bring about a good growth of alfalfa, as well as a fair yield of nectar. I expect to sow several acres of alfalfa next spring. My neighbors are becoming greatly interested in this experiment, and several have asked for infected soil. I had several visitors who came purposely to see this alfalfa.

From the way this alfalfa grew last year on the best part of the patch, I feel safe in saying that when it has become well established it will yield twice as much hay as common clover, and that it will, with its long roots, not only stand the dry weather better, and not freeze out, but it will bring both potash and phosphorus from a greater depth than any other leguminous plant, thereby adding not only nitrogen but potash and phosphorus as well.

My catnip experiment is as yet only a moderate success, but does well among any decayed rubbish without any shade. I will perhaps tell more about it some future time.

However, I got about 100 pounds of extracted honey that smelled very strong of catnip when I was extracting it. This honey has a flavor very much like hoarhound candy, and we all like it so well that we kept it for our own use. It is a little darker than clover. I suppose it is about half smartweed. I will send a pint jar free to the editor if he will pay express charges. Knox Co., Ill.

[The sample of honey arrived in due time, but we could neither smell nor taste any catnip about it. Some 25 years ago we had a sample of catnip honey that was the real thing, and, compared with that, the sample sent to us by Mr. Johnson has scarcely a trace of catnip honey in it, we think. Mr. Johnson's sample is good enough for any one to eat at any time, while the catnip honey we had long ago would be a good remedy for a certain kind of childish ache—just below the belt!—EDITOR.]

## No. 2.—Bee-Keeping in the Southwest.

BY PROF. LOUIS H. SCHOLL.

[Continued from page 85.]

MANAGING THE BEES BEFORE THE HONEY-FLOW.

IN a previous article were listed the honey-flows as they appear in the different localities, and the readers will therefore have an idea about the time when these flows may be expected, and the length of time the bee-keeper has for bringing his colonies to the best possible condition for them.

WHEN TO BEGIN PREPARATIONS.

With many bee-keepers the idea still prevails that the time to begin preparing the bees for the honey-flow is not until spring, but many years of experience have taught some of us that the right time to begin is in the fall before. If the bees go into winter quarters in good condition, with plenty of stores, they will come out the following spring ready to make preparations for business when the honey-flow comes. Such colonies will build up rapidly, and populous colonies are one of the most important essentials in producing a large crop of honey. Herein lies the way for success in bee-keeping. Weak colonies, in a poor condition, will not do; they will profit their owner little or nothing at all.

MANAGEMENT THE PREVIOUS FALL.

Begin the fall before by having good queens in all your colonies. This is of great importance, for around them centers everything. To have a good queen in a colony means the same as heading a herd of fine-bred animals with one of the best breeders. Of course, all this is well known by the bee-keepers in general, but do they follow such teachings about which they have learned? While some do, it is neglected by entirely too many, and that to their own detriment and loss.

Besides good queens, the condition of the brood-nest should be looked after, that there are no defective or incompletely built out combs; or, as it sometimes happens in some of our Southern apiaries, that there are no pollen-filled combs left in the center of the brood-nest. Sometimes an abundance of pollen is stored in the late summer, and combs are packed solid with it. Such, together with otherwise unsuitable combs, only retard the progress of brood-rearing of the colony in the early spring; and no matter how good the queens may be, they will not be able to do their part unless a brood-nest is provided for them in the

best and most suitable manner for their purpose. For this reason it is important to look after the condition of the brood-nest also.

Provide the colonies with *plenty* of stores—for winter? No, not only, but *for next spring also*. Many a time a colony has had enough to live on during the winter, only to starve during the early spring until the honey-flow arrives. This is a decided loss. It retards the progress of the colonies to such an extent that they are not in shape to do the best possible work when the required time comes.

#### WINTERING THE COLONIES.

Such a subheading looks strange in an article on Southern bee-keeping; nevertheless there is more truth in it than may be supposed, for we *winter* our bees in the South as well as elsewhere, or at least we should do so. This does not mean bee-cellars or chaff-hives, and the like, but it means that the bees are to be prepared for the winter just as outlined above, with sufficient stores, and every colony in good condition, with plenty of young bees. Very little else is necessary in the South during winter. If they are protected from the north and exposed to a southerly location, it is all the better.

The extracting-supers are left on the hives the entire year, and usually contain some honey as part of the winter stores. Later in the spring they are used for brood-rearing, thus providing additional room for the queen; and large hives prevent swarming. Still later, when this room is not occupied with brood any longer, and more honey is being brought in than is used by the bees, it is stored in these supers, thus preventing the clogging of the brood-nest, which so often happens if only a single-story hive is used. Thus, the extracting-supers have an advantage for three purposes if left on the hives—for containing an extra amount of honey for winter stores; in providing additional room for brood-rearing; and furnishing room for storing early honey.

#### THE HONEY-FLOWS.

In my own locality, and many others, some honey is coming in more or less during early spring, and brood-rearing goes on rapidly, so that colonies soon become very populous. Brood-rearing is begun *very* early, the queens quite often not ceasing their egg-laying at all, in which case some brood is present during the entire year. Therefore it is possible to have strong colonies very early, and ready in plenty of time for the coming honey-flow. The first flow comes in April, from mesquite, and is the one toward which we are building our colonies during the early spring. They should be so managed that they will be in the best possible condition for this flow—strong in bees of the right age for gathering the nectar. Upon this depends the profit of keeping bees.

#### SWARMING AND PREVENTION.

With everything favorable, swarming might be expected early from such populous colonies, and such will appear as early as the month of February in some years—sometimes later—and often lasting until June or July. This is what we want to prevent if we have an early flow and expect any surplus. For a later flow it may be best to force them to swarm instead of preventing it, as the two, if built up, might store more surplus than if they were not increased. This would be the better plan perhaps if increase is desired. The swarms might be natural or artificial.

#### SWARMING CEASES WHEN FLOW BEGINS.

If the colonies can only be kept populous and swarming can be prevented until the honey-flow has begun well and the bees have gone to work in earnest at storing surplus honey, then we shall have conquered so much of the problem. The bees devote their whole time and attention to the storing of honey, and seem to forget all about swarming—a fact which is entirely different from those existing elsewhere, especially in the North where the colonies swarm right in the midst of the honey-flow, leaving the hive with supers of sections only partly completed, much to the vexation of the bee-keeper.

There are two ways of preparing your bees for the surplus honey-flow for the best results, when such comes early in the season. One is by preventing swarming altogether, and the other is done by preventing swarming up to a certain time, but forcing them to the swarming condition just before the flow, and then practice "shook swarming". Of these more will be said later, as space here does not allow me to dwell upon it as fully as I would wish to.

Brazos Co., Tex.

[To be continued.]

## Convention Proceedings

### ONTARIO BEE-KEEPERS' CONVENTION.

REPORTED BY MORLEY PETTIT.

The Ontario Bee-keepers' Association held its 25th annual meeting in Toronto, in connection with the Provincial Fruit, Flower and Honey Show, Nov. 15, 16 and 17, 1904.

The secretary read the minutes of the 24th annual meeting, which were approved and signed by the president.

Pres. J. W. Sparling's address was then presented, after which Mr. Morley Pettit read the following paper on

#### EXTRACTED HONEY.

The main products of our industry are comb honey and extracted honey; and in this country we produce the latter much more extensively than the former. It will be seen, then, that my subject is almost as broad as the business itself. It naturally falls into two main divisions: I. The production of extracted honey. II. The care and sale of extracted honey.

The quantity and quality of honey produced depends upon:

1. Weather. 2. Locality. 3. Bees.

1. Weather is beyond our control; but a careful study of conditions extending over several years enables one to forecast with some degree of accuracy, and plan operations accordingly.

2. Locality must be chosen and studied with equal care. The nature of soil, flora and climate are of the utmost importance. The soil should be moist, though not cold, and flora of the honey-bearing varieties. It is desirable to have honey coming from early spring until late fall with two or three sharp intermissions, when bees may kill drones and lose the desire to swarm.

3. I spoke of weather, locality and bees, meaning by the latter: a. Race or breed of bees. b. Condition of bees.

a. There are three races of bees which play an important part in Canada: Italians, Carniolans, and blacks. Black bees are the most common, and have their good qualities and their champions. They are, however, too excitable to be handled comfortably, and do not defend their hives well from robber-bees and moths. The Carniolans are handy and prolific. They breed up rapidly in spring; but are great swarmers. The Italians are quiet and good workers, defend their homes well, and are not so much inclined to swarm.

b. The condition of bees would include style of hive and management. As we strive for uniformity in the apiary, or set of apiaries, so throughout the Province, country and bee-keeping world, the standard hive should, as far as possible, be adopted. That is the Langstroth hive. For the production of extracted honey I prefer the 12-frame Langstroth hive, with supers of the same size. A good queen will occupy this brood-chamber with brood until the fall flow, when she will slacken her operations enough to allow plenty of winter stores to be crowded in at the sides.

There is nothing about a hive so important as the queen. She is the heart of the colony. From her comes the life-blood, as it were—the young bees to take the place of those which are wearing out and dying. With a good, vigorous queen the brood-chamber is kept full of brood in all stages, from the egg to the young bees emerging from the combs. A populous, energetic colony is assured, ready for any honey-flow that may come. A poor queen allows the circle of brood to become smaller and smaller, and the bees get "lazy" according to the old idea. That is, they dwindle in numbers, lose ambition, and store but little honey. The sooner such a queen is replaced the better.

But the thing most to be dreaded is queenlessness. The bees are working and growing old, while none are hatching to take their place. The combs of the brood-chamber which should be bright and filled with eggs and brood, take on a forsaken appearance, and soon become choked with pollen and honey. I am convinced that if it can possibly be avoided a hive should not be one week without a laying queen at any time. With the present scientific methods of queen-rearing, and the low price at which queens can be obtained, one should always have a few extra queens, of his own rearing or coming by mail, to use in emergencies. The queen-condition of every colony must be carefully watched at all seasons of the year, but particularly in preparing for winter.

The year around management has a direct bearing on the amount of honey produced. During the fall flow every colony is assured a good queen, good worker combs in the brood-chamber, and plenty of stores for winter. In preparing for winter, remember first that in cold weather bees must supply their own heat to keep the hive at a living temperature. They also must breathe like any other animal. Third, their breath is laden with moisture. Fourth, as in any other city of from 30,000 to 50,000 inhabitants, the death-rate is considerable.

The spring management is quite as important as the winter. It is then the breeding-up for a honey-flow is done, and two points particularly must be observed. By all means provide plenty of stores, and conserve the heat of the hive. By the beginning of fruit-bloom most colonies should be ready for a super. At the opening of white clover and alsike in June, the dark honey of the previous fall and present

spring should all be removed as far as practicable from both super and brood-chamber. Then put in wedges to enlarge the entrance, and put on two supers containing 11 full Langstroth combs each, with excluder to keep the queen in her place.

The month of June is spent struggling with the swarming problem. By all means, so far as in you lies, hold your colonies together and allow no swarming. With plenty of extracting supers, the tiering-up system is more profitable, as by giving two or three supers to each hive, extracting may be postponed until the height of the swarming impulse is past. Then an adequate gang of men taking off from 2000 to 3000 pounds daily can soon extract the honey. The needed machinery for the yard consists of bee-hats, smokers and brushes; a light cooper's hatchet for prying and scraping, a wheelbarrow with smooth, tight bottom, and a robber-cloth. The extracting-room should be tight enough to keep out bees; but if such a place is not at hand, the smoke from one or two smokers in the room will help considerably to keep them out. Last season I used a 6-frame reversible extractor, and now would buy nothing smaller. It is placed on three legs high enough to deliver the honey into a barrel, and has inside a device which strains the honey before it goes out into the spout. This management, for which I am indebted to Mr. R. F. Holtermann, I have found to be a great saving of time and labor. The can for cappings consists of a square galvanized-iron can large enough to hold all the cappings that two or three men could take off in a day. Fitted within this can is another with perforated-steel bottom to hold the cappings up 6 or 8 inches from the bottom and allow them to drain. Wooden cross-bars on top support the combs, being uncapped. The knives are kept particularly sharp, and in all our operations we study the quickest and easiest way of doing things.

All white honey should be removed by the first of August to avoid any admixture of dark honey. Owing to the great affinity which honey has for moisture it is better, if possible, to extract on drying days. The process of uncapping and extracting exposes so much surface of honey to the air that a saturated atmosphere would thin the honey considerably. In no case should honey be extracted during the honey-flow unless three-quarters capped. It should, as soon as possible, be put into the packages in which it is to be sold, and sealed up. For honey exposed to the air not only absorbs moisture and becomes thin and watery on top, but it loses a certain amount of the delicate flavor and aroma which it has from its native flowers.

This matter of the care of honey deserves attention. The producer should understand thoroughly the nature of honey, what treatment will benefit, and what will injure it. Then seek at all times to educate buyers in this line. I might mention a few points:

Honey is first nectar of flowers. Bees gather and ripen it by evaporation in the hive. The latter process is dependent upon the weather. In dry weather it is ripened quickly and capped. In damp weather little capping is done. In our climate honey extracted thin can seldom be thickened by any process which will not injure flavor and color. The point to be made is, that honey should be well ripened by the bees, then extracted dry, and sealed up as soon as possible.

The natural condition of honey is first liquid, then crystallized. As agitation hastens crystallization in a saturated solution, so it hastens the granulation of honey. Stirring, straining, dripping through cappings, the jar of machinery, changes of temperature which cause contraction and expansion, all hasten granulation. To repeat the comparison: One crystal dropped into a saturated solution of a salt causes the whole to crystallize quickly; so a few grains of honey left in the combs or cans from last year, or mixed in the honey, make it granulate sooner than it otherwise would.

As honey is a natural product—not manufactured—it should be sold in its natural condition. Many prefer it liquid because they do not understand that it should granulate. As we desire to educate the public to eat more honey, we should teach them that its natural condition is granulated. Of course, we must give the buyer what he wants, but use our influence to make him want granulated honey.

The package must be chosen to suit the trade. For liquid honey glass seems to be preferred. For granulated honey use tin, wood, or paper, but not glass. Cultivate the home market. See that every house is supplied.

Further points which I have missed will no doubt be brought out in the discussion.

The points which I would emphasize in the production of extracted honey, study your weather, climate, and locality. Choose the best breed of bees and the right style of hives, and keep both in extra condition the year around. Give extra attention to the queens and the wintering, and allow no natural swarms, and as few as possible artificial ones. Do not extract honey until well ripened, then seal it up as soon as possible. Study short cuts in working. Study your market. Sell to the best advantage possible, and make good use of your money when you get it.

MORLEY PETTIT.

In opening the discussion on Mr. Pettit's address, R. H. Smith endorsed the main points, emphasizing the effect of climate and atmosphere on honey. Methods of extracting which might do for California or Colorado would not do for Canada.

G. H. Sibbald—The plan of having two supers on every hive is all right, but if a colony were a little weak, to raise the super up and put another under would not work well. Mr. Pettit's point in urging the importance of queens is good.

Mr. Pettit—If the colony is too weak for two supers, or you have not enough supers to put two on each, you might extract only the best-filled combs from the super each time over the yard. The balance should be placed together at

one side of the super, to be finished while the empties are being filled.

James Armstrong recommended taking combs of thin honey from weak colonies and giving them to strong ones to be ripened.

#### SIZE OF HIVES.

There was a lengthy discussion on the size of hives.

R. F. Holtermann—The great point is to keep your bees together so they do not swarm. The larger hive rightly managed will do that.

Mr. Sibbald—To keep bees from swarming, one must keep the brood-chamber from clogging with honey. In a large hive one can not do this, for they will crowd it in around the brood, then swarm as much as ever. To get well-ripened honey one must make the bees crowd the honey up into the super.

Mr. Holtermann—I find by experience that a good queen will have as little honey in a 12-frame brood-chamber as in an 8-frame. If you can keep the bees from swarming, that is the point.

#### CARE OF HONEY.

Wm. McEvoy puts his honey into tanks and covers over tight for a few days, then skims off the foam. In what he skims off he finds fine specks.

Mr. Pettit—If the honey is well strained there is no need of any further skimming. The foam which rises on the top is just honey—same as the froth on a milk-pail is only milk.

Mr. Holtermann—Thin nectar may rise to the top. Then moisture is absorbed at the top of the can and makes the honey thin. This is the only difference between the surface honey and any other. Honey should be sealed up as soon as possible.

E. Dickenson, Jr.—This skum, if allowed to stand, goes back to honey.

Mr. Armstrong had found quantities of wax in the foam which rises on honey that has been strained. Liquefying honey brings more foam to the top, and in this is wax.

Mr. Dickenson uses a milk-strainer wire-cloth for straining.

Mr. Deadman criticised the use of a wheelbarrow. He would use a wagon and tier supers up six high. He can draw 500 pounds, or, on level ground, 1000 pounds, with one ahead to draw and one behind to push.

Several spoke in favor of the wagon on smooth ground, but where out-yards are in uneven ground the wheelbarrow requires only one track. Then Mr. Pettit pointed out that the specialist has so many things to move when he moves his bees that a wagon seems an extra burden. Every farmer has a wheelbarrow which can be borrowed.

(Continued next week.)

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Starting with Bees—Selling Honey—Bee-Stings.

Five years ago I purchased an only colony of bees from a neighbor for \$2.50. I knew nothing about bees. That was in early spring, and about the second week of June I thought it time to put on the "upper story", as we called it. By the last of July I examined it, and found to my joy and surprise it was full. I managed to get it off, and it was leaned against a tree, a little way from the hive, to let the bees crawl out. It was left there all that day and part of the next, until the bees seemed to be carrying the honey out, and it was taken into the cellar.

There were so many bees, and no super to put on, we thought we would try to divide them. We took out two frames of brood and put in some old empty frames and made two new colonies. That was so late that all the bees died in winter.

A friend let us take some old copies of the American Bee Journal, and we read those and found out if we wished to keep bees we must read. We sent for the Bee Journal, and got all the books we could and spent the winter in reading.

In the spring we bought 4 colonies of black bees. They were regular hornets. We increased to 9 by dividing or by taking a frame of brood from each colony that we could and giving them an Italian queen; by fall they were very strong.

We got a good supply of honey that season, averaging about \$4.00 worth a colony, besides what we kept for home use. We did not lose a colony that winter, and increased to 13 with a fair honey crop the next season.

The season of 1903 was a good one, as we had 1300 pounds of extracted and 800 pounds of comb honey from 29 colonies, spring count.

Last season we had 35 colonies, spring count, and about 325 pounds of extracted and 300 pounds of comb honey. I began to sell my first super of honey, and have had such a demand for both comb and extracted honey the past year that I could not supply half of my customers. I sell all from house to house. The extracted is put up in quarts, half-gallons and gallons. I have regular customers who wait for their winter supply. I never sell any honey that is not nice and does not look No. 1.

Some order honey from the house, or take it when they come for their berries. I get 8½ cents for all extracted and 12½ to 15 cents for comb honey, according to the quantity wanted.

I mold the beeswax in small cakes, and sell at 5 cents a cake, which brings me 45 cents a pound; or 40 cents a pound for large cakes of 4 to 6 pounds to the laundries.

We use now only the 10-frame dovetailed hive. There is very little trouble in hiving a swarm when one does issue, as the bees always settle on a low tree near the apiary. Last season it seemed as if every swarm would settle on the same tree. We try to keep down swarming by dividing, and keep them strong by sometimes moving the combs of hatching brood from one colony to another, giving the strong one empty combs.

The bees sting me very much, and it always swells and feels bad; while the helper they very seldom sting.

We winter some of our bees in a cellar and some in the house-cellar. Forty colonies went into winter, but I fear some were a little light.

I like the Sisters' department, so that is why I try to do a little. If you think this any good, I may tell what we do next season.

MRS. J. E. MILLIGAN.

Linn Co., Iowa, Jan. 16.

You have no doubt by this time realized that one can not be too careful about not leaving honey exposed in the apiary. It is almost sure to start robbing unless nectar is coming in very abundantly.

You did not say anything about taking any bees with the two frames of brood that you took to start those 2 colonies with, but I suppose you took the adhering bees with them. One frame of brood and bees is not enough to start a nucleus with at any time of year early or late, for many of the bees will return to the parent colony. Two frames of hatching brood well covered with bees is the very least that should be taken, and usually three would be better, especially if rather late in the season. Of course, I am not referring to baby nuclei, or several nuclei, in one hive for queen-rearing purposes, but nuclei for increase. It is much better to have them strong to begin with.

You certainly have been very successful in your venture, and in disposing of your beeswax to such good advantage in your home market.

One reason why you are stung more than your helper may be that you make quick, nervous movements, while your helper does not. Watch and see.

By all means let us hear from you as to the results of next season's work. We heartily bid you welcome to our corner.

Among the thousand and one remedies recommended for bee-stings, there is at least one which might be called a woman's remedy—the washerwoman's Javelle water—which is used to take out fruit-stains and the like. Whether effective or not, it is probably as good, at least, as the average bee-sting remedy.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### BEE-KEEPERS A CLOSE CORPORATION.

So Editor Hutchinson can peacefully contemplate our craft reduced to such a close corporation that bee-papers would cease to exist. Bee-men too few to support papers. Now my feelings are inclined to "rage and pitch" a little at such a prospect as that. How is it with thee, gentle reader? Page 874.

### DIVERSE CONCEPTIONS OF APICULTURE.

What a lot of diverse conceptions of apiculture comprise the A, B, C, D of the thing! And what a contradictory mix societies and conventions and journals oft make of the incongruous list! Quite enough to make Pegasus wake up and snort.

A's Apiculture—nice, rural side-show.  
Lo a few hives, set up seven in a row,  
Where'er you go.

B is Bee-Ology—science the best;  
Pays us in wisdom, life, profit and zest—  
Come and be hlest!

C is cute Charity's bee-keeping plan,  
For the pantry and purse of each laboring man—  
Teach him, who can!

D is trust Dives—and sooner be hung  
'Than drop a cool dewdrop on Lazarus' tongue—  
Go it—you're young!

### A MISSOURI PROVERB AND HONEY-PRODUCTION.

A good Missouri proverb is that furnished by Mr. Calhoun, page 874: "No one so far from market as he who has nothing to sell". Same class of proverbs as Solomon's, "Where no oxen are the crib is clean". The world over, in all ages, it seems to be the case that nothing tends to beget nothing—and abundance of something good tends to find its way where it is needed. But a turnip is not going to ship a jug of warm, red blood—loo far from market. Also, the Missouri proverb kind o' brings us around toward the encouraging fact that there is never so much honey produced in our country as ought to be eaten in it. No fundamental impossibility to trouble us.

### BEE-KEEPING IN RUSSIA.

So Russia mostly uses hives of the kinds without frames; but the proportion of frame hives steadily and rapidly increases. It was 13 percent in 1894; now probably over 26 percent. In the 17th century, and previous apiculture (or api-capture), was very prosperous; and there were large amounts of both honey and wax to export. Now the nation pays out \$2,000,000 a year for bee-products. Like good, thrifty people they are scratching around to see if that sum can not be saved by improved apiculture; and thus it comes about that their representative, Mr. Abram Titoff, has been for some two years searching the United States for ways and ideas that may perchance make Russian apiculture more profitable. Mr. Titoff's paper read at St. Louis is a very noteworthy document. To help stimulate the declining industry the tax on bees was removed more than 100 years ago. Pages 878-880.

### CANDY-MAKERS AND ADULTERATION STORIES.

Misery loves company. It soothes us some to learn that the national society of candy-makers has to struggle with prevalent lies about adulterations of candy. The case of flour is not quite similar. No amount of lying about flour would bluff people off from using it; but when candy and honey are believed to be spurious and unwholesome consumption declines. Page 881.

### A QUEEN YARN TO KILL THE HONEY YARN.

A fib about a regular trade in queens at \$50 to \$200 each is not a yarn that we need to get infuriated at. Wonder if we can not turn it to good use. Lies oft devour each other; and we should be happy in seeing a harmless lie devour a pestilent one. Tell the good people that if honey were all manufactured by machinery, interest in queens would surely die out; and there would be no fancy prices. Queens can't do anything toward manufacturing honey except in the old-fashioned honest way. Page 3.

### IMPORTANT OMISSIONS APT TO MISLEAD.

How often a comrade in print leaves us utterly in doubt whether what he is giving us is remarkable and important or very much a matter of course—all by omitting to tell us a few necessary things. About California's 8th question (page 8), as many as three different theories suggest themselves. Supposing that he increased 3 colonies to 51, he hardly gave them a chance to swarm that year. Increasing 54 to 65 would leave room for some swarming; and of 65 run for a season without any artificial increase we would of course expect some swarms. Swarming, however, is a very lawless matter—to present view. It is quite impossible to forecast it. A season with no swarms when we expected and wanted some is not unusual; and to have two such in succession is only mildly surprising. But a second supposition is that

all increase was by purchase, and that he manipulated them in the same way with intent to prevent swarming. The third supposition is the same, leaving out the manipulation—simply did nothing, and just tells us of three years without swarming as a natural wonder.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Spring Stimulative Feeding of Bees.

Will what is termed "Yellow C Bright" sugar do to make syrup for stimulative feeding in the spring? I see it is quoted considerably lower in price than the granulated sugar. If it is as good, and has no ill-effects on the bees, I am thinking of using it next spring.

MISSOURI.

ANSWER.—Any kind of sugar that bees will accept will be all right to feed in the spring after the bees can fly daily. It is generally considered that granulated sugar is as cheap in the long run as sugars of lower grade at less cost. But it is possible that there may be some mistake in this, provided there is very much difference in price.

As you say you are "just a beginner", it may be well to remind you that there is danger of doing harm rather than good by stimulative feeding, for those who have not had much experience. Indeed, many of those who have had long experience do not find it advisable to practice stimulative feeding at all.

### Cleaning Brood-Frames—Fumigating Foul-Broody Hives—Prevention of Swarming.

1. In boiling frames to get the wax and propolis off, do you know of any acid that will help the matter along? I have had foul brood, and want to clean up and disinfect the frames.

2. I have been experimenting with formaldehyde, using a formaldehyde generator by boring a hole in the back of the hive, close to the ground, so the fumes could penetrate the brood-nest. In doing it that way I fill the hives and supers full of the fumes. What do you think of it?

3. Last summer, in manipulating my bees to prevent swarming, I took two frames of brood with sealed queen-cells on them, intending to leave the parent queen in the old hive. But by having my attention taken away from my work, I took the old queen along with the two frames. The old colony did not swarm, and I got 70 pounds of honey from it; in fact, it produced nearly twice as much honey as my other colonies where I kept the queen-cells destroyed and did not divide in any form. What do you think of that plan? Do you think it will work out that way every time?

ILLINOIS.

ANSWERS.—1. I don't know. It is possible that a liquid preparation of formaldehyde might answer, but I am ignorant on the subject. It is pretty generally agreed now that it is safe to use hives that have contained foul brood, and it is possible that it would be just as safe to use frames that had been boiled.

2. I have had no personal experience, and the testimony of those having had experience is conflicting. It is possible that the failures are owing to lack of thoroughness.

3. No, you can't always be sure of the same result, for in many cases—probably in most cases—taking away two frames of brood and bees with the queen would result in a swarm from the old hive as soon as the first young queen was old enough to go with the swarm. You may forestall that action, however, by cutting out all queen-cells as soon as the first queen has left her cell, or the next morning after the first evening when piping can be heard in the hive. But don't count too much on the plan; you're not likely to get any more honey than you would if the colony should be left entirely alone, provided the colony of its own sweet will should entirely refrain from all attempts at swarming—indeed, you'd probably get more honey in the latter case. The unfortunate feature in the case is that bees are not always willing to refrain from swarming.

### Movements of the Cluster of Bees in Cellar-Wintering—Mating Queens in Confinement.

By observation, I am led to believe that a colony of bees wintered on the summer stand in an 8 or 10 frame hive, with honey in all of the combs, does not move to a new place when a warm spell gives them the chance, but spreads out the cluster and carries the honey to the old place, until it gets too cold again, then they draw back about where they were at first.

1. What are the facts in the case?

2. Do bees in the cellar change the location of their cluster during the winter?

3. If one were to discover a way to mate successfully queens in confinement, would it be of any great practical value to the craft?

4. What recompense could one rely on, to follow success? Experi-

ments along this line, I think, are rather expensive, and require much care and time.

5. Please give us a sample page out of Dr. Miller's record-book.

ILLINOIS.

ANSWERS.—1 and 2. Bees do both ways, both in the cellar and out. Sometimes honey is carried from an outer comb, without changing the place of the cluster. Usually the cluster moves gradually backward or upward, as the bees eat their way into the full combs.

3. In special cases it would; in general, probably not.

4. The greatest recompense would probably be the satisfaction of having conquered a difficulty generally considered unconquerable.

5. It wouldn't do to give a whole page; there would be a gibbering maaiac in the Bee Journal office if one of that troublesome crew should attempt to get such stuff into type, but I think I'll risk giving one-third of a page, containing the full record of one colony:

50

24 72 96 120

Apr 29 q cl good May 11 g 1 br & b br in 4

03 19th 4 br 25th t 1 br & b br in 5 Jun 1

t 2 br & b 4 br 13th July 11 kleg

Translated into the United States language, that means that 50 is the number of the colony. The "03" under the 50 means that the queen was born in 1903. The figures at the top are the numbers of sections taken. First time, one super of 24 sections was taken, and the number 24 was put down. Next time two supers were taken at the same time, and 72 put down as the whole number up to that time. Then another super was taken, making 96, and the last time made 120 as the total for the season from that colony. If the last super had been only half full, the number would have been 105.

The remaining record runs: April 29 I found that the queen was clipped, and the colony was good for that time of year. May 11 I gave the colony 1 frame of brood & its adhering bees; and when that was done there was brood in 4 of the combs. May 19th there were 4 frames of brood, no frame being less than half full of brood. If one or more of the frames had been less than half full, the entry, instead of being "4 br" would have been "br in 4". May 25th I took 1 frame of brood & adhering bees, leaving brood in 5 combs. June 1 I took 2 frames of brood & bees, leaving 4 combs well filled with brood. June 13th I put on the first super, July 11 I killed 1 egg; that is, I destroyed one egg in a queen-cell. Evidently there was no further attempt at preparation for swarming the remainder of the season, no record being made if neither grub nor egg was found in a queen-cell.

The above is a true transcript; but not all colonies made so little attempt at swarming, while a few made no attempt whatever.

You will see that in the foregoing translation I have put in italics the letters that are in the actual record.

### Transmission of Bee-Traits—Krainer Bees—Old Brood-Comb and Size of Bees.

1. Are the good and bad traits of bees transmitted through the drones as much as through the queens?

2. Have the Krainer bees from Krain, Austria, ever been imported to this country? Are they more hardy than Italians?

3. How many years constant use for brood comb worker-comb be used without diminishing the size of bees? I have read that the cocoons left behind imperceptibly diminish the size of the cells of the future occupants, and prevent the bees from attaining their full development and size.

NEW YORK.

ANSWERS.—1. It is generally considered so; indeed, I think the preponderance of opinion is that the disposition of the offspring depends more upon the drone-father than upon the queen-mother.

2. You have probably read and heard quite a little about Carniolan bees. Well, Krain is merely the German word for Carniola. I'm not sure whether the claim for greater hardiness has been well established, but some think well of a cross with Italians.

3. I have combs that are 30 years old or more; and I can not see that the bees reared in them are any smaller than those reared in new combs. I remember that one of the patient foreign investigators—a German, I believe, whose name does not now occur to me—took the trouble to measure the contents of cells in combs very old and new, by actually filling them with liquid, and he found that the old cells contained just as much liquid as the new. The idea that the cells become smaller with age has been taught faithfully for many years, and there are still some who advise that combs be renewed every four or five years, but I think the idea is based only upon theory. Without any careful examination, one might easily conclude that as something more than was there before is left in a cell every time a young bee is reared in it, the cell must necessarily become smaller. But examine carefully, and you'll find that the diameter of the cell at its mouth remains the same. You will probably find that the bees gnaw out some of the cocoons at the sides, leaving it at the bottom. That, of course, will make the cell shallower, but to make up for it the bees add fresh wax to the cell-wall at the mouth of the cell. If they add to the cell-wall at the mouth, that ought to increase the thickness of the comb oughtn't it? Well, that's exactly what it does. Measure the thickness of a piece of worker-comb from which the first batch of brood has just emerged, and you will find it measures  $\frac{1}{8}$  of an inch. Take one old enough, and it will be fully an inch thick, and you will find the septum  $\frac{1}{8}$  of an inch thick. The only practical danger is that if the combs get to be old enough the spacing from center to center may become too small; in other words, the space between two combs becomes smaller. Don't worry about good, straight combs being hurt with age.

## Bee-Supplies!

Discount for Early Orders

We carry a large stock and greatest variety of everything needed in the Apiary, assuring BEST goods at the LOWEST prices, and prompt shipments. We want every beekeeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Massie Hives, etc. WRITE AT ONCE FOR CATALOG

## Reports and Experiences

### Results of the Season of 1904.

I started in the spring of 1904 with 67 colonies and got 4500 pounds of extracted and 3700 pounds of comb honey, and increased to 140 colonies. I took 300 pounds of extracted honey from one colony. I am only a novice in bee-keeping, but I am learning. I have the "A BC of Bee Culture" and Prof. Cook's and Dr. Miller's books, and the best of all the "Old Reliable".

PAUL JONES.  
Polk Co., Minn., Jan. 11.

### Bee-Keeping in Arkansas.

I have some fine Italian bees that came from Illinois. I had them shipped to me in the fall, and they stored about 3 frames of nice honey in October.

I have secured 100 pounds of surplus honey from every strong colony during the past 3 years.

My apiary is well located 64 miles from Little Rock on the Rock Island road. I have been keeping bees here for the past 4 years, and have been a subscriber to the American Bee Journal the most of that time, and have read some good books and papers on bee-culture. I can sell all the honey I can produce right here and in neighboring towns at 12½ cents per pound.

I believe bee-keeping in Arkansas can be made a success. It is a fine State, and has lots of rich soil yet undeveloped.

Yell Co., Ark., Jan. 2. A. E. STONE.

### The 4x5 Section vs. the 4¼x4¼.

The 4x5 section is receiving a great deal of attention lately, and much is being said about it, but it seems to me a rather one-sided discussion. Let us look into the subject a little:

Its strong points or desirable features are too well known, (being set forth in nearly every catalog or paper that one may pick up), to be mentioned here. We will dwell only upon its most noticeable flaws.

Did you ever think, when putting full sheets of foundation into sections, that the 4x5 takes more than the square ones? Well, it does; and at the present prices, or 70 cents per pound, it costs about 66 cents per thousand more for these than for the old-fashioned square ones. I am supposing, too, that the foundation is cut to fit them. If regular

## QUALITY.

Some of our competitors have been trying to cast a suspicion upon our goods, by stating that the quality of the bee-supplies furnished by us, at a less price than is usually charged for same, is of lower quality.

**WE DENY THIS,** and defy any one to prove that such is the case. All goods manufactured by us are guaranteed to be of standard quality, irrespective of the prices.

The cause for selling our products at lower prices than others, is very simple. We are at the heart of the lumber district, consequently do not have to pay freight for several hundred miles on raw material and also prepay return freight on the manufactured product.

We have one of the most modern plants in the country, running by water-power. This saves us the expense of fuel. Altogether we are able to sell at **25 percent less** than the average manufacturer is able to do, without sacrificing the quality of our goods.

We guarantee you absolute satisfaction or refund your money.

**JOHN DOLL & SON, (Power bldg.) Minneapolis, Minn.**

## Telephone Facts

Facts are what the farmer wants, whether buying a team or a telephone. If you want to know how others have built successful telephone lines write for free book 80. Our book F-80 "Telephone Facts for Farmers" gives the facts you ought to know about telephones for farm use, and whether you buy

**STROMBERG-CARLSON TELEPHONES**

or not you will be in possession of information which will enable you to buy the right telephone, build the right line and save unnecessary experimenting. We send it free.

Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y., Chicago, Ill.

Please mention Bee Journal when writing.

goods are used the cost will be a great deal more, on a mathematical of waste.

It is a mathematical fact that a sphere contains the greatest solid contents in relation to its surface, of any solid; i.e., that a sphere having 100 square inches of surface will have a greater number of cubic inches contained in it than any other solid having the same area. But we can not have a spherical section, for various reasons. The nearest approach to it that we could use would be one in the form of a cube. This is hardly desirable because it would be almost too small to put foundation into, and would look small when filled. However, we can use the 4 1/4 x 4 1/4 plain section, which is the nearest approach to it.

Let some scientist figure out for us how much more comb or wax it takes to fill a 4x5 than a square section, then let him multiply this by 10 to 25, which I think is the number of pounds of honey commonly claimed to produce a pound of wax. Again, let him multiply by 15 cents, the price per pound of the honey, and this product by 1000. We will then know how much we lose on every 1000.

Then, too, there is the first cost. Section-holders for these boxes cost \$2.25 per 100, while those for others can be obtained for \$1.90. Other goods are in proportion. One

## Hardy Evergreens.

grown in blizzard belt of Northern Iowa are healthy and full of vigor. We grow them by the million, and our prices are the lowest. We will allow you a cash discount of 3 percent on orders sent in during January.

PAGE & LYON MFG. CO., New London, Wis. U.S.A

hundred section-holders will hold 400 sections, so that it takes nearly 300 of them to hold 1000 sections—a difference here of \$1.05 in 1200 sections. But you will say, "I won't have to buy supers and section-holders every year." Quite so, but your money is tied up in them, and you are losing the interest, and I tell you that if bee-keepers make a living they have to look out for such things.

There are possibly other things against the 4x5 sections, and many things in their favor. Please do not understand me as condemning them. I have just mentioned a few points that seem to have been overlooked. I use a few of them myself, and find them entirely satisfactory, except in the several ways mentioned above.

ROBERT H. SMITH.

St. Lawrence Co., N. Y.

### Home Market's Demand and Supply.

The invitation on page 19, for those who can sell more honey in the home market than they produce, to tell the rest how they accomplish it, induces me to relate my experience, although it really seems to my mind a trifle tame.

I am a practicing physician, and some 10 or 12 years ago I purchased a colony of bees, thinking they would furnish me some needed

## FIELD'S REID'S YELLOW DENT

The big brother of the original or Illinois type of Reid's Yellow Dent. Bred to fit the low idea of longer ears, rougher grains, plenty of vigor, and a big yield. Same perfect form, handsome color, deep grains and straight rows, but a bigger, better type every way. I sell it either ear or shelled. Catalog, photographs, and samples free and I throw in a package of watermelon seed and one of flower seeds besides. Send for them today.

recreation and supply our own table with honey. When I was 17 years old I lived several months with an uncle and aunt who made a specialty of bees, and during that time I picked up some rudimentary knowledge of the business.

Well, I gave that first colony such good attention that they not only supplied our table and my wife's mother's table, but we had a good many pound sections to give to friends or relatives. At first I refused to take money as I was not in the business for gain. I did not myself belong to any church, but always tried to help all denominations when I could, so it happened that every minister in town, or that came to town to hold service, was sure of at least one pound of my honey every year.

In a few years the number of colonies increased to 3 or 4, and I told my wife and boy they might sell what they could spare after our near relatives and all the preachers had been well treated. Since that time there has never been a season we could not have sold at from 15 to 20 cents per section, several times as much honey as we had to spare.

Last summer I increased to 12 colonies and Italianized all of them, purchasing queens from 3 different dealers, thus seeking to get a mixed strain. Several people have already spoken to me for honey, although January has not yet passed.

As to the final outcome I am not very sanguine. We have in this locality so many years that bees do almost nothing. There has been in the last decade such a slaughter of basswood trees, and the white clover is so very uncertain, that whoever keeps bees in

### 10,000 Plants for 16c

More gardens and farms are planted to Salzer's Seeds than any other in America. There is reason for this.

We own and operate over 5000 acres for the production of our warranted seeds. That you may try them, we make you the following remarkable offer:

#### For 16 Cents Postpaid

**CONVENTION NOTICES.**

Utah.—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same. G. E. GARRETT, Sec. E. S. LOVESY, Pres.

Michigan.—The Michigan State Bee-Keepers' Association will hold its annual convention Feb. 23d and 24th, at the Eagle Hotel in Grand Rapids. The Eagle Hotel is located at 65 to 71 Market St., cor. of Lewis St., one block south of Monroe St. It will give a rate of \$1.50 per day, and furnish a room free for holding the convention. The Michigan State Dairymen's Convention will meet in Grand Rapids at the same time, and advantage may be taken of this fact to secure reduced rates on the railroads. When buying your ticket, ask for a certificate on account of the Dairymen's Convention. The secretary of the Dairymen's Association will sign this certificate which will then enable the holder to buy a return ticket for one-third fare. W. Z. HUTCHINSON, Pres.

**R. A. BURNETT & CO.,**  
166 SOUTH WATER ST. CHICAGO, ILL.

the future will have to calculate on feeding to such an extent as to make the profits somewhat uncertain.

In this village, too, there are a good many people trying to keep bees in unscientific ways. It surely must be that there are too many bees for the amount and kind of pasturage. This evil will probably remedy itself ere long.

As I think over what I have written I strongly suspicion that if I had been really trying to create a market for honey, the results might have been different.

Several times I have had occasion to inform people that artificial comb honey is never made, and that I am authorized to offer \$1000 for a pound of such. DAVIS R. EMMONS, Champaign Co., Ohio, Jan. 27.

**Feeding Bees In An Observatory Hive.**

On page 40 is a query concerning feeding bees in an observatory hive. Dr. Miller will pardon me for saying that he has not given good advice in his answer. If it were late in fall it would, indeed, be best to give the full comb of honey; but the question reads otherwise. To take away the frame from an observatory hive means more than a mere furnishing of food, for this hive has all-in-one-comb its entire assets in honey, pollen, and brood. It would not be advisable to give a comb of honey then any more than to give a full colony a set of combs of honey for its own combs.

Nor would it be wise to feed "Good" candy. The bees could not make good use of it for keeping up breeding, and at the best would be a discontented lot of bees.

"New Jersey" took the right place to feed his bees, but did wrong to place the food in an open saucer. Had he filled a tumbler with the feed, inverted the tumbler in a saucer, and placed a pin under the edge of the tumbler, he would probably have had no difficulty with robber bees. Obviously, bees can not protect an open dish of honey, but bees can protect a thin crack of honey. Then, too, the open dish is inviting robbers by throwing out a sweet odor, but the tumbler furnishes practically no odor.

If the observatory hive is tight at the bottom it is well to pour half a cup of syrup right into the hive when the bees are urgently in need of feed; if robbers get in, expose the hive to light and the confused robbers will not be able to find the entrance before they find death.

Yes, "New Jersey," you can winter bees in observatory hives, if you follow the right method. I wintered one winter before last, two last winter, and am wintering two this winter. They winter just as well as one could ask. I expect my earliest swarms from those hives next spring. ALLEN LATHAM, New London Co., Conn.

**BEES FOR SALE**

I wish to sell 40 colonies of Bees. They are the Italian Strain, in a good, strong condition, and are wintering good. Reasons for selling: No time to take care of them. Will sell all, or 5 or 10 colonies. Inquire of

## Honey and Beeswax

CHICAGO, Feb. 8.—The trade in honey is still below the normal in volume with prices unchanged, except that the pressure on the part of the holders to realize is more urgent. Fancy white comb honey, 12 1/2 @ 13c; No. 1, 12c; off grades, 10 @ 11c. Extracted, white, 6 @ 7c, according to flavor, quality and package; anything off is lower; amber grades, 5 1/2 @ 6 1/4c. Beeswax, 30c per pound, if clean and good color.  
R. A. BURNETT & Co.

BOSTON, Feb. 8.—Sales of honey still continue light, principally on account of the extreme cold weather which we are having. On account of the large stocks in hand, prices that we have quoted are shaded in round lots. Fancy white, 15 @ 16c; A 1, 15c; No. 1, 14c. Extracted, from 6 @ 7c, as to quality.  
BLAKE, SCOTT & LEE.

KANSAS CITY, Jan. 9.—The demand for comb honey still continues light, as most of the retail dealers were stocked up on \$2.25 honey before the holidays, two cars of which were sold here at that time. We look for a better market in the near future, and quote: Fancy comb, 24-section cases, \$2.50; No. 1, \$2.25. Extracted, white, per pound, 6 @ 6 1/2c; amber, 5 1/2 @ 6c. Beeswax, No. 1, 28 @ 30c.  
C. C. CLEMONS & Co.

CINCINNATI, O., Feb. 7.—Comb honey is now coming in more freely, and prices if anything have moderated a little. The sales made and prices obtained were for No. 1 fancy water-white comb, 12 @ 13 1/2c; single cases, 14c. Extracted is sold as follows: White clover, in barrels, 6 1/2c; in cans, 7 1/4 @ 8c; amber, in barrels, 5 1/2 @ 5 3/4c; in cans, 6 @ 6 1/2c. Beeswax, 27c.  
C. H. W. WEBER

PHILADELPHIA, Feb. 8.—The market of all grades of comb honey continues rather weak and trading light, with a good supply on hand. We quote: Fancy white, 15 @ 16c; No. 1, 13 @ 14c; amber, 11 @ 12c. Extracted, white, 7 @ 8c; amber, 6 @ 7c. Beeswax, 28c.  
We are producers of honey and do not handle on commission.  
WM. A. SELSER.

CINCINNATI, Dec. 30.—Since our last report was published, the price of extracted honey has advanced, no doubt acting in sympathy with the sugar market. We quote amber extracted in barrels at 6 @ 6 1/2c; white clover, in barrels and cans, 6 1/2 @ 8 1/4c. Fancy comb honey, 13 @ 14c. Beeswax, 28c.  
THE FRED W. MUTH CO.

ALBANY, N. Y., Feb. 8.—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13 @ 14c; No. 1, 12 @ 13c; mixed, 10 @ 11c; buckwheat, 10 @ 11c. Extracted, better demand: Buckwheat, 6 @ 6 1/2c; white, 6 @ 6 1/2c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30 @ 32c.  
H. R. WRIGHT.

SAN FRANCISCO, Jan. 25.—White comb, 1-lb. sections, 11 1/2 @ 12 1/2c; amber, 9 @ 11c. Extracted white, 6 @ 6 1/2c; light amber, 4 1/2 @ 5 1/4c; amber, 3 3/4 @ 4 1/4c; dark amber, 3 @ 3 3/4c. Beeswax, good to choice, light, 29 @ 30c; dark, 27 @ 28c.  
Market is quiet and for other than choice water-white is lacking in firmness. High-grade honey is in light supply, but there is no scarcity of amber stock. Three lots of Hawaiian Island honey, aggregating 523 cases, arrived the current week.

NEW YORK, Feb. 8.—The market is decidedly dull on comb honey and very little moving, with plentiful supply. We quote: Fancy white comb, 14c; No. 1, 13c; amber, 11c; dark, 9 @ 10c. Extracted honey is in fair demand, and prices remain about the same. Beeswax steady and in good demand at 29c.  
HILDRETH & SEIGELKEN.

1903

THE LATE CAPT. J. E. HETHERINGTON.

# Correspondence Course in Bee Culture.

Last fall we announced this course and made a special offer to students for early enrollment. We have secured quite a number of students, but nearly every one of these wants to continue his own bee-keeping so that we find ourselves without a sufficient number to recommend to parties wanting help in their yards.

We have inquiries now for help from a number of States—California, Colorado, Florida, Idaho, Illinois, Pennsylvania, Michigan, and other States. See what one of our students says :

THE A. I. ROOT CO., Medina, Ohio.

LA COSTA, TEXAS, Jan. 28, 1905.

Dear Sirs:—I am very grateful for the 1905 edition of the "A B C of Bee Culture". I am highly pleased with your instructions in your Correspondence Course. It brings out points the amateur could never find by reading bee-books as it gives the essential parts in rotation so to explain them understandingly. It is like having a teacher or trying to study off-hand. Saving so much time and getting the foundation started right is half the battle. I hope to be an expert bee-keeper some day. Should I fail I certainly could not blame you. Everything bearing your name is first-class. May you ever prosper and live long to instruct us. With best wishes, Yours truly, W. R. HESSKEW.

Send for our prospectus, or, better still, send us your order with \$10.00, for which we will send you :

**Complete Course of 17 Lessons.  
Gleanings in Bee Culture 1 Year.  
1 A B C of Bee Culture.**

We give in addition personal answers to as many questions as the student desires to ask, either on bee culture, locations, help, honey markets, or, in fact, any subject relating to bee-keeping. We know where many good locations are yet untouched ; where the good honey markets are ; who is needing help, and hundreds of other things that the bee-keeper wants to know. We can't tell you these things unless you ask. If you have hesitated to ask us, thinking we could not well afford to give time to answer your questions, enroll in our Correspondence Course. Never mind if you have been a bee-keeper for 20 years. If you do not need the lessons, the information we can give you by mail on a variety of topics will more than pay you. Let us show you one case :

A party became interested in bee-culture a few years ago and set about to build up a large apiary. He succeeded remarkably well, but paid little or no attention to the honey markets, his time being taken up with other matters. The third season he produced a very large crop of honey (150,000 pounds) and being unacquainted with the markets, he sent it for sale to a large city, to a house no more familiar with the honey markets than he. It appears that they sold it at any price they could get, for he told us later that the information we gave him of another market would have saved him over a thousand dollars on the one sale. (He hadn't asked us for it, but learning of the situation we wrote him, but too late ; the sale had been made.) Perhaps the American Bee Journal readers think they would not be benefited. We assure you there are dozens of ways in which you can be helped.

Here is what one of our customers thinks of our "A B C of Bee Culture", which is included with the course :

"After looking through the 1905 'A B C of Bee Culture', just received to-day, I told Mrs. C. I would not take \$25.00 for it if I could not get another copy.—P. F. CONKLIN, Elmira, N. Y."

**The New Edition (1905) "A B C of Bee Culture" is \$1.20, postpaid, if ordered alone.**

And another customer speaks thus of Gleanings in Bee Culture :

Dear Sir :—You ask if I have found "Gleanings" a good investment, and I can truly say the investment has not only been good, but very good. Although I do not keep bees for profit at this writing, but hope to at some future time, will say that I am trying to learn all I can about the subject, and "Gleanings" adds more ideas to my limited store of knowledge than any other publication I receive. All the departments treated in this semi-monthly paper are very interesting to me, and I get anxious to see its pages when the date arrives for its appearance.

Yours truly,

RALPH P. FISHER.

**Don't you think \$10.00 is a small price for what we are offering you ?**

**Gleanings (semi-monthly, 52 pages) is \$1.00 per year if ordered alone.**

**THE A. I. ROOT COMPANY,  
MEDINA, OHIO.**

ESTABLISHED IN 1861

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

GEORGE W. YORK, Editor.

CHICAGO, ILL., FEB. 23, 1905.

Vol. XLV.—No. 8.

## Editorial Notes and Comments

### A Capt. Hetherington Memorial Double Number.

That is rather a big heading, but so is this a big number of the American Bee Journal. It contains some very interesting reading matter, not only on the life of Capt. Hetherington, but on a variety of other subjects as well.

Mr. P. H. Elwood, a life-long, intimate friend of Capt. Hetherington, has written a most excellent memorial article, which, with the illustrations used in connection with it, makes it by all odds the best and fullest sketch yet published of the world's most extensive bee-keeper and honey-producer.

It was our privilege to meet Capt. Hetherington at the Buffalo National convention some years ago. We never had a personal acquaintance with him, but we have always felt that it was extremely unfortunate that a verbatim report of his address at that meeting was not taken. If we remember rightly, he told us some very interesting history, especially touching the early work of the lamented Moses Quinby and Rev. L. L. Langstroth, in connection with their bee-keeping.

The brief tributes to Capt. Hetherington, written by others who knew him, will also be read with interest.

For the use of the engravings showing Capt. Hetherington's first and last load of bees, as well as the one showing his damaged sword, and also the one on the first page, we are indebted to Gleanings in Bee Culture. All the others are new ones, made especially for the article in this issue of the American Bee Journal.

### Newspaper Facts (?) About Bees.

It seems just a bit strange that to have facts about bees correctly given it is almost an absolute necessity that the one giving the facts must be one having a speaking acquaintance with the busy little creatures. Wm. E. Curtis, a veteran newspaper correspondent, one of the ablest in the world, gives this in the Chicago Record-Herald:

"Bees and other insects are very important agents in the fruit and flower business. The big yellow and black bumble-bee, as we call it, is almost essential to the production of fruit and flowers. We could scarcely get along without him. Almost all flowers and fruits must be cross-fertilized—that is, pollen must be brought from one to the other in order to produce, and this work is chiefly done by wild and tame bees. As an illustration, the bumble-bee is a native of this country and does not appear in Australia. Down in Australia they had no clover because they had no bees. The bees not only get a great deal of honey from the clover blossoms, but they fertilize them in the act of getting the honey. Hence, as soon as our bees were imported into Australia and set to work in the fields the clover began to grow and has developed there as well as here or any place else", said Mr. Marlatt.

As a matter of fact, orchards would go on just the same if every bumble-bee were dead; at the time of fruit-bloom bumble-bees are too few in number to make any material difference. "Down in Australia they had no clover because they had no bees". "Error in the bill";

they had clover; they had bees. Several kinds of clover, several kinds of bees. They lacked red clover and bumble-bees. Red clover grew just as well without bumble-bees as with them; but all the seed had to be brought from elsewhere until bumble-bees were present to fertilize the blossom.

### Candying or Crystalizing of Sugar and Honey.

A neat little pamphlet that seems to be issued by the Michigan Bee-Keepers' Association contains this statement:

"Remember that sugar never candies, it crystallizes, and this fact alone should be sufficient proof of the purity of any honey that is candied solid."

Will the correct use of words justify the statement that sugar never candies? The definition of the verb *candy* in the dictionary begins with the words, "To form into crystals of sugar"; and under the word *candied*, "candied sugar" and "candied honey" are both given as examples. Manifestly it will not do, then, to say that sugar never candies, especially as candy is commonly made of sugar.

But is there not a difference in the appearance of candied honey, as compared with sugar, that may easily be described? Who can put in words just what that difference is?

### Disposing of the Honey Crop.

Judging from the reports of the various leading markets, and also from the fact that there seems to be quite a quantity of honey still in the hands of the producers, the question of disposing of the honey crop is just about the liveliest subject now before bee-keepers. It isn't a question of keeping more bees, but how can the one who has just a few bees sell his crop of honey at even a reasonable price?

We believe that in many cases bee-keepers themselves must be their own salesmen, at least until some organization decides to do some combined honey advertising in the daily and other newspaper press of the country. The dear public needs to be informed of the great value of honey as a health-giving food, in the same way as it is told of the various breakfast foods. The demand for honey must be created first, then there will be scarcely any trouble to dispose of all that can be produced, we believe.

This is a live, practical, up-to-date subject. What about it?

### Shaken Swarms in Australia.

From the Australasian Bee-Keeper it appears that our antipodal friends differ from us in their views and practices with regard to shaking swarms. The editor says:

"There seems to be some variance of opinion as to what a shaken swarm is. I have always understood it to be a sufficient number of bees and a queen taken from a colony by means of shaking them from the combs, to found another colony."

Chas. U. T. Burke gives his method of procedure as follows:

"Prepare a hive of empty combs, or frames of foundation, leaving room for two frames, one with eggs just hatching, the other with fresh pollen and honey. Have a young laying queen on hand. Go to one of your strongest colonies, shake fully two-thirds of the bees into a new hive (after finding the queen and placing her aside). Drop your laying queen among them, sprinkle all very slightly with water sweetened with honey, place the hive on a fresh stand; the swarm will go to work in a few days, and in a week will be bringing in a surplus of honey. I have never had a failure this way, nor have I had any swarm out. I always leave the frame of brood with them,

as it encourages the bees to work well, and the queen to lay almost immediately. Do not use much smoke, either in artificial increase or shaken swarms. With the latter I prefer to use none at all, as it appears to confuse them, causes balling of the queen, and sometimes causes the shaken swarm to take flight, and thereby cause much delay."

Two other correspondents give their method of procedure, and all agree in putting the swarm with the queen on a new stand, leaving the brood on the old stand. The difference between that and the common practice here is somewhat radical. The Australian plan divides the colony, putting the swarm on a new stand. The American swarm is left on the old stand. Indeed, it might be said that no swarm is made; the brood is merely taken away, with few or no bees. The Australian swarm, according to Mr. Burke, "will go to work in a few days, and in a week will be bringing in a surplus of honey". The American swarm will go to work immediately, or, rather, will not stop storing. The Australian gathering-force is divided; the American kept together. In a long season may not the divided Australian force do the more gathering? But may not the Australian mother colony swarm again in too many cases?

### Is There a Bee-Supply "Combine" or "Trust"?

This question was asked of us just recently. Also, we were requested to name those manufacturers and dealers who are not in the "combine" or "trust".

Not being aware that there is a trust or combine among bee-supply manufacturers and dealers, of course we couldn't possibly say who are in it, or not in it.

While it may be true that the same class or grade of goods is priced the same by more than one dealer, it would not necessarily follow that there is a combination or trust. For instance, a certain style of honey-extractor may be priced exactly the same in the catalogs of several manufacturers and dealers. This might be true, and is true in at least one case, as a certain kind of extractor is made only by one firm, and several others handle the same extractor. So, of course, the price on it would be the same in the catalogs of all the firms handling it.

To readers of the American Bee Journal we would suggest sending for the catalogs of all the best firms advertising in it, and then order from the ones that you believe will give you the best and most satisfactory goods for your money. Of course, you might consider distance, as that would likely influence freight-rates a little.

A good thing to remember is this: Sometimes the cheapest goods at the start are the dearest in the end.

You pays your money and you takes your choice. So runs an old saying.

## Miscellaneous News & Items

Mr. F. H. Drexel, one of the leading bee-keepers of western Colorado, called on us a few days ago. His young son was with him. They were on their return journey from Maryland, where they visited Mr. D's old home, which he left some 13 years ago for the great alfalfa honey-fields of Colorado. Mr. Drexel, like some other bee-keepers in that State, produces honey by the car-load.

**To Missouri Bee-Keepers.**—We have received the following letter from R. A. Holekamp, of St. Louis Co., Mo., with the urgent request that it be published at once, so that Missouri bee-keepers can act upon it in time to accomplish the desired object:

The Missouri State Bee-Keepers' Association at its convention last September, passed resolutions to introduce to the State legislature at its present session a Bill for the enactment of a foul brood law and the appointment of an inspector of apiaries.

In both branches of the legislature now in session at Jefferson City, has been introduced a Bill for the appointment by the Missouri State Board of Agriculture of a State inspector of apiaries to aid and assist in the development and protection of the honey industry, and especially for the eradication of an infectious disease known as foul brood.

The Bill has been drawn up with care, and will, when passed, be a great help to the honey-producers of Missouri. So it is of importance that every bee-keeper in this State, who has the welfare of the honey industry at heart, write to the Representative from his county, and

Senator from his district, or any other member of our legislature he may be acquainted with, at once, urging him to work and vote for the passage of this Bill.

If these letters come in at Jefferson City in large numbers, they will show that the bee-keepers want this Bill passed, and it will also show that the bee-keeping industry of Missouri is of some importance.

There are in Missouri, according to the United States Census of 1900, 41,145 bee-farms, with 205,110 colonies of bees. It produced in the year 1903 over 6,000,000 pounds of honey, which shows that Missouri is one of the great honey-producing States of the Union.

It is necessary that the bee-keepers who will assist in getting the Bill passed shall write the letters to the members of our legislature *without delay*, as the hearing of the committee on the Bill will be before may days.

Let all progressive bee-keepers unite their efforts and work for the passage of this Bill, and thus get the assistance of our State Board of Agriculture in developing the bee-keeping industry, and protecting our apiaries against infectious diseases which are now spreading over the State.

ROBT. A. HOLEKAMP,

Assistant Secretary Missouri State Bee-Keepers' Association.

### The Humming of the Bees.

BY HARRY LATHROP.

There's a deal o' solid comfort—  
Call it nonsense if you please—  
In that pleasant homelike music—  
Just the humming of the bees.

Though we sport in winter weather  
With the cold and with the snow;  
Though we sit by cosy firesides  
Where the cheerful embers glow,  
While we read our books and journals,  
Lay our plans and take our ease,  
Still we long to hear the music  
Of the humming of the bees.

When the fragrant apple-blossoms  
Hang in clusters pink and white;  
When the plum-trees by the roadside  
Almost dazzle with their light;  
When the gentle summer breezes  
Murmur soft among the trees—  
It is then we hear the music  
Of the humming of the bees.

Crawford Co., Wis.

H. K. Beecham, of Grand Traverse Co., Mich., called on us last week. He has been a bee-keeper since 1879, and has taken this Journal for the same length of time. He put 64 colonies of bees into winter quarters last fall, from which he harvested about 5000 pounds of honey, mostly extracted. Mr. B. has no trouble to dispose of all his crop either in his home market or near home.

**Our Advertisers**, as a class, we believe can not be excelled for reliability and square dealing. We invite our readers to patronize them as generously as are your needs. Please do not fail to mention having seen their advertisements in the American Bee Journal when writing to any of our advertisers. It will help both them and us, and so both they and we will greatly appreciate such mention.

**To Illinois Bee-Keepers.**—Secretary Stone, of the Illinois State Bee-Keepers' Association, desires that at least our Illinois subscribers shall read the following:

The secretary of the Illinois State Bee-Keepers' Association gets numerous letters (so many in fact that he can not give them personal answers) like these:

"I keep only a few bees, and it would not pay me to belong to the State and National Associations."

"What are the benefits to be derived from being a member of your Association?"

"I have only a few bees, and I can find a home market for all my honey; there is no foul brood in my part of the State, and I do not need to advertise, so what benefit would I get from belonging to the State and National Associations?"

As secretary of the State Association, and a member of the executive committee, I just want to put a few questions to the men who are the writers of such letters as are quoted above.

Have you ever thought of what the Illinois State Association has been trying to do from year to year ever since its organization, to make it profitable for you to keep your "few colonies" of bees? and to keep out all diseases of bees, that it may be made possible for you to keep them?

Have you ever thought of our efforts, combined with those of the National and the bee-papers, to put down the adulterators of honey that have flooded the market, and thus make it possible for you to sell your honey without a suspicion of its being adulterated?

Do you know that we have secured to the State Association a foul brood law the past two years, and have strong promise of one for the

Wintering-Cellar and Apiary of 300 Colonies belonging to John F. Otto, of Calumet County, Wisconsin.

next two years, whereby you can be instructed (free of cost) as to treatment of your bees in case of foul brood?

Do you know that a membership in the National protects you (in the right) from a neighbor who might through envy or otherwise, declare your bees a nuisance? And no charges to you but your membership fee and one-half the costs.

Have you ever thought of the lives of our good men, that are being spent to publish the bee-papers just in the way that will instruct us most? And have you ever begrudged the little dollar, a year you gave them for their papers?

We could ply many more questions on these lines, but we do not believe bee-keepers as a class, if they knew it, would hold back the simple fee of \$1.00 that gives them membership in both the Associations named, and in that way support the institutions that help to make their interests successful.

Our next Annual Report (the 4th) of about 200 pages, will be out in several weeks, and the larger membership we can show in that the better our prospect, when we go before the Legislature, of a successful appeal being made.

With all kindness to my brother bee-keepers,  
I am, sincerely yours,  
JAS. A. STONE, Sec.

## Contributed Special Articles

### Comb Honey and Separators—Foul Brood,

BY PROF. A. J. COOK.

I was much interested in the answers to inquiries in the last American Bee Journal. In the production of honey I always took most delight in working for the comb. It always seemed to me that nothing was more beautiful than a perfect specimen of clear white comb-honey. This is specially true when the combs are uniform, smooth and well-filled. I have succeeded many times in securing whole supers where every section was almost perfect, and this without the use of separators at all. I think this usually comes when the colonies are very strong and the harvest is bountiful. The bees seem to rush the honey in to the hive, and if sections are put in either with starters or full sheets of foundation these are carried on together and uneven combs are rarely produced.

I often found, however, quite a different state of things. Some of the combs would be thicker, and there would be a general lack of uniformity. Indeed, this unevenness was so great, or frequent, that in my own experience I decided that it was never wise to strive to get along without the separators. I did not find it mattered much whether these were of wood or tin. While this was true in my own experience, I have known some bee-keepers who are astonishingly successful in securing these almost perfect sections without exception, yet these persons never used separators at all. Thus I was led to say that it was possible to get good sections without separators, but that I found it better to use them. I was much interested to find how many there were who, like myself, found they could not produce satisfactory results without the use of these valuable aids in comb-honey production.

Indeed, I have always considered that the securing of a fine crop of excellent comb-honey, each season, was the best test of skill and proficiency in the art of bee-keeping. Almost anyone can secure extracted honey, and, for the novice, or the one who does not study to attain the best in the art, it is perhaps always wisest to work for extracted honey. The advantages in working for comb honey are: A much more beautiful product—and there is much joy in producing the beautiful; the producing of that which brings a much higher price in the market; and the fact of knowing that we have reached the highest skill of the art. The two handicaps in comb-honey production—I might say three—are, frequent failure, always securing a much less quantity, and the fact that it is much more difficult to ship comb honey.

The California bee-keeper finds this last point one that materially concerns him. He must ship car-loads of his honey for thousands of miles. In case he produces extracted honey, he can do this with no fear of loss or disappointment. This alone will always make extracted honey a favorite with the apiarists on the Pacific Coast. The difficulties in the way and the invariably lessened production makes it imperative that we secure at least double for comb honey that which we might expect for extracted, the quality being the same in each case.

The requisite as I take it, to the best success in the

comb-honey production is to have our colonies very strong at the dawn of the season. This may, and often will, require stimulated feeding. I would always have the supers in place at the very commencement of the honey-flow. It is an advantage also if the swarming is past for that season. In case

PROF. A. J. COOK.

the latter is not true, we can attain the same results by working for very strong colonies. If necessary, we can unite to accomplish this.

I do not think that any one who works for comb honey can afford to dispense with foundation. I always reach the best success with thin foundation, and while I often use full sheets, I do not find that this is necessary. Neither did I ever find very great advantage in using starters both above and below, in the section.

In case the apiarist produces extracted honey exclusively, there is little to be said except, of course, it is always desirable to keep one's colonies strong and in the very best thrift. I do think, however, that it is generally best not to extract until the bees commence to cap the honey. No one can ever afford to put thin or unripe honey on the market. Such honey is very apt to ferment. It always lacks body, and is always deficient in flavor. It is true, however, that I have produced very excellent extracted honey, which I removed from the combs before it was ripened. But in this case, it was kept for a long time in a warm room, in rather shallow vessels, and thus evaporation continued even after the honey was taken from the comb. The evils arising from marketing unripe honey are so great that no one can ever afford to be guilty of such misdoing.

#### FOUL-BROOD LAW IN CALIFORNIA.

We are having quite a controversy in two or three counties of California over the matter of bee-inspectors enforcing the foul-brood law. We probably have as excellent a law as any State in the Union. This law makes it the duty of the Supervisors, upon the receipt of a petition of a certain number of bee-keepers, to appoint a foul-brood inspector, whose duty it shall be thoroughly to inspect all the apiaries of his county, and in case foul brood is present to eradicate it. The inspector is well paid, and, as the supervisors have no object to do other than the best for their constituents, competent men have usually been secured.

The difficulty in the matter comes from the fact of our "off years" in this State. The past season there was no honey gathered at all in most localities. Men who are not very well informed regarding foul brood are loth to pay for treatment when they see no chance for gain ahead. The inspector, too, knows how ready bees are to rob from each other when no honey is being gathered; knows also how dan-

gerous it is to work with bees at such times, from the fact that robbing is so likely to be induced, and so is quite likely to decide that he will do nothing at all; and he finds the most of his bee-keeping friends are quite willing that he should desist from treatment. We should remember, however, at such times that the possibility—nay, probability—of robbing brings great danger into any community where there is any foul brood at all in existence.

First, the enforced idleness of the bees makes them ever ready to plunder the other and weaker colonies. The colonies infested with foul brood are almost certain to be weak, and thus we have every condition for the rapid spread of this serious malady. It seems to me it is much the wiser course to eradicate the disease entirely during this let up of the honey-flow. Yet it is certainly true that the foul-brood inspector must exercise very great caution or he will get the bees to robbing, and surely make a bad matter worse. It is, however, perfectly easy and practicable, by spreading a canvas beneath the hive, and surrounding the latter by a good bee-tent, to make all necessary examination with no trouble from bee-stings, no danger of robbing, and no scattering which would otherwise induce robbing and very likely scatter the germs of the fell disease which it is the purpose to destroy. Just two things are necessary: A wise, competent inspector, and most careful manipulation.

Los Angeles Co., Calif.

## Separators Nailed to Wide Frames.

BY G. M. DOOLITTLE.

A correspondent wishes me to give my views on wide frames with separators nailed to them, and closes his letter in these words:

"Is this not as good as anything I can have? And cannot the separators be cleaned of propolis as easily as can wooden separators, even the new fences, as they are called? Please tell us of these matters through the American Bee Journal."

I have used wide frames with separators nailed to them for the past thirty years, and so far I see no reason for changing my surplus arrangement. During this time I have been trying everything that has been advocated as better than the above; but after a careful testing of each and all, I have every time come to the conclusion that, for me, nothing is as good as *thin* separators nailed to wide frames. And,

G. M. DOOLITTLE.

as my honey has always brought as much as, or a cent or two more a pound than, the biggest market quotations, I see no reason why I could secure better prices were I to change my mode of securing surplus.

After a careful experimenting all along through these years,

I am satisfied that the claim that tin separators have a tendency to less work in the sections, and a decreased yield of section honey, is unfounded. I have used sections without separators and separators of five-sixteenths mesh wire-cloth, so that the cluster of bees would be broken up as little as possible, where separators were used, and at the end of many careful experiments I failed to see any greater production of section honey with either of these, than was obtained with the tin separators. I know that the theory put forth in favor of an unbroken cluster seems reasonable, and from such theory it would appear that a less yield should be the result where separators were used, but the cold facts with me say that all such reasoning is fallacious.

Then, I use wide frames on account of the great advantage they have in that the bees do not have access to the outside of the sections at any point, except the edges of the horizontal pieces above and below the separators, and here there is very little stain or bee-glue used. Hence, when the sections are filled and finished, they are nearly as new and perfect as they were when put on the hive, requiring very little, and often not any, scraping to clean them of propolis or bee-glue, as it is often called by many apiarists. This is no small item, as all of our older bee-keepers know, who have spent days, if not weeks, in cleaning sections so they would be in presentable shape for market.

From the honey obtained from basswood, the sections come out of these wide frames almost as clean in all parts as they were when put on the hive; and no large amount of work is required where the honey is from buckwheat, at which time there is more propolis carried in and daubed about the hive than at any other time of the year.

That this cleaning of sections is no small item will be seen from the many section-cleaners which were invented and advertised a few years ago, many of which are still in use. These find no place with the apiarist who uses properly-constructed wide frames. Yes, more: All the expense required in constructing one of these section-cleaners, or in buying one, is entirely saved by using such wide frames.

More, still: All the time required in using them can be taken for the improvement of the mind in reading, etc.; going to some summer resort and hearing some of the best talent in the world; or, if nothing else seems of more importance, the time saved can be used to go camping or fishing, if one is so inclined; and with me, either or all of these seem to meet my requirements better than spending days and weeks in cleaning sections with a section-cleaner or without one.

As to inventing section-cleaners, I have no discouraging word to say, for in the inventing of anything the mind is improved, and a certain joy comes, which is often greater than any that can be experienced in going fishing, etc. I would not discourage inventive genius in any way, for, when used aright, it is not only a help to the world through the invention, but a help to the world also by making the inventor a greater man or woman, socially and intellectually.

As to the ease of cleaning separators, I am not much interested where tin is used; for, to my knowledge, I have cleaned mine only once, and many of them have been in use for from 25 to 30 years. In using the wood separators in conducting my experiments, I found that the bees daubed them to a much greater extent than they did the tin ones. But this was not my reason for discarding them, but was because they did not answer their purpose as well, when used in connection with wide frames, as did the tin. It is possible that if I were to live in some of the localities of the South and West, I might find reasons that would change my views from the above; but for all sections where white clover, basswood and buckwheat are the chief sources of honey, I firmly believe that there is nothing better to use in securing our section honey than wide frames with tin separators.

## Cellar-Wintering of Bees and Its Difficulties.

BY F. GREINER.

In this locality of New York State, wintering bees in the cellar gives us the best results with the least worry. We learned a dear lesson last winter, viz.: It is safer to place bees in their winter quarters early than defer it till December. Even though that nestor, Rev. Dzierzon, has said: "Do not worry about the bees even should it freeze and snow before you put the bees in." About Christmas, he thought, was a good time. The difference

in the climate may have something to do with it; perhaps if Dzierzon had such winters to contend with as we here, he might have given other advice.

If I am informed right, the German beekeepers have so far had a mild winter up to Christmas, almost no freezing weather. With such weather it would not matter so much whether the bees were cellared a month later than we practice. The reason why I deem it wise to put in our bees early and before freezing weather is, hives and combs are dry; hives are not frozen down to the hive-stands and may be carried in without disturbing the bees very much. Bees need no cleansing flight during November; they are even loth to improve an opportunity in December, and thus I can see no reason for keeping them outdoors at a risk. Imagine the state of affairs when taking in hives that are icy, the combs freezing cold. You bring them to the cellar into a warmer and humid atmosphere. What will be the effect? The hive and combs would soon be dripping with water, a condition to be avoided by all means. We might wait for a warm spell before we carry the hives in; but supposing that spell does not come, as was the case last winter; what then?

It is quite evident for this climate the best policy is to

F. GREINER.

get the bees in early. Some of our best bee-masters advise not to take all the colonies out at once and put them on hive-stands sufficiently far apart to prevent any mixing up—in other words, scatter them about over the yard. I have never noticed serious results to follow from this mixing up. Particularly with an out-yard far away, this method is not practicable, and I do not hesitate to put the whole bunch out in one night, about April 15. When the bees warm up in the morning, of course, everything that has legs and wings is out. I always try to be on hand as soon as the bees have become quieted down, and close up the entrances to about one inch in width. On a day following—preferably when it is real cool—I clean the bottom-boards or exchange the filthy ones for clean ones. The majority of bottom-boards are usually clean enough.

Sometimes it occurs that after putting the bees out on the summer-stands we have a heavy fall of snow, with bright, sunshiny weather to follow. This is unfortunate, for if bees come out under such conditions many will be lost. They become dazed and fly right into the snow where they will die. Something will have to be done at once to keep the bees in the hive as long as is safe without worrying them. Having a great many colonies to see to, it would be impracticable to cover up the snow with sacking, canvas, straw, etc., as may be done in case of a house-apiary, or where but few colonies are kept. The bee-keepers in Germany are sure to do something of that sort, but with us this is out of the question. The best we can do is to bank up our hives with the snow and keep the bees thus confined till the snow has

become heavy and wet. In this condition it is not the death-trap that it is when light and dry. A strong and vigorous bee can well rise from heavy snow.

In addition to banking up the hives one might sprinkle ashes, dust, sawdust, or something similar, on top of the snow around the hives to modify its glare. It is the strong white light from the new snow that blinds the bees;

View of Mr. Greiner's Apiary in April, 1904.

subdued as spoken of, it does not prove so detrimental.

The accompanying picture shows the condition of my bees as they were April 21, 1904, myself in the act of kicking the snow against the hives. I hope such a time will not occur again this year; to mention it may prove a help to someone—may save some faithful bees.

Ontario Co., N. Y.

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

#### THE NATIONAL A BENEFICENT ASSOCIATION.

Among Manager France's recommendations I think the most valuable to be this one: "Keep together; compromise; keep out of court." An association that should encourage members to "law it" when they might abstain (and would if they were not members) would be sadly something else than a beneficent association. Page 9.

#### ENCOURAGING NATURE STUDY.

How nice that the educational authorities of a great state like Wisconsin should encourage young people—and people not so young—in nature study! How nice that they should help inquiring ignorance by naming books to be read! How nice in them to make bees a separate department of nature! Then, after getting our feelings up thus high, what pathos is this that we wind up in, what tumble from the stars into the mud? No mention of the great and scholarly works of Cowan and Cheshire, Langstroth and the Manual, and A B C, all omitted, and a long list of half-chaffs and out-of-dates named. Verily this is a queer world. Still I suppose the most important thing for us to remember is that it is worse than useless for us to subject that official to sarcasm and contemptuous remarks. Nemesis will overtake him; and *sometime* a more reasonable list will appear. Page 12.

#### NEW REMEDIES FOR BEE STINGS.

We're always ready to hear of a new remedy for stings (as long as the different substances on earth hold out); but it rather jarred us to have a doctor propose to dope us three hours before we get stung. As the editorial suggests, perhaps it's all right for amateurs not yet injured. Page 19.

#### TO SEPARATOR OR NOT TO SEPARATOR?

Another example of how the world moves, we have in Question 20. We used to have lots of lively fighting in behalf of separators—sheer waste of good cash—mark of a green operator. Now only 2 out of 26 unqualifiedly advise doing without them—yet one of that forlorn two hints that people that need them are green. Some of the replies are unusually illustrative. Comrade Pettit says: "Some of us used to do it, but the standard is higher now." Also notable is comrade Stone's experience at the Chicago World's Fair. Only a little over 600 pounds out of 2,300 would case without rubbing. Yet I ween some of the combatants of 30 years ago would have described that identical 2,300 pound lot as all right except just a few combs. Page 20.

#### THE HIVE QUESTION AND SUGGESTIONS.

I licked my lips with anticipation over that new and best hive of Allen Latham's—and, lo, a "long idea" hive adapted to chunk honey only! Still, if you want to post a small out-apiary in June, and never look at it again till at your convenience you take it away in the fall—just getting some honey that would otherwise be lost—and getting it very cheaply so far as expenditure of time is concerned—quite likely there is something in the idea. And it's a scheme a shade different from the ordinary out-yard idea. Worth thinking of in bed some night. Page 21.

#### "RED CLOVER" BEES AND QUEENS.

Thanks to C. P. Dadant for giving the "red clover" bees and queens a mild cuffing up all 'round. If we really had such a strain of bees it would be all right to recognize them—but then the size of that "if!" And a good laugh over that sample of red clover honey that tasted strongly of *basswood* will do us no harm. Page 22.

#### EXPERIMENTING IN APICULTURE.

Prof. Scholl is some like behemoth who trusted that he could draw Jordan into his mouth, if he thinks he can do Uncle Sam's census work over after him. But all right—we need just such enterprising spirits to tackle just such big jobs. I believe we have heard before that Texas was at the lead in honey production—that is, years when the California season was bad and her own good. Getting on a semi-desert cattle-range 40 miles from a railroad station for the sake of a good and vacant bee-range, is bidding quite high for it, indeed. Even at that high price it's possible that some determined comrades will bid. Page 25.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed *free* at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

**Why Not** send in some new subscriptions for the American Bee Journal? Samples free for the asking.

# Capt. J. E. Hetherington: Bee-Keeper, Inventor, and Soldier

Written by P. H. ELWOOD, of New York.

THE subject of this sketch would have gained distinction in any occupation, for he was endowed by Nature with boundless energy and indomitable will-power, coupled with organizing and executive abilities such as would have quickly placed him at the head in any large undertaking. His power of comprehending the whole was no less remarkable than his ability to grasp at the same time the minute details of an extensive business. Had he at maturity engaged in some extensive industrial operation, such as railroad construction, mining, or manufacturing, undoubtedly success would quickly have been his with its attendant wealth; but long before this, while yet in his teens, circumstances and inclination led him into a new and untrodden field—that of making bee-culture a specialty—a separate and successful branch of agriculture.

At this early date there were no bee-books nor bee-papers; no movable-comb hives, no honey extractors, no bee-smokers, no comb foundation—nothing in fact to warrant the average bee-keeper to believe that bee-culture could be made a separate and independent business. Yet Capt. Hetherington believed it could be done, and made it a specialty from the beginning, being first, I think, to depend entirely upon the sale of honey and wax for his livelihood, and the maintenance and upbuilding of the business.

His intimate friend and co-laborer, Moses Quinby, always regarded him as the ablest exponent of modern bee-culture, and as pre-eminently the one to demonstrate to the world that bee-keeping as a business could be made as uniformly successful as any other branch of agriculture. How well he has done this a faithful history of his life should recite, but no one can tell of the time and energy, and money, spent in reaching this result, nor can any one ever fully know of the discouragements that befell him before his efforts were crowned with success.

John Edwin Hetherington was born in Cherry Valley, N. Y., Jan. 7, 1840, and died in the same place Dec. 31, 1903. He came of a good ancestry, his father being an educated English gentleman; his mother a member of the old Judd family of Connecticut. The father dying when the youngest of the three brothers was less than a year old, Master John less than three, the entire care and training of the three children fell upon the mother, and the highest tribute we can pay her is to point to the characters developed in her sons. All three were in the military service during the war for the preservation of the Union, and they came out as they went in, with spotless reputations and characters, and abstainers from the use of tobacco and strong drink—gentlemen in thought, word, and deed.

Capt. Hetherington bought his first colony of bees when 12 years old, with money earned for that purpose. The thorough-going business methods of the mature bee-keeper

Capt. Hetherington's First Load of Bees.

were foreshadowed in the care taken in bringing home this first colony. The old family horse is put before the large spring wagon, and is driven by a member of the family. For the additional comfort and security of the colony of

bees, the hive is suspended in a sheet, the ends of which are tied over a springing pole, while the ends of the pole rest on the shoulders of the two older brothers, who sit facing each other, as shown in the engraving. This extra care seemed necessary for the colony that was destined to contribute so much toward bringing apiculture from the dark-

Capt. Hetherington's Home, with Last Load of 32 Colonies of Bees.

ness of superstition into the full light of modern science. In contrast to this is given a picture of one of the later loads of 32 colonies. On one side is seen the family residence, while on the other side is the first honey-house and shop, with the barn in the rear. At the back of the well-kept lawn are a couple of wintering-cellars, one of which is shown in another engraving. The bee-yards, spring and fall, are near the cellars, and cover acres of ground. For some years back no bees have been kept at home during the summer months, thus avoiding all annoyances to neighbors.

The boy bee-keeper had good success, and within five years he had marketed honey by the ton, and had secured an average of nearly 60 pounds of honey in glass boxes from his entire apiary. He was a close observer and quick to adopt improvements. Before he had been in the business a half-dozen years he had perfected a double-walled hive with a chamber of confined air between, and had applied for a patent on the same. On thorough trial he discovered that while warmer for a while this double-wall prevented the sun from drying out the moisture, and the hive soon became damp and consequently cold. He made 600 of these, and mechanically they were probably as perfect as hives can be made. Not finding the double-wall satisfactory he next put his bees into straw hives, the last of which were made to take the Quinby size of the Langstroth frame. This was about the time of the commencement of the Civil War. The box straw-hives were excellent for winter and spring, and better suited to the requirements of the bees at other times than the hives previously used. They were not of the usual straw-hive shape, but had flat tops as shown in the picture, and were well adapted to boxing. They cost nearly \$2.00 apiece, and at one time he had about 1400 of them.

With the immovable-comb straw-hive he adopted a system of artificial swarming by driving that was so successful that often he had not a single natural swarm from an entire apiary.

Previous to this he had in use swarm-catchers for issuing swarms. These were placed before the old colonies and held the clustered swarms until the apiarist could get around to hive them.

After a trial of the movable frame the Captain found he could not do without it, but in his trial he made the important discovery that the colonies in the straw-hives with

the Langstroth frames did not winter or build up in the spring nearly so well as did the others whose combs were built against the sides of the hives, leaving no spaces at the ends of the combs. He therefore adopted the newly-invented Quinby hive, after materially assisting in perfecting the closed-end frames of the same. And after an experience of many years with both open and closed-end frames, he repeatedly assured me that he decidedly preferred the Quinby frame to anything else.

A part of his Virginia bees were put in the Van Deusen metal-cornered self-spacing frames, but those he cared for himself were kept in his own frames.

No new invention ever entered the apicultural world but that Capt. Hetherington noted it, and, if valuable, he adopted it. The honey-extractor was his as soon as it crossed the Ocean, and he used it ever after, believing it to be one of the greatest inventions and one of the most useful articles in the apiary.

He very hopefully followed up the invention of comb foundation from the beginning, and experimented with it four or five years after the date of Wagner's patent, obtaining his samples from a Mr. Steel, of New Jersey. The invention came from Germany, as perhaps did also the samples. It was only a midrib without any attempt at cell-walls, and was a failure, but lacked only Yankee ingenuity to make it a success by giving it side-walls. He was quite enthusiastic at the time of receiving the first handsome

Two of Capt. Hetherington's original straw-hives over 40 years old. Wall about 3 inches thick. One at the right is the Langstroth movable-comb, while the other has no frames.

sample from the Weiss machine, but, alas! he did not then know that it was made of paraffin, nor did he at first observe that the cells were intermediate in size between worker and drone. The queen was slow to use this size cell except when the foundation was convex or stretched so that the cells were enlarged, when she very freely deposited drone-eggs in them. Noticing this fact, he saw the necessity of making and keeping the cells of proper size. To prevent sagging he tried cloth, paper and wood centers, all of which were objectionable.

Finally, in 1876, he incorporated fine wires into the wax sheet from which the foundation was made, and met with complete success. Several years before this Mr. Quinby and himself had made a complete comb of very thin tin coated with wax. This was tested in midwinter, Capt. Hetherington bringing bees into a warm room for the purpose, and although the cell-bottoms were flat, it was freely used for rearing brood and storing honey.

In the manufacture of comb foundation it was found that impressing the rhomboidal bases upon the wax sheet would lay bare the wires unless a wasteful quantity of wax was used. To avoid this he left the cell-bottom flat as in the tin comb, thus also economizing in wax and simplifying its manufacture.

Previous to the invention of flat-bottomed foundation he had persistently refused to use natural-base foundation in his honey-boxes, as he was unable to make or buy any that would not leave an objectionable fishbone in the honey, and he did not wish to sell to others what he would not use on his own table, or what would injure the high reputation

his honey had gained. With flat-bottomed foundation 12 to 14 feet to the pound, he was able to produce comb honey that, on the average, had a more delicate center than that built wholly by the bees.

In 1888, Mr. Cowan, president of the British Bee-Keepers' Association, and the most illustrious scientific exponent of bee-culture in Great Britain, searched in vain for foundation or fishbone in Capt. Hetherington's honey. The next day he visited a neighboring bee-keeper and found the objectionable hard center in his honey, although he had used no thicker natural-base foundation than 10½ feet to the pound. Certain it is, that until the advent of the so-called "new process" Weed foundation, the flat-bottomed had no rival in the production of fancy comb honey. Capt. Hetherington's patent covers all kinds of wire supports for foundation, whether imbedded in the foundation as made or consisting of supporting wires in wired frames to which the foundation is later attached in various ways, and he should be recognized by the bee-keeping fraternity as the inventor of all wire-supported foundation. This is one of the greatest inventions of modern apiculture. Without it we could hardly use comb foundation in the brood-chamber, or newly-built comb in the extractor. And the flat-bottom wired foundation as used by Capt. Hetherington is probably also the cheapest way in which to use such supports. It substitutes machine-work, which is cheap, for hand-work which is costly and scarce. It saves wax, because being better supported it can be made lighter. It saves brood, since by the usual method of attachment there are hundreds of cells in every hive crossed by bare wires, and other hundreds or thousands of cells so stretched because of insufficient support that the queen does not use them for brood-rearing. The loss yearly from this cause may amount to enough to buy wired foundation. Capt. Hetherington was a skilled mechanic, and until within a few years ago made all of his own supplies, including hives, sections, packing-cases, honey-extractors, box-making machines, etc. Even the three dozen wheelbarrows used in his out-yards were made by himself. The material was usually prepared ready to put together at a mill five miles from home. To this mill he went daily with his men, arriving at daybreak and returning after dark. This, kept up for weeks in the cold winter weather, was indeed a strenuous life, and told heavily on a constitution impaired by army life and disease; but so energetic was he that he would have continued it longer had not the importunities of family and friends prevailed.

His hives, sections, cases, etc., were models of perfection and neatness. His packing-cases were of the whitest basswood he could find in the forest, papered inside, with the sections resting on cross-cleats—the style now so widely advertised as the "no-drip" shipping-case. The editor of *Gleanings*, in an appreciative article, gives him credit of being not only the originator of this, but also of the tall section and super-spring for holding them in place. He was among the very first to adopt the section-box, and his first were made to contain a comb taller than the brood, and the sections were held in place by the flat super-spring now coming into general use.

In 1874 he made a shipment of comb honey to Great Britain, being the first sent abroad in quantity. At the Centennial in 1876 his exhibit of 3500 pounds of honey in single-comb sections, together with a variety of ornamental packages of honey and wax, was admired by all visitors. The exhibit was built up to represent the turreted front of an old castle, so arranged as to permit the light to pass through in the freest manner, the whole surmounted by the flag under which he fought for three long years. The highest award was given him—a medal and diploma. A like award was given him at the Columbian Exposition at Chicago in 1893. The wording of this diploma by his friend Secor—"For great skill in the apiarian art, and taste in preparing its products for the market, this exhibit is exceptionally complete in every particular"—was very gratifying to Capt. H.

He also received an award on comb honey at the Pan-American Exposition at Buffalo.

For many years past Capt. Hetherington has been recognized as the most extensive bee-keeper in this country. Sixteen years ago Mr. Cowan, editor of the *British Bee Journal*, after traveling through nearly all bee-keeping countries, wrote that at Cherry Valley, N. Y., he "met the most extensive bee-keeper in the world". That year his colonies numbered 3000, located in 22 out-yards, from 2 to 12 miles from home. The fall of 1903 he went into winter with 2200 colonies, 600 of which were placed in the cellar in one day.

After adopting indoor wintering he moved all of his bees home in the fall and away again in the spring. To avoid this extra work, and for other reasons, he, some years ago (1889), established his Virginia apiaries. The season of 1903 he had more bees there than in this State. The shrinkage in numbers here was owing to the devastations of black brood, which, to quote Capt. Hetherington, "Is twenty times as bad as foul brood". One of the means lately used to fight this disease has been the introduction of Carniolan queens, which, on account of their prolificness, keep up the strength of the colonies even though quite a percentage of the brood dies of the disease. He had previously been well pleased with this race in his Virginia apiaries, where he introduced them for the purpose of carrying on brood-rearing during the usual summer dearth of honey there. Their good disposition and wintering qualities were found as represented, while as gatherers of buckwheat honey they proved to be ahead of the yellow bees.

Perhaps no incident in his life better illustrates certain characteristics of the man than does the establishment of his Virginia apiaries. His brother Oliver, of Michigan, through a friend had become informed as to the bee-keeping resources of the Shenandoah Valley in Virginia, and during a visit to his old home had canvassed with the Captain the advantages of keeping bees where the honey was all white, and where they could be wintered safely unprotected on the summer stands. A few days after the Captain was in Virginia, when he soon concluded this would be a favorable spot to locate the natural increase of his business. And a most prominent characteristic of the man was that after making up his mind to do a thing he did it without delay. His executive abilities were equal to any task in hand.

In this case he resolved to locate a thousand colonies of bees in Virginia in time for the fall flow of honey, which commenced in two weeks. He wired home, ordering lumber for the hives and castings made for the Van Deusen frame-corners, into which he transferred the bees. The hives had to be built complete from lumber in the rough, and given two coats of paint. The bees were in various out-apiaries from 2 to 12 miles from home. These had to be hauled in and transferred, comb and bees, into the new hives (putting 2 colonies together for extra strength), and then a little time given the bees to unite the comb for a thousand-mile journey.

The writer, in ignorance of his undertaking, happened over for a visit when he was in the midst of his preparations. He briefly explained his plans, but when it was proposed that the visit be postponed to a later date, he emphatically refused to entertain the proposal, saying he had nothing to do but oversee his men, and as each had his day's work assigned him, he did not expect much interruption. Twenty-nine men were at work that day. Every man had his place. There was no bustle nor confusion, and everything went off like clock-work. The bees were moved nearly on time, what delay there was being caused by others not in personal touch failing to do their part promptly.

The management of the large number of colonies kept by Capt. Hetherington has necessarily always been in a systematic, wholesale way, to which we may fairly apply the word *extensive* rather than *intensive*. In order that this system of management might apply to all alike, his bees were carefully equalized early in the season. In a good many of the details of his business, however, the word "intensive" might very appropriately be applied, for in the mechanical perfection of his supplies and appliances of all kinds, in the careful looking after the welfare of each individual colony, in the superseding of old or unworthy queens, and in the neatness and order displayed in every branch of his business, even to the minutest detail, he far surpassed the average keeper of a dozen colonies. So well did he look after the details of his business that it was almost impossible to inquire for any implement or article used or remnant left but that he could tell where it was.

As soon as possible after giving the bees a flight in the spring they were moved to the out-yards, after which they were visited as often as necessary, or about once in nine or ten days during the honey-gathering season, unless special work like queen-rearing required a more frequent visitation. A plot of ground was rented on which to set the bees, and to each yard was moved a small sectional bee-house and a wheelbarrow. No one looked after the occasional swarms issuing, for, as the queens' wings were clipped, such swarms would return.

For some time after adopting the new Quinby hive, he labored with Mr. Quinby to prevent swarming by giving shade, young queens, and plenty of room in surplus and

brood apartments of the hive; and in 1868 he succeeded in preventing all increase from the 150 colonies then under experiment. What worked well in one season, however, did not succeed in all, and it was not until he practiced remov-

View of Capt. Hetherington's first Wintering-Cellar. The roof covered with a foot of earth and then a board roof. The stones shown are for the new cellar.

ing the queen that he was entirely successful in controlling swarming. After the advent of black brood it was discovered that removing the queen was also beneficial in checking this disease.

More than a score of years ago he adopted the T clamp with the one-pound section. At first his honey was all in glass, but of late years he shipped it unglassed, much in paper cartons.

In the fall the bees were carefully looked over, and all those lacking in bees were rejected. Some seasons as many as one-third were thrown out.

In connection with his last attempts at outdoor wintering, he experimented quite largely with plaster of Paris as a material for bee-hives, it being an excellent non-conductor of heat, and a good absorbent of moisture. He soon discovered that in common with the absorbents heretofore used, in proportion as it became saturated with moisture, it lost its non-conducting properties. He, therefore, after a most thorough trial with almost all kinds of hives, and all kinds of packing material, abandoned outdoor wintering as unsuited to his severe climate, where a five months' confinement to the hive without a flight is occasionally experienced.

Winters like that of 1903-04 would cause disastrous losses. In the high mountainous region in which Cherry Valley is situated, successful wintering has been the most difficult part of bee-keeping, as the honey-bee is indigenous to warmer climates, and when removed to long winters it does not bear confinement well, unless every condition is perfect. Both on account of climate and of the poor quality of the late stores sometimes gathered in this locality, the wintering problem was the last one to be solved by Capt.

Capt. Hetherington's new Bee-Cellar. Ventilators are large and open all the time. Also openings in the floors over the bees which are open except in the coldest weather. He believed in abundant ventilation for bees.

Hetherington, and the solution of this cost him a mint of money and a score of years.

For the last dozen years he wintered his bees as well as farmers winter any kind of live stock. A year ago he took

out one lot of bees numbering over 800 colonies without finding a dead one.

As for honey, he has for years past been as certain of getting a paying crop as the farmer has been of getting a crop of anything else dependent upon the weather. During his lifetime he produced a greater quantity of honey than any other bee-keeper that ever lived. He found bee-keeping depending upon luck for a passing existence; he left it a specialty founded on the rock of science, the peer of any branch of agriculture. No one ever labored more, no one

Part of Capt. Hetherington's Bee-Yard in the fall, waiting for the cellar.

ever sacrificed more, no one ever accomplished more, toward this result than did Capt. J. E. Hetherington.

Captain Hetherington was one of the founders of the Northeastern Bee-Keepers' Association (now the New York State Association), one of the oldest, if not the oldest, organization of its kind in the country; and after the death of Mr. Quinby, its president. He was also present at the organization of the National society, and later elected president. At one time he was associated with Mr. Quinby in giving addresses on bee-keeping before farmers' clubs in some of the towns of central New York. He had a good command of language, and was a clear, forcible writer and speaker, and it is to be regretted that time and inclination did not permit him to make a more frequent use of his gifts in this direction.

Socially, and as a host, he had no superiors and very few equals in the fraternity, and many who read this will testify to the excellent treatment received at the hands of himself and his accomplished wife. His naturally excellent conversational abilities were improved by cultivation. His stock of anecdotes was large, and drawn upon almost wholly as apt illustrations of the various points under discussion, while his army life was so eventful, and his memory so retentive that from this source alone he could entertain and instruct by the hour.

At the camp fires of his G. A. R. Post he was looked upon as chief entertainer, and he was very successful in getting the old veterans to live over again, for a short time, their old army experiences. At a late public gathering of the Masonic Lodge of Cherry Valley, of which he was past-master, he was somewhat unexpectedly called upon to act as toast-master. His remarks on this occasion, the last time he was at a public gathering, were said to have been uncommonly brilliant and eloquent.

The citizens of his historic, native town have long held him in their highest esteem because of his sociability, his high intellectual and moral worth, and particularly because of his splendid military record. Nothing ever came up for the benefit of Cherry Valley but that Capt. Hetherington used his rare executive abilities to help it along. It was he who secured the organization of the Board of Trade in the nick of time to obtain the location of the most helpful industry of the town. He was also foremost in procuring a site for a summer park and recreation ground on the shores of Otsego Lake. And no one labored harder than he for the splendid public water supply of this town—an honor to this small village and a monumental work to those who conceived and carried the project through to completion.

Capt. Hetherington thoroughly enjoyed his home life, while his happy, hopeful, resourceful spirit made him the light of an affectionate household. He leaves a wife, a son, and a daughter. The son, recently married, has inherited his father's stirring activity and much of his executive ability. A younger son died 15 years ago, when a little more than 4 years old.

