The position of the Church in New France cannot be properly described unless a reference is made to the dominating influence which controlled Europe during the age of colonization. Seventeen years before Cartier's first voyage to the Saint Lawrence (1534) Luther had denounced the sale of indulgences at Wittenberg. In the interval between Cartier's first voyage and his last (1541) the "Institutes" of Calvin (see CALVIN, JOHN) was becoming the foundation of a Church and the Company of Jesus (see JESUITS) was arising to stem the tide of heresy. Despite the wars of religion and the national exhaustion which they produced, religion was still the reigning issue in France when Champlain sailed westward to continue the work of Cartier. This may be seen chiefly in two ways: from the missionary zeal of the religious orders and from the anxiety of French Catholics that New France be kept untainted by Huguenot misbelief. With De Monts and Poutrincourt, Calvinism made its appearance at Port Royal and a little later it maintained itself for a while at Quebec under the protection of William and Emery de Caën, who did not carry out their promise to exclude heretics from the colony. But during the sway of Richelieu, the Huguenot cause perishes even more completely in Canada than in France, and a way is left clear for the unchecked ascendancy of Rome. No one can read the religious literature of New France without recognizing the sincerity of motive which brought Jesuits, Récollets, Sulpicians, Ursulines to Quebec and Montreal. The savage races of America had excited the imagination of all Europe, and in France the desire was particularly strong to rescue these heathen from the doom of the unbaptized. The greatest nobles in the realm subscribed funds for the mission and acted as sponsors at the baptism of Micmac or Algonquin converts. First in importance among the religious orders of New France come the Jesuits, whose missionary tradition had been established more than half a century earlier by Saint Francis Xavier. Entering Acadia and Canada with a record of brilliant success to give them confidence, they prosecuted their labors among all the nations from the Iroquois to the Illinois and from the Ottawas to the Natchez. Their most heroic deeds of self-sacrifice are bound up with their mission to the Hurons (ending in 1649, when the power of the Hurons was destroyed by the Iroquois) and with their mission to the Iroquois covering the third quarter of the 17th century. It was always the aim

of the Jesuits to turn the Indians from the nomadic life to the arts of civilization. In this attempt they were but partially successful. Although certain tribes of the Algonquin family yielded themselves willingly to the guidance of the missionaries, the total number of converts was far smaller in New France than in Paraguay. During the first generation after the restoration of Canada to France the Jesuits published in Paris an annual account of the labors undertaken by members of their order among the American Indians. These 'Relations' (see JESUIT RELATIONS AND ALLIED DOCUMENTS, THE) are the best single source of information about the habits of the aborigines and also rank high in the list of our authorities for the history of Canada. Next to the Jesuits in order of prominence stand the Sulpicians, whose efforts centred chiefly in Montreal and the neighboring district. The founding of Ville-Marie de Montreal exemplifies in its purest form the mood of devotion that prompted Frenchmen to leave the civilization of Europe for a life of privation among the barbarous heathen of Canada. Here the colonizing impulse proceeded solely from a desire to spread the faith. With Olier and Dauversière, who founded the Society of Notre-Dame de Montreal, there was no thought of gaining wealth through the fur trade. The charter of the Society expressly states that its members detach themselves from all regard to temporal interest and take for their one purpose the conversion of the natives. From 1642 to the close of the century Montreal was an outpost of civilization and Christianity, exposed to frightful dangers, as the exploit of Dollard (1660) and the Lachine Massacre (1689) testify, but defended by men who cared more for religion than for life. In the relations of the Church with the *habitants* friction seldom arose. There is reason to believe that the Jesuits incurred some unpopularity because they did not favor the appointments of *curés* in the outlying districts, but for the most part the attitude of the peasants toward the clergy was one of complete deference. Until 1665, when the Carignan Regiment came to Canada, the social order presented many features of a theocracy. Religion was supported by the state and derived a stronger support still from the energy of the religious. The prevalent mood was pietistic and public opinion sanctioned the ecclesiastical punishments which were called forth even by minor offenses against morals. Apart from Church festivals the routine of daily life at Quebec or Montreal made little provision for relaxation or entertainment. Taverns were under the ban, dancing parties were unknown and the general demeanor of sobriety would have met favor in the eyes of a New England Puritan. The coming of the Carignan Regiment broke in on this religious Arcadia and proved an entering wedge for frivolity, but in the early days the temper of New France was deeply religious, if not ascetic. One other aspect of ecclesiastical affairs deserves emphatic notice. While the clergy had to do with a docile population and were animated by pure enthusiasm in their work among the Indians, the religious life of the colony was not free from friction. The Récollets, and after them the Sulpicians, felt that their interests were threatened by the enmity of the Jesuits. The Jesuits in turn prevented

the Abbé de Queylus, an able Sulpician, from being made bishop of Quebec, casting their influence in favor of Laval (see LAVAL-MONTMORENCY, FRANCIS XAVIER DE), who became the first titular bishop in New France. Laval, once appointed, quarreled with successive governors on different grounds—with Argenson (1661) on the question of precedence, and with Avau-gour (1662) on the question of selling brandy to the Indians. The difficulty over precedence brought in the whole issue of Church and state; the quarrel over the brandy question was less lofty but more practical. The position of the Church was that brandy should not be sold to the savages under any circumstances. The general, though not the invariable, position of the government was that if the French did not sell brandy to the Indians the latter would buy rum from the Dutch and English. The Church as a whole and the *habitants* as a whole lived on excellent terms; but there was much friction between the religious orders, the *coureurs de bois* were a thorn in the side of the clergy, and a governor of secular tastes, like Frontenac, might keep up a running feud with the hierarchy for years.