Capt. H. was an active temperance worker, and for

many years a member of the Good Templar order. He was a regular attendant of the Presbyterian Church, of which his wife and daughter are members. He was also an officer and worker in the Sunday-school. He believed in a religion of a practical, working kind that bears immediate fruit, that raises the fallen, feeds the hungry, cares for the sick; and he was a living exponent of that religion, as many persons have testified since his death. At the same time he believed in the Divine side of religion, with duties beyond those to our fellowman, and with privileges and enjoyments and helps not found elsewhere. One of the last quotations he made was from a favorite poem—Tennyson's "Crossing the Bar":

"For tho' from out our bourne of Time and Place  
The Flood may bear me far,  
I hope to see my Pilot face to face  
When I have crost the bar."

Eminent comrades have testified that as a soldier J. E. Hetherington had few equals. It was from no boyish freak, but from a deliberate sense of duty that on Oct. 12, 1861, he enlisted in Company D, 1st Regiment, U. S. Sharpshooters, Col. Berdan commanding. The spare time of the summer before had been spent in target rifle practice, and his mother had made his underclothing previous to enlistment. His bee-business at this time was the most extensive in the land, but it and his life, if necessary, were ready to be sacrificed when his country was in peril. Before the second year had passed, of nine intimate friends from Cherry Valley who had entered the army, four were dead, four discharged for disability, and Capt. Hetherington alone remained in the service. Truly, to quote Gen. Sherman's epigram, "War is hell".

Gen. Sheridan says, "Courage measures the power the mind has over the body". The Captain stood at his post in a most dangerous branch of the service, when most men would have been in the hospital or discharged for disability. His army surgeon has left on record the following to his bravery:

"On May 12, 1864, at Spottsylvania, he became very much exhausted by reason of chronic diarrhea, but declined being relieved from duty; and although wounded in the head, he heroically remained in command of his company." And, again: "On June 22, 1864, in action before Petersburg, Va., he received a serious wound in the hand, which disabled him from duty. At the time of receiving said wound he was suffering from chronic diarrhea, and was so weak and debilitated by it that he was a better subject for the hospital than the battle-field".

This was the wound he received when his sword was shattered by a bullet, and a piece of the weapon driven through his hand. The engraving shows this piece lying by the broken sword. The portrait shows the position of the sword and hand. He had thrown his rubber blanket across the hilt of his sword, and that over his shoulder. Providentially, the bullet, so accurately directed, found a lodgment in his sword and hand instead of his heart, which lay just beneath. Major Gen. Wilkenson, of the British army, on seeing this sword, said that he had seen many of the heirlooms of prominent British families, and the relics sent home from 20 years of active service, and then added, "Among them all there are none that I consider so fine a personal relic as this broken sword". The Captain threw

The Sword which saved the Captain's life.

this away as being of no further use, but it was preserved by his men. He also received a gunshot wound in the shoulder in the second battle of Bull Run, Aug. 29, 1862.

Entering the army a private he came out a captain in that branch of the service where the command of a company meant in some ways as much as the command of a regiment in other parts of the army. The captain of Company D was killed in the battle of Gettysburg, July 3, 1863, and Lieut. J. E. Hetherington was recommended for promotion by Col. Berdan from the battle-field. At the close of the

Gettysburg campaign an order was sent to the commanding officers of the army to report to the Secretary of War the names of such officers and men as had distinguished themselves for bravery and meritorious conduct during the

Capt. Hetherington during War Times; the position of hand and sword when struck by the bullet.

Before an engagement, an officer transfers to his darkey or servant all luggage—retaining only his rubber blanket and haversack, for use in case the aforesaid gentleman fails to put in an appearance after the fight. His blanket is made into a small roll and tied at the ends, then carried across his shoulder and breast as a sash is worn. In hot weather this is oppressive; and for temporary relief, although in the midst of a hard fight, the captain had thrown his rubber across the hilt of his sword, and that across his shoulder.

campaign. The name of J. E. Hetherington appears in this list, and furnishes the best of proof that his promotion was well earned.

While in the army the Captain was in all the principal battles of the Army of the Potomac, and since, when he joined the Comrades of the Battle-Field, the affidavits of others revealed the fact that he had been under fire 114 days, thus exceeding the requirements of this strictest of strict organizations by 24 days. He was discharged from the service Sept. 20, 1864, by reason of disability from wounds received in action. For two years after it was a question whether he would live, but he gradually regained the larger part of his former vigor. The chronic army disease from which he suffered never fully left him, and at last, after extreme prostration from the grip, ended his life.

In personal appearance the Captain was tall and commanding, and looked every inch a soldier. But for his youth, undoubtedly higher rank and still greater honors had come to him while in the army. Had his health permitted him to remain in the service at the close of the war, and take a West Point course, as was suggested, he could have filled with credit any position in the army. He had resources to meet any emergency; executive ability to carry through any undertaking; will-power that would not be defeated, and a comprehensive mind that grasped the entire situation and strategic points of a battle-field. His description of the battle of Gettysburg clearly showed that, young as he was, he comprehended the situation and movements of the two armies. As a commander he gained the confidence and enthusiastic support of those under him.

The bee-keepers of this country may feel honored that they have had enrolled in their ranks one who as a citizen, bee-keeper, and soldier has contributed so much to the welfare of his fellowman. The world is better for such lives. Good deeds live on forever in continual multiplications, hastening the glad day when all evil shall be overcome by good.

True heart, that beat so brave, and true and strong,  
Then failed him first who never failed his friend;  
True hands, that always could their succor lend  
Where Need was born of Want or cruel Wrong;  
True lips, that gave the courage of a song  
To fainting souls who would the Right defend,  
Throughout the way until he found its end;  
Farewell! And if the way, perchance, be long,  
Unlighted by his loving, genial smile,  
We still may walk it, weary mile on mile,  
With surer Faith, and always willing feet,  
Because of heart, and hands, and lips, that went  
So far with us, and such rare presence lent,  
And wait, Somewhere, our coming soon to greet.

—A. A. HOPKINS.

## A Few Tributes to the Memory of Capt. Hetherington.

We wish to give, in addition to what Mr. Elwood has told so well, several appreciations of Capt. Hetherington from personal friends and those who valued his efforts in different lines. One of them, from Maj. Chas. J. Buchanan, was sent to us by Mrs. Hetherington, who accompanied it by the following note:

MR. GEORGE W. YORK—

Dear Sir:—Among the letters of sympathy I received was one from an army comrade who had been a member of the same Company during the entire time of my husband's service, and with whom there has been a warm friendship ever since—Mr. Charles J. Buchanan, a well-known lawyer of Albany, N. Y. It expresses such a true and just appreciation of my husband's character that I thought you might like to include a portion of it in your memorial number. I send you a copy which you can use at your discretion, or not at all, as you think best.

Yours sincerely,  
EVA B. HETHERINGTON.

A portion of the letter referred to by Mrs. Hetherington reads as follows:

From Major Chas. J. Buchanan, of New York.

So passes away my most intimate friend and comrade of the Civil War. Our acquaintance commenced in November, 1861, and continued unbroken until his death. He was

a soldier by instinct. Manly, courageous, brave and honorable, he easily met and sustained himself through all the vicissitudes of army life. No demand was ever made upon him to which he did not render more than full equivalent. There was a charm and dignity in all that he did.

He was always kind and generous to others, even to the detriment of his own self-interests. His high sense of duty was never lacking in any conviction or emergency. He never demanded of his associates as much as he exacted of himself. His theory and practice were to do just what he believed to be strictly right, always leaving to those with whom he came in contact to act from the same standpoint.

Any one who gained his confidence, was always his intimate.

I always knew, without asking, where he would stand upon any question where the facts involved were undisputed.

He would go out of his way to benefit his surviving comrades, never waiting for his assistance to be solicited.

Take him all in all, he was one of the noblest specimens of manhood that I ever knew. He could, when necessary, reprove as well as commend, but such censure, when he gave it, was to admonish rather than to reproach.

There was no guile in his nature. Frankness and the utmost sincerity characterized his every action. His motives were always pure. His line of conduct through life

was marked by that standard of excellence which was born in him, and which he never sullied nor disgraced.

He has gone to his reward, which I doubt not will be commensurate with his aims and ideals in this life.

If he had any motto it was this: "Forward, as occasion offers. Never look around to see whether any shall note it. Be satisfied with success in even the smallest matter, and think that even such a result is no trifle".

Sincerely yours,

CHARLES J. BUCHANAN.

#### From Mr. L. C. Root, of Connecticut.

MR. GEORGE W. YORK:—A most cheerful and gratifying task is accorded me when I am asked to join in the praises of my good friend, Capt. J. E. Hetherington.

I think I may say that few people outside of his own family knew him better, or had a better opportunity to judge him accurately, than myself. He was intimate from boyhood with the Quinby family, to which my wife belonged.

In writing of Mr. Quinby, Capt. Hetherington said: "I went to him as a mere lad for instruction in bee-keeping".

I first met him at Mr. Quinby's, quite early in the morning after a 16-mile ride. I well remember his enthusiasm at that time. This marked enthusiasm characterized his whole life, whether in business, social, army, religious, or home circles.

His business interests in bee-keeping were probably the largest in the world, and his success was marked, though his life was characterized by generous impulses and deep interest in the higher walks of life. Whatever he did, he did well. Few men have done more accurate and faithful work than he, or shown greater cheerfulness and nobleness of purpose.

L. C. Root.

#### From Prof. A. J. Cook, of California.

It is certainly a pleasure to voice my feeling of esteem and respect for our friend, the late Capt. Hetherington. It was my pleasure to meet Capt. Hetherington at the home of his brother, whom I knew more intimately than I did the Captain, and also at some of our National conventions. A feeling of strong admiration was the result of this all too slight acquaintance. Indeed, I think Capt. Hetherington had many points in common with his brother, who was one of our honored Michigan bee-keepers. These gentlemen seemed to have rare inventive genius. We all know that some of our best implements in bee-culture, especially the honey-knife, owe much to the Hetheringtons. They seemed to have that rare faculty that divines things which as yet have had no existence. It was never my privilege to visit the large apiaries of Capt. Hetherington. I am sure that, could I have done so, I should have seen there what I saw at the Saginaw apiary of his brother, many ingenious helps that I should have carried away to aid me in my own work among the bees.

Another peculiarity of the Hetheringtons was their neatness and method. Like our friend Bingham, they could not abide dirt, which simply means things out of place. No wonder Mr. Bingham and the Hetheringtons were brought together. We all know about "birds of a feather". I am sure that at the large Hetherington apiaries we should have seen system and method supreme. Without doubt this was no mean factor in the success of Capt. Hetherington in the extensive work which he carried on among the bees.

But the best characteristic of Capt. Hetherington, as of every true man, was his courtesy, thoughtfulness of others, and exceeding probity and honor. One had to be with him but a very short time to recognize the fact that he was with a gentleman who valued truth and honor as of highest worth. Such men honor any business or profession. It is very rare that I learn of the death of one whom I knew no more than I knew Capt. Hetherington where I feel such a burden of loss as came with the sad words that our friend had passed into the Beyond. Great souls are none too common in this world, and when they leave us we all—the world itself—are poorer.

A. J. Cook.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Location in Virginia or Maryland.

Would Virginia or Maryland be a good location for starting a bee-yard?  
WISCONSIN.

ANSWER.—There are good locations in both States, but it will probably need personal investigation to find such locations not already occupied. Sometimes there are bee-keepers in good locations who are willing to sell out, and a short advertisement might reach them.

### Size of 10-Frame Hive—Depths of Rabbets.

1. What are the outside dimensions of a 10-frame hive?  
2. How deep should the frame rabbets be when one intends to use tin rabbets and the Hoffman frames? I intend to make the hive-bodies and buy the tin rabbets and the frames.  
WISCONSIN.

ANSWERS.—1. I think the usual dimensions are 20 inches long, 16 wide, and 9½ deep. That, however, leaves no room for a dummy. If I were making them I should want them 5/8-inch wider, so as to have room for a dummy.

2. Three-quarter inch.

### Keeping Bees Near a Lake.

1. Would bees be likely to do well near a large body of water, or would they be likely to fall into the lake?  
2. On which side of a lake would you prefer to keep bees—the east or west side?  
WISCONSIN.

ANSWERS.—1. The water is not likely to do any harm, only it is just so much surface without any pasturage, just like so much barren land. If the body of water was so narrow that the bees would cross it to get pasturage on the other side, a few bees might be beaten down in crossing by high winds.

2. The side that had the best pasturage.

### Prevention of Swarming—Reducing Rearing of Young Bees in Honey-Flow.

1. For the prevention of swarming is there any objection to the use of perforated zinc at the entrance, other than that it hinders the passage of the bees?

2. Is it an advantage or a disadvantage (in a short honey-flow and severe winters) to have the production of young bees reduced to say one frame during the honey-flow (swarming season)?  
ONTARIO.

ANSWERS.—1. It makes the hive warmer in hot weather, and imprisons the drones so that they die in the hive unless liberated by the bee-keeper. In some cases it may prevent a young queen from taking her wedding-flight.

2. In the majority of cases it would be a disadvantage.

### Races of Bees—Cutting Out Queen-Cells—Wintering.

1. I am sending you a few worker-bees, which I picked up from the front of the hive. Are they Italians, blacks, or hybrids?

2. How do you cut out queen-cells when the supers are on the hives? Do the supers have to be removed every time, and, if so, doesn't this put the bees back with their work?

3. Last fall I put the bees into winter quarters as follows: On top of the frames I put a few strips of wood 1/4-inch thick; on top of this a few thicknesses of cloth; on this about 4 inches of leaves, and a dry-goods box over the hive. Today they had a flight, and there seemed to be a good

many bees still in the hive. Last fall the hive and all weighed about 75 pounds. How do you think they will winter?

4. I have a bee-book dated 1887, called "A B C Guide to Bee-Keeping," by W. B. Webster. Did you ever know this man?  
ILLINOIS.

ANSWERS.—1. When they got here they were of the smashed variety, making it hard to tell much about them. I think one has one yellow band, making it a hybrid. The other may have three yellow bands, and no one can tell whether a single three-banded bee is pure Italian or hybrid. If all in the hive are three-banded, they're Italian.

2. Yes, the supers are lifted off to get into the brood-chamber, and of course that disturbs the work of the bees, but not very much.

3. As far as can be judged from description, they ought to winter well.

4. I knew one bee-keeper by the name of Webster, but I'm not sure he is the man. [It is a book written by a bee-keeper over in England, and has been reprinted in this country. Scarcely any bee-keeper in America would use the implements and fixtures illustrated in it, and, besides, they could not be bought here.—EDITOR.]

### Wintering bees in a basement.

1. How would it do to winter bees in the basement of a brick building where the temperature is 22 degrees above zero when it is 18 below out-of-doors? The air is absolutely pure. The building is 36 x 60 feet. It has a center wall which divides the basement. There is a furnace in one part of it, which is fired up once a week, raising the temperature to 55 degrees above zero. I am wintering 15 colonies of bees in the other part. I put them in Dec. 12, and they are doing nicely so far.

2. Do you think they would winter better out-of-doors?  
IOWA.

ANSWERS.—1. If the bees have done well up to the last of January, it would seem reasonable to expect still further success. On general principles it would not seem desirable to have a repository range from 22 to 55 degrees, but if it does not touch the lower figure very often, generally ranging in the neighborhood of 45, it may do very well.

2. Likely not.

### Increase—Honey-Drinks—Wintering Out-Doors.

1. Which is the more profitable, forced or natural swarming when running for section honey, and when increase is desired?

2. Can a good alcoholic drink be made with honey? If so, how?

3. How much air-space must be allowed to keep the bees from smothering in outside wintering, when the temperature goes as low as 10 degrees below zero?  
MISSOURI.

ANSWERS.—1. Depends upon the person; with little experience natural swarming is best; with sufficient experience something else may be better.

2. I've had no experience in that direction, and would rather throw good honey away than to make it into an alcoholic beverage.

3. The entrance should amount to something like two to four square inches, depending upon the strength of the colony.

### Best Hive—Detecting Queenlessness.

1. As there are no bee-keepers in this vicinity using patent hives (nothing but the box-hives), I would like your advice as to the kind and size to buy. The main source of honey is white clover.

2. I heard an old bee-keeper say that he could tell when a colony was queenless by the actions of the bees. I asked him how, but he would not tell. Can you tell me?  
IOWA.

ANSWERS.—1. You will probably be well suited with 10-frame dove-tailed hives. If you are working for comb-honey, 8-frame hives may do better, but even in that case it is better to have 10-frame hives unless you expect to give your bees a good deal of attention. There is much more

danger of starvation in winter with the smaller hives, if they do not have close attention.

2. I don't believe there is any way to tell whether colonies are queenless without looking in the hive, although a pretty good guess may be made when a colony is carrying in very little pollen when others are carrying in much. If a colony has just become queenless, you may see the bees running about at the outside in an anxious way.

### Drone-Comb Required in a Hive.

How much drone-comb does an 8-frame hive require?  
CALIFORNIA.

ANSWER.—If you allow no drone-comb whatever, you will probably have all the drones needed, because the bees will manage to get drone-comb into some corners in spite of you. Yet it is better to encourage drones in one or more of your best colonies (not the ones from which you rear queens), suppressing them in others. Mr. Doolittle's plan is good. Allow one or two square inches of drone-comb in each colony whose drones are to be suppressed, so as to prevent them from building drone-comb: then every two or three weeks shave off the heads of the drone-brood.

### Improved "Frost-Proof" Hive.

I have been interested in bee-culture for the past two years, and am contemplating increasing considerably my apiary the coming season. This will necessitate the purchasing of additional hives. I have heretofore used only dovetailed hives, but a gentleman who has invented and applied for patent on a hive is desirous of furnishing me with his product. He makes a hive which is fastened at the corners by a metal device, which he claims to be a great improvement, as the hives can be knocked down at any time; it is frost-proof; and requires no nailing to put together. He also claims he can make them out of basswood instead of pine, as his manner of joining the corners prevents warping.

In your experience have you found that being able to take the hives apart at any time is of importance? and what do you think of adopting this hive? I can see that it is much easier to put together than the dovetailed pattern, but if you can see any reason why it would be unsatisfactory in any way, I do not want to invest to any great extent.  
ILLINOIS.

ANSWER.—I know nothing of the particular hive in question except what you say, but on general principles you may feel pretty safe in saying that 9 out of 10, if not 99 out of 100, of supposed improvements are anything but improvements. Just now I cannot think of any advantage there would be under ordinary circumstances in having a hive capable of being taken apart. The only advantage I can think of in any case would be to take the hives apart so as to pack them in less space, but that would apply only to unoccupied hives. The corners of a basswood hive may be held against warping, but would that prevent shrinking and swelling, so as to keep the brood-chamber always of the same depth? A "frost-proof hive" in northern Illinois sounds like a fairy tale.

### Stimulative Brood-Rearing—Feeding Bees—Leasing Ground for an Apiary.

1. What is the most satisfactory way of stimulating brood-rearing in the spring?

2. Is not extracted honey and sugar syrup mixed the best feed when it is fed warm?

3. What should be the proportions?

4. In feeding is it not better to have all the hive-bottoms perfectly tight, and raise the front somewhat higher than the back end, pouring the syrup in at the entrance?

5. Can you give a form of agreement in regard to leasing ground for locating an apiary?

6. Should the land-owner be bound to protect the apiary from thieves and stock so far as he is able to do so?  
WEST VIRGINIA.

ANSWERS.—1. The most satisfactory way for me is to see that the bees have plenty, yes, more than plenty—abundance—of stores, keep them well closed up, and then let them entirely alone. If your queens are not so good at laying as to do their best without the lash, or if your locality is such that you have good flying weather without any pasturage,

then it may pay you to feed half a pound of diluted honey every other evening, or to change end for end the outside comb on each side.

2. It is not so good as solid combs of sealed honey.

3. It's like the rule for the proportion of oats and sawdust for good horse-feed—the less sawdust the better. In many cases, however, sugar syrup must be fed when honey enough is not to be had, and then one-fifth honey is better than pure sugar. Sugar alone does better for a winter than for a spring feed.

4. I have fed many a colony in that way, and it worked well, only for some reason that I did not understand quite a few dead bees were carried out next morning.

5. I'm not a lawyer, but I should think all that would be necessary would be a writing saying that such a piece of ground was to be leased for such a time for such a consideration.

6. Not unless it was so specifically agreed, in which case the consideration should be correspondingly greater.

### Best Foundation to Use.

What kind of foundation is better to use for brood, light or medium? Also what kind is better in supers for extracting? Which is the better cell, the round or hexagonal?

CANADA.

ANSWER.—It matters little which kind of cell, or whether light or medium for either brood or extracting frames, only the light foundation needs to be better supported than the medium.

### Bees Noisy In the Cellar.

It is 64 days since my 21 colonies were put into the cellar, some of them nuclei and some real strong. The room is 12 x 14 x 5 feet deep, 3 feet under and 2 above. I have a furnace in the cellar, but there is a double-wall partition between the bees and the furnace, and the temperature is always at about 45 degrees. The cellar is dry, cool and sweet, with good outside ventilation when required, and a chimney runs from the cellar up.

Three of the strong colonies are always more or less noisy, and I do not understand why. Each hive is raised one inch from the bottom-board, and has a cushion on top. At one time I let the cold air in and the temperature went down to 32 degrees, then it gradually went up to 55, and finally down to 45. I let them alone for days at a time, thinking they would quiet down, but that same noise is always heard more or less, while the others are very quiet. The entrances are not spotted, and so far only a few bees have died.

Would it be better to take them out and leave them out when the weather is warm enough?

ILLINOIS.

ANSWER.—It is not easy to understand just how much noise those bees make. It is possible that they are dangerously noisy, and it is possible that the noise they are making may be safely kept up all winter. The strongest colonies may be expected to make more noise than the others. It might do better to take them out and leave them out, but likely not. You might try giving them still more ventilation below, or a very little above.

### Italianizing Bees.

I have 11 colonies of black bees. I wish to increase as much as I can this year, and would also like to Italianize, or change to better stock. At the same time I wish to interfere as little as possible with the honey crop, which comes here in June, July and August. I notice on page 225 of "A B C of Bee Culture" a plan which says to purchase a choice breeding queen in the spring or summer, not to remove the old queens until the summer crop of honey is stored, and instead of natural swarming take frames and make nuclei, giving them queen-cells from Italian brood.

Where will I get the queen-cells? Is it not possible that the Italian colony will not have any queen-cells in it at the time I want them? Would it be necessary for me to make the Italian colony queenless at about this time?

TEXAS.

ANSWER.—You cannot be certain there will be queen-cells in your Italian colony when you want them, but you

can make it more likely by giving occasionally a frame of brood from other colonies to your colony with the choice queen. Thus building it up strong you will be likely to have queen-cells early enough. But to make sure of them, look through the hive about 10 days before you want to use the ripe cells, and if you find no cells started you must make the colony queenless. Take out the queen with 2 frames of brood and adhering bees, and put them in an empty hive on a new stand, adding from some other colony a frame or two of honey, and filling up the hive with frames filled with worker foundation. A week later let the 2 hives swap places, for by that time the cells will be sealed, and the nucleus with the old queen being put on the old stand will get all the flying force. You can cut out and use the cells 9 or 10 days from the time the old colony was made queenless.

### "Good" Candy Made with Granulated Sugar.

I have made some "Good" candy, using granulated sugar. After I had it made I noticed that the recipe called for pulverized sugar. I have no way of pulverizing the sugar. Will it make good feed as it is?

ILLINOIS.

ANSWER.—The granulated sugar will make good feed, only it will be rather extravagant, for the bees will be likely to throw out the coarse grains. I don't know of any way to pulverize granulated sugar, unless to borrow the druggist's mortar and pestle; but you ought to have no trouble in getting pulverized sugar from your grocer.

### Shaken Swarms—Rearing Queens.

I started last spring with one colony. It cast a fine swarm, but as I do not have time to watch them during swarming time, I did not see it come off. It was leaving an apple tree when I saw it, and in spite of all I could do to save it, it went off to the woods. I bought 3 colonies last summer, so I have 4 in the cellar at present.

I would like to make 8 colonies out of the 4 this coming season, and get as much surplus honey as I can, besides. My bees are blacks, and I want to Italianize at least 2 colonies. As I have not time to watch them and they are not situated very close to the house, if I allow them to swarm naturally I will be likely to lose them, so I have been trying to plan some suitable method of artificial swarming. The bees are in movable-frame hives, but owing to crooked combs and brace-combs, they are practically immovable. So it would be almost impossible, especially for an inexperienced bee-keeper, to find the queen to clip her wings, or in case of Italianizing to destroy the old queen before introducing the new. I have read considerable during the past year, in bee-books and bee-papers, about shaken swarms, and from the methods given have been trying to arrange one to suit my case. I will outline it and ask your advice as to its suitability or practicability.

I thought to purchase four 10-frame, 2-story Langstroth hives (for extracted honey), with Hoffman frames, and fill them with full sheets of foundation in both stories. Order 2 Italian queens in time to have them about the first of the honey-flow from white clover, as it is about the first that yields any surplus. Then when honey is coming in freely, put the new hive with full sheets of foundation and an entrance-guard to prevent the queen and drones from going in, on the old stand; shake all the bees but a few to care for the brood in front of the new hive, and let them run in; catch the old queen at the entrance-guard, and put her back in the old hive, removing it to a new stand. Give the new colony an Italian queen. I would have to give the 2 new colonies for which I have no Italian queen, the old queen, and let the old colony rear a queen for itself.

A neighbor bee-keeper who has had considerable experience, and to whom I was telling my plan, thought it would work all right, and said a good way to get the bees out of the old hive was to place an empty super on top, smoke the bees good, then drum on the sides of the hive from 10 to 15 minutes, when all the bees would go up into the empty super, and could then be shaken in front of the new hive.

1. Do you think the plan would work all right?

2. Would I need to wait until the bees were preparing queen-cells for swarming to shake them, or would it be all right to do it as soon as there is a good honey-flow coming

in? (It would be hard for me to find queen-cells without removing the frames.)

3. Would you put the cage with the Italian queen in the new hive before letting the bees run in or immediately after?

4. If worker foundation in full sheets is given will the bees rear any drones?

5. What grade of foundation should be used in the brood-chamber? In the upper story for extracted honey?

6. Would colonies shaken in this way be likely to swarm again?

7. Are queens that are reared by the bees after their old queen is removed (when this has been done previous to the forming of queen-cells) likely to be all right? Are they as good as those reared under the swarming impulse?

8. If so, would it be all right after a colony is properly Italianized, to remove the old queen and give it to a queenless colony, and let the then queenless one rear a new queen?

9. If this will not work, will you please give me a simple method by which an inexperienced bee-keeper could rear queens from an Italian colony to supply any colonies which may be left queenless, or to improve his stock?

CANADIAN.

ANSWERS.—1. Yes, with some modifications mentioned in following answers:

2. You can shake, without waiting for queen-cells, as soon as colonies are *strong enough* in a good honey-flow.

3. I wouldn't put her in the new hive, but in the old one. Her reception will be more kindly, and the broodless bees will be much better satisfied with their old queen.

4. They will be likely to build a few drone-cells in odd corners, and of course rear a few drones.

5. Medium brood, unless you support the light brood well.

6. Not likely.

7. Yes and no. As you propose to manage, I wouldn't expect the best of queens.

8 and 9. Your colonies, in the way you propose, wouldn't be strong enough, and having no field-workers would be in too discouraged a condition. You will be all right if you take the queen (with perhaps one or two frames of brood and bees) from a strong colony with its full working force at a time when honey is yielding well.

### Feeding Bees in Winter—Punic Bees.

New Hampshire lost most of her bees last winter. My 9 colonies died on the summer stands.

I bought a new supply last spring, and put 7 colonies in the cellar the first of January, this year, having waited in vain for 6 weeks to give them another flight. My cellar is not a good one for bees. The temperature is 35, and it is sometimes wet in the spring or during prolonged thaws in the winter.

Several of the colonies are small in numbers, and all are deficient in stores. They are in two-story dovetailed hives, the upper story empty, and inch blocks under the front corners of the hives.

I commenced feeding "Good" candy a week ago, giving each colony a piece about the size of an orange. Today I cleaned out about a half-pint of dead bees, on an average, from each hive, and found on the bottom-board under each ball of candy as much powdered sugar as it took to make the candy.

1. Was the candy too sugary?

2. A neighbor of mine who is an old bee-keeper, says he has successfully fed bees in winter with thick syrup, in fruit-jars covered with thin cloth and inverted over the cluster. Is it safe to try this plan if the candy won't work?

3. Ought I to cover the frames with a chaff cushion?

4. Will it be better to put them out early in the spring to feed them, or wait until the maple blooms appear?

5. There is a continual hum in the hives, sometimes sufficient to be heard across the cellar. Is this too much noise to call it good behavior, and, if so, what is the cause and remedy?

6. Have the Punic bees proved a success in this country, or are they still an experiment?

NEW HAMPSHIRE.

ANSWERS.—1. Probably. Perhaps not as thoroughly kneaded as it should have been, and perhaps *too fresh*. You

will generally find directions to let it stand some time after being made. That gives time for the sugar to be dissolved by the honey, and if that time is not allowed it may be sugary. There is, however, little loss in the case, for you can collect the dry sugar that the bees have thrown down and use it over again, either now or in the form of syrup in the spring. Possibly you might succeed better to make common boiled candy, merely boiling sugar in a little water till it will be hard when dropped in cold water.

2. Yes, if the candy won't work, but it will work. I commend to your reading the article on page 86, by that very practical and common-sense bee-keeper, C. P. Dadant.

3. It will be better. Or, it may be more convenient to use pieces of old quilts, carpets, or something of the kind.

4. Somewhere from the middle of February till the middle of March it may do to take them out for a flight on a warm day, and then take them back in the cellar till after maple-bloom. Sometimes maples get in too much of a hurry, and it's better for the bees to stay where it's warmer, even if the maples are fools enough to start blooming only to be frozen up again.

5. Less noise would probably be better; but as cold as 35 degrees they will make a good deal of noise to keep themselves warm. Can't you warm up the cellar in some way? Even if only occasionally to 45° or more, it would help. Hot stones or jugs of hot water *tightly corked* might do it.

6. In the experimental stage; reports varying from favorable to extremely unfavorable.

### Colony with an Imported Queen.

Last May (1904) I received by express a 3-frame nucleus containing the highest grade (according to price) imported Italian queen. The nucleus was given a 10-frame Danzenbaker hive, 7 frames containing foundation in full sheets. The nucleus did not build up quite as rapidly as I had hoped, but by the end of October, by dint of spreading brood and feeding sugar-water, it had grown to a fair-sized colony having 20 frames (double brood-chamber) of honey and brood. I turned a Danzenbaker cover over the hive, simply a thin 3/8-inch box, reaching a couple of inches below the top brood-chamber. I left the entrance 1x14 inches open, except for wire screen to keep out mice and robbers. The colony seemed to be wintering well, very well indeed. On occasional flight-days they came out actively, and there were never but a few dead bees on the bottom-board or in front of the hive. Dec. 8 and 31 bees were out in good force for play-spells, and Dec. 21 a few were out. Jan. 1, 1905, the temperature was 54 degrees in the shade, all the bees were out, and robbing began. (I have 7 colonies, one a weak one which I had carelessly left with the wire guard off.) Jan. 2 there was a snowstorm. Jan. 19 the temperature was only 38 degrees in the shade, but the sun was very much warmer for a short while, and the bees from the 3 south colonies (they are in pairs) came out in surprising force, also some bees from the hive containing the queen mentioned. At no time this winter has the temperature here in the daytime been to zero. But a few nights before the last-mentioned play-spell the temperature for a brief period was 6 degrees below zero.

On the morning of their last play-spell, previous to their coming out, I gently pulled out with a small stick, the dead bees that were on the bottom-boards of the 4 Danzenbaker hives. The 3 other hives are old-style with very small entrances. In the hive containing the queen mentioned only a few bees were on the bottom-board, a dozen or two at most. But all alone about the middle lay the queen herself. She was easy to identify as the same queen, because of her wing which I clipped last May. As she was not dried up, her death must have been quite recent. On the hive next to this one I had used a small entrance for protection. I pulled a load of dead bees out of it, and left a large entrance, as the other 2 Danzenbaker hives with wide-open entrances showed as few dead bees on the bottom-boards as the one with the queen did.

1. Since the other 2 wide-open entrance hives (which also faced the west wind) and the queen's hive (which faced east and has a building at its back) seemed to have a few dead bees, while the one Danzenbaker hive with the small entrance, about 3/8 x 8, was loaded with dead bees, is it likely that the imported queen perished from that cold-spell mentioned?

2. In a cold-spell wouldn't any queen be near the center of the cluster, and be among the first to die?

3. In case of starvation isn't the queen one of the last to die?
4. Is it possible that the mild winter has led to unseasonable brood-rearing and egg-laying, and undue tax on the queen?
5. In that case would the fact of considerable part of the stores being non-nitrogenous sugar-water work destruction to the queen or not?
6. Do bees ever supersede a queen in winter? If so, how could they rear a new queen without her being an unfertilized drone-layer?
7. Would you think it at all likely that they superseded last September, but left the original queen on the combs, as sometimes happens (so I have read) till she died naturally?
8. Would you be inclined to think that that hive has no queen?
9. Assuming it is not destroyed by robbing, how early next spring, if winter continues mild, will that colony cease to exist, or at least fall below the point of easy building up?
10. Is it possible to introduce a queen in winter in an outdoor hive? If so, how?
11. I notice in bee-papers one Southern queen-breeder advertises, "I can send you a queen any month in the year and guarantee safe arrival." And another, "Queens from now until Feb. 1, \$— each." Would it be advisable to attempt to secure a new queen now, or do these advertisers mean these offers only for their Southern customers?
12. If you had this colony what line of action would you pursue to make the best of the matter for the coming season?

ANSWERS.—1. No. 2. Yes. 3. Yes.

4. Even if the queen should lay several times as much as usual in winter, it would still be a small amount compared with her full capacity, and would not be likely to have any appreciable effect on her health and strength.

5. The lack of nitrogenous food would have for one effect to save the queen from laying, and it couldn't kill the queen without killing the other bees.

6. Probably not. I don't know for certain just what would be the result in all cases if a queen were killed in winter. If at a time when brood was present they might rear a queen, and it is among the possibilities that she might be fertilized as soon as drones were flying; but it is not likely that such a queen would be valuable.

7. It is entirely possible. It is also possible that she was killed on the occasion of the robbing mentioned.

8. The probabilities are in that direction, but you can't be sure until you find no brood in spring when all other colonies have brood well under way.

9. Not till in honey harvest if laying was kept up well in the fall.

10 and 11. Yes, you can introduce in winter the same way as in summer, but it is hardly advisable. It would disturb the colony unnecessarily, and there would be no particular gain. Even with guaranteed arrival, she might not arrive in as good condition as later.

12. I'm not sure whether it's worth while to tell you what I would do, for bee-keepers who have been no longer in the business than you have are almost certain to think it of more importance to have a large number of hives with bees in than to have a large number of bees in each hive. The chances are 99 in 100 that I would break up the colony when spring opened—of course on the supposition that it is queenless or has a worthless queen—distributing combs and bees to colonies that would be the better for strengthening. That would leave all in shape so that by fall I'd have more good colonies than if I had coaxed along the queenless one. But you'll hardly be willing to break up that colony, and you can keep gradually adding brood from other colonies and buy a queen to introduce near the opening of the honey harvest. But if you can steel yourself to be so hard-hearted, you'd better break up a colony that is queenless in the spring.

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

## Convention Proceedings

### ONTARIO BEE-KEEPERS' CONVENTION.

REPORTED BY MORLEY PETTIT.

(Continued from page 119.)

The Question Drawer was reversed from the usual order. The president chose a subject, subdivided it, and asked the members leading questions.

#### PRODUCING COMB HONEY.

1. What race of bees would you choose for producing comb honey?

R. F. Holtermann would choose Carniolans, if it were not for their tendency to swarm. They are hardy, build up well in spring, cap white, use little propolis; in fact, seem to have only one fault; but on that account, in a locality where the flow is continuous, and inducement to swarm great, they must be strongly mixed with Italian blood.

Jacob Alpaugh—A cross between Italians and blacks produces good comb honey. Blacks cap whiter but do not store so well. There is a great difference in Italian bees.

#### WHAT SIZED HIVE WOULD YOU USE?

Morley Pettit prefers the 10-frame Langstroth.

F. J. Miller considers the Heddon hive excellent for either comb or extracted honey.

Jno. Fixter for five years got more honey from a 10-frame than from either the 8-frame or 12-frame hive.

Mr. Sibbald said last year if the hive is too large put in a division-board and run the hive at the capacity it has at the beginning of the flow.

R. H. Smith—How about uniting at the beginning of the honey-flow?

Mr. Holtermann—I do not care for uniting at any time.

Morley Pettit—The main thing is to equalize brood. This can be done by taking from the strong and giving to the weak. It should be capped brood, and not more than one or two combs at a time from any hive.

#### TIME OF PUTTING ON SUPERS.

Mr. Alpaugh—I would make sure to have supers on in plenty of time. I do not find the bees do the foundation any harm before the season. It is after the honey-flow is over that they gnaw and wax it.

R. H. Smith—I would not put on supers until the bees are ready to work in them. If you have a super drawn out from last year, put that on first; but be sure last year's honey is extracted out of it. A good way to get well-filled sections is to put on extracting supers until the bees swarm, then put sections on the swarm. But sometimes the season is half over and not nearly so much comb is obtained.

Mr. Holtermann—We must consider the most paying system. To wait until the bees swarm may give the best quality, but the quantity is so much less that the money returns are entailed. In any case, sections must not be put on until the end of the dark honey flow. Where a raspberry honey counts, the honey from it often runs on into the white clover season and injures quality considerably.

#### SECTION FOUNDATION, AND HOW PUT IN?

How much foundation would you use in a section? And how would you put it in?

The consensus of opinion was that the section should be filled with foundation.

R. H. Smith said it should fit the sides and bottom to 1-16 inch.

F. J. Miller fastens foundation with a hot-plate machine, and uses a bottom-starter.

H. G. Sibbald, whose comb honey took first prize at the Honey Show, uses what he calls an old-fashioned method. He puts the section together, puts the foundation in, and runs melted wax around, fastening it on all four sides.

Mr. Holtermann—You cannot get good sections without full-fitting foundation. Too many supply dealers turn out

narrow foundation which does not fit the sections. That made by the Weed process does not sag and can be put in to fit.

Morley Pettit—If foundation is hung the strong way in the sections it will not sag. By the "strong way" I mean with ridges running up and down instead of horizontally. With strong foundation put in this way there is no occasion for using bottom-starters.

#### WHAT STYLE OF SEPARATOR.

Morley Pettit—The best separator I have used is rather expensive. It is bored full of  $\frac{1}{4}$ -inch holes, so the bees pass freely through it. It is important to allow the bees to go through the separators, but slatted separators give a wash-board appearance to the comb.

Mr. Alpaugh—I do not see the need of separators.

Mr. Holtermann—The best separator known was invented by Mr. Bettsinger, of New York State. It is made of wire cloth with a quarter-inch mesh.

#### HIVING SWARMS.

Do you hive swarms on starters, full foundation or combs?

Use a contracted brood-nest with starters and one comb. Mr. Hall said this comb should contain young brood to make the hive more home-like.

R. H. Smith—Use 2-inch starters. They give less pollen in the sections than narrow starters.

#### PUTTING SECTIONS ON SWARMS.

Do you put sections on the swarms as soon as they are hived?

Mr. Hall—Put them on at once.

Morley Pettit—If the swarm is inclined to be restless at first, do not put the dummies in the brood-chamber for a few days.

#### REMOVING SECTION-SUPERS FROM HIVES.

In taking off sections do you use a bee-escape, or how?

Mr. Hall—During the honey-flow, when no robbers are about, set the supers on the ground and the bees fly home. After the honey-flow use escapes.

Mr. Holtermann recommended a cloth soaked in carbolic acid solution. Insects abhor this acid and the smell from the cloth spread over the super will drive them down and out.

The evening of Nov. 15, the Fruit-Growers, the Bee-Keepers, and the Horticultural Associations held a mass meeting in Association Hall, at which Mayor Urquart, of Toronto, officially welcomed the numerous delegates to the city. Honorable Jno. Dryden, the Ontario Minister of Agriculture, was chairman of the meeting. Dr. Jas. Fletcher, of the Central Experimental Farm, Ottawa, addressed the meeting on

#### "WHAT THE LITTLE BEE IS DOING."

In his remarks the Doctor called attention to the interdependence of all things in nature, as illustrated by the community of interest between the fruit-men and the bee-keepers. The little bee is doing much more than it is given credit for, and not some things that it is supposed to be doing. There is much to be learned from the life of the bee. The fact that bees are so common is assurance that more should be known about them. Things common to us should be best known. The scheme of Nature is to make things perfect. One of her plans is to fertilize flowers, and to do this two sets of organs are developed, one for the production of fruit or seed, and another for protection and fertilization. And because Nature abhors self-fertilization she provides means by which her scheme may be carried out. This plan insures uniformity of type in all the productions of Nature. One of the most active agents in the carrying out of this scheme of Nature is the bee. In return for this service the flowers of Canada provide the best nectar and honey that can be obtained in any part of the world, at the time when they require the service of bees.

One of the best things for the bee-keepers is the assertion made a few years ago by fruit-men, that bees punctured fruit. This sensational libel upon the bee set people to studying more closely than before, with the result that bees are better known. People are now better aware that the bee and the wasp are not close relatives. Bees have a business-like way of going from flower to flower of the same kind, not from one variety of flower to another. This insures a uniform quality of honey and an economical distribution of pollen.

Peculiar as it may seem, bees gather honey from flowers most extensively just at the time when flowers are most in need of having pollen distributed. The flowers in their turn change their color after fertilization, so that the bee knows it is no longer in need of visitation.

In some parts fruit-growers are finding it to their advantage to keep bees in their orchards, simply for the assistance the bees give in the perfecting of fruit.

#### SECOND DAY—WEDNESDAY MORNING SESSION.

Prof. F. C. Harrison, of the Ontario Agricultural College at Guelph, addressed the convention. He congratulated the Association on having in a way amalgamated with the fruit-growers and horticulturists. He said we should follow the example of these associations, which, not content with holding annual meetings, are going out during the year to hold orchard and garden meetings. We are in an era of greater prosperity and should help those who are starting in the business. We should have apiary meetings to give instructions in the best handling of bees. We should also recognize the fact that apiculture is taught only at the Agricultural College by offering an annual prize to be competed for by students at the college. The Professor then took up his subject:

#### DISEASES OF BEE-LARVÆ.

The diseases of the larvæ of bees may be roughly divided into two groups: one, in which the disease is contagious, and the other in which the disease is not due to a special virus but to some physiological or physical cause. The contagious diseases are the most harmful, as they spread from hive to hive and from one apiary to another, often producing a severe epidemic.

In all cases of infectious diseases there must be present a virus or a living organism which may be a fungus or a mould-like growth, or due to minute organisms, which are popularly called bacteria. These micro-organisms may be carried from one hive to another in many different ways, and the following are the principal means by which contagion is spread, and infection caused:

1. Bees entering wrong hives.
2. Bees robbing a diseased colony.
3. Feeding bees with honey from an infected hive.
4. Inserting diseased combs into healthy hives.
5. Using as a foundation, wax from a diseased colony which has been improperly boiled.
6. Transferring bees into hives that have been inhabited by a diseased colony without first thoroughly disinfecting it.
7. Placing a hive upon a stand previously occupied by a diseased colony.
8. The handling of healthy colonies by the bee-keeper after manipulating diseased hives.
9. The introduction of a diseased queen.
10. Healthy bees visiting flowers which may have been infected by diseased bees.

All these are means by which infection can be carried or transferred from one place to another, and evidence can be brought forward to show that disease has been produced by each of the different means above mentioned. "Foul brood" being the infectious disease which is best known naturally affords more examples of these methods of transmission than any one of the other contagious bee diseases.

It is important that all bee-keepers should clearly understand these means by which infection is carried; also they should have a knowledge of the appearance of the various diseases of bees so that they can diagnose or tell the kind and character of the disease in order to apply intelligently methods of prevention or cure.

I shall endeavor to give you a brief account of the general appearances of several of the best known diseases, taking them in order of their importance.

#### FOUL BROOD.

The larvæ attacked by *B. alvei*—the cause of foul brood—may die during all stages of their development. In every instance the larvæ lose their white and glossy appearance, when suffering from the disease, and turn to a dull yellowish, and later to a brownish, color. In the further progress of the disease, they die and collapse into a darkish brown, coffee-colored, more or less tenacious, shapeless mass. This mass is characterized by its viscid character and before it dries up can be drawn out in threads when lifted with a match or a pointed instrument. It has an offensive odor, which is said to resemble that of glue, and when much disease is present, there is an ammonia-like smell. The cap

of the larvæ sinks and appears concave instead of being concave or flat, and it is often perforated with a small hole near the center. Often the appearance of this sunken cell is the first indication of disease noticed by the bee-keeper. The decomposed larvæ gradually dry up and ultimately form a dry black or deep brown crust at the bottom of the cell.

The sunken and perforated cappings, the reduction of the larvæ to a tenacious brown mass, the characteristic odor and stringy nature of the mass, and the dwindling of the colony, are the most noticeable indications and results of the disease.

As the disease advances, the offensive odor pervades the hive, and when infection is spread over a great number of brood-combs the smell may be noticed some distance away. The bees become more and more despondent over their helpless condition and ultimately succumb or in some cases desert their hive.

#### THE NEW YORK BEE DISEASE, OR BLACK BROOD.

For a number of years past there has existed in the State of New York a disease known to the bee-keepers there as "Black Brood." It has also been called "New York Bee Disease," from the fact that it was first noticed in that State. So far as is known it was reported first from Sloanville, N. Y. The description given by the New York Bee-Inspector is as follows:

"The young larvæ have a yellowish speck upon the body, about the size of a pinhead, while the older brood stand out lengthwise in the cell, sharp at the ends, white, but not capped over. This brood dies, and is either removed by the bees or later flattens down in the cell and becomes a cream-colored, and in a later stage, a coffee-colored, mass. Later in the season some brood that died in the cells which had been capped over, becomes a rotten mass, a coffee-colored matter about the consistency of heavy honey. A toothpick dipped into this and drawn out causes this matter to stretch from half an inch to an inch, but does not break and fly back as quickly as in 'Foul Brood.' The smell is not very bad, but in some cases it has a sour smell; while in some of the sealed, rotten, coffee-colored brood, there is a kind of rotten smell, but not like that of the old-time 'Foul Brood.' Howard states with regard to this disease, that the brood is usually attacked late in the larval life, and dies during pupation, or later when nearly mature and ready to come forth through the chrysalis capping. Even after leaving the cell the bees are so feeble that they fall from the combs helpless. Most of the brood die after sealing. When the larvæ show the first signs of this disease there appears a brownish spot upon the body about the size of a pinhead. The larvæ may yet receive nourishment for a day or two, but as the fermentation increases the brownish spot enlarges. The larvæ dies, and stands out swollen and sharp at the ends. In time the brood becomes dark and rotten, and these rotten masses, in time, break down and settle to the lower side of the cells as a watery, syrupy, granular liquid not like the sticky-ropy, or glue-like semi-fluid substance of 'Foul Brood.' It does not adhere to the cell-walls like that of 'Foul Brood,' and has not the characteristic foul odor which attracts carrion flies, but a sour, rotten-apple smell. The cap is disturbed from without, sometimes uncapped and the cell-contents removed by the bees."

It will be seen from these accounts that whilst agreeing in some particulars there are points of difference between the two descriptions given of this disease, and probably if a bacteriological examination of the diseased larvæ had been made by Mr. N. D. West, the New York State bee-inspector, the organism which produces "Foul Brood" might have been found.

Howard, in connection with this disease, described an organism which he considered to be the causal agent of "Black Brood." He gave the name of *Bacillus millii* to it, from its resemblance to millet-seed. The *B. millii* is a spindle-shaped organism which forms spores, and, according to Howard's drawings, forms two spores in each cell, a rather remarkable occurrence, for in most bacteria, as a rule, only one spore is found in a single cell. No description is given of the germination of these spores, nor the cultural features of this organism, so that except from its peculiar shape and its ability to form two spores it would be a rather difficult matter to identify this organism.

Howard claims to have produced the disease by feeding bees with syrups containing *B. millii*.

This disease has also been the subject of an investigation by Moore and White, of the New York Veterinary College, Cornell University. These investigators have ex-

amined a number of specimens sent to them during the season, and which were labelled as "Black Brood." The ten specimens of black brood contained a bacillus which suggested by its constant presence that possibly it was the cause of the trouble. It was thought first that the bacillus so constantly associated with the black brood was the bacillus described by Howard as *B. millii*; but a more extended study of this organism showed that it resembled *B. alvei*, the cause of foul brood. A very careful investigation of this organism from the specimens of black brood confirmed the identity of the species from the different sources, and the only conclusion they came to was that the prevailing bee-disease in the State of New York was similar to, if not identical with, the foul brood of other States, Canada and Europe.

From this evidence there seems to be some doubt as to whether black brood is a new disease, caused by a new or partly-described organism, or whether it is merely a disease closely allied, if not identical, with foul brood, but occasionally showing appearances which are different from the typical appearance of foul brood. Further investigation will be needed before this question can be properly settled.

#### PICKLED BROOD.

Pickled Brood is said to attack the larvæ about the time of pupation, and the appearance of the larvæ is similar to those that are infected with black brood, except that the brown spot is not present and no decomposition from putrefactive germs takes place in pickled brood. The cappings are usually undisturbed and the decayed brown masses do not adhere to the cell-walls. According to Howard, the infection in pickled brood is in bad pollen, and new pollen always causes it to disappear.

The cause of this disease is said to be a fungus (*Aspergillus Pollinis*). Moore and White, who examined five specimens of pickled brood, report no fungi present, but various micro-organisms were found, none of which, however, were specific.

#### CHILLED BROOD.

The cause of the death of the larvæ from this calamity is cold, as the name correctly indicates. It generally occurs when, after warm weather, which has induced the bees to deposit brood freely, a sudden change takes place, or very cold nights set in again. The brood in the center combs and where the bees cannot cover them sufficiently generally suffer most. The larvæ may be killed during all stages of their development, but the capped brood rarely suffers to any extent unless the change of temperature is much prolonged. In cases of chilled brood the larvæ turn gray, afterwards the color darkens and in the final stages of decomposition it becomes black. No ropiness develops and the putrid mass is more or less watery, and its smell is said to resemble stagnant water. No relation exists between chilled and foul brood although many writers have mistaken the one for the other or have stated that chilled brood turns to foul brood. Schirach, as long ago as 1769, clearly distinguished between the two. In fact, he said that chilled brood is no disease at all.

"Chilled brood" is caused by putrefactive bacteria which attack the larvæ after death. In foul brood and other infectious diseases, the micro-organisms attack the living brood and cause their death.

#### STARVED BROOD.

Occasionally instances of the starving of brood have been noticed. This occurrence probably can be explained by an abundant honey-flow, having induced the bees to encourage a large brood deposit, when after a severe extracting of honey, the bees were suddenly checked in the gathering of food for some time through bad weather. The brood do not die suddenly but become emaciated and dry up, rather than putrefy. This affection is of rare occurrence, but it is curious and interesting to note that Virgil in his *Georgic* on the husbandry of bees mentions starvation and the cure for it. The lines are as follows:

When sickness reigns, (for they as well as we  
Feel all the effects of frail mortality),

By certain marks the new disease is seen,  
Their color changes and their looks are thin;  
Their funeral rites are formed and every bee  
With grief attends the sad solemnity;  
The few diseased survivors hang before  
Their sickly cells and droop about the door,  
Or slowly in their hives their limbs unfold,  
Shrunk up with hunger and benumbed with cold.

Now lay fresh honey near their empty rooms,  
In troughs of hollow reeds whilst frying gums

Cast 'round a mist of spicy fumes.  
Thus kindly tempt the famished swarm to eat  
And gently reconcile them to their meat.

#### TREATMENT AND REMEDIES.

"Remove the cause, and the effect ceases." Practically all the various methods of cure of the infectious diseases of bees adopt this maxim more or less thoroughly. The various starvation methods aim at getting rid of the infected honey and the infected combs. The method of conquering the disease by feeding medicated syrups aims at the destruction of the vegetating bacteria, or preventing them from growing and the spores from developing. At the same time the action of the medicine may in some way exercise a tonic effect upon the bees. Treatment by means of disinfection by formalin or other vapor destroys the greater amount of infecting material which is present in the hives and in the comb, relying upon the natural resistance of the bees to get rid of any micro-organisms that may be present in or upon them. The beneficial results obtained from any of these methods depend upon the thoroughness with which they are carried out.

Thus we have numerous instances of the starvation method failing, because of failure to disinfect the hive. Medicated syrups often fail because of methods of application; the use of weak or feeble drugs, and not using the medicine for a sufficiently long period at a time.

We have also occasional instances of the failure of the formalin treatment, perhaps due to improper methods of application, not using strong enough formalin, or not disinfecting the combs and hives in an air-tight box. These failures should not be counted against the method of treatment, for I am convinced that anyone of these methods, if properly and conscientiously carried out, will cure even the worst case of foul brood, which of all the infectious bee diseases is the most difficult disease to deal with.

It remains for each bee-keeper to decide for himself as to the method of treatment he intends to follow, and having made up his mind, he should carry out that treatment intelligently and thoroughly.

F. C. HARRISON.

#### HOW TO MANAGE THE BEES.

"A Season with the Bees and How to Manage Them," by A. E. Hoshal, was next on the program. This was an illustrated talk in which the speaker had the hive and implements with which to show just how he did the various things described. He spoke to beginners rather than to old heads. There had been three main systems of bee-keeping—the box-hive system, the movable-frame system, and the case system. The old-fashioned way required no description. The second had for its root-principle the manipulation of individual combs. The third was a system of manipulating cases instead of combs. Mr. Hoshal believes the case system to be the best. The first week in June go out to the yard with smoker and veil. Get a good smoker; an experienced man can do with a poor smoker better than a beginner. You will soon discard the veil. Unpack the bees from their winter boxes. Some will have double-case brood-chambers, some single. When the honey starts, put on a slatted honey-board and another case. A single brood-chamber colony will give as much honey as a double brood-chamber colony in a short season.

A deep-frame hive gives the top third of comb filled with honey. The honey will be crowded downward as the season advances. The shallower the frame the less honey is stored in its upper part. With the Heddon cases the honey can be raised and empty combs put right over the brood. These shallow cases with narrow top and bottom bars to frames are accepted more readily than deeper ones. Then the narrow top and bottom bars admit of seeing right through between the combs to see the exact condition of things without handling the individual combs.

For clipping queens, about the 8th or 10th of June drive the bees up out of the lower case and through the excluder. The queen will be found on the top bars or on the under side of the excluder. It is an advantage to clip when the flow is on, as a smaller percentage of queens is lost. Then the queen is returned to the empty lower case where there are no bees to ball her.

When swarming-time comes, have hive ready with two cases, one empty and the other filled with combs. Catch the queen in a cage when she comes out. Lift off the supers. Set the hive off the stand and the new one in its place. Put the supers on the swarm. Close the entrance of the parent hive with grass. In a few days take out the empty case

from underneath and give plenty of super-room. In the parent-hive are queen-cells and danger of after-swarms. In 8 or 10 days shift the parent hive so as to throw the flying workers into the swarm.

Spring management consists in having good queens, plenty of stores, warmth, and *let alone*.

Towards the end of the season remove the honey with escapes. Be careful not to take all the honey. Leave the lower surplus case. For winter, unite weak colonies in July as soon as the flow is over. Set one on the other; don't care if old bees are killed. The brood is what counts. Each hive must weigh 50 pounds if double; if a single case, 40 pounds. Make up shortage by feeding in the fall. In spring *let severely alone*. Much handling in spring causes loss of queens. Note the importance of having the brood-chamber shallow and filled with brood.

Mr. W. J. Craig then read a paper on

#### THE INFLUENCE OF BEE JOURNALS.

Considering the subject of the influence of bee-journals broadly, we may rightly apply much of what has been said, and can be said, of the influence of current literature generally. We live in an age of literature, an age when people read a great deal and think a great deal, and whether in the form of newspaper, magazine, book or pamphlet, such reading must necessarily wield a large influence over the individual and community, in the formation of opinion, the moulding of character, and the regulation of action.

Bee books and journals have taken their distinctive place among the literature of the world. From recent statistics we find that there are over eighty magazines devoted exclusively to bee-keeping. France leads the way with 19, Germany 11, Russia 9, Belgium 9, United States 7, Austria 6, Italy 3; England, Spain, Algiers and Australia 2 each; Denmark, Switzerland, Sweden, Norway, Holland, Romania, Nederland, Ireland and Canada, one each.

These magazines must, as a matter of course, have an effect upon the bee-keeping of the many thousands of readers they represent; all of them advocating better bee-keeping, better systems of management, better marketing, presenting new theories, reporting new discoveries and inventions, vying with each other in original matter from the best authorities, and in carefully-selected matter from the most reliable sources, standing up for the right and exposing and denouncing the fraudulent and the wrong.

All this can be truly said of present-day bee-journals; they are, in brief, doing all that they possibly can do for the furtherance and development of the bee-keeping industry. This statement may no doubt be questioned by those who consider the motive of the bee-journal always a selfish one, and that it exists merely for the sake of direct gain to the publisher, or a desirable adjunct to his business. Such view is narrow, and mean, and selfish in itself. None of the journals that we know of are making a fortune; in fact, some of them would have gone out of existence long ago had it not been for the substantial financial support of their publishers.

Guide-books and hand-books on general management are good and useful as references, or for the beginner in laying a foundation of sound apicultural knowledge, but if the novice is to advance, with advancing thought and advancing methods, he must have access to current bee-literature. The bee-keeper's column of the newspaper or agricultural magazine, no matter how well conducted, cannot be satisfactory to the bee-keeper who would make a success of his bee-keeping, and can never take the place of the journal devoted exclusively to apiculture; in fact, the most dangerous and obstinate heresies that bee-keepers have had to contend with have issued from these sources.

Local conditions and requirements, apart from loyalty to State or Country, make the support of the local representative magazine of first importance; then as many others as the bee-keeper feels he can afford. Unfortunately the great mass of small bee-keepers do not seem to have a proper estimate of the value of apicultural information; they are interested to a very small extent—"only a few hives for their own use," they tell us; but somehow more or less of their ill-favored product finds its way on the market, to the detriment of the excellent article placed there by the intelligent producer. There are probably upwards of 8,000 such bee-keepers in our own Dominion, whose bee-keeping is of the crudest character.

Our Canadian publication needs the coöperation of this Association much more than it has been favored with. There

is no lack of ability on your part to make the Canadian Bee Journal more distinctly Canadian, and to rank like Canadian honey—the “first of its kind.” W. J. CRAIG.

Messrs. Deadman, Holtermann, E. Grainger, R. H. Smith, Chadwick, Sparling, Dickenson, Darling and others spoke of the importance of bee-journals in general, and of our national bee-journal in particular. Bee-keepers should not only subscribe, but should contribute of their best thought to the Canadian Bee Journal.

Mr. W. Z. Hutchinson sent a paper on

#### QUEENS AND THEIR INFLUENCE UPON SUCCESS IN BEE-CULTURE.

I expect it will be called heresy, but, many times, when reading extravagant expressions about “the whole of bee-keeping centering upon the queen,” I have felt like exclaiming: “Other things being equal, one queen is as good as another.” This may be putting it stronger than it will bear; besides, it does not *exactly* express my meaning. Perhaps I can not make myself exactly understood, but I will try.

It is not so much what a queen is *herself*, as what her ancestors were; or, rather, what her *bees* are. That is, she may be an insignificant-looking specimen, may have been reared in a manner wholly at variance with the established principles of queen-rearing; may be one of those short-lived affairs whose days are soon numbered, yet, if she comes from the *right stock*, her bees, whatever may be the number of which she becomes the mother, are *just as good bees as can be produced*. In other words, there is no system of queen-rearing that will improve a strain of bees.

Try and not misunderstand me. To be sure, we must have queens that are sufficiently prolific to keep the brood-nests full of brood at a time of the year when this is desirable; and possessed of a longevity that will enable them to perform this feat two or more seasons; having this, what more is needed? As a rule, the honey-producer need trouble his head very little about the rearing of queens. The bees will attend to that, and rear just as good queens as are needed. If his queen don't fill the brood-nests in the required season, how much more practical simply to reduce the size of his brood-nests until the queens *do* fill them, instead of ransacking the earth for more prolific queens, or else by twisting, turning, and shifting about of combs, endeavor to make one queen lay an increased number of eggs.

As I look at the matter, in the light in which I am discussing it, the queen is simply the vehicle of transmission from one generation to another. It is the *qualities* to be transmitted, rather than the *vehicle* of transmission, that should receive our attention. To illustrate: A man has a strain of bees that are of little value as honey-gatherers. Can he, by any sort of “jugglery” at queen-rearing, transform them into energetic workers? Something might be done in the way of selection, but not by methods of queen-rearing.

Bee-keepers often tell how much better are the bees from the queen secured from this breeder than from the queen bought of some other breeder, or that the bees from the daughter of a queen from a certain breeder are superior to bees from the daughters of some other queen, and have argued from this that the queens, and the manner in which they were reared, caused the difference in results. I say *no*. The difference is in the *strain of bees*, and not in the manner in which the queens were reared.

That there *are* circumstances in which much depends upon the queen it is idle to dispute. Some of our best bee-keepers have argued against extra-prolificness in queens, some of them even going so far as to assert that prolificness in the queen is at the expense of quality in the bees; but that prolificness is all-important to the user of large brood-nests can not be dodged. *He* must have prolific queens, else one-half of his brood-chamber is transformed into a store-room. But this extra prolificness is not secured by some peculiar method of queen-rearing, but by *selection*—by rearing queens from the colonies having the most prolific queens. Here, again, the queen is simply the vehicle for transmitting the quality of prolificness from one generation to the other.

The *age* of queens may also have some bearing upon success. Where the harvest ends with white clover, more surplus will be secured if the bees do not swarm; and colonies with young queens are far less likely to swarm. Then, again, young queens lay much later in the fall, and this has a bearing upon the subject of wintering, as also does the time when they begin laying in the spring.

As I have already said, we need queens sufficiently prolific to fill the brood-nests with eggs at the season of the year when this is desirable, and possessed of a reasonable amount of longevity. This secured, nothing more needs consideration except the *stock* from which they come. Naturally, when a man buys a queen, he expects to get the worth of his money. If he buys her to rear queens from, he expects her to be able to endow her royal offspring with the qualities and characteristics of her ancestors; and, if she does this, he need not mourn if she lives only long enough to allow him to secure a goodly number of her daughters. If he buys queens in large quantities to re-queen an apiary, he has a right to feel that he has been cheated if the queens live only a few short months. The practical honey-producer has not this problem to solve. Simply let the bees rear their own queens, and they will be as good as any. That queens can be reared artificially, the equal of any, there is no doubt. Most *certainly* they can. How it can be done has been repeatedly published.

As I said at the beginning, we have a lot of sayings something like the following: “Good queens are at the foundation of bee-keeping.” “Bee-keeping all centers about the queen.” “As the queen lays all of the eggs, of course, success depends upon her.” It is to combat such ideas as these that I have written. The queen is of no more importance than the hive, the combs, or the location. By importance I mean, in this case, that which can be by some decision, or management of the bee-keeper, be made to contribute to his success. W. Z. HUTCHINSON.

Mr. H. G. Sibbald read a paper on

#### FOUL BROOD.

A disease that attacks the larvæ or brood of bees, the most dangerous and destructive of any of the diseases that bees are subject to, and had made such headway that the Ontario government a number of years ago passed a law and appointed an inspector for its suppression. Credit for obtaining this excellent law is due, I believe, to our Ontario Bee-Keepers' Association.

Since the inception of the law and inspection, the disease has been checked and is better understood by the mass of expert bee-keepers. Still, on account of the contagious nature of the disease, and the ignorance of a few, the expert is constantly in danger as long as it exists and bees are in the hands of these few.

It is therefore a subject worthy of a place in our program, and of a full discussion by those who, like myself, have had to their sorrow more experience than is desirable or profitable.

The larvæ or brood in its early stages is attacked by the foul brood germs, decomposes, decays, and settles in a shapeless mass to the bottom and lower side of the cell; becomes yellowish-brown in color at first, later brown or coffee-color; gives off a very offensive odor, and if pricked by a pin or toothpick, it will be found ropy, and will draw or string out a half inch or so. If the cell has been capped the capping recedes, and presents a sunken appearance. In time the matter dries down and is of such a sticky, gluey nature that it adheres strongly to the side and bottom of the cell. Thus leaving what we call the scale or stain-mark of foul brood.

Other forms of dead brood, such as chilled, stained, pickled and poisoned, are different and may be described as follows:

The larva dies, but holds its form better, that is, shrinks and dries from the outside; gives off very little odor and less offensive; does not adhere so tightly to the cell side, and may be removed by a pin or toothpick, and when pricked by them will not string out but appears watery. They will be removed by the bees themselves.

Not so with foul brood, however, for, soon after the death of the larva, it becomes so foul that I verily believe not a bee can be found that will attempt to clean it out. The cell is apparently avoided until it becomes dried down and the odor has become less noticeable. The bees then accept it again, and after polishing it, fill it with nectar. The moisture thus applied softens the scale or stain-marks and releases the thousands of foul brood germs, which float in the honey or nectar, awaiting only until fed to larvæ, thus coming in contact with congenial matter, causing its death and their further development and multiplication. Thus it spreads more and more, cells become polluted, the colony dwindles and dies, leaving its honey a prey to robber-bees which unsuspectingly carry it to their homes and

thereby transmit the disease until an apiary will soon be destroyed and neighboring apiaries jeopardized.

Every person who keeps bees, whether they have many or few, should study and try to be able to detect the disease in its early stages, and know how it may be carried from one hive to another, which might be briefly summed up in a few words. In any way in which honey or the stain-marked cells can be changed from one hive to another. Watch the brood—take an interest in it; whenever you lift out a frame take a look at the brood. If it is all healthy, fat and white-looking, all is well. If not, apply the tests and find out what is the matter, and, if you find the real thing, close the hive and mark it and consider.

To cure it, we must get rid of the combs and honey, for therein is the disease and germs.

Go to the colony late in the evening when the bees will not fly or scatter to other hives. Shake the bees off into the hive and give a set of frames with foundation starters. We have thus gotten rid of the combs as far as the colony is concerned. Not so with the honey. As soon as we disturbed the colony the bees loaded themselves with honey, and we must still get rid of that. They also clean up any that shook out during the manipulation on the floor of the hive, and any that remains on burr-combs or was attached to the inside of the hives. This they would store if they had a particle of comb supplied ready. We have only given foundation starters, however, and they must work it out. Wax-secretion is necessary, and most of the honey is digested and used; but they soon have cells built and may store some of the diseased honey therein. To make a complete cure it is therefore necessary again to shake three days later, the same way as before, and supply full sheets.

Melt up or burn up the old combs and the first set of starters, and the cure is complete, if properly carried out.

This cure can only be applied in the early part of the season, and during a honey-flow. If no flow is on, the bees must be fed or they would swarm out, and perhaps scatter into one or more hives, and thus make matters worse. If the disease is discovered late in the season, and the colony still strong, leave it until November, take the combs away and supply honey from a clean colony, in full, sealed combs. The queen is not now laying, and any honey that they have picked up will be consumed first, and thus out of the way.

If a yard of bees or apiary is badly diseased, when discovered, send for the inspector or some one who has had experience, so that it is unnecessary for me to describe how to go about curing a badly-infected yard.

In looking for the disease, hold the frame or comb so the light may shine into it. The stain-marks may be seen by standing with your back to the sun, and holding so the light will shine on and into the lower side of the cell.

In dealing with foul brood, the first loss is the least, and while it is well to cure as economically as possible, if we have a large number of colonies, plenty to do, and the disease is not discovered until after the honey-flow, it would be better perhaps to destroy the combs and kill the bees. The top story or super-combs, if very clean and free from pollen, may be saved by having the diseased colony clean it out before curing. But in this case, again, perhaps the first loss will be the least and it might be better to melt the combs.

Never put a diseased colony into winter quarters.

Always clip the queen before shaking to cure.

H. G. SIBBALD.

Mr. Hoshal—When I treated my own yard, it had not fully developed. In the first stages if we change the queen we cure the disease.

Prof. Harrison—There are different degrees of virulence in foul brood as in typhoid or other human diseases. There is no specific method for curing foul brood. Mr. Sibbald has carried out the Formalin Method very well. It is considered an efficient disinfectant in the case of human diseases, and should be so for *Bacillus Alvei* if properly used. The gas generated is more potent if the temperature is low and there is lots of moisture. Either hang wet sheets or turn on steam to get moisture. Leave in a tight box for 18 to 24 hours. Bertrand recommends medicated syrups—formic acid. Through long exposure the bees of Europe have become partly immune to the disease. In a similar way the sheep of Algiers are partly immune to anthrax.

#### INSPECTOR OF APIARIES' REPORT.

During 1904 I visited bee-yards in the Counties of Norfolk, Brant, Simcoe, Victoria, Perth, Oxford, Wentworth, Lincoln, Peel, Grey, York and Ontario. I inspected 91

apiaries, and found foul brood in 32 of them, and dead brood of other kinds in many others.

The spring was one of the most unfavorable for bees that we have had in many years. At no time during the spring did bees bring in honey fast enough to keep pace with the amount of larvæ that required feeding, and the result was that more or less starved brood was to be found in every apiary. I received many samples by mail of starved brood, asking what it was, many dreading it to be foul brood because some of the capped cells of brood were punctured. I also received samples that contained both foul and starved brood in the same comb.

I set the bee-keepers to feeding in every apiary that I examined during April, May and the early part of June. I was much pleased with the way the bee-keepers took hold and cured their apiaries of foul brood.

It is one thing to know how to cure an apiary of foul brood in the shortest possible time and to do it with the least loss, but it is quite another thing to handle all classes of men, and particularly so when things get into hot dispute over the sales of diseased colonies, and notes for large amounts have been given. No man on earth can deal with cases of this kind so well as the inspector, and I always claimed the right to have such cases placed in my hands to deal out justice to both parties, and I am pleased to say that they were always left to me, and that I got things settled very nicely.

Death makes big changes, and where the widows had diseased apiaries and wanted to sell the bees, I managed the business for them, and had everything put to rights as nice as the flowers of May, and secured fair prices for them.

In every locality that I went into I picked out the best bee-keeper in it to go the rounds with me, so that he could (on the quiet) let me know from time to time how the people were getting on at the curing. By keeping in touch with the business this way, I was able to get everything put to rights with the help of the good men that "I picked out to pad the road with me."

With the help of those men and very many others, I have not only driven the disease out of the Province in the most wholesale way, but converted the foul-broody apiaries into the best paying ones in Ontario.

No Province or State in the world had as much foul brood in it as Ontario had when I first started out to cure the diseased apiaries of foul brood, and now no country has as many fine, clean ones for the number kept.

For the very courteous treatment that I received from every person while on my rounds, I return to them my most heartfelt thanks.

W.M. McEvoy.

Mr. F. J. Miller read a paper on

#### THE PREVENTION AND CONTROL OF SWARMING AS USED WITH THE HEDDON HIVE IN THE PRODUCTION OF EXTRACTED HONEY.

The subject assigned me is one leading up from early spring management, hence my article begins with the work as the hives leave the winter-cases. At this time supers are put on all colonies showing sufficient strength. Queen-clipping follows as rapidly as possible, great care being taken that no queen is allowed to pass unseen although last year's record may show her to have been clipped. Apple-bloom is now closing, and some queens may yet remain unclipped; this makes but little difference with the short-cut methods of handling the divisible brood-chamber hive, and the work is completed as I must know that every queen is clipped in order to carry out our future plans.

During this early management a watchful eye is kept that no colony becomes congested with honey in the brood-nest. If the queen is being crowded and not allowed all the room she can occupy, the divisible brood-chamber hive affords the quickest results possible with the least amount of labor. We simply divide the center of the brood-nest horizontally by exchanging the two sectional parts of the brood-chamber, i. e., by replacing the bottom-chamber with the top one, thus placing honey in the center of the brood-nest. This being averse to the instinct of the bees the honey is quickly removed. The brood now extending to the top-bars under the queen-excluder, the honey is carried above this line into the supers, leaving empty cells for the use of the queen in the center of the brood-nest as it now exists.

During the week of honey-dearth between fruit-bloom and white-clover, this interchanging of the brood-nest has the same stimulating effect as feeding, or the uncapping of honey. With the opening of white-clover supers are again added un-

derneath on the tiering-up plan, as soon as the last one contains from five to seven pounds of nectar.

About this time, or as soon as the indications of swarming are apparent, each yard is visited as nearly every four days as the weather will permit. During these visits each hive is examined for queen-cells by simply raising one end of the top section of the brood-chamber, and drawing slightly forward and raising it up about six inches, thus giving a view of the bottom-bars, which will expose a part of any queen-cells that may be present. If there are no cells in view the hive is closed, the work being completed; but if, on the contrary, queen-cells are started, or in any stage of completion, then a division is made as follows:

The top section of the brood-chamber with queen-excluder, and, in most cases with the queen, is removed and placed on top of a chamber of foundation or empty combs at the side of the colony; also placing a chamber of foundation or empty combs on the colony. Add a queen-excluder and return all supers to the colony. All danger of swarming is now over for the present. An abbreviated entry is now made, showing at a glance the date of this division.

On returning to the yard in four days the usual examination takes place; in five cases out of six the entrance of the division made four days ago will show dead drones, indicating the presence of the queen. A record now being made to this effect no further work is required on this division or parent-colony during this visit.

Four days later, or on the second visit after the division is made, the colony must have the queen-cells removed from the combs in the bottom section of the brood-chamber, and as they are likely to have larvæ yet held back, of which they will again start queen-cells, they require cutting again any time within the next two visits, and either give a virgin or laying queen, or return the division to the colony. Or the division may be left in the present condition beside the colony until the busy season is over, when according to the strength and amount of honey it contains, it is made use of either to be placed on a separate stand or to be united with another division.

The system I have here outlined is one I have used for several years, and have found it to work admirably. The loss from absconding swarms does not exceed an average of two, or possibly three, for each yard during the season. Being a system of short cuts it is capable of much improvement, according to the skill of the apiarist; and reduces the amount of skilled labor to a minimum, one man being able properly to attend to three or four yards of 90 or 100 colonies each, doing all of the yard work himself, only requiring the aid of one unskilled helper in the honey-house during extracting.

Having endeavored to give as concise an account of my work as possible, I may have left out details, but I trust it may bring out either discussion or thought that may be profitable to the members present.

F. J. MILLER.

(Continued next week.)

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Report for 1904—A Propolized Experience.

DEAR MISS WILSON:—I know I am very tardy with my report, but I was extremely busy at the time it should have been made. We have been building a new house, and moving therein—no doubt most of the sisters know that to move means work.

I had 13 colonies in the spring, 6 of which I bought in all kinds of boxes, and they had black queens. I now have 17 colonies of Italians (some few of the bees are possibly hybrids) in Danzenbaker hives.

I harvested 769 sections of honey, most of which was fall honey, the spring crop being almost a failure. The best colony stored 143 finished sections. Some colonies containing black queens stored—nothing. Some of the fall honey is beautifully white, much nicer than the spring honey. (It is from wild aster.)

My bees are experts on propolis, this locality being adapted to any amount of practice, and for the benefit of any other propolized sufferers I will tell how I changed my Danzenbaker hives. Of course if I hadn't been ignorant I never would have put all of my bees on closed-end frames, and frames that rest on cleats way down in the middle of the hive, at that. (No doubt the Danzenbaker hive is all right in localities non-propolized.) There was no such thing as not disturbing the bees whenever a frame was removed. I did well if I didn't smash the whole business. To pull the little flimsy follower all to pieces was generally my first act. I borrowed a draw-knife and converted the closed-end frames into staple and nail spaced frames, and ripped the cleat from the center of the hive and nailed it near the top, taking care to place them so as to leave a bee-space over the frames. I then drove all rivets of the frames back, and substituted sixpenny nails, driving them near the top to support the frames.

Trouble? Yes, but now I have a hive containing open-end frames, which rest on cleats at the top of the hive, and are supported by nails—a hive which I like very much, and can overhaul at any time without the aid of the whole paraphernalia of a carpenter's shop. A good, strong screw-driver is all that is needed.

Perhaps some day I'll give my experience with my observatory hive.

MRS. C. D. MEARS.

I wonder, Mrs. Mears, if all the sisters will enjoy as hearty a laugh over your letter as I did. Now you may not think this very sympathetic, but, really, you must not be so entertaining in your recitals if you expect us to weep over them. However, you seem equal to any emergency and do not need our sympathy very badly. If all were equally frank in telling of their failures as well as their successes we might receive much benefit.

You say your best colony gave you 143 finished sections while some colonies having black queens gave—nothing. Now perhaps the fact that they were black was not the only reason why they did nothing, for some Italians are equally lazy, and it is a fact well worth remembering that by breeding from your best queen you can increase no little your average yield per colony.

### Honey in Aikin Paper Bags—Fence Separators and Tall Sections.

MISS WILSON:—Beg pardon for breaking into the Sisters' department, but how am I to help it after reading Mrs. L. Schmitt's letter on page 23? "Oh, gee, but it's nice to be crazy," as the comic songs runs, but the editor of the "Oregonian" is still at large.

Mr. W. H. Pennington is one of my very good friends, and I have but recently returned from a short visit to his home yard. He is indeed an enthusiastic convert to the "Aikin honey-bag" system of putting up extracted honey. He has several honey-tanks of from perhaps a ton to about 5 tons capacity; from these the honey is drawn off into the Aikin bags.

Mr. Pennington has developed some exceedingly useful things in the line of moving bees, artificial pasturage, etc. He uses largely the standard 10-frame hive, with shallow extracting-supers of unspaced frames. He has 80 colonies in hives containing 13 frames of the regular Dadant size, and they always give a satisfactory crop and fill the supers just as quickly as do those in the 8 or 10 frame hives. But, in a good season, they swarm.

Yes, you may be sure "that honey is all right."

Just tell "the sisters" to go slow in the fence-separator-tall-section fad. I have been all through it, an enthusiastic advocate of its mostly imaginary advantages, to my great loss. Am now changing back to the good, old universally satisfactory  $4\frac{1}{4} \times 1\frac{1}{8}$  section. Have 600 new supers containing single-tier wide frames (section-holder with top-bar). They are the thing here. Have some T supers, but they are no good for me and this locality. The wood of the sections is stained fearfully, and I am surprised that such is not the case in a "gluey" locality like Marengo.

Ada Co., Idaho, Jan. 14.

E. F. ATWATER.

No need to apologize, "Brother" Atwater, for breaking into the Sisters' department in such a case. The amount of Mr. W. H. Pennington's honey crop was sufficient guarantee that he was all right.

The T super is all right at Marengo. Sorry such is not the case in your locality. Perhaps you do not use a little stick, as we do, to fill up the space between the sections at the top. That does not allow much chance for bee-glue.

 FRED FODNER.

**Reports and Experiences**

**Cook County Bee-Keepers—A Hopeful Fraternity.**

What is the matter with the bee-keepers in our county? I have not seen a report from any of them. Are they all in "blasted hopes" like myself?

I had about 100 colonies of bees April 1, 1904, and secured about 1500 pounds of extracted honey, of not very good quality. I put very few sections on, as I saw that it was a useless task. The number of colonies has decreased to 95, and a few of them are weak. I fear they will not winter very well on account of poor stores. I have 40 colonies outdoors that had a good cleansing flight lately. The other 55 are in the cellar. They have more dead bees than usual, and they may suffer considerable loss especially if the spring is late. But I hope it will not be. We bee-keepers are a hopeful lot of people. We hope for a better season, hope for a better price of honey, hope that the trust will not raise the price of supplies, and a good many more hopes.

Many of the neighbor bee-keepers have stopped using movable-frame hives, and will run for bulk comb honey.

I have tried buying supplies from the "Cheap Johns", but do not want any more of them. Some of the goods are dear as a gift. I make my own hives and find that I can earn a big day's wages at it, doing it by hand.

# SALZER'S SEEDS

WHEN you sow Sir, you want to reap, not sparingly, but bountifully, that is eternally right. When you sow Salzer's Seeds you are just as sure of reaping a big crop, as you can be of anything in this life, because Salzer's seeds are full of life and vigor and producing qualities. They must yield, drought, rain or elements notwithstanding.

**MACARONI WHEAT**  
Yielded for thousands of farmers in 1904 from 30 to 80 bu. per acre, of as fine a Wheat as the sun ever shone on. Rust proof!

**SALZER'S HOME BUILDER CORN.**  
Positively the biggest eared, earliest corn on earth. Yielded in Indiana, 157 bu.; Ohio, 160 bu.; Tennessee, 198 bu.; Michigan, 220 bu.; and South Dakota, 276 bu. per acre. It is really a marvelous corn. Sinks its roots deeply after moisture and nourishment; grows like a weed, producing everywhere record breaking crops.

**BILLION DOLLAR GRASS AND TEOSINTE.**  
Most talked of grass on earth. Yielded 10 and 14 tons of elegant hay per acre, while Teosinte would be ashamed of itself, if it did not produce over 80 tons of rich green food per acre.

**SALZER'S NATIONAL OATS.**  
The Oat marvel, giant in yield and quality, nothing on earth quite like it. It will revolutionize Oat growing. 150 to 300 bu. per acre, if you sow it in 1905.

**SPELTZ OR EMMER.**  
Most marvelous cereal and hay food on earth, producing from 60 to 80 bu. of grain, and 4 tons of hay, as good as Timothy per acre.

**ONION SEED 60c A LB.**  
We are the largest Vegetable Seed growers in America, operate 5000 acres. Our stocks are warranted. We have \$5000.00 that says there are no earlier Radishes, Peas, Sweet Corn, Cabbage, Cucumbers, Tomatoes, Cauliflower, Potatoes, etc., than those grown from Salzer's Seeds.

**FOR 10c AND THIS NOTICE**  
We will send you a lot of farm seed samples, fully worth \$10.00 to get a start, together with our mammoth 140 paged illustrated catalog. All this we send for but 10 cts. postage.

**JOHN A. SALZER SEED CO.**  
La Crosse, Wis.

## QUALITY.

The quality of our goods is guaranteed to be equal to any others made in the country. We stand ready at any time to refund your money if we do not do as we say. We can refer you to reputable firms in the city of Minneapolis, or any bank.

We sell for less money than others, because we are able to manufacture at a less cost than others are. We do not have to sacrifice the quality of our goods in order to make the prices that we do.

Of course, competitors will try to make you believe that the quality of our goods is not up to standard, because they have to get more for their goods, in order to make a profit. We guarantee our prices and the quality of our goods. Any one not entirely satisfied can have money refunded upon return of the goods.

## JOHN DOLL & SON,

Power Building, MINNEAPOLIS, MINN.

A prominent Western grower says of Big 4 Oats:—"It has the plumpest kernel of any variety, and is as large in every way as any. It is always a very white oats, free from black kernels, and this year certainly it is the brightest oat that we have. Then it has a wonderfully stiff straw, so that it stood up well in spite of one of the worst seasons for farm known. It is medium early, and a great yielder." Big Four

a fellow who is afraid of his own honest name.

In the first place, Mr. Learner uses obscure language, and also puts an obscure interpretation on some of my own perfectly clear English. I say "wide bottom-bars", but he asks: "Which one of our sages is advocating close-fitting bottom-bars?" To that question I reply that I do not know, nor do I know what a "close-fitting bottom-bar" is. If Mr. Learner will read all that is on page 293 of the American Bee Journal for 1904, he will find an answer to his question, if he means to ask what sage is advocating wide bottom-bars. I refrain from naming the gentleman from other motives than those which cause my questioner to remain incognito.

Now let me explain why I disapprove of wide bottom-bars: If a bottom-bar is 1 1/2 inches wide, and frames are spaced 1 3/4 from center to center, there remains only 1/4 inch of space on either side of the bottom-bar as the frame is lifted from the hive. Possibly that space may be increased slightly since the comb above will be less in thickness than the width of the bar, but there will be many places, especially near the top where there is only a bee-space between the sealed honey portions, where the space will be even less. Unless the frames are well spread before a frame is raised the bees will roll into a heap right above the bottom-bar, gathering something as a snow-ball gathers, and many will be maimed for life, if not killed outright. Any one who has lifted out a frame along the bottom edge of which has been built an unlooked-for strip of drone-comb will appreciate the result. I have seen dozens of bees rolling about with broken and crippled legs after a

FOR SALE  
50 lbs. or over, at 5 cents per pound. Address, 5A9t JOSEPH SHAW, Strong City, Kans.

**ATTRACTIVE AND FRUITFUL FARMS.**  
—There are many good reasons why every farm should be made as attractive as possible. One of the best is that it makes farm life more pleasant and relieves the bareness and monotony that often make farm life tedious. Another reason is that it pays in dollars and cents. The orchard and the garden should be as fruitful and profitable as the fields and the pastures. They should be as zealously planned and looked after. The surroundings of the house and the barns may be materially beautified and health and comfort added by the proper planting of fruit, ornamental and shade trees.

The farm garden that is well stocked with berries, bushes and vines, with roses and all sorts of small fruits, is a thing of beauty and a source of pleasure and profit. The orchard filled with fruit-trees and the lawn bordered with shade and ornamental trees, shrubs, etc., mark the home of the wise, widespread, progressive farmer.

It doesn't cost a great deal to add all of these attractions to the farm. The Gage County Nurseries, of Beatrice, Neb., right in the heart of the belt of where healthy trees are grown, has been in business for over 24 years, helping all that time to make the farm a better place to live, more attractive, more home-like, more profitable and more healthful. The beautiful homes it has helped to make dot the western prairies and eastern hills. From North to South all over the land it has sent its products and has gained a reputation for reliability, for honesty and fair dealing that it prizes very highly. The good words of its many regular customers prove that its policy is appreciated and that its products give universal satisfaction.

The Gage County Nurseries claim it costs more to sell a tree through an agent than it does to grow it. Consequently it sells direct to the customer at only a fair profit on what it costs to grow the stock. Send for catalog before you buy, listing everything in the nursery line, describing the improved facilities of its complete nursery plant, and telling why it can serve you to your entire satisfaction. Please mention the American Bee Journal when writing.

frame has thus been injudiciously pulled out. After removing such a frame just take a peep down into the hive and see for yourself.

I prefer a bottom-bar less than an inch wide, otherwise I am greatly hindered in my work when the combs are crowded with brood, bees, and honey. Wide bottom-bars have ruined many a fine queen-cell, killed thousands upon thousands of bees, and not a few queens.

Mr. Learner has apparently bettered me in my argument relating to the advantages of the "closed-end" over the "Hoffman". Were I to admit that the advantage of the extra warmth was overbalanced by the disadvantage of the killed bees, I should here and now haul down my colors; but I do not admit that. My closed-end frames save many times the number of bees killed in bees kept alive. A few bees killed in the height of the season are not felt, but a few bees saved in spring make themselves felt. It is difficult to get people to appreciate this extra warmth of closed-end frames till they try them. To see absence of spring-dwindling, rapid and sure building up in spring, early swarming or early work in sections, will make many a bee-keeper shut his eyes to the disadvantages of the closed-end frames, and will let him scrape off the few flattened mumm-

**A TELEPHONE ON THE FARM.**—Why not? Why shouldn't the farmer and his family enjoy the convenience of this modern time-saver? Why shouldn't the farm home be brightened in every way possible?

The great problem of keeping girls and boys contented on the farm would be solved in short order, if farm-life had more of the luxuries and conveniences the city offers; if a large share of the monotony and isolation of farm life were dispelled.

The farmer himself would be greatly benefited by the adoption of some of the more necessary modern improvements his city brother employs in his home and business. For instance, the telephone. Every farm should have a telephone. If any business man needs a telephone the farmer is that man. With a telephone the farmer, no matter how remote his location from the great centers of business, comes into close contact with the outside world. He may get the market reports every day and can sell his products when the market is right. Thus, the extra price he may realize from a single crop will often pay the entire cost of his telephone and the expense of building his line. A telephone keeps the farmer in touch with his neighbors, gets help to him without delay or loss of time when help is needed or accidents occur; calls the doctor quickly when emergencies arise, day or night; often saves a trip to town in busy seasons when time is money, and cements the entire neighborhood into one big, helpful family.

Farmers are awakening to the numerous advantages of owning their own telephones and lines. Hundreds of farm lines are being built all over the country. The improved telephones and appliances built especially for farm lines by the Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y., makes the building and operating of such lines a very simple and inexpensive proposition. No better instruments and apparatus are built, and the testimonials of hundreds of users prove that the success of their lines is due to the superiority of Stromberg-Carlson telephones. They are simple, do not get out of order, or require experts to operate them. They are built for durability and efficiency.

The Stromberg-Carlson Company will be glad to hear from farmers everywhere who are interested in knowing more about telephones and how to build and operate farm lines. They have a lot of valuable information which they will be glad to send free to farmers. Write for it, and please mention the American Bee Journal when writing.

**PAGE & LYON MFG. CO., New London, Wis. U.S.A**

mies of bees from the edges of the frame without any qualms of feeling other than enough to cause him to seek methods of handling such frames so as to reduce this killing to a minimum.

I have trailed out this reply too much, but wish as a parting shot to say to Mr. Learner that he has misinterpreted my "one and a half advantages". The "closed-end" has many advantages, and of all of these only one and a half are possessed by the "Hoffman".

It may interest you to have me state that I looked into my observatory hives to-day and

A MUSICAL NOTE.—Twenty years of successful business with a record of continuous growth and expansion certainly signifies something. It means that merit and fair dealing must have been back of every transaction. Twenty years ago there was established in Cleveland, Ohio, a music house, by a practical music man with a fixed determination to build success strictly on QUALITY. To sell only the highest class of goods at as low a price as such goods could possibly be sold for direct to the customer, with only one small profit from maker to user.

Being a practical man he knew that Musical Instruments cannot be judged from the outside. Their merit is on the inside, and unless made with care will be without quality, while they may look all right. His success and the fact that he daily receives cash orders from all over the world proves that his instruments are made with the care that is required to give them true musical quality, as well as handsome appearance.

H. E. McMillin, Cleveland, Ohio, manufactures, imports and retails "EVERYTHING MUSICAL." Therefore his customers get the goods direct from headquarters, with the guarantee that they will be just as satisfactory as if the customer came direct to the store and made his purchase in person. Mr. McMillin looks back over his twenty prosperous years with pardonable pride, and forward to the future for a continuation of his business. His numerous customers always have a good word for his house. Mr. McMillin makes it a point to have every customer a pleased, satisfied customer. Write to him for catalogs of anything you may need in the music line, and you will readily understand why his business has grown to such proportions. Please mention the American Bee Journal when writing.

could see only one dead bee in one hive, and none in the other. In the closed porch outside the entrances were 15 dead bees. These bees have not flown since Nov. 19. What does this say for wintering bees in observatory hives?  
ALLEN LATHAM.  
New London Co., Conn., Feb. 10.

### Controlling Bee-Paralysis.

The report of the 35th annual convention of the National Bee-Keepers' Association held at St. Louis is a good one, and I read the report on bee-paralysis with much interest. I think I can throw a little light on keeping the disease under control.

Late in October, 1902, I found a bee-tree. The bees were 2 and 3 banded, and I transferred them into a movable-frame hive, and fed them up well. They came out in spring in good condition, and I increased them to 5 colonies. All 4 of the queen's daughters produced paralytic bees, and the old queen's progeny showed symptoms of the disease. Although the malady was hardly noticeable in spite of the immense number of bees dying at each hive-entrance, they went into winter quarters in good condition, and all came out fair colonies in the spring. One of them dwindled to nothing a month after being put out. The grass would be full of dying bees, and they would crawl out of the hives, some of them to die, and others would lay around the entrance on their backs for hours, with their legs quivering.

Just as soon as I could get queens I requeened the other 3 colonies, having for queens daughters of the old paralytic queen, before they got to rearing drones.

I allowed the colony containing the old paralytic queen to swarm once, giving the new swarm and queen on the old stand. I put the parent colony on a new stand, and cut out all queen-cells and drone-brood, giving them a queen-cell from a healthy colony. The old queen being a very prolific one, I did not like to kill her, although she perished the

**THE LITTLE WEATHER COCK.**—This is the very appropriate name that Mr. Geo. H. Stahl has given to an entertaining, interesting little novelty which he will send free to any of our subscribers. It is a very fetching and saucy looking little rooster, so dressed that the color of its clothes foretells the weather—dry, wet or changing. It is a scientific weather forecasting device. Mr. Stahl

will send one free to any of our subscribers who will write to him for it, enclosing six cents for postage and packing and mentioning this paper. He will also send one of his new, large, illustrated Catalogs of the famous Excelsior Incubators and the Wooden Hens, which he has manufactured for the past twenty years. His advertisement will be found elsewhere in this paper. Address Geo. H. STAHL, QUINCY, ILL., and do not forget to mention the American Bee Journal when writing.

following winter with her colony. I have seen nothing of the paralysis since I got rid of those bees.

I don't believe bee-paralysis is a contagious disease, but I do believe it is hereditary. I would advise any bee-keeper who has the disease running through his apiary to requen all colonies with queens which he knows are free from the disease, and mated to drones that are also free from it.

FRANK STOFLET.

Wood Co., Wis., Feb. 2.

**Disposing of the Honey Crop at Home.**

On page 51 expressions are called for from those who have been successful in selling their crops of honey in the home market. With the exception of one year I have sold mine at home for 30 years. The comb honey I sell at 10 cents per pound, the chunk honey at 9 cents, and the extracted at 8 cents.

My crop for 1904 was 1500 pounds, the least I have ever harvested. The most for any year was 4000 pounds. I aim to keep 35 colonies.

There are so many ways to begin that I can't explain all of them. The one I practiced most was always to have samples of honey with me, and not miss a chance to have people taste it, especially the children, for they almost always want more. Now, after 25 to 30 years those same children have homes of their own, and still have a taste for honey, and don't forget where to get it.

To illustrate: Years ago one little girl asked a good many questions about honey, and insisted on her folks buying once in a while. She is now married and lives in Kansas. Every fall she sends an order for honey, and knows just what to ask for. I have many such customers all through interesting the children.

Beginners sometimes think that the trade must all be worked up in one year. It is important to remember that it takes time, with lots of vim and push, to be successful.

As to packages, my standard for comb is 5-section cases (4 1/4 x 4 1/4 x 1 1/8), always sold by the pound or by weight; for chunk honey 3-quart pails which hold about 10 pounds, and extracted in 3-quart pails holding about 10 1/2 pounds. One should know what kind of packages best suit his class of customers, and how to put them up, and must keep everything clean and neat. J. H. SHEDENHELM. Iowa Co., Iowa, Feb. 2.

**Selling Small Honey-Crops in the Home Market.**

As I have not written to the "Old Reliable" for some time, I would like to give my experience in selling small honey crops in the home market, called for on page 51.

I began keeping bees in 1895 with one colony, which I have increased to about 60. I have buckets that hold 10, 25, and 50 pounds, respectively. I do not take the honey on the street in large quantities to sell it, but I take orders from house to house, then fill the or-

**SCIENCE VS. NATURE.**—Among the many enterprises connected with the large and ever-increasing poultry industry of the country, perhaps none is of greater importance than the manufacture of hatching machines, or incubators, as they are commonly called. The brains and inventive genius expended in

perfecting the practical utility of these machines is evidenced by the surprising results which some of them achieve. In fact, such a close approach to natural conditions combined with commercial practicability has been attained that the "settin' hen" has been almost crowded out of business, even among the smaller poultry-raisers, while among the larger farms artificial incubation has reached huge proportions and is used exclusively. To meet these demands many different machines are offered, each claiming peculiar merit. Among these the Ormas Incubator, manufactured by L. A. Banta, of Ligonier, Ind., occupies a prominent place. The Ormas line, which includes Brooders also, are models of scientific efficiency and judging from the testimony of those who use them, give good satisfaction. Mr. Banta sends a beautifully illustrated catalogue, containing full description and prices, free to all who request it. Please mention the American Bee Journal when writing. Address, L. A. Banta, Ligonier, Ind.

**CONVENTION NOTICE.**

Utah.—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturalists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same. G. E. GARRETT, Sec.

E. S. LOVESY, Pres.

**EDGE-DROP**

**SEED CORN**

"Edge drop" planters are no good unless the seed is of even size and perfect shape. I breed corn with perfect and uniform kernels and I grade all my shelled seed with a specially constructed mill that throws out every uneven, round or thick kernel better than you could possibly do it by hand. Every kernel must be just like every other—even, flat, just right. That means even, accurate planting and a perfect stand. No trouble, no delay. All my shelled seed is screened this way, a feature no other seed man can offer. Sample and catalog free.

Henry Field, Seedman, Box 50, Shanandoah, Iowa  
"The seed sows man."

**PROGRESS**

I publish and recommend to you **THE RURAL BEE-KEEPER**, the best all-around 50-cent monthly bee-journal in America. On trial 3 months for this ad. with 10 cents. Or send \$1.00 and get **The Rural Bee-keeper** and an Untested Italian Queen-Bee. Sample copy free. Agents get liberal terms.

**Putnam Makes Good Bee-Hives**  
And sells them at reasonable prices. New catalog now ready. Address,  
W. H. PUTNAM,  
Dept. 50-C. River Falls, Wis.

1A1f Please mention the Bee Journal.

**For Queens** SEND TO JOHN W. PHARR Berclair, Tex.

□ He will furnish at same prices as last year: Tested, \$1; Untested, 75c; 5 for \$3.25; 10 for \$6.15 for \$8.25; 25 for \$12.50; 100 for \$45. He breeds Goldens, Carniolans and 3-Band Italians. Also 1, 2, and 3 frame Nuclei, and full colonies. Prices given on application. Pharr pays the freight, and guarantees satisfaction on all Queens. To do justice and judgment is more acceptable with the Lord than sacrifice. —(Prov. 3: 21.) 6A1f

**Wanted** Man 20 to 30 years old capable of taking charge of an apiary of 200 colonies. Can give employment balance of year collecting and soliciting for lumber and coal. In answering give reference and salary expected. **TRESTER SUPPLY CO. LINCOLN NEB**  
6A1f Please mention the Bee Journal.

ders and deliver them later. In this way I can sell more honey and give better satisfaction than in any other way. I guarantee every pound of my honey, and agree to refund money for any that is not as I represent it.

I talk bees and honey whenever I have an opportunity, and exhibit bees at the county "Trades' Day". I have taken every premium on bees, wax, and honey that has been offered there since the Trades' Day was organized. Why? First, because I keep the best bees; second, because I have the best honey; and, third, because I take more pains with my apiary than any other man in this county. I show the bees and honey to every one who comes to the house, and in this way they become interested.

I have the 5 1/2-inch deep extracting-frame, and use the Cowan extractor, No. 17. When filling orders, after having extracted some honey, I fill the buckets just as full as I can with comb, and then let enough extracted honey run in the pail to cover the comb. Then I put 2 or 3 sheets of nice paper over the honey, put on the lid, and the honey is ready for delivery; and when I reach the customers' homes the honey is just as nice as it was when I left home. I sometimes open a bucket and let people see and taste of it, and thus make satisfactory sales. Sometimes I get a new order from a lady who may be visiting where I am delivering the honey.

I can not produce enough honey to supply my trade, and orders are coming in from other cities. I sell it at home for 10 cents per pound, but when I take it to the market I charge 12 1/2 cents in small quantities. When 50 to 100 pounds are taken, I sell at 10 cents per pound.

Bee-keepers are doing harm here by not working together. Some of them bring nice honey into town and sell it for whatever price the merchant will offer for it. Then there are others that take no special interest in the bees, and bring old black combs to the market which will discourage one from ever wanting to see any more honey. These are some of the things that I have to contend with.

M. H. SOSSAMAN.  
Franklin Co., Ark., Jan. 30.

**A 20TH CENTURY WONDER.**—The Cycle Hatcher, a metal machine for hatching chickens, is styled a 20th Century Wonder. It embraces features not found in any other machine and is a new departure in the incubator world. It was designed to take the place of the hen, and is offered as an improvement over wooden machines, embodying principles that cannot be attained with a wooden construction.

Being made entirely of metal and asbestos it is absolutely fireproof, will not swell or shrink, and is not affected by varying conditions of atmosphere, as wooden machines are. It is the result of years of experiments conducted by a practical poultryman with an am-

bition. His ambition was two-fold; he wanted to make a metal machine that would get nearer to the mother-hen conditions in the hatching process, and then he wanted to be able to sell that machine for \$5.00. Five dollars is a nice, easy price to pay; it's even money, and, while it don't leave the manufacturer much profit, he figured that people could afford to buy several of them. In fact, his experience with hatching machines convinced him that three 50-egg incubators were better than one with 150-egg capacity. His reasons for this are interesting, and fully set forth in the catalog advertising his machine.

The Cycle Hatcher, sold for \$5.00, is a complete machine, and includes everything necessary to hatch eggs but the oil. It is made by the Cycle Hatcher Company, of Salem, N. Y., who would like to place a copy of their new catalog in the hands of every poultry-raiser and everybody interested in hatching chickens. They will send it free to all applicants; simply mention the American Bee Journal when you write.

## Honey and Beeswax

**CHICAGO, Feb. 8**—The trade in honey is still below the normal in volume with prices unchanged, except that the pressure on the part of the holders to realize is more urgent. Fancy white comb honey, 12½@13c; No. 1, 12c; off grades, 10@11c. Extracted, white, 6@7c, according to flavor, quality and package; anything off is lower; amber grades, 5½@6½c. Beeswax, 30c per pound, if clean and good color.  
**R. A. BURNETT & Co.**

**BOSTON, Feb. 8**—Sales of honey still continue light, principally on account of the extreme cold weather which we are having. On account of the large stocks in hand, prices that we have quoted are shaded in round lots. Fancy white, 15@16c; A 1, 15c; No. 1, 14c. Extracted, from 6@7c, as to quality.  
**BLAKE, SCOTT & LEE.**

**KANSAS CITY, Jan. 9**—The demand for comb honey still continues light, as most of the retail dealers were stocked up on \$2.25 honey before the holidays, two cars of which were sold here at that time. We look for a better market in the near future, and quote: Fancy comb, 24-section cases, \$2.50; No. 1, \$2.25. Extracted, white, per pound, 6@6½c; amber, 5½@6c. Beeswax, No. 1, 28@30c.  
**C. C. CLEMONS & Co.**

**CINCINNATI, O., Feb. 7**—Comb honey is now coming in more freely, and prices if anything have moderated a little. The sales made and prices obtained were for No. 1 fancy water-white comb, 12@13½c; single cases, 14c. Extracted is sold as follows: White clover, in barrels, 6½c; in cans, 7½@8c; amber, in barrels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c.  
**C. H. W. WEBER**

**PHILADELPHIA, Feb. 8**—The market of all grades of comb honey continues rather weak and trading light, with a good supply on hand. We quote: Fancy white, 15@16c; No. 1, 13@14c; amber, 11@12c. Extracted, white, 7@8c; amber, 6@7c. Beeswax, 28c.

We are producers of honey and do not handle on commission.  
**WM. A. SELSER.**

**CINCINNATI, Feb. 17**—The demand for honey at the present time is like business—frozen. Nevertheless, we are looking forward to a brighter future. We quote amber extracted honey in barrels and cans at 6@6½c, respectively; white clover at 7@8c.

The conditions of the comb honey market are aught but encouraging, owing to the vast amount of Western comb honey that is being consigned at almost any price. We quote fancy white at 12@13c, with but few sales. Beeswax, 27c.  
**THE FRED W. MUTH CO.**

**ALBANY, N. Y., Feb. 8**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c.  
**H. R. WRIGHT.**

**SAN FRANCISCO, Feb. 8**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Market is quiet and easy in tone, especially for amber grades, stocks of which are fairly liberal, and include several lots of Hawaiian Island product. There is not much strictly choice water-white honey offering.

**NEW YORK, Feb. 8**—The market is decidedly dull on comb honey and very little moving, with plentiful supply. We quote: Fancy white comb, 14c; No. 1, 13c; amber, 11c; dark, 9@10c. Extracted honey is in fair demand, and prices remain about the same. Beeswax steady and in good demand at 29c.  
**HILDRETH & SEIGELKEN.**

**FIGHTING WAS KEEN**.—St. Louis, Dec. 1.—“The friendly competition” entered into by the world’s manufacturers at the Exposition has turned into a regular free-for-all fight, and its fury has centered around the typewriter award, which was finally decided today when the Exposition officially awarded the Oliver Typewriter the gold medal as a mark of its practical superiority. Each exhibitor presented a score of claims why he should get honors as against all comers, and the competition became so keen that each firm felt the entire standing of their business was tied up in the receipt of the prized medal. All the typewriter exhibitors being American, they displayed a spirit of Yankee fight that made decision hard. Some of them even went so far as to anticipate results, and announced several weeks ago that they had won in the contest, though the official award was only made today, and as a result the Oliver Typewriter people are being congratulated on winning a great victory.—Special to Chicago Evening Post.

# Correspondence Course in Bee Culture.

Last fall we announced this course and made a special offer to students for early enrollment. We have secured quite a number of students, but nearly every one of these wants to continue his own bee-keeping so that we find ourselves without a sufficient number to recommend to parties wanting help in their yards.

We have inquiries now for help from a number of States—California, Colorado, Florida, Idaho, Illinois, Pennsylvania, Michigan, and other States. See what one of our students says :

THE A. I. ROOT Co., Medina, Ohio.

LA COSTA, TEXAS, Jan. 23, 1905.

Dear Sirs:—I am very grateful for the 1905 edition of the "A B C of Bee Culture". I am highly pleased with your instructions in your Correspondence Course. It brings out points the amateur could never find by reading bee-books as it gives the essential parts in rotation so to explain them understandingly. It is like having a teacher or trying to study off-hand. Saving so much time and getting the foundation started right is half the battle. I hope to be an expert bee-keeper some day. Should I fail I certainly could not blame you. Everything bearing your name is first-class. May you ever prosper and live long to instruct us. With best wishes, Yours truly, W. R. HESSREW.

Send for our prospectus, or, better still, send us your order with \$10.00, for which we will send you :

## Complete Course of 17 Lessons. Gleanings in Bee Culture 1 Year. 1 A B C of Bee Culture.

We give in addition personal answers to as many questions as the student desires to ask, either on bee culture, locations, help, honey markets, or, in fact, any subject relating to bee-keeping. We know where many good locations are yet untouched; where the good honey markets are; who is needing help, and hundreds of other things that the bee-keeper wants to know. We can't tell you these things unless you ask. If you have hesitated to ask us, thinking we could not well afford to give time to answer your questions, enroll in our Correspondence Course. Never mind if you have been a bee-keeper for 20 years. If you do not need the lessons, the information we can give you by mail on a variety of topics will more than pay you. Let us show you one case :

A party became interested in bee-culture a few years ago and set about to build up a large apiary. He succeeded remarkably well, but paid little or no attention to the honey markets, his time being taken up with other matters. The third season he produced a very large crop of honey (150,000 pounds) and being unacquainted with the markets, he sent it for sale to a large city, to a house no more familiar with the honey markets than he. It appears that they sold it at any price they could get, for he told us later that the information we gave him of another market would have saved him over a thousand dollars on the one sale. (He hadn't asked us for it, but learning of the situation we wrote him, but too late; the sale had been made.) Perhaps the American Bee Journal readers think they would not be benefited. We assure you there are dozens of ways in which you can be helped.

Here is what one of our customers thinks of our "A B C of Bee Culture", which is included with the course :

"After looking through the 1905 'A B C of Bee Culture', just received to-day, I told Mrs. C. I would not take \$25.00 for it if I could not get another copy.—P. F. CONKLIN, Elmira, N. Y."

**The New Edition (1905) "A B C of Bee Culture" is \$1.20, postpaid, if ordered alone.**

And another customer speaks thus of Gleanings in Bee Culture :

Dear Sir :—You ask if I have found "Gleanings" a good investment, and I can truly say the investment has not only been good, but very good. Although I do not keep bees for profit at this writing, but hope to at some future time, will say that I am trying to learn all I can about the subject, and "Gleanings" adds more ideas to my limited store of knowledge than any other publication I receive. All the departments treated in this semi-monthly paper are very interesting to me, and I get anxious to see its pages when the date arrives for its appearance.

Yours truly,

DANVILLE, N. J., Dec. 12, 1904.  
RALPH P. FISHER.

**Don't you think \$10.00 is a small price for what we are offering you ?**

**Gleanings (semi-monthly, 52 pages) is \$1.00 per year if ordered alone.**

**THE A. I. ROOT COMPANY,  
MEDINA, OHIO.**

## Editorial Notes and Comments

### Advertising the Value and Uses of Honey.

We believe it was at the Denver National convention, in 1902, that the advertising of the value and uses of honey was first discussed publicly. Since then more or less has been said and written about it.

At the Wisconsin convention at Madison, in February, 1904, we read a paper on this subject, but it never appeared in print, for the reason that it was burned among other papers in the fire that swept away the office and factory of Secretary Dittmer. When Secretary Brodbeck invited us to furnish a paper for the St. Louis National convention, and to select our own subject, we quite naturally took up the honey-advertising question again, and tried to write as best we could on it.

The more we think on this subject the more we are convinced that the thing for bee-keepers to do in order to overcome the apparently stagnated honey market, especially in the larger cities, is to do some good advertising of honey. The fact is, most people are afraid to buy honey. They have so often read the infernal lies about comb honey being manufactured that they have come to believe them true. Also, they think that all the extracted honey found on the market is adulterated.

Now, what is to be done to counteract the effect of the misrepresentations about honey that have been going the rounds of the newspaper press for nearly 25 years? What can be done to get the great consuming public to regain confidence in honey? Our answer to these two questions is, ADVERTISE!

"Oh, but that will cost lots of money!" some one says. Surely, it will. But it will cost a lot more in loss by a continuation of the present low prices on honey, or no sales at all, than it will ever cost to put the advertising idea into effect.

What if 5000 or 10,000 bee-keepers should each pay \$1.00 each (some would pay more) within the next 30 days, for the purpose of advertising the great value of honey as a food, in say two of the leading daily newspapers of New York, Chicago, Cincinnati, Boston and Philadelphia—don't you think the good effect would be felt very soon? We believe it would. And the newspapers that advertised the truth about honey would perhaps not be so likely to publish false statements about honey very soon.

We believe this is the "next move" on the honey-producers' checker-board.

### Sugar-Feeding Among Bee-Keepers Denounced.

In the December number of the American Bee-Keeper Arthur C. Miller denounces sugar-feeding in such vigorous style as to warrant the editor in giving the sub-head, "Baneful Results of the Practice Forcibly Presented". Seven pages farther along in the same journal, L. E. Kerr, M. D., says, "All intelligent bee-men now rely to a great extent upon the sugar-barrel". Which raises a question as to Mr.

Miller's intelligence; although he may console himself with the thought that "there are others" lacking in intelligence in the same way.

One part of Mr. Miller's argument that may well be pondered, reads as follows:

Suppose it is possible to so feed the bees that all of the syrup is consumed and that none of it goes into the surplus; the average consumer won't believe it. It may be said the consumer does not know. Perhaps not in many cases, but he does in others, and suspects all. Then if he asks the bee-keeper what is the result? We know that the small amount of syrup that gets into the honey from stimulative feeding (when this is carefully and honestly done) is small indeed. But there are the looks of the thing, and the name of it, and such a name does not react to our advantage.

But none too few among us are careful with stimulative feeding, and as for fall feeding they crowd the brood-chamber with food. Any one who is familiar with the various feeding systems advocated is well aware that most of them afford ample opportunity for some of the syrup to get into the honey. If there is a probability or a possibility of any being there, then the bee-keeper can not honestly say that his honey is absolutely pure. And until we can say that, we can not raise our hands or voices against others who buy our honey and then add more syrup of some kind.

### Do Bees Starve or Freeze?

Entire unanimity as to the answer is lacking. There are some who are very positive that a colony of bees never dies from cold, and it seems that a diametrically opposite view is also held. C. H. Oldham, in the British Bee Journal, asserts, as a fact, "that when bees have consumed all their winter stores, they do not die of starvation, but of cold". As proof of the assertion, he says that on a number of occasions during the past year he has found bees apparently dead, their stores all gone, yet upon warming them up they revived, and were all right after being fed. His argument seems to be that as feeding did not and could not restore them so long as the cold remained, it could not be a case of starvation; and as warming could and did revive them, it was cold that sent them into their temporary death—a death that would have become permanent if the cold had been continued.

### Pear-Blight and the Bees.

A paper upon "Pear-Blight in Northern California", published in the Newcastle News, has been sent to this office by H. Vogeler. The writer, Prof. Ralph E. Smith, of the State University, paints a vivid picture of the terrible ravages of the disease, and wisely urges that thorough investigation of it be made under the auspices of the State. In the course of his paper he says:

infection takes place largely in the blossoms, whither the germs of the disease are brought by bees and other insects."

He quotes from a recent publication the following statement:

"Spraying, fumigating, and all other external remedies are utterly worthless, as the disease is in the sap-wood of the tree, protected from all external influences."

In this statement he thinks too much is taken for granted, and proceeds to argue in favor of the possibility of efficacious spraying after the following fashion:

"If, then, we may well ask, the disease is 'protected from all external agencies', and its germs on that account not to be reached by any spray or similar treatment, how does the honey-bee obtain such germs to carry to the blossoms? Why, then, if the germ of pear-blight is accessible to the honey-bee, is it so certain that a proper

spray, at the proper time, might not reach and destroy the same source of infection?"

The gist of the argument is this: The disease is brought by bee and conveyed through the blossoms; therefore timely spraying of the blossoms must be of value in combating the disease. That is, the guilt of the bee is assumed as a fact, and the efficacy of spraying is sought to be built upon that fact. But is it not possible that the facts are the other way? Has the guilt of the bee ever been proven? Is it anything more than a theory? Is not the failure of spraying the fact? Has not spraying been tried, and has it not failed?

The following argument is commended to Prof. Smith: There has never been any direct proof that bees convey the disease through the blossoms, and the fact that spraying as a remedy has been found worthless is proof that such conveyance of the disease by the bees is not possible.

### Preservatives Not Allowed in Honey.

We find the following paragraph in *Gleanings in Bee Culture*, which we think every bee-keeper should read and heed:

#### PRESERVATIVES NOT ALLOWED FOR PREVENTING GRANULATION.

Dealers over the country should understand that putting small quantities of preservatives such as salicylic or phosphoric acid, or even glycerine, in honey to keep it from candying will, in all probability, cause it to be classed by chemists and food commissioners as adulterated, and subject the seller of such goods to a fine. One such case occurred this summer, where a dealer put a small quantity of phosphoric acid in honey—not to adulterate it, he said, but to keep it in a liquid condition. Whether it would or not I do not know, but the pure-food commissioner got hold of a sample of this, had it analyzed, and the dealer was notified to discontinue the sale of all such honey, which he did. If preservatives were permitted for the purpose of preventing granulation this might open the door wide to fraud; and it is well, perhaps, that the commissioners and chemists should declare that all such honeys be classed as adulterated.

It seems to us that bee-keepers, above all others, should not indulge in adulterating honey. It is better to educate the public to know that pure honey will granulate than to mix some foreign substance with it in order to try to prevent natural granulation.

## Miscellaneous News \* Items

Secretary Geo. W. Brodbeck, of the National Bee-Keepers' Association, passed away in Los Angeles, Calif., on Feb. 6. He had been sick for some months, as most of our readers know. We hope soon to publish a biographical sketch of our departed friend and brother.

**To Our Foreign Subscribers.**—It seems necessary at frequent intervals to inform our foreign subscribers—those not entitled to domestic postal rates—that none of the special offers we make in the *American Bee Journal* or elsewhere apply to them. Hence, whenever we get such order from foreign countries, with a remittance, we always apply it *all* on subscription, which is at the rate of \$1.50 a year to most foreign countries. If foreign subscribers would just stop a minute to think, they would see that none of our domestic offers apply to them on account of the extra foreign postage. So by applying on subscription all the money they send, they get full value in return even if they do not get a queen, knife, or some other things we sometimes offer to those living in this or other countries enjoying domestic postal rates.

**The Home Apiary of E. E. Butcher** (or at least a corner of it), of Bent Co., Colo., appears on the first page. In 1893 there were 135 colonies in this apiary which produced 17,000 pounds of honey, and in 1904 there were 205 colonies which produced 4000 pounds—only about one-fourth of a crop.

**R. A. Morgan and the Clay Co. (So. Dak.) Honey Exhibit.**—The picture of the bee and honey display at the Clay Co., So. Dak., Fair, held on Sept. 20, 1904, was sent us by Mr. Morgan, whose picture also appears on the first page. Mr. Morgan was superintendent of the exhibit, and is the vice-president of the South Dakota Bee-Keepers' Association. He was on the grounds during the Fair, giving the visitors, both young and old, a taste of some fine extracted

honey which was put up by himself in 1882, and which had been exposed to all kinds of weather and conditions, and was still very nice.

Mr. Morgan is 49 years of age, and has been in the bee-business since he was 13. He owned and operated 400 colonies of bees for 5 years in Southern Wisconsin, but went to Dakota 19 years ago, at which time there was not a head of clover to be found, and he has lived to see the southern part develop into a beautiful clover-producing section. Mr. E. A. Morgan, of Wisconsin, a brother of R. A., has lately joined him, believing that there are greater possibilities in South Dakota for bee-keeping than in Wisconsin.

Referring again to the honey display, there is shown a large pyramid of choice white clover honey near the center; to the left is a pile of choice white honey and dark fall honey. On the right are two single-comb observatory hives with queens, bees, drones, queen-cells, honey, and bee-bread. On the sides and top of the pyramid may be seen a fine display of extracted honey in glass jars, put up during the past 22 years. On the right of the exhibit is a honey-extractor. At the back of the honey display is a complete dovetailed hive, bee-smoker, honey-knife, veil, bee-brush—in short, everything needed in the apiary. The whole was draped in white and red hunting, and over all was the large inscription shown in the picture.

**The Apiary of F. C. Smith & Son**, shown on the first page, is thus written about by the "Son" of the firm:

PIERCE Co., Wis., Jan. 27, 1905.

DEAR EDITOR;—As pa and I are in the bee-business I thought I would report about our apiary. My pa's name is F. C. Smith. We have 105 colonies in the cellar, which gave us 6350 pounds of very fine honey last year. We extract it so the bees lose no time in making comb. We sell it at 10 cents a pound, or a 12-pound can for \$1.15.

We started with one colony years ago. Not knowing anything about the work, we sent for the *American Bee Journal*, and that helped us out. We could not get along without it, for it is a big help to us.

I am 15 years old, and can hive bees as well as anybody. I can walk among them without a veil, and barefooted. They do not very often sting me, and if they do by mistake, it does not swell and hurt as some folks say.

I send a picture of our bee-yard and bee-house. The man you see is pa, and the little man is myself.

FRED SMITH.

**York Honey and Bee-Supply Co.**—This seems to be the latest. Since Mr. H. M. Arnd purchased our interest in "The York Honey Co.," about a month ago, he has arranged with the G. B. Lewis Co., of Wisconsin, to handle their line of bee-keepers' supplies in Chicago. He has also moved from 101 E. Kinzie St. to 141 & 143 Ontario St., five blocks north of the Chicago & Northwestern railway passenger station, and will conduct his business under the name as given in the first line above.

## Opinions \* of Some Experts

### What is Honey?—Some Definitions.

**Ques. 22**—What, in your opinion, would be a correct, concise and comprehensive definition of HONEY?

WM. McEVoy (Ont.)—I don't know.

JAS. A. STONE (Ill.)—The best of all sweets.

S. T. PETTIT (Ont.)—Nectar of flowers gathered by bees.

First the flowers and then the bees;  
No honey on earth except through these.

The term "honey-dew honey" is quite injurious and uncalled for. "Honey-dew" is good enough for that article. See page 167.

C. H. DIBBERN (Ill.)—Nectar gathered by the bees from flowers.

R. C. AIKIN (Colo.)—Vegetable and similar sweets collected by bees.

N. E. FRANCE (Wis.)—Nectar of flowers and plants, gathered by bees and stored in honey-comb.

ADRIAN GETAZ (Tenn.)—The sweets from natural sources gathered and elaborated by the bees.

O. O. POPPLETON (Fla.)—The nectar of flowers after having been gathered and properly manipulated by honey-bees.

PROF. A. J. COOK (Calif.)—A reducing sugar in solution stored in comb by the honey-bee. This is the only possible definition. No one

can know where the bee secures the nectar, which is changed by the bees to honey.

G. M. DOOLITTLE (N. Y.)—Honey is the product of the bee from the saccharine matter as gathered from natural sources.

Dr. J. P. H. BROWN (Ga.)—I would define honey: A saccharine matter secreted by flowers, gathered and manipulated by bees.

L. STACHELHAUSEN (Tex.)—Honey is a saccharine matter of natural source, gathered, modified, and stored in the comb by honey-bees.

REV. M. MAHIN (Ind.)—A sweet, thick fluid manufactured mainly from the nectar of flowers by the bees and deposited in waxen comb-cells usually in hives.

E. WHITCOMB (Nebr.)—Nectar gathered by bees, stored and evaporated by the general process until it will keep after being sealed over by them. Otherwise it is not truly "honey".

C. DAVENPORT (Midd.)—Certainly nectar gathered by bees from flowers and plants. Perhaps it should be broader than this, and include any sweet liquid gathered by bees from flowers, plants, and trees.

ARTHUR C. MILLER (R. I.)—The nectar of flowers, converted, thickened and stored by the bees. Possibly it might be well to add "sealed", as often unsealed "honey" is little more than raw nectar.

EUGENE SECOR (Iowa)—A sweet, watery fluid gathered by bees from various natural sources, chiefly from the nectaries of flowers, deposited by them in honey-comb cells, and ripened to the proper consistency.

P. H. ELWOOD (N. Y.)—Honey is that saccharine part of vegetation stored by the honey-bee—principally the nectar of flowers, with the larger portion of the cane-sugar changed to grape sugar in the process of storage.

R. L. TAYLOR (Mich.)—Honey is a saccharine, viscid substance made by bees, by evaporation and other manipulations, from sweetish liquids already gathered from different sources, but chiefly from the nectaries of flowers.

G. W. DEMABEE (Ky.)—Honey is the nectar of flowers (vegetable bloom) gathered, stored and evaporated to proper consistency by honey-bees. All "scientific" talk about "digested nectar" is undigested delusion, as I have proven to my own satisfaction by practical experiment.

MORGAN BROS. (S. Dak.)—1. Nectar from flowers gathered by honey-bees, manipulated by them, and stored in their combs and sealed. 2. A sweet liquid substance gathered from the blooms of plants by bees, manipulated by them only, and stored in combs and sealed as its final treatment.

DR. C. C. MILLER (Ill.)—That's a tough one. It should include all sweets gathered from flowers and other parts of plants, and possibly should be more inclusive than that; and it should exclude anything fed directly by the hand of man except honey itself. To put that in a concise definition is beyond me.

C. P. DADANT (Ill.)—I hold that the only true way to look at this matter is from the standpoint of the honey-producer who harvests what the bees gather. Nothing fed artificially to bees can be properly called honey, unless it *was* honey when fed. But of the crops harvested naturally by the bee, we should be very careful in rejecting anything, even if it is of low quality. See page 166.

E. D. TOWNSEND (Mich.)—Nectar from whatever source, principally of flowers, and such other sweets as bees collect from natural sources; digested through the process of evaporation, in the condition as to body and flavor that it is usually sealed by the bees. Anything extracted prior to this stage should be sold under another name. This answer is not scientific, but from a practical bee-keeper's standpoint.

Mrs. J. M. NULL (Mo.)—Did not Dr. Miller, on page 89, offer to receive "sealed proposals for a satisfactory definition"? Why not unburden the problem upon his shoulders? More especially as he is considered authority, and since he has offered about all there is to offer, what right have we to show up our frailties? I must confess those words "correct, concise and comprehensive" just about corner me. How would "concentrated sweetness" do?

JAS. A. GREEN (Colo.)—Honey is the liquid gathered by bees from natural sources and stored in their combs. This may not be narrow enough to suit the chemist, but the bee-keeper can not afford to have the line drawn any closer. If honey containing honey-dew, fruit-juices and the extra-floral secretions of plants is declared impure, there is not a bee-keeper in the land who might not at some time be brought before a court of justice on the charge of selling adulterated honey.

E. E. HASTY (Ohio)—A delicious, edible sweet, from flowers and other natural sources, gathered and elaborated by bees. This wording cuts off all unedible, poisonous and ill-tasting stuffs, even though bees were guilty of collecting them. It also cuts off the sweets resulting from feeding, except when the substance fed is honey to begin with. It "splits the difference" on honey-dew, letting in the good and shutting out the bad. It would be better to let in everything that can claim to be honey than to try to rule out any pleasant tasting sweets that bees gather without feeding. A wrong definition of this kind would make us all evil-doers and law-breakers in spite of ourselves.

E. S. LOVESY (Utah)—Honey is a nectar gathered by the bees from the flowers, and the only thing that will produce nectar in the flowers is atmospheric conditions. Through the action of the dews this nectar becomes a watery substance, though sweet, and the honey-

bee is so created that the liquid passes through what is known as the tongue into the stomach of the bee, where it is digested. Then it passes into the honey-sac and is carried to the hive and deposited in the cell, where it goes through the process of evaporation and is thoroughly ripened, after which it is hermetically sealed by the bees. In this state it will keep for an indefinite period.

## Contributed Special Articles

### No. 3.—Bee-Keeping in the Southwest.

BY LOUIS H. SCHOLL.

[Continued from page 118.]

**I**n my previous article nothing was said about the various methods of management practiced by some bee-keepers to hasten the building up of the colonies in early spring, such as stimulative feeding and spreading brood. Of these, the latter has been tried thoroughly, while stimulative feeding has never been practiced in my yards, as a slow honey-flow that we have early in the spring in my locality can not be improved upon by feeding.

#### SPREADING BROOD NOT ADVISABLE.

The method of spreading brood in the spring was tried thoroughly in my own apiaries a number of years ago, but was discontinued. It may work to advantage in other localities, and especially in the North, where the colonies need crowding on account of the shortness of the season, but in our Southern apiaries, at least, I do not think it advisable or advantageous.

In my manipulations with the bees it has never seemed necessary to interfere with the progress of the colonies except in a few instances, and with a few colonies when a change of the combs was of advantage. In colonies that had in the brood-nest combs filled with honey or pollen which the bees were slow in removing, and having empty combs on the outside, perhaps it paid to shift them. This must be done with care, however, placing the combs on the *outside of the brood-nest* in the early spring, as it is of the utmost importance to keep the brood-nest in as compact shape as possible. Later in the season an empty comb may be inserted by spreading the brood-nest, and always placing it between two combs of sealed and hatching brood, so that the order of the brood-nest will be disturbed as little as possible. This the bee-keeper, and the beginner especially, should bear in mind if spreading brood is practiced at all.

#### PRACTICED ON A LARGE SCALE.

When managing over a thousand colonies of bees in nine different apiaries for one of our Texas bee-companies several years ago, I was compelled to practice the method on a large scale, and as this was after I had given up the idea in my own apiaries it afforded an excellent opportunity for noticing more closely the results of such practice.

The manner of procedure was as follows: Beginning with warm weather in February the colonies were examined for their condition, amount of brood and stores, and a record of this was made. Queenless colonies were either supplied with a queen or united with another colony. Weak colonies were united, and those short of stores were helped from stronger ones. Three weeks later another visit was made to all of the yards. The number of combs containing brood averaged about five, some of the strongest having seven. From these one or two combs were drawn and given to weaker colonies. Then the whole apiary was gone over and an empty comb was placed on each side of the brood-nest between the last comb containing brood and the adjoining comb of honey. In three weeks more this was repeated, but an empty comb was also placed in the center of the brood-nest between two combs of hatching brood. As soon as the lower combs were occupied with brood, the queen extended her egg-laying up into the shallow extracting super left on the year around.

Just before the honey-flow in April, all the combs with unsealed brood in the brood-chamber were placed on the outside of the brood-nest, and the hatching brood was shifted to the center. This provided the queen with laying room and prevented the storing of honey in the outside combs. Such manipulations put the colonies in an ideal

shape for the honey-flow, but the many manipulations and the disturbance to the colonies caused by them seems to be unsatisfactory.

#### TOO MUCH WEAR AND TEAR TO THE COLONY.

There is no doubt that more brood is reared by colonies so manipulated. The spreading of the brood-combs and inserting empty ones forced the bees to enlarge the brood-nest, and the removal of the honey and pollen from the combs in the rearrangement of the brood-nest stimulated them. But while this may have been an advantage in that way, it, at the same time, was in a large measure a great disadvantage in a large amount of honey or stores being consumed, in a great waste of energy, and an unnecessary amount of wear and tear, resulting in a sacrifice of bee-life, a comparative depletion of the colony to the increase in numbers obtained, and leaving the colonies in no better condition, if as good, as when they are left alone. There is apparently no advantage gained when practiced in a wholesale way, for the extra labor and expense involved, even if it is done with care and sound judgment in the hands of an experienced bee-keeper. The difference is not great enough to warrant its practice, and as this was apparent to the members of the firm, the method of spreading brood was put out of practice.

#### COMPARED WITH THE LET-ALONE PLAN.

Colonies that were left entirely alone built up stronger and gave more surplus. A thorough test of this was made in a yard owned by two assistants in the employ of this same firm. The brood-nests were all in nice condition, with good combs and plenty of stores. The shallow extracting supers were left on the hives and provided room for enlarging the brood-nest and storing honey that was not needed in the brood-chamber below. The colonies spread their brood-nests in a natural way; they were not disturbed by unnecessary manipulations, and a good crop of surplus honey was obtained with a less amount of labor and expense.

Brazos Co., Tex.

[To be continued.]

## What is Honey?—Official Definition.

BY C. P. DADANT.

The official definition of the word "honey" has recently been submitted to one of the committees of the National Bee-Keepers' Association of which I am a member. This definition when once adopted will bar out anything else as adulteration. But the present proposal would bar honey-dew. I most emphatically sustain the views expressed by several bee-keepers when they ask that the so-called honey-dew be not excluded from the definition of the word "honey." The honey-dew in some sections is gathered by the bees one summer out of every four, at least, and is often mixed with other honey or nectar from the flowers, in such small proportion as to make it very injurious to the bee-keeper if the product had to be discarded. All honey-producers who are at all acquainted with the low quality of honey-dew recognize the fact that it must be sold as a very inferior article, but there are honeys harvested from the blossoms which are also low in quality. This honey-dew is a natural product harvested by the bees in the fields and woods, and it would be awkward, as well as unjust, to punish a bee-keeper who sold the natural product of the bees as honey, solely because it was honey-dew either in part *in toto*.

The laws of the country are for the protection of both the producers and consumers, and they cannot be too stringent on real adulterations, but they ought to protect and not punish the honest-producer. I have, myself, harvested tons upon tons of honey-dew—in one season as much as thirty barrels of it; I have seen it mixed with the finest white clover honey in all sorts of proportions; but although I recognize its inferiority, I feel that it is an absolutely legitimate product, and should be classed as inferior honey. There are many uses to which it can be put, and its color will always show its presence in any quantity; for that reason there is no need of fearing that any material injury will be inflicted on the consumers, who can readily ascertain that its flavor, like that of buckwheat or honeysuckle-honey, forces it in a third or fourth class position. Tobacconists, bakers, vinegar-makers, etc., can use these low grades of honey with more profit than any of the grades of glucose, the sweetening power of which is much below that of any grade of honey.

This matter is of some importance and should be thoroughly sifted by the bee-keepers. Hancock Co., Ill.

## Best Size of Hive for Bread-and-Butter Bee-Keeping.

BY E. D. TOWNSEND.

IT has been said that if you want to get the ear of a bee-keeper, and hold it, you must talk about hives.

In the first place, the majority of writers on the hive question are too positive in their assertions, or, in other words, they have had an experience in one locality, perhaps, with one or two styles or sizes of hives, and have worked out a system that fits their particular hive and location, so that it is a practical success in their hands. What is more natural than that they should cry "Eureka!" and grab their pen and write to their favorite bee-paper under the bold head-lines, "The Hive Problem Solved at Last"?

As I am in a liberal frame of mind to-day, I am going to allow that an experienced bee-keeper can get fair results with almost any known hive, in any location where there is nectar to be gathered, of either comb or extracted honey. Allowing this to be a fact, which I do not think many will dispute, one can see how easy it is for a bee-keeper who has had experience with only one or two sizes or styles of hive, to come to the conclusion that he, as good luck would have it, has adopted the only good hive, when, really, if he had started with some other good style or size of hive, he would have worked out a system that would fit his location so well that the results would have been about the same. As a person will get *fair* results from a hive that is ill adapted to his location or system, he is quite likely to change that word *fair* to *good* results, and plod on through his bee-keeping experiences, never knowing how much he has been handicapped by not adopting the hive his location and system required for the best results.

#### STUDY WELL YOUR LOCATION.

In the first place, study well your location, and the time your main honey-flow commences, whether you will produce comb or extracted honey, or, if you intend to operate one home yard, or several out-yards, where no one will be present to hive swarms that may appear at any time, especially would I caution you against taking the advice of any one who claims that his one size of hive is especially adapted to all these conditions, for the best results in the production of honey.

To illustrate: You may be getting the best results with the 8-frame Langstroth hive, with your system and location, in your home yard, but as soon as you begin to establish out-yards you might have to sacrifice the advantages of the 8-frame hive and adopt the 10-frame, on account of the swarming problem.

Then, the time your main honey-flow commences must be taken into consideration. I would use just as large a hive as would breed up and get full of bees so as to be in good shape to gather honey when the season opens. This size of hive is all right for either comb or extracted honey, in the home yard where some one will be present during the swarming season to take care of any swarms that may appear. In an out-yard for extracted honey, on the let-alone system, the hive should be somewhat larger to prevent swarming.

When I commenced the keeping of bees—in 1876—like many others, I suppose, I adopted the hive my neighbors used. In this case it was the 12-frame Gallup, with the then popular 1½-inch spacing of the brood-frames. After a few years I, with many others, adopted the 1¾ spacing. In my case it was very easy. As our hives were 18¼ inches long inside, all I had to do was to add another brood-comb to each hive, and it was done. With these 13 Gallup frames as a brood-nest, I have never found a hive that would produce more extracted honey than this would in this locality.

Later, as I began to establish out-yards, I found it more convenient to buy bees in Langstroth hives, mostly in the 8-frame size, so I had quite an experience with this size also. But the results were not quite as good as with the 13-frame Gallup hives. So when I commenced to build new hives, what would be more natural than that I should build the Gallup size, in the Langstroth style, which resulted in the 10-frame Langstroth? Then with my system of tiering up several stories high, to allow the honey to ripen thoroughly on the hive before extracting, the wide, shallow 10-frame Langstroth style makes a better proportioned hive than the narrow Gallup or 8-frame Langstroth.

Then for eight or nine years I had 10 Gallup hives with only 10 frames each. These, as you will notice, were still smaller than the 8-frame Langstroth—about 100 square

inches of comb space less—and I got so I did not expect as much from these as from the larger hives. The brood-nest, after allowing the usual space for honey and bee-bread, seemed to be too small to breed up a normal colony. At any rate they never averaged as much surplus as the larger hives, and had to be watched more closely as to winter stores, etc.

Then, I have had some experience with larger hives. I bought and used, one season, 50 colonies in 12-frame Langstroth hives. While they did not produce quite as much surplus honey as the 10-frame, they had more honey in the brood-nest in the fall. They were cumbersome to handle, and previous experience with large hives that I am about to explain, had convinced me that the 10-frame size was the right size for this location. While I do not consider one season's experience with a certain hive as worth very much, still I give it for what it is worth toward determining the proper size of hive to adopt. But what has convinced me most, that the extremely large hive is not adapted to this location, is a 16-years' experience with 50 10-frame Quinby hives (except the last 6 years, when 25 of them were contracted to 8-frames by the use of a division-board on each side in place of the two outside combs).

These Quinby hives, like most of my others, are chaff hives, and all wintered with their full number of brood-combs, as with my present system of producing honey I do not handle any brood-combs of colonies that are in a normal condition. My practice is to give the same amount of labor to a larger number of colonies, or yards, rather than put a great amount of work on a less number; and since adopting this practice I have made a very much better success, financially, than with the old intense method. So you see, all our colonies have to winter on the same number of combs they have in summer. The results are, that bees in these large 10-frame Quinby hives (1800 square inches of comb space) do not winter and spring as well as those in the smaller hives, and our short, early, white honey-flow, coming as it does mostly in June, is usually one-half over before these large hives are full of bees and honey, ready to enter the upper stories. Thus the surplus honey is always below the average in these hives.

There is no question about these large hives breeding large colonies. If one were further south, where bees winter better, or, if our honey season were in July, the results might be much better. One thing is certain, with my location and management I can not afford to use this size of hive.

In conclusion, let me add: I have nothing at stake in this hive controversy, only the largest grade of honey produced with the least amount of labor and expense. We earn our bread and butter with the bees.

Mecosta Co., Mich.

## Something Further on Defining "Honey".

BY S. T. PETTIT.

TO question No. 22 (see page 164) I would say further: I am aware that, however desirable, it is all out of the question to draw the reins so taut. Honey-dew occasionally comes at all times, in warm weather, in season and out of season; sometimes when the honey-flow is off, and again when the flow is on. So, in some cases, it is impossible to keep the two articles separate. In such cases, if it is fit for table use we must sell it for what it is worth.

A few years ago, during white clover bloom, the clover yield was light, but honey-dew was plentiful. It was of bad flavor, but the color was good. The bees drew out the section-combs and stored quite a lot of honey-dew with a little clover; but they refused to cap it, leaving the sections about half full. Later on the basswood flow was fairly generous, and the sections were filled and capped, and my crop turned out pretty well, after all. Myself and others would have felt it quite a hardship if the law forbade us to sell that honey for what it was worth. So I conclude, in a commercial sense, honey is "what bees gather from natural sources".

When working at Ottawa, the Canadian Capital, to secure the passage of our Pure Honey Bill, I coined and used that term, and I never have seen any reason to change it, for, in a commercial sense, "Honey is what bees gather from natural sources".

Doubtless, we should keep the two articles—honey from flowers and honey-dew—as separate, in all respects, as possible. I can not see how any good can come from calling "honey-dew" "honey-dew honey". The term "honey-

dew" is quite good enough for that article. I am not blind to the facts that some honey-dew is very nice indeed; but such is the rare—very rare—exception, in the great majority of cases. Elgin Co., Ont.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bees Wintered in a Shed.

I have 18 colonies of bees which I winter outdoors in a bee-shed. On each hive I put a super filled with maple leaves and packed well around them. When I put them away they weighed 50 pounds and over, and each hive had 8 frames in it.

1. Were 8 frames too many to leave in each hive over winter?

2. Should I lessen that number when I put them on the summer stands?

3. When should I put them on the summer stands?

4. Is this a good way to winter bees?

Lake Co., Ill.

MRS. L. ANTES.

1. No.

2. No, there's no good reason for having any less than the full number of combs at any time of the year. Some have favored the plan of having less than the full number in winter, closing up what are left by means of a division-board. But we are told that European scientists proved by careful experiments that a comb was just as good as a division-board. That hardly seems possible, but, at any rate, the difference must be so little that it is best to leave the full number of combs the year around.

3. Better not disturb the packing any sooner than necessary; not till settled warm weather in May. And yet if you wait as late as that there will be trouble in moving them, for they will have marked their location in the shed, and will go back in numbers to that place. If the distance is not great that they are to be moved, you can overcome the difficulty by moving them a short distance each day; if that is not convenient, put them on the summer stands before they do much flying, perhaps the last of March or first of April.

4. If located so that strong winds can not blow into the entrances, they ought to do well.

### A Wisconsin Foul-Brood Experience.

In 1899 my husband, who has been a bee-keeper for nearly 25 years, sold his bees, consisting of over 100 colonies, and went to Southern California, returning in 1903 and purchasing the same bees, or their descendants, from the man who bought them, a near neighbor, and a warm personal friend, Joseph Mathews, who was about leaving the neighborhood. The bees were in winter quarters at the time of purchase, and Mr. M. informed us that they, with the bees of several other apiaries in the vicinity, had been troubled with foul brood, but that Inspector France had been there and exterminated the disease, a fact which Mr. M. undoubtedly believed; but when the bees were taken from winter quarters, some 15 or 20 out of about 100 colonies were found to be badly diseased.

Inspector France was immediately sent for, and promised to come. After several months he came, arriving late at night and leaving early in the morning, saying it was too late in the season to do anything, and advised us to wait until spring.

In the spring he came again, staying about the same length of time, and giving a few instructions. In the meanwhile we had been getting all possible information on the subject, and proceeded to act accordingly.

The combs from the diseased colonies were cooked, and the hives cleansed, either by boiling or burning out, a near neighbor bringing his diseased colonies to be treated also, and the disease was apparently exterminated so far as the two apiaries were concerned.

Last fall 30 colonies were put into winter quarters, and

a number of them showed foul brood. The question is, What good did it do us to treat our bees when the country around was full of foul brood? and would it have been so full of it if Inspector France had been at liberty to come sooner, stay longer, inspect more fully, and give more instruction as to the treatment?

Judging from short acquaintance, we found Mr. France a fine man, but it seems to the "foul-broody" people here (nearly all the bee-keepers belong to that clan) that he has "too many irons in the fire" to attend properly to his regular "knitting"; that is, if inspecting bees is his regular work.

My husband has just read what I have written, and wishes me to add that Mr. France told Mr. Mathews that 3 of the colonies were diseased, and promised to come and treat them, but failed to do so (that was after treating them, and he made a second call, as I understand it); but instead of 3 there proved to be some 15 or 20.

There is foul brood in a number of apiaries, ranging from 5 to 10 miles away in all directions, and unless it is exterminated the bees will soon be, and I think I am voicing the feelings of the most of the bee-keepers in writing to you.

A great deal of the foul brood is in small apiaries, where the owners care very little for the profit from them, and so do not try to get rid of the disease. If there is any way of compelling these people to try to get rid of foul brood, the bee-keepers here hope to see it speedily put into operation.

I will close by adding that I spent several years within 12 miles of Prof. A. J. Cook's home; that we have had the pleasure of seeing him, and listening to him speak, and that I could tell a very different story about typhoid fever, water, prosperity, and a plenty of work for willing workers, even the short distance of 12 miles away, than he tells on page 37. Not that I doubt him, but things are so "exceptional" in California, and I, perhaps, had a better chance to see some of the "exceptional" things than he has.

Waushara Co., Wis., Jan. 31. MARY B. HALL.

Inspector France has the reputation of being a very reliable and careful man, although perhaps overworked, and the probability is that he regretted as much as you the peculiar circumstances that prevented closer attention in that one instance.

You say, "If there is any way of compelling these people to try to get rid of foul brood", etc. If I am not mistaken, all that is necessary is to report to the State inspector such cases, and he will make it his business to see that they have proper attention, you being specially favored by living in a State whose laws give the inspector compulsory powers equal to those of a sheriff.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### TO SETTLE WHICH IS THE BEST HIVE!

And some more Prof. Scholl is going to "draw Jordan into his mouth". Give him a little time and he can settle the question which is the best hive! We laugh. But don't you mind it, Prof. S.; our laughter is not of the contemptuous kind. We dearly love the young investigator who magnifies his office, and gets now and then a little too hopeful. Hardly so well do we love the seasoned and humbled old chap, all the time too pessimistic. But you see we catch a sly glimpse of a theorem that says: Behold a thousand official professors settling the hive question; and presently behold a thousand different hives that they have settled us on! Corollary! One professor's settling is less confusing, but not any more reliable.

The truth seems to be that there are a great many very excellent hives possible to be made—economic difference between them to be expressed in quite small figures—figures so small that the "personal equation" (as scientists express it) upsets and obscures everything else. Also no one hive, and no five hives, could possibly be best for all persons, climates, circumstances, and objects in view. Page 26.

### VARIOUS PROBLEMS TO BE INVESTIGATED.

To return to Prof. Scholl, he has an interesting lot of weighty problems on his memorandum; How to manage a distant out-apiary with the least work and loss. Some more whacking away at the tough job of making liquid honey stay liquid when it is put up. One

kind of hive in the apiary, and the most profitable kind. Honey-vinegar to equal the best vinegar in the market, and be made with cheap honey. All inferior honey kept off the market and converted into wax by the bees. (The last, not the least.) In these problems we see a minimum of the academic inquiry, and a praiseworthy maximum of the dollars and cents. I'm old pessimist enough to fear that honey-vinegar from poor honey (or dirty washings) can never be made to hold its own in the market alongside the best cider-vinegar. He may try it, though.

As to making poor honey into wax, my advice would be, don't waste much time in small experiments that try to settle the wax-honey ratio beyond doubt—experiments that try to cut off all causes of error. Folks will doubt anyhow—and we get out of visible causes of error by getting into invisible ones twice as big. Be a little shy of all small experiments. Let the scale be large; and inquire, What does it cost for these 10 colonies to make 10 pounds of wax? Have another 10 colonies alongside, fed the same honey in the same way, but caused to make as little comb as possible. Poor honey for this purpose should be poor but perfectly sound. Don't expect anything of honey that has changed even a little in the direction of souring. Sound but thin, sound but bitter, sound but black, sound but weedy tasting, are the hopeful kinds. One good way to make bees secrete wax is to give them ready-made extracting-combs to store in, but the cells cut down so as to be only half as deep as they ought to be. Keep slicing down again and again and feeding back the same honey—a little water added. Don't believe I would put the combs in the extractor at all. Another taking way (if not good) is to take new swarms just hived and cut away every four days all the comb they make—all except just enough for starters at the top. Page 26.

### OFFICIAL "STANDARD HONEY".

I think the official "Standard Honey" of the government chemists should not allow so much as 25 percent of water. Sorry I can not pretend to say what should be the minimum. Not much less than that found in best 12-pound-to-gallon honey—but somehow few authorities convince us that they can tell exactly what that proportion is. Page 36.

### ORGANIZING HONEY-PRODUCERS' ASSOCIATIONS.

That's not the way the great trusts of the world accomplish results—to move for them without cash in hand, without confidence, and without anybody vested with full power to do any identical thing. Rather seems to me that I'm glad of it that bee-folks hitherto are playing at organization, rather than organizing. Have we exhausted the possibilities of simple agency? One honest, capable salesman should not be impossible to find. And the simple question of the large producer to him, What will you take to sell my honey? hardly requires more of organization than agreement in what order the successive employers shall stand. First man in the line more pay, and last man much less pay. Page 36.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal,  
or to Dr. C. C. MILLER, Marengo, Ill.

### Van Deusen Wired Foundation—Painting Hives.

1. Have you used the Van Deusen wired foundation? If so, would you recommend its use in brood-frames in preference to putting wire in by hand?
2. Do you recommend painting hives both inside and outside?

VIRGINIA.

ANSWERS.—1. I have never used it to any extent. If the work is well done there can be hardly any choice of the two ways. Either makes good work. But foundation splints make better.

2. Not inside in any case. If I lived in a village with hives in full view of passers-by, I should paint them; not otherwise. I think they are a little better for the bees if left unpainted.

### Hive-Cleats—Deep Bottom-Boards—Refining Propolis.

1. In "Forty Years Among the Bees" you advise nailing a cleat at the rabbit ends of the hive. Do you nail it flush with the top of the hive? If so, do you use a special cover, or could it be placed so as to use an excelsior cover?

2. Would you also use a deep bottom-board for the 10-frame hive?

3. How can I refine propolis and separate it from wax? Does it lose its aroma when boiled in water?

4. I can not use a dummy the size you recommend with staple-spaced frames. Do you use staples on the frame next to the follower?

5. About how much would you pay to have 100 supers scraped of propolis—8-frame supers with fence separators? Also, how much would you pay to have 50 8-frame bottom-boards made of second-growth pine, complete, such as you recommend in your book?

NEW YORK.

ANSWERS.—1. Yes, the cleat comes flush to the top of the hive. It can be used with any cover that is flat on the under side, but not with

a cover that has projections below the under surface at the ends, unless the cover is made enough longer to make up for the cleats. In any case I prefer a cover entirely flat on the underside. Quicker to handle in putting on.

2. Most certainly.

3. I don't know how to refine propolis. I have separated propolis and wax by putting it in a dripping-pan in the oven and pouring off the wax; but it doesn't make a perfect job. One would think it would work to boil in water. Boiling water doesn't seem to hurt the aroma of propolis.

4. Yes, the frame next the follower or dummy is just the same as all the rest with staples—no, not staples but nails—on one end of the frame next the dummy, and there's plenty of room for the dummy. I suspect you have 10-frame hives made too narrow to take a dummy, as a good many are made. That's an invention of the—well, I don't know whose notion it is; but something ought to happen to him for getting up a thing so difficult to use. Rather than to use self-spacing frames without a dummy, I'd go back to loose-banging frames, and I'd feel very sad to give up self-spacing frames. If I had a 10-frame hive too narrow to admit a dummy easily, I think I'd use only 9 frames and a dummy.

5. Sorry to say I don't find a record of cost of bottom-boards; perhaps about 20 cents each. To scrape such supers and separators I'd give \$1.50 a day, and I don't know how many would be done in a day.

**Preventing Afterswarms.**

After the first swarm is out, and as soon as I can hear a queen pipe the seventh or eighth day, is it safe then to destroy all queen-cells, and will the colony have a queen hatched? I don't want my bees to swarm more than once.

MINNESOTA.

ANSWER.—Yes, it is entirely safe to destroy all queen-cells as soon as you hear piping, and you may then be reasonably certain that swarming for that colony is all over for the year.

**Miller Frame—Deep Hive—Bottom—Latham Hive, Etc.**

I kept bees 15 or 20 years ago in the original Langstroth hive, with single bottom nailed to the hive. I am 66 years of age, live in Will Co., Ill., and will start anew, keeping just a few colonies to employ my time partly, produce enough honey for my family, and a little to give away to my friends.

As I have not studied bee-keeping the last 20 years, in reading the American Bee Journal I find so many new things that I do not understand. One is the double bottom-board, as you describe it on page 89. Is this double bottom fastened to the hive, or does the hive simply rest on it loose? What is the object of it being double when it is open on the end? It can not be for a dead-air space beneath the hive. I would like a direct answer to the following questions:

1. In what respects does the Miller frame differ from the Langstroth frame and the staple-spaced frame?

2. Dummy frames—their construction and use.

3. The double bottom-board mentioned on page 89—its benefits over the single bottom.

4. Your opinion of the Latham hive for comb honey as described on pages 21 and 37—also as to the crosswise, closed-ends-to-bottom frames.

ILLINOIS.

ANSWERS.—1. The Miller frame is only one form of the Langstroth frame. It differs from most other frames in that top, bottom, and end-bars are all the same width, 1 1/4, and the frames are spaced apart by means of four heavy 1 1/4-inch wire-nails with heads about 3-16 of an inch across, the nails being driven in so as to project 1/4 inch. It is easy to drive them in the exact depth by having a hardwood stick 1/4-inch thick held close beside the nail when it is driven. A nail is driven into each end of the top-bar on opposite sides about 1/4 inch from the top, and 1 1/4 inches from the extreme end; and into each end-bar a like nail is driven 2 1/4 inches from the lower end. Hold up the frame before you, and the two nails on the right end of the frame will be on the side of the frame from you, and at the left end on the side toward you.

2. Take a top-bar and nail on a board so that the length of the board is the same as the length of a frame, and the depth of top-bar and all the same as the depth of frame, top-bar and all. That's your dummy. It may be an inch thick, or anything less down to 1/4 inch. It is used to fill up any space desired, and especially at one side of a hive. If no dummy is in the hive it is hard work to get out the first frame if the frames are self-spacing or fixed-distance frames. If there is a space filled with a dummy at one side, it is easy to take out the dummy, and then easy to take out any desired frame.

3. I think you will not find a double bottom-board mentioned on page 89, only a deep one. The advantage of that 2-inch space under the bottom-bars is that in winter there is no danger of its being clogged with dead bees, and in the cellar it allows full ventilation.

4. I do not think I should like it. Frames running parallel to the entrance have been in common use in Europe, but they seem to be now favoring what is called the "cold arrangement", as commonly used in this country. The "warm arrangement" is a step backward.

**When to Put Bees Out of the Cellar.**

I have 5 colonies of bees in the cellar wintering on sugar syrup. The mercury ranges from 30 to 36 degrees above zero. How early will it do to put them out? I want to feed them a little each day and start brood-rearing as early as possible.

CONNECTICUT.

ANSWER.—Don't bring them out to stay out till red or soft maples are in bloom, and not then unless it has quite the appearance of settled weather. If, however, you are anxious to do so, they could be brought out on a warm day in the first part of March for a flight, and then taken back in the evening.

If you had asked whether it was desirable to start bees brood-rearing as early as possible, I should have advised not to be in too much of a hurry; but as you haven't asked I'll say nothing about it.

**Every Band in the Land**

Every man in the band and everybody that blows a horn ought to know about the "Crown Model"—King of Band Instruments—guaranteed for 5 years—sent on 6 days' trial, one instrument or full set. They are the finest instruments made, magnificent in design and finish, incomparable in tone and tone, representing the highest achievement of artistic skill and musical perfection, most perfect valve action known, unequalled for ease of blowing. As sole makers of this line of band instruments we stand back of every claim we make for it, and allow 6 days' trial that you may know just what you are getting for your money. Ask for illustrated catalogue. Our immense stock comprises all the better makes of Band Instruments, and if you do not want our "Crown Model" we'd like to give you figures on some other line before you buy. "Everything Musical"—in business 20 years—means that we can save you money on anything and everything in the music line. **SECOND-HAND** list fairly bristles with bargains of every sort of musical instruments, made like new again. If you don't want new this list may have just the thing for you. Ask for the list to-day and any other information or catalogues that you may desire. We'll be prompt; we want to serve you in all of your musical needs. Address

H. E. McMILLIN,  
108 Superior St.,  
Cleveland, Ohio

# SALZER'S SEEDS

**Beardless Barley**  
The barley of your dreams; no beards; easy to harvest; always big yielding. Mr. Wells, of Orleans Co., N.Y., threshed 121 bu. per acre. You can beat this in 1905 if you try.

**National Oats**  
The marvel and wonder in oats. Will yield for you on your own farm from 150 to 300 bu. in 1905. Try it.

**Billion Dollar Grass and Tensintie**  
The two greatest forage plants of the century. Billion Dollar Grass will produce 12 tons of magnificent hay and Tensintie 80 tons of green fodder per acre. Catalog tells about it.

**Look At These Yields**  
Speltz, 80 bu. grain per acre, and 4 tons of hay besides.  
Monroal Wheat, Rust Proof, 80 bu.  
Victoria Rape, 40 tons of green food per acre.  
Pea Oat, 35 tons.  
Earliest Sweet Cane, 60 tons green food.  
Potatoes, 800 bu. per acre.

Now such prodigal yields pay. You always get them when planting Salzer's Seeds.

**Onion Seed 60c**  
a pound, and other vegetable seeds just as low. We are the largest Vegetable Seed growers in the world, operating 5000 acres.

**\$10.00 for 10c**  
We wish you to try our great Farm Seeds, hence offer to send you a lot of Farm Seed Samples, fully worth \$10.00 to get a start, together with our great seed catalog, all for but 10c. postage, if you mention this paper.

**John A. Salzer Seed Co. LA CROSSE WIS.**

## FOR SALE.

250 Colonies of Italian Bees, with everything belonging to a first-class apiary, in one of the best localities in the State. 1903 crop over 40,000 pounds. Address,

**N. STAININGER, Denison, Iowa.**  
9Atf Mention Bee Journal when writing.

### For Queens

SEND TO **JOHN W. PHARR** Berclair, Tex.  
He will furnish at same prices as last year: Tested, \$1; Untested, 75c; 5 for \$3.25; 10 for \$6; 15 for \$8.25; 25 for \$12.50; 100 for \$45. He breeds Golden, Carniolans and 3-Band Italians. Also 1, 2, and 3 frame Nuclei, and full colonies. Prices given on application. Pharr pays the freight, and guarantees satisfaction on all Queens. To do justice and judgment is more acceptable with the Lord than sacrifice. —(Prov. 3: 21.) 6Atf

**RED RIVER VALLEY EARLY OHIO,**  
grown in the cold Northwest, are unsurpassed in vigor and in early maturity. Old's pure select seed is the best that can be obtained. Very large stock in store. Prices reasonable. Send postal for Common Sense Catalog of All Leading Varieties Potatoes, Corn, Oats, Barley, Grass Seeds, Garden Seeds, Etc.  
**L. L. Olds Seed Co., Drawer G, Clinton, Wis.**

## Reports and Experiences

### Selling Honey in the Home Market.

I have not the slightest trouble in selling all my honey (extracted) at 15 cents per pound in the home market. But it is fully ripened on the hive, and never a pound sold that is not first-class in every respect, and when I hear of a man who finds slow sale for his honey I think, "There is another man who sells unripe honey". I believe the stuff that some bee-keepers offer for sale is our worst enemy in regard to prices and demand.

Honey is the best thing to eat in this world, and it should not be disgraced in the way that some of it is. It is just as necessary to enact laws to stop the sale of unripe honey as it is to stop adulteration of honey. Offering for sale poor, unripe, thin stuff hurts the sale of honey more than anything else combined. Buyers sample it, and think that if that is

real honey they do not see that it is so very good after all, and conclude not to buy any, when, if it had been good, ripe honey it would have helped instead of hindered the demand.  
Boone Co., Nebr., Jan. 31. W. H. MILLS.

**Worker and Drone Eggs—Foul Brood—Bee-Paralysis.**

I have had a few colonies of bees, off and on, for many years. When I got a good start I would sell them, then later get the bee-fever again, buy a few colonies, etc. But a year ago I decided to go into it and stay by it. So I bought 124 colonies from a bee-keeper, also his extractor and all the supplies he had on hand. He had the bees all put away for winter, and assured me that they were all right. I did not go near them until spring, as I had other business to attend to, but when I got ready to put them out I found them all starved to death but 17 colonies, and they were in bad condition. But I stuck to it,

doing the best I could with what I had. I increased to 35 colonies and sold about \$125 worth of honey.

I am wintering them in a house above ground, and they seem to be all right. I put them into winter quarters the first week in November, and they will not see daylight until April.

I watch for all the answers to questions in the Bee Journal with great interest, trying to learn something. But the things that puzzle me seem to puzzle old experts, too.

I supposed there was no difference between a worker-egg and a drone-egg, and that a worker or a drone could be produced from any kind of an egg, as I know a queen is produced from a worker-egg.

I had a case or two of what I think was foul brood last summer. I think it was caused by the brood being scalded or overheated. I had to put them in a sheltered place to keep off

# Ahead of Shook - Swarming!

The March Review is now in course of preparation, and will be out about the middle of the month. One article in this issue will be by H. G. Sibbald, of Canada, and he will describe a new system of management that promises to be away ahead of shook-swarming. It has these advantages: No shaking of the bees; no handling of the brood; no possibility of the queen being in the wrong hive; no danger of after-swarming; no increase unless desired (but easy to secure if wanted); no queen-cells to hunt up and destroy; yet the whole force of bees may be kept together the whole season, and each

colony may be requeened with a queen from a naturally-built cell.

This is only a single article in one issue of the Review, but it is a fair sample of the information that you are losing if you don't read the Review, and what you will gain if you do read it. Send \$1.00 for the Review for 1905, or, if you prefer, send 10 cents, and when the March issue is out a copy will be sent you, and the 10 cents may apply on any subscription sent in during the year.

## The Cause of Low Prices.

We are located in the center of the lumber manufacturing district. Nature furnishes us power at a nominal cost (St. Anthony Falls). Our shipping facilities are unlimited; our machines are of the most modern type, running at a high rate of speed, capable of turning out the largest quantities per day.

We save freight on our raw material and save on fuel and labor, consequently are able to sell at a less price than would be possible otherwise.

The quality of our products is standard, and guaranteed to be such. Money back if not satisfied.

maker is generally supposed to understand how to handle tools, but give him an order to make a hive and see if it will be satisfactory. Exactness of measurement beyond that to which he is accustomed is demanded in the making of a hive."

This part of the reply is what is misleading. I am an old-time cabinet-maker, and wish to say for all time to come that a cabinet-maker must know how to use tools, and, more than that, he must have a practical use of them. Don't say "exactness of measurements beyond that to which he is accustomed". It is not correct.

I will give you a true illustration by giving you what is a fact:

When working in the shop I made a bureau, and when it was finished the "boss" came to inspect the job. After taking a long look he started away, but turned his head for another glance, saying, "Why, you have put the locks all on the bottom of the drawers, and worked key-holes at that". We went back to take another look. "Oh", said I, "I left the drawers upside down and then turned them over, and they fit as well one way as the other, and you can pull the drawers out without a hitch with one pull, and can push them in with one thumb on either corner, and when one end is in so is the other".

But the factory-made furniture has run us out of business, even if we can get lumber much cheaper than the factories. And I say no man can afford to make his own hives, no matter how cheap he can get his lumber—even if he can get it for nothing—if he can get anything to do of any kind at wages of 75 cents per day and board, or \$1.00 per day and board himself. Not because he can not work close enough, but because hand-labor is too slow, and the more accurate the work the slower. This is where the machinery makes the gain, for the faster it turns out the work the nicer the job.

B. W. FISHER.  
Barhour Co., W. Va., Feb. 11.

### CONVENTION NOTICE.

Utah.—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same.

## Honey and Beeswax

CHICAGO, Feb. 20.—Honey-business is not too brisk and consequently prices are none too firm. A good deal of pressure is being made by producers as well as dealers upon their correspondents to move consignments. Fancy grades of white comb bring 12½@13c; No. 1, about 12c, with some desirable at 11c. Extracted, 6@7c for white, 5½@6½c for amber, the price being governed by quality, flavor and package. Beeswax, 30c, if clean and of good color.

R. A. BURNETT & CO.

BOSTON, Feb. 23.—On account of the very light demand, stocks of comb honey continue to accumulate, causing a weaker market. Fancy white, 15c; No. 1, 14c. Extracted, 6@8c, according to quality. BLAKE, SCOTT & LEE.

KANSAS CITY, Feb. 20.—The honey market at present is very low, the best comb stock selling at \$2.00 per case of 24 sections, with absolutely no demand for amber or the cheaper grades. Extracted honey selling from 4½@6½c, according to the quality of the stock. Beeswax in good demand at 28c. C. C. CLEMONS & CO.

CINCINNATI, O., Feb. 20.—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7½@8 cents; amber, in barrels, 5½@5½c; in cans, 6@6½c. Beeswax, 27c. C. H. W. WEBER

PHILADELPHIA, Feb. 20.—On account of the very bad weather the sales among the retail trade in honey have been slow. Quite a good many shipments have been arriving from distant points and the market at the present time is overstocked. We quote: Fancy white comb, 15@16c; No. 1, 13@14c; amber, 12c. Extracted, white, 6½@7c; amber, 6c. Beeswax, 27c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

CINCINNATI, Feb. 17.—The demand for honey at the present time is like business—frozen. Nevertheless, we are looking forward to a brighter future. We quote amber extracted honey in barrels and cans at 6@6½c, respectively; white clover at 7@8c.

The conditions of the comb honey market are aught but encouraging, owing to the vast amount of Western comb honey that is being consigned at almost any price. We quote fancy white at 12@13c, with but few sales. Beeswax, 27c. THE FRED W. MUTH CO.

## C. H. W. WEBER CINCINNATI OHIO

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

ALBANY, N. Y., Feb. 8.—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

SAN FRANCISCO, Feb. 16.—White comb, 1-1b. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 2½@30c; dark, 27@28c.

There is a moderate movement on local account and some small shipments are being made outward. Values are without quotable change, but dealers are desirous of reducing holdings and market is favorable to buyers, especially for other than most select. A carload of comb honey arrived from Nevada.

NEW YORK, Feb. 8.—The market is decidedly dull on comb honey and very little moving, with plentiful supply. We quote: Fancy white comb, 14c; No. 1, 13c; amber, 11c; dark, 9@10c. Extracted honey is in fair demand, and prices remain about the same. Beeswax steady and in good demand, 29c. HILDRETH & SEIGELKEN.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. THE A. I. Root Co. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

We trust the same will be continued to our successors in the business.

GEORGE W. YORK & Co.  
Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of **GLEANINGS IN BEE CULTURE**. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"**Facts About Bees**", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE.

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything **JUST RIGHT**, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

Address all Orders, Remittances, Inquiries, etc., to

**THE A. I. ROOT CO., 144 East Erie Street, Chicago, Ill.**

## Miscellaneous News \* Items

The Ontario Convention Report was crowded out of last week's number of the American Bee Journal, and also again this week. But next week we expect to issue another double number in which we will complete that report, and also publish much other interesting matter.

The Michigan Convention was held in Grand Rapids Feb. 23 and 24, and we had the pleasure of being present. While the attendance was not as large as anticipated, it was a splendid meeting in many ways. It was another proof of the value of the question-box program. Among others who are well known to the reading bee-keeping public, there were present T. F. Bingham, W. D. Soper, L. C. and A. G. Woodman, E. D. Townsend, and Huber H. Root (of Ohio); also these who were elected as officers for the ensuing year: President, W. Z. Hutchinson; Vice-President, Geo. E. Hilton; and Secretary-Treasurer, E. B. Tyrrell, of Davison. We expect to publish a report of the meeting a little later in these columns.

The Fourth Annual Report of the Illinois State Bee-Keepers' Association will be issued some time in April—next month. It will contain full reports of the last meetings of both the Illinois State and the Chicago-Northwestern conventions; information on foul brood and other diseases of bees, and how to treat same; also a list of the names and addresses of the membership of the Illinois Association which numbers almost 200 members. Any Illinois bee-keeper who wishes to have his name and address in the forthcoming report, should send his dollar to the Secretary, Jas. A. Stone, Route 4, Springfield, Ill., before April 1. This dollar will also pay a year's membership in the National Bee-Keepers' Association. Better attend to this at once, Illinois Bee-Keeper, and help yourself as well as the two Associations mentioned.

Result of the National Election of Officers.—February 27 we received the following from W. F. Marks, chairman of the Board of Directors of the National Bee-Keepers' Association, but it came too late for publication last week:

To the Members of the National Bee-Keepers' Association:—

The chairman of the Board of Directors is in receipt of a letter from Mrs. Geo. W. Brodbeck, dated Feb. 11, 1905, announcing the death of her husband, Secretary Geo. W. Brodbeck, and inclosing the following result of the ballot taken last November for officers of the National Bee-Keepers' Association:

The whole number of votes cast for President was 355, of which J. U. Harris received 232, C. P. Dadant 89, Dr. C. C. Miller 11, G. W. York 4, G. W. Brodbeck 2, N. E. France 2, E. R. Root 2, and the following 1 each: Secor, Cook, Stone, Aikin, Benton, Hutchinson, Hannegan, McIntyre, Harren, Abbot, Grenner, Lovesy, Toepperwein.

The whole number of votes cast for Vice-President 355, C. P. Dadant received 251, J. F. McIntyre 46, J. U. Harris 9, G. M. Doolittle 7, Dr. C. C. Miller 5, E. T. Abbott 5, G. W. York 4, G. W. Brodbeck 4, M. A. Gill 3, W. Z. Hutchinson 3, Muth 2, Hershiser 2, Pennington 2,

Duff 2, Akslin, Marks, Hull, Moore, Cook, Lovesy, Hyde, Nebel, Hambaugh, E. R. Root 1 each.

The whole number of votes cast for Secretary was 359, of which W. Z. Hutchinson received 203, G. W. Brodbeck 95, G. W. York 23, W. H. Laws 15, E. T. Abbott 4, L. Scholl 3, F. E. Brown 3, France 2, and Hide, Moore, Dadant, Doolittle, Niver, Hyde, Miller, Loveland, Dallant, Kate V. Austin, E. R. Root 1 each.

The whole number of votes cast for General Manager was 349; N. E. France received 336, L. F. Scholl 4, R. L. Taylor 3, C. P. Dadant 2, G. W. York, W. Z. Hutchinson, E. T. Abbott, O. O. Poppleton 1 each.

The whole number of votes cast for Director to succeed E. Whitcomb was 165; E. Whitcomb received 100, H. H. Hyde 26, F. Muth 5, N. E. France 5, H. E. Hill 3, M. A. Gill 3, E. T. Abbott 3, W. S. Cogshall 2, C. H. Webber 2, J. H. Havistin 2, and H. Lathrop, E. D. Townsend, Eugene Secor, J. F. McIntyre, L. Scholl, Ed Bevins, J. Heddon, U. Toepperwein, C. A. Thompson, A. I. Root, G. W. York 1 each.

The whole number of votes for Director to succeed W. Z. Hutchinson was 256; R. L. Taylor received 102, W. Z. Hutchinson 83, G. W.

## Special Announcement.

Although I have stated the fact twice (pages 116 and 164) that on Feb. 1, 1905, I sold all my interest in The York Honey Co. to Mr. H. M. Arnd, there seem to be some of the readers of the American Bee Journal who either have not read the two notices referred to, or else do not place credence in them. Let me say as plainly as possible, that neither the writer nor the American Bee Journal is now connected with the handling of honey or bee-keepers' supplies. Of course as editor and publisher of the American Bee Journal, I shall continue to encourage the production, use and sale of both honey and bee-keepers' supplies, for I believe that bee-keeping is but in its infancy, and that there are great possibilities in it which will be developed as time goes on. And it will be my constant aim to help advance the interests of all concerned, through the columns of the American Bee Journal, in the future as in the past.

Thanking the thousands who have helped make the American Bee Journal what it is to-day, and soliciting a continuance of their hearty support, I am

Yours for good bee-literature,

GEORGE W. YORK.

Chicago, Ill., March 1, 1905.

Brodbeck 18, J. L. Smith 8, M. A. Gill 7, H. E. Hyde 4, C. P. Dadant 4, G. W. York 3, Ernest Root 3, Eugene Secor 3, and Geo. E. Dudley. R. C. Aikin, Hershiser, Cook, Abbott, Poppleton, Barge 2 each, Kretchum, A. I. Root, Mrs. N. J. Stow, E. B. Tyrrel, W. S. Hart, P. H. Elwood, J. U. Harris 1 each.

The whole number of votes cast for Director to succeed Udo Toepperwein was 311; Udo Toepperwein received 189, E. S. Lovesy 50, H. H. Hyde 24, F. Laten 6, Dr. Miller 5, J. F. McIntyre 4, H. E. Hill 4, H.

Mendleson 4, F. Benton 4, W. H. Laws 4, O. L. Hershiser 3, F. L. Aften, Chas. Stewart, F. E. Brown, E. T. Abbott, N. L. Stevens 2 each; M. Rorig, J. L. Smith, T. E. Fisk, R. L. Taylor 1 each.

J. U. Harris having received a plurality of the votes cast for President was elected President.

C. P. Dadant having received a plurality of the votes cast for Vice-President was elected Vice-President.

W. Z. Hutchinson having received a plurality of the votes cast for Secretary was elected Secretary.

N. E. France having received a plurality of the votes cast for General Manager was elected General Manager.

E. Whitcomb, R. L. Taylor, and Udo Toepperwein having received the greatest number of votes for Directors, to succeed those whose terms expired, were elected Directors.

The result of this ballot should have been declared last December, but owing to the fatal illness of Secretary Brodbeck it has been delayed.

W. F. MARKS,  
Chairman Board of Directors National Bee-Keepers' Association.  
Feb. 23, 1905.

John A. Martin, of Delta Co., Colo., called on us recently. He has been keeping bees with his father for some years, and the elder Martin has been a reader of the American Bee Journal for many years. They are in an irrigated alfalfa country, and in good seasons their bees turn out considerable honey.

**To Illinois Bee-Keepers.**—Secretary Jas. A. Stone, of the Illinois Bee-Keepers' Association, sends us the following as another part of the Bill published on page 116 (it having been divided), requesting us to publish it, and at the same time desires us to urge every bee-keeper in this State to write his senator and representatives now in Springfield, Ill., to be sure to support and vote for the bee-keepers' Bills:

#### A BILL.

For an Act providing for the appointment of a State Inspector of Apiaries, and prescribing his powers and duties.

Sec. 1.—Be it enacted by the People of the State of Illinois, represented in the General Assembly: That the Governor, by and with the advice and consent of the Senate, shall appoint a State Inspector of Apiaries, who shall hold his office for the term of two years and until his successor is appointed and qualified.

Sec. 2.—Said Inspector shall, when notified of the existence of the disease known as foul brood among apiaries, examine all such as are so reported, and all others in the same locality, and ascertain whether or not such disease exists, and if satisfied of its existence, shall give the owner or the person who has the care of such apiaries full instructions as to the manner of treating them. In case the owner of a diseased apiary shall refuse to treat his bees, or allow them to be treated as directed by the said Inspector, then the said Inspector may burn all the colonies and all the comb necessary to prevent the spread of the disease, provided said Inspector shall, before burning, give one day's notice to the owner or other person who has the care of the colonies of bees and comb, that in his judgment should be burned.

Sec. 3.—The Inspector shall, on or before the second Monday of December in each calendar year, make a report to the Governor and also to the Illinois State Bee-Keepers' Association, stating the number of apiaries visited, the number of those diseased and treated, the number of colonies of bees destroyed, and of the expenses incurred in the performance of his duty.

Sec. 4.—Any owner of a diseased apiary, or appliances taken therefrom, who shall sell, barter, or give away any such apiary, appliance, or bees from such apiary, expose other bees to the danger of contracting such disease, or refuse to allow the Inspector of Apiaries to inspect such apiary, or appliances, shall be fined not less than fifty dollars nor more than one hundred dollars.

**To Missouri Bee-Keepers.**—Again the attention of the bee-keepers of Missouri is called to a matter which vitally affects their interests. Read what Mr. R. Holekamp, of St. Louis County, says in the following communication:

DEAR MR. YORK:—I returned last week from Jefferson City, where I appeared before the Committee of Agriculture of our Senate, to which our Apiary Bill had been referred. The committee reported the Bill favorably; it was engrossed the next day, and I expect it to pass the Senate and go to the House before the end of this week.

I intend to go to Jefferson City again, when the Bill is referred to the House Committee of Agriculture, and appear before that Committee.

Our Apiary Bill makes apiculture part of the Agricultural Department of our State (Missouri State Board of Agriculture), which is of immense advantage to our industry. Our State Board of Agriculture issues a bulletin about every one or two months, which is mailed for a year to any person asking for it, free of any expense. After the year has expired an inquiry comes, whether the bulletins are still desired, and if the answer is in the affirmative, the bulletins come again for a year, and so on. At the end of the year all bulletins are bound in one volume, together with the report of the Secretary, and are distributed free of charge.

In these bulletins a few pages could be devoted to apiculture, or special bulletins in apiculture be issued and distributed. These bulletins reach bee-keepers who never read a bee-paper. In this way the attention of the farmer bee-keeper can be called to the diseases of bees; he can be made familiar with the symptoms of the diseases, and

can be taught to treat them; he can be requested through these bulletins to report to the Board of Agriculture, or the Apiary Inspector, the appearance of foul brood or other diseases in his own or neighbors' apiaries. In this manner the Apiary Inspector can be kept informed where inspection and treatment is needed, and it will be possible to eradicate foul brood and other diseases of bees from Missouri.

The expense to the State in devoting part of the bulletins of the State Board of Agriculture to apiculture would be small, as these bulletins are mailed out as newspaper matter.

I have ascertained through circulars sent out by me, that foul brood exists in different parts of this State; it is in the east, in the west, in the north, in the south, and if bee-keepers are made familiar with the symptoms of the disease, it will be found that a good deal of the so-called "bad luck" of the farmer bee-keeper is caused by foul brood.

Now, bee-keepers of Missouri, those of you who have not already done so, I ask to write to the representative of your county when you read this; tell him to support the Apiary Bill; tell him we need it to keep our honey industry from ruin.

Our Legislature will be in session only a few weeks longer, therefore don't delay writing, but sit down right now and urge your representative to help push this Bill through. If these letters are showered on our representatives from all parts of Missouri, our Apiary Bill will become a law at this session of our Legislature.

Below will be found a copy of the Senate Bill, No. 268, as engrossed Feb. 21.

ROBT. A. HOLEKAMP,  
Assistant Secretary Missouri State Bee-Keepers' Association.

#### AN ACT.

To provide for the appointment of a State Inspector of Apiaries, and to regulate the duties thereof, providing a penalty for disposing of diseased honey or bees, with an emergency clause.

Be it enacted by the General Assembly of the State of Missouri as follows:

Sec. 1.—The State Board of Agriculture of the State of Missouri shall appoint a State Inspector of Apiaries to aid and assist in the development and protection of the honey industry in the State of Missouri, and especially for the eradication and control of infectious diseases known as foul brood, black brood, and bee-paralysis, some of which are known to exist at the present time among some of the apiaries of the State. Said Inspector of Apiaries shall be a practical apiarist, and shall give to the State Board of Agriculture, before his appointment, satisfactory evidence of his practical knowledge of handling bees, and of their diseases, and shall hold his office for the term of two years unless removed for cause.

Sec. 2.—Said Inspector shall, upon satisfactory evidence of the existence of the disease known as foul brood, or other infectious diseases among apiaries, examine such infected apiaries and all others in the same locality, and if satisfied of the existence of foul brood, or any other infectious disease, shall give to the owner or person having charge of any such apiary full instructions as to the manner of treating them. Within a reasonable time after making the first examination, the Inspector shall make a second examination, and if the conditions of any of the colonies affected are such as in his judgment render it necessary he may personally treat the disease, or, if in his opinion it is necessary to prevent further spread of the disease, and the owner refuses to treat them according to the instructions of said inspector, then the Inspector may burn or otherwise destroy diseased comb or other material that might cause the spread of the infection.

Sec. 3.—The Inspector shall make a full report to the Secretary of the Board of Agriculture at least once each year, stating the number of apiaries inspected, the number found to be diseased, and the number treated, and such other information as he may deem important. The Secretary of the Board of Agriculture shall publish in his Annual Report, or otherwise, such of the information as he deems of importance to the apiarists of the State.

Sec. 4.—Said Inspector shall receive four dollars for each day actually and necessarily spent in the performance of his duties, and shall be reimbursed for the money expended by him in defraying necessary traveling expenses: Provided, the total expenditure for such purposes shall not exceed one thousand dollars in any one year: Provided, further, that the said Inspector shall render to the Board of Agriculture an itemized account of his per diem and expenses, and upon approval of the same by the Executive Committee of the Board of Agriculture, the President and Secretary of the Board are authorized to draw a warrant upon any available funds for the amounts allowed.

Sec. 5.—Any owner of a diseased apiary, or any other person who shall knowingly sell, barter, or give away any colony of bees, honey or other article infected with disease, or expose other bees to the danger of contracting such disease, or refuse to allow the Apiary Inspector to inspect or treat such apiary, honey or other articles so infected shall be guilty of a misdemeanor, and shall be fined not less than five nor more than twenty-five dollars.

Sec. 6.—It being necessary to treat the diseases herein provided for in the early spring, in order that satisfactory results may be obtained, creates an emergency within the meaning of the constitution, and this Act shall go into force and effect upon its passage and approval.

**Notice to National Members.**—We have received the following from General Manager France, of the National Bee-Keepers' Association:

PLATTEVILLE, WIS., Feb. 6, 1905.

#### FINANCIAL AID.

Dr. Miller's motion, passed by vote of Directors: "That in case of litigation hereafter the financial aid extended by the National Bee-Keepers' Association shall not exceed the sum of one-half the expense

incurred in such case". It is not the object, expressed or implied, of the Association to aid the several States to prosecute their burglars or thieves. It is the duty of the commonwealth to prosecute criminals. Also collecting debts due our members, losses by fire or freight, or other personal grievances should not be referred to the Association for settlement. It has no such power to enforce civil law in the hands of officers there for such purposes. City ordinances declaring bees a nuisance, in most cases, are result of personal differences between neighbors. I, therefore, ask you to make neighborly calls frequently, and at times donate a little honey, and avoid trouble.

Make special effort to place your bees out of the cellar after wash-day, so clothes on lines will not be spotted. Our bees have no right to disturb people or stock in highways, or neighbors' premises. If you have never received a copy of my red-covered 37-page book on "Bee-Keepers' Legal Rights", free to every member, let me know and I will send it.

If you send me samples of suspected diseased brood by mail, be sure it is in a light but strong box, so it will stand transfers by mail. The same applies to samples of honey by mail.

N. E. FRANCE, *Gen. Mgr.*

**Why Not Advertise?**—Quite frequently we receive postal cards with requests like the following:

"I want to sell my bees. If you know any one who desires to buy, please refer him to me."

"I need a man to help me with my bees. If you know of any good bee-keeper wanting such place, tell him to write to me."

"I want to buy some bees. If you know of any for sale, let me know about them."

It seems a good many people do not yet know that our advertising columns are open to just such notices, and at the low rate of only 10 cents a line, one-half inch (or 7 lines) being the minimum space. This would cost only 70 cents. Isn't it worth that small sum to find a man to work in the apiary, or to sell your bees, or for any other business you want to do?

One of the ways of raising the necessary money to pay our office-help, to pay for white paper, for printing, office-rent, etc., is through the use of our advertising columns by those who wish to buy or sell, etc. We could not publish the American Bee Journal on subscription receipts alone, when we furnish 52 copies for only \$1.00. So we must depend upon our advertising receipts to help out. And the advertising columns are open to any and every legitimate and honorable advertiser.

## Contributed Special Articles

### Duties on Honey—The National Association.

BY C. P. DADANT.

I AM in receipt of letters on this question of duties on honey, from Mr. Frank Rauchfuss, secretary of the Colorado Honey-Producers' Association, and from Mr. Henry Reddert, secretary of the Southwestern Ohio and Hamilton County Bee-Keepers' Association.

Both writers mention the fact that comb honey from Cuba, of inferior quality, is now being sold in United States markets. Mr. Rauchfuss, while hoping for an increase in the tariff, says that if it were made compulsory upon importers and dealers in foreign honey to label it plainly with the country of its production, it would help matters a great deal, as Cuban honey is not so good as the honey produced here, and very much inferior to Colorado honey. The Ohio bee-keepers object to comb honey being imported on the same duty as paid for extracted honey. All ask what is to be done.

If the bee-keepers of this country desire an increase in the tariff, they can surely obtain it by going at it in the right way. It is, however, worth our while to take notice of the fact that duty is always a two-edged sword. American honey has often been exported. When California produced enormous crops, which she is likely to do again, the honey from the Pacific Coast flooded our markets and went to Europe. If we protect ourselves against the importation of an article which we produce largely and may want to export, it is quite likely that other countries will retaliate by putting duties upon our products in the same line. A duty on Cuban honey may protect us against Cuba, and, in the meantime, France or Germany may consider that as we are forcing Cuban honey to flow in their direction, it is necessary to retaliate by putting an interdiction on the importa-

tion of all American honey, whether from North or South America.

But if it is thought best by the bee-keepers of this country to obtain an increase of duty, it should be carried on in a practical manner. The National Bee-Keepers' Association has appointed a legislative committee, but such a committee has neither the right nor the power to act without instructions and backing. I believe that it is necessary that this matter be thoroughly discussed in the bee-papers.

I strongly favor the compelling of labeling imported honey with the mark of its origin. It is a fact that if all that is sold under the name of honey could be sold exactly for what it is, there would be no trouble in getting rid of all our product. If the tons of fine honey from Colorado were absolutely known by the consumer to be all pure honey from alfalfa (just what it is), it would all sell readily at good prices. If the glucose that has been mixed with extracted honey by unprincipled dealers was labeled just what it is, there would be but little of it on the market, because the demand for it would be killed. Cuban honey would never sell at a price to compare with our home product. I believe, therefore, that we should lay great stress on obtaining laws that will compel everything to be sold for what it really is.

The National Association is the proper channel through which all National reforms for bee-keepers should be secured, but just now the executive function is in bad shape, owing to the sickness and death of the secretary. Mr. Brodbeck was evidently between life and death several months previous to his demise, and the last election of officers has never been reported by him. Mr. France, the General Manager, has taken upon himself many of the duties of the secretary. It is now urgent that the Board of Directors should take steps towards the appointment of a new secretary, if the returns can not be had, for the National Association will become every day more necessary to the welfare of the pursuit in this country. The time has gone by when men fought their way through the world without association and union with their fellow laborers. Even in the most backward countries of Europe the need of union is being felt for success.

Hamilton Co., Ill.

### Honey and Pollen in Brood-Combs.

BY G. M. DOOLITTLE.

I AM quite often written to by those who think their bees store too much honey and pollen in the brood-combs, and at a bee-convention, some years ago, I heard a man say that he would give \$50 for a machine that would remove pollen from the combs without injuring them. And as a letter is just at hand containing these words, "Will you please tell me through the columns of the American Bee Journal why my bees store so much pollen and honey in the brood-combs just before the honey harvest?" I thought I would write a few words on the subject, believing that others may be helped as well as the one asking the above.

Two things generally incite to the storing of too much honey and pollen in the brood-combs at the beginning of the season, or as soon as the bees become numerous and active in May and June in this locality. The first is a poor queen, or one which will not lay enough eggs so that the increasing larva from those eggs will consume what honey and pollen is coming in from the fields. In other words, the old or field bees are too numerous for the laying capacity of the queen. The remedy in such a case as this is to change the queen for a younger and more prolific one. And such a change of queens is best made in the fall, for it is far better for a colony to have a prolific queen when spring opens than it is to try to introduce such a queen to take the place of a failing one early in the season.

The other thing inciting to the storing of too much honey and pollen in the brood-combs is too large a hive. If the hive is too large for the capacity of a really good queen, that colony is placed in nearly the same condition as is the one having a failing queen in a smaller brood-chamber, for if the season opens with any large amount of comb unoccupied with brood, the bees will begin storing in the empty comb in the hive rather than enter the sections to build comb there or draw out comb foundation. And having once commenced to store honey and pollen in any large quantities in the comb immediately surrounding the brood, the bees will continue along this line to the detriment of our crop of section honey, and often to the damaging of the wintering success of this same colony.

But even with a good, prolific queen, and a hive of the

right dimensions to accommodate her prolificness, it sometimes happens that the queen does not breed up to her full capacity when pollen is coming in freely. Just why queens do not breed sometimes when pollen is coming in very rapidly is a mystery I have never been able to solve, though I have spent much thought and study on the subject. The nearest I have come to the matter is that, for some reason, the bees fail to feed the queen on the stimulating food usually given at all times when she is laying very prolifically.

All observing bee-keepers know that when queens are laying at their best the bees give them food every few minutes, and many think this food is the same, or very nearly so, as that which is fed to the larvæ. But at these times, when the combs are being crowded about the brood-nest with pollen and honey, it is a rare thing that I find the bees feeding the queen. For this reason I have always felt that the fault lay with the bees rather than with the queen, and if any one can devise a plan or way whereby the bees can be caused to feed the queen abundantly at the time when brood is being crowded with honey and pollen, he will have the key to the situation, and be able to turn these things to a good account by causing them to be changed over into brood. But until such a plan has been devised, I will tell the reader how I treat these combs that happen to be filled with honey and pollen at times when it seems to be impossible to coax the bees and queen to work in harmony in turning these into brood at just the time the bee-keeper would wish them to.

The excess, if any, in pollen comes from hard maple, the same coming between the willow and apple bloom. At this time some colonies will fill combs almost solid full of pollen with more or less honey along the top edge of the frame, and I used to remove these combs at such times and put empty combs in their places, only to have them filled again in two or three days. Finding that I did not gain much here, I next put in dummies in place of the frames taken out, and when the sections were on, this would throw a greater force of bees into them, and thus as soon as any honey came from the fields it would go into the sections and remove the honey part of the pressure from the brood-combs. But, still later on with the advent of comb foundation, I would simply shove these combs of pollen and honey back toward the side of the hive, by removing an outside comb if necessary, and place a frame of comb foundation between the pollen and brood, and where honey enough was coming in from the fields to cause them to draw out this foundation the queen would fill it with eggs before the cells seemed deep enough for the bees to do such work at storing either pollen or honey in them, and thus I had brood where I should get only pollen and honey were I to put an empty comb in place of the foundation.

There is always something about drawing out foundation or building comb that sets the bees to feeding the queen more abundantly, and she in turn lays more vigorously than when no comb is built; and where combs can be drawn from foundation, or built from starters, there is usually no trouble in having them filled with brood; and where young brood is maturing rapidly much pollen is used, thus keeping the combs from becoming overloaded with pollen, and rearing a lot of bees for the harvest. But with me such large yields of pollen do not come more than once in two or three years, and when they come they do not last more than a week or ten days, after which the bees are generally anxious for brood; and what appeared as combs nearly spoiled because they were so full of pollen, very soon assumed a different aspect, and by the time the main honey harvest arrived there was little more pollen than was necessary in the hive.

Onondaga Co., N. Y.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

See Langstroth Book Offer on another page of this copy of the American Bee Journal.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### Increasing the Home Demand for Honey.

The Editor asks, "Why do not more families use honey? What can be done by bee-keepers to induce them to use it more than they do?"

I believe there is only one answer to the question, and that is the majority of bee-keepers must first produce and sell their honey differently than they do now. I believe they are largely in the fault why honey is not used more.

The bee-keeper must not be above his business, but sell his own honey in his own city or village. Many a man ships his honey when the people in his own town or neighborhood ought to be eating it, but because it is not brought to them and their attention called to it they do not use it.

People like good food to eat, and will buy and use good honey just as they will fresh eggs and the best butter, and will be steady customers of the one who brings it to them. The most important of all is that the honey be ripe; not extracted until it is all sealed over; for honey taken any other way will not build up a market on a firm foundation that will grow and enlarge with time.

We have worked up a market in this way, and created a demand for honey in our part of the city and country where there was none to speak of before we came here. We are not dependent upon commission men or grocery stores to sell our honey. They do not know how to keep it, nor how to create a demand for it—they sell only to the demand already created.

We are happy that we can supply people with so healthful and delicious a food. The one that comes for a dime's worth is waited upon as pleasantly and carefully as if he had bought a gallon. I feel it a privilege to tell any one the many uses of honey besides using it on the table. How they could make their own vinegar, at small cost, and know it was pure, instead of buying the adulterated stuff at the stores that never ought to be eaten.

We never tire of honey, but eat it every day in the year; yet we know of bee-keepers who do not save enough for their own use, but sell it at a lower price than they pay for sugar. Surely, such bee-keepers ought not to expect other people to use it. There are months at a time without a pound of sugar in our house. On account of honey being the most healthful, we use it in all places where sugar is used except making jelly.

Fruit canned in sage honey is delicious, and when I mention it to others they wonder that it can be used for that purpose. I use enough to make a thick syrup on the fruit. Satsuma plums are especially nice that way, and usually opened when we have company. They are of a beautiful blood-red color. I never have any fruit spoil, but use only ripe honey, that was all sealed over before extracting. Unripe honey would not keep the fruit.

The Germans are the best honey-buyers, and the ones most likely to use it for cooking. They probably learned to use it in their native country. People learn more readily to use honey on the table than for cooking, and unless the price is a little lower than sugar there will not be much inducement to use it, so long as the market abounds in unripe honey. Sugar is always the same quality, but honey, bought from the stores, is almost always different in quality and flavor. One time it may be white but thin; sometimes sour; next time may be thicker, but dark and strong. Often it is granulated. Few know how to liquefy it, or want to be to the trouble of doing it. And some I have met had supposed it was spoiled when in the granulated form. Most people prefer mild-flavored honey because they are used to sugar which has no flavor. At first some do not like the flavor of honey in cooking. I did not, but after years of using it I have learned to like the flavor. We are afraid to use sugar.

About nine years ago we thought we could increase the sale of our honey by putting a label on every section, jar and pail of honey we sold, stating it was "Pure Mountain Sage Honey", and our name and address so they would

know where to get more. We gave away hundreds of "honey cooking recipe" leaflets, but saw no increase in sales on that account. They probably regarded them the same as any other advertising leaflet. A part of the people do not read much. Another part do not heed if they do read. But the bee-keeper who retails his honey has a chance to educate all classes. Finally we dropped the extra labor of putting on the labels, as the honey was always sold by taste and did not seem to need them. Now I give the leaflets only to those who are interested sufficiently to use some of the recipes. The honey has always made the demand for the leaflets instead of the leaflets selling the honey.

Los Angeles Co., Calif. MRS. C. W. DAYTON.

Mrs. Dayton has given us many helpful suggestions in her very excellent letter. She tells what they have actually done, so she knows what she is talking about. If we all did as much as she has done about using honey for cooking, canning, etc., and trying to get others to use it, too, it surely would help materially in increasing the sales and prices of our honey. She says, "We are afraid to use sugar". Perhaps more of us ought to be afraid to use it, too. We might be if we were wiser.

No doubt she is right about people having to learn to like the flavor of honey in cooking. You know we have to learn to like many things we eat, and afterwards become very fond of. Why not the flavor of honey, especially if it is so much better for our health to use it?

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glaases.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

LOVELY AND LOVABLE CALIFORNIA.

Prof. Cook is evidently not like the homesick individual who talks up his locality to sell out and get away. His words about California are the words of a sincere lover—and not a new, love-at-first-sight lover either. Lovable climate, inspiringly lovable scenery, deliciously lovable fruits, fraternally lovable people—not so phlegmatic and unresponsive as people in other States—and once a Californian never long contented anywhere else. But I have a brother who has recently lived six years in California, and previous to that a number of years in the Magdalena Mountains of New Mexico, and I find the fascinations of the Magdalena stick to him more persistently than those of California do. Page 37.

CROSSWISE FRAMES AND CLOSED ENDS.

So Allen Latham thinks crosswise frames and closed ends are a pair that should go together, or not at all. Will not be very hard to agree on that—because, you see, most of us will take the second alternative. And while sitting on this contrary horn some of us would ask him whether he believes that story he told on three generations of our ancestors carrying stones on a horse's back to balance corn. I suppose, he sits waiting for us to answer the question, Why not tilt our dwellings forward to keep the rain from driving in under the front door? Tolerably pert question that—even if his deductions are not any more correct than his stories. Page 37.

SHEEP IN THE APIARY.

It's quite a few years since I have had sheep within constant eye-shot, but it doesn't seem to me that they are much given to rubbing. So, Dr. Miller, I would suggest that their badness in moving hives comes not from rubbing but from their inclination to crowd one another. Whole flock, be it little or big, makes a "flying wedge" of itself. A sheep on one side, and toward the front, gets caught against the side of the hive, and then both sheep and hive are pushed sidewise by the joint force of the flock. Even when there are but three, two may get the third one fast and hold it until its struggles do mischief. Page 40.

APICULTURE IN THE DEPARTMENT OF AGRICULTURE.

Bad blood, cross purpose, personal ends, and queer statements—hardly worth while to afterthink them a great deal, if we can only leave them behind us effectively. How much apiculture has suffered from them! Mr. Benton's very valuable paper (page 41 and page 57) reminds of that once more—and happily does us some much better job, also.

Nice that it's the "nater of things" to grow! Entomology, which includes Apiculture, at Washington, not so very long ago was only a chair with one sitter—and he not a cent to use in any investigation under the sun. Entomology had the man; and Apiculture's share in the business was some interest and hope the man had toward it. "And she grows, and she grows," and after awhile we see two or more men. All were at work at Entomology; but one of them had,

in addition to interest and hope, an excellent knowledge of bees. "And she grows, and she grows," and after awhile one man experiments, in a clandestine sort of way. He didn't do this with U. S. bees, for there were none, but with his own bees. "And she grows, and she grows," and at length (in a sporadic, "now you see it, and now you don't" sort of way) a modest appropriation comes just for once. "And she grows, and she grows," and as a finality Apiculture is now expected to have some money to work with every year. The chair has grown a Bureau; and the set of notions in the sitter's head has grown a Division of the Bureau.

CAUCASIAN RACE OF BEES.

And so the Caucasian bees are to have the first place on the stage in Uncle Sam's own apiary. Soon we shall have official knowledge of what their wonderful disinclination to sting amounts to, and whether their troublesome forwardness to swarm makes them undesirable when in the hands of a competent man. Page 58.

GIANT BEES AND THE PHILIPPINES.