The mention of Frontenac's name recalls a striking personality, for of all the governors who were sent out to New France during the long reign of Louis XIV he must be called the ablest and most forcible. That his policy toward the Church was judicious or free from prejudice cannot be maintained, nor can it be forgotten that his memory is defaced by the stain of fearful massacres. But he was bold, resolute and thoroughly devoted to the interests of Canada. Throughout both periods of his rule (1672-82; 1689-98) he was master of the situation as none of his predecessors had been, and during the seven years of his absence from the colony the failures of La Barre and Denonville served to set off his virtues in the strongest light. The main political problems with which he had to deal were the enmity of the Iroquois, the aggressive policy of the English as suggested by Governor Dongan, and the extension of French influence from the Great Lakes into the valley of the Mississippi. Speaking broadly the Iroquois were the chief menace of Canada in the last part of the 17th century as the English were its chief menace in the first part of the 18th. The most celebrated of the Jesuit martyrs, Jogues and Brébeuf, met death at their hands; the most brilliant deed of courage which the annals of New France contain was Dollard's fight against them at the Long Saut; it was in their face that Madeleine de Verchères shut the door of her father's fort. Whether left to themselves or set on by the English they had every disposition to molest the French. The spirit of conciliation they mistook for weakness and, as Frontenac saw, the only way to impress them was by a show of strength. In 1696 he ravaged their country more thoroughly than De Tracy had done 30 years earlier, burned their palisades, destroyed their corn and convinced them that he had a power which they must respect. The next year their envoys came to Quebec speaking the language of humility. Frontenac's attack upon the English dates from the beginning of his second term of office. Returning to the colony in 1689 he found that French prestige had vanished almost wholly during his absence. To impress

the Indians and terrorize the English he equipped those raiding parties which carried the torch and the tomahawk to Schenectady, Salmon Falls and Casco Bay. As a *tour de force* of endurance, this winter campaign of the French was a remarkable feat, but the atrocities which accompanied it cannot fail to awaken the deepest abhorrence. Parkman finds extenuation for Frontenac in the standards of his age. "He was no whit more ruthless than his times and his surroundings, and some of his contemporaries find fault with him for not allowing more Indian captives to be tortured. Many surpassed him in cruelty, none equalled him in capacity and vigor." Everything considered, this must be called a mitigated sentence, and apart from all considerations of humanity it may be doubted whether Frontenac's policy of carnage was a sound one. Its momentary success in impressing the Indians was not an equivalent for the spirit of vengeance which it awakened among the English. From 1690 forward New France and New England have their rancorous enmities which continue to exist quite irrespective of peace or war between the mother countries. Ships may be turned back from Quebec but the memory of massacre endures until French power in Canada has been destroyed. A much brighter feature of Frontenac's régime is the progress made by French exploration in the Far West. While the famous journey of Marquette (q.v.) and Joliet (q.v.) down the upper waters of the Mississippi (1673) may be more fitly connected with the names of Courcelle (q.v.), Frontenac's predecessor, and of Talon (q.v.), the good intendant, the picturesque exploits of La Salle (q.v.) and Tonty (q.v.) fall within the period of Frontenac. It was by favor of Frontenac that the fort at Cataracoui (now Kingston) was placed in La Salle's hands, thus enabling him to establish a fixed base at the east end of Lake Ontario for his operations on the Great Lakes and beyond. As far as the Huron country the French had been on familiar ground ever since the days of Champlain, but their chief triumphs in opening up the *Hinterland* were won under Frontenac.

The 18th century opened for New France with bright prospects which were destined never to be realized. The war that closed at the Peace of Ryswick (1697) had just demonstrated the defensive strength of Canada, and though D'Iberville's (see IBERVILLE, SIEUR D') conquests in Hudson's Bay were restored to England, France did not lose Acadia. Frontenac's chastisement of the Iroquois had brought relief from an ancient scourge and Callières' diplomacy concluded the peace which had been made possible by a decided blow. The War of the Spanish Succession closed less favorably. The success of Vaudreuil's raids was a poor equivalent for Marlborough's victories or even for Nicholson's capture of Port Royal. France lost Acadia and was thrown back for her hope of an Atlantic dominion upon the single fortress of Louisburg (q.v.). The Peace of Utrecht (1713) may be called the beginning of the end.

The history of Louisburg is a tale of great effort, enormous expense and complete disappointment. France lavished upon this harbor in Cape Breton as much money as it would have cost to erect a fortress of the first class in

Europe. Until 1745 its strength remained untested, but the French themselves thought it impregnable and the English looked upon it with dread. The political effect of Louisburg was two-fold. Its near neighborhood to Acadia prevented the French of that province from becoming loyal to British rule, and in New England it was regarded as a permanent menace to peace. When the War of the Austrian Succession offered an excuse, Massachusetts was ready for the attack. Governor Shirley (see SHIRLEY, WILLIAM) devised the plan, which was daringly executed by a colonial fleet under William Pepperell (q.v.) in co-operation with four British men-of-war. The capture of Louisburg by a militia force was the greatest humiliation which France had suffered in America and its restoration by the Peace of Aix-la-Chapelle (1748) (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), came to New England as the sorest affront which it had ever received at the hands of the home government.

At the Peace of Utrecht New France contained a population of rather more than 25,000. In 1763 when Canada was ceded to England the number of inhabitants had advanced to about 60,000. It is obvious that this rate of increase was trivial in comparison with the progress of the English colonies during the same period, and when we remember the unusual fecundity of the French Canadians, some special reason needs to be assigned for the slow development of the colony. The cause of this striking phenomenon will be found in the fact that immigration was not spontaneous, as in the case of the English colonies, but controlled by government. Partly owing to the institutions which prevailed in France during the 17th and 18th centuries, and partly owing to gross mismanagement of colonial affairs by the court of Versailles, New France was handicapped in the long race with its southern rivals. This fact must be brought out because it is often erroneously stated that the Frenchman has never made a good colonist. The biography of Canada from Champlain to Montcalm gives the direct negative to such an idea. Maladministration, the lack of local self-government and excess of loyalty to inherited institutions account for the defeat of the French in America rather than the want of promptness, courage, industry and resource. It must be remembered, moreover, that the English colonies took root in a soil which was fitted to stimulate rapid growth. The long calm which followed the Peace of Utrecht (1713-42) was often broken by signs of acute restlessness. As early as 1725 the Marquis de Beauharnois, who had become governor in succession to Vaudreuil, was busy with schemes for keeping the English within the limits they already occupied. This meant that their expansion northward should be checked in the vicinity of Lake George and their expansion westward by the range of the Alleghanies. Far from losing their love of exploration, the French pushed farther and farther westward with each decade. Michilimackinac was to Verendrye what Cataracoui had been to La Salle, and just at the moment when Maria Theresa was preparing to recover Silesia from Frederick the Great, one of Verendrye's sons caught the first glimpse of the Rocky Mountains. In America the hostilities which accompanied the War of Austrian Succession

centred at Louisburg and accordingly this conflict affected Canada less than the two preceding wars had done. But every man of colonial origin, English and French alike, saw that the Peace of Aix-la-Chapelle was merely an armistice. Unsettled boundaries suggested endless friction, especially in Acadia and the Ohio Valley. The line which was run by Céloron de Bienville at the instance of France aimed at excluding the English from the Ohio and, according to patriotic opinion in such colonies as New York, Pennsylvania and Virginia, amounted to a *casus belli*. Before the development of the western trade the English and French had been separated by a wide zone of wilderness. The expansion of both races brought them face to face at the junction of the Allegheny and the Monongahela. Should the stronghold built in this angle be called Fort Duquesne or Pittsburgh? Here was an issue on which hinged the future of a continent. It was the misfortune of the French both at home and in Canada that their administrative system suffered from the worst evils of a corrupt absolutism. At Versailles the folly and extravagance of Louis XV, at Quebec the unblemishing thefts of the Intendant Bigot, were but a poor preparation for war. And so the small but valiant race of the Canadian French bore the burden of vices not their own when they entered upon the last act of an irrepressible conflict. CHARLES W. COLBY,  
*Formerly Professor of History, McGill University.*

**5. GREAT BRITAIN'S FIGHT WITH FRANCE FOR NORTH AMERICA — 1753-63.** For several years previous to the formal declaration of war between England and France, in 1756 (see CANADA — UNDER FRENCH RULE), the stirring events in the Ohio Valley and in distant Acadia foreshadowed a great crisis, during which territorial disputes, aggressions and political intrigues would be lost sight of for the moment, and the question paramount would be the supremacy of France or of England in North America. The policy of France, as dictated from Versailles, had not been broad enough to successfully promote colonization, in the sense of expansion, or even to maintain permanent occupancy, although this was much desired. And the honest designs of her colonial administrator, La Galissonnière, to increase the dominion of his royal master, at an opportune moment, met with no responsive aid. The mother country was wedded to schemes of aggrandizement at home, and was inclined to leave her colony to work out its own future. Besides, the French then, as now, were rather a stay-at-home people. New France was consequently weak in population, and not in a position to retain her empire in the North, and, moreover, her influence was being undermined by official corruption. Great Britain, on the other hand, had the real advantage of superior numbers in the New World, although she had no definite colonial policy, and was already smarting from the effects of an earlier administration, due rather to ignorance than to knavery. The disputes touching possessions in Acadia were of long standing. By the 12th