When Mr. Benton went after the giant bees he didn't quite fetch 'em. But, that memorable first of May, Dewey, he fetched 'em. Now it's our duty, don't you see, to benevolently assimilate our new millions into the comforts and sweetnesses of Apiculture. So, when things grow a little more, it will be one of the simplest outcomes to have a U. S. branch apiary on Mindanno or Palawan, or some other island, and learn a heap of things about wax-culture with the giant bees. And then we must induct the much enduring Filipino into a new and profitable business—a business hopefully suitable for lazy folks like he'uns and we'uns. Page 59.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

Difficulties in Answering Questions.

In attempting to make reply to questions coming from so many different sources, and covering almost the whole ground of bee-culture, one can not feel the limitation of one's knowledge, and entertain some degree of fear lest harm be done by giving wrong replies. So it is a comfort to know that sharp eyes are upon this department, and that little error is likely to appear without being brought to light by some good friend.

It is not entirely clear to me, however, that there is anything incorrect in the reply on page 40, to which Allen Latham takes exception, page 126. Mr. Latham says:

"If it were late in the fall it would, indeed, be best to give the full comb of honey; but the question reads otherwise."

The question does not definitely state that fall or winter feeding is meant, but the question coming in January, and referring to no earlier period of feeding than "late summer", when bees were robbing, I felt warranted in understanding it to mean when brood-rearing had ceased. It hardly seemed necessary to give the caution not to destroy brood. Even if brood were present, it would be all right to give a comb of honey, and if it were desired to aid the nucleus with brood a comb of honey containing brood could be given. Candy is not advised to keep up brood-rearing, nor was it so intended.

Mr. Latham expects his nuclei to be ahead of his full colonies in swarming. Probably few can succeed so well with one-frame observatory hives. C. C. MILLER.

Highbarger's Record of Queens.

Referring to the sample given from record-book, page 121, L. Highbarger writes me his plan of keeping record. He says:

"A lath-nail driven in slightly at the entrance of the hive at the left hand side shows that there is present an unclipped queen. Driven in at the center it shows a clipped queen one year old. At the right, with another nail added, it shows that the queen is clipped and two years old, and that is as old as I care to keep queens.

"If you should come into my yard, I can give you the age of every queen, and tell whether clipped or not, merely by glancing at the nails. So when I go to clipping I don't need to open any hive except those with the one nail at the left. Of course, I have to look out for superseding."

A reference to page 121 will show that the nails would save the entry "03" in one place and "q cl" in another, but that is all. The remainder of the record would still be needed, and needed not at the hive, but in a book where I can look it up while lying on a lounge in the house or on the way to an out-apiary, or even ten years afterward. Neither would the nails aid me at the spring clipping (the one time in the year when a business of clipping is made), for without looking in the hive there's no way of telling whether the queen has been superseded or not.

For those, however, who do not care for other records, and want a quick way of knowing something about the queen in each hive, Mr.

Highbarger's method commends itself by its simplicity and convenience.

This gives me opportunity to mention an omission on page 121, probably due to the lack of anything within reach of the typesetter that would make the right character. June 13 the first super was given, and the blank left by the printer at that place should be filled with a plain square.

C. C. MILLER.

### Size of 10-Frame Langstroth Hive.

What is the size of a 10-frame Langstroth hive, with plenty of room for a dummy?

ANSWER.— $18\frac{1}{4} \times 10\frac{1}{2} \times 14\frac{1}{2}$ , inside measure.

### Shipping Bees.

We are about moving to Minnesota, and have 6 colonies of bees which we would like to take with us. What is the best way to ship them?

ANSWER.—The important thing is to fasten hives in the car so they will not move. Put them in the car with the frames running parallel with the tracks. (In a wagon they should be crosswise.) If there is plenty of room, so that each hive can be on the car floor, nail cleats an inch thick onto the floor so as to hold the hives in place. If they have to be piled up, then a board from one side to the other may brace them. Have them at the end rather than the middle of the car. At this time of year a good-sized entrance closed with wire-cloth will give air enough, but in warmer weather more ventilation will be needed. Make sure that everything is fastened securely so no bees shall leak out.

### Queens Mating More than Once—Dead Bees at the Hive-Entrance—Brood Dying in the Spring.

There is a rumor going the rounds that queens leave their hives to meet the drones after they have been mated successfully. Some very prominent apiarists insist that they have seen laying queens leave their hives the second time to meet the drone.

1. With your experience what importance, if any, do you attach to this matter?
2. If queens meet the drone more than once do you think this renders them more prolific than a single mating?
3. If by meeting the drone more than once queens become more prolific, will not the wing-clipper have to go?
4. Two colonies of equal strength, equal stores, queens equal in prolificness, packed exactly alike for winter, yet at the entrance of one ten times more dead bees are found than at the other. Why?
5. Will not some of the brood perish in the spring from natural causes?

KENTUCKY.

ANSWERS.—1. I do not know of any case in my own experience, yet that does not prove that there is no such thing as second mating. Others claim to have seen it.

2. Probably a queen that has mated twice is no better off than other queens.

3. Clipping has nothing to do in the case. A queen is not clipped till after she begins laying, and I think no one claims that a queen ever mates after beginning to lay.

4. There may be a material difference in the age of the workers, or some other difference not easily recognized.

5. If I understand your question correctly, I don't believe there ought to be death of brood in a normal colony in spring if everything is all right. When brood dies there is probably something wrong.

### Fastening Foundation—Stimulative Feeding—Making Hives.

I have been studying up some questions to see if I can stick Dr. Miller.

1. I have been putting foundation into a lot of frames, and having on hand plenty of good wax I have crossed the wires with quite a heavy layer of wax, and also have run some all along the inside of the frames, and allowed any that dropped on the frame or foundation to remain where it fell. Have I helped or hindered the bees?

2. In this State we are liable to have fine, warm weather early in the spring. Trees are all in bloom, grass growing, and everything as beautiful as can be. Then a fierce northwest wind comes along, and we have a freeze-up and perhaps snow—in fact, real winter weather in the summer. In such case what time would you begin to feed for stimulating?

3. In making hives (for Hoffman frames) I find that by making an 8-frame body just a little wider inside than standard width I can barely slip 9 frames in without a division-board, and that the sides of the hive will just hold the 9 frames snug together. Now, if one does not use a board in a 10-frame hive what is wrong with this 9-frame hive that can be used either under or above an ordinary dovetailed 8-frame hive?

NEBRASKA.

ANSWERS.—1. It's not so hard to stick me as you suppose, but if you would stick the wax that you used to stick on the wires upon little sticks such as I use, your foundation would stick in the right place just as satisfactorily and without leaving at the bottom a space for the bees to stick their heads through. However, the bees will probably

consider themselves helped rather than hindered by what you have done, provided you don't mind the time and wax used.

2. Very likely I wouldn't commence at all; I don't here. But if I did, it would probably be after the time of fruit-bloom.

3. The same thing that's wrong with a 10-frame hive with no division-board or dummy—too hard work to get out the first frame. If you don't want to get into the habit of using bad language, don't make more than one till you know how you like it.

### What is Honey?—Are Bees Wild or Domestic?—Do Bees Hatch More than Once?

I notice on page 89 that Dr. Miller hardly thinks all liquid sweets gathered and stored by bees could be called honey.

1. If liquid sweets as gathered by the bees, clarified or rectified, distilled and digested in their laboratory, and stored in waxen cells is not honey, what is it?

2. Do bees belong to the wild or domestic animals? Much depends upon this fact, for all know that domestic animals deteriorate by inbreeding, and wild animals retain their original perfection. We are inclined to believe they belong to the wild.

3. My attention has been called to the word "hatch". Do bees hatch more than once? Would it not be better to have bees hatch once, and emerge to come into existence?

ILLINOIS.

ANSWERS.—1. There is certainly a difference between a piece of comb filled with material gathered from clover blossoms and one filled with sugar syrup, no matter how much manipulated by the bees, and it is hardly to the interest of either the public or bee-keepers that the one filled with sugar syrup should be called honey. I don't know what is the best name for it—how would "sugar syrup" do?

2. They are considered wild when in hollow trees, etc., without any owner; domestic when in the possession of man.

Are you sure that all know that there is a distinct line between domestic and wild animals, making inbreeding wrong for the former and right for the latter?

3. You are quite right; it would be better to say that the larva "hatches" from the egg, and the young bee "emerges" from the cell. Indeed, you will find that quite often the word "emerges" is used in that way, although generally it is said that the young bee hatches out of the cell.

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

**BEE JOURNAL**  
PUBLISHED WEEKLY BY  
**GEORGE W. YORK & COMPANY**  
334 Dearborn Street, Chicago, Ill.

**IMPORTANT NOTICES.**

THE SUBSCRIPTION PRICE of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

THE WRAPPER-LABEL DATE indicates the end of the month to which your subscription is paid. For instance, "dec 4" on your label shows that it is paid to the end of December, 1904.

SUBSCRIPTION RECEIPTS.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

ADVERTISING RATES will be given upon application.

**National Bee-Keepers' Association**  
Objects of the Association.

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

Annual Membership Dues, \$1.00.  
General Manager and Treasurer—  
N. E. FRANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

**\$5.00 WORTH OF SEEDS FREE**

I want to get in touch with every buyer of seeds. My plan of giving \$5 worth of tested seeds free, is worth knowing. It includes a chance to make more dollars. Send for catalog and get packet of choice flower seeds FREE. A postal will do it.

**HENRY FIELD**  
Box 50  
Shenandoah, Ia.  
"The Ear-Seed-Corn Man."

**FOR SALE**

Several Hundred Cases  
**Nevada**  
**White Alfalfa Honey**

PRICE—7½ cents per pound, or \$9.00 per case of two 60-pound cans, f.o.b. Chicago. Two cases or more at 7 cents per pound. Write for special price on larger quantities. Guaranteed absolutely Pure. Sample, 10c.

**H. L. WEEMS,**

**Reports and Experiences**

**Bees Wintering Well.**

I have been in the bee-business for 25 years, and, at the present writing, have 52 colonies in good shape. I pulled through one nucleus, with an 18-below-zero freeze at that. I would like to tell the readers of the American Bee Journal some facts I have learned about bees if the Editor would be pleased to have me do so. **EVAN E. EDWARDS,**  
Madison Co., Ind., Feb. 27.

[Mr. Edwards, that is just what we want you and others to do—to send us interesting facts that have been learned in the management of bees. You are hereby invited to send in your share of those facts!—EDITOR.]

**Zero Weather in Kansas.**

We have had much zero weather lately, but it is now warmer and the snow is melting rapidly. The bees in my apiary seem to be safe so far, with abundant stores to last until warm weather. **G. BOHRER,**  
Rice Co., Kans., Feb. 16.

**Getting Bees Out of a Chimney—Feeding Bees.**

Two or three years ago my brother asked "Our Dr. Miller", at the Chicago convention, the question, "How can I get a colony of bees out of a chimney without removing a brick?" The Doctor answered somewhat like this: "I don't know; guess the best way would be to turn the chimney upside down and dump the bees out".

Well, that might have been the simplest way, if the Doctor could have sneezed a tune up the chimney the way he did it for that convention. But we had perfect success by another plan, and this is the way we did it:

We placed a hive-body on top of the chimney, leaving only one entrance in front of the hive; then placed two frames of comb containing dead bees and a little honey right over the opening in the chimney, closed the hive except the entrance, fastened it with

—ADDRESS—

**American Bee Journal,**  
334 Dearborn St., CHICAGO, ILL.

The American Bee Journal is in its 45th year.

**GOOD LUCK TO PLANTERS  
OF SALZER'S SEEDS**

**ALFALFA CLOVER**

We are headquarters for Alfalfa, the kind yielding 7 tons per acre; Salzer's Alsike Clover, hardy as oak, yielding 5 tons of magnificent hay per acre. We are the largest growers in the world of Mammoth Red Clover, of Crimson Clover, of June Clover, Timothy and all sorts and varieties of grasses.

**TEOSINTE AND BILLION DOLLAR GRASS**

Greatest green food on earth, yields 80 tons per acre, should be planted on every farm in America, enormously prolific. Billion Dollar Grass yields 7 to 14 tons hay per acre.

**SALZER'S NATIONAL OATS**

Greatest Oats of the century, yielding in forty States from 120 to 300 bushels per acre. Every farmer in America can have such yields in 1905. Salzer positively guarantees this. Often so strong, heavily laden stocks from one kernel of seed! That is the secret of its enormous yield. Straw strong, stiff, stands like a stone wall. Nothing ever seen like it before.

**HOME BUILDER CORN**

So named because 50 acres in 1902 produced so enormously that the product built a beautiful house. See Salzer's Catalog. It is the earliest, big-eared and heaviest Yellow Dent Corn on earth, yielding in Indiana, 157 bushels; in Ohio, 160 bushels; in Tenn., 198 bushels, and in Mich., 270 bushels.

**SPELTZ AND MACARONI WHEAT**

Speltz is the greatest cereal food on earth, yielding 80 bushels of grain and 4 tons of hay per acre. Macaroni Wheat, doing well on all soils, yielding 80 bushels per acre. Hanna Barley for arid, dry soils, yields 75 bushels per acre; and Salzer's Beardless Barley, 121 bushels.

**ONION SEED, 60c. A POUND**

Largest stocks of Vegetable Seed. Prices low!

**FOR 10c. IN POSTAGE STAMPS**

and the name of this paper, we will send you a lot of farm seed samples, fully worth \$10.00, to get a start, together with our mammoth 140 page brilliantly illustrated catalog, painted from nature, alone worth \$100.00 to every wide-awake farmer.

**JOHN A. SALZER SEED CO.  
LA CROSSE, WIS.**

wire, and left it undisturbed until fall. Then I found the bees had "moved up", and a fine swarm they were. They filled a 10-frame hive chock-full. Placing an escape-board upside down on top of the chimney and under the hive, finished the job.

I used to buy bees in box-hives and transfer them, as per the text-books, but I don't any more; it's too uncertain and expensive.

Here is the way I got several good colonies just for the trouble, and a beginner could do it just for the experience.

I called on a bee-keeping farmer of the old school who I knew used the sulphur-pit method, and in the course of our conversation asked him if he had ever tasted honey without the sulphur flavor. He had not, and became interested when I informed him that if he had no objections I would take the bees home and leave him the old hive with its combs of honey free from any dead bees, brood, or sulphur gas. All I did was to drum the bees, mark the date, and make a second drumming 21 or 22 days later. The result pleased the farmer. By running one or two of the strongest colonies for extracted honey without the extracting, one is sure of good colonies with good winter stores; and if the transfer is made late, as I transferred one big colony last fall (the first week in November), only one drumming is necessary, using the escape-board and treating the box-hive as a super of honey.

Next spring, if you want to feed the bees some grist as a substitute for pollen, make an arrangement like this:

Select a pretty good cast-away hive with a portico, nail a lath across the lower edge of the portico and bottom-board, then nail a board to the back end for a leg to tip the hive to an angle of about 45 degrees; nail a couple of strips across the inside of the bottom-board, make an inch auger-hole near the top of each side, hinge the cover, and your "rabbit-trap" feeder is ready to be set down anywhere in the bee-yard, facing the south. Place a little flour in the portico for a starter; then cover the bottom thickly, and you will soon have a bad case of robbing. The lath on the portico catches the waste; the auger-holes are to let the bees out should the entrance become clogged, and the cover keeps out the rain and fowls or other molesters.

DER IMKER.

**Bees Almost a Failure.**

Bees in this locality have been almost a failure as far as profit is concerned.

The last two years they have done very poorly, and bee-supplies are so high, and honey so low, it does not pay to keep more bees than enough for our own use.

Benton Co., Minn., Jan. 30. E. L. COOK.

**Bees Wintering All Right.**

My bees are in the cellar and are all right so far, but we have very much snow and it is very cold—30 degrees below zero to-day.

I think there can not be too many reports and experiences in the American Bee Journal. I always read them first. I have had bees four years, and won't take \$200 for what I have learned with the bees and in the "Old Reliable".

Vernon Co., Wis., Feb. 13. A FARMER.

**Foul Brood and Its Treatment.**

Foul brood has made its appearance in this county, the disease is spreading rapidly, and unless checked soon it will destroy the bee-industry in this locality.

My own experience is possibly about the same as others here who keep a small number of colonies.

Last spring I commenced with 10 colonies all fairly strong, owing to the mildness of the preceding winter. During the swarming season my number was increased to 19 hives. Discovering foul brood in one colony I destroyed it, but not before its weakness was discovered by the bees and the honey carried away. Later, on close examination, I found 8 colonies infected, all of which had plenty of honey to keep them, and even several sections full in the supers. However, I killed all those bees having foul brood and took the honey,

but can't use it. Could it be treated so as to be fed to the healthy bees without endangering them? and can the hives and supers with the sections be used if thoroughly cleaned and fumigated? One dislikes to burn good double hives even worse than to lose the bees. How can the wax be extracted and made salable?

Several of your readers here would be interested in the answers to the foregoing questions, which we hope will be published. Saline Co., Kan., Feb. 8. J. B. JOHNS.

[We referred the above to Mr. N. E. France, who replies as follows:—EDITOR.]

First, where did you get foul brood? That must be cured before your treatment will be successful. No need to burn or destroy any bees or hives to cure foul brood.

Honey from infected hives can be boiled so as to be safe to feed, but I do not recommend that you do so. Better eat or sell the honey for table use. It is not harmful for people to eat. If boiled to kill all disease it will be much darker and of poor flavor. Hives and supers, if scraped clean, are safe to use at once. The infected combs, after brood in them is hatched, should be melted by steam or boiling water, not in a solar wax-extractor. The wax is safe to make foundation from.

Treat infected colonies at the beginning of your honey harvest, using the McEvoy treatment. Be very careful all the time that all

infection in combs or honey is treated when and where bees will not come in contact with it. Avoid drug treatments.

Combs never having had foul brood in them are safe to use, and if cleaned perfectly by the bees of all honey, even if once over infected combs, they are safe to use.

N. E. FRANCE.

**Severe Winter—Divisible Brood-Chamber Hives.**

Until about Feb. 1 we had the finest winter for bees that could be wished for, but for the last 10 days we have had an almost continual blizzard with about 12 inches of snow, which drifted over the hives on the summer stands as fast as it could be shoveled away.

February 12 two colonies were found to be almost dead from want of air, and some others suffering. I then gave fresh air from above which seemed to quiet them. But Feb. 13 the thermometer stood at 28 degrees below zero and the snow was still drifting; Feb. 14 it was 15 degrees below and still storming; Feb. 15, 10 below, but still, and at noon 15 degrees above zero. Some hives were entirely covered with hard, packed snow. By the aid of a scoop-shovel I cleared away all the snow in front of the hives, and found all colonies in good condition except 6, which suffered badly for want of air, and were restless, some

**Langstroth on the Honey-Bee**

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**THE MARSHFIELD MANUFACTURING CO., Marshfield, Wis.**

**The Novelty Pocket-Knife.**

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister in a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$2.00.

HAMILTON, ILL.

bees having crawled above the cushions. All hives having divisible brood-chambers, that is, having 16 shallow frames in two supers instead of 8 regular Langstroth frames, were in excellent condition, bees being perfectly quiet and enjoying repose. This is the third winter that the divisible brood-chamber has shown itself to be better for winter, probably because bees could move easier from one comb to another in cold weather. In very cold weather they consume honey very fast, and any aid to their changing from the empty to a full comb is certainly a benefit.

Last winter was a very hard one on bees, and I lost 19 colonies, but none of those in divisible brood-chamber hives. All came out strong, and the first super of honey was from one of those hives. This kind of a hive has some drawbacks, but wintering is not one of them.

There is very little white clover in pastures as the blue-grass has crowded it out, or, at least, it appeared so last fall. So I do not look for a very good honey season. Bass-

wood bloomed so heavily last year that we can not expect a heavy bloom this year; but if I fail to get any surplus honey it will be the first entire failure in 22 years.

Knox Co., Ill., Feb. 15. J. E. JOHNSON.

### Fastening Foundation in Sections—Selling Honey.

I can answer P. D. Jones' question on page 110. Buy a Daisy foundation fastener, and you will have little trouble.

I used poplar 4-piece sections last year, and had no trouble.

I had 13,000 pounds of honey last year. I am now getting 13 cents a pound for extracted, 15 cents for comb honey, and \$20 per day. I do nothing but sell and deliver.

JOHN C. STEWART.

Nodaway Co., Mo., Feb. 12.

### Selling Honey Conscientiously.

In answering a letter of mine (page 40) Dr. Miller accuses me of having a conscience. Herein lies my secret of selling honey. I mean always to have a name among my neighbors for keeping my word. If I have some poor, unfilled sections I sell them at what they are worth. If my sections turn out as we all like to have them, I charge accordingly. My motto is, "Absolutely pure" whether it is wax or honey. If I place sections on sale in the store with my name written thereon, it is understood that the honey was produced by my own bees.

I am in a small village in the suburbs of a large city. One of our wholesale houses receives annually a car-load of section honey. I can sell mine right alongside of theirs at a higher rate, because it is morally, as well as legally, pure honey. All it is necessary for me to do is to let it be known that I have honey to sell, and before I am aware of it it is all gone. Last season I sold out and sent to a friend for a case of honey. The honey was

## The Cause of Low Prices.

We are located in the center of the lumber manufacturing district. Nature furnishes us power at a nominal cost (St. Anthony Falls). Our shipping facilities are unlimited; our machines are of the most modern type, running at a high rate of speed, capable of turning out the largest quantities per day.

We save freight on our raw material and save on fuel and labor, consequently are able to sell at a less price than would be possible otherwise.

The quality of our products is standard, and guaranteed to be such. Money back if not satisfied.

# BEE-BOOKS

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchingson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

## 850,000 GRAPE VINES

69 Varieties. Also Small Fruits, Trees, &c. Best rooted stock. Genuine, cheap. 2 sample vines mailed for 10c. Descriptive price-list free. LEWIS ROESCH, FREDONIA, N. Y.

fine to look upon, and it was produced only about 8 miles from my home, but I could not sell it because I would not indorse it with my signature.

I am soon to deliver a little talk to some boys, and the base of my remarks is, "A good name is rather to be chosen than great riches". Is this not the sum and substance of a pure food law—something that you can swear is "morally", as well as "legally", pure?

Yes, fellow bee-keepers, if you would sell your small crops of honey at home to a good advantage, see to it that your own name among your neighbors is to be depended upon, that what you offer for sale is absolutely pure. Worcester Co., Mass. C. R. RUSSELL.

### Bees Wintering Well—Smoking Bees.

I have 28 colonies of bees and they seem to be wintering all right so far. We are having lots of cold, and more than lots of snow. We didn't get much No. 1 honey last year. There was plenty of white clover, but I think we had a rain that washed the nectar out.

I notice there is quite a difference in opinion as to the amount of smoke to use, some wanting lots and some none. I find that for my use my pipe furnishes about the right amount, only it is generally out when I want the smoke. I get to work with the bees and forget to keep it going. I usually keep my smoker lighted and handy, but seldom have to use it.

I haven't many bees, but I am the one that sells the honey here, thanks to the "Old Reliable". I have sold about \$70 worth, and the most of that was comb honey at 10 cents a section. LYMAN NORTH.  
Page Co., Iowa, Feb. 12.

### CONVENTION NOTICES.

**Illinois.**—The Western Illinois Bee Keepers' Association will hold its spring meeting April 5, in the County Court Room, in Galesburg. Seasonable subjects will be discussed. Each meeting so far has been more interesting than the previous one, and we hope to continue that way. We earnestly invite all who are interested in this industry who are within easy reach of Galesburg, to be at this meeting.

E. D. WOODS, Sec.

**Michigan.**—The Northern Michigan Bee-Keepers' Association will meet in Lady Macca-bees Hall, at Central Lake, Wednesday and Thursday, April 5 and 6, 1905. Hotel rates will be, The Tavern, \$1.50 per day. Editors A. I. Root and W. Z. Hutchinson will be present; also E. D. Townsend, Geo. E. Hilton and a number of other practical apiarists of Northern Michigan. If you have never attended a convention let us suggest that you try it for once, and you will have a higher opinion of your calling when you leave.

W. MOHRMANN, Sec.

Geo. H. Kirkpatrick, Pres.

**Utah.**—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same.

G. E. GARRETT, Sec.

E. S. LOVESY, Pres.

## Honey and Beeswax

**CHICAGO, Feb. 20.**—Honey-business is not too brisk and consequently prices are none too firm. A good deal of pressure is being made by producers as well as dealers upon their correspondents to move consignments. Fancy grades of white comb bring 12½@13c; No. 1, about 12c, with some desirable at 11c. Extracted, 6@7c for white, 5½@6½c for amber, the price being governed by quality, flavor and package. Beeswax, 30c, if clean and of good color.

R. A. BURNETT & Co.

**BOSTON, Feb. 23.**—On account of the very light demand, stocks of comb honey continue to accumulate, causing a weaker market. Fancy white, 15c; No. 1, 14c. Extracted, 6@8c, according to quality. BLAKR, SCOTT & LEE.

**KANSAS CITY, Feb. 25.**—The honey market is still very lax, with scarcely any movement at all; the best white comb stock, 24 section case, is selling here at \$2.25 per case. Extracted moving all the way from 4½@6½c per pound, according to quality. We look for an improvement. Beeswax in good demand at 28c.

C. C. CLEMONS & Co.

**CINCINNATI, O., Feb. 20.**—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7½@8 cents; amber, in barrels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c.

C. H. W. WEBER

**PHILADELPHIA, Feb. 20.**—On account of the very bad weather the sales among the retail trade in honey have been slow. Quite a good many shipments have been arriving from distant points and the market at the present time is overstocked. We quote: Fancy white comb, 15@16c; No. 1, 13@14c; amber, 12c. Extracted, white, 6½@7c; amber, 6c. Beeswax, 27c. We are producers of honey and do not handle on commission. Wm. A. SELSER.

**CINCINNATI, Feb. 17.**—The demand for honey at the present time is like business—frozen. Nevertheless, we are looking forward to a brighter future. We quote amber extracted honey in barrels and cans at 6@6½c, respectively; white clover at 7@8c.

The conditions of the comb honey market are aught but encouraging, owing to the vast amount of Western comb honey that is being consigned at almost any price. We quote fancy white at 12@13c, with but few sales. Beeswax, 27c. THE FRED W. MUTH Co.

**ALBANY, N. Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb,

which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

**SAN FRANCISCO, Feb. 21.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Not much inquiry, either for shipment or on local account. Market shows in the main an easy tone, especially for comb and the ordinary grades of extracted. Supplies of uncandied water-white extracted are not heavy, and for this description tolerably firm figures are being realized in a limited way, mainly on local account.

**NEW YORK, Feb. 8.**—The market is decidedly dull on comb honey and very little moving, with plentiful supply. We quote: Fancy white comb, 14c; No. 1, 13c; amber, 11c; dark, 9@10c. Extracted honey is in fair demand, and prices remain about the same. Beeswax steady and in good demand, 29c. HILDRETH & SEGLKEN.

**\$55 IN SPECIAL CASH PRIZES FREE**

**IN ADDITION TO REGULAR PREMIUMS.**

We have decided to offer TEN SPECIAL CASH PRIZES in addition to the regular premiums, for getting new subscriptions to the Weekly American Bee Journal. The 1st Prize will be \$10; the 2d, \$9; 3d, \$8; 4th, \$7; 5th, \$6; 6th, \$5; 7th, \$4; 8th, \$3; 9th, \$2; and 10th, \$1.00.

**Read the Following Conditions Very Carefully:**

1. This Special Cash Prize Contest will begin on the morning of March 20, and close the evening of July 1.
2. All who compete for the Cash Prizes must have their own subscription to the American Bee Journal paid at least to the end of this year (1905). And each one competing for a Cash Prize must have Five (5) new subscriptions to his or her credit before entering the contest for Cash Prizes. That is, those who have sent in 1, 2, 3 or 4 new subscriptions will not be counted as contestants for the Special Cash Prizes. You must have 5 to your credit, but need not send in the 5 all at one time.
3. New subscribers are considered as those who have not taken the American Bee Journal regularly since 1903. That is, any one who is not getting it now, but received it during 1904, would not be considered a new subscriber now.
4. A new subscriber must not be a member of the same family where the Bee Journal is being taken now. A new subscriber must be in fact a new reader.
5. Cash must accompany every order when sending in new subscriptions. And after any regular subscriber has sent in 5 new ones, he will say when sending in the sixth new one that he wishes to compete for a Cash Prize. Then we will enter his name on the Contestants' List. (If all is not now plain, please ask any questions and we will try to clear up anything that is not understood).

**LIST OF REGULAR PREMIUMS GIVEN**

(whether you compete on the Special Cash Prizes or not).

**Given Free for 1 NEW Subscription.**

YOUR CHOICE.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. THE A. I. ROOT CO. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

We trust the same will be continued to our successors in the business.

GEORGE W. YORK & Co.  
Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE.

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything JUST RIGHT, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

Address all Orders, Remittances, Inquiries, etc., to

# AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER  
IN AMERICA

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

Published Weekly at \$1.00 a Year by George W. York & Co., 334 Dearborn St.

GEORGE W. YORK, Editor.

CHICAGO, ILL., MARCH 16, 1905.

Vol. XLV.—No. 11.

## Editorial Notes and Comments

### The Third Double Number So Far This Year.

Yes, this is the third double number of the American Bee Journal for this year, making 48 extra pages already, and it is only the middle of March. That is almost one-seventeenth more pages than we agree to furnish during the year for one dollar, for the regular issue is 16 pages weekly. But we are glad we can publish these occasional double numbers, for we believe they are appreciated very much by our readers.

### Midwinter Flights of Bees.

Strictly speaking, when midwinter flights are spoken of in connection with cellar-wintered bees, midwinter is not really meant, but February or early March. C. Davenport, in *Gleanings in Bee-Culture*, mentions what may help to account for ill effects of these flights in some cases. He says the bees should be returned to the cellar on the evening of the same day after their being taken out, or, at most, not later than the next day. Left out longer they are likely to start breeding. So the ill effects of midwinter flights may have come from leaving out too long.

### The Contents of the Brood-Chamber.

In order to judge properly whether all is as it should be inside a hive, the beginner should have some idea what to expect when he opens it. Upon this point the books are to a large extent silent, leaving him to gain the desired knowledge through a series of observations extending through one or more years. Indeed, after many years of observations it may not be the easiest thing for him to give anything like a definite answer in a few words to the question, "What ought I to find upon opening a hive?" In no two hives will exactly the same thing be found. What is found to-day will be different from what was found in the same hive at the last inspection. But at least an attempt may be made to enlighten the inquiring neophyte in a sort of general way as to what he may expect to find in a bee-hive.

If the bees have been left to their own devices, there will be found drone-comb in different places, amounting to the half or the whole of a full frame. If the bee-keeper has controlled, there may be nothing but worker-comb in the hive, or, at most, two or three square inches of drone-comb in one of the outer frames. Drone-cells are not likely to contain brood except in times of prosperity when honey is coming in. At other times they may contain honey, but not pollen.

The queen in a colony wintered outdoors is likely to begin laying a few eggs in February—sometimes even in January. If a colony is cellared, it is not likely to have brood started much, if at all, before being brought out of cellar. The queen begins with a very few eggs daily, a compact cluster being in the center, or warmest part of the hive. By and by eggs and brood will be found in two or three frames, the whole being no more than would easily go in one frame, which means that the queen may be laying at the rate of about 300 eggs a

day. When she gets to laying 1000 a day, she will have four frames fairly well filled with brood—at least they would be called well filled, although little more than three-fourths of their actual capacity. With 1500 a day—many queens will not go beyond this, while some will more than double it—she will have six Langstroth frames well occupied, and this a fairly good queen will reach by the last of May in the North.

Looking into the hive at this time, there will be found a brood-nest of a somewhat globular form, the central frames being a little fuller than the others, a band of honey being at the top and at the two ends, although a good queen may have brood clear to the top-bar. There may and there may not be some pollen in the upper part of these frames, but the frame next them at each side will have a good supply of pollen as well as honey. In a 10-frame hive it is not a very common thing to find brood in the outside frame at each side, but in an 8-frame hive the queen will often insist upon occupying a good part of the two outside frames.

This amount of brood will be found kept up pretty well throughout the season, but toward the close the sphere of brood will gradually become less and less, the space left vacant by the brood being filled with honey and pollen, and somewhere in September or October all brood-rearing ceases, and all the combs should be found filled with honey and pollen except the lower portions of the central combs.

Thus a rough sketch is given as to what may be found in a hive at different times, subject to innumerable variations, and no one must understand that any attempt at exactness has been attempted. Dates must be changed for the South. Neither must any beginner understand that 8 or even 10 frames make the limit for every queen. If given the opportunity, there are queens which will occupy 12, 14, or more frames.

### The National Association and Incorporation.

Dr. C. C. Miller has this to say on the subject of incorporation of the National Bee-Keepers' Association:

I am glad, Mr. Editor, to see the matter of incorporation of the National discussed in your columns. I don't know all about such things, but so far as I can judge from what is said on page 115, the weight of argument is on the side of incorporation. After incorporation we would not be obliged to engage in a lawsuit any more than we are now. In the case mentioned, the *Ladies' Home Journal*, I think there was no lawsuit on the part of the incorporated concern; merely a request for retraction, the same as was made by the National. Prompt and satisfactory apology was made in the case of the incorporated concern because it was incorporated, and it was not made in the other case because it was not incorporated. If we had received the same treatment as the incorporated concern, would not this one case have paid for the cost of incorporation several times over?

Again I repeat that incorporation does not oblige us to engage in lawsuits. Yet I can not believe it would be so very hard to prove that individual members of the National were damaged a fixed amount by some of the things that have been done.

The National, in one of its former states of existence, was incorporated. If it did no good it certainly did no harm. Would it do any more harm now?  
C. C. MILLER.

We think the principal question to be decided before incorporating the National is this: Will the Association take any advantage of the added power and responsibility? If not, why not remain as it is?

There is a committee on incorporation that will report at the next annual meeting of the National. No doubt they wish to get the views of the members. Dr. Miller is on that committee, we believe.

### A Bee-Keepers' Paradise.

The paradises for bee-keepers that we sometimes read about and sigh for will probably turn out generally, upon close acquaintance, to be no more paradisaical, all things considered, than the places we are already occupying. Arthur Laing, in Canadian Bee Journal, besides the mention of scorpions, centipedes, frogs, land crabs and fleas, which one of the paradises enjoys, has this to say:

Jamaica has been described as a "bee-keepers' paradise", but I am becoming more and more satisfied every day that we have in Canada a better chance for success as bee-keepers than we would have in Jamaica. I do not believe that the annual average yield would be over 100 pounds per colony; in fact, was told to-day by a gentleman who has 400 colonies of bees, that his best average in any year had been 84 pounds per colony, and last year, after the hurricane, he averaged only 42 pounds, and this honey, mind you, will not bring more than from 2½ to 3 cents per pound above the cost of package, and out of this the expenses of the apiary must be paid, so that the apiarist here must keep at least three times as many bees as our Canadian apiarist in order to make the same money. Then just think of three times the number of hives, barrels, extractors, honey-knives, smokers, etc., that have to be bought, and the extra help that must be paid for. Lumber for hives costs from \$50 to \$60 per 1000 feet.

Money can undoubtedly be made here by bee-keeping, but, in all sincerity, I say again, we Canadian bee-keepers have a better opportunity in Canada than we would have in Jamaica.

### Honey Definitions by the Government.

Circular No. 13, by the United States Secretary of Agriculture, entitled "Standards of Purity for Food Products", has been received. Especially interesting to bee-keepers are the following definitions that may be considered authoritative, though not beyond the possibility of modification in the future:

1. *Honey* is the nectar and saccharine exudations of plants gathered, modified, and stored in the comb by honey-bees (*Apis mellifica*). It is lavo-rotatory, contains not more than twenty-five (25) percent of water, not more than twenty-five hundredths (0.25) percent of ash, and not more than eight (8) percent of sucrose.

2. *Comb honey* is honey contained in the cells of comb.

3. *Extracted honey* is honey which has been separated from the uncrushed comb by centrifugal force or gravity.

4. *Strained honey* is honey removed from the crushed comb by straining or other means.

It is perhaps a matter of regret that in the list of vinegars, honey-vinegar is not included.

### Shaken Swarms in 1865 and 1880.

On page 19 we called attention to the fact that Mr. Geo. W. House, of New York State, described his method of shaken swarms in 1880, in the Bee-Keepers' Magazine, published at that time. Mr. Geo. M. Sowarby, of the same State, now requests us to republish Mr. House's method, which request we comply with. It is as follows:

As soon as a swarm has made preparations for swarming by having eggs deposited in the queen-cells, we proceed as follows: Remove the old colony a few feet one side, and on the old location place a new hive (either empty or the frames filled with foundation), put a small block between the lower front edge of the hive and the bottom-board (to give the bees an easy access to the hive), and place a wide board in front of the new hive, with one edge resting against the bottom-board while the other edge rests upon the ground, so the bees may run up and into the hive.

We now open the old hive and draw a frame a little one side from the center of the hive, and after looking the comb carefully over to ascertain if the queen is thereon, we turn to the new hive, and, by a little sudden jerk, we shake nearly all the adhering bees on the board in front, and they readily enter their new house.

Setting this frame in the shade of a near hive (that we may have easy access to the frames to work), we return to the old hive, and draw the next frame towards the center, looking for the queen and shaking the bees in front of the new hive, as we did with the preceding frame. Replace this frame in its original place, and proceed as with the preceding frame, until you have two-thirds of the bees from the old colony into the new hive. As soon as you find the queen, take her from the comb and place her at the entrance of the new hive and let her run in with the bees. Now close the old hive and contract the entrance, and remove it to a new location.

By this time you may remove the wide board in front of new hive, so that the old location will not be disfigured, and the working bees will lose no time in entering the new hive.

The next day give the old swarm a queen-cell that will hatch within 48 hours, and the work is done.

A laying queen may be introduced instead of a cell if desired. The first few swarms will furnish us with queen-cells of the most perfect type. But we generally make a few swarms about ten days before we wish to use the cells, and claim there is no difference in queens reared from larvæ from two to four days old and those reared by the queen depositing the egg in the cell. This is during the swarming season.

The day is not far distant when the apiarist that can manage the most bees, in the same length of time (all conditions equal), will be considered the most skillful and the most successful. In artificial swarming on the above plan, you will notice we secure our new swarms at least a week sooner than we would by allowing them to

swarm naturally, and in the old hive we have a laying queen at least five days earlier than we would by allowing them to hatch their own queen—two very great items during the honey season. Swarms having extra qualities we allow to rear their own queen-cells, that we may use them in other hives, thus improving the qualities of our bees.

After a few days I claim there is no one that can discover the difference between such a swarm and one that swarms naturally. We have practiced this mode of swarming for the past 15 years, and are satisfied there is no plan that surpasses it, where you wish to have one new swarm for each old one.

Onondaga Co., N. Y., April 12, 1880.

GEO. W. HOUSE.

Mr. Eugene Secor so often becomes delightfully rhythmical that bee-keepers are seldom surprised at his poetic productions. They are always so good. Here is one of his latest:

#### Pussy Willows.

By the brook that skirts the pasture  
Pussy willows scent the breeze  
Long before the sleepy linden  
Wakes to tempt the honey-bees.  
April woods are bare and brown,  
But the willows—pussy willows—  
Shake their dainty, fluffy pillows,  
Soft as beds of eider-down.

All the wealth of love and service  
Are not lavished on the great.  
In the scales of the Eternal  
They are least who lag and wait.  
Bare and brown the giant trees,  
But the willows—pussy willows—  
Early shake their golden pillows,  
Serving hungry honey-bees.

Winnabago Co., Iowa.

EUGENE SECOR.

**On the Death of Geo. W. Brodbeck.**—We have received the following resolutions, which were passed by the stockholders of the California National Honey-Producers' Association at their regular annual meeting, Feb. 15, 1905:

WHEREAS, it has pleased the Great Ruler of the universe to remove from our midst our esteemed president and brother bee-keeper, Geo. W. Brodbeck; therefore, be it

*Resolved*, That we sincerely mourn our loss, and will long cherish his name and remember his many kind deeds and persistent endeavors in behalf of ourselves and the bee-keepers at large. We hereby tender our sincere sympathy to the bereaved. May the softening influence of time remove the grief, and simply leave happy thoughts of his kindly life.

*Resolved*, That a copy of these resolutions be sent to Mrs. Brodbeck, and to the press for publication.

(GEO. L. EMERSON, }  
T. O. ANDREWS, } *Committee.*  
G. F. MERRIAM, }

**Not a "Fellow".**—Mr. E. Brubaker, of Philadelphia Co., Pa., has sent us the following stanza, taken from a Philadelphia newspaper:

The roving bee is often called  
A bold, bad robber fellow;  
But for the sweets from honey-bloom,  
He pays in gold-dust yellow.

—CORA LAPHAM HAZARD.

That's all right, except that the "roving bee" referred to is usually not a "fellow".

**Utah and Other Apiarian Exhibits at St. Louis.**—On the first page we present a picture of the Utah apiarian exhibit at the World's Fair held in St. Louis last year. Some weeks ago we presented a picture and brief description of the Colorado apiarian exhibit. Mr. E. S. Lovesy, of Utah, sends us the following concerning the Utah display:

We sent nearly 4 tons of alfalfa, sweet clover, and some white clover honey for the Utah exhibit at the World's Fair at St. Louis. It consisted of 300 pounds of comb honey and about 3¼ tons of extracted, collected from 12 counties and about 20 different localities of the State. There were about 2 tons of beautiful white alfalfa honey put up in large glass jars, some of them holding about 100 pounds each. This is too large a package to put on exhibition. Had the contents of one of those jars been put up in 1 or 2 pound jars it would have shown up clear and water-white. The light amber was put up in smaller jars, with the result that it looked whiter than the best white

in the large jars. But this light amber honey would have looked dark in those big jars.

Our object was to represent correctly the honey product of the State. Our honey will easily go 2 to 1 white, and if it had been re-liquefied at the Fair, and put up in smaller jars, the effect would have been all that could have been desired. The only excuse we can offer is that those who managed the exhibit thought they were doing everything for the best, and the bee-keepers had nothing to do with the exhibit other than to collect the honey, fill the jars, and deliver it to the Fair commissioners. Moral: Don't exhibit honey in bulky packages. They are too heavy to handle, and don't show up well.

The unique wax-model, representing a maiden on the mountain-top holding aloft a horn of plenty, which was intended to represent the industries of the State—including its mining, agricultural, horticultural and apicultural industries; also the American flag, which, with the bee-hive, is the emblem of the State—was the creation of one of our local artists.

E. S. LOVEST.

Salt Lake Co., Utah.

The British Bee Journal, in January last, contained quite a full report, prepared by Mr. Walter F. Reid, of the apiarian exhibits from various counties, as shown at the St. Louis Exposition. Mr. Reid reported the following:

In the Exhibition there were many exhibits of bee-products, some of them of considerable importance. Several foreign countries were represented, and some of the American States had special honey exhibits.

France had a very small exhibit, consisting of a few jars of excellent Narbonne honey and a defective "Gariel" hive.

Madagascar exhibited four cakes of beeswax of pronounced odor, three of which were of good color.

Reunion showed three bottles of honey of fairly good color, but indifferent flavor.

Germany did not exhibit any bee-products; but Prof. R. Klebs, of Konigsberg, showed a unique collection of insects in amber, some of which were mounted in a resinous mixture of the same coefficient of refraction as the amber, so that the specimens could be easily studied. Among the 68 exhibits were several apidae. One was a new species of bombua, while another represented a hitherto undescribed apis much resembling our honey-bee, but slightly larger. Although the pollen-baskets appeared to be fully developed, yet the compound eyes met on the top of the head as in the drones of the present day, leaving a small triangular space on the forehead in which three single eyes were placed. The upper part of the thorax has a thorny appearance, and seemed devoid of hair. The collection included eight vespidæ, which, in their general structure, reminded one of South American forms.

Bulgaria showed three samples of candied honey of fairly good quality, and three cakes of wax.

Argentina had three exhibits of honey, one of which, apparently from alfalfa, was of good quality. One cake of wax was also exhibited.

Nicaragua exhibited a cake of nearly black wild beeswax, and also some interesting specimens of vegetable wax, obtained from the berries of a shrub with leaves resembling those of the myrtle.

Mexico had a good exhibit of wax from several provinces. Some large cakes of bleached wax from Jalapa were of excellent quality, and there were good samples from Matamoras and Vera Cruz. Some of the native beeswax was of very dark color, resembling cakes of chocolate.

Cuba exhibited a few samples of indifferent honey, packed in wine and champagne bottles! Only one from Guantamo would be considered of average quality in this country.

Philippines—The United States had a large collection of Philippine products, including about 25 specimens of wild beeswax of various degrees of purity, and a number of home-made wax-candles as used in the churches. The wax was said to be derived from two kinds of bees, one a large variety, probably *Apis dorsata*, and the other a small bee of about the size of a house-fly, and striped black and yellow, more resembling a wasp than a bee. The cells of the small combs were about 1/8 inch in diameter, and the native name of the bee was "Putyucau".

Japan's exhibit of honey was remarkable for careful and tasteful packing. Some jars—or, rather, stoppered bottles—from the Suwa apiary, Osaka, were specially neat. The hive-bee is said to have been introduced about 100 years ago from Spain; but wild bees existed previously in the Japanese forests.

Canada had a splendid trophy of honey, both extracted and in the comb. About 50 exhibitors had contributed towards this collective exhibit, which weighed about one ton.

Among the States of the Union, Colorado had a very fine exhibit of honey, chiefly collected by Senator G. W. Swink, who owns a number of apiaries. The quantity of honey shown was considerable, being about two tons of section and one ton of extracted honey. The whole of it was of good quality, and there was also some excellent beeswax.

Utah showed a collective exhibit of about 5000 pounds of excellent alfalfa, packed in large glass jars 4 feet high and 9 inches in diameter, with glass lids.

California would have made a better show had her exhibits not been split up into counties. San Diego County showed some good white sage honey, and Los Angeles some extra-large sections of good quality. More than 100 sections from Fresno contained good honey, but were badly finished, judging by our standard, and the same may be said of a number of sections from Sacramento. Perhaps the best exhibit of extracted honey was from Los Angeles County, packed in clamped jars.

Nebraska.—The custodian of this exhibit, Mr. Wm. James, is himself a bee-keeper, and gave some interesting information upon the bee-keeping industry in that State. The chief sources of honey are alfalfa, white clover and heartsease (*polygnum*). Langstroth S-frame

hives are chiefly used, and the yield of honey averages about 45 pounds per colony. A large number of samples of honey were shown, which had been collected and arranged by Mr. Stilson.

Arkansas was represented by only one jar containing comb and honey mixed, the flavor of which was good. There seems to be an opinion that the flavor of honey is improved by an admixture of comb.

Missouri had a large trophy of honey, badly staged, the sections being shown in the packing-cases. Some honey was exhibited in stoppered bottles, and was very deficient in flavor of any kind.

Kansas showed a few samples of alfalfa extracted honey of average quality.

Mississippi had both honey and wax exhibits. Some of the honey was from the *melilotus* [sweet clover], and of excellent quality. The *melilotus* was said to have been introduced before the alfalfa, which latter is now supplanting it. Six samples of wax appeared to be of good quality; but it is difficult to judge wax when the temperature is above 90 degrees Fahr.

Iowa staged about half a ton of section honey of average quality but no extracted honey. About 1 cwt. of good wax was also shown.

Louisiana had a small exhibit of 1/2-pound jars of honey marked "Goldenrod", "Morning-Glory", and "Willow", of which the last had the finest flavor.

Oregon was represented by a small quantity of inferior honey. It is said that the honey gathered near the coast is inferior in quality to that obtained further inland.

Idaho had a small exhibit of sections arranged in fancy design.

New Mexico showed about 100 sections and 50 pounds of extracted honey, chiefly alfalfa. The bulk of this honey was produced at a height of 3600 feet above sea-level. The chief apiarist owns about 1000 colonies. When he arrived at the place where his bees are now located his whole belongings consisted of two wagon-loads of hives and a tent, and he is now a prosperous colonist.

There were very few bee-appliances exhibited at St. Louis. The A. I. Root Co. had an exhibit of well-made goods familiar to bee-keepers, but which contained nothing new except a novelty in form of a smoker without a nozzle.

There were three colonies of bees in the Horticultural Building, of which two were of the Italian variety. It was remarkable that while the humming-birds drove away both butterflies and native bees from the beds of flowers in the exhibition grounds, they took no notice of the hive-bee. Up to the middle of October the bees were still bringing in honey from numerous wild flowers, especially goldenrod and aster—a small Michaelmas daisy.

WALTER F. REID.

**Baiting Fish with Honey.**—Honeyed words have often lured foolish members of the human family to their ruin, but we have never known a member of the fish family to be lured by a honeyed hook, though good Isaak Walton is authority for the catching of tench with "a bait made of a paste of honey and brown bread".

The office boy has tried to improve the above sentiment in this "poetical" fashion:

Brown bread and jelly-cake  
Makes a fellow's belly ache;  
Brown bread and honey-paste  
Just suits a fish's taste.

The last line is "bum", but it is excusable, as the "boy" is not yet a full-fledged poet—his hair is yet clipped quite short—for obvious reasons.

**Doolittle & Clark** is the way it reads now, instead of simply "G. M. Doolittle". The strenuous life that Mr. Doolittle has been leading for so many years has compelled him to share the labor as well as the pleasure of his business, and so he has associated with him Mr. P. G. Clark, who is a practical apiarist. They will hold forth at "the old stand" where Mr. Doolittle has lived for over 30 years—at Boro-dino, N. Y. See their advertisement on another page.

The Pacific Rural Press has been designated by the State Grange Executive Committee as the official organ of the State Grange of California.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

See Langstroth Book Offer on another page of this copy of the American Bee Journal.

## Opinions \* of Some Experts

### Should the National be Incorporated?

**Ques. 23**—Do you think it desirable that the National Bee-Keepers' Association should be incorporated?

JAS. A. STONE (Ill.)—Yes.

J. A. GREEN (Colo.)—Yes.

WM. McEVOY (Odt.)—Yes.

O. O. POPPLETON (Fla.)—Yes.

G. M. DOOLITTLE (N. Y.)—No.

S. T. PETTIT (Ont.)—I do not know.

N. E. FRANCE (Wis.)—Not at present.

C. DAVENPORT (Mind.)—I do not know.

EUGENE SECOR (Iowa)—I doubt if it will pay.

REV. M. MAHIN (Ind.)—It seems to me desirable.

MORGAN BROS. (S. Dak.)—Yes, all things considered.

DR. C. C. MILLER (Ill.)—With my present light, yes.

E. S. LOVESY (Utah)—I think it would be desirable if it should be incorporated.

P. H. ELWOOD (N. Y.)—I am not informed as to advantages and disadvantages.

E. E. HASTY (Ohio)—Quite open to conviction on this point, but rather think not.

PROF. A. J. COOK (Calif.)—I see no harm, and I can see great possible advantages.

E. D. TOWNSEND (Mich.)—There is work ahead for the National to do, so it will be necessary to incorporate.

E. WHITCOMB (Nebr.)—Incorporation is of no advantage unless we desire to acquire property; to sue and be sued.

R. C. AIKIN (Colo.)—Yes, if we want legal standing. But I am not a lawyer, nor have I thought much on the subject.

C. P. DADANT (Ill.)—It can do no harm, and will give more authority to the officers, the General Manager especially.

DR. J. P. H. BROWN (Ga.)—If the Association has any property, or intends to do a business, it would be better to have it incorporated.

R. L. TAYLOR (Mich.)—Yes. Without incorporation it can neither sue nor be sued. Pleading the "baby act", as it is called, is not looked upon with favor.

ADRIAN GETAZ (Tenn.)—Yes. It would enable the Association to carry legal business in its own name, and under its own responsibility. In a word, using legal terms, it could sue and be sued.

G. W. DEMAREE (Ky.)—I do not think so. The good work that has been accomplished by the bee-keepers' societies all over the country is the result of unselfish commingling with the people of all rural pursuits.

L. STACHELHAUSEN (Tex.)—I do not see how the Association could be incorporated except a capital for some business purpose is raised and the members become share-holders. As the Association does no business of this kind as yet, I do not see a possibility or a purpose for incorporation.

C. H. DIBBERN (Ill.)—This is a legal question rather than an apicultural one. Yes, I think it should be incorporated, to give it legal standing in court. Necessarily, to carry out the intentions and purposes of the Association, many legal questions will come up for solution, and the Association is constantly at a disadvantage without incorporation.

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### HYBRID BEES AND FAIR PREMIUMS.

And so hybrid bees have an unbroken record of 20 years—taking every first premium for comb honey at the Nebraska State Fair for that time. Noteworthy. I'll venture to guess that this fact does not mean exactly what it seems to mean at first view. I infer that very little honey stored by pure blacks ever comes in—pure blacks so very scarce—thus making it a race between Italians and hybrids. As to the hybrids, presumably one type of them finishes up its honey much as Italians do; while another type of them does it so nearly the same as black bees do that one could scarce tell the difference. The prize-winners belong to the latter type, I take it. Page 61.

### SYRIAN BEES AND QUEEN RECORD.

And the Syrian bees (as vided by Prof. Benton) seem to hold the record for manipulation of queens. He doesn't appear to say whether they were all at liberty at once, or only part of them, but there were 250, and at least a great part of them at liberty at once. Suspicious. Suspicious because it seems to be a going back to a state of things existing before the bee had attained its present high and peculiar state of development. A colony of bees which inclines to build very few queen-cells—and in which two virgins are pretty sure to settle matters at sight with a mortal combat—*may not* be any better than the colony where the opposite state of things prevails, but the probability lies in that direction, I think. Degeneracy and atavism are things to watch out against. Page 64.

### BLACK FOUL BROOD AND ITS SPREAD.

Mr. Stewart's paper on black foul brood is a very lucid one. And when the disease *seemed* to leap four miles through the air he proved beyond reasonable doubt it seems that bees from diseased apiaries were there. This appears to settle it that it is bees that carry the germs, either in their honey-stomachs or about their bodies somewhere. This is a contribution of considerable magnitude to our knowledge of black brood. When infecting germs do float in the air it is desirable to know that fact; but we don't want to know it when it isn't so. Not only in bee-diseases, but in other diseases also there is a bad, lazy tendency to assume that infection must have traveled in the air when other possible routes have not been half explored. Page 65.

### BEE-PARALYSIS NORTH AND SOUTH.

O. O. Poppleton draws a decided rein on a prevalent dictum, on page 69. Paralysis more prevalent in the South not because Northern summer climate is unfavorable to it, but because Southern winters don't kill off the infected colonies and Northern winters do. I am not sure that this view of the case is the whole story, or even half the story; but it is worth thinking of at least. I do not remember to have seen it in print before, that unusually tight clinging to the combs is a prominent sign of paralysis. I suppose this is in part because the diseased bees have never done any work, and therefore the original sharpness of their toes has never been dulled. It is of interest that Mr. Poppleton finds sulphur an effective cure—and yet he thinks the better tactics to be to pull down the diseased colonies and build up healthy nuclei with the proceeds.

### TEXAS AND HER FLOWERS.

Happy Texas! Has 13 months of flowers in a season! This is not wholly a joke, as it is not claimed that there are 13 months in a year. Just notice the possibility of a season being somewhat longer than a year—the too-previousness of the mistletoe and the persistent ever-blooming of the cotton spreading thiogs beyond the calendar sometimes. But alas—

Nor bee nor bee-keeper can bunt  
To make flowers give down when they won't.

And horsemint, which we used to think of immediately when Texas honey was spoken of, is over large areas much less abundant than formerly. Prof. Scholl lays this to several successive dry years cutting off the supply of seed. Quite likely he is right in the main; but Nature has many such pranks, and some of them can not be solved so easily. In my range there used to be square miles of blue lupines. This was on "oak openings" sort of land—and much of the territory would have yielded a good swath of lupines if mown with a scythe. Now there are only scattered plants, and here and there a spot where they are close enough to be neighbors. What's got my lupines—and will they ever come back? Rest of us can hardly find a match for the Texas mesquite, which has two distinct periods of bloom, the second beginning when the beans from the first bloom are getting ripe. Say, that makes two seasons—two seasons in one year. And we wind up as we began, saying: Happy Texas! her seasons are a month longer than elsewhere in the world—and, indade, there are twice as many of them! Page 85.

# Northern Michigan a Bee-Keepers' Paradise.

By W. Z. HUTCHINSON.

"Bells' ding dong, and choral song,  
Deter the bee from industry;  
But hoot of owl, and 'wolf's long howl',  
Incite to mull and steady toil."

Northern Michigan, the home of the huckleberry and the speckled trout, where the wild deer drinks deep from little sparkling lakes with white pebbly beaches, where forests of magnificent beech and maple stretch away for miles unbroken, where still lingers some of Nature's wildness, here is proven the truthfulness of our opening adage—here is a veritable paradise for the bee-keeper. From Canada to California have we sought for the Eldorado, only to find, as is often the case, that it lies at our very door.

Four years ago I attended, at Traverse City, a meeting of the Michigan State Bee-Keepers' Association, and two things struck me quite forcibly: The uniformly good yields reported, and the wonderful interest shown in discussing the problem of how to have populous colonies early in the season, that the best advantage might be taken of the red raspberry bloom.

#### THE WONDERFUL AND UNIFORM YIELDS OF NORTHERN MICHIGAN.

The next year I attended another meeting of bee-keepers held in that part of the State, only further north, at Bellaire, Antrim County, and again I was surprised at the uniformly good yields reported, and upon inquiry as to the source, the reply was almost invariably "raspberries". Occasionally some one would add milkweed, or basswood, or willow-herb. I believe I quizzed the members of that convention more persistently than I ever did those of any other convention. If a man that I had cornered got away, I immediately corralled another. The man who occupied the room with me at the hotel, where we stopped, was snoring when I asked my last question. Then I went home with Mr. S. D. Chapman, and stayed a day or two, looked over the ground from which his honey was gathered, and listened to the ups and downs of his apicultural life. Red raspberries and bees have certainly pulled his feet out of the slough of debt. I became thoroughly satisfied that this region was the best place I had yet seen for the production of honey; but I wanted to see it with my own eyes when the harvest was in full swing, so, July, 1903, with camera and pencil, I started in at Traverse City, and spent nearly two weeks visiting bee-keepers from there along up north until near Charlevoix.

#### A BIT OF WILDNESS.

I did take one little side-trip to which I would like to devote a few words. The grand forests of white pine with which so much of this State was once clothed are now nearly extinct, and

when I heard there was still a small tract in Otsego County, I thought "Here is an opportunity to get photographs of something that in a few years will be difficult to find—forests of pine in their native wildness, lifting their beautiful, plume-like tops 150 feet towards the heavens". After leaving the cars I walked five miles along a logging road, lugging my big camera with me, ate with "the hands" at their shanty (and it was pretty good fare, too), slept with the "boss" in his bunk, and the next morning started through the woods for a small lake, about two miles away, along the banks of which the men told me I would find the finest growth of pine. It had rained during the night, and my trou-

sers and shoes were wet through long before I reached the lake—but an enthusiast does not stop for such trifles as that. I loosed the boat fastened to a stake, and floated out over the clear water—so clear that I could see the bottom at a depth that made me feel uncomfortable to think that I was over such deep water. On all sides towered the massive walls of dark green pines. The morning sun was driving away the wreaths of white mist that still lingered in their tops. Beautiful water-lilies, white and yellow, in all their purity and freshness, floated in great profusion on the surface of the water. As I rounded a little point, a red deer, standing knee-deep in water, eating lily-pads, gave one frightened look,

MILKWEED IN FULL BLOOM.

This picture shows the blossoms about one-fourth natural size. The leaves are a deep, glossy green, while the blossoms are a lilac purple, shading off into a magenta red. Later in the season each bunch of blossoms is replaced by a seed-pod nearly as large as a banana, and, attached to the seeds when ripe is some of the softest, silkiest, fluffiest, whitest, downiest substance that ever grew. Besides furnishing an abundance of honey, the blossoms also secrete a sort of gluey substance that sometimes catches a bee by the leg—usually the bee pulls away.

PATCH OF MILKWEED BY THE ROADSIDE.

In some parts of Northern Michigan milkweed furnishes an abundance of pasturage. In 1902, Mr. Ira D. Bartlett secured 75 pounds per colony from milkweed alone. The plant grows freely by the roadside, in openings, and really becomes a weed in crops that can not be cultivated—oats, for instance. It is about as difficult to eradicate as a Canada thistle. The honey is of good body, light in color, and has a flavor similar to the odor from the blossom—something like vanilla.

three magnificent bounds, and disappeared in the pines. Over all was a stillness that could almost be felt. It seemed as though I had never been nearer Nature's heart. The peace, the joy, the reverence, that came over my soul, is beyond my power to express.

#### SOIL AND CROPS—GINSENG CULTURE.

But, to return: A large portion of Northern Michigan, that portion I am describing, from Traverse City north to Petoskey, is hard-timber land—the grandest beeches and maples that I have ever seen—and the greater portion of the land is still uncleared. The best of the timber is being cut for lumber, then the small and crooked trees are cut up into furnace-wood. Some two years ago, or thereabouts, Mr. Chapman's son bought a tract of wild land just across the road from his father's, paying \$4.00 an acre for it. The timber, fit for lumber, had been cut. Last winter he was cutting up what was left into furnace-wood. After paying for the cutting and hauling the timber was netting him \$16 an acre. Such land is now worth about \$10 an acre. The soil is a sandy loam, which, aided by the cool, moist climate, produces the finest potatoes in the world. No other portion of the country is better adapted to the production of winter apples; and, while I am about it, I may as well describe a somewhat novel industry that flourishes here—the raising of ginseng for market.

Originally the plant grew wild, in great abundance, in these north woods, but men made a business of hunting for and digging it for the market (sometimes making \$3.00 or \$4.00 a day), until it is now very seldom that a plant is found in the woods, but I visited several gardens where it was under cultivation. The plants to start these gardens were dug up in the woods

and set out. The natural home of the ginseng is in the deep woods, and in order that it may flourish under culti-

vation, the same conditions must be supplied. Leaf-mold is brought from the woods for use in making beds, and a shade is furnished by an immense frame-work 6 or 7 feet above the ground, upheld by stout posts, and covered with laths nailed on about an inch apart. The sides of the enclosure are also covered similarly with laths. In short, one way of describing the shade would be to say that a huge box was made of laths placed about an inch apart, and then turned upside down over the garden. The plants are set in rows about a foot apart, in beds 5 feet wide and about 100 feet long, and the dark, rich green of the leaves, growing in that semi-darkness, like that of a deep woods, is something delightful to behold. The dried roots are worth about \$7.00 or \$8.00 a pound, while the seeds are sold at such a fabulous price that I would rather not mention it. I was shown one bed of old plants, bearing aloft their bright-green seed-pods (and turn to scarlet when ripe), and told that if those roots should be dug and marketed, after the seeds had ripened, that the seeds and roots would bring \$500! Just think of it, a piece of earth 5 feet wide and 100 feet long, bearing a crop worth \$500!

The market for ginseng is in China, where it is regarded with a sort of superstitious reverence—supposed to possess unusual curative virtues; in short, a cure-all and a charm combined. Ginseng is a perennial of slow growth; the root continuing to increase in size for several years. Making a fortune raising ginseng is rather slow at the start (it takes a year and a half for the

HOME-APIARY OF S. D. CHAPMAN, OF ANTRIM CO., MICH.

Mr. Chapman winters his bees in the cellar, and this view was taken in March soon after they were put out. There were still patches of snow in the edges of the woods. Years ago Mr. Chapman had fine crops of honey from basswood. When this was lumbered off, there was scarcely anything left to produce honey, as the country was nearly all forest, and he seriously contemplated abandoning bee-culture. Finally lumbermen began cutting off the hard timber, and this left the land so nearly unoccupied that red raspberries sprang up and changed the location to one of the best for bee-keeping. From 150 colonies in 1902, Mr. Chapman secured \$1000 worth of raspberry honey. In 1903, from 190 colonies, in two apiaries, he secured 23,000 pounds of extracted honey.

APIARY OF JAS. MARTIN, OF KALKASKA CO., MICH.

This apiary, of about 100 colonies, was built up in two years from 12 colonies, and a little over 4000 pounds of extracted honey taken. The enthusiasm of a beginner, together with raspberry bloom, did it.

seeds to germinate), but, if one has the patience to wait, it is very profitable in the end. Mr. Chapman told me that he sometimes wished that he had "gone into it" years ago when he began bee-keeping, but doubted if he should bother with it now. One man near Mr. Chapman's started two years ago, and now has gardens worth \$5000, but he advertised and posted notices all over the country offering good prices for roots, and probably paid out a good share of his \$5000 for stock.

THE RED RASPBERRY AND ITS HONEY.

But I must stop wandering and get down to business. I must take up the feature in which bee-keepers are specially interested. When this hard timber is cut off the wild red raspberries spring up and occupy the ground, and furnish the most reliable bee-pasturage there is to be found. The luxuriance of the growth is something wonderful. Many times, in riding along a woods-road, have I been able to reach out and pick the luscious ripe berries as we passed—the bushes being so tall and bending with fruit. I supposed that the wild red raspberry blossomed only a week or two, and then was done, but such is not the case. It keeps in bloom fully as long as white clover. It begins the last of May or the first of June, and when I was there, the latter part of July, the bees were still working upon it. If there is a drouth in August, and there are rains and warm weather in September, it sometimes blossoms again, and furnishes a second crop of honey. One bee-keeper told me that his daughter visited him the Fourth of July, and they went out and picked enough berries to have a shortcake; in September she came again, and they repeated the operation. While the honey is not quite so white as that from clover, it is still classed as a light honey, and has a delicious raspberry flavor.

The time will probably eventually come when this country will all be

cleared up and cultivated, as is the case now in the older portions of the State, but that will be many long years hence. For 20 or 25 years it is likely that this portion of the State will improve as a bee-keeping country—more of the timber will be cut off; and the acreage of raspberry increased. In some localities of this part of the State there is still some basswood, but it certainly will not remain there many years. The same may be said of the willow-herb, or Epilobium. In some places milkweed furnishes a good crop of fine honey. Clover is already beginning to creep over the cleared fields. Perhaps the bee-keepers already here

will not thank me for thus exploiting their territory; they certainly would not have done so a few years ago, but bee-keepers are learning that it does not pay to crowd. Selfish motives alone prevent this. In a new country settlers are always welcome, and I doubt if there is a bee-keeper in this region who would not welcome other bee-keepers, and help them to find good locations, provided they came in the right spirit—willingness to go back a little farther rather than crowd some bee-keeper already located. How I should delight going into that region, buying 40 acres of land in some romantic location, clearing it up and planting it all to winter apples, and at the same time establishing a series of out-apiaries. If I were not located just as I am I certainly should do it. . . . . But if I were a young man just beginning in bee-keeping, or a middle-aged man, for that matter, and trying to make a living keeping bees in a poor locality, I should certainly go to Northern Michigan. I would not do it rashly. I would not sell a good home, pack up my things, and drop down almost anywhere—I should spend a year or two in investigation, and learn from personal observation, long continued, the best place to go.

In this region bees are wintered both indoors and out, but the most successful wintering that I came across was that of the bees belonging to Ira D. Bartlett, of Charlevoix County. Although Mr. Bartlett is a young man, and unmarried, he has made a wonderful success of bee-keeping. For one thing, he is very particular. The hives must all stand exactly so, and the covers be put on square, and so on with everything. Perhaps these things in themselves do not bring success, but the trait of character that demands them is quite likely to command success. He has a bed, stove and dishes in the house near his apiary, and he literally lives with his bees during the working season, cooking his own

APIARY AND HOME OF GEO. H. KIRKPATRICK, OF KALKASKA CO., MICH.

A few years ago Mr. Kirkpatrick was making a scant living keeping bees in Indiana. A visit to Northern Michigan showed him its possibilities, and he was not slow in making the most of them. He now has a farm and the beautiful home and apiary shown above. In 1903 his 138 colonies increased to 206 and stored about 13,000 pounds of extracted surplus honey.

APIARY OF IRA D. BARTLETT, OF CHARLEVOIX CO, MICH.

Mr. Bartlett began with a single colony when he was 14 years old, has steadily increased, with no winter losses, until the spring of 1902 he was old enough to vote, and owner of an even 100 colonies, which he the next year increased to 150, and secured 4000 pounds of comb honey, besides extracting 7000 pounds. He dresses in white duck from head to toe, and believes that the use of this light-colored clothing saves him many stings and much annoyance from the bees. A train of cars was passing when this picture was being taken.

meals. His father lives in town, a mile and a half away, and when it comes time to pack the bees for winter they are hauled home and packed in the boxes that stand in his father's back yard. In the spring they are unpacked and hauled out to the apiary. The reason he gives is that he wants them under his eye all the time, and where they will not be molested by prowling marauders. Mr. Bartlett's onward and upward career as a bee-keeper is one that I shall watch with pleasure.—Bee-Keepers' Review.

## Our Sister Bee-Keepers

Conducted by  
EMMA M. WILSON, Marengo, Ill.

### Late Fall Warm Days—Apple Honey.

DEAR MISS WILSON:—Referring to yours, "I never knew before that there are localities where there are no warm days after buckwheat frost" (page 88), I will explain more fully.

Our sun has considerable power well into October, and we have many beautiful days some years, that would be quite summery but for the icy breath—our foretaste of winter—that sweeps down from the Adirondacks or across the Lake from the Green Mountains to us. These winds are bracing tonics for worn-out nerves; but prevent any work in the hives being practicable after the supers are removed, for we leave them on as long as there is a chance for an extra hundred pounds, or until after the frost that usually occurs at the full of our September moon.

Our seasons are about a month shorter at each end than they are in

Orange, N. J. Vegetation starts from 4 to 6 weeks later, but it hustles! In September we have the Jersey's October. Our October is their November.

I promised to tell you of a strange experience in our bee-yard last fall. Here it is:

We extracted just prior to the untimely frost of Sept. 10, after which we had several warm, beautiful days. As the bees were quite active I left the supers on for a week or two, thinking they might be working on a patch of flora that had escaped the frost. When the weather changed and the supers were removed, I found in them over 400 pounds of a delicious-flavored honey, utterly unlike any ever before gathered at Clovernook.

Our apiary is in our apple orchard. We had a very heavy yield this year, and twice each day the windfalls were collected and fed to our ducks. They ate three bushels a day. The honey had a very decided flavor of apples, and I concluded the bees got their nectar from those left in the grass or that rolled under their stands; but still I could not account for the 400 pounds as returns from the few apples that we had missed. I silently puzzled over the matter quite a bit.

Early in November, when I was fill-

WILD RED, RASPBERRY IN ALL ITS GLORY.

The timber has been lumbered off, or cut for furnace wood, and the raspberries have completely occupied the ground. This view was taken in Kalkaska Co., Mich., and there are thousands of acres in that and adjoining counties where similar growths of berries each year "waste their sweetness on the desert air"—there are no bees there to gather the nectar.

ing an apple order for a A No. 1 fruit, I could scarcely find a perfect Tolman Sweet. They were covered with little punctures—small, black specks. These trees are in the bee-yard. None of our other varieties showed these spots. I remembered noticing bees crawling over apples and tap, tapping on the skin with their tails, and when I saw these spots it seemed as if they might have punched the holes with their stingers, and then turned around and licked up the nectar.

A friendly bee-keeper in Saratoga, to whom I confided my suspicions, wrote me that she had a similar experience in her orchard, only more so. Her fruit was badly punctured, and the bees were so thick on her windfalls that they drove her away when she tried to gather the fruit.

Our Farmers' Institute sent us last week, among other speakers, Prof. Stewart, of the Geneva Station, whose specialty is the diseases of fruit, especially apples and trees. I privately told him my tale, and gave him two sample apples, which he took away, and after careful testing will report to me results, which he expects will

simply show whether the defects in the apples are due to disease or the sting of an insect.

Usually, you know, when the apples are growing mellow, the buckwheat bloom is at its best, and after the frost the bees take only short flights at about noon. At that time in the fall we gather our app'es. This is the first fall, in my 10 years' experience here, that we have had so early a frost followed by such beautiful weather, and if my surmises are correct, this may account for the experience.

I will send you Prof. Stewart's report as soon as it is received.

(MISS) FRANCES E. WHEELER.  
Clinton Co., N. Y.

That report of Prof. Stewart will be awaited with much interest. But, surely, the finding will not be that the bees had any hand (or sting) in puncturing the fruit. At one time Rev. W. F. Clarke gravely asserted that bees used their stings as trowels with which to work the wax in building their combs, but no particle of proof was ever given for such statement, and no one takes it seriously nowadays. It is extremely doubtful that the bee ever

uses its jaws to puncture fruit, and still more doubtful that it uses its sting for that purpose.

It is true that bees do make a sort of tapping with their tails that you have been observant enough to notice; but when you saw them doing so did you ever see one thrust out its sting? It ought easily to be seen, if the sting is thus thrust out. Did any one, in any case, ever know a bee to thrust out its sting while in the act of searching or taking a lunch? It might be suggested, also, that if a bee should sting an apple and then turn around to lick up the escaping juices, the act of turning around could be plainly seen. Please note next fall whether such turning around really occurs.

It may be interesting to some of the sisters to know that Miss Wheeler is a member of the faculty of the Columbia School of Poultry Culture in New York State. She makes a specialty of rearing high-grade Pekin ducks, most of which she sells at good prices as breeding stock. She also devotes a considerable portion of her time to bees, having found the combination of bee-keeping and poultry culture both profitable and pleasant.

## ONTARIO BEE-KEEPERS' CONVENTION.

REPORTED BY MORLEY PETTIT.

(Continued from page 152)

Mr. R. F. Holtermann read a paper on

### THE PAST WINTER'S LOSSES AND THE DEDUCTIONS TO BE DRAWN THEREFROM.

In the Canadian Bee Journal for September appears a letter from the veteran statistician in the Department of Agriculture for the Dominion, Mr. George Johnston, which reads in part as follows:

"We certainly had a severe loss in our bees here. I lost all I had in Nova Scotia. East of the Ottawa I think more than 75 per cent of the colonies were lost. That would mean 53,000 or 54,000 colonies dead, leaving not more than 17,000 that came through the winter, while 50 per cent loss west of the Ottawa would leave the stock of bees not more than 60,000, giving in all 77,000 where the census of 1901 gave a total of 190,000. This is a terrible death-rate, and at \$2.00 a colony the loss through the winter's action would not be far from a quarter of a million dollars for bees alone, to say nothing of the loss of honey through not having the bees. If the whole 77,000 give off two swarms this season, we would still be 69,000 to 70,000 colonies short of what we were in 1900."

The above statement, coming from such a source, has upon it the stamp of authority. I had previously placed the percentage of loss at 70, which in my estimation is not too high.

In estimating the financial loss, we must remember that a great many of the combs and hives in which the bees perished have become useless, the combs having been destroyed by that enemy (and friend) of the bee-keeper—the moth. The hives sometimes find a market at a loss, but quite often the moth renders them partially valueless, carelessness and time completing the work of destruction. Three or four dollars per colony would be a very conservative estimate of the loss in bees and hives. Again, the majority of the colonies that survived were in too weak a condition to take proper advantage of the honey-flow when it came, resulting in the loss,

through lack of workers, of a large percentage of nectar which might have been harvested.

Looking at it from a national standpoint, there would be a financial loss to the country of at least half a million dollars, and a blow to the industry from which it will take years to recover. So much for the fact. Next in my address I am called upon to make deductions.

Webster's Dictionary gives as the meaning of deduction, "That which is deducted or drawn from premises by a process of reasoning; an inference; a conclusion." Let me confess that this is a line of work I like, however feeble my powers may be to perform. Looking at bee-keeping as a whole, I see in many of the articles which are written for bee and agricultural papers in general, in the items in the general press, even in the addresses at conventions, and in the discussions which take place, a great many statements as to what the exponent does, or informing others what they should do, but painfully little as to how he should act under given conditions, and showing why it should be done in that way. There are laws in Physics, in Chemistry, in Nature, which can be explained and made intelligible to even a simple-minded individual. Without the above, in connection with instruction, there can be no intelligent action and no solid, intelligent progress.

Conditions studied are of prime importance, and the foundation of successful action, and such a course would lead to greater harmony in our discussions, greater intelligence and greater progress in the bee-keeping industry, and vastly benefit us individually and collectively.

To learn to think truly, and not merely imitate or ape would not only lessen the per cent of winter loss, but would revolutionize many of our lives for time, yes, for eternity.

May we from last winter's experience come to the conclusion that Canada is not suited to this, the æsthetic branch of agriculture, or may we even say that it is not a safe branch of agriculture in Canada? Far be the thought from us. As to quality, wherever shown, the quality of Canadian honey has proved itself to be unsurpassed. Judges—not Canadian, even foreigners—have again and again pronounced in favor of our honey. British experts, honest men, who had a love for and a fostering interest in the development of bee-keeping in their own land, have told me and others that our Canadian honey leaves nothing to be desired.

As far as the winter is concerned, we have among us those who winter bees with as great certainty and success

as the shepherd and the herdsman winter his flocks and herds. In this respect what one can do another may. Shall we then say that the past winter was a winter in which bees could not be wintered with success? We must admit it was the most disastrous for many years. To my recollection we have had none like it for 23 years, but both in repositories and outside bees were, during the time under discussion, wintered with success. Such a line of argument must then fall to the ground.

Shall we then say that a great many do not know the conditions under which bees can be wintered with reasonable safety? If we can judge from what we see and hear, we may surely make this assertion with safety. There are many who do not know, who can not know, the conditions under which bees can with reasonable safety be wintered. They have begun bee-keeping through the acquisition of a stray swarm, or the microbe of bee-fever has taken root in their mind through the success of one who has devoted his time to the work. They see the returns, but not the labor. No literature upon the subject is sought; they have no proverbial "long-felt want," or short either, for knowledge. An old hive is bought, perhaps with foul-brood germs; this neglected hive may be a breeding-place for this disease, and the moth. During their short career as bee-keepers, if product they have, it is oftener than not, taken in such a shape that when sold it depresses the market. They sell at a sacrifice. This class of bee-keepers is a menace to apicultural society, and cannot be too strongly discouraged. With the beginner who sees in it a business and desires to engage in it in a business-like way, we as individuals and especially as an association having a Government grant, entrusted with public money, should have every sympathy.

Let us state the truth, that bee-keeping is an occupation full of problems, which multiply to our view as we gain experience and rise in it.

The occupation we know nothing of is the one which appears simple and easy to understand. Let us take home the wholesome lesson in spiritual as well as temporal life, imparted when man fell, "In the sweat of thy face shalt thou eat bread"; to produce good, evils must be resisted and difficulties overcome. We can easily recognize this class who do not know the conditions under which bees can be wintered with reasonable safety. There is, however, under this head another class, perhaps not as numerous, but more dangerous, who can do an immeasurable amount of harm in influencing the less experienced and less thoughtful bee-keeper. I refer to the blind leaders of the blind. It is a well-known joke among the veterans that when a bee-keeper has a little experience he knows more than he ever will again; he can tell you all about it; this he realizes he never can at a later stage of the game.

I am fairly familiar with the various branches of agriculture, having been brought up on a farm, worked on a farm, taken a course at the Ontario Agricultural College, and kept in touch with the developments of modern agriculture since. Seeing from that standpoint, it seems to me that no class of agriculture is handicapped as bee-keeping is with such inefficient instructors and experimenters in one way and another. Anything and anyone is good enough to take the bee-department, when in other lines it would not be offered or tolerated. These agencies, be they Government or private, by their action endorse the thought that it requires no training to keep bees, and these agencies help to swell the ranks of those who increase the percentage of winter loss, and who are a menace and a detriment to the agriculture of a country.

Our world's governments, if we except some countries in Europe, our public institutions, our press, in the development of our various branches of agriculture, remind me largely of the unjust father who had a large family to provide for, and found it impossible to give to every child a first-class education and position, so he sent some to school, college and university; they became noted men; others, however, instead of educating them at school and university, he set at breaking stones on the road; the children became marked contrasts; the former in time looked down with scorn upon the latter; the stone-breaker as the eminent man's carriage drove by, justly despised and perhaps envied his rich brother because he had been elevated by having given to him what was justly the stone-breaker's share, and the head of the family was judged for his partial action, and condemned by every just and thoughtful person. Some branches of agriculture are rolling by in their carriages, whilst apiculture and apicultural markets are still in the stone-breaking stage.

Then we see those who know how to prepare their bees, but are too busy, too careless, and too indifferent to put that knowledge into practice. We know of many who undertake too much, who have too many irons in the fire; the return they get for the capital they have invested is a loss, a reputation for lack of thoroughness, to say nothing of added worry and annoyance. The person who is constitutionally a little behind should never keep bees. The "too many irons in the fire" man never reaches the degree of success where that success gives him a stimulus and pleasure of which the ordinary man knows nothing. We are in the days of the specialist; no man is competent to lead in a variety of agricultural subjects.

My last deduction is that last winter's experience, and years of experience, teach us that bee-keeping is a branch of agriculture which punishes sooner or later the careless, inexperienced bee-keeper, and the person who cannot give it due attention. And it rewards liberally the careful, energetic, thrifty and studious performer; in other words, it is worthy the attention of our brightest minds and dispositions. This last deduction is sound, and the more we blazon abroad this fact, the better for bee-keeping, and the better for the country. The more successful bee-keepers' will we have, the less of the dangerous elements. Bee-keeping is an occupation peculiarly dangerous to one of a slothful or improvident disposition. Action has to be taken when present circumstances would not spur us to that action. To prepare for a honey-flow weeks, yes, months, before, when cold would rather draw us to the fireside; to prepare for a rush of honey when scarcely a bee is stirring in the apiary, requires energy and foresight. The life history of the bee, a knowledge of the best implements, mechanical training, botany, chemistry, entomology, physics, and meteorology, the nature of soils, physical strength, mental endowments and business acumen possessed and applied, all will be rewarded when one engages in bee-keeping. This is more or less true of all branches of agriculture.

In choosing a life profession the parent and child often choose a calling where the means financial, mental and otherwise, can give no hope of being in anything but the vanguard of the profession. Desire in this should be governed by solid sense. The careless and thoughtless, and the poorly-equipped and shiftless, better not follow agriculture as a business, and select something which does not require so wide a range of information and powers. It would be better for him to become a lawyer, a doctor, a merchant, a politician, or the like.

Strictly speaking, my subject ends here, and yet I venture an addition to what has been said, to say a few words upon the additional prevention of these winter losses. Seeing that every colony has a fertile queen, of the best wintering strain, and 30 pounds of winter stores, would reduce the percentage of winter loss very much. The colder it is the more compactly bees cluster. If stores do not reach the cluster they may not be able to break the cluster to reach the stores, and starve. This is frequently the case during prolonged cold-spells, and only a moderate amount of stores in the hive.

The moisture given off by the bees should be expelled from the hive. After allowing in outside wintering sufficient packing to protect from cold, there are two methods advocated. By means of one, the fresh air is brought in at the entrance of the hive, and the air laden with moisture and carbonic-acid gas carried off at the same opening.

The other method is to bring in the pure air at the entrance and carry the foul air by the pressure from the fresh air entering the hive, and the natural tendency for the warmed air to rise, by these means to carry the exhausted air through the packing above.

Arthur C. Miller, in the Review, lays down in no uncertain tones that the entrance is the proper opening for fresh air, and also the outlet for foul. In a stove we have the place where the fresh air enters, as in the hive we have the entrance to the hive. In the wood and fire we have combustion and oxidation, as with the bees and honey we have combustion and oxidation. When the fresh air entrance becomes the natural outlet for the smoke and carbonic-acid gas, then the entrance to the hive will be the natural outlet for the exhausted air of the hive.

In the common entrance and outlet we have what is known in science as a friction of air currents, the bees wasting energy in expelling it, as they do in forcing the warmed atmosphere down. Another objection is that more or less of the exhausted, impure air, must be drawn back into the hive by what is known as diffusion of gasses. But what makes this advice so dangerous in colder climates—and I have no doubt that this advice has led to the loss of many a colony of bees

during the past winter—is that as the moisture-laden air returns to the colder part of the hive, it condenses and freezes, the distance inside of the hive the moisture condenses depending upon the cluster, the size of the hive, the size of the entrance, and the efficiency of the packing. Such conditions were common, and the cold and damp atmosphere with the frozen entrance destroyed the bees. Let me say that cold alone rarely kills bees. I saw in Norfolk during the latter part of March bees alive and apparently in fair condition that had been standing out all winter in hives, with upper stories, and a  $\frac{7}{8}$ -inch hive-cover, the combs and the bees in the lower chamber of the hive did not even have a thin cloth above them, the nearest protection was the warped  $\frac{7}{8}$ -board at the top of the upper story. Cold was there surely in abundance, but no moisture lingered in the atmosphere about the bees.

The right method is the chimney principle—the foul air carried away at the top, packing enough to keep the bees warm, but not so abundant or so compact that the foul air could not rise through the packing on the hive. Here where the moisture leaves the hive the hive is warm, the heat of the cluster and the air rising and no condensation takes place until the moisture reaches the top of the packing, or until it strikes the under side of the outside case-cover. Here it can be disposed of at favorable periods by allowing moderate ventilation under this cover. The common opening ventilator is wrong in principle in any climate, but particularly injurious and dangerous in a cold climate. I trust I have made this clear.

In inside wintering there have been heavy losses, chiefly in repositories which could not maintain an even and sufficiently high temperature. The moisture above-mentioned has also not been carried off. This combination with low temperature resulted in heavy losses.

Our own repository, which will hold 1,000 colonies, and has this winter 700 in it, is especially built with the object of securing a uniform but sufficiently high temperature. The fresh and the foul air is not brought in at the same entrance, but for convenience and economy of space the back of the hive is raised two inches on the stand and  $\frac{3}{8}$  inches from the bottom-board. Through this rear-opening the foul air escapes.

In conclusion, let me say, not alone will these periodic attacks occur to bee-keeping, but the cheapest production and the best goods will not be secured, neither will we have our markets developed to their best until we secure that recognition for bee-keeping and that aid in the development of the industry which has been given to other branches of agriculture. We may bluster, we may make statements that bee-keeping does not require such aid, but it cannot be shown by a line of logic that in this respect the principles which govern its development are different from other branches of agriculture. Dairying would not go back to the days before it had no fostering care. Fruit-growers value the help they are getting; the poultry industry has been put upon a more profitable footing; and so might bee-keeping have a new era of prosperity under proper guidance.

R. F. HOLTERMANN.

J. K. Darling—Much loss of bees was caused by the dearth of honey last season. The bees quit breeding too early, and did not have enough honey for winter.

J. B. Hall—They started breeding too early and exhausted themselves. Old age comes not from the number of months bees have lived, but from the number of babies they have reared.

Mr. Holtermann—Top ventilation is not so necessary in the cellar as out-of-doors. It is not a question of bringing the bees out alive. They must be in good condition for best results.

Mr. Sibbald—They must have heat to expel the moisture at the entrance.

D. W. Heise—The loss was caused by the continued low temperature. I had wintered successfully with no packing on the sides and bottom—only on top, but that was not sufficient for the last winter.

Mr. Chadwick piles his bees five high in the cellar; has ventilation all at the entrance; and very little air is admitted to the cellar. He sets his bees out on April 27.

Morley Pettit considered the cover might well be tight when the hive is pried up  $\frac{3}{8}$ -inch from the bottom-board at the back. Of course some upward ventilation through a chaff cushion is good. The point to be observed is, warm covering for hives in the cellar to raise the hive temperature

above that of the cellar air. This facilitates change of air in the hive.

#### RESULTS OF APIARIAN EXPERIMENTS AT THE CENTRAL EXPERIMENT FARM—CELLAR WINTERING OF BEES—DESCRIPTION OF CELLAR AND GENERAL ARRANGEMENT OF HIVES.

The cellar is below a private house. The walls are of stone and the floor of cement. The bee-room, 11 feet 6 inches wide by 15 feet long and 7 feet high, allows three tiers of shelves and two passages. It is boarded off from the remainder of the cellar by a partition which extends all around the chamber, and far enough from the stone wall to allow of an air-space. Should there be enough bees to fill the cellar the boarding could be left out. Under the cement floor a layer of one foot of stones varying in size acts as a drain and keeps the cellar perfectly dry. The lowest shelf is 18 inches from the floor, the second 20 inches in the clear above, and the third 20 inches above that. Neither the hives on the third or uppermost shelf nor the uprights supporting the shelves touch the ceiling, so that no vibration can reach the hives from above. This chamber is thoroughly ventilated as is also the whole cellar. Before entering the bee-room is a smaller compartment with a door leading outside and another leading to the bee-room. Both rooms have sliding ventilators in the doors, so that outside air may be let in at will. Ventilation is carefully attended to and sudden changes of temperature are avoided; for this, a thermometer which is always kept in the cellar, is watched. The best temperature for the bee-cellar has been found to be from 42 to 48 degrees Fahrenheit. This arrangement has given entire satisfaction. In former years there was not proper ventilation, and the cellar was always damp. Since the concrete floor has been laid and the ventilators put in, the cellar has been much drier and cleaner. It is also rat and mouse-proof, which is a very great advantage.

*Experiment No. 1.*—Six colonies were put into winter quarters in the cellar and placed on the shelves. Under the back end of each hive was placed a 2-inch block, each hive was besides raised from its own bottom-board by a one-inch block being placed at the back so as to insure free ventilation. All front entrances were left wide open, the wooden covers were all removed, and replaced with cushions made of chaff 4 inches thick, sufficiently wide and long to lap over the hive 2 inches. Temperatures were taken once each week all through the winter and were kept very even, from 44 to 48 degrees. The bees were quiet, only a very slight hum being noticeable up to February, when, the temperature having risen to 48, the bees began to get uneasy and made considerable hum. Cold air was carefully let in during the night by opening the slides in the doors and closing them in the morning; this of course lowered the temperature and the bees quieted down. During the past winter [1903-'04] every colony in this experiment was perfectly dry and clean, and all came out in excellent condition. Average weight of each hive when put into winter quarters, 58½ pounds; when taken out on April 22, 49¼ pounds per hive; showing that each hive had lost 9¼ pounds on an average.

*Experiment No. 2.*—Six colonies were put into the cellar and placed on the shelves, a 3-inch block being placed between the bottom-board and the brood-chamber only in front, making the full entrance 3 inches high across the whole front. The wooden covers were removed and replaced with a chaff cushion. Temperature same as in Experiment No. 1. During the whole winter all the colonies in this experiment were perfectly dry and clean, and showed no uneasiness of any kind. The bees could be seen hanging in a quiet cluster below the frames any time during the winter. The average weight when put into winter quarters on Nov. 23 was 59 pounds and 12 ounces; when taken out April 22, 51 pounds and 8 ounces; showing that each hive had lost on an average 8 pounds and 4 ounces.

*Experiment No. 3.*—Six colonies were put into the cellar and placed on the shelves, with tops and bottom-boards of the hives left on, just as they were brought in from the beeyard. They were watched for dampness, mold, or dysentery, also to compare the amount of honey consumed. Temperature of cellar the same as in Experiment No. 1. During December and January all were very quiet. During February there was considerable humming. Drops of water were noticed along the entrances of three hives. There were but very few dead bees on the bottom-board and no sign of dysentery. On examination when put on the summer stands, two of the hives had considerable molded combs. The aver-

age weight when put into winter quarters, 58 pounds and 10 ounces; when taken out April 22, 49 pounds and 3 ounces; showing that the average loss of each hive was 9 pounds and 7 ounces.

*Experiment No. 4.*—Six colonies were put into the cellar and placed on the shelves, with bottoms of the hives left on, just as they were brought in from the bee-yard. The wooden covers were removed and nothing left on except a tightly-sealed propolis quilt; the natural entrance was left wide open. Temperature of cellar same as in Experiment No. 1. During the entire winter the bees kept perfectly dry, and a very slight hum could be heard. There were but very few dead bees on the bottom-board and no sign of dysentery. On examination when put on the summer stands all the colonies were found to be in first-class condition. The average weight when put into winter quarters Nov. 23 was 59 pounds and ounces; when taken out April 22, 49 pounds and 3 ounces; showing that on an average each had lost 8 pounds and 12 ounces.

#### DAMP CELLARS FOR WINTERING BEES.

Many letters are received enquiring whether a damp cellar is a fit place to winter bees in. An experiment was conducted during the winter of 1902-3 with three colonies of bees. During the winter of 1903-4 it was thought best to try this experiment with six colonies in a similar manner as in the previous experiment. Seven pails of water were arranged in such a way that the colonies of bees would rest on the edges of the pails, allowing the full surface of the water to be exposed.

Six colonies were selected for this experiment, all of about equal strength, and all in Langstroth hives, weighing on an average 57½ pounds each. The wooden covers were removed from the hives and replaced with propolis quilts; the bottom of each hive was loosened from the brood-chamber and a block 2 inches square was placed at each corner between the bottom-board and the brood-chamber, ensuring free ventilation from the bottom of each hive. The cellar was kept at a very even temperature of 44 to 48 degrees. The bees could be seen hanging below the frames in a quiet cluster all winter. They were all examined once each week and at no time did there appear to be any sign of uneasiness from the extra moisture. There were scarcely any dead bees on any of the bottom-boards nor any sign of dysentery, and all came out in excellent condition. The colonies were put on the summer stands on March 20; the day being fine and warm, all began flying at once. The average weight of the six colonies when put on the summer stands was 44¼ pounds each. During the days intervening from March 20 to April 5 the weather was cool and no flying took place up to the later date. At this period there was but one good, bright, warm day (April 5) and the bees had to content themselves to remain indoors until April 22, when the weather turned quite warm. The bees then built up very rapidly and were in excellent condition for the honey flow.

A second experiment was tried, adding more moisture. Six colonies were selected for this experiment, all of about equal strength, and all in Langstroth hives, weighing on an average 58¾ pounds each. The wooden covers were removed from the hives and the sealed propolis quilts left on, the bottom-board of each hive being loosened from the brood-chamber and a block 2 inches square placed at each corner between the bottom-board and the brood-chamber, ensuring free ventilation from the bottom of each hive. Seven pails of water were then put on the floor in such a way that the six hives were resting on the edges of the pails, allowing the full surface of the water to be exposed. In addition to the pails of water six inches of sand was spread on the cellar floor between the pails and covering six inches of the floor outside of the pails. There was also a large cotton sheet spread over the six hives. The sand and sheet were kept thoroughly saturated with water once each week during the winter. The cellar was kept at a very even temperature of 44 to 48 degrees and was well ventilated during the whole winter. The bees in this test were more uneasy than in the experiment first described where no sand or cotton covering was used, having to keep up fanning for ventilation. There were also considerably more dead bees on the bottom-boards and several had drops of water along the entrance, but there was no sign of dysentery. On March 20, the day being fine, the colonies were removed to the bee-yard, where all began flying at once. The average weight of the six colonies when put on the summer stands, was 44¼ pounds each. From March 20 to April 22 the bees had but

one good flight. After April 22 the weather became considerably warmer, they began building up rapidly, and were in excellent condition for the clover bloom.

The average strength of the six colonies that had the extra moisture was not as great as in the former test, but as soon as they got fine weather they gained rapidly. Care was taken to see that the colonies in both tests had plenty of unsealed stores before fruit-bloom and between fruit and clover-bloom. This was done by uncapping one side of a frame of honey nearest to the cluster, allowing the bees to use up the honey for food and providing space for the queen to lay her eggs. Although so much moisture was in close proximity to the colonies, a great deal of the success of this experiment is no doubt due to the good cellar in which it was tried, the cellar having stone walls, cement floors, good ventilation and the temperature being easily regulated. This goes to show that good ventilation and even temperature have a great deal to do with successful wintering. An excellent plan for ventilating is to have sliding ventilators in the doors, so that much or little air may be let in as desired. Also connect an extra stove-pipe, provided with a damper to the regular heating stove. This may be done by means of a T or an extra flue will answer. Allow the pipe to extend into the cellar. This plan of ventilating has proven very successful.

#### EXPERIMENTS TO DETERMINE WHICH BEES WOULD CONSUME MOST, OF HONEY OR SUGAR, WHILE BEING CONFINED IN THEIR WINTER QUARTERS.

Eight colonies in Langstroth hives were selected for this experiment, all of as nearly equal strength as could be secured. On September 1 their natural stores were removed from both sets. On September 2 all were weighed as follows:

(a.) The 4 colonies fed sugar syrup: No. 1 weighed 30 lbs. 7 ozs.; No. 2, 31 lbs. 12 ozs.; No. 3, 31 lbs. 10 ozs.; No. 4, 31 lbs. 2 ozs.; average of weight 31 lbs. 4 ozs.

(b.) The 4 colonies fed extracted honey: No. 1, weight 30 lbs. 9 ozs.; No. 2, 31 lbs. 10 ozs.; No. 3, 30 lbs. 12 ozs.; No. 4, 31 lbs. 1 oz.; or an average of 31 pounds.

Miller feeders were placed in empty section-supers, close to the top of the brood-frames, any part of the brood-frames not covered by the feeder being covered by a propolis quilt cut so as to allow the bees a passage through it. By keeping the feeder well packed around, except where the bees enter, the heat is kept in and at the same time the bees cannot daub themselves with the liquid. In both experiments the bees had a constant supply of syrup and honey. Both the honey and the syrup were supplied to the bees at about blood heat. The syrup was made of the best granulated sugar, two parts to one of water by weight. The water was first brought to a boil, then the boiler was set back on the stove and the sugar having been poured in, the mixture was stirred until all was dissolved.

The 4 colonies fed sugar syrup when put into winter quarters November 24 weighed as follows: No. 1, 61 lbs. 4 ozs.; No. 2, 62 lbs. 9 ozs.; No. 3, 62 lbs. 7 ozs.; No. 4, 62 lbs. 0 oz.; or an average of 62 lbs. 1 oz.

The 4 colonies fed extracted honey when put into winter quarters on November 24 weighed as follows: No. 1, 62 lbs. 13 ozs.; No. 2, 62 lbs. 14 ozs.; No. 3, 62 lbs.; No. 4, 62 lbs. 5 ozs.; or an average of 62 lbs. 8 ozs.

The 4 colonies fed sugar syrup when taken from their winter quarters March 22 weighed as follows: No. 1, 47 lbs. 3 ozs.; No. 2, 49 lbs. 4 ozs.; No. 3, 51 lbs. 5 ozs.; No. 4, 51 lbs. 8 ozs.; average, 49 lbs. 13 ozs.