article of the Treaty of Utrecht (see **UTRECHT, PEACE OF**), Nova Scotia, within its ancient boundaries, had been ceded to the Crown of England. A controversy soon arose over the interpretation of a certain clause. Great Britain claimed that her possessions under the Treaty of Utrecht were of the same extent as those acquired by France under the Treaty of Breda; but France protested that the territory she then received was quite distinct from the ancient boundaries, which confined Nova Scotia to a portion of the southern peninsula. At the conclusion of the Treaty of Aix-la-Chapelle (see **AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT**), when Louisburg (q.v.) was restored to the French, the boundary questions were referred to commissioners, each Court agreeing that, until a decision was reached, no fort or settlement should be attempted upon the debated ground. But the shrewd La Galissonnière, disregarding the stipulation, if he was ever officially acquainted with it, commenced the construction of forts, and favored settlement upon the lands claimed by England. The importance of Nova Scotia in the future development of Canada was apparent to each nation, both from a strategic and commercial point of view, but neither power could furnish from its colonial resources an army of sufficient strength to support its ambition. The policy of Great Britain toward Nova Scotia was most short-sighted. Instead of encouraging the emigration of a desirable class, intended to grow up with the Acadians and form a united and loyal people, she allowed the French, for nearly 40 years, to regard the country in the light of an exclusive settlement. It is true that they were good subjects; but they were French at heart, and it remained to be proved whether, under extraordinary pressure, their sympathies would incline to France or not. The possibility of such a contingency was for years practically ignored, but when it was seriously considered the methods adopted were ill-advised. The lands of the French were divided and subdivided, until new grants were necessary; but Great Britain decreed that new lands could be acquired only by Protestants. The question of religion, therefore, became a condition of tenure. Shirley (see **SHIRLEY, WILLIAM**), the energetic governor of Massachusetts, who was largely responsible for the government of Nova Scotia, was firmly convinced that until French influence was exterminated British interests could not flourish; and so he endeavored to effect the conversion of the inhabitants, suggesting that rewards be given to those who renounced their faith. The King favored an assurance that the people should enjoy the exercise of their religion, but Shirley, in a proclamation, omitted the passage as dangerous. The home government then consented to a scheme for promoting the loyalty of the province by the importation of foreign Protestants, to mingle with the Acadians—a fusion possible under the British flag, but doubtful at such a critical moment, when the military organization was insufficient to protect the frontier, or to inspire confidence in the stability of British institutions. Government agents in Geneva, and elsewhere, were active in advertising in the papers for settlers, and bargaining with poor artisans. But the scheme fell through; though at last 3,000 good settlers were

landed at Chiboucto Bay in 1749, from which at length sprang the important naval post of Halifax (q.v.). In the meantime, however, a great struggle was impending, which led to the deportation of 8,000 Acadians (see article **THE ACADIAN REFUGEES**), whose subsequent misery and suffering contribute the darkest page to the history of Nova Scotia. A new oath of allegiance was demanded by Governor Cornwallis, which from time to time was deferred. While, on the other hand, the fiery zealot, Le Loutre (see **LE LOUTRE, LOUIS JOSEPH**), backed by the Indians, exercised every effort to retain influence over the people. Le Loutre detested the English, and was generally successful in persuading the unhappy people that an oath of allegiance to a Protestant monarch was very much like being disloyal to their faith, the penalties for which did not cease with their natural existence. But, although the dark deeds which were being enacted in 1753, concerning Nova Scotia, had a distinct bearing upon the approaching conflict, they were of secondary importance to the great mass of the British colonists, when compared with the prize which both France and England coveted—the possession of the Ohio Valley. The details of the contest in this section cannot be given here. (See **BRADDOCK, EDWARD**; **COLONIAL WARS IN AMERICA**; **FORT NECESSITY**; **PITTSBURGH, History**; **WASHINGTON, GEORGE**). The effect of Braddock's defeat was felt in the expeditions of Shirley against Oswego (q.v.), and in that of Johnson against Crown Point (see **CROWN POINT, FORTRESS OF**). A body of provincials had been raised, and placed under the command of Johnson for the reduction of Crown Point. But Dieskau intercepted, and almost captured, a detachment of this expedition. Reinforcements arrived at a critical moment, and the tables were turned by the capture of Dieskau. This circumstance was made a great deal of, but, nevertheless, Crown Point was unmolesed, and still in the hands of the French. War and bloodshed had desolated the homes of the colonists and destroyed their commerce, and over all of them hung the dread of the tomahawk and the scalping knife of the Indian. Panic-stricken, they could devise no means of defense, and surrender seemed preferable to fight. In Acadia, while the two nations were still at peace, the determination of the British had driven into exile the unhappy Acadians. But their own position there was by no means to be envied. British prestige was indeed at a low ebb in America, when the struggle between the colonists was superseded by a contest between the two powers, which commenced officially when King George II signed the declaration of war against France in May 1756.