The 4 colonies fed extracted honey when taken from their winter quarters March 22 weighed as follows: No. 1 50 lbs. 9 ozs.; No. 2, 53 lbs. 1 oz.; No. 3, 51 lbs. 13 ozs.; No. 4, 51 lbs. 2 ozs.; average, 51 lbs. 10 ozs.

Difference in favor of the honey, 1 lb. 13 ozs. per colony.

When put into winter quarters they were placed on the shelves in the cellar, and the wooden covers were raised at one end ½ an inch, while the sealed propolis quilt was left undisturbed. The hives were all given extra ventilation at the bottom by placing at the entrance a wooden block between the bottom-board and the brood-chamber, thus raising the front of the brood-chamber 3 inches extra. During the balance of November and December very slight humming could be heard; January and February scarcely any appreciable hum could be heard. During the whole winter there was no sign of uneasiness of any kind and very few dead bees about the entrance, the bottom-boards were quite clean and no sign of dysentery in either experiment. All came out in first-class condition and built up rapidly for the honey-flow.

## INSULATING HIVES FOR OUTSIDE WINTERING.

Two colonies of equal strength with good laying queens in Langstroth hives were taken for this experiment. The hives were insulated against the winter cold by cushions in the following manner:

Slats 1 inch thick were nailed at intervals all around the hive; on these was tacked one layer of thick brown building-paper and then a layer of oiled paper, which increases durability and also keeps out vermin. In order to provide extra protection to the hive, a box six inches wider and six inches longer was placed over this with an opening cut at the entrance, 1 inch by 2 inches, all other openings being closed. The wooden covers of each hive were removed and replaced with a chaff cushion 3 inches thick, the latter placed on the propolis quilt, and lapping over the sides of the hive; two layers of paper were then placed on the top of the cushion and a second cushion added, with the top of the outside box over it.

The bees were put into winter quarters November 18. No sound could be heard from these colonies all winter, up to March 10, when a slight hum was perceptible. On March 20, the first bees made their appearance; there were many dead bees at the entrance of the hives. On March 21, the day being bright and warm, the outside cases were removed, leaving the paper and one chaff cushion on during the cold spring. Upon examination, one colony was found to be in fairly good condition; the other very poor, with many dead bees on the bottom-board. A few days afterwards the latter was found to be deserted. The frames in both cases were all dry and clean and had abundance of honey to carry them through from November to the clover bloom. Weight, when put into winter quarters, 53½ pounds each; in spring, 37¼ pounds each, or a loss of 16¼ lbs.

A second experiment was tried similar to the above. Four hives were taken for this test, instead of having them packed single. The four were placed in a large packing case, the case being one foot larger each way than the hives, the hives being placed six inches apart in the case, with six inches of cut straw on the bottom of the case for the hives to rest upon. The 6-inch space between the hives was packed with cut straw, also the one-foot space all around and on top of the hives. The entrance of two of the hives faced each that of the other, and two hives faced west. The entrance to the hives was kept clear of snow all winter to insure free ventilation. No sound could be heard from these colonies all winter.

On March 22 the bees made their appearance, when many were flying briskly going out and returning. From March 22 to April 22 the bees had but one good flight. On April 22 they were then examined. Very few dead bees were found on the bottom-boards; the combs were dry and clean and no sign of dysentery. They were then removed from the packing case and placed on the summer stands. The average weight of the hives when the bees were put into winter quarters was 62½ lbs.; when put on the summer stands, 49¼ lbs., showing that each hive had lost 13 pounds and 4 ounces. The weather at this date being bright and warm the bees built up rapidly and were in excellent condition for the honey flow.

This experiment was tried in a well-sheltered corner where no cold winds could get at the hives.

## SAINFOIN.

This clover has again attracted much attention on the Central Experiment Farm, both as a fodder-plant and also as a honey-producer. Sainfain sown in May, 1903, came in bloom on Aug. 15, of the same year, was cut for hay on Aug. 23, and gave a yield per acre of one ton and 760 pounds of cured hay.

The autumn growth was allowed to remain as a cover for protection to the roots over winter. The summer of 1904 growth strong and even; height averaged 23 inch; came in bloom May 31, and lasted up to June 20, when the plot was cut for hay. These dates might have been extended had the plants been grown merely for honey; but as they were at that time in the best condition for hay they were cut for that purpose.

The yield of the first cutting was 2 tons 840 pounds of cured hay per acre. The second bloom was on July 30, and lasted until Aug. 15, when it was again cut for hay, giving one ton and 837 pounds of cured hay per acre, or a total yield for the year of 3 tons and 1,677 pounds per acre.

## INTRODUCING QUEENS.

Eight queens were introduced during the season, four on the Benton plan and four with frames of brood taken from several hives. All queens belonging to the colonies that were to receive the imported queens were removed 24 hours before introducing the new queens.

*Benton Introducing Cage Method.*—The Benton mailing and introducing cage is ordinarily used over the country. This consists of an oblong block of wood with three holes bored nearly through, one of the end-holes being filled with "Good candy, and the other two being left for the occupancy of the bees and queen. On the back of the cover are printed the directions for introducing, and at each end of the cage is a small hole bored through horizontally, but which in the mails is stopped by a cork. One hole is for the admission of the bees and queen preparatory to mailing, and the other for the liberation of the queen, by the bees eating out the candy in the course of 20 to 30 hours, thus releasing her automatically. When the cage is received, the cork covering the candy is to be removed, as well as the wooden cover over the wire-cloth. The cage is then placed on top of the frames, care being taken to place the wire-cloth over the space between two frames in the center of the brood-nest. The queen is then released by the bees in the manner explained.

I would advise all to have extra cages for introducing so that no disease may be brought in with the queen. See that the cage you introduce with is thoroughly cleaned, and have fresh food in readiness made from your own honey placed in the cage. Then remove the queen and bees from the cage they were received into the one prepared for them and follow directions above.

*How to Make Honey and Sugar Thick for Feeding.*—Take good, thick honey and heat (not boil) it until becomes very thin, and then stir it into pulverized sugar. After stirring in all the sugar the honey will absorb, take it out of the utensil in which it is mixed, and thoroughly knead it with the hands. The kneading will make it more pliable, and soft, so that it will absorb or take up more sugar. For summer use it should be worked, mixing in a little more sugar until the dough is so stiff as not to work readily, and it should then be allowed to stand for a day or two; and if still so soft as to run, a little more sugar should be kneaded in. A good deal will depend upon the season of the year—there should be more sugar in proportion to the honey in warm weather than in cool weather.

## ANOTHER METHOD OF INTRODUCING QUEENS.

Select a strong colony, remove the wooden cover, and place a fine wire netting over the tops of the brood frames to prevent passage from one hive to the other; place on top of this wire-cloth a brood-chamber with 4 frames of well-sealed brood, selected from different hives, with young bees just hatching out, but with no unsealed brood. Put the queen in this and close the hive bee-tight, and keep it over the strong colony four or five days. By that time a respectable force of young workers will be present, and the hive may be placed on the stand where it is to remain and the entrance to be made large enough for only one bee to pass at a time. As a matter of precaution against robbing, the entrance may be opened as the colony gets stronger. This later plan has never failed with me.

JOHN FIXTER.

## DIRECTOR'S REPORT.

The year just past has been a very peculiar one for the bee-keepers of this Province, and of the northern and eastern portion of the United States as well, in that there was an almost unprecedented loss among bees. This fact, coupled with the rather poor honey season, has resulted in a very small crop of honey. We have the satisfaction, however, to report that the quality of the crop secured has been up to the average.

The sum of \$200 was set apart for the affiliated societies. This was expended in accordance with the by-laws. There was no money granted to the different agricultural societies during the year, but we have added \$50 of the funds of the Association to the special grant from the Government for the prizes and other expenses of the Fruit, Flower and Honey Show. The Canadian Bee Journal has been sent to each member of the Association, as usual. As you will see by the reports of the different officers we are able to report that our finances are in a healthy condition, notwithstanding our extra expenses during the year.

THE DIRECTORS.

The election of officers resulted as follows: President,

H. G. Sibbald; First Vice-President, R. H. Smith; Second Vice-President, F. J. Miller; Secretary, W. Couse, of Streetsville; Treasurer, M. Emigh; Auditors, J. L. Byer and Jos. Thompson; Inspector of apiaries, Wm. McEvoy, of Woodburn; Assistant Inspector, F. A. Gemmill; Committee to revise report, H. G. Sibbald and Morley Pettit; Committee on transportation, H. G. Sibbald, R. F. Holtermann and Wm. Couse.

As the next place of meeting, Toronto was chosen.

## Report of the Vermont Convention.

BY W. G. LARRABEE.

The 13th annual meeting of the Vermont Bee-Keepers' Association was held in Middlebury, Jan. 12, 1905.

The meeting was called to order at 10 a. m. by Pres. Cram. Reports of secretary and treasurer were read and adopted, and Pres. Cram appointed the following committees:

**RESOLUTIONS**—J. E. Crane, H. L. Leonard, and Mrs. C. M. Rice.

**NOMINATIONS**—V. V. Blackmer, G. C. Spencer, and P. E. Crane.

Then followed a discussion led by J. E. Crane on the benefits derived by bees fertilizing flowers of all kinds, which was participated in by others.

G. C. Spencer then gave a talk on how to produce honey free from travel-stain. He thought travel-stain was caused more by using old combs than any other way. Mr. Crane prevented travel-stain by using a honey-board with entrances to the supers only on the sides and ends of the hive.

W. G. Larrabee then spoke on the production of comb versus extracted honey, as did many others. This discussion brought out the fact that honey would not be poisoned by being stored in galvanized-iron tanks.

The question box was opened by V. V. Blackmer, and several questions asked and answered. One was, "Is it any advantage to give bees water in the spring before they are able to fly?" Answer, no.

It was then voted that the 3rd article of the Constitution be amended so as to make the annual dues 25 cents instead of 50 cents.

Reports of committees and election of officers was the first on the programme at the afternoon session. The nominating committee nominated the old board of officers, and they were duly elected, as follows:

President, M. F. Cram; Vice-Presidents, for Addison Co., G. C. Spencer; for Orange, C. B. Fisk; Lamoile, E. K. Savery; Chittenden, C. M. Rice; and Rutland, V. N. Forbes. Secretary, W. G. Larrabee of Shoreham; Treasurer, H. L. Leonard.

Mr. Leonard then read a paper on the sources of sweets of the country, in which he gave the sources of Vermont honey as follows, in this order from spring to fall: Poplar, willow, soft maple, rock maple, horse plums or wild plums, apple and fruit blossoms, dandelions, raspberry, clover (including alfalfa), basswood or linden, buckwheat, smartweed and goldenrod.

Mr. Leonard also read an article from Gleanings, on how to tell if there will be a honey-flow next year. Others spoke on the causes of flowers secreting or not secreting honey. Mr. Crane said that a thunderstorm would reduce the flow of honey even if it did not come nearer than 30 miles. Prof. Seeley said that if red clover could be produced with a tube half the length of the present one, the amount of honey and clover seed would be increased millions of dollars.

Mr. Forbes being absent, others spoke on his subject, "Labor-saving conveniences in the bee-yard and honey-house." Mr. Holmes advocated the use of bee-escapes in taking off comb honey. He also spoke on the causes of the heavy winter loss in 1904. He thought the long, severe winter, combined with other things, was the cause. Mr. Cram thought the heavy winter loss was not caused by the severe winter, or by the honey the bees had to consume, but by the condition of the bees themselves, and said the advantages of cellar-wintering were 10 pounds less honey to the colony, less labor to put in the cellar than to pack out-of-doors, less spring dwindling, and more perfect wintering.

Mr. Crane said the advantages of outdoor wintering were the opportunity to have a flight in winter, better spring protection, and earlier brood in spring.

G. W. Fassett then spoke on controlling increase.

The question-box was opened again, and this brought out

a talk about the gypsy or brown-tailed moth, and it was thought it was not liable to be injurious to the bees or their forage. It was also stated that more alsike clover seed was sold by the dealers than either the red or mammoth varieties.

The question, "Will it pay to feed bees in the spring to induce brood-rearing?" was answered by Mr. Blackmer, yes; by others, no.

"Do bees gather more honey from white than alsike clover?" The general opinion seemed to be that more was gathered from alsike than from the white.

It was voted that the Executive Committee fix the time and place of the next meeting.

The treasurer's report showed a balance of \$10.55.

The Committee on Resolutions submitted the following:

*Resolved*, That a vote of thanks be extended to the proprietor of the Addison House for favors shown.

*Resolved*, That a vote of thanks be extended to the Rutland Railroad Company for reduced rates.

This meeting was very interesting and profitable, and was quite well attended. W. G. LARRABEE, Sec.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Bees Storing Water-Melon Juice.

My bees had access to a great many water-melons last fall and I think they stored considerable of the juice. They now have dysentery.

1. Would the use of the melon-juice cause dysentery?
2. Can I do anything for them before warm weather?

OHIO.

ANSWERS.—1. Most likely.

2. A flight is their hope. Most likely there will very shortly be a day warm enough for it. If in the cellar, take them out the first day they will fly, and if it is still, and the sun shining, you will find they will fly at 45° in the shade—possibly at 40 degrees by your thermometer, for thermometers vary. Then put them back in the cellar the same day or the next.

### Putting Bees Out Early—Largest Average Yield—Prevention of Swarming.

1. I often see it stated that bees should not be brought out of the cellar too early in the spring. In what way would it be any more injurious to them to do so than to the ones that are out all winter?

2. What is the largest authentically-recorded yield of honey from one colony of bees in one day, and also for one season?

3. How was the colony manipulated in the above instance?

4. Would it be too personal a question to ask what your average and also your largest (colony) yield was for 1904?

5. When you secured 300 pounds of comb honey from one colony how did you manipulate it, and how long was the flow on, or, rather, how many days were the bees engaged in gathering it? Was it all from one hive, or from one colony and its increase?

6. On page 186 of "Forty Years Among the Bees" is a plan to prevent swarming, called the "foundation plan." On page 188 you say that the plan worked well for the first two years, but not so well in 1902. Would you mind stating how it worked during the seasons of 1903 and 1904?

7. I keep from 10 to 15 colonies, but never get much honey—from less than nothing to about 30 pounds. I have the records of my wonderful "manipulations" of some of the colonies from June 1, 1903, to the present date. I would be pleased to send some of them to you if you think they might be of benefit as a warning how *not* to do it, and to show me when I made blunders. PENNSYLVANIA.

ANSWERS.—1. I don't know that I can give an entirely satisfactory answer. Experience has shown that bees taken

out of the cell in February or March, before flying weather has come to stay, do not do as well as when brought out later, unless they are taken back immediately after taking a flight, and upon this last opinions are not yet unanimous. You want to know why a colony brought out too early isn't just as well off as if it had been out all winter. Possibly it is as well off, if protected the same way. But when brought out of the cellar there is generally no protection given such as is given to those left out all winter.

2. I can speak only from memory. I think G. M. Doolittle had 20 pounds in one day, and a Texas bee-keeper from whom nothing has been heard of late years, claimed 1,000 pounds in one season from a colony and its swarms.

3. I don't know, but I don't remember that anything was credited to special manipulation. Perhaps Mr. Doolittle will enlighten us—although I doubt that manipulation would have much to do with the gathering of one day, beyond manipulation to get the right number of bees of the right sort at the right time. But there's a big lot in that. There is just a little room for suspicion in the Texas case, with no intention to deceive, that some other swarm may have clandestinely united to swell the product of that one colony.

4. The average yield in 1904 was about 60 pounds of section honey per colony. The best colony gave 153 pounds (165 sections). It was nothing like so good a year as 1903.

5. The largest yield I ever had from one colony was not 300 pounds but 300 sections, about 279 pounds. The manipulation recorded is as follows: June 22, eggs in queen-cells destroyed; July 1, queen-cells destroyed, two frames of brood were taken away and two empty combs exchanged for them; July 9, queen-cells destroyed; Aug. 4, destroyed 1 queen-cell; April 23 the hive was opened to see if the queen was clipped (she was of the previous year); May 12 to see how the colony was doing (it then had more or less brood in 4 frames); and it was opened at least three other times to see if queen-cells were present, but none were found. I don't know how many days the bees were gathering, but I think most of the time from early in June till first week in September. The 300 sections were the yield of one colony; it had no increase. The yield might have been more if the two frames of brood had not been taken away—and it might have been less.

6. It was not used enough to tell.

7. Send 'em along. We often learn more by failures than successes.

### Making Sugar Candy—Dry and Liquid Substances at Hive-Entrances.

1. On page 86 Mr. Dadant advises feeding sugar candy in the cellar. I should like to know how to make this candy, and other candies for feeding.

2. There is a whitish liquid running out of some of the hives in my cellar, and others have a dry substance like fine sawdust in front of the entrance. The hives from which the liquid comes seem to be wet and nasty inside. What is the cause of this? They have plenty of stores. IOWA.

ANSWERS.—1. Don't any of the girls or women in your neighborhood make candy? If they do, just get them to make you some plain candy. Take best granulated sugar and about one-fourth as much water, stir the sugar into the boiling water, keeping it on the stove. The greatest care must be taken not to burn it, for burnt sugar is death to bees in winter. Keep trying it, and when a little dropped in a saucer grains, take it quickly off the stove, stirring it, and pour it into dishes slightly greased.

2. The sawdust-looking material is the gnawings from the cappings and other debris, and indicates nothing wrong. The liquid is the moisture from the vapors condensing in the hive. Your cellar may be too cold, and hive-entrances hardly large enough.

### Queens Reared in the South—Serradella—Making Hives—Supply Dealers' Trust.

1. Will queens reared in the South be as hardy for a northern climate?

2. Do you know anything about the honey-plant called Serradella? The seed catalogs recommend it highly.

3. Most of the long-tongued queens advertised are spoken of as leather-colored. Are not the golden Italians as long-tongued as any?

4. I have 17 colonies now, and expect to have 50 colonies

this time next year. I make my own hives. On page 106 the editor rather discourages this, but I make just as good a hive as can be bought for my purpose. You gave me a pointer on those cleats on the end. That was where the hives were weak, as they would warp in wet weather.

Whatever the Editor says about it, I do think there is a trust to raise prices. If not why is foundation higher this year? Wax is the same price. INDIANA.

ANSWERS.—1. Theoretically, no; practically, yes. A strain of bees continued for a long series of years in a warm climate would hardly be expected to be as rugged as one continued for the same length of time in a severe climate; but with the constant exchange from one part to the other there is likely to be no appreciable difference. If there is any Italian blood in them, they can not have been in the South more than half a century at most, and in that time they would hardly have changed much in characteristics.

2. I have seen mention in foreign journals of serradella, or serradilla (*Ornithopus sativus*), but know nothing about it.

3. There is much variation in golden Italians, and you will probably find some with longer tongues than others, and the same with the leather-colored.

4. The Editor is without doubt correct in saying it is better to buy one's hives than to make them. That's the truth for 9 out of 10, if not 99 out of 100. If you find it is better for you to make them, you ought by all means to do so, but you're the exception to the rule.

For anything I know the price of foundation is more than it should be, but because wax is no higher it does not necessarily follow that foundation should remain the same. Part of the cost of foundation is in the labor, and labor is higher than it was. If you are so situated that you can make hives cheaper than you can buy, it is possible that you could profitably make your own foundation, either with a mill or with the Rietsche press.

### Cellar Wintering—Danzenbaker Hives—Introducing Queens.

1. I have always wintered bees outdoors, our cellar being too damp for them, but I lost so many last winter that I thought I would try cellar-wintering. About two weeks before it was time to put them away for winter I moved them a quarter of a mile where I put them into a neighbor's cellar with his bees. I expect to give them a flight in three or four weeks. Should they be put in the same place I had them before I put them into the cellar?

2. When I put them out for good would it be better to close up the entrance and bring them home, putting them on the summer stands, or leave them up there for a few days and then bring them home?

3. What is the best way to get them out of the cellar? This cellar is partitioned off for the bees, making it necessary to pass through two doors and up some steps.

4. Doesn't Doolittle give his bees a midwinter flight?

5. I introduced a fine-looking select-tested Italian queen to a colony before swarming, following the rules on the card attached to the cage. About a week later I overhauled the hives to find the queen doing fine work, but there were several capped queen-cells, which I destroyed. About a week later I noticed a number of bees in front of the entrance to that hive, and upon investigating I found the queen dead among them. I found a hatched queen-cell in the hive, and other capped queen-cells. I let them alone, expecting them to swarm, but they did not. In another week I again examined the hive and found the other cells all cut out, but this queen not yet fertilized. After that I looked several times for the queen, but could not find her. Nor was she fertilized. After spending hours looking for her (I gave the colony brood and eggs every now and then, but no cells were started), I tried different ways of introducing queens, but they killed every one of them. At last I put a light colony with a good queen (it being fall now) on top of this hive with a paper between them. They all went down into the hive and united nicely. But what was the matter with the colony? It meant the loss of about 50 pounds of comb honey.

6. I notice you don't think much of the Danzenbaker hive. I tried a few of them last summer, and I like them very well. I think I will get all of that kind. What is it that you don't like about them? Is it the changing from one hive to another?

7. Do you introduce all your queens now by the "drowning" plan? I haven't heard much of it lately. I had pretty

good luck by daubing the queen with honey, the bees accepting the queen nearly every time I used the plan.

I would like to have you visit me next summer. I am sure you would enjoy it.

MICHIGAN.

ANSWERS.—1. It will probably make very little difference. If they flew very little during that two weeks after being moved, it may make no difference. If they flew much, some of the bees will be likely to want to go to their old stands. Even that will not be likely to do any harm, for they will be kindly received, and what are lost to one colony will be gained by the other.

2. Set them out and let them have a flight; then bring them home as soon as convenient afterward.

3. There are steps to my cellar, and a man just picks them up and carries them out.

4. I don't think he does. Not many do, and one of the things now under discussion is whether it is best or not.

5. Hard to tell. It is possible that the young queen was still present, up to the time of uniting the two colonies, and while they would accept no queen alone, they preferred the laying queen when it came with another colony.

6. The difficulty of changing is not the reason I don't use the Danzenbaker hive. If I were now using Danzenbaker hives entirely, I think I would be to the expense of changing to the dovetailed. The difficulty of handling closed-end frames without killing bees, is a serious objection, but I might stand that rather than to buy all new hives. A more serious objection is that ten times—yes, I think a hundred times, as much pollen is carried into sections as with the dovetailed. The closed-end frames must be warmer, I think, for winter, and if you can handle Danzenbaker frames as easily as Miller frames, especially as they grow older, and if you have no trouble with pollen in sections, the Danzenbaker may be a good thing for you. The manufacturers are good friends of mine, but I can not believe they are doing a good thing for bee-keepers by praising the Danzenbaker hive so highly.

7. I don't drown them, although I said I did. That was because I was not sufficiently acquainted with the English language. I only hold them under water for a short time, although sometimes till they appear entirely dead. I used that method last year with a good many, and it's safer than putting in an uncaged queen without the wetting, but in many cases not so safe as caging.

I thank you for your kind invitation, but can hardly accept.

### Cutting Foundation—Placing Hives in the Cellar—Increase and Rearing Queens.

I took advantage of the club offer when renewing my subscription to the American Bee Journal to also obtain a copy of "Forty Years Among the Bees," which I have read, and like very much. Being of the number classed as *bee-owners* (I fear), having 9 colonies in the house-cellar with which I have had about 5 years' experience (the number of colonies varying from 3 to 15), I will take the liberty to comment upon some parts of the valuable book:

1. As per directions for cutting foundation (pages 142-144), would not the board mentioned, with its guides, work much better if those guides for cutting were each made of two separate pieces with just space enough between them to allow of the free passage of a 2-inch roller knife, which could be dipped into heated water between cuts? The space for the passage of said knife being  $3\frac{1}{4}$  inches,  $6\frac{1}{2}$  inches, etc., upon the guide frame; strips  $\frac{5}{8}$ -inch wide being used between spaces for cutting the  $\frac{5}{8}$ -inch bottom starters. The knife is made of a thin steel disk, having a small hole in its center, through which a rivet holding the crocheted handle passes.

2. In Fig. 109, page 301, I found a free advertisement in favor of Montgomery Ward & Co., for which I hope you received a nice donation. If you have not you *should*.

3. In placing the hives in the cellar I think it a very good plan to have the hive-bodies pitch forward to such an extent that any moisture that may condense on the covers will run to the end of the hive instead of dripping on the cluster, as it would if the hive stood level.

4. Do you think it would be profitable for me to increase by the method mentioned by you on page 260?

5. Would the field force of No. 4, as in plan given page 260, rear a good queen from young brood if I did not have a queen or cell to give them, when the made colony is placed where No. 4 was, No. 4 removed to a new stand, as per

second part of plan given? I am interested in farming as well as bee-keeping, so when the bees need the most attention the farm requires most of my time, hence one of them must suffer.

NEW YORK.

ANSWERS.—1. Not having tried it, I cannot say how it would work.

2. I made the mistake of not contracting beforehand that I was to receive a stipulated amount if that box should be allowed in the picture. I'll know better next time.

3. I'm a little surprised to find that the hives don't pitch forward in the book. They do in the cellar. Wait a minute, and I'll go down cellar and see how much \* \* \* I find the hive at the back end is from 1 to 2 inches higher than at the front. I'm not sure there's any great advantage in it. Certainly the slant is not enough to make the drip run to the front. Wouldn't it need 6 inches or more for that? and so much slant would hardly be desirable. Besides, I doubt that water often settles on the cover in my cellar.

4. It's largely a matter of convenience. If convenient for you to use the plan, I think you'll like it and find it successful.

5. No, or at least I wouldn't be satisfied with queens reared in that way. So much depends upon the queen that the best is none too good. You would be trusting to field-bees to start cells, and nurse-bees are the right ones for that purpose. If you want the bees to rear their own queen, you might combine the two ways; first set your brood over No. 4 over an excluder for an hour or so; and then set in place of No. 4, and you would have young bees enough. But there might, in that case, be some danger of swarming at the maturing of the first young queen.

### Streaks and Scum in Granulated Honey.

Last fall, when extracted honey in tanks began to granulate, I run some into paper oyster pails. When it became thoroughly candied in the paper pails, it had a white scum-like gum on top, and also white streaks running irregularly through the honey, so that it had a mottled appearance, when cut through. When winter set in I melted some of the same honey in the tanks, and run it into paper pails. When the honey in these latter pails were fully candied again it was all one solid color—no streaks running through it, and no light shades on top or on the sides.

How can I prevent these light streaks and scum-like coverings, without re-melting before running into the paper pails?

What would be the effect of running into the paper pails as soon as the honey is cleansed, after extracting?

MICHIGAN.

ANSWER.—I cannot speak with authority, but I'll say how it looks to me, and if I am astray I hope some of the good brethren with experience will straighten me out. I suspect that the streaked effect might be caused by different kinds of honey settling in different strata in the tank. It might also be caused by air-bubbles being caught in the partly-granulated honey. When the honey was melted, the air-bubbles could escape. It is quite possible that if the honey was run directly into the pails as soon as cleared it would be all right.

### Winter Hive-Entrance—Afterswarms—Alsike Clover—Piping of Queen—Alley Traps.

1. I winter my bees on the summer stands, having them in winter-cases with inch and a half sawdust between walls of the winter-cases and the hives. I allow an entrance of only 2 inches by  $\frac{3}{4}$ . Is this too small?

2. As to afterswarms, I have all queens clipped; give the swarm on the parent colony's stand, removing the parent colony to a distance. Parent colony still insists on sending out an afterswarm. Would it be better to destroy all queen-cells in the parent colony as soon as the young queen is heard piping, so as to be certain of allowing *no* afterswarm?

3. Can virgin or unfertile queens pass through queen excluding zinc?

4. Would 70 or 80 acres of alsike clover planted on the farm where the apiary of 50 colonies is located make any *appreciable increase* in the average of surplus honey stored by the bees?

5. What should I consider a fair *yearly* average for 50 colonies in this State?

6. Colony A swarms. Will a young queen be *always* heard piping in about 7 days thereafter?

(a) Will a colony ever swarm without the young queen's piping being heard 7 days after?

(b) Will a colony that has swarmed once send out an afterswarm if the young queen is not heard piping in 7 days?

(c) Finally, is a young queen's piping a certain sign of the intention of the colony's sending out an afterswarm, and the *not* hearing her piping a sure sign that no afterswarm is to be sent out?

7. What is the use or purpose of the bee-space now put behind the Alley queen and drone trap? Is it not just as good, for all practical purposes, without such bee-space?

VIRGINIA.

ANSWERS.—1. It is probably large enough, although I don't know how cold it is with you. If your bees are located so that there is no chance for cold wind to blow into the entrance, it is possible that a larger entrance might be better.

2. Destroying all cells after queen is heard piping ought to make a sure thing of it, unless it might be possible you had waited till the bees were just on the point of swarming when you cut out the cells, and would swarm without finding out that no cells were left. I don't know whether such a thing could happen or not. But hold on; 'fess up, now, didn't you move the old hive to a new location at the time of hiving the prime swarm? If you did, no wonder you had a second swarm. That's not the way. Hive the prime swarm on the old stand, and put the old hive close beside it; then move the old hive to a new stand a week later. You see, if you move the old hive to a new stand right away, so many young bees will hatch out by the time the young queen emerges that the colony will be strong enough to swarm. But if you put it close beside the old stand, and then move it a week later, all the field-bees will, on their return from the field, go to the old stand and join the swarm. That will greatly weaken the stump, or mother colony, and it will hardly feel it can afford to send out another swarm. Still further, the field-bees going to the old stand, there will be no honey coming in from the field, making them think, "Well, as the honey-flow has stopped entirely, we most certainly would starve if we should attempt to set up house-keeping in an empty hive; so let's not swarm."

3. A laying queen looks much larger than a virgin, but it's the abdomen that's larger not the thorax. It's not the abdomen, but the thorax that prevents a queen going through the zinc, and I think the thorax of a laying queen is no larger than it was when she was a virgin; so she ought to go through no more easily one time than another. But a virgin queen probably makes a more vigorous effort to go through, so she might go through an aperture through which she would not force herself after she settled down as a laying queen.

4. That depends. If the bees had all they could do on basswood or some other heavy yielder, the alsike would make no appreciable difference. If they had nothing or very little else, the alsike would make not only an appreciable, but a very big difference. I should suppose 80 acres would give 50 colonies more than they could possibly do.

5. I don't know. Possibly 1,500 pounds.

6. I wouldn't like to be too positive about it, but I think the young queen always pipes before she is many hours out of the cell; usually about eight days after the issuing of the prime swarm, although it may be 2 or 3 days sooner than that time, and possibly several days later.

(a) If you mean a second swarm, I think the queen will always pipe before swarming, perhaps not often as soon as 7 days.

(b) I don't believe it will send out an afterswarm till after the piping; but, as before intimated, the 7 days is not right.

(c) Please allow me to answer the spirit rather than the letter of your question. You may rely with much confidence upon the noises made by young queens in deciding whether an afterswarm will issue or not. Eight days after a prime swarm has issued, place your ear against the side of the hive in the evening when all is still, and if swarming is planned for the next day you will hear a young queen piping and one or several yet in their cells quahking. The quahking is not so shrill as the piping, and seems more hurried. If you hear *both* the piping and quahking you may confidently expect an afterswarm, generally as soon as the next day. If you do not hear it, you may as confidently say, "No swarming to-morrow." In most cases you may settle it one way or the other by listening that one evening. But, as before intimated, there may be a variation in time. If the weather has been wet and cold, the prime swarm may have been delayed in its time of issuing, making the time till the issuing of the second swarm just that much less. Or, the

time may be longer, and it may be worth while to listen on the evening of the 9th day or later. But you needn't listen any later than the evening of the 15th day. As said before, I think the young queen pipes in all cases, swarm or no swarm, but there must be both piping and quahking to make you expect a swarm, and if there is to be no swarm the piping will be neither so loud nor so long continued, and you will not likely hear it at all.

7. I don't know. I haven't seen traps made very lately. Perhaps Mr. Alley will tell us.

### Bees Under the Snow—Feeding Bees—Candied Sections.

1. My colonies are buried under the snow. Will they smother? I have planer shavings on top to let the air through.

2. What is the best way to make candy for bees, and how would you feed it?

3. Which is the best feeder to use in feeding either honey or sugar syrup, so that the bees will not be disturbed very much?

4. I have some honey that is a little sour. Will it injure the bees if I feed it to them in the spring?

5. I have some sections filled with candied honey. Would it be well to melt them, feeding the honey to the bees and saving the wax?

WISCONSIN.

ANSWERS.—1. Enough air works in through the snow so there's no danger of smothering. But look out not to let the entrance become filled with damp snow and then freeze solid.

2. Just the same as your women-folks make it. Stir the sugar into a very little water in a vessel on the stove, and when a little dropped into cold water is brittle it is done. Lay the cake of candy over the frames and cover up warm.

3. The Miller feeder, the Doolittle frame feeder, or the Boardman entrance feeder can be used with very little disturbance.

4. Not after they are flying every day or so.

5. There is probably no better way. The honey will also be good for table use.

### Producing Comb Honey With and Without Separators.

BY M. A. GILL.

I see the question, "Can marketable honey be produced without separators?" has been passed upon by the Board of experts, on page 20. When I look over the list of names and see the decided opinions where the answer is "No," I am reminded of the case where a prisoner in jail had sent for his attorney who, after viewing the case, said, "Why, they can't put you in jail!" Whereupon his client answered, "But I am in here!"

Is it possible that these experts are not aware of the tons upon tons, and carload after carload of honey that goes to market every year that has never seen a separator? Is it possible, too, that they are not aware that there are a number of markets that prefer this kind of honey to the most perfect separated honey that was ever produced? Why is this so? It is because honey is sold by weight there instead of upon its merits.

Not all markets are alike, however, as some jobbers prefer, and their market demands and appreciates, a nice, straight article, weighing from 21 to 22 pounds per case of 24 sections, which is all that a carload can possibly weigh, as an average, where the honey is produced with a full set of separators.

When sections were first invented they were made intending to hold one pound of honey, and they met the requirement very well, weighing from 15 to 17 ounces. Soon after separators were adopted, using the same sections, cutting off one-half of a bee-space, the weight dropped to from 14 to 16 ounces, much to the detriment of nice, straight sepa-

rated honey, when sold in markets where they care nothing for quality but are stricter on the matter of weight.

I have in mind a carload of honey that went east within the past three years, to a large wholesale dealer and jobber. In the car were a few hundred cases of almost perfect honey, fit for exhibition purposes, and weighing from 21 to 22 pounds net, average per case. The balance of the car was made up of unseparated honey, many sections being so bulged and pussy that they would vary from 12 to 20 ounces, but, as a whole, would weigh from 22 to 25 pounds net, per case; but it was almost impossible to take a section from the case without breaking the cappings.

When loading the car I thought how I wish it was *all* like the first, then I knew my fastidious buyer would be pleased. But imagine my chagrin when the buyer drew on me for damage on the first-mentioned honey, and has never ceased to sing the praises of the bulged and pussy stuff, saying it brought him from 25 to 50 cents per case more than the "light honey," as he called it. This honey was sold to the jobber by the case.

Now, most writers, and some editors, teach that he did right—that comb honey should *always* be sold by weight, claiming their conscience bothers them if they know a customer gets an ounce more or less than actual weight. Right here I want to plead guilty that my conscience is not so tender, and that I believe in paying a premium for quality. Hence I buy my oatmeal by the package, and my pills for their quality instead of how many there are in a box.

And if I have two cases of honey, one weighing 22 pounds net, and it is perfect, and the sections can be handled like a child's toy blocks; and another weighing 25 pounds net, but is bulged and cannot be handled without causing it to leak, I claim that right to offset quantity with quality.

And if you are not going to allow us this privilege, won't you please have the manufacturers make a little difference in the size of the sections so that each will have a fair chance?

Tell the board of experts, who say marketable honey cannot be produced without separators, *that it is* produced and sold by the carload, and even preferred (in some markets) to the finest separated honey they can show up.

These conditions will exist so long as both use the same size section-box, and so long as honey is doled out by the ounce and no premium paid for quality.

We can only deal with these conditions as they exist, and the facts are simply this, that there are 24 (so-called) one-pound sections in a case, and people have been taught to expect (approximately) 24 pounds of honey. Without separators, they can get it, but with separators 22 pounds net is a high standard of excellence for a carload of 30,000 pounds of No. 1, and 20 pounds net for No. 2.

Then why not adopt a universal standard of weight and excellence? It would surely increase the sale of honey, because dealers would push the sale of it.

I have known many dealers (retailers) who abandoned the handling of comb honey, because of its mussiness, for it would daub up the counter and everything near it. Still, it had the one merit of being heavy honey. Juggle with these conditions as much as you please, and the fact will remain that 22 pounds of nice, separated honey is truly worth more than 24 pounds, or even 25 pounds, of bulged and leaky stuff—and yet the "stuff" brings the most money.

For years I have been producing both kinds, and carefully watching the market demands, and I must confess I hardly know now which to adopt, whether to use all separators and produce the lighter but more fancy honey, or throw away all separators and produce all heavy honey.

I find the extreme East and Northern markets prefer quality to quantity, while the more Southern and Western markets prefer quantity to quality. I have come to these conclusions after handling from two to five carloads per year for the past five years. Boulder Co., Colo.

## Species and Races of the Honey-Bee— Other Matters.

BY PROF. A. J. COOK.

One of our most prolific writers, in scientific entomology, is Dr. William H. Ashmead, of the United States National Museum. He has been one of the leaders in systematic work in the Order (Hymenoptera) which includes our bees. This gives his opinion great weight in this Order, and so we are greatly interested in his revision of the genus of the honey-

bee. In Volume 6, No. 2, of the Proceedings of the Washington Entomological Society, published in May, 1904, he gives his views of this group, which must interest all who care for bees or give study to these interesting insects.

Dr. Ashmead divides the old Linnæan genus *Apis* into 2 genera: *Apis* and *Megapis*. This latter is a new genus, and is appropriately named, as the prefix means "large." The form and position of the eyes and ocelli and the wing structure, give warrant to this change, in the opinion of Dr. Ashmead. On page 46 of the latest edition of my *Bee-Keeper's Guide*, (1904 edition), the reader will find the species and races described.

Two species are included in this newly-founded genus. One is the much discussed "*dorsata*," which we will now know as "*Megapis dorsata*," instead of "*Apis dorsata*," the name which we have used to designate it in the past. This species is found on the islands off Asia from Ceylon, where, as we know, Mr. Benton found it, to our own lately acquired possessions, the Philippines. The bees are very large, black, with yellow bands crossing the abdomen. In some cases nearly the entire abdomen is said to be orange-yellow. The other is *Megapis zonata*, also found in the Philippines, and in some other islands. These are blacker than are the others, but not as large. The first two segments of the abdomen are lined with whitish.

In the genus *Apis*, Mr. Ashmead places *Apis mellifera*, which, as we know, has been carried to all parts of the world. I suppose it originated in Asia; *Apis cerana*, of China and Japan; *Apis nigrocincta* of China, Malay Peninsula, the Philippines and India; *Apis Indica*, of India; *Apis nigritarum*, of Africa; *Apis unicolor* of Madagascar, and *Apis florea* of India. Dr. Ashmead suggests that the last should really be separated, and though while he gives it as belonging to the genus *Apis*, he suggests that it be removed to a new genus and suggests the very appropriate name of *Micrapis*. While the changing of names and the undue increase of names in describing and writing of plants and animals, is not to be encouraged, yet I believe that these changes of Dr. Ashmead are warranted, and that we may well use these new names in our future references.

### GOVERNMENT AID TO APICULTURE.

I read with much interest Mr. Benton's address at the St. Louis Convention. I think it was correct for the most part, though in one or two points I know the truth to be a little different. The Late Dr. Edwin Willets thought that the Department of Agriculture should do more for bee-keepers. As Assistant Secretary of Agriculture, he sent Dr. Riley to visit me to confer as to aid that might be given. I suggested that experiments in growing honey-plants exclusively for honey, and the importing of foreign bees, were hopeful lines for research. I also urged strongly that Mr. Benton be secured to do the latter. I urged that his experience would specially fit him for this work. He was then in Europe and I suggested that the work could be cheaply done. There was an attempt to carry out both of these suggestions. Mr. Benton was engaged, but Dr. Willets wrote me they found that they could not send a man abroad. Lately a more wise and liberal construction, or better laws have been framed, so that now we have men sent to all parts of the world to get better plants and animals, if they are to be found.

I stated that I did not believe that it would pay to plant especially for honey, but that much of it was being done, and that careful experimentation could alone determine. It would pay to settle the matter once for all. I commenced the work, carefully prosecuted it on an extensive scale, and I think settled the matter, thus doing what was proposed. This work was carried on by me aside from my regular college work which was severe besides, and was done by me entirely as a labor of love, as I never received one cent for doing it. I found I was unable to do more, and thus refused further work.

### APIARIAN EXPERIMENTS NEEDED.

I am glad that the Department has concluded to take up the work again. Surely the matter of bee-keeping is important enough more than to warrant research along lines that can not well be carried on by the practical man. I believe the two lines that should receive attention are these: Importation of new races and species, and the improvement of those that we have; and the study and prevention of diseases that destroy our bees. The first promises much. We have made wonderful advance in improving other races of our domesticated animals, and our plants as well. It is said that the corn has been bred up in Illinois so as to make it produce ten more bushels to the acre. Who knows but what our

bees could be improved so as to produce ten more pounds to the colony? Surely a Burbank hold of this matter might give us results that would startle the world. I certainly am in favor of the utmost along these lines, and believe that we all ought to work to have the very best research carried on to a finish.

#### A VERY HOPEFUL OUTLOOK IN CALIFORNIA.

It is unnecessary to say that the matter of rain in Southern California is all-important. With it we have great crops, and phenomenal production of honey. We have been having great rains, not only timely, but they have come so slowly that every drop has been saved to the soil. We now have about eleven inches—as much as we had in all the season last year. At this time last year we had less than one inch. Thus we see that our prospects for this season are very flattering. We shall be very sure of not only a good crop of honey, but we shall probably have a very prosperous year all along the line. In all the eleven years of my sojourn here, we have never had so bright an outlook as we have today.

#### HONEY PRODUCT FOR CALIFORNIA.

Mr. C. O. Wilder, of Vermont, asks, "What would be the money value of the honey from 50 colonies of bees in San Diego Co., Calif., and in what seasons in that section are the bees active, and when idle?" I think we can count on an average of 75 pounds per colony. Some years the yield is very much more, but in others, like the one just past, the bees get no honey at all. It all depends on the rainfall. This winter we are getting fine rains, and the bee-keepers may rejoice in the glad prospect of a maximum crop the coming season. April, May and June are the honey months of Southern California, though the bees may gather in every month of the year.

#### MORE INFORMATION ABOUT CALIFORNIA.

Mr. F. P. Briggs, of Massachusetts, "Missouri," and several others, ask for more information concerning California. Work here is begging for good workers. I do not believe that such need fear. Pay is better for orchard work than in the East. I do not think the cost of living here is more than in the East. I find it as cheap to live here as it was at Lansing, Mich. Chickens do well here, and there is no danger of overdoing this work. The Chinese raise the most of the vegetables, but I pity an American that would suffer from such competition. The schools are of the very best. Here, as elsewhere, all depends upon the man. The good man finds work, and success; the indifferent one lags in both.

#### HONEY OR SUGAR SYRUP FOR BEES.

Mr. O. A. Stewart, of this State, asks if sugar syrup is a good and sufficient food for bees. Yes, it is certainly as good as honey. Of course neither is enough. The bees, when breeding, must have proteids, which they do not get in either honey or sugar syrup. This is furnished by the bee-bread or pollen. There is a trace of this in the honey, but practically none—none to speak of. We have proved it over and over that sugar syrup is very excellent for a winter food for bees. Mr. Heddon used to argue that it was better than honey, as it was entirely free from proteids, and so bees could not breed and were better with the less activity. I should fear neither good honey nor good sugar syrup.

Los Angeles Co., Calif., Feb. 8.

## The Average Length of Bee-Life.

BY G. M. DOOLITTLE.

Picking up a mislaid letter, bearing the date of September 3, 1904, I find the following in it:

"About the 20th of last June I made a colony of bees by setting the combs and most of the bees that were on them, out from the old hive into a new one, leaving one comb containing brood in the old hive, and filling it out with empty combs. The bees seemed to work well from both hives. July 10th I was called from home, and did not return till August 22. On my return I went out to see the bees. I found those in the new hive all right; but those in the old hive were nearly all gone, only about 100 or 200 being left. What do you think was the trouble? Why did these bees leave the hive, while the others staid all right? Please answer through the columns of the American Bee Journal."

This letter should have been answered sooner, but got covered up with other matter in the rush of work which is generally at its height during the time of getting honey

ready for market. I have answered the letter to-day, privately, telling why the delay; but in thinking the matter over I have concluded to say a few words further regarding it, as it seems that there is much ignorance along the line of the length of life of bees, from the many letters I get which show a lack of knowledge regarding their average life; and this life has much to do with the successful making of swarms, or increase of colonies by any of the plans made known, outside of natural swarming. And with natural swarming, it is well to be fully posted in this matter, else we may lose the old colony by its failing to rear a queen from the queen-cells left, from some cause or other.

It seems strange to me that any one should be ignorant on this subject when one experiment will tell the truth in the matter, and convince the most skeptical that the average life of the worker-bee is about 45 days during the working season. Take a colony of black or German bees, for instance, and about June 10 take the queen away and introduce an Italian queen, keeping record of the date on which the change is made. In 21 days the last black bee will have emerged from its cell; and if the Italian queen went to laying immediately, the first Italian bee will have made its appearance, which fact should be jotted down also.

At the end of 45 days from the time the last black bee came out of its cell, no black bees will be found in that colony. At 40 days many will be seen, but they grow less and less each day, so that on the 44th day it will be very few indeed that will be left. From this, the questioner and the reader will see why there were only a few bees in the hive of the questioner when he returned home, if we take it for granted (which was undoubtedly the fact) that the bees in the old hive failed to get a laying queen from the frame of brood which was left with them. Having thus failed, the last bee in this frame of brood would have emerged 21 days later, or on July 11, and 45 days from that time would have been August 25, so that there would have been only three days of the bees from that frame of brood left, on the return of the questioner. And if there were from 100 to 200 bees left on August 22, they certainly held out well.

This length of life of the bees of which we have just been talking about is for the summer months, and does not apply at all for those of the fall, winter or spring. The life of the bee seems to depend on the work it does, or on its activity. Thus when it labors the most, its life is the shortest. Hence it comes about that, through the inactivity brought on by the advent of cool and cold weather, the individual bee can live from six to eight months. This is proven by changing the queen as before, only it is to be done this time about the middle of September, in this locality. Soon after the first of October the last black bee will be out of its cell; but I have often found black bees in such colonies on the first of June of the next year, and in one instance, there were a few still remaining on the first of July; but that year the bees were kept in their hives on account of bad weather very much of the time previous to this. Also, when spring opens there will be but a few Italian bees in the colony so treated, which shows that very little brood is reared from October till April, where the bees are wintered in the cellar; as well as to tell us that more bees die in two months in the spring than during five or six months of winter.

The life of the drone is regulated very largely by the workers, for they are usually driven off or killed by the workers long before they would die of old age. Any sudden cessation in the flow of honey from the fields is often sufficient reason for their being driven out to die, or the killing of them by stinging, if they are persistent in staying in the hive; so it is hard to tell just what age they might attain to, were they allowed to live to the age allotted to them, without persecution. Most apiarists think that they would live about the same length of time the workers do; but I am of the opinion that they are a little shorter-lived. It is a rare thing that any drones are allowed to stay in the hive after the honey harvest is over for the year; still, I have a few reports of drones which have wintered over, and I have known of a few doing so, and that in a colony having a fairly good queen. But the hive was crowded to its utmost with honey during the fall. Where I have tried to keep drones in a queenless colony to preserve them, they would all be gone at the end of about 40 to 42 days.

The average life of queens, as I find it in my apiaries, where a colony is allowed to stay in a normal condition, is about three years, although I have had one or two live nearly six years, and several four and a half to five years. They live also in proportion to the work they do, or, more properly speaking, in accordance with the number of eggs they lay,

as egg-laying is the only work they do. Under the present system of management the queen is often coaxed to lay as many eggs in two years as she usually would in three if in a tree or box-hive; hence most apiarists think that all queens should be replaced after the second year, with those which have just commenced to lay. However, I do not make this a practice; for I find that, as a rule, the bees will supersede their own queen when she gets to be too old to be of service to them; so I trust the matter to them, believing they are less liable to mistakes along this line than I am.

Onondaga Co., N. Y.

## Rendering Old Combs Into Beeswax.

BY C. P. DADANT.

MR. DADANT:—I read in your instructions on rendering combs that they should be soaked in a tub of water before rendering. Shall we set them up straight in the tub or lay them flat? They seem to soak water best when set up.—A READER.

The old combs, such as are generally taken from very old colonies, contain more than nine-tenths dirt and cocoons. It is therefore of the greatest importance to put them in such condition that the wax will not soak into the residue, since there would be hardly enough of it fairly to moisten the dirt. That is why so many people think that there is no longer any beeswax in old combs. The only method to keep the wax from soaking into the rest when liquefied is by wetting, for beeswax will not stick to anything that is wet. So we instruct the bee-keeper to soak the combs. It matters little how they are soaked, but if they are very dry it will not take one long to find out that they are difficult and slow to soak. But if you leave these old combs in the shape given them by the bees, each of those cells, coated as it is with the cast-skin of a larva, will retain its shape and make a nice little nest for some of the liquid wax to sink into. Anyone who has rendered much beeswax and old combs has noticed occasionally a cell full of clear wax, which may be removed only by a press.

Now, our method is to break and crush these old combs out of shape, so that the cells may be closed or flattened. In this shape they will sink in water more readily. But there is a very good way to compel the combs to become soaked, and that is to put the stuff all in a coarse sack and load it down with bricks or stones at the bottom of a tub filled afterwards with water. You will notice that in a short time the water will begin to take color. When the entire lot is well soaked, it may be melted with hot water. No hard water should be used.

Here permit me to explain: Hard water contains mineral invariably, in fact, it would not be "hard" unless it did. Some of this mineral will act on the beeswax and damage it. For instance, the least amount of iron in the water will darken the wax. That is why in some localities bee-keepers seem entirely unable to produce nice, bright beeswax. If they were to use rain-water there would be no trouble.

The man who has a wax-press has no difficulty in getting out all the beeswax, or nearly all. But even he who has a press needs some direction for its proper management. It is just as necessary to soak the combs when using the press as when melting the combs and skimming the wax off the top of the water, because whatever the residue will soak will be impossible to secure, and much less will soak into the residue if it is already wet, when the wax is melted, as I said before. But those who use the press are all liable to go too fast and use too much power. If the press is filled with well-melted old combs, and kept hot, a turn now and then is all that is needed, and one hardly needs to use more power than what may be applied without effort with the hand on the screw. It is just like pressing grapes for the juice—if you try to get it out all at once you simply imprison some of the juice so that it has no means of escape; while if you give it time to slowly leak out, you will get more result with less effort.

With the man who has no wax-press, although there is more difficulty in rendering the combs, still nearly all the wax may be secured by using plenty of water and skimming the melted wax off the top of the kettle as he goes. If the worst residues are put into a sack with very coarse texture, and this is turned over and over under hot water, nearly all the wax will ooze out. Of course this wax must be rendered once more, in order to remove the remaining impurities.

Rendering combs with the solar extractor will do well for those who have but little residue, and especially for the

odds and ends of the apiary, as they are gathered during the summer. When they are rendered by sun heat, they are out of the way of the moth, while the keeping of these is difficult till they are rendered, especially during the last of the summer months.

But the solar extractor is not at all fit to render old combs. The beeswax in them soaks into the cocoons, and nothing is left for the apiarist.

In rendering beeswax care should be taken not to over-boil it. The mealy residue at the bottom of cakes of beeswax is nothing more nor less than water-spoiled beeswax—beeswax that has been beaten into a sort of meal by boiling water. Sometimes a bee-keeper will spoil his entire product in this ugly way. A good boil is all that is needed.

Do not use sulphuric acid in rendering wax. You will be likely to use a half-pint where ten drops would be too much, and it will give your product a sickening and bad smell.

Hancock Co., Ill.

## Curiosities and Myths of Bee-Literature.

BY ARTHUR C. MILLER.

Among the curiosities of bee-literature, few strike the student more forcibly than the persistency with which many ancient myths about bees are repeated, often being stated as the results of the writer's own observations or quoted as if of recent discovery. Some are too absurd to receive serious consideration while others seem plausible until subjected to a comparison with the actual habits of the bees.

An accurate interpretation of the actions of the bees is not always possible without a knowledge of the anatomy of the bee, and, again, deductions as to the functions and mode of using various organs are not infrequently wrong, owing to lack of full knowledge of the bees' habits. Also there is often a strange confusing of cause and effect.

Such things would be of small account to practical bee-keeping were it not that many practices are based on the beliefs, and when the latter are wrong the former are faulty and costly to the bee-keeper.

The legend about the snail, which, getting into the hive, and the bees being unable to remove it and fearing the contamination of decomposing matter, hermetically sealed the floor with propolis, is as old as bee-keeping. It reappears with every new bee-book, being cited as an example of the sagacity of the bees.

The sealing of the snail to the floor was merely the result of the effort of the bees to fill crevices which they could not enter or penetrate with their mandibles. They just as readily and thoroughly fasten a pebble in the same way.

The ramming of pollen into the cells with the bee's head as the rammer, is another myth which dies hard. The work is done with the mandibles, as may readily be seen. The bee's use of her tongue is so greatly misunderstood as almost to warrant the statement that nothing is known about it. How long and how persistently it has been asserted that a worker holding out her tongue toward another bee is offering food, yet the fact of the matter is that *the thus extended tongue is always seeking or asking.*

Most instructions for introducing queens cite the "offering of food" as one of the details to be observed. The many and constantly-recurring failures despite the presence of the supposed "peace indicating offering" strangely fail to raise suspicion as to the tenability of the theory.

### CHANGING NECTAR INTO HONEY.

Another error most solemnly reasserted from time to time is that bees ripen the honey by creating a high temperature, establishing a rapid circulation of air and then pumping the nectar back and forth on the tongues, that it may be exposed as much as possible to this warm draft. It is a very pretty example of the cart before the horse, coupled with an ingenious but erroneous theory as to what converts nectar into honey.

The heat is caused by the action of the bees in treating the nectar, and the heat together with the moisture compels the bees to create the draft. The belief about bees pumping the nectar up and down the tongue seems too absurd to warrant consideration were it not so often stated as fact. Some writers have made the theory even more absurd by stating that the bees crook the tongue slightly, that the drop of nectar may not be knocked off by contiguous bees.

A knowledge of the structure of the bee's tongue, together with a little observation of the bees at the ripening

work, will quickly convince any unbiased person of the inaccuracy of such statements.

A description of the actual operation is subjoined, and may be readily verified. It is part of the results of a long series of studies into the functions of various organs of the bees. The nectar-treating worker becomes quiet, generally on the comb containing nectar or honey, then the mandibles part, the mouth opens and becomes filled with a drop of fluid. This drop extends outward between the mandibles, filling the space and covering the openings of gland system No. 4, of Cheshire and Cowan. (For description of functions of these glands see Cowan's "Honey-Bee," pp. 120 and 121.) The drop of fluid remains in this position for a period of several minutes at a time, and while it is there the chin is slowly and steadily moving up and down—exactly as if the

bee was chewing something in her mouth—and this causes the drop to pulsate slightly. During this time the tongue is folded up behind the chin and *takes no part in the process of converting the nectar into honey.* After a time the drop of fluid is swallowed and after a moment's pause another appears and the process continues.

Each "mouthful" is equal to more than half of the capacity of the honey-sac. The tongue of the bee could not begin to care for the quantity of fluid treated by her in her mouth, and, furthermore, if treated on the tongue it would be beyond the reach of the gland secretions. The primary cause of the conversion of nectar into honey is the action of the secretions of the glands; the evaporation of moisture is secondary. Providence Co., R. I.

**50 EGG INCUBATOR \$5**

Everything necessary to complete the process of incubation is included in above price and shipped with the machine—a complete incubator (except the oil). We guarantee the

**CYCLE HATCHER**

to hatch every strong fertile germ, when directions are followed, or we will refund the purchase price. We have worked for years to perfect this machine and go to simplify it that we could sell it for \$5 with a guarantee so broad that no one need hesitate to buy one. We have reached our goal. Send for our free catalog of the Cycle Hatcher before you buy, or send \$5 and we will ship machine subject to trial, money to be refunded if it don't substantiate every claim we make.

Cycle Hatcher, Co., Box 224, Salem, N.Y.

**Reports and Experiences**

**Getting Supers Ready in Winter.**

Perhaps I should not contradict anything said by G. M. Doolittle, yet my experience has been directly the opposite of what he advocates on page 54, where he says:

"All the foundation used in both sections and frames in my apiary during the past 15 years, was placed where it is to be used by the bees during the months of December, January, February and March."

Last winter I fixed my supers in the way he mentions, and when I came to get them to place them on the hive, lo and behold! 3 starters out of every 4 were fallen to the bottom of the super, so that I had to go through every super and fasten them again. Owing to this experience I shall wait until warm weather to fasten starters.

L. L. Olds Seed Co.—Many of the thousands of farmers who visited the Louisiana Purchase Exposition will remember with pleasure the exhibit of the L. L. Olds Seed Company, of Clinton, Wis. Those who have received the Olds catalog for 1905 have again been pleasantly reminded of their visit to St. Louis by the half tone view on its first page. They will also notice that the exhibit by this concern captured a gold medal. The gold medal standard of seeds and potatoes—potatoes are one of L. L. Olds Seed Co's specialties—is certainly the quality that the farmer and gardener should plant in order to secure the best results. A careful perusal of their catalog shows what the L. L. Olds Seed Co. is prepared to do for those who will place their orders with them. Any who are not already posted in this regard should obtain a copy before making out their orders for the coming season. Please mention the American Bee Journal when writing.

**MUSICIANS** get in touch with "EVERYTHING MUSICAL" by asking for our catalogues. We import and Wholesale all sorts of instruments and publish all kinds of music, and our prices rule the retailer out. Buy every thing you want from our catalogues. Every day's a bargain day at this big music bargain house. Write for catalogues. Ask for list of SECOND HAND instruments, repaired and made almost as good as new.

H. E. McMILLIN, 108 Superior St. Cleveland, O.

**For Queens** SEND TO JOHN W. PHARR Berclair, Tex.

He will furnish at same prices as last year: Tested, \$1; Untested, 75c; 5 for \$3.25; 10 for \$6; 15 for \$8.25; 25 for \$12.50; 100 for \$45. He breeds Goldens, Carniolana and 3-Band Italians. Also 1, 2, and 3 frame Nuclei, and full colonies. Prices given on application. Pharr pays the freight, and guarantees satisfaction on all Queens. To do justice and judgment is more acceptable with the Lord than sacrifice. —(Prov. 3: 21.) 6Atf

**LICE SAP LIFE**

That's how they live and thrive. You can't have healthy, profitable fowls or stock and have lice too.

**Lambert's Death to Lice** promptly kills all insect vermin and makes sitting hens comfortable. Sample 10c; 100 oz., \$1.00 by express.

O. K. STOCK FOOD CO., D. J. Lambert, Vice-Pres. 106 Monon Bldg., Chicago, Ill.

Please mention Bee Journal when writing.

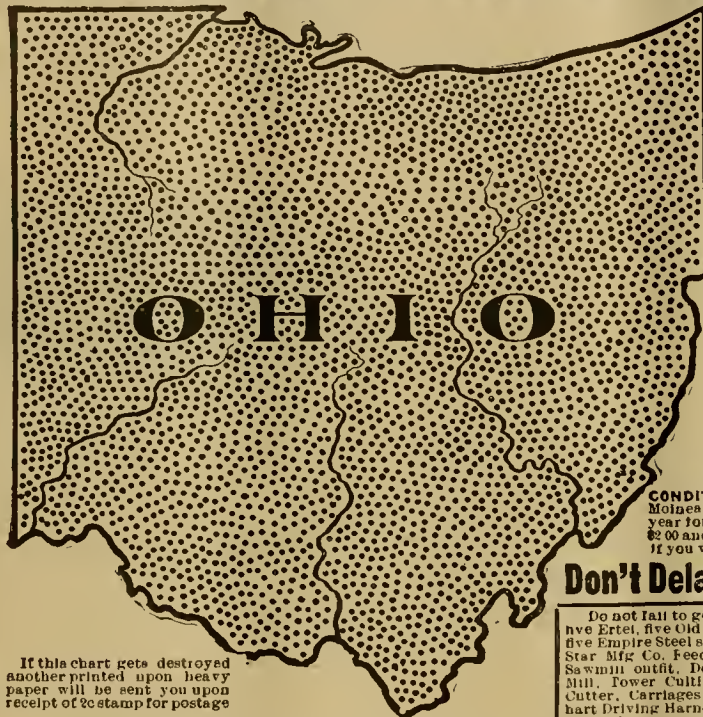

OTISVILLE, PA., Jan. 13, 1904.

Dear Sir:—I have tried almost everything in the smoker line; 3 in the last 3 years. In short if I want any more smokers your new style is good enough for me. I thank the editor of review for what he said of it. Those remarks induced me to get mine.

FRED FODNER.

# GRAND CONTEST! BIG PRIZES FREE! TWO PIANOS! CASH! GASOLINE ENGINES, INCUBATORS, CREAM SEPARATORS, BUGGIES, ETC.

## FREE If You Can Tell How Many Dots in Ohio?

IF YOU CAN COUNT AND PLAN YOU CAN WIN!

Those who can count the dots in Ohio correctly or nearest correctly will be given the following list of prizes:

- Two Elegant Pianos, one to a lady and one to a gentleman.
- 2nd. An Elegant Cabinet grand six octave Organ.
- 3rd. \$150 cash, 4th. \$100 cash, 5th. \$50 cash.
- 6th. Weber Gasoline Engine.
- 7th. DeLaval Cream Separator.
- 8th. Elegant Elkhart Top Buggy.
- 9th and 10th. Each a first-class 100 or 150 Egg Incubator.
- 11th. Empire 6-hole Steel Range.
- 12th. F. W. Mann Bone Cutter.
- Next 20, \$5.00 each. Next 25, \$2.00 each.

CONDITIONS: We have made arrangements with Successful Farming of Des Moines Iowa, to send both FARMERS' TRIBUNE and Successful Farming one year for \$1.00 which gives you one free count, or both papers two years for \$2.00 and give you three counts. You should have three counts as it means \$50 if you win. See below.

**Don't Delay!** If you want a Piano or other Prizes **Win! Win! Win!** free, send your counts at once.

Do not fail to get counts in at once. Our complete list of prizes contains six pianos, five Ertel, five Old Trusty and five Sure Hatch Incubators, five Galloway barrow carts, five Empire Steel six hole ranges, Hoover-Prout Potato Digger, Smith Manure Spreader, Star Mfg Co. Feed Mill, Parlin Orendorf Corn Planters, Osgood Scales, a \$175 DeLoach Sawmill outfit, Deere & Co. Cultivator, an Electric Handy Wagon, Campbell Fanning Mill, Power Cultivator, Kaestner Feed Grinder, Milne Stump Puller, Stearnes' Bone Cutter, Carriages, Hapgood Plow, five C. A. S. Farm Forges, Wilson Bone Cutter, Elkhart Driving Harness, etc.

Send in counts and subscription as above and get our complete premium offer. Never did you have such an opportunity before. Don't delay, you want some of these premiums. Now is your chance

If this chart gets destroyed another printed upon heavy paper will be sent you upon receipt of 2c stamp for postage

**TEST OF SKILL**—This contest is not to be confused with the guessing or estimating contests which are not permitted by the Post Office Department. Our contest is a test of skill in counting and getting up best plans and the best man wins. It depends upon you. There is no guess or chance about it. Do not hesitate about entering but get your counts in at once.

**CONDITIONS**—\$1.00 pays for one full year a subscription to both the FARMERS' TRIBUNE and Successful Farming and entitles you to one count. \$2.00 pays for two years and entitles you to three counts and makes you eligible for the \$50.00 prize.

**\$50 PRIZES**—We believe everybody should have three counts so they can have one each side of what they think is correct to be more sure to hit it. To encourage this we will give \$50.00 extra to winners of 1st prizes if they have three counts. Remember if you have one count you get 1st prize only but if you have three counts you get \$50 extra.

**AWARDS** will be made as follows—The person giving correct or nearest correct count will get first prize. Next nearest correct, second prize, etc. In case of a tie for any prize it will be awarded to the person giving best plan for counting the dots. State whether you enter ladies' or gents' contest, as one piano goes to lady sending best count or plan the other to gentleman sending best count or plan.

**DON'T FAIL** to enclose remittance with your letter giving counts, as we cannot enter you as a contestant until it is received.

**JUDGES**—The awarding of prizes will be wholly in the hands of disinterested judges. We have chosen bankers, ministers, public officials, etc. in act as judges in our contests. Ex-Governors, Mayors, Treasurers, etc. have acted as judges. We are bound our contests must be absolutely fair.

**OUR FINANCIAL RESPONSIBILITY**—As to whether we are abundantly able to do as we say, we are glad to refer to Sioux City Stock Yards Co. or First National Bank of Sioux City

In the event more than one person should submit the same plan and this was considered the best plan by the judges, each person so tying will be asked to tell in 50 words how best to improve Successful Farming. The one making best suggestions gets first prize, next best next, etc. Understand this is only in case of tie in plan, which is not at all likely

Publishers FARMERS' TRIBUNE, Sioux City, Iowa.

I enclose \$..... for ..... year's subscription to both FARMERS' TRIBUNE and Successful Farming and I wish to enter the

..... (write ladies' or gents') Contest. If \$2.00 is paid send three counts; if more than \$2.00 send one count for each \$1.00 over \$2.00. If only one year is paid send only ONE COUNT. The extra \$50 go only to those having THREE or more counts entered.

My Count is: (1)..... (2)..... (3).....

Name ..... P. O. .... State .....

Remarks: My plan of counting is .....

Dept. 63

### PRIZE WINNERS IN PAST CONTESTS

**A Piano for \$1.00.** Surely people may enter your contests knowing that they will receive fair treatment. How glad I was to win a piano for so small an amount and wholly unexpected. The paper alone is worth all I paid. MRS. L. W. NOTT, Marion, Ia.

MRS. L. W. NOTT, Marion, Iowa.

**A Piano for Illinois.** An Elegant Piano for a Dollar! That is what I got and anybody that thinks your prizes are not awarded fairly don't know. There can be no favorites or I would not have won. MIRA E. FURSMAY, Panola, Ill.

D. L. FREEBORN, Knoxville, Pa.

**A Piano for Pennsylvania.**

Easiest way I ever saw to get a piano and you people are surely fair. Friends laughed at me and said friends received the prizes. Now they are sorry they did not enter. Will never be without your paper. D. L. FREEBORN, Knoxville, Pa.

W. C. ELLIOTT, Audubon, Ia.

**He Won a Piano.** Refer people to me if they want to know whether you are honest. I got a piano for a prize and never heard of you until I answered your ad. Your paper is worth twice the subscription price. W. C. ELLIOTT, Audubon, Ia.

AMY R. BARNES, Van Horne, Ia.

**\$100.00 Prize.** I got my \$100 and it was the easiest I ever earned. The dots are hard to count but I know the prizes go to those who win them fairly. AMY R. BARNES, Van Horne, Ia.

**Won \$350 Cash.** To Whom It May Concern: I won grand prize of \$350.00 Cash in last contest. I was much surprised. I want to touch as to Successful Farming's fairness to any and everybody. JOHN A. OODWIN, Akron, Ohio.

EUGENIE FOURNIER, Matane, Quebec.

**\$50.00 CASH**

**\$50.00 for Canada.** Way up here in Canada I won \$50. Never knew there was such a paper until I answered ad. Now I will never be without it again. MISS E. FOURNIER, Matane, Quebec.

NEWTON RARICK, Ligonier, Ind.

**\$50.00** NEWTON RARICK, Ligonier, Indiana.

**Others Who Won:** \$100—Eve I. Buckner Fredonia, Kan. \$25.00—Clara Albers, 1209, Wal, Cincinnati, O. \$100.00—C. S. Wyman, Vinton, Ia. \$50.00—S. Irving Stoyer, 226 E. Balt., Baltimore, Md. \$100.00—E. M. Hall, Montrose, Mo. \$25.00

Nobody connected with our paper will be allowed to compete. Contest closes April 30, but get your counts in at once. See about time prize above. Anybody having three counts entered may enter additional counts at 25 cents each. Be careful to give your plan of counting, as the best plan used will decide all ties.

Address all letters to **FARMERS' TRIBUNE, SIOUX CITY, IOWA.**

my children established certain routes where they peddled the honey, and in a little while it took them about a week to supply their customers who bought readily and regularly. In this way I might have sold much more.

The same year I offered to sell a merchant some at 2 pounds for 25 cents, and he replied that he could sell me some at 7 cents a pound. I asked him how he could do that, and he said, "Oh, don't believe that it is real honey; it's glucose". I really believe that merchants believe in honey very little.

Can any experienced bee-keeper tell me whether or not it would be wise for a man getting an average of \$15 a week to discontinue his work and go to bee-keeping in the vicinity of Chicago? G. H. KIENZLE.

Kane Co., Ill., Feb. 13.

**Bees Stored Little Surplus Honey.**

My 67 colonies of bees did not do very well last season. They gave only 700 pounds of surplus honey against 3500 the year before. Moving from Alabama to Mississippi I think is the cause, together with the season not being favorable.

The worst of the winter weather is now upon us. Last year at this time the bees were gathering pollen freely from elms, alders and maples.

I enjoy reading the reports of the subscribers, and hope each will report his ups and downs. R. V. GOSS.

Monroe Co., Miss., Feb. 8.

**Bees Did Very Well.**

My bees did well last year. I wintered them on the summer stands, losing one colony. I increased from 10 last spring to 20, and secured 1284 pounds of surplus honey,

The Fruit of the Vine.—Autumn seems a long way off when snows of winter have scarcely gone. But the agriculturist must be a man who looks far ahead and lays his plans for the future. Summer will be well on the wane before the purple clusters of grapes hang in juicy lusciousness on the vines. It is then that most people will be thinking about grapes. But the grape-grower has to be thinking about what the harvest will be long, long before—several years before, in fact, for it takes time to develop a good vineyard. Mr. Louis Roesch, of Fredonia, N. Y., makes a specialty of fine grapevines—he has over 800,000 of them for sale, including some 60 different varieties besides trees and small fruits. Any one intending to set out vines or small fruits may obtain a descriptive price-list free by addressing Mr. Roesch, who is a specialist in this line. Send for his catalog, and mention the American Bee Journal when writing.

**THIS LIGHTNING Lice Killing Machine**

kills all lice and mites. No injury to birds or feathers. Handles any fowl, smallest chick to largest gobbler. Made in three sizes. Pays for itself first season. Also Lightning Lice Killing Powder, Fruity Bait, Lice Remover, etc. We secure special low express rates. Catalog sent free. Write for it.

which was very good for a season following so cold a winter as last winter, leaving them weak in the spring.

Bees appear to be in good condition so far this winter.

I wish great success to the American Bee Journal, as it will bring success to those who study its pages. Wm. Z. RUGGLES.

St. Joseph Co., Mich., Feb. 7.

**Bees Seem to Be Wintering Well.**

We look for a good honey crop the coming season, as we have had lots of snow and the clover has been protected all winter. I have 70 colonies of bees in the cellar, and they seem to be doing well. We usually put our bees out about March 20, if the weather is nice.

I think a good deal of the "old reliable" American Bee Journal, and have it filed away for 5 years. C. M. LAWRENCE.

Blackhawk Co., Iowa, Feb. 28.

**Other Side of Bee-Keeping—Non-Swarming Bees.**

I have read many letters in the American Bee Journal from beginners, telling of great success with bees, so much so that I am afraid some of the uninitiated might get it into their heads that all they have to do is to get a few colonies of bees and grow rich, and

A Flourishing Enterprise.—A business career of 19 successful years is something any firm may look back upon with pardonable pride. And when to the achievements of the past is added the more progressive methods of the present, the outlook for the future assumes a most promising prospect. The proprietor of "The German Nurseries", Mr. Carl Sonderegger, of Beatrice, Nebr., may reasonably expect a continuation and steady growth of the patronage which has enabled him to not only carry on a successful business, but so to increase his facilities as to be able to handle a much larger trade than heretofore. Mr. Sonderegger believes that "value received" merits fair compensation, and that it is better to build the reputation of his nurseries on the integrity of his stock rather than the amount offered at a certain price. Consequently, his 1905 catalog contains no offers of cheap seeds to equalize the quality and price. His guarantee goes with his stock, and every precaution is taken to insure arrival at destination in perfect condition. Send for his catalog, and please mention the American Bee Journal when writing.

**SALZER'S SEEDS** **Never Fail**

**600,000** planters scattered the world over are willing to say under oath that Salzer's Earliest Vegetables are from six to twenty days earlier than the earliest of their kind produced from other seedsmen's seeds. Why? Because for more than one-third of a century Salzer's Seeds have been bred up to earliness.

that, too, without much labor. I have had men tell me (of course men who knew nothing about the business) that there was more money in bees than in anything else. One object in writing this letter is to show that there are two sides to bee-keeping as well as all other things, and another is to answer Dr. Miller's question on page 8, as to how I kept my bees from swarming.

In the spring of 1902 I purchased 2 colonies from a neighbor, and he gave me another which he had in a nail-keg. He said he had never gotten any honey from the nail keg, but had lots of swarms. I bought 5 dove-tailed hives, set them up, put in foundation and made ready for the first swarms that might issue. At this time I was living in Eagle Co., Colo., and as I was away from home a great deal, and fearing the bees would swarm in my absence, I divided the strongest colony and bought a queen for the queenless portion. The nail-keg colony became so strong that a great many bees had to sleep outdoors at night, and in the daytime they hung out in a great cluster. But *nary a swarm* did they cast.

On Aug. 18 I removed to California, afterwards selling my bees and hives. In April, 1903, in partnership with another man, I purchased 59 colonies. These bees had to be moved 12 miles, and though handled by an old bee keeper (I being absent at the time), they were loaded into lumber wagons without any cushions, and without any ventilation except a wire-screen over the  $\frac{3}{4}$ x12 entrance, and trotted over rough roads, and the result

**SHENANDOAH YELLOW**

The corn that has made Shenandoah famous. Has outyielded all other varieties of yellow corn wherever tested. A deep grained 100 day yellow corn, ripe in September. Will outyield, outbell, and outsell any yellow corn you ever grew. The world's banking record, 201 bu. in ten hours, was made in this corn near Shenandoah, Dec. 8, 1903. Send for free catalog, photographs and samples of this and other varieties of corn. \$3.00 worth of seeds free on club orders. Ask about it.

10Atf LANSING, MICH.

It's a Pleasure to Plant.—There's a genuine fascination about plowing and digging around the garden, in plowing and planting a field; besides, it's a healthy, profitable out-of-doors pastime to raise a garden. You can get nearer to Nature in the garden and the field than anywhere else on earth. To plow and plant—to see the tender sprouts shoot above the soil, and to watch them grow and develop—what grander way to study Nature than this occupation affords? What is more beautiful than the neat, clean rows of growing garden-truck or the waving grain of the field? What more pleasant than the table loaded down with the green things you raised yourself? What more disappointing than the garden that refuses to grow? To be certain that your garden shall be a success, and the yield of your field profitable, you must look well to your soil and your seed. W. W. Barnard & Co., 161 & 163 E. Kinzie St., Chicago, Ill., will be pleased to help you; they will send free their 1905 *Annual Seed Catalog*, which will put you right as to the best seed for you to plant to insure success in your garden and on your farm. Write for the book to-day, and please mention the American Bee Journal.

**A Telephone for the  
Country Home**

The telephone in the country home is not a luxury—it's a money-saving investment that brings returns every day. Keeps the farmer's family in close relation with the neighbors, saves many a trip to town, and helps to make the young folks satisfied with the farm by giving them advantages like their city cousins.

**Stromberg-Carlson  
Telephones**

Are the right telephones for country homes. They work right, stay right, and the price is right. Our Book F-80 "Telephone Facts for Farmers"—gives complete information on how to organize, build, equip and maintain a telephone line. Farmers are building lines all over the land. Why not you? Write for the book and see how cheaply it can be done. Our book 80 tells how others have built rural telephone systems. Both books are free. Address nearest office today.

was something awful. Five of the strongest were killed outright, and about half of the others were damaged so badly it took them all summer to build up into fair-sized colonies.

The honey crop in this part of the country that year was a light one, but we got about 1200 pounds of extracted, and not a single swarm. I forgot to say that I had in the meantime purchased "A B C of Bee Culture" and subscribed for the American Bee Journal, and I expect to get more bee-literature later on. During this season the bees were run by the old bee-keeper who moved them, while I worked at my trade.

In the fall I purchased my partner's interest, and also bought 13 more colonies from another man, and in the spring of 1904 moved them to a location 6 miles away. This time I had charge of the moving myself, and did not break a single comb.

The honey crop for 1904 was a complete failure. I got only about 75 pounds of comb and 75 pounds of extracted, and in the fall I had to feed about \$15 worth of sugar, but, as usual, I did not have any swarms. I have done nothing to keep them from swarming unless I did it without knowing it, for I wanted them to swarm, so the only way I can answer Dr. Miller is in his own language, "I don't know".

I did not go into the bee-business expecting to make "easy money", but I made up my mind some years ago I would like to follow it, and though it has been a failure financially so far, I am more enthusiastic over the business now than ever. The nearest I can size things up in this part of the country, after a two years' residence here, is as follows: We can depend upon a heavy honey-flow once in 5 years and one failure in that time, and the other 3 years will be ordinary or light crops, and if a man gets an average of 75 pounds per colony per year he is doing well.

I am gradually learning the business as I go along, and if I should get "fired", or get too old to run a locomotive, I hope to be able to make a living keeping bees.

I think the prospects for this year are good. We have had about 10 inches of rain, and it is raining to-day. I expect to try my hand at brood-rearing this year, and make some artificial increase, as I seem to have a strain of non-swarming bees, and I must do something to make up for winter losses.

This is my first letter, and it is rather lengthy, but a man is usually forgiven for the first offense, so I hope to be in this case.

J. W. KALFUS.

**The Incubator an Educator.**

Looking at the history of artificial incubation in America from a critical standpoint the name "Prairie State Incubator" stands identified intimately with its successive stages of progress. Any man, woman or child can apply the plain directions in the Prairie State book of directions and with a Prairie State Incubator and Brooder any farmer, villager, suburbanite or commercial poultryman can make money every day. The Prairie State has been a winner "from the start". From 1886, when Mr. Mix first put his incubator on the market and won the first prize at the great St. Louis show, to the present date, the Prairie State has been forging ahead—a steady winner. Three hundred and twen-

ty-six of these prizes are recorded in the new catalogue with dates. The majority of these were not won by trained operators trained for the purpose, but by local poultry-raisers. Some were farmers' wives—genuine poultry enthusiasts; some were storekeepers—some farmers. These enthusiastic people take their own machines in their own wagons. The Prairie State had fulfilled all their anticipations. It had not disappointed them. Consequently they were proud of their ability to select a machine that hatched 85, 90 and 95 per cent of the fertile eggs. Naturally they wanted to exhibit the machine. The Prairie State Catalogue is a library of information on every point for the education of beginners or experts in poultry raising. Any one can get one free from the Prairie State Incubator Company, Homer City, Pa.

### CONVENTION NOTICES.

**Illinois.**—The Western Illinois Bee-Keepers' Association will hold its spring meeting April 5, in the County Court Room, in Galesburg. Seasonable subjects will be discussed. Each meeting so far has been more interesting than the previous one, and we hope to continue that way. We earnestly invite all who are interested in this industry who are within easy reach of Galesburg, to be at this meeting.

E. D. WOODS, Sec.

**Michigan.**—The Northern Michigan Bee-Keepers' Association will meet in Lady Macca-bees Hall, at Central Lake, Wednesday and Thursday, April 5 and 6, 1905. Hotel rates will be, The Tavern, \$1.50 per day. Editors A. I. Root and W. Z. Hutchinson will be present; also E. D. Townsend, Geo. E. Hilton and a number of other practical apiarists of Northern Michigan. If you have never attended a convention let us suggest that you try it for once, and you will have a higher opinion of your calling when you leave.

W. MOHRMANN, Sec.

GEO. H. KIRKPATRICK, Pres.

**Utah.**—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a. m. All are invited. Matters of great interest to bee-keepers, and horticulturalists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same.

E. S. LOVESY, Pres.

G. E. GARRETT, Sec.

## Honey and Beeswax

**CHICAGO, March 8.**—There has been somewhat of an increase in the number of sales during the past 4 weeks, yet the volume has not been large, while prices are if anything lower than in January, especially on other grades than white clover. Fancy grades of white comb bring 12½@13c; No. 1, 12c, with some off in color at 11@11½ cents; amber grades slow at 8@10c. Extracted, white, 6@7c; amber, 5½@6¼c; the price being governed by quality, flavor and package. Beeswax, if clean and good color, 30c per pound.

R. A. BURNETT & CO.

**NEW YORK, March 11.**—There is no improvement in the comb honey situation. The demand is next to nothing; quotations nominal and no doubt some of the stock will have to be carried over. We quote fancy at 13c; No. 1 at from 11@12c, and dark at from 9@10c. Extracted is in fair demand; White at from 6@6¼c; light amber at 5½c; Southern in barrels from 50@57c per gallon, according to quality. Beeswax firm at 29c.

HILDRETH & SEGELKEN.

**BOSTON, March 9.**—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality.

BLAKE, SCOTT & LEE.

**KANSAS CITY, Feb. 25.**—The honey market is still very lax, with scarcely any movement at all; the best white comb stock, 24 section cases, is selling here at \$2.25 per case. Extracted moving all the way from 4½@6½c per pound, according to quality. We look for an improvement. Beeswax in good demand at 28c.

C. C. CLERMONS & CO.

**CINCINNATI, O., March 8.**—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7½@8c; amber, in barrels, 5½@5½c; in cans, 6@6¼c. Beeswax, 27c.

C. H. W. WEBER

**PHILADELPHIA, Feb. 20.**—On account of the very bad weather the sales among the retail trade has been slow. Quite a good many shipments have been arriving from distant points and the market at the present time is overstocked. We quote: Fancy white comb, 15@16c; No. 1, 13@14c; amber, 12c. Extracted, white, 6½@7c; amber, 6c. Beeswax, 27c.

We are producers of honey and do not handle on commission.

WM. A. SELSER.

**ALBANY, N. Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily.

We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6¼c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c.

H. R. WRIGHT.

**SAN FRANCISCO, Feb. 28.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

A shipment of 200 cases extracted went forward per steamer for Germany the past week. Several small lots were taken for the Orient. Business on local account is light. Prices are without quotable change, but market is easy in tone.

**CINCINNATI, March 10.**—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6½c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c.

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. The A. I. Root Co. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

We trust the same will be continued to our successors in the business. GEORGE W. YORK & CO. Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything JUST RIGHT, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

## Editorial Notes and Comments

### Local Advertising of Honey.

The bee-keeper who wants to get the best there is out of the local market is blind to his own interest if he neglects local advertising. J. E. Johnson says this in the American Bee-Keeper:

Last year I wrote articles in our home and country papers explaining the value of honey as a food. I then wrote a leaflet, "Facts About Honey and Bees," and had it printed. I put one in every case of honey, and gave copies to people who had not bought honey. I also inclose them in letters.

I sold one case of No. 1 honey to a prominent citizen of our town. I gave a leaflet to his wife when I delivered the honey and put one in the case. To that family I sold last year seven cases of comb honey and one gallon of extracted. They got interested, and he bought two cases to take to a brother 30 miles away. In two or three weeks I got a letter from a lady who had been to visit that brother and sampled that honey. She wanted two cases of that same kind of honey. And so, from that one case and my leaflets, I now have three good customers. This first man has already this year taken five cases, and is going to take four cases to his brother and lady friend.

### Shipping Comb Honey to Market.

This is a most important subject to the comb-honey producer, if he ships to the distant market. The Fred W. Muth Co., Cincinnati honey-dealers, have just had an experience that is quite fully explained in the accompanying correspondence. The first letter, dated March 10, is to us, and the second one is from the Muth Company to the customer who shipped them the honey:

FRIEND YORK:—Some time ago, while at your office, you will recollect I spoke to you relative to a shipment of six carriers of comb honey we received, in which a large majority of the frames were broken. We do our utmost to make a friend and customer, and gave this party the very best price we possibly could afford. It might be well to call the attention of your readers to the letter we wrote him, a copy of which we are inclosing herewith.

Yours very truly,

THE FRED W. MUTH CO.,  
Per FRED W. MUTH, Pres.

The following is the copy of letter referred to in the foregoing, the customer's name being omitted, of course:

Dear Sir:—We are inclosing herewith our check in payment for the six carriers of comb honey as per credit statement attached.

Shipments like this we regret to receive, for they are prone to put a damper on future transactions, and still, at the same time, we are not to blame.

This shipment arrived just when we were having the coldest weather of the season, when the thermometer ranged from 10 to 15 degrees below zero. Furthermore, to make matters worse, there were no marks on top of the carriers to warn the railroad company to handle them with care, and only one of the carriers had handles. Judging from the condition in which the honey arrived, the railroad company handled the carriers, presumably as though they were so many trunks. From outward appearances there were apparently no leakages, but upon opening the packages we beheld an awful sight, because we had your interests foremost in our minds.

We want the support of every shipper, but, as it is, we lost money in this transaction, as we did not charge you one cent for the great

amount of labor required to overhaul the lot. We interested the vegetable peddlers, who made their own price, for it needed selling, and we were anxious to rid ourselves of it.

At first we removed the combs from the sections, and tried to dispose of it as chunk honey, but learned that the peddlers could sell it best in the frames, the last case or two of which are still on our hands unsold.

As stated before, we did not charge you for the extra labor, for we felt that the price, as it is, will be unsatisfactory to you.

Hereafter, in shipping honey, and especially comb honey, we warn you to be more careful. In the first place, please see to it that each carrier has two handles, and mark these words on the tops of the carriers: "CAUTION, COMB HONEY, HANDLE WITH CARE." And if you will do this, you will find that you will realize a better profit on your crop. If possible ship your honey as early in the season as you can, for after the trade is supplied you can not expect to get as good a price as before.

If you will heed these words of advice, you will profit thereby.

Yours very truly,

THE FRED W. MUTH CO.,  
Per FRED W. MUTH, Pres.

We venture to say that the shipper referred to does not take and read a bee-paper, nor has he read a first-class book on bee-keeping. He doubtless lost enough on that one shipment to buy all the bee-books published in this country, and also enough to pay the annual subscription price of all the bee-papers for 20 years.

We have so often published directions for preparing comb honey for shipment that it seems almost a waste of space to repeat them. But what's the use of spending months in producing comb honey, and then by improper packing for shipping lose half the value of the honey? It pays to read—to learn—how to do things right. It is usually such bee-keepers that say they can't afford to spend a dollar a year for a good bee-paper. Why, they really can't afford to do without the paper that tells them how to prevent such losses.

A little later on we will again publish full directions for preparing comb honey for safe shipment.

### Prices of Hives Further Considered.

On page 99 a clipping from The Farmer was inserted and some views regarding it expressed. Mr. E. A. Morgan, a well-known bee-keeper of 30 years' experience, conducts the apicultural department in that periodical, and in a recent letter says:

"Bee-keepers can not buy hives for less than they can make them, and where is the carpenter or cabinet-maker that can not do as accurate work as any expensive machinery?"

Bee-keepers, as a class, are a very intelligent sort of people, and if they can make hives cheaper than they can buy them, they will be likely to do so, and whenever a majority of them, or even a considerable majority, report that they are making their own hives, the beginner will be advised accordingly in these columns. The question about "the carpenter or cabinet-maker" is referred to the reader.

Mr. Morgan further says: "The supply-dealers' combine do take the statement from Washington to raise their prices on supplies, however much you try to cover it up. Your comparison of the wood-chopper and his ax bears no comparison, and does in no way apply in this case."

Not being in the secrets of any "combine," of course we can not dispute any illogical thing attributed thereto, but can see no reason why the wood-chopper and his ax do not apply. If 100 percent profit on investment in one case should affect prices on articles for investment, why should it not in the other?

Then Mr. Morgan says this in his letter on this subject:

But you ask, Is it true that prices have doubled? and ask The Farmer to give a single instance of a case in which any manufactory lists a hive at double the price at which it listed it at any previous time. This is the greatest break in your whole article. Would you please name one single manufactory that *hasn't* doubled prices on supplies, and many have trebled?

I have before me bills paid in 1879, 1880, 1881: 8-frame Langstroth hive, 1½ story, nailed and painted, 75 cents. That was before the day of sections, but eight 5-pound boxes were furnished with glass sides.

In 1889 hives took a drop. I bought, that year, 100 hives, 10-frame, 1½ story, in the flat, at 50 cents. When sections came on the market they were sold at \$1.75 per 1000; later on, sandpapered both sides, \$2.00 per 1000. This as late as 1897; since that time they have doubled in price.

At the first-mentioned date honey sold in the comb at 25 cents to 30 cents per pound. In 1883 I sold my entire crop at 17 cents, and paid \$1.00 each for 10-frame 1½-story hives, and \$2.00 per 1000 for sections; and now, when the best comb honey must be sold at 11 to 14 cents, extracted at 7 cents, delivered, they ask \$2.45 for an 8-frame 1½-story hive, and \$5.00 per 1000 for sections.

Is it any wonder that bee-keepers are going out of the business? I have a list of 51 bee-keepers that have quit the business on this account alone.

Therefore, I say, bee-supplies are unreasonably high, and much higher than prices of lumber would warrant, or the prices of honey can pay for. Look over the many supply-dealers' catalogs and note the stereotyped price-lists; no matter whether in the lumber region or 200 miles away, all are printed from the same type, showing the combine. So I say, bee-keepers, make your own hives or quit the business. E. A. MORGAN.

However interesting Mr. Morgan's figures may be, are they relevant? The request, as repeated by Mr. Morgan, was for "a single instance of a case in which any manufactory lists a hive at double the price at which it listed it any previous time." That single instance Mr. Morgan *has not given*. It is not said he can not do it, but he has not done it; and his paying double, or five times as much one time as another, does not meet the case. Neither does the intimation that every manufactory has "doubled prices on supplies, and many have trebled" meet the case. Supplies in general, including sections, were not under consideration. A look at the clipping, page 99, will show that Mr. Morgan was advising that bee-keepers could make their own hives, and the request was for a *hive* which was listed at a price double the price of a previous year.

But Mr. W. R. Ansell, of Minnesota, comes to the rescue of Mr. Morgan, giving a clear instance that is directly to the point. He has a catalog issued by one of the Wisconsin manufacturing establishments less than ten years ago, in which the 8-frame 1½ story Improved Langstroth-Simplicity hive in the flat, in lots of five, with fixtures enumerated, is quoted at 65 cents each; and the same thing is now quoted at \$1.70 each.

It certainly does not seem that an advance of 161 percent over the prices of nine years ago is warranted, and if there is no mistake in the case, there is good ground for considering the question somewhat debatable, whether the beginner shall make or buy his hives. That question may be further considered hereafter.

In the meantime, as the request for a doubling of list prices has not been answered by Mr. Morgan, but by another, there may be nothing unfair in asking him to make good his directly implied statement that prices have been doubled within a year. For he says the statement from Washington last January (presumably January, 1904) caused a doubling in prices. Will he give us a specific instance?

Since the foregoing was written an attempt has been made to compare prices of hives in the catalog of 1896, issued by one of the larger manufactories, with those of 1905 by the same firm. Attempting to compare prices of the same hive, in lots of 10, there is found in one case an advance of 50 percent; in a second case the advance is 64 percent; in a third case, 69 percent. This may not be entirely exact, for it is not easy, in comparing the catalogs, to make sure that one has exactly the same thing in each. In other hives the advance may be more, or it may be less. The comparison is, however, sufficiently reliable, in all probability (and any one can make such comparisons for himself) to warrant a doubt as to a general doubling in the price of hives, to say nothing of the doubling within a year.

Further, we wish to refer briefly here to Mr. Morgan's advice to bee-keepers as given in the last sentence of his letter. If barn lumber should double in price, would he advise the farmer to quit farming or stock-raising? If mowing machines should double in price, we suppose Mr. Morgan would advise farmers to make their own, or quit making hay!

To us it doesn't seem to be so much a question of what bee-supplies cost, as it is what price can be realized for honey. The bee-keeper that can get a net price of say 15 cents a pound for his comb honey, and average 75 to 100 pounds per colony annually, isn't going

to object to paying a fair price for hives once in 10 or 20 years. So it appears to us.

We want to say further, however, that we have no use for trusts or combines that are formed for the purpose of raising prices and keeping them raised. And if any bee-keepers can save money by making their own hives and other supplies, they certainly would be very foolish to buy them ready made. We do not manufacture or have for sale any hives, so we have nothing whatever to do with fixing the prices at which they are offered for sale. If bee-keepers do not make their own, no doubt all kinds of hives can be bought in the market at all kinds of prices. If buying, "You pays your money and you takes your choice," as our German friend would say.

### Treatment of Chilled Bees.

Whether you believe that a colony of bees freezes to death or starves to death makes little practical difference, but it is of much practical importance for every beginner to know that a colony with stores exhausted and apparently dead is not always beyond recovery; indeed never, if taken in time. If you find a colony apparently dead, without knowing how long it has remained in that condition, don't give it up for lost, but at least give it a chance. If it has only recently succumbed, and if the day be warm, it may be necessary only to sprinkle on the cluster a little diluted honey or syrup to bring it back to life. If the day be cold, take the colony into a warm room, and warm it up. In any case it will be better to take the bees into a warm room. Watch for signs of life before giving any food. Don't be in a hurry; it may sometimes be an hour before you see the bees begin to move, but if they haven't been too long motionless you may be sure that after a little you will see a leg begin to move here and there, and as soon as they move they are ready for a lunch. Many a good colony may thus be saved.

## Miscellaneous News & Items

**To Minnesota Bee-Keepers.**—Mr. Wm. Russell, an officer of the Minnesota Bee-Keepers' Association, informs us that the Association's Foul Brood Bill (House Bill No. 563) has been introduced and referred to the Committee on General Legislation. Minnesota bee-keepers are urgently requested to write their senators and representatives in St. Paul *at once*, asking them to be sure to support the Bill when it comes up either in the House or Senate.

**Rev. Dr. John Dzierzon**, the "Father of German Bee-Keeping," is thus referred to in a late number of the *British Bee Journal*:

On Jan. 16 this venerable bee-keeper entered upon his 95 year, having been born in 1811. He has been a bee-keeper for 70 years, and has a world-wide reputation for his work in advancing apiculture. The principal scientific discovery of his was parthenogenesis—that is, reproduction without fecundation. This was known to exist in other insects in the first half of the 18th century, but it was in 1835 that Dr. Dzierzon commenced to think about it, and in 1842 to 1844 he made known his ideas in *Frauentorfer Blaetter*. In 1845 he published his discovery in the *Bienenzeitung*, and this drew the attention of scientists to the subject. "The Dzierzon Theory," as this was called, was subjected to the most searching investigation by Siebold, Leuckart, and others, and, although still denied by some, is generally accepted as true. The *Allgemeine Zeitung fur Bienenzucht* prints some very pretty verses dedicated to this veteran, and also gives extracts from papers eulogizing him at the time of his bee-keeping jubilee 20 years ago, and mentions the honors conferred upon him. We are sorry to hear that Dr. Dzierzon is at present unwell, and he has our best wishes for his recovery.

**The Mondeng Mfg. Co.**—This company is represented on the first page. The members of the firm are Messrs. Chas. Mondeng, J. W. Hare, and L. H. Burke.

Their new factory is located opposite Bryn Mawr Park, in Minneapolis, and affords a beautiful view. It is surrounded by natural woods, and running creeks make it a very picturesque site.

Though practically a new one, their factory is fitted up with the latest improved machinery, and is equipped to compete with the best. Their prospects for a good future are very encouraging.

Mr. Mondeng is a practical bee-man, and has an apiary adjoining the factory; having also been in the bee-supply manufacturing

business for many years, he looks after the mechanical part of the work, and personally superintends it. Being a thorough bee-man and also a practical mechanic, he understands the business from beginning to end.

Mr. Hare personally superintends the shipping and receiving, having had considerable experience in a mercantile way. He has been in the general store business for a number of years, and is a very valuable man in his department.

Mr. Burke, who has been a book-keeper for years, looks after the office-work, and is constantly busy keeping in touch with many bee-keepers throughout the country.

The foregoing trio in charge of the different departments, and working together, should soon place the Mondeng Mfg. Co. in the forefront of the manufacturers of bee-keepers' supplies.

We had the pleasure of visiting this Company when attending the Minnesota State convention last December, and were very favorably impressed with the members composing the firm. They were evidently preparing to get their share of the bee-supply business, and certainly should be in a position, so far as ability and equipment is concerned, to handle satisfactorily all that comes their way. We wish them success.

The Apiary of Walter Hoss, of Marion Co., Ind., is shown on the first page. The picture represents only a part of his apiary. There are 45 colonies in the yard, which is located on the rear lawn of his beautiful home. The hives are kept nicely painted, the combs are all straight as a board, and every colony is bred up to highest standard of Italian purity.

Mr. Hoss produces both comb and extracted honey, and has a local demand for every pound—in fact, he does not have enough to go around. He is engaged in other business, but his bees are never neglected. In his work he is assisted by his good wife. His facilities for queen-rearing, with the present encouraging demand, indicate that he will some of these days devote his entire time to that line of apiarian work.

### Comparative Cost of Honey, and Light-Weight Sections, Causes of Small Demand.

BY L. V. RICKETTS.

THE question of increasing the demand for honey and its consumption is one that is frequently brought up for discussion at bee-keepers' conventions and in the American Bee Journal. Among the latest being an editorial on page 19, the Editor asks:

"Why is not more honey used by the ordinary families of to-day? What can be done by the bee-keepers to induce them to use it more than they do?"

These are questions which deserve the most sincere thought and careful consideration of all honey-producers. What I shall say on them will apply principally to section honey.

From July 1, 1886, to April 2, 1896, I was engaged in the retail grocery business; and during those (nearly) 10 years I had considerable experience in selling section honey, which, together with some recent observations that I will now give, lead me to believe that the principal reasons for the ordinary families not using more honey are: Because of the price being greater than for many other sweets (which it should be); and particularly because of the swindle that is being perpetrated on the consumer by the selling of light-weight section honey. Now as to my observations:

While in the retail business it sometimes happened that the case of honey would be placed on the counter within reach of my customers, and they would frequently select a section of honey that seemed to suit their fancy best—and you may rest assured that the best-filled and heaviest sections would be the first to go; these would generally find quite a ready sale, but the lighter weight and poorly-filled

ones would move off very slowly, there being quite a difference between the weights of the heaviest and the lightest in the same case.

My recent observations are, that, during the last year, I have at various times gone into the retail stores and bought a section of honey and then weighed it, to find its exact weight. This I found to vary from 12 ounces for the lightest to 16 ounces for the heaviest, giving an average of 14 $\frac{3}{8}$  ounces each, for 12 sections purchased at as many different times and at different stores. The sections thus bought were of different sizes, some were 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x1 $\frac{1}{8}$ , some 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x1 $\frac{1}{2}$ , and others 4x5x1 $\frac{1}{2}$  inches. Among the 12 there was but one that weighed as light as 12 ounces; this was a 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x1 $\frac{1}{8}$  section; and only one that weighed 16 ounces—this was a 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x1 $\frac{1}{2}$  section. All the square sections were bee-way sections, and the 4x5 sections were plain. All excepting the one weighing 16 ounces seemed to have been used with separators while being filled. The retail price is 20 cents per section the year around at the stores here, and for all grades and weights.

As before stated, I have come to the conclusion that it is owing to the greater price asked for honey than for other and inferior sweets, together with the selling of light-weight section honey that keep the common people from buying and using more honey, and not because they don't understand the food value of it, or have not acquired a taste for it.

It is folly to say that there is more honey produced than the people wish to consume. The great mass of customers know that when they buy a section of honey they should get a full pound of honey, yet they know full well that they don't get that amount in the great majority of cases. Therefore, they are dissatisfied with their purchase, no matter what the price paid, so they frequently look for some substitute for honey that is being sold cheaper, with better weight or measure.

The remedy for this is plain. The standard weight for a section of honey is, or should be, one pound (16 ounces). This, then, should mean a section of honey weighing fully one pound (16 ounces), and not a pound section of honey weighing anywhere from 12 ounces to 16 ounces.

Why is it that so many bee-keepers produce light-weight section honey? Is it not for the purpose of some one to receive pay for something they never possessed? A 24-section case of No. 1 honey should weigh fully 24 pounds (exclusive of shipping-case, of course). To do this, the sections should weigh from 15 ounces to 17 ounces; and in order to have them weigh this it will be necessary to have a little larger section than is now in general use. (Of this I will write in another article in the near future.)

The object in writing this article is to advocate the use of a little larger section, and to use methods that will give us as nearly as possible a uniform section, weighing as near 16 ounces as we can possibly get it. This would increase the sale of section honey so as to pay us well for the extra amount used to fill the larger sections.

According to certain grading rules, a 24-section case of No. 1 honey must average 21 pounds net. This is only 14 ounces per section. Is it any wonder that people are slow to buy an article for daily use as a food when they are being swindled in weight to such an extent as this, amounting as it does to 14  $\frac{1}{7}$  percent of the whole amount?

Produce an honest pound of honey and then sell it at a fair and remunerative price. This will do more to increase the demand for honey than anything else that bee-keepers can do.

Whitman Co., Wash.

### Rapid Increase Through Afterswarms.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes that he is anxious to increase his bees as much as possible the coming season by using the afterswarms for such increase, and finishes up his letter as follows:

"Please tell us something on this matter of increase through afterswarms in the columns of the American Bee Journal, for I have no doubt that others are interested in this matter as well as myself."

Before answering the above I would say that, as a rule, I do not think it pays to keep or build up afterswarms unless, perhaps, as in the case of the questioner, a more rapid increase is wanted; and that the one wishing such increase is not familiar with increasing rapidly by artificial means; for the reason that with the afterswarm goes all prospect for any surplus honey from the parent colony from which it

came. To hive each first or prime swarm that comes generally allows of very nearly doubling the number of colonies in the apiary each year; and unless winter losses are great this would build up an apiary as fast as the experience of a novice would warrant did he expect to become the most successful apiarist. Then, again, the amount of surplus honey obtained from the parent colony from which no afterswarms are allowed to issue would, as a rule, sell for more than enough to buy good full colonies to take the place of the afterswarms, and thus all fussing with them will be saved. Of all the annoyances and nuisances in the apiary, with me, afterswarms are the worst. Many the bee-keeper in the past who would give ten times as much to know how to be entirely rid of afterswarms as he would to know how to build them up to good colonies for wintering.

But as all are not of this turn of mind, it is well to know how to prevent afterswarms and how to build them up where any one wishes so to do. Many articles have been written on how to prevent afterswarms, but articles on how to manage them and build them up so as to be in good shape for wintering, are very few indeed. I can conceive how one might wish to save afterswarms after such a loss in bees as was experienced a year ago, so that the combs from which the bees died might be saved and again occupied with bees, and so I am going to do my best to tell the questioner and the readers of the American Bee Journal how I used to do this when I was more anxious for bees than I was for honey, as well as some of my experience since.

The very first requisite toward a successful start for an afterswarm is a *frame of brood* in all stages, to be placed in the hive at the time of hiving them. As the queen with an afterswarm is never fertilized when the swarm issues, and seldom sooner than from one to three days later, and many times for a longer period, if the weather proves unfavorable from clouds and rains, it is all the way from two to ten days before she commences to lay, so that it is nearly a month from the time of hiving before any young bees emerge from their cells from this queen, by which time the bees going with the swarm are the larger part dead, dying of old age, which makes and keeps the colony weak as to numbers from the beginning till entering winter quarters. By giving a frame of brood this weak part is very materially helped, for, as fast as the bees die of old age young bees are emerging from this frame to take their places; and thus the queen, when she gets to laying, has suitable bees to mature the eggs which she lays, so that by the end of six weeks from the time the afterswarm was hived, we have a good, populous colony instead of a weakling.

This frame of brood is also of the greatest value should this afterswarm lose its queen when she goes out to be fertilized, by being caught by birds or otherwise. This is something which quite often happens, and when it does, where no brood is given, the fate of that colony is sealed, unless the bee-keeper is on hand to remedy the matter by giving a queen or some brood. By giving this brood when the swarm is hived, we are safe along all lines, for if the queen becomes lost, they have the material from which to rear another.

Then, if in addition to the frame of brood we can fill out the remainder of the hive with empty combs at time of hiving, or, better still, combs having some honey in them, we shall have a colony in the afterswarm at the beginning of the winter more valuable than are those from prime swarms, inasmuch as the queen will be at her best the next year, while the queens in prime swarms, where more than two years old, often begin to weaken and fail before the honey harvest of the next year.

In the absence of combs, more than the one containing brood, I would certainly use foundation for all afterswarms, even had I to pay 75 cents per pound for it, did I intend to winter the afterswarms. I am aware that such afterswarms will build almost exclusively worker-comb, and I have often used them up in such comb building, and used to think that there was profit in so doing, but if I wished them to become strong for wintering I would give them every advantage possible, and comb foundation is one of those advantages where we do not have the empty comb to give them.

Having them fixed as above, they are now in good condition except, perhaps, stores for winter; and if stores are lacking they must be fed, the same as any other colony which is short of stores when winter approaches. And if thus short, don't delay the feeding till cold weather, but do it just as soon as you reasonably expect that the honey harvest is over for the year.

"How much shall I feed?" Well, that depends where you are to winter your bees, whether in the cellar or outdoors. For outdoor wintering make sure that each colony

has at least 25 pounds of good stores. From more than 30 years' experience I have found that this amount is needed, one year with another, to insure colonies wintered outside, from the time of the failure of flowers in the fall till their opening again in the spring. But where wintered indoors the above amount can be shaded by from 5 to 10 pounds. Yet, with the average bee-keeper, I should not advise the going into winter quarters, where bees are wintered in the cellar, with less than 20 pounds to the colony.

Onondaga Co., N. Y.

## Convention Proceedings

### Report of the Wisconsin Convention.

BY HARRY LATHROP.

The Wisconsin Bee-Keepers' Association met in convention at Madison, Feb. 1 and 2, 1905. The meeting was called to order at 2 o'clock p.m., Feb. 1, by Pres. N. E. France. Notwithstanding the very severe cold there was an attendance of about 40 bee-keepers, including Editor York of the American Bee Journal and Editor Putnam of the Rural Bee-Keeper. There were a few ladies, including the eminent writer on bees, Mrs. Millie Honaker, and Miss Candler, the successful owner and operator of 200 colonies. The bee-supply business was represented by Gus Dittmer, and G. E. Bacon of the G. B. Lewis Co. The others were mostly practical bee-keepers, some of whom own extensive apiaries.

Pres. France said that he had been unable to provide for a regular shorthand report of the session, and the editors present might take notes for publication if they wished.

The Secretary, Mr. Dittmer, was called on for his annual report, and said that his records had been destroyed in the fire that occurred at his place last year, in which his shop and all his office records had perished. A part of our book of records had been saved, and was presented in a damaged condition. This was the 21st annual meeting, and that book contained an interesting history of the work and growth of our Association. We all regret its loss, but no one attaches any blame to Mr. Dittmer.

Pres. France spoke of having local associations in the State affiliate with the State Association, and mentioned several ways in which this could be done. In New York State they have county organizations in which two members of each are accredited as delegates to the State convention, and have a part in all the deliberations of that body; the county associations paying a fee of \$2.00 annually to the State Association, which entitled them to this representation.

Mr. Huffman called attention to the fact that it was very desirable that all local associations should be affiliated in order to aid the State organization in holding all valuable laws that we now have, and procuring other needed legislation for our industry.

Pres. France said he favored the New York plan of two delegates from each local. It was voted to have a committee appointed by the President to consider the question of affiliation, and report at a future session. Mr. Putnam and another member were appointed to act with Mr. France on this committee.

Pres. France said he believed there would be a large number of local societies organized in the near future.

In regard to our present meeting, it had been decided to follow the plan of the Chicago-Northwestern convention, and use the question-box instead of a regular program, allowing the meeting to develop the scope of its own discussions as it proceeded.

Before taking up the regular question-box, Pres. France read the questions that were asked of all candidates for the office of foul-brood inspector in the State of New York.

Pres. France explained how he had made the honey-map of the United States at the World's Fair in St. Louis, by procuring samples of honey from the different States. From these he had prepared smaller samples which he had brought along and presented for the inspection of the members. It was noticeable that the whitest honeys came from the North and West, while the samples from the Southern States were mostly dark.

The question-box was taken up at this point.

**COST OF SECTIONS—ADVERTISING THE CONVENTION.**

"Why do sections cost \$5.00 per thousand when basswood excelsior is sold at \$3.50 per cord of 52-inch bolts?"

Mr. Wilcox answered, saying that the higher price of labor, and also of lumber, made the price of sections higher. He had bought sections years ago as low as \$2.00 per thousand, but did not think the manufacturer made anything at that price.

"Why is not our State convention advertised the same as those of other States?"

This question was introduced not for the purpose of criticising the officers for not advertising the meeting, but because it was not advertised earlier. It was brought out that the dates of the meeting could not be ascertained sooner, as we are dependent upon the action of other societies that meet at the same time, and with whom we have to co-operate in order to secure reduced railroad rates.

**CANS FOR EXTRACTED HONEY.**

The next question related to the jacket-can for extracted honey. Pres. France said that while the can in its present form had given good satisfaction, some improvements were to be made in its construction for the coming season. Some difficulty had been experienced in securing fourth-class rates for honey in this can, as they are not clearly covered in the classification. It is expected that this will be provided for before the next crop is ready to move.

The question of a seal for the cans, to prevent their being pilfered, coming up, a member recommended a paste for putting on labels, made by cooking two parts corn-starch, then adding one part honey. Paste the labels over the cap in such a way that it must be broken in order to remove the cap. Pres. France recommended a paste made from 1/2 pound of gum-tragacanth in an ordinary pail of water. This might be improved by adding 1/2 pound of furniture glue.

**SELLING EXTRACTED HONEY.**

"If I had a crop of 48 barrels of honey, where should I sell it if not to the commission-house?"

This brought out a discussion on the subject of having an association to sell the product for the members, the same as is done in some parts of the West. Pres. France pointed out the great difference between the conditions of Wisconsin and the bee-keeping districts of Colorado. He thought we were not so favorably situated as they were in the West for the operation of a honey exchange. Some members said they sold their honey mostly to private customers and dealers with whom they had established relations. These members did not need any aid in disposing of their crops.

Although this question has been up in each of our annual meetings for some years past, nothing of a practical nature has been accomplished in the direction of selling honey through a central organization.

Mr. Putnam said that their local association handled comb honey for the members and shipped it by the car-load.

Mr. Jaeger asked why we could not have an association to dispose of our honey, as well as other States, and said that if the whole State is too large, and the members too widely scattered, he would suggest that it be divided into districts.

**WIRE FOR CUTTING GRANULATED HONEY.**

"What size of wire is used to cut granulated honey?"

Mr. Wilcox replied that No. 20 annealed wire is the proper thing, and only well-ripened honey, when thoroughly granulated, could be cut in this way.

It was asked if it were advisable to melt extracted honey before selling it. The answer was, "Yes, if the customers desire it done."

**EVENING SESSION.**

This consisted for the most part of a stereopticon lecture on the subject of bee-keeping by Pres. France. The illustrations were very fine, and the lecture interesting and instructive to a high degree.

(Concluded next week.)

**A Queen-Bee Free as a Premium.**—We are now booking orders for untested Italian queens to be delivered in May or June. This is the premium offer: To a subscriber whose own subscription to the American Bee Journal is paid at least to the end of 1905, we will give an untested Italian queen for sending us one new subscription with \$1.00 for the Bee Journal a year. Now is a good time to get new subscribers. If you wish extra copies of the Bee Journal for use as samples, let us know how many you want and we will mail them to you. Address all orders to the office of the American Bee Journal.

Conducted by EMMA M. WILSON, Marengo, Ill.

**Old vs. New Foundation—Getting Sections Filled**

1. The latest number of the American Bee Journal mentions something that alarms me—that some people think that comb foundation may be too old to use to advantage. I bought a quantity a year ago last summer, and have some left—the heavy for frames, and the thin for sections. It has been left packed just as it came. Will this do to use this season, or ought I to get some new?

A number of questions have been suggested by the most interesting discussions reported from the National convention, which I am going to ask now, and shall be pleased to have them answered at any time.

2. Is there any special manipulation necessary to have all the sections in a super filled? Mine are always stuck together so tightly with propolis that I can not shift them without first clearing them of bees. Only once have I taken off a super that had 24 perfectly sealed sections. Do people usually succeed in accomplishing this result?

3. The honey often is attached to the section only at the top, hence I can not pack and send it away at all. Is this the fault of the strain of bees, or would it probably be corrected by putting a strip of foundation at the bottom, too?

HELEN PERRY.

Clark Co., Kans., Feb. 1.

1. Packed as that foundation is, it will probably keep good for a generation. Even when fastened in frames or sections, it is good for several years.

2. In a good season probably most of our supers would contain 24 completed sections if left long enough. But we do not generally wait for that, but take off the super when all but a few of the outside ones are finished; generally all but the corner sections are finished when the super is taken off. Then the unfinished sections from several supers are put into a super and given back to a colony to be finished.

3. There may possibly be a little difference in bees about fastening the comb to the bottom of the section, but certainly not much. The honey-flow may have more to do with it, but with bottom starters you will probably find the difficulty overcome.

**Italians vs. Other Bees—Report for Last Season.**

DEAR MISS WILSON:—In the early fall I attempted to write something about my bees, and to ask one or two questions, which I have forgotten now. I started about three years ago, taking care of my brother's 4 colonies of common black bees. As I started in the fall of the year there wasn't much for me to do except prepare them for winter.

During the winter I studied the "A B C of Bee Culture." What I wanted next was experience. The bees wintered all right, and built up fast in the spring. After the clover season, which was a poor one, I thought I would Italianize 2 colonies, so I sent for 2 queens—one they accepted all right, and the other they killed.

I took much pleasure watching for the new bees. I had never seen Italian bees before, and there wasn't a day I didn't look in that hive to see how they were getting along. I decided I wouldn't have any other kind. But the next year, when they began to swarm, I thought there would never be an end to the bees in that hive, for I can truthfully say they swarmed seven or eight times, probably more, for aught I know. I then changed my mind about Italian bees, thinking they were all alike, but have learned different since. I have now Italians, hybrids, and common blacks, and find good and bad qualities in both.

In 1903 I had 27 colonies of bees to winter, but sadly neglected them, and the severe winter left me in the spring with only 6 colonies. That is, I doubled up some to make them strong enough to build up fast.

Last fall I put 12 strong colonies into winter quarters with the exception of one, which I must confess I could do

nothing with the entire summer and fall—a strong colony of hybrids, which were as savage bees as I ever saw.

What would you do with them in the spring? Would you introduce an Italian queen? That is, if you could get near them? or if you couldn't, what would you do? Last year was a fairly good one for dark honey or buckwheat. Clover was checked by the dry season, but come to think of it, there was too much rain. I took off about 300 pounds of extracted honey and one super of comb honey.

I can easily sell more than I can get. There are only two other bee-keepers around here, and they are men. I would like to get some other women interested in bees, but they get frightened when I mention it, saying they are afraid of getting stung. Well, I was, too, but have gotten over it.

ETHEL M. BURDETTE.

Hunterdon Co., N. J., Feb. 6.

Yes, it would be a good plan to give them a queen of gentler stock, if not too difficult to do so. But you may find that they superseded their queen last fall, and that the workers of the new queen are more gentle. And you may find, too, that without any change of queen there may be a change of temper. I have distinctly in mind a colony that was extremely cross, and the only thing that saved the head of that queen was the fact that we were so very busy that we let it slip along until too late to requeen that season. The next spring they were a good, strong colony, and did excellent work all season, and so far as we could see were quite as gentle as any colony in the apiary.

### Report from a "Mother" Bee-Keeper—Severe Winter.

DEAR MISS WILSON:—If the rest of the sisters had been as slow as I have been in giving their reports you would not have had very many. I have had so much to do, and no one to do anything but me.

The past season was not a very good one. From 8 colonies I secured only 75 full sections, 22 not full, and 13 that I gave to one of the colonies to clean out. This colony did not have enough to winter on, and I made candy and put on the frames under the cushion. Week before last I looked to see if they had eaten it all, but there was quite a little left.

I have only 10 colonies; some have boxes over them with leaves packed between the boxes and the hives, and some have padding around them and a board set up in front of the entrance.

Last week we had the worst weather of the winter, and the most snow, and the wind blew so hard that the snow drifted badly. Saturday afternoon I shoveled through the drifts until I got to all of them, took away the boards and brushed the snow from the entrance, returning the boards after doing so. The snow had blown in between the boards and the hive until it was packed full, and I was afraid that they might smother. Now they can get air until another storm comes, and I hope that will not be this winter.

I had so much to do all summer that they did not get the proper care. I had 50 chickens and over 60 pigeons, all having to be fed and watered three times a day.

It took me all of week before last to make my chicken yard larger, digging holes, putting in posts, nailing on boards at the bottom and putting on the wire.

On page 72 the "Elder Sister" says that she is 70. I was 76 in December. How is this for a sister that does the work that I do? I look for the sisters' corner the first thing.

MRS. SARAH J. GRIFFITH.

Cumberland Co., N. J., Jan. 30.

There is not usually much danger of harm from snow at the entrance. In fact, some count it an advantage to have it there so long as it is soft and porous, so the air can slowly work through it.

Perhaps at 76 one should be counted a "mother" rather than a sister. When we all reach the same age may we be as active.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon-Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### CELLAR-FEEDING OF SYRUP-FILLED COMBS.

C. P. Dadant succeeds pretty well in knocking out the plan of feeding syrup-filled combs in the cellar. Granting that something must be fed, candy has three decided advantages. First, one doesn't have to tear the winter cluster apart to give it to them; second, they will not get excited when they first find it; and third, the keeper can easily see, without causing any disturbance, how the supply is holding out. All correct; but I'll be off-oxed enough to talk back to the effect that for other times in the year the empty comb filled with syrup (or honey) by means of the—well, call it the "in-tractor"—and put right where it will do the most good—this going-to-be improvement is one of the good things which the future has in store for our craft. Page 86.

### A "NERVY" ERROR.

In my corner, on page 88, read optic nerve instead of "optic never."

### A BRAVE SISTER AND OTHERS.

Sister Wheeler's locality and climate (north end of Lake Champlain) are certainly very trying to run an apiary in. Surplus very late, and almost no pleasant weather from then till the opening of spring. That she and others nevertheless "make the rifles" is quite to their credit. Page 87.

### HEAVY LOSS, BUT STILL CHEERFUL.

An excellent example of "count your mercies," we have on page 92. Losing all but 7 out of 148 (and the survivors with only a pint of bees each) would make some of us grumble—some of us cry, possibly. But here comes Mr. Hammersmark as our exemplar, crowing and congratulating himself that now he is going to have exclusively such a hardy and profitable strain of bees.

### "CLOSE SPACING FOR WORKER-COMBS."

The British Bee Journal would not have had such a high and excellent reputation as it has did it always give such silly answers as that quoted on page 99. Possibly it is meant that the frames are also to be filled full of worker foundation. That would redeem it. Mere slips of comb, less than a half an inch in thickness because the crevices they were to fill didn't allow room for anything thicker, are often built with cells of drone size. And spacing frames  $1\frac{1}{4}$  inches, or any other distance, is no assurance that the combs, when finished, will be according to guide, if they have starters only. If the bees want a drone-comb they will build it, and crowd the next comb over to that extent—sometimes omit the next altogether, or in part, and fill the space by bulging from both sides.

### EVERY BEE-KEEPER HIS OWN HIVE-MAKER.

Ah, dear Boss, don't you forget to remember that this whole nation (except the culprits) is tender and excited on the subject of trusts. If you even seem to favor their side but a little there will instanter be lots of bees around your bonnet, if not in it. If you were a guest in the Russian royal family you would not argue very much in favor of the bomb-throwers—and you are in a somewhat similar fix now. The cabinet-maker has already "dressed you down" for saying that hives must be made with more accurate measurements than cabinet-makers and carpenters use—and here comes your friend and mentor to dress you some more for the logic in your first paragraph. If a man makes his own hives with profit it most decidedly doesn't follow that he can make for others with still more profit. He makes his own hives with his own hands; but if he wishes to enlarge in that line the vexatious question of hired help comes in and knocks everything endwise. Page 100.—[It is hardly necessary for us to say that we have no use for trusts or combines that have for their object the raising of prices unduly, and then keeping them elevated. We believe in the motto, "Live and let live!"—EDITOR.]

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more money they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal. □

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Dimensions for a Honey-House.

I intend to build a honey-house in the spring. It is to be a storage-room, workshop and extracting-room combined, for a yard run for both comb and extracted honey. What size would you advise building for an apiary of from 80 to 100 colonies? NEW YORK.

ANSWER.—Rather hard to say; likely you'll find it none too large to have it 18x24 feet, two stories.

### Maple Syrup for Feeding—Putting Bees Out of the Cellar

1. Would maple syrup be good for feeding bees in the spring for stimulative brood-rearing?

2. What is the best method to pursue in putting the bees on the summer stands in the spring? I have 150 colonies in the cellar in good condition, and I want to put them out very early in the morning, about 2 o'clock. QUEBEC.

ANSWERS.—When the weather is warm enough so bees are flying every day it will do very well to feed maple syrup, or any other sweet that bees will take. No more should be fed, however, than will be used up in brood-rearing. If, however, it be fed at a time when bees can gather from the flowers, it will do little in the way of stimulating.

2. It will be all right to take bees out at night, or even the previous evening, provided the day following be favorable for them to fly. If it should turn out a bad day the bees might fly out, become chilled, and never return.

### Bees Gnawing Starters in the Sections.

When double starters or full sheets of foundation are put in the sections don't the bees gnaw the starters off? I have been using the small triangular piece about  $\frac{3}{4}$ -inch wide, but find that the bees very often gnaw the piece entirely off, and often—very often—leave only the thin line of wax where foundation had been attached to the sections. I have also noticed that wider and longer pieces of foundation had been gnawed down to about  $\frac{1}{4}$  of the original size. I want to use double starters above and below this season, but if my bees are to attack them and gnaw and mutilate them as has often been done in the past, I want to know how to correct this trouble. VIRGINIA.

ANSWER.—I don't believe you need have any trouble of the kind. I'll tell you what I know about it. In a full honey-flow you will probably find that there is no gnawing, no matter what the size of the starters nor the kind of foundation. At the close of the harvest if they have a chance they are likely to do more or less gnawing. The thinner the foundation the more likely they are to gnaw. I prefer thin-super foundation to extra-thin. They are more likely to gnaw a little strip than a larger piece. With starters above and below, and not more than  $\frac{1}{4}$  inch between them, the bees seem to think their first business is to fasten together the two pieces. For some reason they do not gnaw before harvest as they do after, and I don't remember any trouble even when sections were put on 10 days before needed. If you use thin-super foundation, and fill the sections with upper and lower starters, and then take them off with reasonable promptness when the season is over, I think your trouble will disappear.

### Cleansing Flights—Bees and Fruit—Hybrids vs. Italians—Weight of Hives.

In reading about the care of bees in the cellar I have often noticed the caution not to leave them out too long when giving them their cleansing flight, as they may start to brood-rearing, or they may not do well in other ways.

1. Why should their case be different from those that have been on the summer stands all winter?

2. What are all the good points for the good of fruit-trees and their fruit in having a near-by apiary to work the honey out of the fruit-bloom, as I so often see advocated by the Government?

3. I have been experimenting since last spring with a hybrid colony and some red clover Italians by close observation in every way, and my judgment is that the Italians are superior in almost every respect. They gather more honey, build the combs just as even and full as the hybrids, are much more gentle, and, I believe, winter better, as I put the Italians out of the cellar last week to give them a flight, and did not find over a hundred dead bees. To-day I am giving the hybrids a flight, and find a full pint of dead bees on the bottom-board. I believe it will pay one to stock up at least every two years with good select Italian queens.

4. In weighing or hefting a hive, about what percent of the weight would you consider other than honey or food for the bees? MISSOURI.

ANSWERS.—1. I don't know. Sometimes we know a thing without knowing why. There is also a possibility that there may not be so great a difference as supposed. We know, however, that bees are not exactly in the same condition before coming out of the cellar as those wintered out-doors. There is also a difference afterward, those from the cellar not being protected by packing, usually.

2. I'm not sure that I understand. If you mean in what way are we to secure all the good possible to the fruit from the bees, I don't know of any special thing to be done other than to have plenty of bees not farther than a mile or so away.

3. You can't be too sure from a single case. Next time you may happen to have a hybrid better than a pure colony. Yet your idea of getting in fresh Italian blood is good.

4. I don't know. It will vary according to the varying weight of the hive, cover and bottom-board. Empty combs vary no little, according to age. One hive may contain much more pollen than another. Find out as nearly as you can what your hives weigh with combs heavy with pollen, and add to that 8 pounds for bees (you'll not often find that many bees), then add 25 pounds more for honey for cellaring, and 30 for out-doors.

### Dead Bees—Liquid Oozing from Hives.

I am a beginner in the bee-business. Last summer I bought 5 or 6 colonies of bees in box-hives. Some of them had no frames at all. Two were in dovetailed 8-frames hives with supera but no sections. They did not store much honey, but seemed to have plenty to last over winter.

This has been a very cold winter here. Since Jan. 2 the temperature has gone all the way from 3 or 4 degrees below to 35 degrees below zero. But at this time I think there are live bees in all the hives, except possibly one. Last fall I tacked heavy carpet-paper snugly around the hives and then placed straw and leaves around the north and west sides about  $\frac{1}{2}$  of the way up, and also underneath, as the hives were about 6 inches from the ground on the summer stands.

I clean the snow out of the entrance at the bottom every day, and find dead bees there. One of the colonies in the dovetailed hives seems to be very strong, no super on, and the bottom entrance was very small and constantly filled with ice from steam or condensation within. I have enlarged the entrance and find a great many dead bees. In some of the hives they come out and try to fly when it is zero weather, and from some others whenever it moderates a little liquid honey oozes out at the entrance.

I would be pleased to know what causes the honey to run out in this way, especially in such cold weather.

I like to work with bees, but have had no experience. I have been reading the American Bee Journal since Jan. 1, and hope to gain some information and instruction therefrom. KANSAS.

ANSWER.—It is nothing out of the common for a comparatively large number of bees to die in winter, in every hive, from old age. It isn't the best way to disturb the bees daily by raking out the dead. Try to have it arranged another winter so this will not be necessary. Better have a space of two inches under the bottom-bars, and then if the entrance is at the upper part of this space there will be little danger of clogging the entrance. The vapor from the bees settles on the walls of the hives in the form of frost in considerable quantity, and when this melts the water will run out of the entrance. Sometimes the frost or moisture settles on the unsealed honey, and then sweetened liquid runs out of the entrance, as in your case. You did well to enlarge the entrance so as to allow free escape of the vapor and foul air.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

**Maple Sugar and the Sugar Bush**, by Prof. A. J. Cook; 44 pages; price, postpaid, 30 cents. This is by the same author as "The Bee-Keepers' Guide," and is most valuable to all who are interested in the product of our sugar-maples. No one who makes maple sugar or syrup should be without it. Order from the office of the American Bee Journal.

# Reports and Experiences

## Good Honey Crop—Advertising Honey.

Last year I produced 2460 pounds, all extracted but about 200 pounds of section honey. This was secured from 10 colonies, spring count, and increased to 18 colonies, all of which are wintering on the summer stands with plenty of stores, and well packed. They had a good flight Dec. 31, that being a beautiful, warm day. But since then it has been very cold, the mercury dropping down to 36 degrees below zero one morning. So I think that those who wintered their bees outdoors, and did not pack them properly, will find in the spring that they are no more.

I have about 1000 pounds of extracted honey unsold at this time, and I find the market very dull. So I thought I would try the "Honey as a Health-Food" pamphlets as a medium of advertising. I mean to mail a pamphlet to each of my friends and acquaintances, and even inclose one in every business letter I write. I hope this method will be successful, and I think it will be. I expect to increase my apiary to about 40 colonies next season, and will probably double the number of colonies for some years to come.

Sioux Co., Iowa, Feb. 6. G. GLEYSTEN.

## Hoffman and Closed-End Frames—Keeping Colonies Warm.

Overhearing a conversation lately between a bee-keeper and a man named Jack, who worked for him last summer, I thought I would send it to you.

"Well, Jack, what do you think of the Hoffman frame?"

"Well, boss, to tell the truth, in handling it I can find no fault. It is a good spacer, but in the extracting-room they don't like them at all, and I think I heard Jim and Tim say some very bad words about them."

"Well, Jack, what do you think about the all-closed-end frame hanging crosswise in a hive, keeping the bees warm in spring?"

"Well, boss, I don't know, but I think they

would be even worse than the Hoffman for extracting. Still, they might be warmer in spring for the bees, and I think a little too warm in summer."

"Well, Jack, I will tell you what happened to me some 25 years ago. I then used division-boards, and put each colony on as many frames as it could well cover every spring. But I missed one, and although I had taken out the spare combs, I forgot to put in division-boards. When it was time to spread their combs, and I came to this particular colony, I found 4 combs and the bees in the middle of the hive, but no division-boards, for I then used 2 division-boards for every colony in spring. I found some new comb started on both sides of the 4 combs, but built on the cover which was a flat one made of one board. On lifting the combs out I found the 4 combs were pretty well filled with brood—just as well filled as any of the stronger colonies with division-boards, for all my strongest colonies were put on not more than 4 combs shortly after being put on the summer stands. They were left that way till about the middle of May.

"Now, Jack, I will tell you how this unlooked-for dose of medicine acted upon the division-board fever. At first I didn't know which to do, put in division-boards or fill out with combs, but I put in the combs. In a few days I looked in, and to my surprise they had new pollen and honey stored in the very outside combs. Out came all the division-boards from every colony, their hives filled out with combs, and I was completely cured of the division-board fever, and never used them thereafter except when I wanted brood in only a few combs.

"When I read articles about making hives and frames to keep a colony of bees warm, as lately advocated by Allen Latham, I must say the dose acts with full strength, as it did about 25 years ago. My aim now is to get good colonies with plenty of young bees, a good, young queen, and 30 or more pounds of good, capped honey to go into winter quarters, and they will keep themselves warm in the spring.

"No, Jack, I don't believe in those warm-hive and warm-frame stories, but I believe in good colonies in the spring. Weak colonies keep warm nowhere, while good colonies keep warm anywhere, even in a hive made of lumber 1/2-inch thick."

"Well, boss, this looks as if bee-keepers ought to try to invent warm colonies instead of warm hives and frames, for I don't believe, myself, that a warm hive will keep warm un-

less a good, warm colony of bees is in it, but still it may be locality. For instance, we bee-keepers just a little this side of the North Pole never lose any bees in winter. If feeding has to be done, we raise the front of the hive with an entrance-block, pour in the feed and call it the best feeder that ever was invented. Farther south they use good feeders, but lose bees in winter."

"Well, Jack, you see they have an eye only to surplus honey, while we in this poor bee-country must have an eye to winter stores first."

"Well, boss, you see it's all locality."

W. F. FRITZE.

St. Louis Co., Minn., Feb. 3.

### Winter Losses May Be Heavy.

Bee-keepers here never do any wintering in the cellar, and are very careless about packing for winter. The bees generally come through all right, but I'm getting a little fearful this time. It has been a snug winter since Jan. 1, and we had another blizzard yesterday.

I have 75 colonies on the summer stands, and may lose 50 percent if this weather continues much longer. As our fall honey here is very dark and heavy, it is not the best to winter on with long confinement.

H. A. BUSHBY.

Republic Co., Kan., Feb. 12.

### Results for Last Season.

I am wintering 40 colonies in 8-frame dove-tailed hives in a cellar under the dining-room. I wintered 32 colonies last winter, and sold 2 or 3 colonies during the past season, so you will see that I was pretty successful in preventing increase, for which I have to thank the Editor and writers of the American Bee Journal.

My last season's crop was 900 pounds of comb and 300 pounds of extracted honey. I have disposed of most of the crop at very satisfactory prices in three towns near by.

During our 21 years continued residence on the farm it has grown from 160 to 490 acres. When we moved on it our family consisted of my good wife, our baby boy 7 months old, and myself. Our "baby boy" is still at home, although he is past 21 years of age, and we also have a boy aged 18, and twin girls aged 10, who are lots of help to their mother as well as to me, in helping to care for the bees.

W. H. ROOT.

Wayne Co., Nebr., Jan. 31.

### Fastening Starters in Sections.

I notice a good many have trouble in fastening starters in sections. A good way is to put the starters on before folding with hot wax. First fill a 2 or 3 gallon kettle with water and beeswax to within about one inch of the top. Heat it till it begins to foam, and then set it off on a work-bench over a lamp. While the wax is heating cut the starters, lay the sections all one way, and inside up, close to the kettle. Pick up a handful of sections and lay them on the kettle over the hot wax. Now pick up a handful of starters, dip the edge of a starter in the wax and put it where it belongs quickly. Hold it up 2 or 3 seconds so it will not lop over. Lay the sections on a 4-foot board, side by side, until all are ready. Set them to one side and fold and super at your leisure. Try it. It is not necessary to have the lamp unless you have a good many sections to fix up.

ALYAH REYNOLDS.  
Knox Co., Ill.

### Loss of Bees—Rains in Southern California.

Judging from reports from bee-keepers in Southern California, or lack of reports for the past year, one would think this was not much of a bee-country. But there are some bee-keepers and a few bees left, though it has cost considerable labor and some money to carry the bees through a whole year by feeding. The careless and faint-hearted, who keep bees because they "board themselves" and allow their owner to eat with them, have dropped out because they have found that (such) bee-keeping doesn't pay. I know of one man who had 65 colonies a year ago, and now he

# "DADANT'S FOUNDATION"

**WE GUARANTEE SATISFACTION.**

**BEE-SUPPLIES**

OF ALL KINDS.

**Beeswax Wanted at all Times.**

**DADANT & SONS, Hamilton, Ill.**

has only one left, and a large supply of wormy combs and cocoons. All died from starvation.

Another who had 300 colonies in the mountains, but lives in town, went out about the middle of the summer to see what condition they were in, found them on the point of starvation, and before he could get sugar to feed them, he lost 150 colonies. He fed the rest well, and has lost but very few since. Most of the real bee-keepers have carried their bees through without a very great loss.

In my own apiary I have 82 colonies left from a total of 103 a year ago. The loss has been caused by loss of queens principally, as there were no swarms and no drones to fertilize the queens where queens were superseded. I have also lost a few by the depredations of "hoodlums."

I have fed about 1500 pounds of honey and sugar at a cost of \$72—an average of about 90 cents per colony—and they have enough to carry them through till honey comes in from the fields. We have a very good prospect for a honey crop, as there have been since the last of December frequent and copious rains, totaling 10.86 inches for the season, and the season for winter rains is only about half passed. In the mountains where most of the honey is produced, there has been considerable more rain.

F. C. WIGGINS.

San Diego Co., Calif., Feb. 1.

### Management with Box-Hives.

I secured a half ton of extracted and a half ton of comb honey in 1904 from 40 colonies. I now have 60 colonies, and am buying other bees. I have 26 colonies in box-hives which I wish to transfer to Higginsville hives in the spring.

Last year I returned all swarms with clipped queens, but even when I left a mature queen-cell the bees invariably started other cells. Then when the queen emerged and found the other cells, out she came with a swarm.

I want honey and not increase, and I would

## Bee-Supplies!

Discount for Early Orders

We carry a large stock and greatest variety of everything needed in the Apiary, assuring BEST goods at the LOWEST prices, and prompt shipments. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Massle Hives, etc. WRITE AT ONCE FOR CATALOG

AGENCIES.—Trester Supply Co., Lincoln, Neb.; Shugart & Ouren, Council Bluffs, Iowa; Fulton & Ford, Garden City, Kan.; I. H. Myers, Lamar, Colo.; Southwestern Bee Co., 438 W. Houston St., San Antonio, Tex. KRETCHMER MFG. CO., Red Oak, Iowa.

Please mention Bee Journal when writing.

## Prompt Shipments

Orders sent in now will be promptly shipped. We are equipped with modern machinery; we buy only the best in raw material and have expert workmen turn out the work. It is the equal of the best in the market, and we save you 25 percent on all kinds of BEE-SUPPLIES.

Please Mention the Bee Journal when writing Advertisers\*\*\*

like to know how to transfer the bees from the box-hives, and also the latest method for working bees in movable-frame hives for section hives.

The bees have ample stores of good honey. They are in box-hives in the cellar, 20 in double-walled, and the rest in dovetailed hives. GEORGE R. KELLY.

Cooper Co., Mo., Feb. 6.

[Any of the standard bee-books give full details for transferring bees from box-hives into movable-frame hives; also by studying such books, and this Journal from week to week, any one will soon get the latest methods of working for comb or section honey.—ED.]

**Foul Brood—Bees Wintering Well.**

Bees did fairly well the fore part of last season, but the middle and latter part they did very little. I got no surplus honey last year, and had to feed a great deal for winter stores. I found some dead brood, which I fear was foul brood and will make its appearance again this year. If it is foul brood it is something that never appeared in this locality before.

The bees seem to be wintering well, although we are having rather cold weather, the temperature being as low as 14 degrees below zero at one time, and it is very cold today.

Success to the American Bee Journal. A. J. MCBRIDE. Wayne Co., N. C., Feb. 16.

**Rains in California.**

We have the February rains I mentioned a month ago, and now we look forward to the March rains. If we get them our season will be all a bee-keeper can desire. We will show those Texans what California can do. We have just had such abundant rains that even if we did not get any in March, and but 2 inches or so in April, it would give us a good crop of honey. Our winter has been unusually mild—only one or two frosts.

C. W. DAYTON. Los Angeles Co., Calif., Feb. 23.

**HONEY-JARS.**

For a limited time we offer No. 25 Honey-Jars, porcelain cover, metal screw cap, holding one pound of honey net, one gross in case complete, in 5-gross lots, \$4.00 per gross; less quantities, \$4.50 per gross, f.o.b. New York. If you want to secure some, let us know at once.

**BEE-BOOKS**

SENT POSTPAID BY

**GEORGE W. YORK & CO.,**

CHICAGO, ILL

**Forty Years Among the Bees**, by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. Seventeen years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**ABC of Bee-Culture**, by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 60 cents.

**Bees and Honey**, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages. Price, in cloth, 75 cents; in paper, 50 cents.

**Advanced Bee-Culture**, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages; bound in paper, and illustrated. Price, 50 cents.

**Bienen-Kultur**, by Thomas G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

**Apiary Register**, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00.

**Dr. Howard's Book on Foul Brood**.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

**Winter Problem in Bee-Keeping**, by G. R. Pierce.—Result of 25 years' experience. Price, 30 cents.

**The BEST RASPBERRY**

is Plum Farmer, early large, enormously productive. Catalog of raspberry, strawberry and other berry plants free. Write, L. J. FARMER, PULASKI, NEW YORK

**Engravings For Sale**

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and using in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid.

**Sweet Clover Seed**

FOR SALE—50 lbs. or over, at 5 cents per pound. Address, 5A9t JOSEPH SHAW, Strong City, Kans.

**Where Honesty Paid.**—Near Shenandoah, in the famous Iowa corn-belt, lies Sleepy Hollow Farm. Here, some 11 years ago, a young market gardener concluded that instead of confining his efforts to gardening for the consumer, he might as well be raising seed for the producer. Having been raised a gardener, his early experience and training rendered him peculiarly adapted to the business of a seedsman; to anticipate the needs and avoid causing the trouble and annoyance which so often vex the patience of the truck farmer. At the start he determined that only reliable seeds should be sold under his name, and only those he could guarantee; that full measure, just weight, and true description should be the rule. He began by making his neighbors his first customers, and they soon discovered that in him they had a man who could always be depended upon to furnish nothing but honest goods. They spread the news to others, and the ever widening circle of pleased patrons necessitated the steady increase of his facilities, until now the name of Henry Field, Seedsman, or, as he is often called, the "Ear Seed Corn Man", is known far and wide among farmers and gardeners throughout the Middle West. His annual catalog is a mine of information on seed subjects, and a carefully prepared list of good things to be found in the "Red Packet" seed packages, red packet being Mr. Field's method of identifying the seeds shipped from his establishment. Before purchasing seed it is worth while securing a copy of Mr. Field's catalog, which he sends free of charge, and becoming acquainted with the good things he offers. The 1905 edition is now being sent out. Please mention the American Bee Journal when writing.

**The Emerson Binder**

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

### CONVENTION NOTICES.

**Illinois.**—The Western Illinois Bee-Keepers' Association will hold its spring meeting April 5, in the County Court Room, in Galesburg. Reasonable subjects will be discussed. Each meeting so far has been more interesting than the previous one, and we hope to continue that way. We earnestly invite all who are interested in this industry who are within easy reach of Galesburg, to be at this meeting.

E. D. WOODS, Sec.

**Michigan.**—The Northern Michigan Bee-Keepers' Association will meet in Lady Macabees Hall, at Central Lake, Wednesday and Thursday, April 5 and 6, 1905. Hotel rates will be, The Tavera, \$1.50 per day. Editors A. I. Root and W. Z. Hutchinson will be present; also E. D. Townsend, Geo. E. Hilton and a number of other practical apiarists of Northern Michigan. If you have never attended a convention let us suggest that you try it for once, and you will have a higher opinion of your calling when you leave.

W. MOHRMANN, Sec.

Geo. H. KIRKPATRICK, Pres.

**Utah.**—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturalists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same.

G. E. GARRETT, Sec.

E. S. LOVESY, Pres.

## Honey and Beeswax

**CHICAGO, March 8.**—There has been somewhat of an increase in the number of sales during the past 4 weeks, yet the volume has not been large, while prices are if anything lower than in January, especially on other grades than white clover. Fancy grades of white comb bring 12½@13c; No. 1, 12c, with some off in color at 11@11½ cents; amber grades slow at 8@10c. Extracted, white, 6@7c; amber, 5½@6¼c; the price being governed by quality, flavor and package. Beeswax, if clean and good color, 30c per pound.

R. A. BURNETT & Co.

**NEW YORK, March 11.**—There is no improvement in the comb honey situation. The demand is next to nothing; quotations nominal and no doubt some of the stock will have to be carried over. We quote fancy at 13c; No. 1 at from 11@12c, and dark at from 9@10c. Extracted is in fair demand: White at from 6@6½c; light amber at 5½c; Southern in barrels from 50@57c per gallon, according to quality. Beeswax firm at 29c.

HILDRETH & SEIGELKEN.

**BOSTON, March 9.**—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality.

BLAKE, SCOTT & LEE.

**KANSAS CITY, Feb. 25.**—The honey market is still very lax, with scarcely any movement at all; the best white comb stock, 24 section cases, is selling here at \$2.25 per case. Extracted moving all the way from 4½@6¼c per pound, according to quality. We look for an improvement. Beeswax in good demand at 28c.

C. C. CLERMONS & Co.

**CINCINNATI, O., March 8.**—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7¼@8 cents; amber, in barrels, 5¼@5½c; in cans, 6@6¼c. Beeswax, 27c.

C. H. W. WEBER

**PHILADELPHIA, March 10.**—Since our last quotations, honey has been gradually declining, and at the end of the season for comb honey especially, commission men and holders are offering at most any price to clear out their stock. Fancy white, 14c; No. 1, 11@12c; amber, 10c. Extracted, white, 7@8c; amber, 5@6 cents. Beeswax, 28c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

**ALBANY, N. Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily.

We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6¼c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

**SAN FRANCISCO, March 8.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3¾@4¼c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Not much strictly choice water white honey on the market, either comb or extracted, but there is considerable amber stock, including some from the Hawaiian Islands. For ordinary grades the market is easy in tone, with demand slow.

**CINCINNATI, March 10.**—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6¼c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c.

THE FRED W. MUTH CO.

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

**GEORGE W. YORK & CO.,**

334 Dearborn Street, CHICAGO, ILL.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. THE A. I. ROOT CO. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

We trust the same will be continued to our successors in the business. GEORGE W. YORK & Co. Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. Send for it.

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE.

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything JUST RIGHT, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

## Editorial Notes and Comments

### The National and Incorporation

MR. EDITOR:—You ask (page 197), referring to incorporation, "Will the Association take any advantage of the added power and responsibility?" Take the case mentioned, page 197. When reparation was desired, and the National was asked, "Are you incorporated?" if it had been incorporated, do you, or don't you, think the Association would have taken advantage of its power to say "Yes?"

C. C. MILLER.

We "don't know." Perhaps it would have done so. But it never did take any advantage of incorporation when it was incorporated, some years ago. Would it do so now, if incorporated?

### Alfalfa in the South

To those who are used to thinking of alfalfa as a permanent crop lasting 50 years without re-seeding, it sounds strange to hear the Sugar Planters' Journal say that in the sugar districts alfalfa generally requires re-planting each year, owing to other grasses crowding it out. "But the fact remains," it continues, "that with three to six cuttings annually it pays to sow each year."

"There are sugar planters who have been planting alfalfa for years," and it would be interesting to know whether these planters have noted that bees have taken any interest in the blossoms.

### Comb Foundation from the Rietsche Press

A sample of this has been received from Adrian Getaz, the man who makes the presses. It would probably be classed as heavy brood, and it is not likely that foundation suitable for sections could be produced on this press. In Europe, where thousands of Rietsche presses are in use, very little section honey is produced. For some reason the incipient cell-walls are much more distinct on one side than the other. The foundation has a soft feeling, like that formerly produced on the Given press, and would no doubt be very promptly accepted by the bees. Those who care to make their own brood foundation could at least make the experiment at a very small outlay.

### Freezing Worse in Cellar than Outdoors for Bees

In a locality where the temperature never goes lower than 10 or 12 degrees above zero, one would never think of putting bees in a cellar, yet in colder localities a cellar would be considered unfit to winter bees if it should ever go as low as that, or even within 20 degrees of it. If it be so very bad in a cellar, why not just as bad outdoors? After discussing the question quite fully in the American Bee-Keeper, Frank W. Proctor says:

To sum up: A fall of temperature to the freezing point leaves the outdoor bees much more comfortable and better able to maintain their normal temperature than those in the cellar because (1) the air in the outdoor hives is much drier, and (2) because the bees outside have occasional opportunities for evacuating the waste arising from any excess of food they may have to consume during cold spells.

### Bee-Culture in the Department of Agriculture

Through the kindness of Mr. Frank Benton, in charge of Apiculture in the United States Department of Agriculture, we have received a copy of the Report of the Entomologist, Mr. L. O. Howard, for 1904. In it we find the following referring to the

#### WORK IN BEE-CULTURE.

A great increase in correspondence on all topics relating to apiculture so far occupied the time of the single investigator in this line that original investigations had to be limited. This correspondence covered nearly every phase of the subject, and came from all parts of the country, indicating a very general increase in the interest in this branch, and often required special letters of some length to elucidate the information needed. Frequent assistance was rendered teachers connected with the public schools and normal institutes where the natural history of the honey-bee, and in some instances elementary instruction in the general methods of bee-management, formed a part of the course. Advice was also given in some instances to agricultural colleges contemplating the institution of special courses in apiculture.

A small number of choice queens of the Cyprio-Carniolan cross, which has proven such an excellent one for the arid regions of the South and West, were sent out. The extremely dry season in Southern California has given a severe test of the remarkable energy shown in honey-collecting by all crosses containing Cyprian blood; and while it has been necessary in many apiaries, in order to prevent starvation of the colonies, to feed a large proportion of the Italians and hybrids which are chiefly kept in that part of the country, reports have been sent in showing that 30 to 40 pounds of honey per colony have been found in the same apiaries in hives whose queens were largely of Cyprian blood.

The comparative test between the Caucasians and other types of bees, including Cyprians, Carniolans, Italians, and various crosses between these types themselves, and also with accidental matings with black drones, has been continued. The conclusion was reached that the Caucasian race was by far the gentlest honey-bee that has ever been brought to this country. Every manipulation necessary in the apiary can be performed with Caucasian colonies with the use of the bee-veil, and only in rare instances has it been necessary to apply smoke to control them. Very small quantities were then employed. Under nearly all circumstances it would almost be believed by all observers that these bees were stingless. The test regarding their honey-producing qualities has not been as conclusive, since the past year was, in general, a poor one in this region. However, in so far as the comparison extended, it was found that they held their own in honey-gathering by the side of the Carniolan race, although not equaling in this respect the Cyprian crosses mentioned above.

The revival in various newspapers of stories relating to the manufacture and marketing of comb honey has called for repeated denials and a plain statement of the absurdity of the whole matter, as well as the great injury it was working to the apiculture industry of the country. The newspapers and other publications which had inadvertently been led to publish these inaccuracies have nearly always been very ready, upon a proper presentation of the case, to insert a correction. Particular attention has been drawn to the fact that it would cost far more, by any process whatever, to produce a wax, or imitation-wax comb, fill it with honey, or any mixture designed to resemble honey, and then seal it over ready for the market, than it would to maintain and care for an apiary of the required number of colonies to produce through the agency of the bees themselves the same quantity of natural honey. This shows at once the absurdity of the claim that the greater part, or any part, of the comb honey on the market is an artificially manufactured product. This showing has also been followed by a statement of the fact that a reputable firm has for 20 years offered to forfeit \$1000 to any person who could produce artificially an imitation of comb honey which would deceive any person when compared with combs that are filled and sealed by the bees themselves.

Early in the fiscal year the apicultural investigator visited the arid regions of the Southwest, making an extended inspection of apiaries over the whole of Southern California, and further investigations in the central and northern parts of the State, with a somewhat cursory view of the conditions of the industry in Oregon, Washington, and

Montana. The conclusions resulting from this tour were to the effect that the introduction of various types of bees adapted in each instance to the respective climates and peculiarities of these regions, together with the introduction of certain honey-plants from other portions of the world, which, from similarity of climate, etc., would be certain to thrive in the portion of the country visited, would result in a very important increase in the honey-production of the West. The execution of this work is therefore advisable in the near future.

In the same way the Bureau will be able during the fiscal year 1904-5 to devote more attention to apiculture than has hitherto been possible. It is proposed as a first step during this fiscal year to establish a model apiary of 50 or 60 colonies of bees at the Arlington Experimental Farm. This apiary will be used in the general conduct of apiarian investigations, and as one of the breeding stations of the races or types of bees which are under observation. Queens of the Caucasian, Cyprian, Dalmatian, Italian, and Carniolan races will be imported for breeding purposes and testing at experimental stations and other places in different sections of the country. Some investigations will be made, and possibly an importation of the bees of the far East, particularly of the large races commonly known as the Giant Bees of India, one species of which is also found in the Philippines. It is believed that these bees would secure the nectar from flowers with deep corolla-tubes, such as the red clover, etc., the sweets in which are, for the greater part, beyond the reach of our ordinary races.

Plans have been made for the procuring and testing in different parts of the country of a number of valuable honey-producing plants which are known to be adapted to portions of our country where intervals in the honey-flows occur which may thus profitably be filled in. In this work preference will be given to such plants as have an economic value besides their production of honey.

Numerous complaints of the devastation of apiaries in different portions of the country by diseases, some of which are highly contagious, call for an investigation of the whole subject of bee-diseases. Some of these diseases can be dealt with during the coming fiscal year, but others, of a bacterial nature, will require a more extended investigation than the funds will permit at present.

It seems desirable to test the efficiency of artificial heat in the wintering and rapid breeding up of bees. The apiary at the Arlington Experimental Farm will be available in this work. Likewise the construction and testing of hives and accessories adapted to migratory bee-keeping.

In addition to the experimental work enumerated above, the collection of data regarding the industry in the United States, and particularly as to the honey-producing plants of the country, will be continued. Bulletins on pasturage for bees and the manner of increasing it, with cultural and other notes on new honey-producing plants; on best methods of rearing queen-bees; and on migratory or pastoral bee-keeping, have been planned. A limited number of queens of improved races will also be reared and placed for testing at the various experiment stations which do work in apiculture, and likewise in the hands of special agents for testing in particular sections of the country.

Surely, the Department has outlined some exceedingly interesting and important experiments and investigations in behalf of the bee-keeping industry of our country. We hope to receive reports of progress from time to time, so that we can keep our readers informed of the apiarian work our Government is doing under the direction of Mr. Frank Benton, who is its very competent Apicultural Investigator.

## Miscellaneous News & Items

"Bee-Keeping in the Southwest"—a subject on which Louis H. Scholl is writing a series of articles for the American Bee Journal—has been discontinued for the present, first, on account of the illness of Mr. Scholl, and also because of his extra college work in Columbus, Ohio, where he has been spending the past winter. Mr. Scholl is a devoted student, and has applied himself so constantly to his studies that it has resulted in overwork, although it has also put him ahead of his fellow students, so that he completed the term's work in advance of the others. He has gone to Texas, where he will put in his time with the bees during the summer, and also help prepare for the meeting of the National Bee-Keepers' Association at San Antonio in the fall. As soon as he is physically able, and his duties will permit him to reach it, he will continue his articles for this Journal.

The General Manager of the National, Mr. France, sent in the following interesting items, March 17:

Another victory for the National Bee-Keepers' Association. The city of Kirkwood, Ill., passed an unconstitutional ordinance that not over 5 colonies of bees could be kept on any city lot. A purely spite case. One hundred colonies will be moved in the spring, now that the

matter is settled. This saves neighbors, and betters the home market for honey.

Again, I have received some syrup samples issued by the Syrup Refinery Co. They have the best labels for honey I ever saw, and very cheap. They are in five colors, showing clover leaves and clover heads with bees working on them, all life size on the labels, and in bright colors. I hope before the time for the National members to market their honey to get such labels before the members, as I am after anything to help them sell their honey near home.

Good honey prospects are reported from California, Colorado, Texas, and Cuba.

Northern bees are reported wintering well, also good clover prospects.

It has been decided to hold the next National convention in San Antonio, Tex.

N. E. FRANCE.

**Apiary of H. Gibson.**—Four little views of Mr. H. Gibson's apiary appear on the first page. He had this to say about them when sending us the pictures:

I enclose four snap-shots of my apiary.

No. 1 is a swarm of bees just hived, which covers the front of the hive and quite a space on the ground.

No. 2 is my son and myself, where I scraped up two handfuls of bees from the swarm shown in No. 1. You will see we have no veils on, and are barehanded.

No. 3 shows my wife and apiary.

No. 4 shows the back of the house and part of the apiary.

H. GIBSON.

**Apiary of F. Z. Dexter.**—This is shown on the first page. When sending the picture, Mr. Dexter wrote thus:

As some of the noted bee-keepers are getting pictures of their apiaries in the papers, how would ours look? You might ask what we are noted for. Well, for reading the old American Bee Journal every week. I send a picture of our home yard that was taken some time ago. You can easily recognize the "old man," and my son and oldest daughter are the other persons in the picture. My place is named "Pine View."

F. Z. DEXTER.

**Hurrah for Missouri Bee-Keepers!**—Just a little too late to catch last week's issue, we received the following from Mr. R. A. Holekamp, of Missouri, which will be read with great interest by the bee-keepers of that State:

DEAR MR. YORK:—I send you to-day good news for the bee-keepers of Missouri. Our Apiary Bill has now been passed by both Houses of our Legislature, and as it has an emergency clause, and an appropriation of \$2000 has been made in the general appropriation for the purpose of this Bill, it will become effective as soon as signed by our Governor.

If an inspector of apiaries can be selected and appointed during the next month, he could probably start on his work of inspection by the time the bees begin to gather honey, and good work ought to be done this season.

I wish to thank you for the assistance you have given us by publishing my former communications in the valuable American Bee Journal.

ROBT. A. HOLEKAMP,

Assistant Secretary Missouri State Bee-Keepers' Association.

We congratulate Missouri bee-keepers upon their success. It shows what persistent and determined effort will sometimes do when put forth in a righteous cause. It will also be an encouragement to other States that should have similar legislation.

LATER.—We have just learned that Gov. Folk has vetoed the above Bill after having passed both branches of the Legislature. More about this next week.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**Some Facts About Honey and Bees.**—This is the subject of an article written by Mr. J. E. Johnson, and published on pages 581-82 of the American Bee Journal for Aug. 25, 1904. We have republished it in 4-page leaflet form for general distribution, and furnish it, postpaid, at 35 cents per 100 copies. Send all orders to the office of the American Bee Journal.

## Opinions \* of Some Experts

### Spring and Fall Price of a Colony of Bees

**Ques. 24**—What do you consider a fair price for an average colony of bees in a good, 8-frame Langstroth hive, (or a hive of about the same capacity)—(a) In the spring? (b) In the fall?

C. H. DIBBERN (Ill.)—a. \$5. b. \$4.

R. L. TAYLOR (Mich.)—a. \$5. b. \$4.

REV. M. MAHIN (Ind.)—a. \$10. b. \$5.

ADRIAN GETAZ (Tenn.)—a. \$4. b. \$3.

L. STACHELHAUSEN (Tex.)—a. \$3. b. \$2.

EUGENE SECOR (Iowa)—a. \$5. b. \$2.50.

WM. McEVOY (Ont.)—a. \$3.50. b. \$2.50.

MORGAN BROS. (S. Dak.)—a. \$5. b. \$3.50.

E. E. HASTY (Ohio)—This can only be an approximation. a. \$5. b. \$4.

JAS. A. STONE (Ill.)—a. Italians, \$7; blacks, \$5. b. Italians, \$6; blacks, \$4.

S. T. PETTIT (Ont.)—a and b. Whatever it will bring when placed upon the market.

N. E. FRANCE (Wis.)—a. \$3.50 to \$4.50. b. \$2 to \$3. In Wisconsin this is what they sell for.

G. M. DOOLITTLE (N. Y.)—a. \$3 to \$6, according to the strain or "breed" of the bees. b. \$2 to \$5.

DR. J. P. H. BROWN (Ga.)—a and b. From \$5 to \$8, depending upon locality and upon supply and demand.

ARTHUR C. MILLER (R. I.)—a. \$7. b. \$3 to \$5, depending upon condition. Fall condition is more vital than that of spring.

PROF. A. J. COOK (Calif.)—a. In the spring, \$5. b. In the autumn little if any less, as bees always winter here, if they are healthy and have food.

J. H. HAMBAUGH (Calif.)—This is a hard question to answer. There are so many varied conditions. All the way from \$5 per colony down to \$2.

R. C. AKIN (Colo.)—a. \$4. b. \$3. These prices are based on common financial ideas and practices. On a true moral basis they should be twice that.

MRS. J. M. NULL (Mo.)—a. \$5. b. \$3. I infer for the purpose of stocking is what the value is based upon. These figures might be reversed if value of honey is to be considered.

E. D. TOWNSEND (Mich.)—Supposing the hive that contains the colony to be worth \$1—a. \$4. b. \$3. This is about what they can be bought for. I do not know what they are worth.

DR. C. C. MILLER (Ill.)—I don't know. It's like other things, a variable quantity, depending upon supply and demand, varying in different years and places from (a) \$2 to \$10. b. 0 to \$6.

C. P. DADANT (Ill.)—a and b. I would not answer in dollars and cents because so much depends upon circumstances, but if I were to buy, I would pay 25 percent more in the spring than in the fall.

O. O. POPPLETON (Fla.)—From \$3 to \$5, but this depends much upon locality, etc. They would usually be worth at least a dollar more in the spring than in the fall, but it is difficult to fix any standard price.

C. DAVENPORT (Minn.)—a. and b. My prices vary according to how bees winter and come through the spring. But, as a rule, I consider an average colony worth a third more in late spring than the previous fall.

J. A. GREEN (Colo.)—It will depend largely upon circumstances. a. \$3 to \$5. b. About 50 cents less. In a locality where wintering losses are apt to be heavy, the spring value might easily be a half more than the fall value.

P. H. ELWOOD (N. Y.)—Bees in box-hives, \$2 in fall; \$3 in spring. Add price or value to you of hive with super and foundation, if any. If you are using or selling to a man who uses Langstroth hives, \$5 would be a fair price or value from cost standpoint. However, bees are usually sold below cost, as is much of the honey also.

G. W. DEMAREE (Ky.)—a and b. This is a question hard to answer satisfactorily. The price of honey-bees is governed by the laws of supply and demand as much so and more than most salable products. Bees sell in my locality at farm sales (10-frame hives) in spring-time at from \$2 to \$3 per hive; and at least 25 percent less in the fall.

E. S. LOVESY (Utah)—a. That depends largely upon existing conditions, and as the indications for a good honey crop, owing to the

heavy snow fall, are above the average in the greater portion of this State, I would consider \$4 a reasonable price for a single-story colony, or \$6 for a 2-story one. b. The value would be at least one-third less.

E. WHITCOMB (Nebr.)—a. and b. That depends entirely upon how many bees there are in the hive, how much honey they have on hand, kind and breeding of the queen, and her age, etc. It is as impossible to fix the price of a colony of bees for different localities of the United States as it would be to fix the price of a pound of fresh fish or a dozen clams.

### Making a Honey Market—Retailing Honey

BY C. P. DADANT.

**W**HEN so many apiarists are asking themselves what to do to dispose of their honey, it may not be amiss to examine what is done in other countries. The following statement taken from the Swiss Bulletin de la Societe Romande d'Apiculture for December, 1904, will probably be read with interest:

To produce hundreds upon hundreds of pounds of honey is very nice and very good. But we must dispose of it in some way. To-day our members are relieved of the anxiety; in fact, for a few years past our section of the Neuchatel Association busies itself actively with the disposal of our crop.

When fall comes we keep a "honey market" in the city of Neuchatel; some years, if the fruit crop has failed, the "market" is held in September, and if the abundance of honey permits of it the "market" is renewed in December. This year the stone-fruits having been plentiful, we have preferred to hold the "market" in October.

A few insertions in the local papers, announcing the coming market, are published as early as September, to advise the housekeepers that they will be able to secure a supply of good honey for winter.

It is a pleasure to see the housewives come at the appointed date to have their pails and pots filled.

Allow me to give you a few details upon the organization of our market; the experience of some ten years has taught us how to manage its workings, and we are now well pleased with it.

We need first to secure a building sufficiently large to accommodate the handling of the stock on hand, and another in which the sale may be carried on, so as not to be obstructed by the clients. The Association in this matter is very much favored by a friend of our beekeepers, who rents to us obligingly some very good rooms in a central part of the city, and in close proximity to the vegetable market.

The day preceding the sale we receive the honey of the members. The members of the honey-market committee weigh the pails brought and verify the contents, which must be liquid and free from impurities. Then they proceed to the putting up in tins containing 1, 2, 4, 5 and 10 pounds, and on each tin is gummed the label of the Association. During the two days of the honey-market we also make an open sale—that is, we fill any and all receptacles brought by purchasers for that object. A large tank containing 450 pounds, put up on a stand and supplied with a faucet of large size, gives excellent service. The handling of the honey is much facilitated by this tank, which we did not have at the outset. The unsold honey is afterwards put up in tins of different sizes, and with guarantee labels over the cover and deposited in our three agencies in the city, these taking charge of the sale thereafter for a commission of 10 percent. The empty pails are weighed and returned to their several owners. The cashier balances up the accounts and makes a first distribution of cash during December; the balance is paid after the agents have concluded their sales.

The organizing of such a "market" as we keep requires a mutual understanding and some good-will on the part of the producers and of the salesmen. The task of the cashier or treasurer is often difficult, and yet, in spite of the imperfections of our methods, we are usually rewarded for our trouble by a large sale of honey. The prices, of course, have quite an influence on the amount which may be sold during the two days of the "market." During the years when honey is cheap we see among our customers many working people who desire to become acquainted with the taste of honey, while, on the other hand, this year, for instance, as the honey had to be sold at 20 cents per pound, we have not been able to take advantage of the custom of the small purses who consider honey at this price as a luxury, which must not be consumed unless sickness demands it. It is to be regretted that we must raise the prices at times, for the production is ever on the increase, and we must increase the demand also. Yet I would not wish to be understood as being in favor of lowering prices too much—that is, I do not wish to see the Associations sell at a price below 16 cents—it would be a mistake, because the expense incurred in organizing the market causes a reduction of 2 to 3 cents per pound on the returns to the producer.

Let us, however, not forget the useful side of this market, which is causing good honey to be more and more known and appreciated in all classes of society. The beginning is often difficult; the public

does not come at once, but by renewing this annual advertisement—this method of popularizing the consumption of honey—we slowly create a good clientele that will remain faithful to the Association, and will return annually to the honey market. E. BONHOPE.

It is, of course, more difficult to follow this method in a sparsely settled country like the United States than in Switzerland, where honey-producers are in great numbers, but not extensively, engaged in bee-culture. But I believe there are some hints in the doings of Europeans. There are many things in which we could imitate them. For instance, their street fairs in small cities twice or three times a year, are the means of helping trades and purchases of all kinds. Whoever wants to buy a horse, a cow, or sell one, goes to the street fair and is sure to find all sorts of bargains. So it might be with honey-sales. If local bee-associations in the neighborhood of large centers would take advantage of the cheapest means of advertising, and let the people know that good honey—honey known to be pure, and guaranteed by their local association—would be offered for sale on certain days at certain points, there would probably be enough sale and enough additional advertising in those "markets" to prove very beneficial to the fraternity. Many people hesitate to buy honey because they fear adulteration, and many of these would probably go readily to get their supply from a local association that was known to represent the honest producer of pure honey.

Is not this matter worth considering?

Hancock Co., Ill.

## Shaking of Bees for Comb-Honey Production Without Any Increase

BY L. STACHELHAUSEN.

ON page 19 I find an editorial note saying that the plan for making shaken swarms is at least 39 years old.

There has been a general misunderstanding in this respect for about five years, when the making of shook swarms commenced to receive the attention of American bee-keepers.

The plan of making artificial swarms by shaking or brushing the bees off of the combs is nearly as old as the movable comb itself. I have made such swarms ever since I commenced bee-keeping, 38 years ago, and saw other bee-keepers make them some years before that. It is the same thing as the driving of swarms from a straw-hive, which has probably been known and practiced for 200 years. Even the plan to make three colonies out of two is very old.

Of newer date are only some modifications. It was the rule that a shaken, brushed or driven swarm should be put on the old stand to get all the field-bees. C. J. H. Gravenhorst, in Germany, about 1878, was the first who explained how to operate when the shaken swarm should be put on a new stand.

So far the purpose of shaking was increase. I believe I was the first one to use this manipulation for any other purpose.

Since 1880 I have been keeping bees here in Texas, and I used at first the 10-frame Langstroth hive, but later a still larger one. I soon found that these large hives are favorable for spring development, but not practical for comb-honey production, while swarms, natural or shaken—especially if they are very strong and hived on starters only—had always given a good crop of comb honey.

There was only one thing I did not like—such swarms were getting weaker all the time during the first 21 days, because no young bees were gnawing out of the cells; the brood in the swarm was increasing, and more bees were necessary to nurse this brood. This, again, causes a diminishing of the field-force at a time when a large force is most needed. If the bees which are reared in the parent colony could be given to the swarm at the right time, we could have the field-force as in an undivided colony.

Heddon's method of preventing afterswarms had given me the idea how to secure this. I put the shaken or natural swarm on the old stand, and the parent colony close by its side; 10 days afterward the most bees of the old hive were shaken in front of the swarm and the queen-cells cut out; and 21 days after the swarm was made all the bees of the parent colony were united with the swarm. There is no increase and no interruption in breeding. I used this plan about 8 years ago, and as I found it a success I published it in *Gleanings*. Nobody mentioned it till about a year afterward, when E. R. Root brought it more prominently before the bee-keeping public. Now, from several sides we hear:

"That is old; somebody made shaken swarms some years ago." But the shaken swarm is only a part of my plan, and can just as well be a natural swarm.

The whole thing is very simple, and it is very probable that some used a similar plan at the same time or before I did, but it was not published before I mentioned my plan in December, 1899, and before I described it in *Gleanings* (1900, page 840). I know of one such plan—that is, the parent hive is set on top of the swarm and a connection is made by a channel or otherwise from the upper alighting-hole down to the lower one, so that every bee that flies out from the upper hive will, after returning, unite with the swarm.

I claim to be the first one who used a plan to unite all the bees from the parent colony at the proper time with the shaken or natural swarm, and in this connection used a new management for comb-honey production, gaining the advantage of large hives during spring development, and of small hives during the honey-flow. Bexar Co., Tex.

## Convention Proceedings

### Report of the Wisconsin Convention.

(Continued from page 231.)

The convention took up the question of affiliated bee-keepers' societies in Wisconsin with the State Association, and a committee was appointed to consider the subject.

Mr. F. Wilcox was recommended for judge of the apiarian exhibit at the next State Fair.

C. Spangenburg exhibited a single-comb honey-extractor which cost 35 cents. He made it himself. It consisted of a handle or pole about 4 feet long, around which swung a wooden half-cylinder about 20 inches long, in which was supported a flat wire-cloth whereon was laid the comb of honey to be extracted. This half-cylinder was attached at each end of it to the pole by means of metal rings, and the whole thing was swung around the pole by a peculiar movement of the hand at its top, the lower end of the pole having a sharp point, which was supposed to drop into a small round hole in the floor. It is an ingenious invention, but hardly practical for the specialist bee-keeper!

The first thing at the morning session of the second day was the election of officers, which resulted as follows: President, N. E. France; Vice-President, Jacob Huffman; Secretary, Gus Dittmer, of Augusta; and Treasurer, F. Wilcox.

It was reported that at the last Minnesota State Fair there were 152 entries in the apiarian department, for which \$408 in cash premiums was offered. Wisconsin offered a total of only \$97 at its last Fair. A committee of three was ordered on State Fair Apiarian Exhibits, consisting of Pres. France, and Messrs. Putnam and Wilcox, with instructions to endeavor to secure, if possible, for the Wisconsin State Fair, a premium list similar to that of Minnesota.

Mrs. Millie Honaker read the only paper of the convention, on the subject, "Who Is, and Who Will Make, a Successful Bee-Keeper." It was an excellent paper.

Practically all of the time of the convention was devoted to the discussion of questions, which is fast becoming the popular kind of program for bee-keepers' conventions.

In reply to the question about emptying barrels of granulated honey, it was advised first to lay a sheet of zinc or heavy paper on the floor, on which place the barrel, and then remove all of the barrel except the lower head. The honey can then be shoveled into any large receptacle for melting.

Experience was called for as to feeding syrup and water in the spring, in the open, for stimulating brood-rearing. It was suggested that it might cause robbing. Some one advised putting combs of honey or syrup in empty hives where bees can get at them. This was found to work well.

For late feeding it was suggested that by elevating the front of the hive a little the feed could be poured in at the entrance on the bottom-board. This was found to work all right, giving the feed in the evening, as the bees would have it all carried up by morning. That is, provided the nights were not too cold. One pint, or even half a pint, at a feeding was mentioned.

Do bees winter well on buckwheat honey? Yes. ☐

Is an absorbent on top of the hive necessary for safe wintering? Yes, especially outdoors.

Does not the lack of a fall honey-flow account for the loss of bees in winter? Yes, even if the bees are fed for winter stores.

Which is the better for marketing dark extracted honey—barrels or cans? Barrels for manufacturers, and cans for retailing to families.

Should Wisconsin establish an Apiarian Experiment Station? Yes.

As to putting bees out of the cellar at night or in the daytime, 15 voted for the day and 4 for the night.

As to using full sheets of foundation in the sections, some suggested that it caused a midrib in the honey, and interfered with its sale. Some thought that the foundation sometimes used was too thick, and that the very thinnest should be put in sections.

Can foul brood be carried by queens in the mails? Yes, and no. Not by the queen, but by the honey in the cage. It was advised to throw away the cage in which the queen arrived, transferring her into a new cage in which to introduce her.

Would you recommend feeding artificial pollen in the spring? Yes, if there was no natural pollen when needed.

What is the condition of foul brood throughout the State of Wisconsin? Pres. France reported that there was still some in perhaps 4 or 5 counties. If its importation from other States could be prohibited it would very soon be all wiped out. A vote of thanks was tendered Pres. France for his good work as State Inspector of Apiaries.

How do you free melted honey from air-bubbles? Let it stand a while after bottling.

What is the best kind of soil in which to build a beecellar? It depends upon the location. A cellar in sandy soil will winter bees best.

The convention adjourned to meet in 1906 at the call of the Executive Committee.

and around the bee-hives? I saw it in this paper last spring, but lost it, and have forgotten what it was.

Merced Co., Calif., Feb. 7. MRS. M. WATSON.

I think perhaps this is the item you refer to on page 99, 1904:

“Mr. H. Potter, in the British Bee Journal, gives his method of getting rid of ants:

“I mixed some bee-candy with arsenic, and put it under the hive, placing a piece of perforated zinc over the candy, and a small box over all, to make sure that the bees could not get at it. The effect was surprising! On the first day the candy was black with ants; the second day only 2 or 3 to be seen; third day ants all gone. I have had no more trouble with them this season. Ants eat their dead, and therefore a wholesale poisoning had been set up by them devouring their dead comrades.”

The perforated zinc mentioned must have had smaller perforations than the ordinary perforated zinc. Small enough not to allow the bees to pass through, while the ants could.

Thank you for the beautiful picture. I hope it may be printed in the Journal so the other sisters may enjoy it.

**Feeding—Bees Loafing—Starters—Color of Drones—Comb Honey Management, Etc.**

1. Is there a limit to the number of questions one person may ask in a year? I hope not, for there are so many things I want to know, and the American Bee Journal is so full of good things.

2. It is fine, warm weather now after a very bad winter on other creatures—though perhaps not so hard on bees. Upon lifting the hives to-day I find one very light. The bees are flying a little, and there are many dead bees in front of each hive. I have put a super filled with unfinished sections upon the light hive. Is that a wise course?

3. Could bees be fed sugar syrup safely on warm, bright days from now on?

4. What do little crumbs of wax, light and dark in color, signify at this time of year at the entrance and on the alighting-board?

5. One of the great troubles I have with the bees is their loafing. They hang out in great clusters. If heat causes it I should think they could find nothing hotter than the bunches in which they arrange themselves. “A B C” says, “Never allow the bees to hang out,” but I have been unable to prevent it. Giving more air and more super-room doesn’t seem to be sufficient. What can you suggest as cause and cure?

6. Do you consider it wise to put starters in the sections on all four sides, or only top and bottom, and why?

7. Does any one know with certainty the relative yield of comb and extracted honey under just the same conditions?

8. I notice in the summer a change in the color of

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

**Bees Gathering Honey—Destroyer for Black Ants**

I enclose a picture of my apiary and home, taken by myself. It is not a very good one, as I am not experienced in the work.

APIARY OF MRS. M. WATSON, OF MERCED CO., CALIF.

The weather here is beautiful now. The almond trees are in bloom, and the fruit-trees soon will be. Bees are gathering some honey, and we hope to have a good season.

Can you give me, through the American Bee Journal, the remedy for destroying those little black ants that are in

drones. Last season they were yellow and glossy early, but by August they were much darker, and some seemed nearly all black. What does that indicate?

9. What are bees doing when they stand for a long while with wings moving rapidly and abdomen erect, about

the entrance of the hive and even up on the front ?

10. Starting this season with 6 or 7 colonies, how would you manage them to secure the most comb honey—natural swarms or artificial, or no swarms at all, as far as possible ?

11. I should like to increase as much as possible and not interfere with the honey crop. Do you advise putting on a brood-chamber first with full sheets of comb to get them used to working up there ?

12. An article, or series of articles, on the meaning and significance of various indications and signs—in other words, the ways in which you judge of conditions in the hive throughout the season, would be most helpful to beginners like myself. I am always encountering some condition which I am unable to translate into simple English language.

13. During the early season and swarming time how often is it wise to look through the hives ?

14. Does it do any harm to look too often ? Does it disturb the bees or interfere seriously with their work ?

Clark Co., Kans., Feb. 24.

HELEN PERRY.

1. The limitations as to questions do not come from their number but from their character. Any number of questions connected with bee-keeping may be asked, provided they are not already answered in the text-books, or books of instruction about bees. The intelligent beginner—and, for that matter, long after she has graduated from the class of beginners—will always find plenty of questions not answered in the books; and in such cases the bee-paper is needed to help out. No one who has faithfully studied her bee-book need be afraid of asking too many questions.

2. Yes, provided you are sure the bees reach the sections. If put on when very cold, it would be of no use till a day came warm enough for the bees to move freely.

3. Y—es, provided you can count on their flying every few days. In other words, it is not best till winter is well over.

4. Chiefly cappings that the bees have gnawed from the sealed honey.

5. The advice of "A B C" might be amended: "Never let bees hang out when there is plenty to do in the field." Nothing strange a strong colony should like to sit outside to gossip after the close of a hard day's work; but it isn't good form in the middle of the day, if there is any work to be done in the field. When there is nothing to be had in the field, the wise little creatures do well not to use up their strength going a-field for nothing, and then they may be expected to cluster outside. But when there is a good honey-flow on, ventilation and super-room enough ought to prevent loafing except with a colony contemplating immediate swarming or disgruntled in some other way.

6. With starters top and bottom, with only an eighth or a quarter of an inch between, and a space of same kind at each side, the bees will build to the sides of their own accord.

7. No; and if you should find out the right answer for a certain condition, the answer might be quite different for some other condition.

8. Possibly, like workers, they may grow darker with age on account of loss of plumage; possibly the later drones may have been from darker colonies; possibly (if you will pardon the suggestion) your memory for colors may have been a little at fault.

9. Just the same that you might be doing on a hot day, fanning. Not exactly to cool their faces, however, but to cool the hive. Other bees inside the hive are similarly engaged, making a well-planned system of ventilation.

10. No swarms at all where the principal gathering comes early; increasing to 50 or 100 percent if there are heavy fall flows. I would have to eat and sleep at your house several days before deciding whether natural or artificial swarms would be best for you.

11. No; their habits are all right in advance.

12. Doubtful whether any general rules could be framed except such as are already in the text-books. Those of us who have been longer at the business probably do not know so much about bees as you give us credit for. If we could only keep quiet all the time we might keep up the delusion, but some question is sure to be asked sooner or later to expose our ignorance.

13. That depends upon management; "in this locality" about once in 10 days with any colony in danger of swarming.

14. The disturbance of opening a hive must interfere at least a little with the labor of the bees, and should occur only when the benefit resulting overbalances the interference.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### THE PRESENT PRICES OF BEE-SUPPLIES.

Doubtless most of the brethren want the price of sections lower, but I do not. I think the current price is low enough. This is not because I sell the wood again for more than I gave for it, but for other reasons. (In my retail sales I make an allowance for the weight of the wood to my customers.) Crowds of people, otherwise good and sensible, would—if court-houses were selling at 50 cents a dozen—would want to get them at 48½. This disposition to *squeeze*—squeeze everybody and everything, without regard to how unjust or cruel it may be—is one of the awful iniquities of human nature. As followers of the Christ of Bethlehem, it is our duty to combat this iniquity—combat it in ourselves first of all, and also in the great, great world—combat it just the same even if it does look like trying to regulate the level of Lake Michigan with a teaspoon. More of the spirit of Christ! And if that sounds too pious for average ears, more of the spirit of "Live and let live!" Murder and "Business" are old pals. Unless we have to take that back and say, Murder and Business are two names for the same old Thug.

When it comes to hives I think a little differently (but without any great vehemence or bitterness.) Mainly the hive-makers' own affair. Still, my private feeling is that a well-ordered, 20th century factory should be ashamed of itself if a single individual, without a bit of machinery, can make his own hives and make more than wages at it. Such a fact rather "gives 'em away."

But all the above is rather like obscuring the real matter with smoke. Also the real matter itself is rather complex, and needs *clear* thinking, if we are to feel just right about it. And this is so important that it will do us no harm to remember an old saying: "Clear thinking is a prerogative of God alone." If we realize a *little* how difficult clear thinking is, we shall be less liable to get 10,000 miles away from it—and be bragging about our clear thinking at the same time. Here are some things which clear thinking probably ought not to forget—some links that belong somewhere in the logical chain:

(Link A.)—The heart of this mighty nation has enlisted in a campaign against a great and real evil—difficult campaign, needing all possible forces. Shall we fail to drop into the righteous current? Shall we fail to push when all honest folks are pushing—and then save our credit by great ado some time when nobody else is pushing at all—or by standing off and saying proudly, "I am a well-wisher to this pushing, just the same as you?"

(Link B.)—One man excitedly makes a lot of objections—because he loves the cause, and wants to save it from a mistake. Another man does the same because he hates the cause and *wants to run it into a mistake*. Another man (fit hardly for loving or hating) objects because he is got up that way—always does it. One needs care in estimating these three men. Also, one man forbears all objections because (in his superficial thinking) he thinks things are all just right. Another man forbears because he sees the criticism business so terribly overdone that he fears the wisest protests, under the circumstances, would be more likely to hinder the cause than help it. Another man forbears because he always revolves around his own feelings—his own enjoyment of a rumpus. Objections break in on the fun; and his enthusiastic nature is never happy unless he is running over like a bottle of bees. One needs care in estimating these three men, too. But *somehow* every good man ought to be ready with his influence when the tide is right.

(Link C.)—Bee-keepers incline to consider themselves a select body of men. Is it not true, to a considerable extent, that they are? Neither the drinking, nor the smoking, nor the swearing about a bee-convention that there is about certain political conventions. I'm just now thinking about a hotel-keeper who passed the cigars to an important bee-committee—and not a man used cigars! Such a body of men should not complain that too high a level of commercial morals is urged upon them. Unless they have been badly led they will not, I think—not even if we say, Let wages and prices, and manufactures and profits, be adjusted as the same would be between a dozen brothers living on a far-distant island. Absolute monarchy—with a common-sense, Christian public opinion for monarch.

(Link D.)—There are certain men, often wealthy, who make it their business to purvey to the wants of other men. If some of these choose for their lot in life ministering to a superior class of men, it should not surprise them if they should run against *accountability* somewhat greater than inferior grades of men usually insist on. Certainly if they have ignored rules of decency made by the non-select world, they are not to be surprised if their own constituency warm their ears pretty well about it—and often, and long.

(Link E.)—There are certain doings and arrangements very common in recent years, repeated over and over again in almost every possible field—very capable of being beneficent, but practically almost always the opposite of beneficent—that the world has at last got up arms against. High time. Touch pitch—and be defiled. Get up trust—and brick-bats begin to come your way—if not striped clothing. No use to tell us that the Meat Trust of Utopia is a perfectly lovely institution, which blesses all concerned, and gives the people the

cheapest possible meat. We know that. We also know that the Meat Trust of the United States is a gang of high-handed and abominable robbers—robbers that rob those who raise the cattle on the one hand, and rob those who eat the meat on the other hand—robbers that fix prices—and fix them not on reason, nor right, nor natural laws, but on a *fiat* as impudent as the Czar's. Most other trusts differ only in degree. By the way, there isn't any Meat Trust. We know that. And we are ready, and waiting to hear, that there isn't any trust among bee-manufacturers. It is one of the commonest characteristics of this particular evil genus to deny their own existence. When the dog howls all night it means, in dog language, "There are no such things as dogs."

We must be getting almost ready now to put things together. We were startled a while ago to learn that those who wrote to different firms for prices on lots of bee-supplies got in reply IDENTICAL FIGURES! *Eccce Rex!* There she am! No more to be said. No place for argument. No place for anything but the searching question, What are we going to do about it? What—*if anything?* Sad that a "decent regard for the opinions of mankind" did not keep our purveyors from this step—but it did not, it seems. Sad that it did not occur to them: We serve a select body of men; we should therefore be a little select in our methods. We did think that there were men among them that were willing to stand in the blaze of publicity as *model men*. We thought that some of them shrank from appearances of evil—shrank from them personally, and, more than that, shrank from them in a Christian sort of way—seeing we are taught to avoid the appearance of evil. That we were mistaken in this came to us as a sorrow and a blow. They are willing, it seems, for some prospective profits (when profits were already good) to take a position which necessarily renders them a sort of stench in the nostrils of mankind. Sorry! Very sorry! If we had not greater things to be sorry for we should be sorry that they threw away such an opportunity as they had—the opportunity of illustrating to the bigger bears how a spirit of live and let live, resting on the public sentiment and public reasonableness of an enlightened patronage can make it unnecessary to form a trust. Well, the *onus of the whole thing is not that certain goods may be offered to us a little too high*. That's not it. Scotch that false idea whenever it pops up. It's the discovery of a yoke for our necks that we didn't know of before. It's the compulsory facing of the problem: Shall we go quietly on in a sort of semi-bondage, or shall we do something about it and break the bonds?—and shall the State Seal of Virginia furnish us with the model for a tableau? On one thing I shouldn't wonder if we were already near unanimity. It's well settled that "Faithful are the wounds of a friend"—we'll make them realize what an awful lot of friends they have, and what phenomenally faithful friends they be.

E. E. HASTY.

[The foregoing was really intended as a private letter to us, but we have Mr. Hasty's permission to publish it.—EDITOR.]

**Doctor Miller's  
Question-Box**

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

**Management with a Queenless Colony**

1. I have a queenless colony. I took a frame of brood and eggs from another colony and gave to it. The bees will rear another queen, I suppose, but she can not be fertilized now, and what will be the result?

2. How would you manage a queenless colony at this time of year, when no queens are to be had? MISSOURI.

ANSWERS.—1. To answer your question in very few words, any queen reared from brood given before the middle of March, as far north as central Missouri, will in 9 cases out of 10 be only a damage.

2. One way is to give it a queen as early as you can buy one. Another, and perhaps a better, is to distribute its bees and combs among other colonies.

**Italianizing Bees**

I have 4 colonies of brown bees which I wish to Italianize the coming season.

1. When is the best time to introduce the new queens? Should it not be early enough to secure Italian drones?

2. When I remove the old queens can I not also remove a frame of brood, honey and bees with her to an empty hive, forming a nucleus? Then if anything happened to a new queen I could return the old one again. Would not the nucleus keep growing until I could later in the season requeen with an Italian queen, or cell reared from the new queens, thus utilizing the brown queens during the breeding season, to some extent? NEW YORKER.

ANSWERS.—1. It would be a nice thing to have the new queens installed very early; yet on the whole it is an open question whether it's best to get the queens early or later. Very early queens cost more,

and there is more danger introducing than in harvest time. The drone part is not so important, for the probability is that your queens will mate with drones from surrounding apiaries.

2. Yes, your scheme is all right. And don't be worried if you don't get all Italian blood in one season. If you do it in 5 you'll do well.

**Transferring Bees**

I bought 10 colonies of bees in hives that are square. I want to transfer them into the regular-size frame hives.

Will it do simply to remove the combs from the old frames which would not fill the new frames in length, or would it be better to fill the new frames completely by cutting the pieces to fit? MISSOURI.

ANSWER.—Better fill frames entirely; otherwise the bees will be likely to fill out with drone-comb. In cutting pieces to fill out, it may be convenient to remember that it is not really necessary to have them the same way up and down that they were.

**Feeding Bees—Clipping Queens—Using Hives in Which Bees Died**

1. Is it safe and right to feed bees honey that has soured?  
2. So much is said about clipping queens in the spring that one might think that it had to be done for each colony every spring. Does not the clipped queen live for several years, as a rule?

3. When a colony is winter-killed, and the hive is filled with comb and considerable honey, can not the hive with its comb and honey be used to advantage for a new colony? If necessary to cleanse it, how should it be done?

4. Are all Italian bees "red clover" bees, or is there a distinct kind especially adapted to gathering honey from red clover? NEW YORK.

ANSWERS.—1. Yes, if fed in the spring at a time when bees are flying daily, and at a time when there is no danger of its going into surplus.

2. Yea, but the safe way is to look for her each spring, or at least before swarming-time, lest she may have been superseded and a successor with whole wings be present. It sometimes happens that a queen is superseded before she is a year old.

3. Yes, indeed. Usually the bees will do the necessary cleansing, but you should brush out all the dead bees, and if any of the combs are very foul withhold them till after the bees have occupied the hive for a day or two, and give only one or two a day.

4. There's nothing very distinct about it. Bees that will work on red clover are called "red clover" bees, whether Italian or not.

**Transferring Bees**

Will you please tell me how to transfer bees from one hive to another? The hive they are in is poor, and I would like to get them into one with 9 frames. ILLINOIS.

ANSWER.—Just exactly how it should be done, provided the bees are now in a frame hive, depends upon the size of the frame now in use compared with the one to which you wish to transfer them. If the frame is shallower than the old one, you will cut down the comb so as to make it the right depth. If the new frame is deeper, put the comb in, and then cut pieces to wedge in on top. Or, which may be more easily managed, turn the comb so the present top and bottom may be at the sides, and then cut the comb just deep enough to go in the frame. Before taking out the first frame from the old hive, have an empty frame ready for it. Lay some strings on a table or something of the kind, on these strings lay the empty frame, then after putting in the comb tie the strings. Of course the strings must be laid in such a way that they will be distributed along the length of the frame, perhaps 6 or more of them, each string independent of the others. When you take out the first frame, brush the bees from it before cutting, and put it in its hive after tying. Then move the old hive from the stand and put the new one in its place, and after that brush the bees into the new hive each time you take out another frame.

It is just possible that the old hive is a box-hive without any frames. In that case it may be better for you to wait till the bees swarm, give the swarm in the new hive, then 21 days later cut the contents out of the old hive. In the meantime it will pay you big to buy a bee-book to tell you more about this and a whole lot of other things.

**Keeping Bees on Shares**

I have an opportunity to get some bees on shares. The other man is to furnish the hives, supers, and bees, and I am to furnish the sections and take care of them. They are in good condition. What proportion ought I to have? IOWA.

ANSWER.—That's a very hard question to answer. If you are an expert with bees, giving them close attention, you ought to have a much larger share than the one who knows little about the business and does little at it. So your share may vary from 1/4 to 3/4. Generally speaking, keeping bees on shares is not the most satisfactory thing in the world.

# \$55 IN SPECIAL CASH PRIZES FREE

## IN ADDITION TO REGULAR PREMIUMS.

We have decided to offer **TEN SPECIAL CASH PRIZES** in addition to the regular premiums, for getting new subscriptions to the Weekly American Bee Journal. The 1st Prize will be \$10; the 2d, \$9; 3d, \$8; 4th, \$7; 5th, \$6; 6th, \$5; 7th, \$4; 8th, \$3; 9th, \$2; and 10th, \$1.00.

### Read the Following Conditions Very Carefully:

1. This Special Cash Prize Contest will begin on the morning of March 20, and close the evening of July 1.
2. All who compete for the Cash Prizes must have their own subscription to the American Bee Journal paid at least to the end of this year (1905). And each one competing for a Cash Prize must have Five (5) new subscriptions to his or her credit before entering the contest for Cash Prizes. That is, those who have sent in 1, 2, 3 or 4 new subscriptions will not be counted as contestants for the Special Cash Prizes. You must have 5 to your credit, but need not send in the 5 all at one time.
3. New subscribers are considered as those who have not taken the American Bee Journal regularly since 1903. That is, any one who is not getting it now, but received it during 1904, would not be considered a new subscriber now.
4. A new subscriber must not be a member of the same family where the Bee Journal is being taken now. A new subscriber must be in fact a new reader.
5. Cash must accompany every order when sending in new subscriptions. And after any regular subscriber has sent in 5 new ones, he will say when sending in the sixth new one that he wishes to compete for a Cash Prize. Then we will enter his name on the Contestants' List. (If all is not now plain, please ask any questions and we will try to clear up anything that is not understood).

## LIST OF REGULAR PREMIUMS GIVEN

(whether you compete on the Special Cash Prizes or not).

### Given Free for 1 NEW Subscription.

YOUR CHOICE.

- |  |   |
|--|---|
| Untested Italian Queen (in May or June).                       | Newman's "Bees and Honey" (in paper).     |
| Doolittle's "Scientific Queen-Rearing" (bound in Leatherette). | Howard's book on "Foul Brood".            |
| Hutchinson's "Advanced Bee-Culture".                           | Pierce's "Winter Problem in Bee-Keeping". |
|  | Monette "Queen-Clipping Device".          |

### Given Free for 2 NEW Subscriptions.

YOUR CHOICE.

- |  |  |
|--|--|
| Dr. Miller's "40 Years Among the Bees".                  | Newman's "Bees and Honey", (in cloth). |
| Doolittle's "Scientific Queen-Rearing" (bound in cloth). | "Americanische Bienenzucht."           |
|  | Stylographic Pen.                      |

### Given Free for 3 NEW Subscriptions.

YOUR CHOICE.

- |   |  |
|---|--|
| Prof. Cook's "Bee-Keeper's Guide; or, Manual of the Apilary."   | A Novelty Pocket-Knife (with your name and address on one side of handle, and 3 bees on the other side). |
| Dadant's "Langstroth on the Honey-Bee".                         | A Fountain Pen.  |
| Root's "A B C of Bee-Culture".                                  | 100 copies "Honey as a Health Food".   |
| Your own Subscription to the American Bee Journal for one year. |  |

Remember, that in each case above it is **your choice of any one** of the premiums offered. And when you have sent in 5 new yearly subscriptions, after March 20, you can then compete on the Special Cash Prizes. The one who sends in the most new subscriptions over 5, between March 20 and July 1, 1905, will receive \$10 cash in addition to whatever of the regular premiums he may have received for sending new subscriptions from time to time between March 20 and July 1. The one sending in the second largest number over 5, will get \$9 cash, and so on.

Now—let every one of our regular subscribers whose subscriptions are paid to the end of 1905 or beyond, get to work and pour in the new subscriptions. If your own subscription is not yet paid to the end of 1905, send it in at once, or when you send your first new subscription.

We will be pleased to furnish all the copies of the American Bee Journal free that you may want to use as samples. Just let us know how many you want.

Address, **GEORGE W. YORK & CO.,**  
334 Dearborn St., CHICAGO, ILL.

### LICE SAP LIFE

That's how they live and thrive. You can't have healthy, profitable fowls or stock and have lice too.

### Lambert's Death to Lice

promptly kills all insect vermin and makes sitting hens comfortable. Sample 10c; 100 oz., \$1.00 by express.

## Reports and Experiences

### Bees Doing Well—Closed End-Bars

The summer of 1904 was a pretty good one with bees in this locality. In 1903 I got a crop of only 400 pounds from 33 colonies, and half of it I had to feed back. This, with six previous years of poor crops, discouraged me. I did not give them the attention they ought to have had, and the consequence was that I lost until only 23 colonies were left. Eight of them were very weak, and it took all summer for them to build up. But I secured 1800 pounds of honey from the 20 that were in a better condition. I had taken care of one colony in first-class style, and secured from it 150 pounds of surplus, and had 35 pounds in the brood-nest, besides a great deal of pollen.

Last fall I provided each of them with about 30 pounds of honey, besides frames of pollen, and I set aside 80 frames of honey and

### Better Seed More Corn

Increase your corn crop 5 to 10 bushels per acre and insure its ripening. Do it by getting seed suitable to your location.

### Pride of the North

is a well known 90 day, early yellow dent. Very small cob with deep kernels closely set, ear medium length. Its extreme earliness insures its ripening in northern latitudes and its yield of shelled corn quite equals many larger sorts. Bushel shelled, \$1.25; on ear, \$2.00. For localities having a longer corn season, we recommend

### PRIDE OF ILLINOIS

a large beautiful Yellow Dent Corn with broad and deep yellow grains. The ears are also of good length and yield a big harvest. Try this new variety. Bushel shelled, \$2.00; on ear, \$3.00. We also offer standard sorts, per bu. shelled, bags included:

Barnard's Yellow Dent	\$1.75
Iowa Gold Mine	- - 1.25
Iowa Silver Mine	- - 1.35
Wisconsin White Dent	1.25

If you don't know just what you want, we will select a seed for you that will give perfect satisfaction. Write for free catalog, full of garden and field hints—worth sending for today.

pollen for spring. They are all doing well now, and for the last 2 weeks have worked hard on willow, and have carried in a good deal of pollen. A full blossom is now appearing on early plum.