The situation in New France was indeed acute. Agriculture had been neglected, grain was scarce, horses were slaughtered for food, famine was imminent. But it should be borne in mind that this deplorable state of affairs was not the inevitable outcome of the struggles through which the country had passed, but a condition actually created for profit, toiled for and plotted for by Bigot, in order that he might appear as the real savior of the distressed colony. The advice of the intendant to his somewhat weak-kneed, and certainly dishonest, henchman, Vergor, to "cut and slip,

and make hay while the sun shone, in order that he might have the means to build a château in France," was but an indication of the course he intended to follow himself, though on a grander and more colossal scale. New France was to be pillaged. The people must be subdued, and bodily suffering would prove effective where less persuasive methods might fail. New life was given to the colony for a moment when the Marquis de Montcalm (q.v.) arrived in Canada in the spring of 1756, with 1,200 troops and ample supplies. No better general could have been chosen than Montcalm. In fact, men of his mold were just what New France needed most at this time. He was an excellent soldier and had already won renown. He was loyal to his sovereign, at a time when loyalty was not profitable; he was brave and courteous, and he dearly loved France. Vaudreuil, the governor, was a Canadian, and attached to the land of his birth, but he despised every form of interference from France. Hence there was constant friction. Bigot, the representative of the King, loved his master and the colony only in proportion to the measure in which they contributed to his needs; and his needs were of abnormal proportions. The conduct of Montcalm throughout the war, until the supreme hour when he yielded up his life in defense of the colony, forms a striking and pleasing contrast to the actions of his two colleagues. He was also fortunate in the chief officers under him.

England was far less happy than France in the choice of the commander-in-chief of her forces. Lord Loudon, who was placed at the head of the 900 regulars sent out to the colonies, was no match for the brilliant Montcalm. Arriving in Albany two months after he was expected by his chief officers, Abercromby and Webb, Loudon was confronted with a condition of affairs similar to that with which Montcalm had to contend—jealousy between colonials and regulars. The War Office had decreed that a colonial officer could not rank above a senior captain of regulars, and consequently well-seasoned officers, experienced in the methods of the enemy, were liable to orders from a man who had never been under fire, and had no knowledge whatever of colonial affairs. The British general seemed unable to decide upon any plan of action, and much valuable time was wasted. In the meanwhile, disaster had overtaken the British at Oswego. By clever tactics Montcalm had surprised the fort, and had 30 guns directed against it before the commander was aware of the danger which threatened him. There was little effective resistance, and capitulation necessarily followed; 1,600 men were made prisoners, and in a few days the fort was razed. The year was passing away without any important move on the part of the British. Loudon desired a change of scene, and induced the home government to agree to an expedition against Louisburg. Large reinforcements were sent out, and in the month of June 1757 he had nearly 12,000 men arrayed against that stronghold. Still unable to decide upon a plan of attack, he wasted a month in exercising the troops, or, as Lord Charles Howe said, "In keeping the courage of His Majesty's soldiers at bay, and in expending the nation's wealth in making sham fights and planting cabbages, when they ought to have been fighting the enemies of

the King in reality." On 4 August a movement was set on foot, but intelligence was conveyed to the commander that the French expected reinforcements and were eager for the fray. Thereupon, the noble lord abandoned the enterprise and returned to New York, having covered himself with ridicule, and greatly amused the French.

In the spring of 1757, the region of Lake Champlain was the scene of unusual activity. The Indians from the distant shores of Lake Superior, and from the forests beyond Lake Erie, were rallying around the French standard; and by midsummer a restless band, eager for the fray and only restrained with difficulty, gathered at Fort Carillon as part of the expedition against the British strongholds of Fort Edward and Fort William Henry. Montcalm's army consisted of about 6,000 of the best troops, with the addition of the Indians. The British force was divided between the two forts. Webb was at Fort Edward in command of 3,500 men, and Munro had 2,000 men in Fort William Henry and 500 entrenched upon a rising ground in the rear of the fort. Montcalm's first move, on approaching, was to occupy the route communicating with the forts, which, at the same time, cut off the British troops upon the rising ground. This was accomplished by de Lévis with 3,000 men. Montcalm strengthened his position and soon had 40 guns bearing upon the fort. From the first it was clear that the British position was untenable. Munro was twice offered terms of capitulation, but he stubbornly refused. At length he was forced to surrender, and the garrison marched out of the fort. Then followed a frightful scene, which has unjustly tarnished the memory of Montcalm. The Indians, disappointed of the plunder to which they looked forward at the sack of the fort, fell upon the prisoners with fury, and horribly massacred nearly 100 before any means could be taken to prevent them. Montcalm and Lévis did their best to arrest the fury of the savage hordes and saved many lives; but the mischief was done, and dire vengeance was threatened. Notwithstanding the dismal failure of Loudon, Pitt was still determined to reduce Louisburg, which was to be made the chief objective in the campaign of 1758. Loudon had been recalled, and the command was entrusted to Amherst, who had already done good service in Germany. The chief officers under him were Lawrence and Wolfe. The force consisted of about 12,000 men. On the 2d of June part of the fleet anchored in Gabarus Bay, a few miles from Louisburg, Boscawen being the admiral in command. The expedition was a joint one, both naval and military. Wolfe was the most conspicuous figure of all present. His brigade made the real attack from the boats, while Whitmore's and Lawrence's supported him by feints in other places. The landward siege was well pressed home, and Louisburg, the gateway of New France, soon fell, and being shortly after razed to the ground, literally became a thing of the past.