I notice there are some bee-keepers that have the preference I have for closed end-bars. I made 10 frames for a hive about 3 years ago—the common thick-top and  $\frac{3}{4}$ -inch bottom-bar with 7-16-inch thick and  $1\frac{3}{4}$ -inch wide end-bar (closed end). I wish all my frames were of the same kind. If they are square and well put together there will be no propolis, and that means a good deal in this locality. It is not necessary to kill bees with them if they are rightly handled. All the frames which I make myself hereafter will be

falling daily. In many instances the rain has assumed torrential proportions, inundating and destroying much valuable property.

Wind has played havoc along the Ocean beach with breakwater piers, small ocean crafts, etc. With all this destruction, however, the good accomplished will be far in excess, and incomputable. We are now looking upon conditions favorable for both ranchmen and honey-producers. **J. M. HAMBAUGH.**  
San Diego Co., Calif., March 20.

**Great Rainfall in California**

Great is our rainfall here, and almost as great is it in the lower counties of the State where dry years are common. The South has been having floods which have sent the rain-gauge higher than it has been for years. 'Tis well; crops will be good, and if everything goes well the honey crop will be the best in a long time. But it is too soon to "count one's chickens." Here we have a great season. The rains began in September; it has been raining a good portion of this month. Wild flowers as well as fruit-blossoms, to say nothing of garden flowers, are out in full swing. If it were not so wet the bees would have a feast galore. They work between showers, however. I notice that they have not increased as fast as might have been expected. **W. A. PRYAL.**  
San Francisco Co., Calif., March 20.

**Bees Still in the Cellar**

Our bees are not out of the cellar yet. There have been quite a good many days when they could fly, but others when they were better off inside. It remains quite cool and cloudy. **EUGENE SECOR.**  
Winnebago Co., Iowa, March 20.

**Fruit-Trees Beginning to Bloom**

Bees are working finely here. Peaches and plums are beginning to bloom. **P. T. LEMASTER.**  
Spartanburg Co., S. C., March 11.

### CONVENTION NOTICES.

**Illinois.**—The Western Illinois Bee-Keepers' Association will hold its spring meeting April 5, in the County Court Room, in Galesburg. Seasonable subjects will be discussed. Each meeting so far has been more interesting than the previous one, and we hope to continue that way. We earnestly invite all who are interested in this industry who are within easy reach of Galesburg, to be at this meeting.

E. D. WOODS, Sec.

**Texas.**—The North Texas Bee Keepers' Association meets at Blossom, Texas, April 5 and 6, 1905. We are expecting a good attendance and a very profitable meeting. We earnestly invite all who are interested to attend.

J. M. HAGOOD, Pres. I. N. HUNTER, Sec.

**Michigan.**—The Northern Michigan Bee-Keepers' Association will meet in Lady Macca-bees Hall, at Central Lake, Wednesday and Thursday, April 5 and 6, 1905. Hotel rates will be, The Tavern, \$1.50 per day. Editors A. I. Root and W. Z. Hutchinson will be present; also E. D. Townsend, Geo. E. Hilton and a number of other practical apiarists of Northern Michigan. If you have never attended a convention let us suggest that you try it for once, and you will have a higher opinion of your calling when you leave.

W. NOHRMANN, Sec. GEO. H. KIRKPATRICK, Pres.

**Utah.**—The Utah Bee-Keepers' Association will hold its spring convention in the Mayor's Office, City and County Building, April 7, at 10 a.m. All are invited. Matters of great interest to bee-keepers, and horticulturalists will be considered. Cache Valley's experience of killing the bees by poison spraying in the bloom must not be repeated. Jot down your thoughts on this or any other question, and bring or mail the same.

G. E. GARRETT, Sec. E. S. LOVESY, Pres.

## Honey and Beeswax

**CHICAGO, March 8.**—There has been some-what of an increase in the number of sales during the past 4 weeks, yet the volume has not been large, while prices are if anything lower than in January, especially on other grades than white clover. Fancy grades of white comb bring 12½@13c; No. 1, 12c, with some off in color at 11@11½ cents; amber grades slow at 8@10c. Extracted, white, 6@7c; amber, 5½@6½c; the price being governed by quality, flavor and package. Beeswax, if clean and good color, 30c per pound.

R. A. BURNETT & CO.

**NEW YORK, March 11.**—There is no improvement in the comb honey situation. The demand is next to nothing; quotations nominal and no doubt some of the stock will have to be carried over. We quote fancy at 13c; No. 1 at from 11@12c, and dark at from 9@10c. Extracted is in fair demand: White at from 6@6½c; light amber at 5½c; Southern in barrels from 50@57c per gallon, according to quality. Beeswax firm at 29c.

HILDRETH & SEGELKEN.

**BOSTON, March 9.**—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality.

BLAKE, SCOTT & LEE.

**KANSAS CITY, March 17.**—The honey market still shows very little life and prices are down and very weak, the best white honey selling at \$2 a case and down as low as \$1.25. Extracted from 4½@6½c. Beeswax, 28c. We have been expecting the market to do better, but so far have been disappointed. C. C. CLIMONS & Co.

**CINCINNATI, O., March 20.**—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7½@8 cents; amber, in barrels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c.

C. H. W. WEBER

**PHILADELPHIA, March 22.**—As the season advances, the call for honey is decreasing, and the market at the present time is dull. Some few sales. We quote: Fancy white, 13@14c; No. 1, 11@12c; amber, 11c. Extracted, white, 6½@7c; amber, 5½@6c. Beeswax, 28c.

We are producers of honey and do not handle on commission.

WM. A. SELSER.

**ALBANY, N. Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buck wheat, 10@11c. Extracted,

better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

**CINCINNATI, March 10.**—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6½c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c.

THE FRED W. MUTH CO.

**SAN FRANCISCO, March 15.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Local demand is light, but there is considerable going outward, another shipment of 200 cases being made this week to Germany. Stocks are largely of amber grades and are not of very heavy volume, but are ahead of immediate local requirements, there being no disposition on the part of jobbers and retailers here to carry much honey at this advanced date in the season.

**BINGHAM**

# Every Bee-Keeper

## Or Prospective Bee-Keeper

should read GLEANINGS IN BEE CULTURE. It gives you the latest in the apicultural world. If you have honey and wax for sale it tells you the market prices. If you have troublesome questions to solve, it helps you. The very best bee-keepers write for it. The following noted writers contribute regularly:

- C. C. MILLER,  
Of Illinois.
- G. M. DOOLITTLE,  
Of New York.
- J. A. GREEN,  
Of Colorado.
- LOUIS SCHOLL,  
Of Texas.
- PROF. A. J. COOK,  
Of California.

Semi-monthly. Over a thousand pages annually. Illustrated fully with the finest half-tones, printed on the best paper. It has the largest circulation of any bee-paper in the world. \$1.00 a year. Sample copy free.

# TRIAL OFFER!

## Gleanings in Bee Culture, 6 months, 25c.

We are certain that any one interested in bees would be greatly benefited by becoming a subscriber to GLEANINGS IN BEE CULTURE. We want you to give it a trial. After you have received a few numbers we are sure you will become a permanent subscriber. We therefore make a special trial offer of 6 months for 25c. Fill in your name in space below, remit 25 cents, and the paper will begin at once.

Enclosed find 25 cents, for which send me Gleanings in Bee Culture 6 months.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. THE A. I. Root Co. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

We trust the same will be continued to our successors in the business.

GEORGE W. YORK & Co.  
Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE.

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything just right, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

Address all Orders, Remittances, Inquiries, etc., to

THE A. I. ROOT CO., 144 East Erie Street, Chicago, Ill.

## Editorial Notes and Comments

### The Honey-Producers' League

This is the name of a new organization which is described in detail by its Secretary, in the following:

#### THE HONEY-PRODUCERS' LEAGUE

##### PROSPECTUS AND CONSTITUTION.

A crisis has been reached in bee-keeping. The time is now here when bee-keepers must band together, as never before, fight an insidious foe, and cope with the conditions of modern times. In short, the wide-spread ignorance regarding the value of honey as a food (its deliciousness, cheapness and digestibility), coupled with an almost universal belief in its adulteration, which belief is fostered by the continued publication of untruthful stories concerning manufactured

#### Constitution

##### ARTICLE I—NAME AND HEADQUARTERS.

SEC. 1.—The name of this organization shall be "The Honey-Producers' League."

SEC. 2.—Its headquarters shall be Chicago, Ill.

##### ARTICLE II—OBJECTS.

Its objects shall be to create a larger demand for honey by popularizing its use among the consuming public through advertising in newspapers and magazines its great value as a food, and by such other methods as may be considered advisable by the Executive Board. Also by publication of facts concerning the production of honey to counteract any misrepresentation of the same.

##### ARTICLE III—MEMBERSHIP AND DUES.

SEC. 1.—Any bee-keeper may become a member by paying to the Manager an annual fee of \$1.00 for each 20 (or fraction of 20) colonies of bees (spring count) he owns or operates.

SEC. 2.—Any honey-dealer, bee-supply dealer, bee-supply manufacturer, bee-paper publisher, or any other firm or individual, may become a member on the annual payment of a fee of \$10, increased by one-fifth of one (1) percent of his or its capital used in the allied interests of bee-keeping.

SEC. 3.—The annual dues shall be payable in advance, on or before May 1 of each year.

SEC. 4.—Membership shall cease when dues are in arrears three months.

##### ARTICLE IV—EXECUTIVE BOARD.

SEC. 1.—An Executive Board, consisting of seven members, shall be elected by mail ballot annually in the month of March (after the first election), the ballots to be sent to the

membership between March 1 and 5, the polls to be closed at noon April 1. They shall be the seven members receiving the highest number of votes cast. In case of a tie-vote, the other members of the Board shall decide it.

SEC. 2.—The votes shall be mailed to the Secretary, who, with another member to be selected by the balance of the Executive Board, shall together count the votes and certify the result to the Manager, who shall then forward copies of the same to the United States bee-papers for publication, and also give same in his annual report.

SEC. 3.—The Executive Board shall have the general management of the League, and shall elect from their number the officers named in ARTICLE V, Sec. 1, who shall execute the orders of the Board, and hold their several offices until their successors are elected and qualified.

SEC. 4.—The Executive Board shall meet annually on the third Wednesday in April, in Chicago, for the election of officers, and for the transaction of such other business as may regularly come before it.

SEC. 5.—Special meetings of the Executive Board shall be held when called by the President, upon request of three or more members of the Board.

##### ARTICLE V—OFFICERS.

SEC. 1.—The officers shall be a President, Vice-President, Secretary, Treasurer and Manager.

SEC. 2.—The duties of the President and Vice-President shall be such as usually devolve upon these officers.

SEC. 3.—The duties of the Secretary shall be to keep a record of the meetings of the Executive Board, and to count the ballots of all the membership, as provided by ARTICLE IV, Sec. 2, the result of which he is to forward at once to the Manager.

comb honey, to which may be added the fact that cheap syrups are being pushed upon the market with great vigor—all these combined are depressing the honey market beyond all precedent; and, unless something is done to counteract these influences, our occupation, or at least a good share of its profitableness, will soon be gone.

A large share of last year's honey crop is still unsold, while the market is practically dead, as is easily shown by reference to the market reports. The crop of the coming season will soon be here, and should it prove a bountiful one, with last year's crop still unsold, where will prices go then? We may as well face the situation squarely. Then comes the all-important question: What shall we do about it?

Three or four of us began recently to discuss this question privately by mail, and we decided to act promptly to the extent of summoning (some by telephone and telegraph) to a conference in Chicago some eight or ten representative manufacturers, dealers, publishers and honey-producers. As a result, such a meeting was held March 14 and 15, the whole two days being occupied in forming an organization, and in discussing ways and means whereby said organization can increase the demand for honey.

The first step was the drafting of a Constitution, which reads as follows:

SEC. 4.—The Treasurer shall keep a record of all moneys received from the Manager, giving his receipt therefor; and he shall pay out funds only on bills approved as per Sec. 5 of this Article.

SEC. 5.—The duties of the Manager shall be to conduct the actual business of the League as directed by the Executive Board; to keep a list of the membership; to account for all moneys received, and turn same over to the Treasurer, taking his receipt therefor; to prepare and mail in March of each year, to the membership, an annual report containing a financial statement, and such other matters as would be of interest to all concerned, including all ballots and amendments; and to issue orders on the Treasurer for payment of all bills when countersigned by the President.

SEC. 6.—The Treasurer and Manager shall each furnish such bond as shall be satisfactory to the Executive Board.

##### ARTICLE VI—SALARIES AND EXPENSES.

SEC. 1.—No salary shall be paid any officer of this League, but the actual expense of holding meetings of the Executive Board (when they deem such necessary) shall be paid from the general expense fund.

SEC. 2.—There shall be an allowance of (5) percent of the cash receipts to cover all general expenses, such as printing, meetings of the Executive Board, etc., the remaining ninety-five (95) percent to be applied on the advertising proper.

##### ARTICLE VIII—AMENDMENTS.

This Constitution may be amended by a two-thirds vote of the membership at any regular election, provided such proposed amendment be first submitted to the Executive Board and approved by it.

### Minutes of First Meeting

A temporary organization was effected and the foregoing Constitution adopted, when, upon motion of Ralph W. Boyden, the following members were elected as an Executive Board: Dr. C. C. Miller, W. Z. Hutchinson, Arthur L. Boyden, George W. York, C. P. Dadant, N. E. France and George C. Lewis.

A permanent organization was then formed, and the following officers elected: President, Dr. C. C. Miller; Vice-President, George C. Lewis; Secretary, W. Z. Hutchinson; Treasurer, Arthur L. Boyden; Manager, George W. York.

Before adjourning it was resolved to do no general advertising until there is at least \$5000 in the hands of the Treasurer; the Manager was instructed to take the necessary steps for securing the incorporation of the League; and the Secretary and Manager were appointed a committee to prepare the necessary literature for use in soliciting membership.

### Some Questions Answered

While the Constitution quite clearly outlines the aims and objects of the League, a few questions will naturally spring to the lips of one who contemplates joining its ranks, hence it may be well to answer in advance as many as possible of them.

Naturally, the first question asked will be: "Why form a new organization when the Constitution of the National allows the use of its funds for such work?" Principally because the National has not enough money at its command to do the work effectively, and it could not raise enough without a change in its Constitution, as, at present, only one extra assessment of \$1.00 per member can be made each year, while the work of advertising, to be effective, requires *thousands of dollars AT ONCE*.

Perhaps some will ask why the matter was not discussed in advance in the bee-papers, and a public meeting called? Why was the matter kept quiet, and the work done with apparent secrecy? It was done so quickly simply to save time. When the true situation had fairly dawned upon the three or four who were first discussing the matter, it became equally apparent that only by the most prompt and active work could anything be done that would help the sale of the last year's honey crop before the coming of this year's crop.

Some may wonder why the members of the Executive Board were all chosen so near Chicago. They were thus chosen that they might quickly and cheaply attend Board meetings. Should an important question requiring immediate action come up, telegrams sent every member in the afternoon would enable them to be in Chicago the next morning. If any mistake has been made in the choice of officers, it can be corrected at the next election. As it is, however, it is doubtful if a set of officers can be chosen who would have more completely at heart the success of the undertaking. Besides this, they are all friendly to one another, and will work harmoniously as a unit.

It may be asked why no salaries are paid the officers. If these men are willing to give so freely of their money, they should be equally willing to give their time; besides, if they were paid salaries, many might be inclined to look upon the whole thing as a scheme on the part of the officers to put money into their own pockets. As it is, these men are really putting in their time, money, and energies, expecting no reward except such as will come to them from the improved conditions of bee-culture. Only as honey-producers are benefited will any benefit come to manufacturers, dealers and publishers, yet a heavier burden is placed upon them than upon the actual honey-producer. The contributions of the Board members alone will reach nearly \$1000.

Every one will, of course, be interested in knowing what forms of advertising will be adopted. Mainly that of advertising in the daily papers and magazines. (No advertising will be done in the bee-journals, as that would be simply a waste of money.) Probably the first feature will be that of killing, or removing, the false beliefs regarding the manufacture of artificial comb honey. Large space, perhaps one-fourth or one-eighth page, will be used in leading dailies, a large heading reading something as follows:

**\$10,000 FORFEITED!**

Then will follow an explanation and refutation of the matter, and the offer of \$10,000 as a forfeit to any one who can show a sample of comb honey that has been produced artificially. Of course, care will be taken to word the offer properly, so that no technical advantage may be taken. The best talent of the country will be employed in preparing and placing the advertising. Many papers that publish these advertisements will probably be willing also to publish articles on bee-keeping written with a view to increasing the demand for honey. Pos-

sibly firms that print "patent insides" for other newspapers may be induced to use such articles.

At fairs and exhibitions it may be advisable to have educational honey exhibits, together with the distribution of suitable literature. Possibly it may be well to put stereopticon lectures in the field; but, as has already been stated, newspaper advertising will be the main feature.

### AN ENCOURAGING INCIDENT.

Let me tell just one little incident: On the train, while going home from the meeting, I fell to talking with a young man who occupied the seat with me. As we became somewhat acquainted I told him of the object of my trip to Chicago, going somewhat into detail. In reply, he said in substance: \*

"At our home we are fond of biscuit and pancakes, with honey or maple syrup. We send down to Vermont, to an acquaintance, to get the maple syrup, as that is the only way that we can feel certain we are getting the pure article. We don't buy honey very often because, while I had never heard how the story started as you explain it, I had been led to believe that a good share, even of comb honey, was manufactured stuff (mostly paraffin and glucose), and I didn't care to eat it. I am very glad to have met you, and to have it proved to me so conclusively that I can eat comb honey, and feel that it is the genuine article."

Friends, there are millions of men and women just exactly like my chance acquaintance, and, in the language of the street, it is "up to us" to convince them of the error of their belief. If we could induce one million of them to step into the groceries to-morrow and each buy a pound of honey, what do you suppose would happen?

This is the work for us to do, and it is the most important work that has been taken up in our line in many a long year. Every other industry is *pushing* its products upon the markets by every means imaginable; are we to sit supinely down and let ignorance, misrepresentation, and business enterprise push our product off the earth? See how new and unknown things are pushed to the front by the force of advertising; let us not lag behind, but use this new force in modern business—*advertising*—to push our delicious product into the position it so richly deserves.

Just a parting word: Don't wait to "see how it is going to turn out." If others are putting in their time and money for the good of the cause—to accomplish something that will help you—meet them half way, join hands with them, do it promptly, and success is assured.

Flint, Mich.

W. Z. HUTCHINSON, *Secretary*.

Address all business correspondence, membership dues, etc., to the Manager, George W. York, 334 Dearborn St., Chicago, Ill.

If you have read all the foregoing carefully we believe you will agree that it is the right kind of a move to make on the part of bee-keepers. Surely, something ought to be done to place honey on a more-certain-demand basis. And we don't know of anything else that should be as effective as the kind of work that is proposed to be done by The Honey-Producers' League.

But it will require money to do the work. And yet, in the manner proposed, it will not be heavy on any one person. The plan is to divide it around among the thousands of those interested in bee-keeping or honey-production so that it shall be no burden on any one.

Already the following are entered on the Manager's Membership Book as having paid their first year's dues:

Dr. C. C. Miller.....	\$ 10
George W. York .....	25
Geo. C. Lewis (for G. B. Lewis Co.) .....	210
H. M. Arnd (for York Honey and Bee-Supply Co.) .....	15
E. Whitcomb .....	1
Arthur L. Boyden (for A. I. Root Co.) .....	610
E. Kretchmer (for Kretchmer Mfg. Co.) .....	50
W. Z. Hutchinson .....	13
C. P. Dadant (for Dadant & Sons) .....	70
Griggs Bros. ....	11
F. A. Salisbury .....	30

Total.....\$1045

We trust that as rapidly as possible our readers will become members of The Honey-Producers' League, and thus aid in furthering their own interests as well as the interests of all who are connected in any way with honey or its production.

# Miscellaneous News \* Items

**Honey Ointment for Sores.**—Honey and flour mixed to the extent of half the quantity of honey with water is stirred into a stiff mass. Lioseed oil and the yolk of an egg to be added in order to give the same a tenacious tendency. Quite simple; try it.—Rural Californian.

**Truly Wonderful.**—The following interview was recently sent us by C. G. Schevalier, of Maryland, having been clipped from the funny column of the Philadelphia Press:

WONDERFUL.

Mr. Kidder—Yes, this is artificial honey.  
Mrs. Kidder—You don't say?  
Mr. Kidder—Yes; gathered from artificial flowers by artificial bees.  
Mrs. Kidder—The idea!

**Country Life in America** is perhaps the most beautifully illustrated monthly publication in the United States. The April issue contains an article on bee-culture by Anna B. Comstock, of New York State. The price of "Country Life in America" is \$3.00 per year, or 25 cents per issue, postpaid. On receipt of this latter amount its publishers, Doubleday, Page & Co., either at their New York City or Chicago address, will mail a copy of the April issue. The Chicago office is Room 345 Marquette Building.

**Bee-Keeping in Wisconsin.**—Pres. N. E. France, of the Wisconsin Bee-Keepers' Association, wrote us as follows March 11:

Yesterday I got the Wisconsin State Fair premium list changed, adding \$100. It is now as follows:

	1st.	2d.	3d.
Italian bees, single-comb nucleus.....	\$ 8	\$ 5	\$ 3
Carniolan bees, single-comb nucleus.....	8	5	3
White comb honey, 10 pounds.....	10	6	4
White extracted honey, 10 pounds.....	10	6	4
Amber comb honey, 10 pounds.....	8	5	3
Amber extracted honey, 10 pounds.....	8	5	3
Dark comb honey, 10 pounds.....	7	3	2
Dark extracted honey, 10 pounds.....	7	3	2
Most attractive comb honey exhibit.....	15	12	8
Most attractive extracted honey exhibit.....	15	12	8
Yellow beeswax, 10 pounds.....	3	2	1

Premiums are offered for Wisconsin products only. Now is the time for Wisconsin bee-keepers to begin to get ready for the State Fair. I am to be an exhibitor, but not for any premiums.

Also, yesterday, I got the new Wisconsin Food Law on honey so changed as to protect the bee-keeper better against adulterated honey. Bees in Wisconsin are reported as wintering well, and clover looking good.

N. E. FRANCE.

**Missouri's Apiary Bill Vetoed by Gov. Folk.**—As announced last week, Gov. Folk vetoed the Apiary Bill passed by both branches of the Missouri Legislature. In doing so, Mr. Folk "got off" the following:

To the Secretary of State—

Sir:—I have the honor herewith to transmit to you, without my approval, Senate Bill No. 268, entitled, "An Act to provide for the appointment of a State Inspector of Apiaries, and to regulate the duties thereof, providing a penalty for disposing of diseased honey or bees," which reached me within the ten days next before the adjournment of the General Assembly.

This Act provides for the appointment of a Bee-Inspector to look after the apiaries of the State. On the first examination, if he thinks the bees are diseased, he is to give the person in charge instructions as to the manner of treating them. Provision is also made for a second examination, and the Inspector may then, if he sees fit, physic the bees himself, or if he thinks best he may destroy them.

This measure illustrates the fallacious idea that the Government can do more for the individual than the individual can do for himself. Any one intelligent enough to conduct a bee-industry is certainly better qualified to attend to them and manage his own business than any State Inspector could possibly be.

There is no magic in a State inspectorship of bees, or anything else to cure the ills that may exist. It is said this measure is asked for by the honey-raisers to suppress contagious diseases among bees. But they can, by meeting together and exchanging ideas, do for themselves what the State can not do through this Bill. If all together they are unable to cope with the situation, how can one of them, named as Inspector, do better?

The principle of the measure is paternalistic, and not in accord with the democratic theory of government. The Inspector is author-

ized to go to any one's home, and if he should not like the way the bee-hives are conducted, he could for some real or imaginary disease annihilate the whole brood, leaving the owner without remedy, but for all of which the Inspector would receive \$4 a day.

Any Inspector appointed would be only a man, with defects just like other men. He could not have superhuman knowledge of bees or of the bee-business, and could not be expected to accomplish more than the individual bee-keeper could for himself.

My opinion is, this question would best be left to the owners of bees, and to the bees themselves, who have repeatedly demonstrated their qualities of self-reliance.

Respectfully,  
JOSEPH W. FOLK, Governor.

By the same lines of argument Mr. Folk would veto a Bill providing for health officers in cities, for if people generally were not "intelligent enough" to keep themselves and their children well, and free from contagious diseases, why, it would be ridiculous to call in a health officer!

Besides, other States having equally intelligent and sane men as governors are approving such wholesome and just legislation. Surely, Mr. Folk, did he rightly understand the Missouri Apiary Bill, would not have vetoed it. It was a needed and just measure, and should have been approved by Gov. Folk.

But Messrs. Abbott, Holekamp, Stewart, and others of the hustling Missouri bee-keepers will now have a chance both to enlighten and sweeten their mistaken Governor.

## Wintering Nuclei in Observatory Hives

BY DR. C. C. MILLER.

JUST when I begin to think complacently that there's some one thing about which I know pretty nearly for certain, along comes some one to give me a rude jolt by showing that I don't know, after all. This time it's a Connecticut Yankee, although there's nothing rude in his manner of giving the jolt. I supposed it was hardly a practicable thing to winter successfully a one-frame nucleus in an observatory hive, although a good many have tried it. Well, Allen Latham feels pretty sure it can be done, and for the very good reason that *he has done it*.

After reading what I said on page 183, he wrote me a letter which, although not intended for publication, contains so much information that I must ask his pardon for giving others the benefit of at least a part of it. That part follows:

MY DEAR DR. MILLER:—I still think that you misunderstand the intention of "New Jersey," and though I would not make any rejoinder through the columns of the American Bee Journal, I think that I will write to you that I may make my own position plainer.

I surely think that the questioner wished to find out a good way to feed an observatory-hive colony during the active months, and I surely thought, when I first read the question, that "late summer" meant the last of August or early in September.

It would be no idle boast for me to lay claim to knowing something about the care of an observatory hive, for I have kept bees in one continuously since May, 1902, and now have 5 full colonies which are direct descendants from that colony. Of its own swarms one came out May 11 and the other May 21, the following year.

I had studied bees many years, and tried without success to winter them in single-comb glass-hives till the winter of 1902-3, when I partially solved the problem. My two observatory hives this winter attest that I have completely solved the problem.

One of the secrets of success in this venture is in causing the little colony to breed late in the fall—till Oct. 20, if possible. This is done by feeding and nursing till the weather makes it unwise to go farther. In this way the colony is composed of young bees which will stand the unusual test to which these bees are to be subjected. If this is not done, and only old bees, bees hatched, that is, emerged, in August and early September, make up the colony, the colony will suffer unless the spring is early and abounding in days when bees can gather pollen.

The limited comb-space prevents the storing of much pollen in the fall, and the small colony must depend in spring upon new pollen for its first young bees. If deprived of this the old bees, rapidly dying off, leave the hive almost deserted.

If the winter is severe only the strong bees will survive even into March.

Knowing these facts concerning the observatory hive, I realized that "New Jersey," and others who might supply a hive with a comb of honey earlier than late in September or early October, would probably commit a fatal error. If this comb of honey has a patch of sealed

brood in the middle of it as large as my hand, or say about 25 square inches, then all is well.

So you see, Dr. Miller, that even though brood-rearing may have ceased in the yard in the regular colonies, that it must not have ceased in the little hive in the window, and it was this fact that led me to write what I did on page 126. I naturally did not stop to think that the "late summer" carried a different meaning to others than it did to myself.

Bees here have wintered excellently, and the spring seems to be opening up earlier than it did last year. Almost every day I see bees out after water.

ALLEN LATHAM.

New London Co., Conn., March 12.

## Some Notes and Comments—Bee-Hives

BY F. GREINER.

SOME bee-hives are so constructed that it seems necessary to give them frequent "goings-over"—removing propolis, burr-combs, and the like, in order that the combs may be handled easily. I have kept bees in frame hives for 30 years, and have not found it necessary to clean any of the frames or hives when there were bees in them. I use hives with wood rabbet and frames made of one-inch-wide material. There is not a frame in my 200 occupied hives but can be taken out with comparative ease, and nearly all my frames are of the loose-hanging kind. When for some reason a hive-body is empty—as it often happens when we "shake" bees—why, then, if it seems necessary, we scrape the inside and the rabbets, but it is not generally necessary.

On the tops of my frames some burr-combs accumulate; these are sometimes removed with a simple little tool which answers nicely as a hive-opener. It is made on the putty-knife order, only much stouter. I made it from a piece of a broken spring. One end is drawn out to not quite knife-edge and is about 1 1/4 inches wide; the other is left the size of the steel, about 1 1/2 inches wide, and has the corners nicely rounded. It suits me very much better than the screw-driver I have been using for many years. I made me a number of these tools and keep one in each yard. They are very handy.

### SECTION-PRESS FOR FOLDING SECTIONS.

When it is proposed to employ a machine to do certain work the questions come up: Is the work done more effectively, better, quicker, with less expense? What does the machine cost? These questions came to me when I was reading Mr. A. F. Foote's illustrated article on a section-press. I don't see that this press facilitates the work. I am able to fold as many sections without it, simply using my fingers to do the work. I fold the sections into a square corner improvised by a piece of scantling securely fastened to the work-bench. The thumbs do the pressing. The tap of a light hammer is very seldom required, and only when a section for some reason fails to go together as it should. Before I invest in a machine I must be satisfied that I can save something by using it.

Mr. Editor, you said before the bee-keepers in St. Louis that honey ought to bring 50 percent more than it does now. I want to ask what sympathies you have for the consuming public? If you were a day laborer, do you think you could afford to eat honey at an advance of 50 percent over the present prices? Don't you think we would sell a great deal more honey if it could be sold lower by 20 percent? My clover honey brought me, f. o. b. my station, 14 cents. I judge that the consumer had to pay not less than 20 cents per pound. What working man can afford to pay 50 percent more, or 30 cents per pound? No, no, the price of honey at 20 cents is high enough compared with 6-cent sugar.—[We meant to say that in a wholesale way prices should be higher.—EDITOR.]

### RENTING LAND FOR AN APIARY.

How much should be paid for the privilege of keeping an apiary on some one else's land depends largely upon circumstances. The bee-keeper can afford to pay generously for such a privilege. While the occupancy by bees of a farm costs the owner of same nothing, and is many a time a direct benefit to him, yet we must not lose sight of the fact that the people living on the farm may be, and often are, inconvenienced by the bees. I find but very few people who are willing to consent to my locating bees on their premises. I could not hire them for a \$5 bill to accept one little bee-esting free.

There is nothing to hinder every farmer keeping bees and producing honey enough for his own family. There is

nothing to hinder his knowing how to manage bees successfully; but when he does not know enough to do so, and has no inclination to learn it, he would better keep his hands off.

### ADVANTAGES OF NO-BEE-WAY SECTIONS.

The only advantage I realize from the use of no-bee-way sections is that I save in shipping-cases and timber to make the sections from. Six shipping-cases take the same amount of honey in no-bee-way sections as seven cases in bee-way sections. The no-bee-way sections cost 25 cents less per 1000.

### DRIP-STICKS FOR NO-DRIP CASES.

Drip-sticks for shipping-cases should be made thicker than they are. It does not happen often, but sometimes honey leaks badly on account of a crack across the flakes. A good amount of room under the sections would prevent the sections from becoming daubed. I have received empty cases back from the grocery which were perfectly dry and clean, and could be used again without replacing the paper trays. Then, again, I have seen honey very badly daubed because the drip-sticks were too thin.

To help out Dr. Miller, on page 39—What would bees do on only drone-comb—I would say that if a new swarm is hived on drone-comb foundation only, they (the bees) will make bad work with it. There will be all sorts of cell-shapes. The aim of the bees seems to be to build worker-comb. But when finished drone-combs are given, the bees will occupy them as other combs, and make the best of it, rearing worker-brood in the drone-comb. The reared workers will be no larger than those reared in worker-cells.

Ontario Co., N. Y.

## Convention Proceedings

### Report of the Michigan State Convention

BY E. B. TYRRELL, SEC.

The 40th annual meeting of the Michigan State Beekeepers' Association was held at Grand Rapids Feb. 23 and 24, 1905. It was called to order at 2 p.m. by Pres. W. Z. Hutchinson. The minutes of the previous convention were read and approved.

Pres. Hutchinson asked how many believed the booklets issued last year helped them to dispose of their honey. Several reported sales made by the pamphlet, one member saying it sold all of his honey for him. It was thought beneficial in giving consumers confidence in the honey.

The Secretary then gave a financial report for the year, showing total receipts of \$43.21, and a total expenditure of \$39.80, leaving a balance on hand of \$3.41. The report was approved by the convention. A vote of thanks was then tendered the Secretary for his reports.

It was decided that last year's motion in regard to issuing the honey pamphlets be continued.

On motion, George W. York was requested to act as judge on the honey exhibited at this convention.

### UNITING WEAK COLONIES IN THE SPRING.

"Has any one tried putting weak colonies above strong ones in the spring, putting a queen-excluder between the hives?"

J. A. Pearce tried putting 16 weak colonies above 16 strong ones in the manner stated, leaving them about three weeks, with good results. He is well pleased with the plan. They were separated at the beginning of the honey harvest. He did not lose any queens by this method.

H. F. Strang tried this plan by putting 18 weak ones over 18 strong ones, with good results. The lower colonies were very strong when put together, and the upper ones very weak. He left them together about 22 days. They should not be left over 25 days. He looked at them every 5 or 6 days, and found them acting as 2 colonies all the time. He raised the front end of the hive and poured in 1/2 pint of feed (half honey and half water) each day. Each colony was put back on its own stand, and seemed to stay all right. He would unite them the last of April or first of May. No entrance was given to the upper story, so all used the same

entrance. One advantage in this plan was that it did away with robbing.

T. F. Bingham thought the only advantage of the plan was that it saved the extra queen. Believes the upper colony is benefited at expense of lower one.

Pres. Hutchinson thinks there is no question but that the upper colony is benefited, but there is a question as to whether the lower one is not hurt some.

Mr. Pearce said the strong colony is not hurt by the weak one being above. He believes the sooner they are put together in the spring the better.

H. K. Beecham believes that colonies too weak in the spring to protect themselves should not be bothered with.

SNOW AROUND HIVE-ENTRANCES.

"To what extent would you remove the snow from around the hives in the winter?"

Huber H. Root believes it beneficial to leave the snow around the hives, but ice should not be allowed to form in the entrance. He reports bees wintering finely for him this year, banked up all around with snow.

G. A. Bleach reports good success from bees covered with snow. He had 20 to 25 colonies entirely covered by snow, and found the heat of the bees had thawed a large cavity at the entrance.

Geo. E. Hilton wouldn't remove the snow from around hives until he was sure the bees could fly. He says bees will winter if the entrance is covered by snow, and that 100 colonies need no more air than one man. He reported one hive being hermetically sealed with ice, and the bees came out all right. He claims bees never smother. Quite a little discussion was raised here on the point of the amount of air that bees need during winter.

Mr. Bingham advised a neighbor to put his bees down cellar, and because they came out of the hives this neighbor plugged the entrance with rags, with the result that the bees wintered all right.

REMOVING BEES FROM HIVE-ENTRANCES.

"Did any one ever get any pay for cleaning dead bees from hive-entrances during winter?"

No one seemed to think it paid, and the discussion went right back on the snow question.

C. A. Huff reported practicing piling snow around the hives with good results.

W. J. Manley believes in banking with snow, although two years ago he had bees covered with snow and all died.

Mr. Hilton thought the honey used for winter stores was to blame. He said if bees are left under snow too long they start brood-rearing; they will not leave the brood for honey, and thus starve.

Clyde Cady asked if there was not danger from too early breeding when covered with snow.

Mr. Hilton thinks there is.

Mr. Cady then asked to what extent they should be covered.

Mr. Hilton said it doesn't matter so much to what extent they are covered, but as to length of time covered.

WRAPPING HIVES WITH BUILDING PAPER.

"Will it be a benefit to wrap colonies with one or more thicknesses of building paper when putting them out in the spring?"

Mr. Kirkpatrick tried it on 20 colonies last spring with good results. He laid it on top of the hive, then folded it down around the hives, then put on the cover. He will use it again this spring.

Mr. Bingham said that Capt. Hetherington reported it beneficial.

TEMPERATURE FOR CELLAR-WINTERING.

"What degree of temperature gives best results in cellar-wintering?"

Mr. Bingham reported 30 to 35 degrees in his cellar.

Mr. Manley said 36 to 38 degrees in his cellar. A discussion then ensued on cellar-wintering, Mr. Bingham giving a clear description of his cistern cellar.

Mr. Hilton believes a cellar as described by Mr. Bingham would be no good in clay ground.

Mr. Bingham believes a cellar could be built above ground, in a clay country, of cement, then banked with gravel. Some advocated cellar-wintering, others outdoor wintering. L. A. Aspinwall and Mr. Hilton advocated outdoor wintering.

ACID FOR WAX-RENDERING.

"How much acid should be used in rendering old combs into wax?"

Mr. Root advised boiling the wax in water until all is melted, then put in one percent of acid and boil 1/4 minute, then pour all into a barrel into which has been previously put 3 or 4 pailfuls of hot water, and let it stand 24 hours. During this time the dirt in the wax sinks. Vinegar can be used in the same manner, but is more expensive. He said acid does not injure the wax. Vinegar, to be successful, must be very strong. Salt has also been used.

E. D. Townsend thinks that wax should not be boiled after it is all melted.

Mr. Root would not boil it after it is melted in rendering old combs, but does not believe boiling wax will darken it unless it is burned.

Oscar Smith renders wax by steam from a steam engine. Mr. Manley also favors steam for rendering wax. He can render 300 pounds in half a day. He renders it over the second time, using screw pressure.

Mr. Root advised melting the wax before putting it in the press, as it is faster than heating in the press.

A motion was then carried, that those who are already members of the National can become members of the Michigan Association by paying 50 cents for dues for the latter.

(Concluded next week.)

Conducted by EMMA M. WILSON, Marengo, Ill.

How a Bee-Keeping Sister Won—and Didn't Get It

An interesting bit of history connected with bees and women has just been closed. The city of New York has some 30 colonies of bees at Bronx Park, and a competent person was to be chosen to care for them. That statement is all that is needed to understand the following clipping from the New York World, sent by the courtesy of Mr. W. M. Scardefield:

A Woman Heads the List

When Park Commissioner Schrader, of the Bronx, comes to select the first of the three apiarists which he thinks necessary to the proper care and cultivation of the bee-colonies in the parks under his jurisdiction, he will find that the name of a woman heads the eligible list which was sent to him to-day by the Civil-Service Commission.

Emma V. Haggerty, of this city, was the only woman among the 30 odd citizens who took the examination, and she passed with 97 percent. Her nearest competitor got 93 percent, and Miss Haggerty demonstrated that she knew more about bees and bee-culture than any of the aspirants.

SHE LIKES BEES.

The position pays \$1200 a year, and Miss Haggerty wants it because she likes bees and has devoted a good deal of her time to studying them. But the question is, Will she get it? There is no doubt that she has proven herself the fittest of all the aspirants for the place, but it is upsetting precedent a bit to appoint a woman to such a place in the Department of Parks. The chances are that Miss Haggerty will be passed over and a man appointed, but if she is it will not be without strong protest from her friends, who believe that she ought to get the place.

To pass the examination for this place required more than an ordinary amount of knowledge about bees. Nine questions were asked of the applicants, and they had to "know bees" to answer them. One was "How does the cell of the queen-bee differ from that of the other bees?"

Another was, "What happens when bees are left without a queen, and how is a new queen provided?" Miss Haggerty answered these questions like an expert; also all the questions about how to protect the public from being stung by the bees, how to save the bees from disease, etc.

MIGHT SOLVE A MYSTERY.

It has been suggested that the appointment of a woman bee-keeper might result in some information being discovered as to what becomes of all the honey which the park bees make. No one has ever been able to discover just where it goes, but Miss Haggerty might solve the mystery.

The answer to the question: "Will Woman Become City Bee-Keeper?" is contained in the following clipping, kindly furnished by Mr. A. D. Jacot:

Rejects Woman Bee-Keeper

John H. O'Mara, of this city, has been appointed apiarist in his Department by Park Commissioner Schrader, of the Bronx, at a salary of \$100 per month. Miss Emma V. Haggerty, a school teacher,

headed the eligible list with a percentage of 97. It is understood that O'Mara was fourth on the list.

The Commissioner threw out the name of Miss Haggerty on the ground that she was a woman, and the keeping of bees was not a woman's work.

We are indebted to Mr. James McNeill for sending the following witty comments on the transaction :

#### Bees

(Miss Emma V. Haggerty, permitted by the Civil-Service Board to take the examination for a \$120. job as city apiarist, led a dozen men, got 97 percent, and is now to be denied the position because she is a woman.)

Say their judgment was B-lated,  
C. S. men have wisely done;  
Though a woman's not B-rated  
Just B-cause she rates "A 1."

Board, B-hind it's rail B-leaguered  
By the beats of politice  
May B-moan the way it figured  
When fair Emma took the tricke.

No B-sotted Bee the B-som  
Of B-nighted woman fears;  
On her face he's sure to see some  
Female emile which honey smears.

"Oh, B-ware B-skirted woman"  
Is a B-atic plan,  
Civil Service men are human,  
Job's B-stowed upon a man.

Let the fair girl atick to sonnets  
On the billows and the breeze,  
Since the Bees buzz in the bonnets  
Of the men who'd boss the Bees!

—J. A.

Some may think this an appropriate place to deliver a homily upon the down-trodden condition of the "sisters," and the wrong they are called upon to endure at the hands of the usurping "brothers," but all things do not point exactly in that direction.

The three clippings were sent in, not by any of the sisters, but by three different brothers, and it seems a fair inference to believe that they were sent in just because these three brothers resented what they believed to be an injustice to one of the weaker sex. If, instead of being a woman, the first name on the list of eligibles had been a man, there would have been equally an injustice in rejecting him for one lower on the list, but in that case would the daily papers have given the matter so much prominence, and would the three brothers have thought it worth while to have sent in the clippings?

It is something for us sisters to be proud of that the first on the list should have been a woman; but was her sex really the cause of her rejection? If so, why was the fourth on the list chosen instead of the second? No, if it had been *Mrs.* Haggerty instead of *Miss* Haggerty, and her liege lord had been the proprietor of a low dive to whom Mr. Schrader owed a political debt; in other words, had she been the wife of a political boss, she might have gotten the position even though she couldn't tell a queen from a white-faced hornet. The very great probability is that Miss Haggerty was rejected because O'Mara, or some of his friends, had a pull, and not because "she was a woman, and the keeping of bees was not a woman's work." Why, the very idea!

### Results of the Season of 1904

Some time ago I saw that Miss Wilson wanted the bee-keepers (or their wives, rather, because all men won't write) to give an account of their success for the year's bee-business. We didn't think we did very well, but when we commenced looking around we found that we did extra well.

We had 30 colonies in the spring of 1904, and secured 1500 pounds of extracted honey, besides about 40 pounds of honey put away that we did not get around to extract (that is 40 pounds to the colony), so our bees didn't do so badly compared with what some others did.

We are right in the center of three big bee-yards, so we couldn't do very well. They are all within 2 miles. We didn't get any increase to speak of. One of our neighbor's told us where there was a swarm; I caught one myself when he was gone away from home, and that is about all the increase.

The bees are wintering well as far as I know. They are on the summer stands packed in chaff. They have had two good flights since being put away. The mice have been working on some of them, but we think they have stopped,

or, rather, we stopped some of them with corn-meal and strychnine.

It has been snowing here for a week, and it looks as if we were going to have a good season for water.

The American Bee Journal is a welcome guest at our house.

MRS. SADIE ELLIFRITZ.

Uinta Co., Utah, Feb. 4.

## Mr. Hasty's Afterthoughts

The "Old Reliable" seen through New and Unreliable Glaases.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

#### "TO TRUST" OR NOT "TO TRUST."

"Tis a point we long to know,  
Of its causes anxious thought,"  
Do we boss our bees or no,  
Have we Trust, or have we not?

If that's our frame of mind, the title page of Feb. 9 is of interest as a sort of side evidence. We hardly have an old, *long-established* trust; else there wouldn't be two such nice agencies in one city. Especially there wouldn't be two agencies in a foreign city like Havana. A recently formed trust, however, may not think best to sweep supernumerary things all off the board immediately—takes its quiet time to fix things just right in its own eyes.

#### SUGGESTION FOR PREVENTING SWARMING.

So G. M. Jones wants to keep 4 colonies of bees in a city, mainly for study and relaxation of mind. Yet he must be absent working-hours every day. He wants a reliable plan to keep swarms from spreading panic among his neighbors. I don't know as I can tell him; but I should hardly be living up to my reputation if I did not reel off a plan. Keep them in big one-story hives, 12 frames or more in size. For each hive have two fat dummies so the brood-chamber can readily be run any size from 3 frames to 12. Have 16 hives in all, and practice double division—that is, have 4 colonies in the spring and 16 in the fall. In the fall put the bees all in 4 hives again, and harvest your crop by extracting the 152 combs not needed to winter on. If they average 3 pounds each the harvest will be 456 pounds. Plenty of objections might be made. Unless the divisions are *very wisely* conducted there will (sad to relate) sometimes be swarms notwithstanding. And in a locality where the surplus all comes in quite early, and the fall flow is poor, the plan would be a total failure—come out with scant honey to winter 4 colonies, and most of that scattered through the 144 combs that wouldn't go in. Page 107.

#### SECTION FOUNDATION STARTERS DROPPING OFF.

May be P. D. Jones is right about his comb foundation dropping off because the sections were too smooth; but I suspect a little that he is barking at the wrong cat. Lots of foundation falls because the sections are just a little damp. Be sure they are dry, especially if you have poured hot water among them previous to folding. Lots of foundation falls because the weather was too cool when it was put on—wants to be just nice and warm, not too hot nor too cold. Also, there's an expert and peculiar wriggling squirm that can be given to the handle of the Parker machine that will make wax stick when a non-expert would find "breakers" ahead. Page 110.

#### SELLING FOUL-BROODY HONEY.

To forbid a man to sell honey because his bees have foul brood looks to me like going a little further than is best. Even if a simple sale of honey is to be penalized at all a possible two months in jail seems rather too severe. To sell foul-broody honey to a *bee-keeper*, when he presumably wants to use it for feed, might be penalized without injustice. Page 116.

#### BUMBLE-BEES AND HONEY-BEES—CATNIP HONEY.

Queer that bumble-bees should ignore the basswood and crowd on the alfalfa while the honey-bees totally let alone the alfalfa and rushed for the basswood! Just merely a difference of taste—perhaps.

From reports to date one might guess that pure catnip honey has far too much flavoring to be good, while a second-rate honey rather destitute of flavor is decidedly improved by a small admixture of catnip. Page 117.

#### POLLEN IN THE BROOD-NEST—STARTING SWARMING.

I don't believe that pollen in the brood-nest is going to do any harm as long as it keeps well. Quite liable to get damaged, and then it may do harm, especially when it gets grown into solid lumps by fungus growing in it.

I think Prof. Scholl will find that many others not in Texas sometimes succeed in getting their bees begun at the principal harvest while free from any strong inclination toward swarming. It's the general rule (I take it) that a grand rush of nectar does not favor swarming unless the bees had their minds turned that way to begin with. I will grant that this last contingency is very apt to prevail among prosperous bees that have recently passed through a hard winter. Page 117.

## Doctor Miller's Question-Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.

### Black Bees—Italians or Carniolans Perhaps the Best

1. I enclose a few bees. They are the only kind here now, and I would like to know what strain they are.
2. I am a beginner, and would like to know what kind of bees are the best for this part of the country? MISSOURI.

ANSWERS.—1. They appear to be the common black bee with a very slight admixture of Italian blood.

2. You will probably do well with Italians, and perhaps with Carniolans.

### Feeding Bees—Wintering Bees—Preventing Swarming

1. I have 5 colonies of bees, 3 are in the cellar and 2 outside. Those in the cellar we put out a few days ago for a flight. The temperature was 50 degrees in the shade. They were all in good condition but one, which was short of honey. We put on a super containing a few chunks of honey before putting them back in the cellar in the evening. Is it right to feed them that way in the cellar?
2. Is it better to leave them in the cellar until spring, or give them a flight? The temperature of our cellar is about 33 degrees in cold weather.
3. I must get some new bee-hives this spring, and would like to know which are the best. I had thought of getting the 10-frame dovetailed with T tin supers that could be used with any width sections. I haven't much time to attend to the bees.
4. Will a swarm be larger from a 10-frame hive than from an 8-frame?
5. Will a colony winter better in a 10-frame hive outside and also in the cellar?
6. I can't walk across the bee-yard without getting stung. How do you account for it?
7. Would a good drink of whiskey do any good?
8. To keep the bees from swarming should all the queen-cells be cut out after swarming?
9. Will bees swarm as often from a 10-frame hive as from an 8-frame? ILLINOIS.

ANSWERS.—1. Yes, only make sure that the bees have reached the honey.

2. Having had a flight in March they will hardly need a flight again till taken out for good, say when soft maples bloom, or later, if the weather does not seem warm and settled.
3. Your choice is good.
4. In general, swarms should be larger from larger hives, but there are exceptions.
5. Yes, for one who, as in your case, has little time to give them.
6. I don't know. Possibly you have a cross strain of bees which would be improved by getting a queen of gentler blood, and possibly you are a little rough in handling them, so as to keep them irritated.
7. I don't know how whiskey would affect bees, but if it works as it does on most men, it would only make them worse. If you were to drink the stuff yourself, I should expect the smell to anger the bees, but if you'd drink enough the stings won't hurt you—say enough to make you dead drunk.
8. You may keep them from swarming if you cut out all queen-cells but one before the first virgin emerges, or by cutting out all cells after piping begins.
9. As a rule, no.

Your tenth question relates to the reliability of a supply-dealer. That question is just a bit outside the scope of this department, but I feel safe in saying that no advertisement is admitted into the columns of the American Bee Journal unless it is believed that the advertiser is entirely reliable for what he advertises.

ANSWERS.—1. Yes, only make sure that the bees have reached the honey.

2. Having had a flight in March they will hardly need a flight again till taken out for good, say when soft maples bloom, or later, if the weather does not seem warm and settled.
3. Your choice is good.
4. In general, swarms should be larger from larger hives, but there are exceptions.
5. Yes, for one who, as in your case, has little time to give them.
6. I don't know. Possibly you have a cross strain of bees which would be improved by getting a queen of gentler blood, and possibly you are a little rough in handling them, so as to keep them irritated.
7. I don't know how whiskey would affect bees, but if it works as it does on most men, it would only make them worse. If you were to drink the stuff yourself, I should expect the smell to anger the bees, but if you'd drink enough the stings won't hurt you—say enough to make you dead drunk.
8. You may keep them from swarming if you cut out all queen-cells but one before the first virgin emerges, or by cutting out all cells after piping begins.
9. As a rule, no.

Your tenth question relates to the reliability of a supply-dealer. That question is just a bit outside the scope of this department, but I feel safe in saying that no advertisement is admitted into the columns of the American Bee Journal unless it is believed that the advertiser is entirely reliable for what he advertises.

ANSWERS.—1. Yes, only make sure that the bees have reached the honey.

2. Having had a flight in March they will hardly need a flight again till taken out for good, say when soft maples bloom, or later, if the weather does not seem warm and settled.
3. Your choice is good.

9. As a rule, no.

Your tenth question relates to the reliability of a supply-dealer. That question is just a bit outside the scope of this department, but I feel safe in saying that no advertisement is admitted into the columns of the American Bee Journal unless it is believed that the advertiser is entirely reliable for what he advertises.

ANSWERS.—1. Yes, only make sure that the bees have reached the honey.

2. Having had a flight in March they will hardly need a flight again till taken out for good, say when soft maples bloom, or later, if the weather does not seem warm and settled.
3. Your choice is good.
4. In general, swarms should be larger from larger hives, but there are exceptions.
5. Yes, for one who, as in your case, has little time to give them.
6. I don't know. Possibly you have a cross strain of bees which would be improved by getting a queen of gentler blood, and possibly you are a little rough in handling them, so as to keep them irritated.
7. I don't know how whiskey would affect bees, but if it works as it does on most men, it would only make them worse. If you were to drink the stuff yourself, I should expect the smell to anger the bees, but if you'd drink enough the stings won't hurt you—say enough to make you dead drunk.
8. You may keep them from swarming if you cut out all queen-cells but one before the first virgin emerges, or by cutting out all cells after piping begins.
9. As a rule, no.

That question is just a bit outside the scope of this department, but I feel safe in saying that no advertisement is admitted into the columns of the American Bee Journal unless it is believed that the advertiser is entirely reliable for what he advertises.

ANSWERS.—1. Yes, only make sure that the bees have reached the honey.

8. Is it best to remove the quilt and put the cover on or not?
9. If I paint the front of all my hives different, and have the hives about 2 feet apart, will the bees know their own hives? ILLINOIS.

ANSWERS.—1. Usually no treatment is undertaken until bees are busy gathering.

2. I don't know. The best way for one may not be best for another. Study up the plans given in your bee-books, and you may be able better than any one else to decide what is best for you. If you have had no experience, natural swarming may be best. If you decide on artificial increase, you will find it very fully treated in the book, "Forty Years Among the Bees."
3. It is not likely to occur, and yet it is perhaps possible that dead brood might be left in an outside comb over winter. Of course you understand that live brood may be found in the combs in March, and sometimes as early as January in your latitude.
4. Nectar should be yielding, so that there will be no need of feeding. If a sudden dearth should occur, a colony should receive a pint or more of syrup daily.
5. If you are at all careless about starting robbing, evening is the best time to feed, but with the Miller and some other feeders you may feed at any time unless you take special pains to start robbing.
6. It will vary greatly. In a flush season an experienced hand would increase to 30 or more. In a poor season an inexperienced hand will do well to hold his numbers without increase.
7. The larger the better. Some have the bottom removed entirely. My hive-entrances are 12 by 2 inches, and I should not like to have them smaller, and yet I have wintered bees well with one-fourth as large an entrance.
8. Just as well to leave all on till time to put on supers.
9. I don't know just how much difference it makes to have hives of different colors, but it is supposed that bees recognize colors; but if there is a space of 2 feet between hives there ought to be no trouble even with the same color, especially if trees or other objects help to mark location. You can do still better by putting your hives in pairs: 2 close together, a space of 2 feet, 2 together, a space, and so on. Contradictory as it may sound, the bees will have less trouble finding their own hives in this way than when no hive is nearer than 2 feet from its neighbor.

### Caucasian Queens Crossed with Cyprians

Where can I get Caucasian queens? I still have those mean bees, which no one dares to go near. I believe I have queened 3 times from the black bees to the present "hornets," and they get worse, it seems to me. Will a cross with Caucasians and these hornets (mostly Cyprian blood, I think) be a good stock? I must get gentler bees, or quit. SOUTH CAROLINA.

ANSWER.—I don't know where you will get Caucasian queens, but from what you say about your bees the probability is that they would be improved by a cross with Caucasians, or with anything else. Very soon you ought to find advertisements of different queens, and I would not be discouraged yet, even if previous attempts in changing blood have not brought desired results.

### Bees Hiving Themselves—Italianizing—Laws Against Spraying

I am an amateur bee-keeper—just bought the first 2 colonies of black bees in box-hives; and I have just received my second copy of the American Bee Journal, with which I also secured Prof. Cook's "Bee-Keepers' Guide" and Newman's "Bees and Honey." I want all the information I can obtain in regard to bees, and as I can not find all that I desire in the literature which I have, I want to ask a few questions.

1. I bought the 2 colonies of black bees merely to gain experience before investing heavily in Italians. I intend to use the Danzenbaker hive, as from what I can read I infer that it is the best for comb honey. If I place an empty hive near the old colony, will not the new swarm be quite likely to enter it of their own will, instead of flying off a long distance to a less desirable home in a hollow tree? If this plan has never been tried it may prove successful in a large percentage of cases, and, if so, it will save a great deal of trouble.
2. Has a bee-keeper in New York State any redress if a neighbor kills his bees by spraying poisonous substances into fruit-blossoms when trees are in full bloom?
3. Several apiaries have been entirely destroyed in this town in this manner. So many bee-keepers have given fruit-growing district that I concluded to try it. For this reason do you not think that I was wise to buy cheap, common bees to experiment with the first year?
4. If I meet with success with my small venture this year, what is your advice as to going into the business on a large scale?
5. Would you advise me to Italianize by introducing first-class queens? or would you entirely destroy all the common bees and buy full colonies of Italians?
6. If I introduce a first-class, high-priced Italian queen into each colony of the blacks, will they gradually merge into pure Italians, or will they be hybrids?
7. I can sell all the fine comb honey I can produce at a good price, if I have it in one-pound sections. Do you advise the use of the Danzenbaker hive for this purpose?
8. How many colonies of bees could I keep successfully on 5 acres of land covered with fruit-trees and clover?

I am entirely ignorant regarding bees and bee-keeping. I never owned a bee, nor had anything to do with them before in my life, and

I am entirely ignorant regarding bees and bee-keeping. I never owned a bee, nor had anything to do with them before in my life, and

I am entirely ignorant regarding bees and bee-keeping. I never owned a bee, nor had anything to do with them before in my life, and

I want to learn to attend to the business according to the latest improved scientific principles.

ANSWERS.—1. It would be a great convenience if bees would hive themselves when everything is made ready for them. Unfortunately, they are more likely to prefer a hollow in some place difficult of access, a mile or so away. I'm not sure that I ever heard of a swarm voluntarily entering a new hive (lots of such opportunities have been offered), although sometimes they enter a hive containing old comb.

2. Yes, I think New York State has a law against spraying, by which you can be protected.

3. It doesn't matter greatly. If you could buy Italians near home it would be better to begin with them. If you have to send a long distance, expressage is so expensive that you would better buy any kind you can get near home, changing the stock later.

4. Whether you make a big success or a failure this year, try it on a little larger scale next year. Better grow into the business than to

jump into it. If you succeed for about 2 years you can then grow very fast.

5. Whatever you do, don't think of destroying any beea. It may be right sometimes to kill a queen, but never a colony of workers, unless it may be badly diseased.

6. If you get a black colony to accept an Italian queen all her progeny will be the same as if you put her in an Italian colony. As soon as the black bees die off (and the life-time of a worker is only about 6 weeks in the working season) the colony will be full-blood Italian.

7. I prefer the regular Langstroth dovetailed hive.

8. Perhaps about 10 colonies, if you have each bee picketed so it can not get off the 5 acres. But if the bees are allowed free flight, so they can fly 2 miles or so in all directions, and there are no other bees in that distance, very likely you can keep 100 colonies successfully.

You're on the right track; do a lot of reading and thinking, and go at least a little bit slower than you think best at increasing.

**LOSS BY LICE**

**Reports and Experiences**

**Still Clear and Cold**

The weather is still clear and cold here, from 6 to 10 below zero every morning, and no sign of a change. There has not been a day since bees went into winter quarters that they could fly in the open air with safety.

IRA BARBER.

St. Lawrence Co., N. Y., March 17.

**Loss of Bees on Summer Stands**

I lost half of my bees the past winter by leaving them on the summer stands. I expected to put them in the new cellar, but did not have it ready in time. It will be all ready for next winter.

Please tell Cora L. Hazard for me that—

The roving bee is not the "he"—  
The "he's" the other fellow.  
And, Cora, dear, don't interfere  
With gathering gold-dust yellow;  
Nor steal her sweet of honey-bloom,  
Or "eh" will make you bellow.

H. W. CONGDON.

Monona Co., Iowa, March 20.

**Outdoor Wintering of Bees**

I have been looking over my colonies, and find that they are all alive except one, which is queenless. I have always wintered them on the summer stands, and have never had any serious loss. A year ago this winter most of the bees in this section were killed. I lost but 3 colonies at that time, and one died from lack of stores.

I shelter them from the cold west and north winds with a few bundles of corn-stalks. After every snow or wind storm that blocks the entrance, I see that it is opened. What they need is an abundance of fresh air. When I know they are getting that, outdoor wintering of bees has no terrors for me.

GEORGE MITCHELL.

Cook Co., Ill., March 6.

**Hard Winter on the Bees**

I always winter my bees on the summer stands, and they generally come through all right if they have plenty of stores. I put

**BEES A big stock ready to GO NOW QUEENS**

We wish to say that we are now loaded with a big stock of **Fine Bees and Queens** ready to mail now; no delay; send for what you need at once.

We breed the 3 and 5 banded Italians, Cypriacs, Carniolans, Holy Lands, and Albinos, in their purity, in separate yards from 5 to 30 miles apart.

Tested queens, \$1.25 each; Breeders, \$3 to \$5 each. Untested, from either race, 75 cts.; 6 for \$4, or \$7.50 per dozen.

Full colonies, 1, 2 and 3 frame Nuclei cheaper than you ever bought good stock for before. No better to be had. Write for price-list **FREE**.

Safe arrival and perfect satisfaction guaranteed or your money returned. Prices of Queens to dealers, or in large lots on application.

We can sell you **BEE-HIVES** of yellow pine at about half the cost of white pine goods. Get our prices before you buy.

them away last fall in better condition than usual, but it turned very cold, and I don't think the ground was clear of snow for two months. About half of the bees ate all of their honey, and were dead when it got warm enough for them to fly out again. I think we had more snow this winter than in any other 3 winters put together.

I had 45 colonies when swarming-time was over last season, but I doubled up some and killed 3 for the honey. I did not get any surplus last year, but I thought the bees had plenty for winter stores. I now have about 21 colonies, having lost 13. I think the cold weather caused them to eat their honey up so fast.

I think the "Old Reliable" has improved this winter. (Guess it's the cool weather.

J. K. HUNTER.

Overton Co., Tenn., March 4.

Shipping and Selling Comb Honey

EDITOR YORK:—From some quite expensive experience I have had the past winter I want to say that you and Mr. Muth have each overlooked the one thing (see page 227) that caused the lot of honey to arrive as it did, namely, the cold weather.

Early in December I had occasion to ship by express, 28 miles, 56 cases of comb honey, crated. It was loaded very carefully, and I was at the unloading point to deliver it to the dealer. It was hauled on a spring wagon, and properly loaded, yet there were some broken

PHONE NEWS FOR FARMERS

GREAT ACTIVITY AMONG FARMERS

Everywhere farmers are awakening to modern ideas.

Just now there is great activity among farmers in establishing and building telephone lines all over this country. The telephone saves time in getting help in a hurry; keeps the farmer in touch with the markets at all times, and in case of emergency gets assistance from neighbors or the city without delay. The building of private and party lines has been so simplified and cheapened by the introduction of

Stromberg-Carlson Telephones

that every neighborhood, no matter how small, can well afford its own telephone line.

For farmers lines none but the best telephones will do—instruments that are practically perfect, that do not require constant adjusting and "tinkering" to keep them talking right. There are many telephones offered to farmers that are actually not fit for such service. It pays to get good instruments at the start. Stromberg-Carlson Telephones meet every need of the farmers line. Write for book F #9 "Telephone Facts for Farmers" how to organize your neighbors and build a line. Ask for book #9 telling how successful lines have been built.

combs in the front rows of sections, when unloaded from the express car and more of them when unloaded from the express wagon. The honey was frozen.

I have shipped thousands of pounds of crated honey in warm weather with no damage, at distances of 400 to 1300 miles.

The moral to both Mr. Muth's letter and this is, *Don't* ship comb honey during freezing weather.

With reference to L. V. Rickett's article, (page 229) I wish to say this:

In my locality we have trouble in getting 4 1/4 x 1 3/4 sections to weigh enough so that 24 No. 1 sections will weigh 22 pounds, on an average, when placed between separators while the honey is being built. Across the country 8 miles from here the bee-keepers must use sections of 1 3/4-inch width in order to keep them from weighing over 23 pounds per case of 24 sections.

As our market demands an average of 22 pounds per case of 24 sections of No. 1 honey, will Mr. Ricketts please name one size of section for those two localities?

Notwithstanding the fact that Mr. Ricketts has had far more experience in retailing honey than I, I can't help believing that when a customer buys a light section of honey by weight, and pays according to the weight he gets, that customer is satisfied with his purchase; in fact, many prefer a light-weight section, as it costs them less (when bought by weight), and is plenty for the occasion for which it is bought.

I believe in putting honey up to suit the large buyer, but want honey sold by weight so far as the bee-keeper and retailer are concerned. Let the middlemen do as they see best.

LEO F. HANEGAN.

St. Croix Co., Wis., March, 24.

[Of course, it is well known to all who have had any experience that it is extremely risky to ship comb honey at all in very cold weather, on account of the great brittleness of the comb when cold. But whether shipped in warm or cold weather, it is best to have comb honey packed properly, so it can be handled with as little danger of breakage as possible.

 CINCINNATI ... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

## Honey and Beeswax

CHICAGO, March 8.—There has been somewhat of an increase in the number of sales during the past 4 weeks, yet the volume has not been large, while prices are if anything lower than in January, especially on other grades than white clover. Fancy grades of white comb bring 12½@13c; No. 1, 12c, with some off in color at 11@11½ cents; amber grades slow at 8@10c. Extracted, white, 6@7c; amber, 5½@6½c; the price being governed by quality, flavor and package. Beeswax, if clean and good color, 30c per pound. R. A. BURNETT & Co.

NEW YORK, March 11.—There is no improvement in the comb honey situation. The demand is next to nothing; quotations nominal and no doubt some of the stock will have to be carried over. We quote fancy at 13c; No. 1 at from 11@12c, and dark at from 9@10c. Extracted is in fair demand: White at from 6@6½c; light amber at 5½c; Southern in barrels from 50@57c per gallon, according to quality. Beeswax firm at 29c. HILDRETH & SEOLKEN.

BOSTON, March 9.—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality. BLAKE, SCOTT & LEE.

KANSAS CITY, March 31.—The honey situation does not improve. While there is a little better movement the prices seem to be lower. Fancy white brings \$2 a case; No. 1, \$1.75; amber and lower grades from \$1.25 to \$1.50. Extracted, 4½@6c. Beeswax, 28c. C. C. CLEMONS & Co.

CINCINNATI, O., March 20.—The comb honey market has been a drag the last month; this caused the holders to offer extra inducements in prices. Quotations obtained are as follows: No. 1 fancy water-white comb, 12@13c; No. 2, 10½@11½c. Extracted: white clover in barrels, 6½c; in cans, 7½@8 cents; amber, in barrels, 5½@5¾c; in cans, 6@6½c. Beeswax, 27c. C. H. W. WEBER

PHILADELPHIA, March 22.—As the season advances, the call for honey is decreasing, and the market at the present time is dull. Some few sales. We quote: Fancy white, 13@14c; No. 1, 11@12c; amber, 11c. Extracted, white, 6½@7c; amber, 5½@6c. Beeswax, 28c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

ALBANY, N. Y., Feb. 8.—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted,

better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

CINCINNATI, March 10.—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6½c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c.

THE FRED W. MUTH CO.

SAN FRANCISCO, March 22.—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Inquiry is not brisk and market is easy in tone, especially for other than most select water white. Spot supplies are not heavy, but there is a general desire to effect a clean up of holdings in the next 60 days, as by the end of that time new crop honey is likely to begin to put in an appearance.

Good VIOLIN OUTFIT for **\$2.50**

A good substantial Violin in a heavy, well-made pasteboard case, including Bow, Rosin, Pitch Pipe, Mute, Set of strings, etc.

We make the broad claim for this outfit that no retail dealer in the land can duplicate it for less than double the price we charge. And when we say "a good substantial Violin" we mean just what we say. It is not a toy or plaything, but an instrument well made, built to produce music, and just the thing for the beginner. Has good clear tone and will be a big surprise to any one wishing a violin.

Write for one, also ask for our free catalogues of "Everything Musical" from the cheapest to the best, for the Band and the Orchestra. If you want a violin costing anywhere from \$25 up, we will send you 5 to select from. We carry an immense stock; being importers and wholesalers, we can supply any demand at prices that mean money saved to buyers. Sheet music catalogues mailed on application. Bargains in SECOND-HAND and shop-worn instruments; send for list. Address

H. E. McMILLIN, 108 Superior St., CLEVELAND, OHIO

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. THE A. I. Root Co. October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

We trust the same will be continued to our successors in the business.

GEORGE W. YORK & Co.  
Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

## Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

## Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

## Terms.

Our terms are cash with the order. We pay cash for material, and pay our

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

## Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

## Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

# DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

## The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

### QUALITY

You can produce better-looking honey.

### QUANTITY

You can produce more of it.

### PRICE

You can get more per pound for it.

### SPECIAL NOTICE.

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything JUST RIGHT, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

Address all Orders, Remittances, Inquiries, etc., to

Vol. XLV.—No. 15.

## Editorial Notes and Comments

### The Honey-Producers' League

In last week's issue we devoted much space to this new organization for bee-keepers, which, it is hoped, will prove to be a valuable one. As its Constitution says, its objects are to create a larger demand for honey through advertising, and also to counteract the evil influence of misrepresentations of honey by correcting them.

It was stated that when there is \$5000 in the League's treasury, the advertising would begin. Last week we reported already over \$1000 on hand. And this week we have more to report. It is hoped that by May 1 the full initial amount will be in hand, so that operations may be commenced.

To show how The Honey-Producers' League is being received, we give herewith a few extracts from letters received by its Manager:

The plan of the League meets our entire endorsement.—THE KRETCHMER MFG. CO.

We must say that such a thing has long been needed, and we trust it will do a great deal of good.—JOHN DOLL & SON.

I believe the project is a good one; at least it is worth giving a good trial.—E. WHITCOMB.

We think The Honey-Producers' League a commendable undertaking, and should be glad to lend what assistance we can.—W. T. FALCONER MFG. CO.

I think The Honey-Producers' League is a move in the right direction, and its work, to be most helpful to honey-producers this year, should begin at once.—(MRS.) CLARA WEST EVANS.

The Honey-Producers' League Prospectus and Constitution just at hand. I have shown it to Mr. Clark, and he, with myself, think we would better throw our lot in with it.—G. M. DOOLITTLE.

We might give more such expressions, but the fact that people are putting in their dollars is proof enough that they believe thoroughly in the proposed work of the League, and want to put "their shoulders to the wheel" and thus help move things. It ought to have 1000 members by May 1. Like every other organization, The Honey-Producers' League has a few objections to meet. But such should not discourage any one.

In the first place, let us say that none of its originators for one moment thought that it was to take the place of the National Bee-Keepers' Association. The National has done a great work, and still has much to do. It is a social organization also, while the League is all for business.

The Manager has received a very few letters saying something like this: "When the League gets ready to advertise, let us know, and we will send in our dues." Or, "When the League has nearly the \$5000 to start advertising with, I will send in my annual dues." But we do not see why some should pay their dues right away and others be waited on. *Everybody* should pay *at once*, so that the necessary \$5000 will be on hand quickly. Surely, if some have faith enough in the League to have paid their \$25 or more already, it would seem

that others whose dues will not be more than from \$3 to \$5 should pay promptly also.

It has been suggested that those who do not become members of the League will reap as great benefits as those who join and pay their money. Hardly. They will really suffer from the feeling that they have failed to live up to their duty and privilege. This is a work in which *all* should co-operate. The expense is not great, but the prospects of good returns are inestimable.

### Spring Troubles with Cellared Bees

Spring is especially the time when the cellarer envies the man who need not give a thought to the question of the right time to take out his bees because they have never been taken in. Often there is a painful uncertainty as to whether bees should be taken out or not. If one could only know what is before one in the shape of weather. A bee-keeper in Northern Illinois writes:

"How the seasons do vary. One year we had deep snowbanks still left the last of April. This year we have the appearance of spring fully established in March. For days it has been mild; March 23 the thermometer stood at 75 in the shade, while in the cellar it was 62, with the bees roaring in a distressing manner."

"But why did the man leave his bees in the cellar when it was so warm?" asks a man in the South. That's just the trouble; he doesn't know what is to come, and if he puts his bees out he may have to wince under two weeks of freezing weather. So he thinks,

"Better to suffer the ills we have  
Than fly to those we know not of,"

and leave his bees in the cellar till a little more sure warm weather has come to stay. There may be no more severe weather, and there may be a lot of it, and how is he to tell?

It might help matters a little if we could have a decided answer to the question whether or not it is wise toward spring to take bees out for a flight and then return them.

### Another Comb-Honey Misrepresentation

In the New York Tribune for Feb. 19, it was stated that "honey is also adulterated in the comb, the comb being made in part of paraffin and saturated with a mixture of glucose and syrups." A protest was sent in by the American Bee Journal, and no doubt by a number of others. The Tribune of March 5 gives a letter from Editor Root, of Gleanings, and a reply thereto, the whole occupying about a column, but in that column there is no hint of any modification of the statement—only pains taken to justify it.

It is not likely that so able a periodical as the New York Tribune is desirous to mislead or misstate, and the probability is that when the statement was made it was believed to be correct. Having been made, it is only human nature to give full weight—and a little undue weight—to anything found to favor such statement. After giving proofs that it probably believes are satisfactory, it concludes by saying:

In offering his reward of \$1000, Mr. Root specifies in his letter that the comb honey must be shown to have been "manufactured out of paraffin by any mechanical process known to science or the arts, filled with glucose, and put on the market as comb honey." Such specifications are of course prohibitive. He demands that a wholly artificial product be brought to him. No one says that comb honey can be completely counterfeited. Adulterations are not wholly spurious. Adulterated olive oil is not all cottonseed oil. It has been shown, however, that honey may be adulterated in the comb with glu-

case; that combs may be artificially formed by furnishing the bees a foundation; that this foundation may be adulterated, and that paraffin is one of the chief adulterants.

In the reward card which Mr. Root sends out, and which he says in his letter he has "published for the last 15 years," he still further safeguards himself with conditions. The reward is only for one "who will furnish evidence that comb honey has been manufactured, filled with honey and capped by machinery, or who will furnish information of any place where comb honey is manufactured by machinery—in either case the product imitated so closely as not to be told from the genuine."

Comb honey sold "in the frame," of which The Tribune made no mention, is uniformly pure in this country. Nevertheless, honey-makers should appreciate that it can only remain so by constant watchfulness. They should welcome instead of criticise any public discussion of the subject. The art of adulteration is on the increase in this country, and is aided by every new discovery in the sciences. As Dr. Wiley says:

"The true friend of the apary interests of the country is not he who shuts his eyes to patent adulterations, but rather he who recognizes facts, even unpleasant, and who, having seen the enormity of the extent of honey-adulteration, supports the labors of those who seek to detect and prevent it."

Bee-keepers as a class are an intelligent set of men (and women), and as such they are not likely to close their eyes to facts, unpleasant though the facts may be; but they do desire that what are given as facts shall not directly or by inference give impressions that are false. One trouble in the case is a lack of thorough knowledge on the subject. The proof of that lack lies in the phraseology used in some parts of the discussion, and also in the arguments used. In all fairness it should be said that The Tribune has been no doubt misled by statements made by those supposed to be good authorities, which statements would probably not have been made just as they were by any fully familiar with the entire facts.

Even with this admission it is a little difficult to admit the relevancy of a passage like the following:

That the honey-comb, as well as the contents of its comb, may be more or less artificial is a well established fact. Dr. Wiley speaks of 15 patents that have been issued for the manufacture of artificial comb and comb foundation. One is described as follows: "The comb is made complete of a web of paper, cloth or suitable material, which, after moulding, is saturated with melted wax. The excess of coating is thrown off by a centrifugal machine. The advantage arising from my invention, says its author, 'is that combs constructed accordingly can be filled and emptied repeatedly without breaking, the honey being extracted by means of a centrifugal machine, or as commonly done with other honey-combs when it is desired to use them a second time.'"

Another patented method, according to the inventor, will produce a comb in every respect resembling the natural comb built by bees. "This comb," says the inventor, "may be placed in the hive and will be used by the bees, thus saving the insects the labor of building combs and causing them to spend the time otherwise appropriated to this work in the gathering and storing of honey."

It is in these comb foundations, these artificial layers of wax, which some apiarists place in the center of the frame for the bees to build on, that opportunities are offered for adulteration.

Now what has that to do with the case in hand? Supposing its relevancy, what about its reasonableness? Imagine "a web of paper or cloth" moulded in the form of a complete comb! Pretty thin cloth would be needed to be no thicker than the thin cell-walls of a honey-comb. And how could it possibly be so molded? Would there not be some danger of tearing the cloth before it could be stretched or squeezed into the right form? Then when the complete form is moulded, it is to be saturated with melted wax! Can you imagine such a structure being dipped in wax hot enough to saturate it without the collapsing of the cell-walls? And suppose there is no such collapsing from the immersion in hot wax, in what shape would the fabric be when "the excess of coating is thrown off by a centrifugal machine?"

All this sounds very funny to a bee-keeper, but very likely thousands have soberly read it in The Tribune without seeing anything funny about it. Can The Tribune or Dr. Wiley furnish a sample of anything of the kind? The fact that a claim has been made for it is not greatly to the point. A lunatic may conceive any absurdity and claim a patent from the patent office.

The second patented method produces "a comb in every respect resembling the natural comb built by the bees"—note well, "according to the inventor." It is safe to say there would be no such resemblance "according to" Dr. Wiley or "according to" the editor of The Tribune. Equally safe to say that neither of them have ever seen anything of the kind, nor any one else.

Prof. M. A. Scovell is reported as saying: "No. 103, labeled 'Choice Comb Honey,' is another instance of the sale of comb honey which is a mechanical mixture of the comb with glucose." That probably has reference to honey in glass, a piece of comb honey being

put in and the jar then filled with glucose. Several other cases are reported that seem to be of the same kind. That sort of fraud is well known, but what has that to do with adulterated comb honey? So far as has ever yet been reported, the piece of honey put in is genuine comb honey, the only fraud in the case being the glucose that is poured around it.

Some pains is taken to prove that beeswax is adulterated, a thing well known, but, "according to Dr. Wiley, no comb foundations have been obtained by his men in the United States which were found to be adulterated, but he publishes a letter from a Canadian chemist which avows that it can be done." It doesn't need a letter from a Canadian chemist to show that foundation may be made of adulterated wax, any more than it needs a foreign letter to show that sugar and sand may be mixed, but it is a compliment to United States manufacturers of foundation that Prof. Wiley has not found that they have been guilty of adulteration.

The passage that has the most direct bearing on the case comes earlier in the editorial, and is as follows:

When Mr. Root said that this statement "is absolutely untrue," he was no doubt unaware that it was founded on various government reports. That some honey is adulterated in the comb is a fact stated in Part 6 of Bulletin No. 13, issued by the Department of Agriculture, Division of Chemistry, Feb. 23, 1892. As a result of a thorough analysis Dr. H. W. Wiley, chief chemist of the department, in that report said: "Many samples of comb honey containing only glucose have come under my observation, but in all these cases the combs, presumably after the separation of the honey by centrifugal machine, had been placed in glass bottles and the glucose then added. I have never yet found a sample of comb honey, sold in the frame, which was artificial, except in the use of comb foundation."

In The Tribune's article no mention at all was made of comb honey sold "in the frame." The exact words used were, "honey is also adulterated in the comb," which is accomplished, as Dr. Wiley explains, by expelling the honey from the cells by means of whirling it about at a high rate of speed, and then placing the empty comb in bottles where the glucose is added.

The idea of filling an empty comb with glucose by plunging the empty comb in a bottle of glucose makes a bee-keeper gasp. "Presumably." By the same token, "presumably" Dr. Wiley never found a piece of spurious comb honey in a bottle of glucose. "Presumably" it was genuine comb honey surrounded by glucose, or simply a piece of honey-comb immersed in glucose.

Emphasis is laid upon the point that no mention is made of comb honey sold "in the frame." But is it supposable that the genius which could produce a piece of comb honey out of the frame not distinguishable from the genuine would balk at the task of putting it in the frame? And whatever may have been said, or not said in the former article in the editorial before us, the general reader will find ground for believing that spurious comb honey may be found "in the frame," when he reads in a passage already quoted that it is in these artificial combs "which some apiarists place in the center of the frame for the bees to build on that opportunities are offered for adulteration."

Yet suppose that The Tribune knows that all section honey, or as he puts it, that all honey "in the frame" is genuine, when he says "honey is also adulterated in the comb," whatever reservations may be in his own mind, the impression made on the mind of the general reader will be such as to make him conclude that any sample of comb honey may be adulterated.

In the passage quoted, The Tribune, speaking of Mr. Root's \$1000 offer says, "Such specifications are of course prohibitive." In the light of what has been advanced by The Tribune, let us see how much there is prohibitive about them. There is a method which "will produce a comb in every respect resembling the natural comb built by the bees." The material used is not specified, but if such comb can be made of beeswax it can be made wholly of paraffine. Then "placing the empty comb in bottles where the glucose is added," we have the comb honey entirely artificial, complete all but the sealing, and surely The Tribune would not ask Mr. Root to accept as a marketable article a sample of comb honey not capped over. True, it is not "in the frame," but the specifications do not require that it shall be "in the frame." The specifications were meant to be prohibitive, are prohibitive, as is proven by the fact that no one has ever yet been able to lift the reward, but there is nothing unfairly prohibitive in them, as The Tribune will find if it can "deliver the goods."

Among the bee-keeping readers of The Tribune there may be those who will vote the editor lacking in intelligence, and some perhaps will call him dishonest in his statements. There is no proof that he is either. His position is sufficient warrant for the belief that he is a man of exceptional ability and intelligence, sincerely desirous to get at the truth, and perhaps the last man to be willing to do an in-

justice to an honest industry; but with the testimony before him, in a field with which he was not entirely familiar, he no doubt felt warranted in concluding that it was a more or less common thing to find on the market that which was sold for comb honey that was not genuine comb honey at all.

Let him do a little investigating on his own account. Let him make the effort to find a single specimen of comb honey that is not genuine, no matter whether "in the frame" or not—waive that—it ought not to be so very hard for him to secure it if such a thing is to be found at all; and when he has concluded his search he will no doubt be ready to say, "Comb honey, whether sold in the frame or out of the frame, is uniformly pure in this country." If, however, he should succeed in finding a bogus article of comb honey, let him send a sample to this office, and he may rest assured there will be no blinking of the truth, but the facts will be stated in all their glaring unpleasantness.

**Apiarian Representation in Australia**

Increase of colonies increases a man's voting power in the New South Wales Bee-Farmers' Association, according to the Australian Bee-Bulletin. If he has only one colony he has one vote, and the same if he has 50 colonies, but each additional 50 colonies after the first 50 gives him an additional vote. With 100 colonies he has 2 votes; with 500, 10 votes; and with 1000, 20 votes.

**Contributed Special Articles**

**How to Rear Early Drones and Queens**

BY G. M. DOOLITTLE.

**A** CORRESPONDENT wishes me to tell through the columns of the American Bee Journal how he can rear early queens before the drones from his neighbors' hives get to flying. He says that he has hives in the cellar which have drones in sight through the glass that is on one side, and wants to know if those drones will be good in the spring; and, if not, how he will get the early drones.

First, I wish to say that I doubt the wisdom of working for very early queens—that is, trying to rear queens before there are any flowers in bloom, or before the colonies become strong enough to have the hives nearly filled with bees and brood, and by that time his wintered-over drones will be dead. All my experience goes to prove that such queens, reared out of season, are of very poor value, so much so that we would better sacrifice somewhat as regards purity rather than have pure queens of poor quality. But if one is anxious to rear queens just as soon as it can possibly be done and have them reasonably good, then I find the following course the best of any I have been able to find:

Select the queen you wish for your drone-breeder in the fall, and give to her colony the bees from some moderately strong colony during the month of September, having killed the queen in this latter colony a week or so before uniting. See that there is a drone-comb in the center of this united colony, and that they have plenty of honey to carry them over the winter and give them a good start in early spring. As soon as out of winter quarters see that the hive is made as warm as possible, and give them a feed of about a half pint of warmed syrup every night in a feeder. For this purpose a division-board feeder is rather better than any other, for it can be brought right up to the cluster, and the warmed feed poured therein will enable the bees to take the feed no matter if the weather should be quite cool. And if you will take a few bees from some other colony and unite them with this one, by keeping them confined in a box for one or two days, feeding them all they wish for those two days, and then just at night let them run down from the top through a little hole in the covering to the hive, and unite with the drone colony, this will help much toward the early depositing of eggs in drone-cells.

As soon as you have capped drone-brood in this colony it will be time to commence to rear queens. But before beginning on this part I wish to say that you will need to keep up the feeding of the drone colony during every cold or rainy spell of weather, or at all times when the bees can not get a supply of nectar from the fields, otherwise you may find your drones all driven out or killed off some day, for very early drones are often given their "walking ticket" on short notice if any failure in the supply of a daily ration of stores occurs. I suppose this is because the bees know that drones are not needed at this early season of the year.

Being assured that your drone part is a success, select the very strongest colony you may have, and this colony should have its hive as nearly filled with bees and brood as possible. Having such colony look over the frames till you find the queen, when you will set the frame having her on in some box or empty hive while you are fitting in a sheet of queen-excluding metal near the center of the hive, having this sheet fit so close that it is impossible for any bees to get around it in any place; otherwise the queen may get in the side where you are rearing queen-cells and destroy them all.

Having the queen-excluder in place, put that part of the brood which is the youngest on one side and the older brood in the other, and then place the frame set out and having the queen on it in the other side. Now leave them for 24 hours, when you will take one of the frames out from the side having no queen and put it in some other hive for them to care for, if it has brood in it. If only honey it can be set away anywhere after getting the bees off it, which should be done in either case, as we wish all the bees in this queen-rearing hive possible.

Now prepare a stick of cell-cups from your best breeder,

**Miscellaneous News & Items**

**A Bee-Department that Means Something.**—Agricultural papers are more or less in the habit of publishing in what purports to be a bee-department, items containing errors that even a novice in bee-keeping instantly detects, raising the question, If bees are of enough importance to demand attention, are they not of enough importance to have some one of practical knowledge about bees to have a supervising care over what is said about them? A pleasing exception is found in the case of "Irrigation," of Denver, Colo., a monthly agricultural journal of high order, beautifully printed and illustrated, which, in its January number, gave a displayed announcement on its title page that with that number began a bee-department to be edited by no less an authority than our old friend, R. C. Aikin. More power to his pencil.

**The Apiary of M. W. Harrington, of Iowa Co., Iowa,** appears on the first page. When sending the picture he wrote thus:

The hive in front is an observation hive with glass sides, which are covered with wooden shutters as shown in the picture. For convenience in handling and shading I have used the straight rows, more or less crowded, for 25 years. While I think I lose a few more queens by crowding this way, it a good deal more than makes up for loss in the handling, shading, stands, etc. M. W. HARRINGTON.

**Conrads' Stand.**—On the first page are two views of a stand used by Wald. C. Conrads, of Comal Co., Tex., who describes it and its use as follows:

I send two views of a stand that I use for holding supers, covers, etc., while painting. Any bee-keeper can have one made by a blacksmith. Take 4 iron rods about 15 inches long by 3/8 thick, and have them welded together about 3 or 4 inches at one end; then bend them apart so that they will be a little wider than the inside dimensions of the supers; then split them at all four corners about 1/2 inch, and bend these two points at right angles, so that the projections pointing upward will just fit into the inside of the supers or hives, while the projections pointing sidewise will support the supers or hives.

This same stand is very convenient for painting covers or bottom-boards, but if used for this purpose the projections pointing upward should all be filed to one level, so that the covers or bottom-boards may rest on them while being painted.

The rest of the stand is made of wood, and in the middle of the center piece a hole is bored so that the 4 iron arms will fit into it where they are welded together; however, this point should be drawn out a little.

When painting covers or bottom-boards, place always a match or toothpick on each corner, and you will have no trouble with having them to stick together; that is, when you stack them away after painting.

It may also be of interest for those using frames end-spaced by staples, to know that it is much more convenient to put in the staples before nailing up the frames. Just keep the V edge of the end-bars toward you when driving in the staples, and you will have them all right when nailing up the frames. WALD. C. CONRADS.

as given in "Scientific Queen-Rearing," and place the same in the space left by taking the frame out, when the bees will go on and perfect them just the same as they would in a well-stocked two-story hive later on, according to my experience of later years. But I like the two-story plan the best when colonies become strong enough so that can be used, as it costs less work in rearing queens where one colony is used to do this work the whole season through, as is generally my custom.

As soon as the queen-cells are ripe prepare nuclei to receive them; or, if you wish to supersede your old queens with these cells, or with queens from them, kill the old queens from 36 to 48 hours before the cells will be ripe enough to remove from your breeding colony, which will be in 11 days if you have used very small larvæ, or 10 days if larvæ as old as 36 hours were used when the cells were started. It is better to make a colony or two up into nuclei if possible rather than keep all the colonies without a laying queen from 10 to 15 days while the queens from these cells are becoming laying mothers, as the rule is that the queen from the ripe cell will emerge in from 5 to 15 hours after the cell is given the colony, then it will be 7 to 9 days before she mates with the drone, and from 2 to 3 days more before she goes to laying. And during these 12 to 15 days from the time of the killing of the old queen till the queen from the given cell gets to laying, the old one, if not disturbed, would lay eggs enough (the same giving bees which would be on the stage of action in just the right time for the honey harvest) to make all the difference between a good crop of honey and a poor one.

By breaking up 2 or 3 colonies for nuclei the old queens can be allowed to lay right along till the young ones are laying, and then by the Simmins' plan of direct introduction, no time of the rest of the colonies is lost.

Of course you will know that the colony rearing cells will want to be fed liberally at all times that nectar is not coming in from the fields, for upon this "plenty of food" hangs all the difference between good and poor queens.

Onondaga Co., N. Y.

## Improvement in Queen and Drone Traps

BY C. H. DIBBERN.

**D**URING the past 12 or 15 years I have experimented a great deal with various queen and drone traps of my own construction, for the purpose of hiving swarms. So well have I succeeded in improving the Alley trap that I feel that bee-keepers generally ought to have the benefit of my invention.

Now in pointing out my improvements, I do not wish to run down any existing traps, as, no doubt, many are suc-

ceeding fairly well with them. I have often wondered why more bee-keeping farmers, clerks and ministers who can give only a very small part of their time to the bees, were not using traps to manage swarming. Perhaps the fact that they were patented, and the cost had something to do with it. But, as a matter of fact, they were invented to catch drones, and it was only incidentally found that swarming could also be controlled, that they were used for that purpose.

Some of the improvements I claim for my trap are as follows:

First, it is far better ventilated, and will not cause the bees to fill the trap full of bees and "lay out," unless they would without any trap. This is done by making them larger, using more zinc, and not having the bottom piece come so very close to the hive-entrance.

Second, having the tube-holes in the middle strip within  $\frac{1}{4}$  inch of the front zinc, with the lower side beveled off so as to leave no square edge between the zinc and the tube-holes for the queen to follow, preventing her from getting readily into the trap part.

Third, the upper part of the trap is made entirely of

perforated zinc except the ends, thus making it very easy to see the queen when trapped.

Fourth, the sliding door in the rear zinc, enabling one to release the queen without removing the trap from the hive. This is a decided improvement over a "gimlet hole" through one end of the middle strip, for when the swarm is entering the new hive, and you wish to release the queen, she is trying to get through the lower rows of perforations in the rear zinc.

Fifth, the rear zinc extends about an inch below the strip containing the tubes, which is to prevent the bees from "boiling over" when rushing from the hive in swarming; thus obviating the danger of getting the queen in behind the trap.

Sixth, the trap is provided with right and left wire-hooks and small screw-eyes to fasten it firmly to the hive, preventing it from tipping forward if the alighting-board is inclined forward, or working away by wind or bees, as it is liable to do if not fastened.

Sixth, the traps are nicely made, and painted white; this makes them look neat, last longer, and enables one to see all parts in the trap.

In a future article I will try to describe how I use the trap in an apiary of 150 colonies, as well as a general system of management. I believe there are many people that would find bee-keeping easy and profitable with this trap.

## Report of the Michigan State Convention

BY E. B. TYRRELL, SEC.

(Continued from page 231.)

### HOW MANY COLONIES IN ONE PLACE?

"How many colonies can be profitably kept in one locality?"

E. D. Townsend thinks 80 or 90 colonies.

Mr. Kirkpatrick has had 160 in one place, and did not think the locality overstocked. He averaged about the same with 160 as with 60.

O. H. Townsend has 225 in one place, and thinks some years 400 colonies would not overstock a locality. With 225 colonies in one place, he did not find a bee 2 miles from home during clover bloom.

Mr. Kirkpatrick did not find a bee  $\frac{3}{4}$  mile from home during raspberry bloom, and 225 colonies were in one place.

Mr. Root reported keeping 500 colonies in one place, but thought the place overstocked.

Mr. Manley says in his locality there were 585 colonies in a distance of 4 miles, and he did not consider the locality overstocked during a clover flow.

Mr. Bingham says bees gather honey freely only about two hours during a day, hence he does not believe a locality can be overstocked during a good honey-flow.

Mr. Cady says localities vary in that respect.

On motion the Secretary was voted \$10 for his services during the past two years.

On motion the Secretary's and Treasurer's offices were united.

The election of officers was then held with the following result: President, W. Z. Hutchinson; Vice-President, Geo. E. Hilton; and Secretary-Treasurer, E. B. Tyrrell, of Davison.

### PRODUCING EXTRACTED HONEY.

"In producing extracted honey how much should be sealed before extracting? How do you uncapp?"

Mr. Huff extracts after the honey harvest, whether capped or not.

Mr. Kirkpatrick thinks four-fifths should be capped. He is not so particular at the end of the season.

E. D. Townsend extracts 10 days to 2 weeks after the season whether sealed or not, but prefers the sealed. He uses  $1\frac{1}{4}$ -inch spacing, and uncaps very deep.

Mr. Manley uses two tubs for an uncapping-can, one tub being cut down half way, then a screen bottom is put on the shallow tub. Now he slips the shallow tub into the deep one, and can uncapp one-half day in this tub. He then

empties the cappings in a larger tank with screen bottom, and leaves them to drain one week.

O. H. Townsend does not extract clover honey until the beginning of the basswood flow. Then he stores the honey in a warm room for two weeks, and all unsealed honey will then be ripened. Then he extracts.

Mr. Bleach extracts at the end of each honey-flow.

The pamphlet discussion was then taken up, with the result that it was decided to get out a much larger edition and try to send one to each grocer in Michigan; also to advertise in a good grocery paper. Some copies will be sent to each member and one to each honey-dealer. It was also decided to insert the names of all members whether they had honey for sale or not. An edition of 5000 was advocated.

CANNING NEW EXTRACTED HONEY.

"Do you think that extracted honey should be canned up air-tight before the natural heat is out?"

O. H. Townsend had no experience in that, but should prefer to let it stand before canning.

Mr. Beecham stores in tanks, then draws clear honey from the bottom.

EXCHANGING SUPERS.

"Is there any advantage in changing supers from one hive to another to secure more rapid storing and completion of sections?"

Pres. Hutchinson thinks there is in some cases.

Leonard Griggs says it pays any bee-keeper to manage all possible ways to get bees to enter supers. He changes supers, also uses bait-sections.

Mr. Aspinwall doesn't want to go to that trouble. He said his hives don't need it.

Pres. Hutchinson advocates moving bees and all when changing supers.

Mr. Beecham places one section of drawn comb in each corner of the super.

Mr. Aspinwall thinks it better to put drawn comb in the center.

Mr. Manley puts the drawn comb in the center for bait-sections, but to get unfinished sections filled he would put them at the outside during the flow. He advocates running for extracted honey at both ends of the flow, so as to get the bees started in supers quicker, and also to have no unfinished sections.

Mr. York then being ready to announce his decision of the winners of prizes, they were given as follows:

Best 10 pounds of extracted honey—1st, W. E. Forbes; 2d, W. D. Soper; 3d, C. A. Huff.

Best 10 pounds of comb honey—1st, Oscar Smith; 2d, J. W. Fileman.

Best 10 pounds of comb honey produced in Danzenbaker hive—1st, W. E. Forbes.

CLEANING SECTIONS—PROPOLIS.

"Who has tried sandpaper rolls for cleaning propolis?"

Mr. Aspinwall says it is not satisfactory as it fills up too much.

"Is there any use to which I can put the propolis scraped from the hives?"

Mr. Aspinwall said it has the best flux for soldering lead pipes one can get.

O. H. Townsend said, to separate propolis from the wax, put all in water and the propolis will sink while the wax floats.

HIVE BOTTOM-BOARDS.

Mr. Soper asked for a talk on bottom-boards, and the following discussion was brought out:

Mr. Beecham prefers a removable reversible bottom with 7/8-inch entrance.

Mr. Soper asked if the members practice reversing the bottom-boards.

Mr. Beecham thinks reversible bottoms preferable.

Mr. Woodman prefers bottoms with 7/8-inch entrance.

Mr. Griggs prefers 3/8-inch for summer and winter, and 3/4-inch for spring and fall. He likes a hinged bottom-board.

Mr. Soper believes bees do as well with a small hive-entrance. He has had good results with an entrance 3/4x3 inches.

Mr. Griggs says his bees did well with small entrance until warmer weather.

Mr. Manley wants a cheap bottom-board, and reported a colony in a 12-frame hive with an entrance 1/4x4 inches giving 130 pounds of extracted honey, and the bees did not hang out. He believes in plenty of surplus-room.

Mr. Beecham believes bees can be given too much sur-

plus-room. He thinks no colony needs more than three half-stories at one time for extracted honey.

Mr. Cady reports favorably on bottom-boards and covers made of cement.

On motion the ladies were extended a cordial invitation to attend and become members of the Association and to compete for any prizes offered.

The question was asked if we could dispense with glass in shipping-cases, but the majority thought not.

SIZE AND SHAPE OF SECTIONS.

"What is the best size and shape for sections?"

Messrs. Aspinwall and Beecham use 4 1/4-inch square, plain.

Mr. Aspinwall thinks that narrow sections take too much foundation, and are too thin and light to handle; also too many sections for the amount of honey. He wants as little foundation used as possible, and predicts that in 10 years more there will be more square than tall sections in use.

Mr. Forbes has used 4 1/4x4 1/4 sections for 20 years, but prefers the tall to the square ones. He uses full sheets of foundation with bottom starters.

Mr. Manley found the honey not as well attached in tall as in square sections.

Mr. Kirkpatrick prefers the tall sections, and uses full sheets of foundation.

PUTTING ON EXTRA SUPERS.