Success had attended British arms in other quarters. Bradstreet at the head of 3,000 men had captured Fort Frontenac, which the unwisdom of Vaudreuil had left inadequately supported, although it was a most important post commanding Lake Ontario and serving as a

base for the Ohio forts. De Noyan, the governor, had demanded reinforcements, but, in the place of troops, Vaudreuil had dispatched a one-armed man to his assistance, and, as resistance was futile, capitulation followed. Fort Duquesne had also become a British post, and now bore the name of Fort Pitt. Forbes, in the face of great difficulties, had endured the perils and suffering of a winter's march; and, when at last his bravery and determination had triumphed over every obstacle, and the fort was in sight, he found that it had been evacuated. While Loudon was "planting cabbages," a harmless occupation, Abercromby was making a worse mess of affairs at Ticonderoga (q.v.). The French had been expecting an attack at this vital point, which commanded the route by way of Lake Champlain, and threatened Montreal. A large body of men had been ordered there in the spring by Montcalm; but the withdrawal of so many troops under Loudon had convinced Vaudreuil that it would be an opportune moment to create a diversion on the Mohawk. Montcalm was opposed to this enterprise; consequently Vaudreuil insisted, and 1,600 men were detached for the purpose. By the middle of June Montcalm had only 3,000 men at Ticonderoga, the battalions of La Sarre, Languedoc, Béarn, Berri, Guienne and Royal Roussillon, with two good engineers. The place was by no means strongly fortified, but works were hastily thrown up in advantageous positions. In the meantime the formidable army under Abercromby, consisting of regulars and provincials, in all 15,000 men, was encamped about half a mile from the fort. But the real head of the army, Lord Howe, the best soldier in America, as Wolfe had said, had been killed in a preliminary skirmish, and the commander was powerless to act. Something had to be done, however, and Abercromby moved his whole force against Carillon. Montcalm's army had been increased by 500 men under de Lévis; and after a seven hours' blundering assault, Abercromby was completely outgeneralled, and lost no less than 2,000 men. This victory covered Montcalm with glory, and he is frequently referred to as "the hero of Carillon." But although he had won glory for French arms, the victory was a blow to the jealous Vaudreuil, and signalized the farther accentuation of discord which produced serious results in future operations.

In 1759 Pitt was at last in a position to put his greater scheme into practice. The tide of war was almost on the turn, and he seized opportunity beforehand. The Seven Years' War (q.v.) was being waged in many parts of the world; in fact, in a purely military sense, there were several different wars going on at the same time. But there was one great connective force which made them one, and that was the British navy. France and England were now in the very middle of their great imperial war, which began after the fall of the Stuarts in 1688, and was continued as one single age-long and world-wide struggle for the over-sea dominion of the world, down to Trafalgar and Waterloo. The Seven Years' War was the most distinctively imperial phase of the whole of this vast conflict; the heart of it lay in the fight for American dominion; and the central episode of this fight itself is to be found in the expedition against Quebec, which culminated in the re-

nowned battle of the Plains of Abraham. The four real conquerors of New France are Pitt, Anson, Saunders and Wolfe. The names of Pitt and Wolfe have always been on every tongue; but the equally important ones of Anson and of Saunders have been unduly forgotten. Pitt, of course, was the originator; and in himself, the most important of the four. But as the whole fortunes of the war were really determined by the British command of the sea, it is absolutely necessary to understand the naval side of the campaign, not only for its own sake, but also to fully appreciate the work of the army. In the ever-memorable year of 1759, it was entirely due to the navy that England remained safe at home, and it was more than half due to the navy that she emerged as a conqueror abroad. France had prepared a gigantic scheme of invasion. One fleet was to sail for Ireland, where the troops were to be met on landing by a general rising in their favor. The Jacobites were to be stirred into insurrection by another French fleet destined for Scotland; whilst their third fleet, larger than both the others united, was to convoy innumerable troop-boats across the Channel, as they made a dash for the south of England. To guard against this national danger the navy then developed the first regular system of blockade ever known. Boscawen blockaded Toulon, Hawke blockaded Brest, Rodney cruised off Havre and Admiral Smith kept the reserve fleet always ready in the Downs. Meanwhile, however, Pitt was preparing a counterstroke; not at France herself—where she would be stronger than England in a campaign fought out on her own home base—but at her over-sea possessions in Canada, from which she was separated by those 3,000 miles of hostile waters, which the British command of the sea had practically made a British possession. Thus Montcalm had to await attack in utter isolation, on the far side of an immense stretch of territorial waters, across which Wolfe advanced in perfect safety to meet him. And it must be remembered that Saunders' squadron was not only a strong one, for it comprised a full quarter of the whole navy, but that it was playing an integral part in a universal scheme of strategy—for all seas are strategically one—whilst Wolfe's little army was only a landing-party on a large scale. There were twice as many seamen as landmen engaged in the taking of Quebec. Saunders had over 18,000 sailors, more than two-thirds of whom belonged to the navy, while Wolfe had less than 9,000 soldiers. The total British force, therefore, amounted to 27,000 men. Saunders and Wolfe received their secret instructions from the King in February, and immediately after sailed for Nova Scotia. The final rendezvous was Louisburg, where over 8,000 men were assembled in May. On 1 June the fleet began its dangerous voyage, with no less than 200 vessels of all sorts and sizes. It was navigated in perfect safety to the Island of Orleans, where it arrived on 27 June, and was not injured by a tremendous gale a day or two later, nor by the costly display of fireworks, in the shape of fire ships, destined to work its destruction. The picket boats met the attack well up stream, and, "taking hell in tow," as a bluejacket forcibly expressed it, put all the enemy's vessels ashore, where they burnt them-

selves out. Wolfe established three camps. The principal one was at Montmorency, just beyond the falls. The second was on the Island of Orleans, completely out of range, and thus very convenient for a hospital and stores. The third was at Point Levis, which Vaudreuil foolishly refused to occupy, in spite of Montcalm's sensible advice, and which was consequently left open for Wolfe to build his batteries on. These batteries literally pounded the town to pieces; as a manuscript note on a plan of the siege in the French War Office truly remarks, "*ce ne fut pas un siège, mais un bombardement.*" Among other projectiles of all kinds, 36,000 solid cannon balls were fired from this coign of vantage. Montcalm's position was still immensely strong, in spite of the loss of the Levis Heights. The upper town of Quebec is built upon the extremity of a long promontory which is bounded on the south by steep cliffs, 200 or 300 feet sheer up above the Saint Lawrence, and on the north by lower, but still easily defensible, cliffs overlooking the valley of the Saint Charles. The town was held by 2,000 men under de Ramesay. It had a double tier of batteries, one on the top of the cliffs, the other along the water front below them. The only open ground in the vicinity was round the mouth of the Saint Charles. But this was well entrenched, and the trenches were carried on continuously for seven miles along the Beauport shore to the Montmorency, opposite Wolfe's camp.

Wolfe's first attempt to break through was made some distance up the Montmorency, where he tried to force his way across the fords and so attack the entrenchments in the rear. But he was repulsed with loss, in a bush-fight in which his regulars were at a great disadvantage. His second attempt was a more serious one. On 31 July he tried to carry the Montmorency Heights by storm, a mile on the Quebec side of the falls. But as his troops had to be collected from several quarters, in full view of the French, Montcalm easily anticipated him at the right spot, before he could deliver the assault. Besides the faulty British plan could not be carried out even according to Wolfe's intentions, because the grenadiers, 1,000 strong, suddenly broke into a wild charge before being properly formed up, and lost nearly half their numbers in a fruitless effort to scale the heights. Then a terrific thunderstorm burst on the scene of carnage, making the heights more slippery than ever, and so he had no choice but to call off his men at once. After this repulse Wolfe fell seriously ill, and toward the end of August he gave his brigadiers, Monckton, Townshend and Murray, a memorandum of three other plans for assaulting the trenches and asked them "to consult together for the public utility." Their council of war resulted in a complete rejection of all his suggestions; because, as they well remarked, the storming of such works from open ground would certainly be both difficult and dangerous. Moreover, even if the works themselves were carried, there would still remain the fortified line of the Saint Charles, as well as the heights of the promontory beyond, to keep him out of Quebec, until the lateness of the season would compel him to raise the siege. Their own plan was to take all the available men up the Saint Lawrence, and land at any suitable point be-

tween Cap Rouge, which was nine miles, and Pointe aux Trembles, which was 22 miles, above Quebec. Wolfe informed Pitt, in a dispatch written on 2 September, that he had acquiesced in this plan, and intended to put it into operation at once.

The Montmorency camp was cleverly evacuated, without the loss of a man, by a general naval and military demonstration against the entrenchments, which made the French feel sure that another attempt to storm the position there was about to take place. From 7 to 10 September the rain suspended all operations; and on 10 September Wolfe made his final reconnaissance. He was already well posted on the lie of the land in every direction, and the idea of attacking above Quebec was thoroughly familiar to his mind long before it was mentioned by his brigadiers. On 19 May he had said to his uncle, that he "reckoned on a smart action at the passage of the Saint Charles unless we can steal a detachment up the river and land it there, four, five miles, or more above Quebec." This plan was better than the brigadiers', as it contemplated seizing the ground much closer to Quebec than the nearest objective point they proposed trying. At the final reconnaissance he chose the Foulon, where a path led up to the Plains of Abraham, within two miles of the walls. If he could get up there without any serious check, he saw that he could forestall Montcalm by forming a line less than three-quarters of a mile from the city, where the promontory was narrow enough to be commanded by his small army, and where the mixed regulars and irregulars of New France would be forced to meet his homogeneous British red-coats on a flat and open ground. The French were on the alert everywhere along the north shore, from the falls up to Pointe aux Trembles, a distance of 29 miles — except just at the Foulon itself. They could not tell what Wolfe was about, nor where the bulk of his men were, behind the impenetrable screen of the ubiquitous British fleet. They were naturally very apprehensive of another desperate attack on their trenches; they were well prepared against an assault upon the town, which was so strongly fortified by nature; while the constant movement of the fleet, and occasional landings from it, in the vicinity of Pointe aux Trembles, 22 miles up, made them think that any new plan would probably take the form of an advance in force by land from somewhere thereabouts. One man, indeed, besides Wolfe, was thinking of the Foulon, and that man was Montcalm. On 5 September he had sent the regiment of Guienne to the Heights of Abraham, but Vaudreuil withdrew it on 7 September, and left no defense there, except the puny Samos battery near Sillery Point, and 100 militiamen at the top of the Foulon, under the treacherous Vergor. Even on 12 September, the very eve of the battle, Montcalm had again ordered the same regiment back, this time to the Foulon itself. However, Vaudreuil had again countermanded the order, saying, "We'll see about it to-morrow." But Wolfe himself was up there on that morrow! [For some account of the battle of the Plains of Abraham, see COLONIAL WARS IN AMERICA; MONTCALM; QUEBEC; WOLFE.]