"Should the empty super be put under or on top of the full one?"

Mr. Manley puts the second super on top, and believes it the better way.

Mr. Short puts the second super on top.

Mr. Aspinwall tried putting the second super on top with poor results. He said the percentage of swarming will be greater when the super is put on top.

Mr. Hilton advises putting the empty super under the full ones.

CLOSED-END FRAMES.

"Is there any advantage in closed-end frames over open-end ones?"

Mr. Aspinwall thinks there is, and Mr. Bingham said there is a great advantage. He then gave a clear description of his hive, which he claims has the original closed-end frames, and said he uses closed-end frames exclusively. He advocated a frame 1 1/2 inches wide, and shorter than the regular Langstroth to prevent sagging. He also explained the uses of his smoker and honey-knife.

MOVING BEES—FREIGHT RATES ON HONEY.

"When is the best time to move bees?"

E. D. Townsend said during apple-bloom.

Mr. Forbes brought up an objection to the handle on the 60-pound cans, saying it often pulled off. He also spoke on the freight rates on extracted honey being higher than on syrup.

A motion was carried that Mr. Hilton be asked to see what can be done to secure a better classification on honey.

A few more questions were discussed, but the Secretary being busy with newspaper reporters, did not get them recorded.

The convention adjourned to meet at the call of the Executive Committee. E. B. TYRRILL, Sec.

Conducted by EMMA M. WILSON, Marengo, Ill.

Loss of Bees—Queenless Colony

DEAR MISS WILSON:—1. I visited my apiary of 35 colonies to-day, and found 3 colonies dead and several more in a hopeless condition. Do you think the intensely cold weather which we have had for the past 6 weeks, could be the sole cause of the loss?

2. It was not from lack of stores, for one of the hives (I don't use any but the 8-frame Langstroth) had all the frames full of sealed honey and pollen, with the exception

of the 2 they had clustered between where the honey was partly consumed.

Was it a queenless colony? When I scraped up all the dead bees in it there was not enough to fill a pint cup. I found several queen-cells started. There was no disease, for everything smelled as sweet as new, and it had less bees in it with all that honey than either of the other 2, and all 3 hives were perfectly dry. I took special care in packing them for winter the latter part of September.

I had been in very poor health during the summer, so did not take the pains to examine them to see if each colony had its queen, feeling satisfied that they did, as they seemed to be doing all right. The bees have always been wintered on the summer stands, and with very little loss.

There was no sign of moths. I am puzzled to know why all that honey is in that hive. I could scarcely lift it, and instead of clustering in the center of the frames under the Hill's device, they clustered between 2 of the outside frames.

MRS. MARY A. RAY.

Adams Co., Ohio, Feb. 22.

1. Not necessarily; and yet it might be; not so much the intense cold as the long continued cold.

2. Almost certainly that one colony was queenless. The starting of queen-cells is one evidence, provided there was anything in them. The mere presence of cups started with nothing in them is no indication of queenlessness, for these may be found in any hive. The case was probably something like this: It was a strong colony, and by some means became queenless some time before the close of the honey harvest. Other colonies were busy storing in supers, while this one was doing a large part of its storing in the brood-chamber, filling up the brood-combs with honey as fast as the young bees emerged from them. In this way you will see that a strong queenless colony is the very one that should be heaviest in stores; for other colonies could not fill the brood-combs so long as brood was in them, and this one had no brood to prevent the honey going into the brood-chamber.

### Bees Gathering Pollen—Wintered Well

Our bees were taken out of the cellar March 27, and were bringing in pollen shortly after being put out. They seem to have wintered well, having been in the cellar four months. To-day it was too windy for them to fly at all. Soft maple is in full bloom.

(MISS) MARY THEILMANN.

Wabasha Co., Minn., March 29.

### Moving Bees a Short Distance

I have about 100 colonies which are on a couple of village lots, and which I wish to move outside the corporation (a distance of about five or six blocks) in April or May. How can I move them at that time of the year so the bees will stay in their new location?

My bees have wintered very nicely, and most of the colonies appear quite strong, but I suppose there will be some loss. I notice the mice have been very bad in some hives.

I trust you have been very fortunate in wintering yours, and wish you "good luck." MATHILDE CANDLER.

Grant Co., Wis., March 1.

In April or May the bees will already have made many flights, and without special precaution, when moved so short a distance, a large number will return to the old stand. If you will move them two or three miles away, and then return them to the new place after two or three weeks, they will be likely to stay put. That's very troublesome, and you would probably rather lose more bees and have less trouble. Shut them up in their hives for two or three weeks, and move them to the new place before liberating them. But some of them would smother, and many bees worry themselves to death. Well, you can compromise. Shut them in their hives in the evening, or any time when all are in the hives. If the weather should be cool enough not to fear smothering, they might remain thus imprisoned two or more days. More likely it will be so warm that you will feel you must move them the next forenoon. No need to be so very careful in moving them gently; fully as well to knock them about a bit. As fast as you move them away clean up the old ground, and don't leave any stands or empty hives standing about. The object is to have the old

ground look as little like home as possible, so that if any bees should return they will not feel like staying.

After all are moved you are ready to open entrances. Go to a hive and smoke and pound upon it till the bees are thoroughly frightened and roaring loud and strong. Less pounding will do if they are already roaring before you touch the hive. When you think they are sufficiently excited open the entrance, setting before it a board so as to prevent the bees from shooting out in a straight line. After all are opened see if you find many bees at the old place that act as if they had a notion of staying there. If you do, it may be well to set for them a hive filled with empty combs. Then when flight has ceased in the evening, distribute these bees in the new apiary where you think they will do the most good, perhaps shaking them down in front of entrances. If they come back next day repeat the process.

## Mr. Hasty's Aferthoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### SHORT HONEY-DEARTH A BLESSING.

Mr. Morley Pettit may be right that a short period of severe dearth in the midst of the season is often a blessing, in that the drones are killed off and swarm-fever stops. How nice it would be to have bees on a barge and tow them to barren regions for a few days, and then to them back.

Imaginable that two smokers running in a room that is not altogether bee-tight might help some in keeping bees out—but, *murderation!* What sort of beings inhabit Mr. P.'s locality, that they can consent to work in a choking, glimmering gloom so suggestive of bad regions? Page 119.

### GRANULATED HONEY—AN "END-STINGER."

To teach customers that the natural condition of honey is granulated—I'm afraid that would be stretching the truth a little. With the honey in the comb, and the comb in the hive, and the hive in the best of condition, granulation is the exceptional and not the usual state. Also it is a state which the bees themselves manifestly don't like, in that they very generally throw the granules away.

For a stinger at the last end, that "make good use of your money when you get it," is just the thing, Mr. Pettit. The dull and ordinary essayist would surely have left that off as not strictly bee-ological. There is such a thing as sticking *too close* to the text when the pews sadly need some "general applications." Page 119.

### WAX AND RELIQUEFIED HONEY.

I should want Mr. Armstrong to wipe his specs and examine his facts once more. Don't believe there is any wax in the foam that rises out of the interior of granulated honey when it is reliquefied. Wax all rises while the honey is at rest previous to granulation. However, propolis usually contains a small percent of wax. It is imaginable that a can of honey might have some propolis settled to the bottom that would yield a trifle of wax when subjected to heat. Propolis sinks in water—can't say that I ever saw it sink in ripe honey. Page 119.

### WORKING UP A HONEY MARKET.

It's a wise suspicion of Dr. Emmons that his excellent home market for honey came largely as the result of *not trying* to make a market—giving away all his surplus at first, and getting to sell only as his crops increased, and even then with a sort of reluctance. *Convinced the flies that he was not a spider.* Underneath the diligent cultivation of the market (which the papers so properly tell us about) the flies oft imagine that they hear the traditional, "Will you walk into my parlor?" And they whisper to themselves, "That spider will not catch me." Page 125.

### FEEDING AN OBSERVATION COLONY.

Allen Latham's suggestions about feeding bees in an observation hive are good; but I think we need something decidedly better—some sort of feeding-chamber right adjacent to the back end of the frame, where robbing-bees could not get it short of first fighting the colony. It would increase the cost of the hive a trifle; but it could be made more convenient than setting a saucer and tumbler on the window-sill. Page 126.

### "BATHOS" INSTEAD OF "PATHOS."

In my second paragraph on page 136, read bathos in place of "pathos."

### SOLIDIFYING OF LIQUID SUGAR AND HONEY.

As to the conundrum on page 131, about the solidifying of liquid sugar and liquid honey, I should say the former is sharp and hard, with some exceptions, while the latter is soft and cloud-like, with some exceptions. Not very satisfying from the logician's point of

view; but when the facts are that way what else can you say about it? The candy maker goes to the length of his art to make sugar soft. The bee-student, experimentally inclined, tries zealously to show a sample of honey sharp, hard, and dry like sugar.

PROPOLIS SCRAPING AND WIDE FRAMES.

Mr. Doolittle evidently has a location not so bad for propolis as some of us have. I, too, still use wide frames and tin separators, but there's quite a bit of scraping to do notwithstanding. But say, comrade, even granting that scraping propolis is not an ideal, Garden-of-Eden pastime, between that and *fishing*—I'd scrape. Page 134.

**Doctor Miller's  
Question Box**

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.  
 Dr. Miller does *not* answer Questions by mail.

**Depth of Langstroth Hive**

On page 134, you say the depth of a Langstroth frame is 10 1/2 inches. Ours are 9 1/2. I use what I suppose is the standard Langstroth frame 9 1/2 inches deep, so I do not know where you would put the extra one inch in depth of hive. Please enlighten us.

TEXAS.

ANSWER.—Of course the depth should be 9 1/2. Now what punishment do you think severe enough for a printer that would make such a mistake as that? The trouble, however, is that I'm pretty sure the printer is entirely innocent and I'm the culprit. I don't understand how I could have written it 10 1/2, unless it be a case of total depravity. Please accept my hearty thanks for the correction.

**Bees and Hens in the Same Yard—Moving Bees**

1. How would it do to place about 50 hens and 30 colonies of bees in a yard 150 feet square.
2. Would many bees be lost by striking the fence-wires on windy days?
3. Could bees that are packed with a burlap cushion of shavings be safely moved a distance of 4 miles by closing the hive-entrance? Would they get air enough through the cushion?

NEW YORK.

- ANSWERS.—1. It would probably do all right.  
 2. If the wires were a foot or so apart so that the bees would be in the habit of flying between them, a very few might be killed; but if the wires were much closer together the bees would always fly over and none would be killed.  
 3. Don't risk it. Close the entrances with wire cloth.

**Getting Swarms to Enter Empty Hives**

There are swarms issuing from the yards of bee-keepers all around me, which they do not take any pains to hive, as they have all they care for. I have seen swarms hanging on the limbs of trees for a day or two, and have set hives out to catch them, but get very few.

Have you any suggestions how to draw them to a hive set out in the woods? This means a great deal to me.

MICHIGAN.

ANSWER.—I don't know anything more than to place a hive where it is easily found by a swarm looking for a home, the inside of the hive being acceptable in every way. Probably nothing, in this latter respect, will be better than to have the hive filled, or partly filled, with clean, empty combs.

**Colonies Affected with Diarrhea**

Last fall I had 50 colonies of black and hybrid bees on the summer stands with no protection except what a thicket on the west and north afforded. During the very cold weather of January and February the snow kindly enveloped them, and when the mild days of March came, and I could examine their home, I found one colony dead, under circumstances which, coupled with subsequent events, led me to believe some disease had appeared among them. It is this belief that prompts me to refer the circumstances and conditions to you for your opinion.

Last summer this hive was glued and waxed with a black, tarry paste-like propolis that did not smell just right, but in every other way the bees seemed healthy and all right. They did not work in the super as freely as some others, but went into winter with ample stores. I did not, at the time, notice any other colony thus affected, but upon continuing my search, in March, I found another dead colony which showed this same dark propolis. In about a week another, similarly conditioned, "played out," and the next day I discovered the whole yard engaged in robbing a fourth. I covered this up with carpets and straw to stop the robbing, and upon examination

later I found it affected the same as one, two and three. On March 15, I found a fifth one dead with these appearances existing.

In no hive did I find any brood except in the fifth. There the brood seemed perfectly healthy, and just ready to emerge from the cell. Not all that showed black propolis died, but all that died were of this class. The offensive odor, noticeable during the hot weather last summer, was not discernible this spring, but there were patches of pollen that seemed to have soured, and the cells containing it were broken down and presented a very unhealthy appearance. All these colonies left plenty of stores, and the cells in the brood-nest were in such good condition, and so clean, as to give no evidence of any "brood disease."

I have tried to be brief in this history of perhaps an imaginary trouble. Although it may not seem to you very brief, I should like to know if you or any reader can tell me if it is a disease, and what I can do in the premises to arrest or eradicate it.

MISSOURI.

ANSWER.—I've read your letter through twice with much care, and am a little puzzled as to reply. The appearance of your letter gives me the impression of a man of intelligence, but I suspect that you have not had many years' experience with bees, and if you will promise to take it good-naturedly I'll assume that to be the case, and answer accordingly. The "black, tarry, paste-like propolis that did not smell just right" was not propolis at all, but the excrement of the bees resulting from diarrhea. To be sure, you mention it as being first noticed last summer, and diarrhea does not usually occur in summer, but that may have been from the previous winter. This winter and spring a number of colonies were affected with diarrhea, smearing the combs and particularly the top-bars of the frames, and probably spotting the fronts of the hives, the worst cases dying from the disease. The fifth case was the only one with brood merely because it was later in the season, when brood-rearing had begun. The remedy for diarrhea is a cleansing flight. Wholesome food and proper protection and ventilation are preventives. Consult your book on the subject of diarrhea.

**Drone-Brood and Worker-Brood**

How can I tell drone-brood from worker-brood? WISCONSIN.

ANSWER.—Lay a rule over the comb containing the brood; if it measures 4 cells to the inch, you may know it's drone-brood; if 5 to the inch, it's worker-brood. If the brood is sealed, the sealing of the worker-brood is flat, and that of the drone-brood raised or rounding. If you have a drone-laying queen, or laying workers, you will have drone-brood in worker-cells, and the sealing will be rounding like so many little marbles.

**Honey Sent to Commission-Men**

About a year and a half ago I shipped two barrels of honey to a honey commission firm at their request, they having informed me that they had a buyer for same. I paid 6 cents per pound here for 1080 pounds net. The firm said they could make a good profit for me on it at that price. Well, time rolled on, as it has a habit of doing, and I received no returns from the honey.

About 6 months ago the firm wrote me saying that they would put the honey in cans, as they could not sell it in barrels. Later they wrote that it was all sold but 3 or 4 cases. Then I wrote them not to sell at a loss, and to send me the money for that already sold. They replied with a draft in full for \$35 49, 969 pounds at 4 1/2 cents, less freight and commission. No account of cans, or labor of transferring, and 111 pounds short. I could have sold it in Chicago at 6 cents, and would have been glad to pay the freight charges, if only I had been informed. I do not know what right they had to sacrifice my property for the little \$3.60 commission they charged for selling, after I had told them not to sell at a loss.

What I wish to know is, Has a shipper any rights in his property after it goes into the hands of a commission-man?

IOWA.

ANSWER.—I'm not familiar with the laws of the different States, but I feel safe in saying that when honey is sent to be sold on commission it remains your property till it is sold to a customer, and is at no time the property of the commission-man. If you say he must not sell below a certain price, he has no right to do so, and in general you have the right to instruct him what he is to do, he, of course, receiving the proper remuneration for his services.

**Various Races in One Yard—Best Workers—Honey in Sunflowers**

1. Last Saturday was a very warm day, and I noticed the bees bringing in a white-looking stuff on their legs. What could it have been?
2. One of my neighbors told me that black or brown bees could not be kept in the same yard with Italians. Is that correct?
3. What kind of bees do you consider the best workers?
4. Is there any honey in sunflowers, and, if so, could the common black bees get it?

IOWA.

ANSWERS.—1. Probably early pollen; possibly sawdust.  
 2. All the kinds of bees in the world might be kept in one yard. Possibly he meant you could not keep two kinds in one yard without their mixing, which is true; but it is also true that they mix when two miles or more apart.  
 3. Very likely you will get nothing better than Italians, although for some purposes or localities some other may be better.  
 4. Yes to both questions.

# ORDER NOW!

If you want BEE-SUPPLIES of any kind you should send your order now. Later the rush will be so great that it will be impossible to fill all orders promptly.

## Temperature of Bee-Cellars

I have 82 colonies to begin the season with. It has been a very severe winter, and the temperature in my bee-cellar has been only 39 degrees all winter, while that of a neighbor's has been 45. We will note the difference in spring. Mine had 5 pounds more of honey each than his did, when put into winter quarters.

I am very much pleased with the American Bee Journal. It grows better every year.

F. A. METCALFE.

Ontario, Canada, March 7.

## The Season in California

I have remarked several times upon the flattering prospects in California for the coming honey crop. In the 11 years that I have been here, although we have had 3 remarkably fruitful years, I think no season has given this early anything like the genuine promise that confronts us at this time. We have had most generous rains, in fact the best for over a decade. As I have stated frequently, 15 inches is our average. We have already gone much

beyond this, and the chances are that the end is not yet.

Yesterday I took a ride into the canyons and there was a wealth of bloom that was surely most encouraging. I chanced to stop my horse beneath a live-oak tree, which was in full bloom, and the loud hum of the bees showed full well that they were making good use of their opportunity. This winter has not only been very wet, but it has been so mild that we are sure to have very early bloom. I have often called attention to the fact that in wet years our bloom is sure to be protracted, so the present year we are not only sure to have a great wealth of nectar-bearing flowers, but it is equally certain that they will hang on for a long time.

There is only one possible chance for a failure. If, at the time of the honey season we should have continuous cold winds, these might somewhat interfere with our success. It is hardly to be expected, however, that we

can have continuous weather of this kind. An occasional day, or a few days, may come and lessen the crop, but that the entire season should be thus characterized is not to be presumed.

A. J. Cook.

Los Angeles Co., Calif., March 23.

**Locations in Virginia and Maryland**

Last fall I sold my bees and fixtures with the intention of locating in the South, hoping to do better where the summers are longer and winters less severe.

Would some bee-keeper in Virginia or Maryland let me know through the columns of the American Bee Journal if it is a good place for bees in those States, when the honey-flow comes in, and what the bees mostly work on? also, if there is any chance for Northern bee-keepers to locate in those States to start an apiary. An answer would be of great interest to many here.

JOHN H. OREN.

Barron Co., Wis., Feb. 6.

**Loss of Bees by Smelter Smoke and Drouth--Great Yield from One Colony**

The few colonies I have left from the wreck of 7 years' smelter smoke and 3 years' drouth have never done so well as they did in 1904. From the causes named, during the last 7 years, I have lost about 400 colonies of bees. In 1900 I had 97 colonies in one apiary, and in the spring of 1903 only 2 of them were left. These I increased to 4, and as there was a good honey-flow I piled supers filled with empty combs on top until 2 of them were 3 stories and 2 of them 4 stories high. I wintered them in that way, and they came through in good condition. There was a good honey-flow last season, and as the bees were located pretty much outside the range of the smelter smoke, they gave a good account of themselves, and I now have 14 colonies.

One of the colonies in the 4-story hives referred to came through the winter strong, and on May 10 it had 3 extracting-supers nearly full of brood, and a super of honey. I removed the queen with 2 supers of brood,

## BEE-SUPPLIES

OF ALL KINDS.

### Beeswax Wanted at all Times.

DADANT & SONS, Hamilton, Ill.

left a super of hatching brood on the old stand, dividing the super of honey between them, and finished filling each super with foundation. May 21 both hives were full of bees and honey, the new one having built over 30 queen-cells. I then divided the bees, brood and honey of the new colony, and filled up with foundation, as before, again moving the old queen to furnish field-bees for the second new one. June 16 the old queen came out with a swarm. July 1 and 11 I made 2 more swarms, and as there was a big honey-flow they were all strong. I moved the old colony on July 1, but on July 11 I found it could not stand a second move. As there were 4 comb-honey supers on the May 10th swarm, I moved the May 21st swarm to furnish field-bees for the last new one. I now had 6 strong colonies, and run them to the best advantage with the following result:

I took off 617 pounds of extracted honey, which I sold at an average price of 7½ cents per pound, and 16 24-pound cases of comb honey which I sold at \$2.50 per case. I also left an extra super for wintering on each of the 6 colonies.

The honey score of the 6 colonies is as follows:

Extracted, June 20 .....	60 pounds
" July 1 .....	117 "
" July 11 .....	50 "
" July 29 .....	150 "
" Aug. 15 .....	165 "
" Aug. 29 .....	75 "
Comb, Aug. 15 .....	2 cases
" Aug. 29 .....	3 "
" Sept. 15 .....	4 "
" Oct. 14 .....	7 "

I am wintering them in 2-story hives, and I think there is honey enough in either story to carry them through. The bees seem to winter better in this way, with less spring dwindling, and they build up faster in the spring.

In taking off the honey I boxed up the full combs and hauled them home, and after extracting the honey from them I melted the

## The Rietsche Press

Made of artificial stone. Practically indestructible, and giving entirely satisfactory results. Comb foundation made easily and quickly at less than half the cost of buying from the dealers. Price of Press, \$1.50—cash with order. Address,

## Langstroth on the Honey-Bee

Revised by Dadant—Latest Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.20, or club it with the American Bee Journal for one year—both for \$2.00; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

15A1f; Please mention the Bee Journal.

combs, getting about 30 pounds of wax. I put sheets of foundation between the partly-filled combs, and kept all queens supplied with full sheets of foundation for laying-room. I regard that particular colony as a wonder.

Our leather-colored bees are on top as honey-gatherers. I have not figured up the profit on those bees, but if the 6 colonies are alive the first of April I would not take \$50 for them.

With my 97 colonies in 1900 I thought I had things pat, but, like Paddy's flea, when he put his finger on it it was not there, and my bees vanished like the smoke that helped to destroy them. It now looks as if the beginning of the end of smelter smoke is in sight, but I will report later if the good news proves true.

Mr. Haaty said last spring that I had thrown up my hat for the 1000-pound mark, and he thought if some one would give figures instead of assertions it would be better. Now this figure has been reached in this State many times, but it must not be inferred that 1000 pounds of honey has been taken from one hive. It is always figured "spring count"—one colony and its increase during the season. **E. S. LOVESY.**

## Honey and Beeswax

**CHICAGO, April 7.**—The market has cleaned up quite well on comb honey. Choice white comb is selling at 12@13c, and the off grades are also moving freely at 9@10c. Extracted is not sharing in this movement and prices are weak at 6@7c for white and 5@6c for dark, according to flavor, body and package. Beeswax, 29@30c. **R. A. BURNETT & Co.**

**NEW YORK, March 11.**—There is no improvement in the comb honey situation. The demand is next to nothing; quotations nominal and no doubt some of the stock will have to be carried over. We quote fancy at 13c; No. 1 at from 11@12c, and dark at from 9@10c. Extracted is in fair demand: White at from 6@6½c; light amber at 5½c; Southern in barrels from 50@57c per gallon, according to quality. Beeswax firm at 2½c. **HILDRETH & SROELKEN.**

**BOSTON, March 9.**—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality. **BLAKE, SCOTT & LEE.**

**KANSAS CITY, March 31.**—The honey situation does not improve. While there is a little better movement the prices seem to be lower. Fancy white brings \$2 a case; No. 1, \$1.75; amber and lower grades from \$1.25 to \$1.50. Extracted, 4½@6c. Beeswax, 2c. **C. C. CLEMONS & Co.**

**CINCINNATI, O., April 7.**—The large stock of comb honey, yet offered with hardly any demand caused lower prices. I quote fancy water white at 12c; other grades in proportion, lower. Extracted is in the usual demand for this time of the year; quote amber in barrels at 5½@5¾c; in cans, ½c more; white clover, from 7@8c. Beeswax, 28c. **C. H. W. WEBER.**

**PHILADELPHIA, March 22.**—As the season advances, the call for honey is decreasing, and the market at the present time is dull. Some few sales. We quote: Fancy white, 13@14c; No. 1, 11@12c; amber, 11c. Extracted, white, 6½@7c; amber, 5½@6c. Beeswax, 28c. We are producers of honey and do not handle on commission. **WM. A. SELSER.**

**ALBANY, N.Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. **H. R. WRIGHT.**

**CINCINNATI, March 10.**—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6½c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c. **THE FRED W. MUTH Co.**

**SAN FRANCISCO, March 29.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

Stocks of amber grades are of fairly liberal proportions for this advanced date in the season, and include some recent arrivals from the Hawaiian Islands. Inquiry is slow and market lacks firmness. Choice water-white honey is in light supply.

4 Largest Sizes Soot Burning

Original Direct Draft CLEAN Bee Smokers

Tin 4-in. Smoke Engine 3½-inch 2½-inch Wonder 31.50, 31.10, 31.00, 90c. 65¢—per mail. Sent on receipt of price per mail.

# Root's Goods in Chicago.

For the saving of freight for our western trade, as well as to give much quicker delivery, we opened a branch office in Chicago, Oct. 1, 1903. The following taken from our catalog of last year, explains the transfer then made:

The business for many years conducted by George W. York & Co., at 144 E. Erie Street, as agent for The A. I. Root Company's supplies, is this day transferred to The A. I. Root Company, to be conducted as a branch office. Please note change of name to avoid confusion in our work. **THE A. I. ROOT CO.**  
October 1, 1903.

### To Our Customers and Friends:

In transferring back to The A. I. Root Company the bee-supply business, which we took over from them some years ago, we do so with regret, as we have labored hard to build up a large and honorable trade in bee-appliances, and value beyond expression the valuable patronage accorded us during the years.

### Low Freight and Quick Delivery.

A glance at any railroad map will show the superiority of Chicago as a shipping-point. Because of the great number of railroad and steamboat lines centering in Chicago, and the large stock of goods we carry, we can give you the best of service. This office is in constant touch with the factory and home office, and in many cases can give your order quicker attention and earlier shipment than the factory, to say nothing about the saving in time and transit and lower transportation charges.

### Wholesale and Retail.

We are prepared to furnish goods at wholesale and retail, the same as the home office.

### Terms.

Our terms are cash with the order. We pay cash for material, and pay our

We trust the same will be continued to our successors in the business.  
**GEORGE W. YORK & CO.**  
Chicago, Ill., Oct. 1, 1903.

The conveniences offered by the branch office were evidently appreciated by the bee-keepers of Illinois, Wisconsin, and other States beyond, for the business done by the branch was much beyond our expectations. During the rush season—April, May and June—orders came in so fast that, in spite of frequent orders to the factory for another car of goods, the stock ran low, and some delays and annoyances thereby were caused. Some little confusion because of change of name and manner of conducting the business (from agency to branch office), but these have all been overcome. We are better than ever prepared to handle your business carefully and promptly, and solicit your patronage.

helpers cash every week for their work; therefore we must have cash in advance for the goods furnished. Do not ask for credit.

### Beeswax Wanted.

We are in the market for good beeswax the entire year, and pay the same prices as quoted by our home office in each issue of GLEANINGS IN BEE CULTURE. Send your wax direct to us for cash or in exchange for supplies.

### Extracted Honey.

In the course of a year we use large quantities of extracted honey, and are pleased to get sample and prices from parties who have honey to exchange for supplies. We are also prepared at all times to furnish first-class honey to any one who is in need of same, either bee-keepers who have a demand for more than they can furnish, or from dealers. Get our prices before you place your orders elsewhere.

## DANZENBAKER HIVE.

"Facts About Bees", a 64-page book written by Mr. F. Danzenbaker, giving a complete description of his famous hive and directions for using. Full of valuable information. Sent on receipt of a 2-cent stamp to pay the postage. **Send for it.**

### The Danzenbaker Hive

THE COMB-HONEY HIVE.  
Three Points of Excellence:

#### QUALITY

You can produce better-looking honey.

#### QUANTITY

You can produce more of it.

#### PRICE

You can get more per pound for it.

#### SPECIAL NOTICE

The great popularity of the Danzenbaker hive has brought the shallow brood-frame and the tall plain sections into prominence. It must be remembered that no other hive contains the essential features of the Danzenbaker. The success of this system depends on having everything JUST RIGHT, so you should place your order for the Danzenbaker hive with our office, or any of our branches or regular agents.

Address all Orders, Remittances, Inquiries, etc., to

## Editorial Notes and Comments

### Great "Farm Journal" and Manufactured (?) Comb Honey

Several of our subscribers have sent us the following paragraph, as having appeared in the April issue of the Farm Journal, published in Philadelphia, Pa :

"Bee-keeping is pleasant and profitable work, and real honey is hard to get in these days. Not only is the 'honey' manufactured, but the wax-cells as well are imitated; so that even though you buy your honey in the 'comb,' you are as likely to get glucose as not. Therefore, fragrant honey, the real product of the bees, will always find a good market, and my women readers might be able to sell it through the Woman's Exchanges."

We wrote to the editor of the Farm Journal, as Manager of The Honey-Producers' League, as soon as we learned of the appearance of the above paragraph. We called his attention to the misrepresentation of honey that he was helping to perpetuate, and also explained to him the origin of the false story about comb honey being manufactured. In reply to our letter he wrote us as follows:

*Dear Sir:*—I am in receipt of your esteemed favor of the 25th. Yes, our good lady made a little mistake, I fear. Of course, the Farm Journal will make everything right. W. A.

It seems the paragraph quoted above appeared in a department called "Heart Problems," which is conducted by a lady who writes under the name of "Aunt Harriet." We feel sure from the above reply of the Farm Journal that proper correction will be made in the May number.

### Make or Buy Hives—Which ?

A member of the American Bee Journal family thinks it is a mistake for the American Bee Journal to advise beginners to buy rather than to make their own hives, he having found out by actual trial that he can do better to make them. His view, no doubt being entirely honest, deserves respectful consideration.

It is probably safe to say that the great majority of bee-keepers buy rather than make. They would not do so unless they thought they could do so at a saving. But there remains the possibility that some of them may be mistaken; possibly misled by what our friend counts the ill-considered advice of this Journal. The testimony of one who has merely gone upon the advice of others does not count for much in this case. But among those who prefer to buy are not a few who have had experience—and large experience—in both making and buying; some of them veterans who made their own hives before there were factories from which they could obtain them ready-made. Their testimony certainly is of value.

Yet in spite of all this, here comes a man who is exceptionally skillful in the use of tools, who makes his hives in time which would be spent at the corner grocery, so that really nothing need be counted for his time; he will do better to make his hives.

Now suppose ten beginners stand up in a row and propound to the American Bee Journal this question, "Shall we make or buy?"

And suppose the Journal answers, "Make." According to what has been said, it is morally certain that nine out of the ten—more likely ten out of the ten—will be misled by that answer. They will find that their hives will cost them more than if they had bought them ready to nail together; and, what is a good deal worse, they will find that they are much less satisfactory than when made in quantity, with every advantage of special machinery and the most exact measurements. So if the Journal is an honest Journal, it will advise, "Buy." If one of the ten happens to be like the exceptional case mentioned, there is little doubt that he will find out very soon that he is an exception, and will act accordingly.

All of this is aside from the question as to whether prices charged by manufacturers are too high or not. Those who make hives in large quantities certainly can afford to sell them at lower prices than if made on a small scale. If they do not offer them at fair prices, competition should bring quotations down to the proper level.

### The Honey-Producers' League

The membership dues are coming in very nicely when it is remembered that The Honey-Producers' League is only about one month old, and has just been announced to bee-keepers through the bee-papers. Since the first report on page 260, the Manager has received the following:

Gus Dittmer.....	\$22	C. J. Thies .....	1
J. A. Green.....	10	Sadie A. Butts.....	1
C. A. Hatch.....	10	W. B. Moore.....	5
Robt. A. Holekamp.....	6	A. D. Hopps.....	2
J. C. Davis.....	5	W. C. Scott.....	1
John Nebel & Son Supply Co.	18	E. D. Townsend.....	15
Walter S. Powder.....	24	Wm. A. Selser.....	10
J. B. Mason.....	12		
A. Mottaz.....	2		\$ 178
W. T. Falconer Mfg. Co.....	30	Reported before.....	1045
Alvin Long.....	1	Total.....	\$1223
Doollittle & Clark.....	3		

From now on the membership should grow very fast, as the objects of the League are such that they should commend it to all who either produce honey or are at all interested in it as dealers. Bee-keepers must do their own advertising, or else it will not be done. They will need to pay for it, too, else it will not be paid for. But by all combining, as proposed by the League, the expense will not come heavy on any particular bee-keeper. "In union there is strength." "Co-operation" is the thing desired in The Honey-Producers' League. If you want to see your own best success, then become a member as directed on page 259.

### Go Slowly On Increase

You will then go more surely. M. A. Gill says in the Bee-keepers' Review: "Remember, if you never make much increase, you will never have much decrease."

### How Many Colonies in One Place

The editor of the Bee-keepers' Review says:

The general experience, from all over the country, is that the yield of almost any locality may be lessened by the bringing in of too many colonies; but just how many colonies it is profitable for one man to keep in one apiary has never been settled, and never will be settled, as localities, seasons and methods differ. My advice or plan would be to keep on increasing an apiary until the profits were lessened by the

increase in numbers. By this I don't mean the yield per colony has been lessened, as this might happen, yet the yield in the aggregate, and the profits, might still be increased. I mean that, when, considering the capital and labor employed, we don't make so much money because the locality is overstocked, then I would start another apiary. It may require quite a little experience to decide this, and, even then, it can't be decided indefinitely for each year; an approximate decision is the best that we can get.

Good advice; only stronger emphasis might be placed on the difficulty of deciding when the point in numbers has been reached that will yield the greatest total profit. Suppose the profit less this year than last; how is one to tell whether it is because of greater numbers or because of a poorer season? Suppose the number kept this year is larger than ever before, and the profit as well. But that is because of the extraordinary flow. Such a flow does not come again in the next 10 years, and there is a loss because the full number is kept right along. As Mr. Hutchinson intimates, it's a game of guess at best, and it is well to guess too low rather than too high.

### Use the Least Possible Heat On Wax

Says E. D. Townsend in the Bee-Keepers' Review: "If you want that soft, nice, pliable wax that is so much in demand in the market, don't ever allow your wax to boil in any process of rendering."

Mr. Fred W. Muth, of The Fred W. Muth Co., Cincinnati, Ohio, gave us a pleasant office call last week when in Chicago on business. He is a hustler from "way back"—or from Cincinnati, more properly speaking. If he doesn't get his share of the business to be had it isn't his fault.

**Hurry Up Printing Co.** is the firm name under which Emerson T. Abbott, of St. Joseph, Mo., is conducting a printing and publishing business. He has just recently purchased the plant and goodwill of the Stewart Printing Co. of that city, and says on his announcement card, "Promptness, neatness, and accuracy will be our watchword." We wish the new concern every success.

**Eastern Georgia for Bee-Keeping.**—We have a request from a subscriber in New York State, who desires information concerning the eastern part of Georgia as a bee and honey country. Will some of our subscribers, who are in that part of the State, kindly let us know briefly concerning the matter, as no doubt others besides our New York subscriber would be pleased to get the information.

"**Building Business and Making Men**" is the title of a little 20-page pamphlet written by Mr. Frank B. White, president of White's Class Advertising Company, Chicago, Ill. It was prepared for reading before "White's Class," which is mainly composed of employees of White's Class Advertising Company, who meet monthly for the discussion of various subjects of interest to their business. The contents of the pamphlet referred to above were read at the January meeting, and at the suggestion of several public-spirited visitors who were present, Mr. White issued it in pamphlet form. Any of our readers who desire a copy can have it on request. It will well repay a careful reading, as Mr. White has had large experience with men and business matters in general.

### GEORGE W. BRODBECK

It has been my great pleasure, and no less a privilege, to know intimately our departed friend, the late Secretary of the National Bee-Keepers' Association, George W. Brodbeck, for over 14 years. I have met him in the railway car, at his bee-ranch in the grand mountain canyon, at the convention, and in the quiet of the home. It has rarely been my good fortune to know one who has taken a stronger hold of my respect and affections than did Mr. Brodbeck. He was certainly a man who was deeply religious, and as sincerely determined to exemplify the teachings of the Master in his life and work as any one I have ever known. His kindly sympathy was ever manifest. When any proposition was urged his first question was, Is it right, and best? If there was any possibility that wrong could come to any one, then

his opposition knew no bounds. If any contemplated enterprise promised benefit to those interested, especially to his bee-keeping brothers, then his enthusiasm and willingness to sacrifice in such cause was almost phenomenal. There is little wonder, then, that he was a leader in whatever concerned the bee-keeping interests of our State. There was no wonder that he was chosen for Secretary of the National Association; there was no less wisdom shown in selecting him to be President of the business organization from which so much was hoped in aiding the bee-keepers to market their honey.

As suggested above, it was once my pleasure to visit the apiary of our friend in one of the most beautiful and romantic spots in the San Bernardino range of mountains. Like all our best bee-keepers, Mr. Brodbeck was exceedingly neat and methodical. I feel sure that method, or system, in all his work might almost be said to be his watchword. I think I never saw a more neatly arranged apiary, or one in better condition in every way, in all the apiaries that I have visited in our State than was this. Indeed, one may safely say that Mr. Brodbeck may be called the Hetherington or Bingham of California. He was no less a student than a practical man, and thus he was an up-to-date bee-keeper. He not only practiced the best that prevailed in other apiaries, but like all our bee-keepers he had many time-savers, short-cuts, and ingenious inventions and methods peculiarly his own. Those of us who used to enjoy his presence in conventions will remember how earnestly he used to father any proposition that looked to the advancement of our apian practices and methods.

One only needed to know Mr. Brodbeck but slightly to recognize at once that he was one of our most clean and pure men. It is a firm belief of mine that a clean heart is almost always indexed in the face. Mr. Brodbeck was no exception. It was no wonder, then, that when his name was proposed for the Secretary of the National Association all of our visiting delegates, who had enjoyed looking into his kindly eye, united with us at once in giving to our revered friend this proud honor. Such clean, true men as Mr. Brodbeck are the glory of any country. Such men always have beautiful homes, and beautiful homes are a very bulwark against everything vicious and mischievous. Mr. Brodbeck was the head of such a home; and the spirit of the man was felt as soon as one entered his household.

Mr. Brodbeck was an earnest, faithful, consistent member of the Methodist Church. His brother, Dr. Brodbeck—these two brothers were very dear to each other—has been for long years superintendent of one of the largest and most successful Sunday schools in the city of Los Angeles. All those who were so fortunate as to be present at the Los Angeles meeting of the National Association, will remember the delightful music which charmed us all on that occasion. This music was rendered by the orchestra of Dr. Brodbeck's school, and, as I remember, was a free gift.

Our friend was one of those rare spirits who carry every principle of their religion into their daily life. It may be said of him almost as truly as of any one I ever knew, as was said of the Master, "He went about doing good. In his life there was no guile."

That Mr. Brodbeck had the confidence of our hard-headed business men is apparent from the fact that he was elected President of the California National Honey-Producers' Exchange. This organization undertook a great work, along untried lines, which promised great things, but which demanded great tact and the best judgment to carry it through to the desired success. I am sure that no one ever regretted this choice, and I am sure that this organization has met a serious loss in the death of its very able President.

Mr. Brodbeck was a native of Lawrenceburg, Ind., a little west of Cincinnati, where he lived until he was married. His early home was very precious to him, and he endeared himself thoroughly to all its members. His married life was an extremely happy one, as he was a very affectionate and devoted husband. This couple were not blessed with any children, which misfortune, I am sure, they both deeply regretted. They had, however, a very merry family, for they both were great lovers of dogs, and they had numerous dog pets, which seemed almost like members of the household. I well remember when I visited Mr. Brodbeck's apiary what a kind greeting I received from the canine part of the community. Mr. Brodbeck's affection for the dogs was most clearly apparent, and this feeling was fully shared by his good wife, who survives her husband, and is now living in Los Angeles. The first years of their wedded life were spent in Edinburg and Indianapolis, Ind., where he first became interested in bees.

In 1887 Mr. Brodbeck first came to Los Angeles, where he resided until the time of his death. In the autumn of 1903 there were extensive forest fires in the canyon where his apiaries were situated. Undue exertion and exposure in trying to check these fires brought on an attack of pneumonia in January of the following year, from the effects of which he never recovered. His death occurred Feb. 6, 1905. He said repeatedly that his mind was not set on the things of this world, but that if it were God's will he would be able to recover that he might do more good. An intimate friend remarks of him, that "the greatest desire of his life was to help any one who might come in his way, never expecting or wishing any reward for his labors."

I am sure I voice the sentiments of the entire bee-keeping brotherhood of California, when I say that I feel that in the death of Brother Brodbeck I have sustained an irreparable loss, and feel that another attraction is added to the great Home towards which we are all hastening.

Los Angeles Co., Calif.

A. J. Cook.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price, postpaid, \$1.00; or with the American Bee Journal one year—both for \$1.75. Address all orders to this office.

## Opinions \* of Some Experts

### Amount of Comb Surface to Be Capped for Distant Market

**Ques. 25**—*What portion of the surface of a section comb should be capped when packing for distant markets?*

- S. T. PETTIT (Ont.)—All, or very nearly so.
- EUGENE SECOR (Iowa)—At least 95 percent.
- REV. M. MAHIN (Ind.)—All of it, if possible.
- C. P. DADANT (Ill.)—All of it, in my judgment.
- JAS. A. STONE (Ill.)—All capped for any market.
- ARTHUR C. MILLER (R. I.)—I do not ship honey.
- L. STACHELHAUSEN (Tex.)—The whole, if possible.
- N. E. FRANCE (Wis.)—The more capped the better.
- MRS. J. M. NULL (Mo.)—Practically the whole of it.
- DR. J. P. H. BROWN (Ga.)—I should want it all capped.
- P. H. ELWOOD (N. Y.)—Practically all. If not all, put in lower grade.
- G. M. DOOLITTLE (N. Y.)—All but the cells bordering on the section.
- WM. McEVOY (Ont.)—All. Ship the very best, every time, to any market.
- MORGAN BROS. (S. Dak.)—99 percent; second grade honey, 85 percent.
- J. A. GREEN (Colo.)—All of it, except possibly the row of cells next the wood.
- C. H. DIBBERN (Ill.)—It should be *all* capped, unless it is a few cells next the wood.
- J. M. HAMBAUGH (Calif.)—The more capped over the better. The less uncapped the better.
- E. D. TOWNSEND (Mich.)—All in Fancy and No. 1, from three-fourths to nearly all in No. 2. Anything less is extracted.
- E. S. LOVESY (Utah)—The entire surface. It can hardly be classed as first-class unless it is well filled and nicely capped.
- ADRIAN GETAZ (Tenn.)—All but the next row or two of cells adjacent to the wood. If all could be capped it would be still better.
- E. WHITCOMB (Nebr.)—All of it. Every cell, if we expect to get a fair price, and not have the combs mused with leaking when they arrive.
- G. W. DEMAREE (Ky.)—The entire surface of the section should be sealed, though a few open cells at the outer edges may be tolerated without loss.
- O. O. POPPLETON (Fla.)—I have supposed that section combs should always be all sealed when packed for any market, either near or distant.
- PROF. A. J. COOK (Calif.)—If I understand this aright, I should answer, all of it. I would not ship section honey or comb honey that was not wholly capped.
- R. L. TAYLOR (Mich.)—Practically all of it. An occasional comb might have to the amount of a square inch not capped if it has other excellencies to counterbalance.
- C. DAVENPORT (Minn.)—The more the better. But if comb honey is ripened as it should be before it is shipped, there will be no leakage from any cells that may be unsealed.
- R. C. AIRIN (Colo.)—In general, all but the outside row, but the rule should not be iron-clad. Other points being good, a few other cells open in a comb otherwise *fine* should not exclude it.
- E. E. HASTY (Ohio)—All except the outer tier of cells; and better have them filled, and capped, too. A very few empty or uncapped cells need not disqualify except for the highest grade or grades.
- DR. C. C. MILLER (Ill.)—It may be that no unsealed cells at all should be allowed, if that's the agreement; and an agreement might be made for sections with one-fourth of the cells unsealed. Of course the price should vary accordingly.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get them subscriptions, for which work we offer valuable premiums in nearly every number of this Journal. You can aid much by sending in the names and addresses when writing us on other matters.

### The Bees Against Spraying Fruit-Trees While in Bloom

BY GRANT STANLEY.

#### A PETITION.

*To Solicit the Sympathy of all Fruit-Growers and Rural People Everywhere, We, the Bees, Make this Our Most Humble Petition:*

We believe we know you much better than you think we do—we know you much better than you know us. We play a very important part in Nature's laws. Yes, we are afraid much more than you care to take time to think. We have a great mission in the pollenizing of fruit-bloom alone.

There is scarcely a fruit-grower or rural citizen that does not understand the pollenization of fruit-bloom; they also know that the wind is a great agency in pollenizing fruit, but, do you know, dear people, that if no wind is blowing at all while the trees are in full bloom, the wind could not be counted upon to do much distribution of pollen, while the less wind there is the more we come forth to complete this pollenization, not only making it thoroughly effective, but at the same time gathering this otherwise wasted sweetness for our little ones?

The people who are acquainted with us most are our best friends. A great many large fruit-growers keep many colonies of us on their lands to pollenize their fruit. A great many people do not like us on account of our sting. Now you know that all living creatures are provided with some weapon of defense, and if we were not provided with the sting we would have become extinct centuries ago.

It is also our mission during our short stay here (and it is short, only about 38 or 40 days during the honey season) to gather this wasted sweetness for the benefit of mankind. You know the Bible says, "Eat thou honey because it is good." Where is the child that does not like honey, or, in fact, the grown-up? And well they may like it; it is the greatest sweet known to man, much superior to the best sugar, from the fact that honey is a pre-digested food and requires no work of the digestive organs before it can be taken up by the body.

In this age of adulteration the woman of the household, if she be prudent, will see that our product graces her table. Honey is used in large quantities for the compounding of medicines; it also has many other uses, and if honey were used in pastry instead of so much sugar, we would hear less cry about indigestion.

We have a very sad tale to tell you, and a tale that is of great importance to you as well as to us. Thoughtless and indifferent people are spraying their trees while in full bloom, and few of you indeed know the injury inflicted upon us as a result. Do you know that about the time of fruit-bloom is a time when we can ill afford to lose any of our family? We have been quietly reposing in our homes all winter, many having passed away, and now during fruit-bloom we rush forth with our ambitions keyed to the highest pitch in an effort to provide food for our babies and replenish our stores consumed by our long repose. This food is about all used to feed our little ones, which are coming into this world of action by the thousands daily, and consequently the food we get from fruit-bloom is of vital importance in order to bring our colony up to a degree that we can secure a surplus for you.

Fruit-growers and men who have investigated this question thoroughly, now claim that it is very wrong to spray fruit-trees while in full bloom, claiming that equally as good if not better results can be obtained by spraying the trees *just before the buds open* and again *when the petals of the blossoms begin to drop*, as by this time other flowers have sprung forth and we have gone to visit them. Spraying at this time will also be found most effective against that greatest enemy of the apple—the codling-moth.

Some States have laws prohibiting the spraying of fruit-trees while in full bloom, and the object of this letter,

dear people, is to appeal to all rural people to withhold their spraying operations for the few days of fruit-bloom, and, in return for this most humble favor, we assure you that we will reciprocate it with an increased amount of honey, health and happiness for you all. Lycoming Co., Pa.

## Bees Crowding to the Super Center

BY S. T. PETTIT.

ON page 616 (1904), Mr. Hasty writes:

"S. T. Pettit will think I'm queer, but I doubt if he can abate much the inclination of bees to crowd into the center of a super. Even if he puts a thin septum below and makes all the bees go up front, rear and sides, I should doubt still. Bees don't seem to regard a thin septum if it is entirely surrounded with bees. They know where the center of things below is, and, as a matter of preference, prefer to be exactly over it."

I want to say that I never used, nor suggested the use, of thin septums, nor any other kind of septums for the use as stated by Mr. Hasty. Those belong to the late Mr. Golden. I use long wedges at the right time and condition of the bees to enlarge the entrance, and also to cause many of the bees to go up at the sides and toward the rear end of the hive.

He says: "They know where the center of things below is, and as a matter of preference prefer to be exactly over it." There may be something in that, but experience says not much. Mr. Editor, if ever a bee crawls into one of your ears, it is not because it prefers to get nearer the center of your cogitating machinery, although a fortuitous observer might think so. It is suffering from the cold, outside air, and crawls to get warm. In that case don't injure that little pet, even if it does emulate the roaring of a train of cars. Just go into a warm room and in a short time it will be against a window-pane. You see it is not all preference for the center of things, but very largely conditions that govern.

Take a strong colony in a hive not too large. By some means keep the super snug and warm, so that the temperature of the interior is right for comb-building; and depend upon it, in almost all cases in a good honey-flow, work will begin nearly simultaneously in all parts of the super. They don't seem to care much where the center is, if only the heat is right day and night.

In this connection I want to say that many bees congregate where the field-bees go up. If they go up at the center, the center will be congested; if they go up at the sides, the congestion will be abated, and they will have elbow-room to work—a very necessary condition for rapid work. So there is much—very much—in having them go up right; and also in having them provided with properly made *dividers* at the sides of the super. I think that Mr. Hasty and I are not so very far apart, after all, for farther on he says, "In cool weather there would be a gain in throwing more warmth into the outside sections." Exactly so, and as in almost all localities there is "cool weather" two or more nights in every week of the year, the argument is conclusive, that there would be a gain in conserving and distributing the heat from the time of giving sections.

A divider like the Root fence, with two exceptions, will give good results. First, the spaces between the slats should be  $\frac{1}{4}$  inch; and, second, they should be spaced  $\frac{5}{16}$  to  $\frac{3}{8}$  inch from the super walls. In many cases the sections will show ridges opposite the spaces, but I never had a customer object to them on that account, nor would I.

Bees can not acquiesce, cluster and feel free and easy in a space only  $\frac{1}{8}$  of an inch. They never make that kind

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food", written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey". It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy.

PRICES, prepaid—Sample copy for a two-cent stamp; 50 copies for 70 cts.; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

of spaces for themselves; they can not, in such cramped quarters, glide into the contented comb-building mood; nor is there room for a cluster to keep up the necessary heat for comb-building.

I can not conceive that it is fair and just to say that such dividers are practically as good as those that are properly made and spaced. I prefer those with holes, but slatted dividers, properly spaced, give good results. Here we are again, right in front of the manufacturer's view-point.

Ontario, Canada.

## Branch Houses and Bee-Supply Prices

BY F. GREINER.

AT the Harrisburg (Pa.) meeting Mr. Selser should have included several other bee-supply manufacturers who also have established branch houses when he said the Root Company have brought the bee-supply business to the door of the bee-keeper, and that they are real benefactors to the bee-keepers. Mr. S., however, conceded that the establishment of such branch houses was costing the bee-keepers some money, as it had raised prices on the supplies. This is undoubtedly true, and we deplore it. It seems, as far as the bee-keeper is concerned, all the branch houses with their increased cost of supplies are superfluous.

Why can not the bee-keeper have sufficient forethought and provide himself with supplies at an early date? There is no need of his waiting till sections and hives are wanted before ordering. I have been in the bee-business about 30 years, and I have never been obliged to buy supplies during the hurry of the season, and if all bee-keepers ordered everything during the winter there would be no need of branch houses and consequent higher prices.

Some years ago, toward the close of the honey season, one of the Western manufacturers advertised "cheap sections." They were seconds, and the price asked was \$2.00 per 1000. I laid in a supply for an emergency. I do not expect to make use of these sections until perchance one of those extra-good honey seasons comes along when even fence-posts will secrete honey! There is not a great deal of money tied up, and I need not worry that my supply of sections will run out. If bee-keepers will watch the advertisements in the bee-papers they may find equally good chances.

### DISINFECTATION FOR INSPECTORS.

Great importance should be attached to what Dr. Hayes said at the Harrisburg meeting in regard to sterilizing or disinfecting the clothing of the operator after handling foul-broody bees; also disinfecting his tools, etc. He says "the bacillus [and spores in particular] can be carried in many ways heretofore not thought of." It is my opinion that foul-brood inspectors should exercise a great deal of care in this respect, and I should make a vigorous protest if a foul-brood inspector, coming from a diseased yard, should want to enter my premises until I was satisfied that his clothing and tools used had been subjected to salicylic acid fumes, or something similarly effective. I know others—some having had the experience—who are fully as anxious as I am in regard to the matter. It is a very serious matter, my good friends and foul-brood inspectors, to be "peppered" with the disease. Frank Benton claims to know of foul-brood inspectors giving the disease to other yards. Dr. Hayes says it may be carried under the finger-nails.

It is often stated that black brood first developed in colonies imported into New York State from a Southern State. If this is true, why is it the disease has not been discovered so far in a State in the South?

### AMOUNT OF BEES IN A BABY NUCLEUS.

Mr. Pratt's statement in regard to queen-rearing, made at the Harrisburg meeting, interested me greatly. He said: "Twenty-five bees are a sufficient company for a queen in a baby nucleus. Fifty bees will do better. More than a teacupful is a decided disadvantage."

The above statements are made from the queen-breeder's standpoint, and in so far as are undoubtedly true; but what does the queen say? It is not so clear to the honey-producer and purchaser of queens why more than a teacupful of bees should be disadvantageous. "Twenty-five bees may do; 50 do better; a teacupful perhaps still better." And there seems to be the limit. I can not see the reason why. I am not a professional queen-breeder.

Ontario Co., N. Y.

# Convention Proceedings

## Worcester County (Mass.) Convention

Members and friends of the above Association dined and met socially on an afternoon in February, and listened to an address on diseases of bees by Mr. Arthur C. Miller, of Rhode Island. The occasion brought together as many people interested in the busy bee as had ever been congregated in Worcester County.

At 2:30 o'clock Pres. Drake called the meeting to order, and introduced A. A. Hixon as presiding officer. After remarks of welcome by Secretary Hixon, of the Worcester Horticultural Society, O. B. Hadwen, a veteran horticulturist, was introduced. He told of the bee being the first live stock he kept on his farm, and of the profit and pleasure it furnished, besides being of inexhaustible study in Nature.

Burton W. Potter, President of the Agricultural Society, said he first kept a colony of bees for pleasure, and to get honey for home consumption, but now he has an apiary of 5 colonies at his farm. He thought the bee an indispensable factor to plant life and fruit-trees.

F. H. Farmer, President of the Massachusetts Apicultural Society, and H. H. Jepson, also spoke of the work of the bee and the bee-keepers.

Following these introductory remarks the speaker of the afternoon, Arthur C. Miller, was introduced, and spoke as follows on

### DISEASES OF BEES

At the start I wish you to understand that the ailments of bees are not of such a nature as to endanger humanity through eating the honey or handling the bees.

Eminent authorities suspect that much that is written of the diseases of bees is fanciful and most of the ailments originate from want of cleanliness or want of food. Bee-keepers are wont to consider their knowledge of the bee as modern, whereas knowledge and practices differ but little from those of two centuries ago. Valuable ideas of early bee-keepers have, as well, been lost sight of.

Bee-ailments, as known to-day, may be divided into two classes, those due to germs and those due to nutriment, but the degree of malignancy of the former is often dependent upon the bee's food.

Foul brood is the only germ disease positively known as such. It attacks bee-brood and causes foul decomposition. Black brood is by some supposed to be foul brood, modified by some unknown cause. Pickled brood is another disease of unknown origin. Paralysis attacks the adult bee, and symptoms point to its being caused by bacteria. Aside from foul brood, the diseases mentioned are not common.

Dysentery, which decimates bees in the spring, is ascribed to no one knows how many causes. Tumefaction of the antennæ is of rare occurrence, and has been noticed mostly in queens. The ends of the antennæ become enlarged and turn yellow. This extends to the front of the head, and the bee soon dies. Vertigo, whose symptoms are a dizzy manner of flying and irregular motions, followed by lassitude and death, is another disease. It is ascribed to nectar from such plants as laurel, azaleas and rhododendrons.

At varying times and places, what seem to be different diseases, becomes epidemic, and whole districts become depopulated of bees. Careful analyses of the conditions preceding and during bee-epidemics, point to food as being at the bottom of the trouble. Hereditary impaired constitutions are also a potent factor in inviting disease.

Until recent times it was the custom to destroy the heaviest colonies for their honey. This destruction of the strongest left the less vigorous to perpetuate the species. Evil results finally became so obvious as to arrest the attention of bee-keepers, and methods were devised to obtain part of the honey without destruction of the bee, also of taking the less populous colonies and saving the heavy ones for stock. Next came an era of excessive and unwise manipulation, resulting in a great loss of bees.

I know of no practice that has been more productive of harm than that of spreading the brood to increase the strength of colonies. Brood killed in this way furnish a hot-

bed for breeding disease-germs. The advent of the Italian bee was hailed as a panacea for all ills in beedom. It did infuse new life into the bee.

Now again bee-disease appears in all directions, and in all degrees of malignancy. Have any of you noticed that the spread of disease is coincident with the so-called cell-cup system of queen-rearing? Proper rearing and development of queens is essential to well bees.

Faults along these lines we can overcome, but curing illness well seated is not so easy. Treatment of any of the diseases by drugs is difficult and uncertain. Success has been obtained in eradicating foul brood by the use of izar. Bee-paralysis has been controlled to some extent by the use of flour sulphur. The first thing for us to do with any disease is to remove all unclean matter, give the bees clean, dry quarters, sound stores and a healthy queen.

The McEvoy treatment of foul brood is to take the bees from everything they had, and keep them from combs or brood until their stomachs are presumably free from the germ, then give them a chance to establish a new home.

Dysentery appears to be a germ disease, which is always present, awaiting favorable conditions to develop. In handling bees we must avoid extremes of heat and cold, and do not change the proportions of nurses to brood so that the latter are liable to suffer from want of food. With bees, as with humanity, an ounce of prevention is worth several pounds of cure.

ARTHUR C. MILLER.

Following the talk by Mr. Miller, he was interrogated upon various phases of bee-life, successes and failures of bee-keepers.

Several of those present were enrolled as members of the Society at the close of the meeting.

It was announced that plans were being made for at least two summer field-days, when the bee in life could be studied.

## Our Sister Bee-Keepers

Conducted by EMMA M. WILSON, Marengo, Ill.

### A Light-Spring Bingham Bee-Smoker

The head of this department hereby tenders thanks to Mr. T. F. Bingham, the veteran smoker manufacturer, for one of his instruments that he thinks will please on account of lightness of spring. A very interesting departure from the ordinary is the manner in which the nozzle is put on. The usual way for a detachable nozzle is for it to telescope over the upper part of the fire-box. Instead of that, in the present case, the telescoping is the other way—the nozzle is shoved down a certain distance into the fire-box. The evident intention is to avoid two objectionable things. First, the loose fit and dropping off of the nozzle; second, the loose fit that allows the smoke to escape before it reaches the point where it can do the most good. Whether it accomplishes these purposes can only be told after it has been in use long enough to have all the pretty, new look disappear, but it certainly looks hopeful.

Right here it may not be amiss to protest against the idea that a light spring is a desideratum only in a woman's hands. Anything more than sufficient stiffness to throw the bellows open and still allow a sufficiently firm grasp to prevent the smoker from falling means only a waste of strength. While a giant might handle with ease a spring with twice the necessary stiffness, there is no sense in wasting a giant's strength in that way.

### A Swarm-Hiving Experience

DEAR MISS WILSON:—As we take the American Bee Journal, and as I enjoy the Sisters' department, I will give my experience in hiving my first swarm of bees.

I had often helped my husband with his bees, and was more excited than he was when a swarm came out. I had long wanted to show my ability in hiving bees, and often thought I could have done better than he did—and perhaps had said so.

My chance came one fine wash-day. My husband had gone away from home. So, on looking toward the apiary, I saw the bees swarming. I quickly donned my bee-veil and gloves, and hastened out to see from which hive they came. I was pleased to find that the swarm had a clipped queen. Then my fear was not that the swarm would leave, but that I might lose the queen.

I searched for her, and finally found her at the corner of the hive. I induced her to crawl into my hand, and carefully carried her to where the swarm had kindly (in consideration of me, of course) set-

bled on a low plum-bush. I let the queen crawl into the swarm, which was a fine, large one. I then got a hive and placed it on a stool-chair which I had covered with a canvas.

I then arranged the frames against the sides, allowing the lower part of the swarm to come between the frames. I gave the limb a quick blow with an ax, and down they fell almost all into the hive, and the rest on the canvas. I quickly placed the hive-canvas over the seething mass, and to my delight saw those on the canvas soon going toward the hive. With a weed I agitated them, and was glad to see almost all going into the hive. I gently lifted the frames in place without removing the canvas, put the cover on, and my swarm was hived.

So intent had I been with my work that my husband had returned, slipped up, and had been a silent witness of my performance, so when I finished and looked up there he was grinning at me from behind the plum-bush. And said, "Bravo! Well done!"

Well, in an hour my bees were working as though they had always lived there. I was interested, and watched them a great deal.

We examined them in 10 days, and I was delighted to find such lovely sheets of well-filled comb, but found no eggs or brood. In a few days we looked again, but still no brood. Finally the bees began to dwindle, and I decided they must have a new queen. The old clipped queen was there all the time. How I disliked to take out the mother of so fine a swarm and kill her! My husband decided to put her in his observatory hive and kept her for some time.

We gave the bees a sheet of comb with brood and eggs from which they reared a fine queen, built up, and went into winter quarters in good condition.

My clipped queen never, to our knowledge, laid an egg after she came forth with the swarm. She left the parent hive well-filled with brood and eggs. She was one year old. Although small, she was considered one of my best queens. What was wrong with her?

Saline Co., Kan.

Mrs. F. G. B.

You succeeded very nicely with your first attempt at hiving a swarm, but let me tell you of an easier way to hive it when it has a clipped queen. When the swarm comes out find the queen and put her in a queen-cage (which is well to have handy before the bees swarm). Now remove the hive from which the swarm issued to a new stand, and put in its place the new hive. Lay the caged queen on the entrance of the hive where you wish the swarm to go, and then all you have to do is to stand still and watch those bees come back of their own accord and hive themselves.

When they have started crawling in nicely liberate the queen and let her march in with the rest. That's all—easy, isn't it? But you must not waste any time about it, or those bees may come back before you are ready for them.

I am sure I don't know why that queen should stop laying unless she was accidentally injured in some way during the swarming.

## Using Honey from Hive Where Bees Died

The bees in one of my hives are all dead, but there are left 3 frames full of honey and 3 that are more than half full.

1. Do you think this honey will be all right to feed to any of the other colonies, if they need it, or is there danger that something is wrong with it?

2. I had them packed well, with cushions on top. The bees were in one end of the hive. Do you think they were queenless, or were they killed by the cold? I did not notice any bad odor coming from the hive, and there did not seem to be anything wrong except that they were dead, and the hive was a little damp.

Cumberland Co., N. J., March 8. MRS. SARAH J. GRIFFITH.

1. I would feed it to the others.  
2. They may, and they may not, have been queenless. In any case they were probably weak, and died of starvation, although there was plenty of honey in the hive. Having used up all the honey within reach, the continuous cold weather did not allow them to leave the cluster to get a fresh supply.

## Mr. Hasty's Aftershoughts

The "Old Reliable" seen through New and Unreliable Glasses.  
By E. E. HASTY, Sta. B Rural, Toledo, Ohio.

### THE HONEY-PRODUCERS' LEAGUE AND COMB-HONEY GUARANTEE.

As to the League, and the exceedingly important matter presented on page 259, I am not nearly ready to say all I think about it. On one particular point I can say what I think. Don't, please don't, raise the guarantee higher than a thousand dollars. The public have more sense than you give them credit for, brethren. They have been dazed and bored, and fairly forced, into a safe and sane conclusion by the myriad offers in the press of \$50, and \$500, and \$1000, and \$10,000—big money for something and everything and nothing—great sums for solving little puzzles so childishly simple that one could hardly help solving them if he tried. The safe refuge of conclusion has been reached that business does not consist in giving away money, and that

all such offers are deceptive—pure bluff it may be—prearranged it may be—at the very least with some invisible string attached to them. All folks with an atom of sense incline to pay no more heed to them than they do to the fat pocket-book that lies so temptingly on the walk April Fool's Day. To illustrate what I mean, let me ask this question: Why not offer a million dollars? You reply, That would defeat itself; because each man would laugh and say, "These people haven't got a million dollars, and they are making no arrangements to raise it." Well, just as little should we be making any arrangements to raise the \$10,000; and folks would conclude so. The child's, "Bet you five thousand million dollars," does not secure any assurance. And when the quack doctor offers \$10,000 for a case which his remedy will not cure, few people hustle to get the money—in spite of the fact that they know that there are multitudes of incurable cases in the world. Let's not imitate the quack doctor. The guarantees that have been offered in the past have silenced many people; but probably three-quarters of them have not been fully convinced—still inwardly believed that comb honey was being manufactured—and also that it would be foolishness to spend time and dollars in the effort to get that money.

What then? Either let the guarantee business rest just where it is, or raise the sum and put it up in some bank window where the incredulous can be sent to look at it. Buy a first-class, interest-bearing, thousand dollar bond. Fully explain the whole sad matter to some friendly State governor, and ask him to act as holder of the bond, and to keep it deposited in the bank that will give it show-room. Appoint three reliable men, only one of whom shall be a bee-keeper, to act as awarding committee. Then we should have things in shape so we could say, "Tell you right where you can see a thousand dollars that you can have by proving what you have just been saying."

### FASTENING FOUNDATION TO SECTION'S FOUR SIDES.

H. G. Sibbald, of the Ontarios, seems to succeed in fastening foundation to all four sides of a section. It doesn't bulge for him, we should infer, as bulged honey would hardly take first prizes. Page 146.

### GUARDING AGAINST INFECTION OF BEE-DISEASES.

Prof. Harrison, of the Ontario Agricultural College, is one of those who encourages the minimum amount of care in guarding against the infection of bee-diseases. Even says that diseased bees, when visiting flowers, may leave infection there which healthy bees may subsequently take. He also asserts that disease is sometimes carried by foundation. Naturally he is not caught in the absurdity of asking the apiculturist to disinfect his hands—and never mind disinfecting the hive, which has had foul-broody bees running over its walls for months; and more or less daubed with foul-broody honey at that. Page 147.

### SINGLE VS. DOUBLE BROOD-CHAMBER COLONY.

A. E. Hoshal says a single brood-chamber colony (Heddon) will give as much honey as a double brood-chamber colony in a short season. Wonder how he figures that out (providing it's so). Some of us would say that strong colonies would have more advantage in short flows than in long ones. Also, I should protest, his don't care if old bees are killed in uniting. Looks to me like a disgrace which a little more care and "gumption" would avoid. Page 149.

## Doctor Miller's Question Box

Send Questions either to the office of the American Bee Journal, or to Dr. C. C. MILLER, Marengo, Ill.  
☞ Dr. Miller does not answer Questions by mail.

### Management in Swarming

If when a colony casts its prime swarm I deprive it of its clipped queen as she emerges from the hive, and 7 days later destroy all queen-cells except one, will such colony be likely to swarm again, and would such management be practical? MISSOURI.

ANSWER.—It may work all right if you don't miss any cells. A variation of the plan would be to wait till you hear the young queen piping in the evening, and then cut out all cells next morning. You would be a little surer of a good queen in this latter way, for it might happen that by the first way you would leave a cell containing a dead larva; for dead larvae are sometimes found in cells that look all right.

### Bees in the Attic—Inbreeding

I have my bees in the attic facing east, and it is so arranged that the temperature can be controlled during the winter months. During our most severe weather the past winter it has not been below 32 degrees, and never above 40, unless the weather out-of-doors was warm enough for them to have a fight.

1. What would be the best temperature and cause them to consume the least amount of stores, with the hive-entrances open to the weather at all times as they are now?

2. Would they consume less stores and winter more satisfactorily

if the hives were put in the center of the bee-room, and the room darkened as in cellar-wintering?

3. Could I buy one Italian queen and rear queens from this one to Italianize the rest?

4. There would be no drones to fertilize my queens except drones from the same queen or mother as themselves. Does this inbreeding of bees amount to anything? Isn't it a detriment to the future generation? I have never seen anything on the subject.

NEW YORK.

ANSWERS.—1. About 45 degrees, but there is a good deal of variation in thermometers.

2. I think not.

3. Yes.

4. Inbreeding is not desirable, but in this case there would not be much chance for it.

### Preventing Robber-Bees

I have noticed that there are strange bees robbing mine of honey. How can I prevent this?

ILLINOIS.

ANSWER.—The chief thing is to help them to help themselves by keeping them strong and by avoiding things that will tempt robbers to start at their work. A queenless colony is a fair mark for robbers. Break it up and distribute bees and brood among other colonies. Keep the entrances of weaker colonies so small that the bees can easily guard them. Don't allow brood-combs or combs of honey to stand exposed to tempt robbers. Don't open hives at a time when robber-bees are troublesome. If for any reason you must open a hive at such times, do it in the evening after flying has ceased.

### Feeding "Cider" Honey from Hive in Which Bees Died

I find upon examining my hives this spring that 5 colonies have died, the frames being all filled with sealed honey except the brood-nest, which they filled late last fall with sweet cider, and the cider soured and killed the bees.

Will it be safe to give those frames to other colonies as they are, containing honey and sour honey not sealed, but no bad odor?

WASHINGTON.

ANSWER.—Perfectly safe to give to the bees after they are flying daily, to be used up in rearing brood. Only look out that it does not go into surplus, and that it is not left for next winter's stores.

### Stimulative Feeding—Transferring Bees

1. Would uncapping a little comb every day be as good for stimulative feeding as syrup made from granulated sugar? There is plenty of honey in the hive, and I want the bees to build up so that they will be booming when the honey-flow comes on.

2. I want to transfer the bees into a dovetailed hive. When is the best time to do it?

NEW YORK.

ANSWERS.—1. Yes, and very likely you may save yourself so much trouble. Every 2 or 3 days may do as well as every day. If the queen is laying all the eggs the bees can cover, it is hardly worth while to take even that trouble, for stimulating can hardly help, unless it be that it gets up extra heat in the hive.

2. In fruit-bloom is a good time, but it is perhaps better to wait till the bees swarm, then hive the swarm in the new hive, and 21 days later break up the old hive. In case they fail to swarm, you can then transfer when other bees are swarming.

### Cover for Brood-Frames—Breeding Queens

1. What arrangement of quilts, enameled cloth, etc., do you prefer between the brood-frames and cover?

2. Will a queen breed better drones when two or three full years of age than when one year old?

3. It is commonly recommended to breed from the queen whose bees gathered the most honey the preceding year. Such a queen is supposed to be a full year old; or, as we commonly say, in the second year. In your experience, are the best queens bred from a queen in her third season if she has been worked to her full capacity the two preceding seasons?

4. Do you think the best queens are the daughters of best queens; or, as often is the case in breeding poultry, is not the prize animal or insect obtained by crossing extremes? In other words, should we breed by records or by characteristics? Great vigor, with high intelligence, for example.

5. If the best queens come from the best mothers, why don't we have more of them?

MICHIGAN.

ANSWERS.—1. Between my top-bars and hive cover there is nothing in the world except about a fourth of an inch of air.

2. I don't think she will. The idea probably comes from thinking that a young heifer will not have so good a calf as when older; but remember that a queen is not young in her first year; the first year is a third or a half of her active life.

3. I don't know for certain much about it; but I doubt that it makes much difference whether a queen is a month old or several years old, so far as her queen progeny is concerned. Of course, one is not likely to breed from a queen until she has had a full season's

work to show what she can do, and if her record was all right I wouldn't object to using her if several years old.

4. As a common, every-day bee-keeper, and not a scientist, the only way I have to judge of the characteristics of a queen is by her record, and the one that gives the most honey has for me the best characteristics. The question of crossing is a separate affair, and there is no doubt that very important results may be obtained by the right kind of crossing in bees as well as other animals.

5. I don't think that I can tell; but I think I can give one reason. The best queens, as a rule, are little given to swarming, and vice versa. Here's a queen that sticks to her knitting, never swarms, and is superseded when three or four years old. It is easy to see that left to herself she will give only the one royal descendant, while another queen that runs to swarming rather than gathering will in the same number of years leave 30 or more.

### Moving Bees in the Spring

I desire to establish an out-apiary, but bee-keepers tell me that it is too late now to move the bees, as many field-bees would get lost, because they would fly straight from the hive, as they were in the habit of doing on the old place, and would not find the way back to their new location.

Do you really think that it would be objectionable to move bees after they have started to gather considerable honey and pollen? I have to move some of the bees about 4 or 5 miles, and others only about  $\frac{3}{4}$  of a mile. How about the last distance?

TEXAS.

ANSWER.—Without special precaution, a colony of bees, at a time when they are gathering, if gently moved only a few rods, may be safely counted to be depleted of all field-bees, which, upon returning from the field, will return straight to the spot where stood the old home. If moved a half mile, not so many will return to the old spot, and practically none if moved a mile or more. How many would return of those moved  $\frac{3}{4}$  of a mile would depend somewhat upon circumstances. If, after removal to their new quarters, they should strike upon forage ground with which they were already familiar, they might return from it to the old spot. But the jolting and jarring of the trip will help to make them mark the new spot when the entrances are opened, and you might help matters by blowing in a little smoke and pounding on the hive just before opening. Mr. Scholl, in Gleanings, reports entire success in moving 50 colonies 100 rods in the following manner:

Before bees fly in the morning close entrance with moss or green grass, and move to new location. Open entrance next day, or else let the bees gnaw their way out themselves. If very warm, a piece of section under cover may afford ventilation. When Mr. Scholl's bees were moved it was pretty cool, and even with the cover slightly raised it might be well to look out for suffocation.

### Feeding Bees—Putting on Supers

1. How much sugar-water shall I feed my bees this spring? "They can drink a pint of it in 3 hours."

2. When shall I stop feeding them?

3. When can I put on the first super?

ANSWERS.—1. Not so much as you are likely to think advisable. If they have plenty of stores, it may not be best to feed any. If lacking in stores, feed till they have abundance. It is not well to feed on days when they can get plenty from the fields, nor on days so cool that the bees could fly out and be chilled.

2. The preceding answer will decide that.

3. When you see white wax along the top-bars and upper parts of combs; or, as you are in a white clover region, any time within a week after you see the first clover blossom.

### Prevention of Swarming

Suppose hives Nos. 1 and 2 were to cast swarms only 2 or 3 days apart, and be hived on three frames of brood which are taken from the parent colony, the remaining 7 frames containing half sheets of foundation; now if one does not want much increase how would it do to cut out all queen-cells except one, in one of the old hives, and then unite the two old colonies by placing a few sheets of newspaper between the two old hives.

By this plan one would have three colonies instead of 4, but the main thing would be that he would get lots of honey from this united colony, as it would be plenty strong enough to take hold of a flow, when if you had the two old colonies separated you would have no honey stored for some time.

We have tried this plan twice so far this year, and it has succeeded very well, so we are going to try it still further.

When brood is hatched in the upper story we use the combs to hive swarms on.

Now when these united colonies get strong, and want to swarm, we will be no worse off than before, for we can keep doubling up.

LOUISIANA.

ANSWER.—Your plan of doubling brood is good. In some places there would be danger that colonies would swarm again if hived on as much as 3 frames of brood. If they don't with you it's all right, for the more brood a swarm can have the better, provided it doesn't swarm.

# BEST BEE-SUPPLIES

Lewis' Goods at Factory Prices.

Root's Smokers and Extractors, Dadant's Comb Foundation, Bingham Smokers

Dovetailed hives with the famous COLORADO COVER. The best cover ever put on a bee-hive. Hives (if entirely complete) cost you no more with this cover than with other covers, but they are far better. ## Reports and Experiences

### Bees Wintered Well

Bees in the cellar are perfectly quiet. They had no midwinter flight.

F. GREINER.

Ontario Co., N. Y., March 22.

### Heavy Rains and Washouts

The rain is pouring down, and has been doing so almost constantly for a week. There have been a good many washouts. We are expecting a good season, but I think bees will be scarce, as I have seen many apiaries where they are all gone.

J. HOLT.

Los Angeles Co., Calif., March 16.

### Do Bees Freeze or Starve?

I think I have demonstrated, the present winter, that bees do not freeze to death. I had one colony in a Danzenbaker hive, very light, probably containing less than a pint of bees, and not expecting them to winter, I did not pack them on the summer stand. But disliking to see anything starve I gave them a well-filled frame of honey, from a strong colony. And they appear to have wintered as well as strong colonies well packed for wintering on summer stands. So I conclude that if this little bunch of bees could survive the zero weather we have had this winter, they do not freeze.

This agrees with the experience I had over 50 years ago, when I wintered bees under a shed facing east, without any further protec-

tion, and scarcely ever lost a colony from any cause.

I remember among my first colonies was one with the date 1847 cut in the hive, and a few years subsequent to this date, I built an ell on the north end of the bee-shed, 4x6 feet, fully enclosed. In order to prevent swarming, I put four colonies in this little room, and they developed into strong colonies, and utilized the room outside their hives, to such an extent that I took out combs well filled, over 3 feet in length.

My bees seem to be all right so far, 20 colonies in number, from 3 three years ago, but I lost several a year ago this winter. They did poorly last season.

JESSE GREEN.  
La Salle Co., Ill., March 10.

**Is Bee-Paralysis Hereditary?**

If I am not mistaken Nels Christensen condemns my article on bee-paralysis. Isn't it a fair indication that bee-paralysis is a hereditary disease when a queen's progeny has it and all of her daughter's progeny are also affected with it?

I had many other colonies in the yard at the same time, and not one of those were affected.

Now, do not get an idea that I think I know all about the disease, for I do not think so. If any one has had any experience with the

### Tested Queens by Return Mail, —\$1.00 Each—

We have a large number of Choice Tested Queens, reared last September and October, and wintered in 4-frame nuclei; these queens are vigorous and prolific, and of our fine strain of Three-Band Italians. Just the queens to build up weak colonies. Try them. Send for circular.

**J. W. K. SHAW & CO.**

13Atf LOREAUVILLE, Iberia Par., LA.

back to look at them I found that the most of the nuclei had smothered and the frames were broken down. The thermometer was 90 de- grees at the time.

But I didn't get discouraged. I gave the nuclei more bees and queen-cells, but didn't bother about stopping the entrances. In some of the nuclei the bees left to such an extent that there were not enough to start the queen to laying.

After I got the first batch of queens out I gave more cells from other colonies, and more trouble followed. None of these queens were any good, so I gave them more queen-cells in queen-cages, but only one; hatched, and it died soon after.

The mistake I made was in giving queen-cells to nuclei that already had queens. However, the bees have paid for themselves, so I may do better another year.

W. GONOR.

Manitoba, Canada, March 1.

### Wintering Bees

I have kept bees for five years, but with the farm and stock work I did not give them the care they ought to have had and the consequence is I lost 6 out of 8 from the severe cold; they had an abundance of stores. I did not have regular hives, just box-hives which I made. I wintered them on the summer stands but believe they are like poultry, if you want them to thrive and be ready for business when spring opens you must give them comfortable winter quarters. I am in a pretty good location, near the timber where there is plenty of early flowers; then white clover, then basswood. I think my family is healthier since we had plenty of honey to use.

DAVID HAYNES.

### Queens Hatching—Piping Heard Before Swarms Issue

I have a neighbor who is a bee-keeper, and claims to be an expert. He came to my home to give me some "pointers" on bees, and

part of the time was taken in showing me how to start a nucleus with 2 brood-frames, a queen-cell and bees. He explained that the queen would hatch out 3 days after the cell was sealed. That was more than I could stand, so I went for him. But he stuck to it, and would not give in. I think he was somewhat mixed.

In the issue of Feb. 9 we read, "When you put your ear to the hive the evening before a second swarm issued, did you hear more than one queen piping?" I have heard queens piping time and again, and have always heard 2. The morning before the swarm issued I have opened the hive, and found 2 queens, one in each side of the hive. Later in the day a swarm would issue, and there would be a queen in the cluster, and one in the hive. Sometimes I would find one or two running in front of the hive on the ground.

NELS CHRISTENSEN.

Crow Wing Co., Minn., March 9.

**Very Severe Winter**

The past winter was very severe in Wisconsin, much more so than the previous one. Colonies went into winter quarters strong in bees and honey, as we had the best honey flow in years last fall.

We started the season with 188 colonies. About 20 were very light, and did but little except build up. We took off 14,000 pounds, mostly extracted, about one ton of which was fall honey (amber). We were greatly troubled, early and late, with honey-dew. The bees got some of it in the brood-chambers, and went into winter quarters with it, and it is causing us a little trouble.

Bees that wintered outdoors had a good flight Dec. 24. After that for 2 solid months the thermometer was below 34 degrees above zero—6 days it was at zero, 12 days 8 below, 4 days 10 below, 5 days 2 below, 5 days 28 below, 2 days 34 below, and the rest of the time from Dec. 24 to Feb. 25 it ranged from zero to 34 above.

We have had over 3 feet of snow in the woods at one time. It is over half gone now. We all think the clover is all right at present, and know that the ground is full of water to the depth of 6 feet.

L. G. BLAIR.

Grant Co., Wis., March 13.

**QUEENS ITALIAN QUEENS**

BY RETURN MAIL.

Try Taylor's 3 banded leather-colored and 5-banded Golden Queens—the best honey-gatherers in America. Untested, 75c each, or \$8 per dozen; tested, \$1, or \$10 per dozen; select tested, \$1.50 each; breeders, the best, \$3 each. I have been breeding queens for 17 years, and I know what a good queen is. No small queens sent out. I guarantee safe delivery. Send your orders to J. W. TAYLOR, Ozon, Ark.

## C. H. W. WEBER

CINCINNATI ... OHIO ...

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

## Honey and Beeswax

**CHICAGO, April 7.**—The market has cleaned up quite well on comb honey. Choice white comb is selling at 12@13c, and the off grades are also moving freely at 9@10c. Extracted is not sharing in this movement and prices are weak at 6@7c for white and 5@6c for dark according to flavor, body and package. Beeswax, 29@30c. R. A. BURNETT & CO.

**BOSTON, March 9.**—The demand for comb honey still continues light with heavy stocks on hand. Fancy white, 15@16c; No. 1, 14c. Extracted, 6@8c, according to quality. BLAKE, SCOTT & LEE.

**KANSAS CITY, March 31.**—The honey situation does not improve. While there is a little better movement the prices seem to be lower. Fancy white brings \$2 a case; No. 1, \$1.75; amber and lower grades from \$1.25 to \$1.50. Extracted, 4½@6c. Beeswax, 28c. C. C. CLIMONS & CO.

**CINCINNATI, O., April 7.**—The large stock of comb honey, yet offered with hardly any demand, caused lower prices. I quote fancy water white at 12c; other grades in proportion, lower. Extracted is in the usual demand for this time of the year; quote amber in barrels at 5½@5¾c; in cans, ½c more; white clover, from 7@8c. Beeswax, 28c. C. H. W. WEBER.

**ALBANY, N.Y., Feb. 8.**—Honey market dull this extreme cold weather, especially comb, which candies or granulates and cracks easily. We quote: Fancy white, 13@14c; No. 1, 12@13c; mixed, 10@11c; buckwheat, 10@11c. Extracted, better demand: Buckwheat, 6@6½c; white, 6@6½c. Buckwheat most in demand, as the Jewish people will have no other. Beeswax, 30@32c. H. R. WRIGHT.

**PHILADELPHIA, April 10.**—The market is still further demoralized on comb honey since our last quotations. Good comb honey is being retailed for two for 25c and wholesaled at 10c a section. This will grade from fancy down, and is bought up in job lots to close out. We have no further quotations, as the market is very irregular. Extracted honey is selling, fancy white at 7c; amber, 5½@6c, according to quality. We are producers of honey and do not handle on commission. WM. A. SELSER.

**NEW YORK, April 8.**—There is nothing doing in comb honey. The demand is next to nothing. Quite an amount of old stock left on hand, some of which no doubt will not be sold before fall. A little fancy stock is moving here and there but of no consequence. Large blocks are

not being moved. Extracted honey is dull also. Large buyers are holding off having an idea that prices will rule considerably lower when the new crop begins to come in from the South and California. For the present time we cannot encourage shipments of either comb or extracted honey. Beeswax is firm and in good demand at 30c. HILDRETH & SEIGELKEN.

**CINCINNATI, March 10.**—There is little, if any, improvement in the honey market here, since our last quotation. We hope to render a more encouraging report soon. We quote amber extracted honey in barrels and cans at 5½@6½c. White clover at 7@8c. Fancy white comb at 12@13c. Beeswax, 28c. THE FRED W. MUTH CO.

**SAN FRANCISCO, April 5.**—White comb, 1-lb. sections, 11@12 cents; amber, 8@10c. Extracted, white, 6@6½ cents; light amber, 4½@5½c; amber, 3½@4½c; dark amber, 3@3½c. Beeswax, good to choice, light, 29@30c; dark, 27@28c.

New crop honey is expected on the market in the near future. Indications are there will be a fairly liberal yield in this State and the quality of high average. No large quantities of 1904 honey now on market, but inquiry for same is light and business is mostly of a small jobbing character.

### QUEENS! QUEENS!

Am ready as usual to furnish the BEST OF QUEENS only. Have changed my address, having moved to 1111 N. Smith St., San Antonio, Tex., where I have better mail service.

Untested Queens, 85c each; Tested, \$1.25 each. Untested, after April, 75c each; or \$8 per dozen; Tested, \$1 each.

I rear only the three and the five banded Italians. DANIEL WURTH, 1111 N. Smith St., SAN ANTONIO, TEX.

Please order from these prices to save correspondence. 14E21

### 3-Frame Nuclei For Sale.

“There’s no use crying over spilt sections.”  
 You won’t have to if they are  
**LEWIS’ SECTIONS**

You are not taking chances when you order Lewis’ Sections.  
 Our name is on every crate.

These are Lewis’ Sections. Aren’t they Beauties?  
 Read what others say about them:

G. B. LEWIS CO., Watertown, Wis.      Deerfield, Iowa.  
 Gentlemen:—I want to say that I consider your make  
 of sections the nearest perfect of any I have ever had. I  
 have folded packages of 500 without breaking one and I can-  
 not say that of others I have used.

Yours truly,      GEO. BROWN.

G. B. LEWIS CO., Watertown, Wis.      Centralia, Kas.  
 Gentlemen:—Everybody wants Lewis’ sections.

Yours truly,      A. W. SWAN.

Grand View, Iowa, June 3, 1904.

G. B. LEWIS CO., Watertown, Wis.  
 Gentlemen:—I have received those sections in good

shape and I am well pleased with same. They are all right  
 in every way. I shall recommend your bee-supplies to other  
 bee-keepers. I think you make better goods than any other  
 firm in the world. Accept my thanks.

Yours truly,      GEO. B. MCDANIELS.

Kenton, Ohio, May 4, 1904.

G. B. LEWIS CO., Watertown, Wis.  
 Gentlemen:—The goods are simply fine in every re-  
 spect. We have compared a few of the No. 1 sections  
 bought of another firm which we carried over from last sea-  
 son with your No. 2 and find that the No. 2 are superior.

Yours truly,      NORRIS & ANSPACH.

Lewis’ Sections have made the Lewis Co. famous. They are for sale all over  
 the world.

## Editorial Notes and Comments

### Putting Weak Colonies Over Strong Ones

Reference to page 262, shows considerable interest at the Michigan State convention in the plan of putting weak colonies over strong ones in spring. The plan was first given by E. W. Alexander, in the Bee-Keepers' Review for April, 1904, where he says:

After the bees have been taken from the cellar, and had a good flight, we commence at one side of the yard and examine every colony carefully. Those that are weak in bees, yet have a good queen, we mark; and, as soon as they have some larvæ in their combs, which is usually in about 5 days after setting out, each is taken to a good, strong colony and set on top, with a queen-excluding honey-board between. If there is no larvæ at this time in the weak colony, I give it a frame from the strong colony, so as to keep the bees from leaving their queen, and all going below. I close up all entrances except that of the strong colony. The bees will divide themselves about equally between the 2 queens; and in about 4 or 5 weeks I can separate them, and, in nine times out of ten, I have 2 good, strong colonies. For 20 years I have treated all of my weak colonies in this way in early spring. Sometimes I have had 100 weak colonies on top of strong colonies, and I don't lose 5 percent. I think it a much better way than to try to build them up alone; as there is no trouble from robbers, and no attention is required until it is time to separate them. Don't keep them together too long, as the young bees, when over 2 weeks old, are liable to sting one of the queens.

Commenting upon this in the latest number of the Review, Editor Hutchinson says:

When I published the foregoing there was no doubt in my mind that it would work out as Mr. Alexander said it would, that the weak colonies would be saved and build up, but I had a lingering suspicion that the strong colonies might lose as much as the weak ones gained—that it was robbing Peter to pay Paul—and I don't feel sure yet that there is anything gained except saving the queens of the weak colonies; however, I am more than willing to be convinced to the contrary.

There can be no question that any accession of bees to the upper colony from below means a loss to the lower colony. Another thing not mentioned is the fact that the upper colony will lose its flying force not once, but twice. When it is placed over the strong colony, any bees that have well marked the old place, when they return from the fields, after the removal, will go straight to the old location and join some colony close by. The number will not be large when the removal occurs as early as Mr. Alexander mentions; but in the cases mentioned on page 262, the removal was no doubt much later, for Mr. Pearce says in the last Review that he got his hint from the April (1904) Review, and the others probably did the same.

When the upper colony is returned to its old stand after 4 or 5 weeks, the loss of the entire field-force will be a somewhat serious matter.

After looking all these objections squarely in the face, there still remains one great advantage, an advantage so great that if the loss of queens is no greater than reported, a debt of gratitude is due Mr. Alexander for giving us the plan. Compare 2 colonies in the spring, one with bees enough to cover 2 frames of brood and another twice as strong. The weaker colony will stand still as to strength, if indeed it

does not progress backward, while the other will increase right along. That is, the proportionate increase is very much greater with the stronger colony. Later in the season, when the weather is warm, the weaker colony will increase with the same proportion as the stronger. Now if we can, after a fashion, unite the forces in the cool, spring weather, there will be great gain. We have practically given the upper colony warmer weather, in which it can have a fair show.

The editor of the Review says "it is really, in one sense, a division of the strong colony, a drawing off of bees and heat for the building up of another colony." The drawing off of heat is admitted; but not so much heat is withdrawn as if no bees were in the upper story. Just a bit doubtful as to drawing off bees. No bees are likely to go above that are needed to cover the brood below, and the bees above can keep warm a much larger amount of brood in the now warmer atmosphere.

On the whole, there seems good reason to believe—always supposing no loss of queens—that the advantage to the upper colony will largely overbalance the harm to the lower. The loss of the field-force, when the upper colony is returned to its old stand, will be just so much gain to the lower colony, and if desired things may be evened up by giving the upper colony one or more frames of brood from below a day or two before the time of the second removal.

It is not too late yet to make a trial of the plan in the North, and let us hope that others will succeed so well that a vote of thanks may be given the Review for blazing the way.

### Sugar Syrup Not All Inverted

Analysis reported in the British Bee Journal showed 3.8 percent of sucrose (cane-sugar) where sugar syrup had been fed, against mere traces in honey obtained from the nectar of flowers. This, the British Bee Journal says, is in accord with the statement of Mr. Cowan at a California convention, where he said:

"When bees have been fed with cane-sugar syrup only part of this is transformed into dextrose and levulose, so that it is easy to detect the presence of cane-sugar in the way I have pointed out before, when this method of fraud has been adopted."

### Missouri's Unfortunate Foul Brood Bill

Mr. Robt. A. Holekamp, who was perhaps the most active bee-keeper in all Missouri in getting the Apiary Bill passed by the Legislature of that State, wrote the following letter to Gov. Folk, who had vetoed the Bill:

ST. LOUIS, Mo., March 23, 1905.

TO HIS EXCELLENCY, JOSEPH W. FOLK,  
Governor of the State of Missouri.

Dear Sir:—I have just read in the St. Louis Republic your message to the Secretary of State vetoing Senate Bill No. 268, the Apiary Bill.

I take the liberty to send you these lines explaining why this Bill was introduced and passed by both houses of our Legislature.

We have diseases amongst the bees of this State which can not be eradicated through the efforts of the individual bee-keepers, because the infection is constantly carried back to his apiary if other apiaries in his vicinity are diseased.

The disease which has a strong foothold in this State is foul brood, which is caused by a microbe called *Bacillus alvei*; this *Bacillus* kills the larvæ in the brood-combs before they mature into bees, and colonies infected with this disease become weak and finally die out. When a colony is in this weak state, or has died out, bees from other colonies enter the hive, rob the honey left in it and carry it into their own hives. The colony to which this honey, which contains the *Bacillus*

alvei, is carried soon shows the disease and will perish as the colony from which the honey was carried, and in this way whole apiaries are destroyed.

Now, if it were only for the bee-keeper's own apiary where foul brood exists, it would probably not be necessary for the State to interfere, but bees from neighboring apiaries will come to this diseased apiary and carry home the disease by robbing in the diseased apiary, thus spreading the disease and destruction.

Bees will travel as far as 6 miles in quest of honey, and it seems they have means, as experience teaches, to find a weak colony or a hive without live bees on long distances.

The State Inspector is needed to examine bees, which the progressive bee-keeper has no authority to inspect. There is no possibility for the Missouri State Bee-Keepers' Association, or the individual bee-keeper to preserve the bee-industry of the State from final destruction; the State must help them.

The disease exists now only in spots here and there over the State, and it can be eradicated if proper measures are taken in time.

The honey industry of Missouri is not small. There are over 41,000 bee-keepers in this State, according to the United States census of 1900, who produced in 1903 over 6,000,000 pounds of honey, according to the reports of the Missouri State Board of Agriculture.

If you will permit me to appear before you to show some combs containing the larvæ killed through foul brood, I will be pleased to come to Jefferson City, and then will be able to explain more fully the workings of the disease, and be able to back it up by proper literature.

The Apiary Bill is killed for the present by your veto, but it will be introduced again in the next Legislature, and that is the reason I take the liberty of addressing you.

I also take the liberty of enclosing a copy of a letter sent by Prof. Frank Benton, of the Department of Agriculture, Washington, D. C., to Senator Voorhees, which shows that Prof. Benton considers legislation necessary for the preservation of the honey industry of this State.

I wish to remark that I have not been a candidate for Inspector, and this Bill had not been gotten up to give a job to some individual. I send you enclosed a circular to the members of the Missouri State Bee-Keepers' Association, which was sent out by me before I read your veto in to-day's paper. There were two candidates for Inspector already, but I was trying to find the best man available, and then to submit his name as the candidate of the Missouri State Bee-Keepers' Association to the Missouri State Board of Agriculture, and to petition the Board to appoint him. Mr. George B. Ellis, Secretary of the State Board of Agriculture, will bear me out in this.

Respectfully,  
ROBT. A. HOLEKAMP,  
Assistant Secretary Missouri State Bee-Keepers' Association.

The letter referred to as written by Mr. Benton to Senator Voorhees, is as follows:

WASHINGTON, D. C., Feb. 16, 1905.

SENATOR VORHEES, State Senate, Columbia, Mo.

Dear Sir:—One of the correspondents of this office has called my attention to Senate Bill No. 268, which is entitled "An Act to provide for the appointment of a State Inspector of Apiaries, and to regulate the duties thereof."

During several visits that I have made to your State, I have seen the necessity for some such legislation, having learned of considerable devastation in different portions of the State through contagious diseases of an extremely destructive character, and I am therefore greatly interested in the success of such legislation.

The only change which I would suggest is to make it slightly more general, through using in the first section of the Bill the words, "for the prevention and suppression of contagious diseases among honey-bees, such as foul brood, black brood, paralysis," etc., instead of the sentence, which, in the present Bill, confines it more especially to one disease alone. The possibility should always be taken into consideration of the introduction of other diseases, as well as the fact that at least one other disease besides foul brood, namely, paralysis, does exist within the State at the present time.

The great benefit which honey-bees do to the horticultural and agricultural interests of the State, through complete pollination of the blossoms of fruit-trees and various clover and seed crops, resulting in greater production as well as better quality of fruits and seeds, renders the protection of bees of great importance to the horticultural and agricultural interests of the State.

The States of New York, Michigan, Ohio, Wisconsin, Illinois, Colorado, Texas, Utah and California have laws which, in most instances, have been of great benefit in the suppression of contagious diseases among bees. Perhaps among these the Illinois law has been most ineffective, simply through lack of proper compensation to the Inspector, and perhaps, in some instances, no appropriation to execute the law properly. On the other hand, in New York, Colorado, Wisconsin and California vast good has resulted, while no interests have been injured thereby.

I commend most heartily to the careful consideration of every Senator this subject, and hope sincerely that the pending legislation will receive unanimous support.

Yours very respectfully,

FRANK BENTON,  
In Charge of Apiculture.

In the Modern Farmer and Busy Bee for April, Editor Abbott devotes several pages to a thorough review of Gov. Folk's veto, which appears on page 261 of this Journal. Mr. Holekamp did well to write to Gov. Folk. The only fear is that he may never see the letter among so large a correspondence as a governor would naturally receive. Of course it was too late to undo the wrong done the bee-keepers of Missouri. They will have to try again at the next session

of their Legislature, and in the meantime endeavor to see to it that the Governor is so well informed on the subject that he will not repeat his unwise action.

On another page appears an article on this subject, from Dr. G. Bohrer, of Kansas.

## Miscellaneous News \* Items

Hon. R. L. Taylor, of Michigan, has been elected chairman of the Board of Directors of the National Bee-Keepers' Association, to succeed W. F. Marks, of New York, who resigned.

**Photographs of Apiaries.**—We could use some more good photographs of apiaries of our subscribers if they will kindly send them in. We should also like brief descriptions to accompany them. In case we would not be able to use any that are received, we will return them if so requested. We will also return any we do use if it is desired. If you have a nice apiary, and no picture of it, why not have one taken during the summer when it appears at its best?

**The Apiary of Edw. Scoggin,** of Eddy Co., New Mex., is pictured on the first page this week. Mr. Scoggin has this to say about it:

I send a photograph of my apiary and a portion of my dwelling-house and family, taken in 1903. My family consisted of myself, wife, four boys and one girl. My apiary contained 120 colonies, and produced 5¼ tons of honey that season—3000 pounds of comb honey and the balance extracted.