The winter at Quebec, after its capture, was a terribly trying one for the little British gar-

rison; and so many men died of scurvy that, in the following April, when de Lévis marched out of Montreal with 7,260 men, expecting several thousand more to join him on the way, Murray could only muster 3,886 effectives. There was a second battle of the Plains, in which Lévis defeated Murray, who in less than two hours lost over one-third of his men. A second investment followed, and Lévis was in the act of advancing to storm the walls, when the vanguard of the British fleet suddenly entered the harbor. The French had now no choice of action. They hurriedly abandoned their camp, and retreated, in all haste, on Montreal, both by land and water. Then, step by step, the final British advance converged on the doomed colony. Murray came up steadily from Quebec, in close touch with Lord Colville's squadron, which the French had absolutely no means of resisting. Haviland advanced from the south by way of Lake Champlain; while Amherst, with the main army, came down the Saint Lawrence from the Lakes. When the united British army, 17,000 strong, actually landed on the Island of Montreal, the few remaining Canadians deserted Lévis in a body, and he found himself left with only some 2,000 of the faithful French regulars. The capitulation of New France occurred two days later, on 8 Sept. 1760. The French troops were deported. The Canadians had already dispersed. The American militia went back to their homes. The fleet sailed away to their stations. The British regulars took up their winter quarters. And the New Régime began. The Seven Years' War was one of the most pregnant events in history; and its results have continued to exert a vast determining influence on the fortunes of every world power, down to the present day. In Europe it foretold the ultimate decline of France and Austria, and the ultimate rise of Prussia to the leadership of Germany. But its significance for the English-speaking people lies mainly in the fact that it was the most truly imperial war they ever waged; and its most dramatic episode—the battle of the Plains of Abraham—will serve to mark forever three vital stages in three great epochs of modern times—the passing of Greater France, the coming of age of Greater Britain and the birth of the United States.

ARTHUR G. DOUGHTY,

*Dominion Archivist; Author of 'The Battle of the Plains,' etc.*

**6. UNDER BRITISH RULE TO CONFEDERATION (1760-1864).** At the moment when Vaudreuil (see VAUDREUIL-CAVAGNAN, PIERRE) capitulated to Amherst (September 1760) (see MONTREAL—*History*) there were no English in Canada save the troops and a few civilians who had come with them. But, outwardly at least, this act of surrender placed the French Canadians and the English colonists in America on the same basis as subjects of the British Crown. One sovereignty was thus established over a vast area where dwelt two races whose origin, sentiments, faith and institutions marked them off from each other in the sharpest contrast. A century later the face of the situation was profoundly changed. The American Revolution had created a second sovereignty in this region at a time when the population of Canada was almost wholly French, and yet by 1860 the Canadian English

had come to outnumber the Canadian French. The maintenance of the bond with Great Britain, the rise of the United States and the influx of English settlers are the broad conditions which have affected the progress of Canada since the cession.

Three years elapsed between Vaudreuil's surrender and the Treaty of Paris, which confirmed Great Britain in the possession of her American conquests. During this interval the country remained under military rule, and though General Murray's relations with the subject population were marked by sympathy and tact, it was impossible that a sense of permanence should be inspired by such a document as the Act of Capitulation. The text of the treaty, in its turn, left many essential points unsettled, especially in the domain of law, and not until 1774, when the Quebec Act was passed, did French Canada receive from the British Crown and Parliament a charter upon which it could rely. The first 14 years of British rule were, however, a time of great importance in that the experience gained during this period suggested legislation which continues in force at the present day. The mass of the French population, *seigneurs* and *habitants* alike, accepted the change of masters in a spirit of resignation. Their courageous support of Montcalm and Lévis is proved by a large variety of evidence. They seem to have shown as much daring as the French regulars, together with a superior knowledge of the country and a better grasp of the tactics which were suited to American warfare. That the deportation of the Acadians had stimulated their resistance to the British is more than probable, but in any case loyalty and patriotism would have led them to make a brave defense. Once beaten, they accepted the situation frankly and were not encouraged to rebel by that restlessness of the Indian tribes which took form in the conspiracy of Pontiac (1763-64) (see PONTIAC). The contrast between their docility and the growing disaffection of New England and Virginia did not fail to leave an impression on the official mind both in Quebec and London. The result was that when difficulties arose between them and their English fellow-subjects the government was not disposed to espouse the cause of the latter. Apart from the retention of their property, the guarantee of their religious institutions was the question which came nearest to the hearts of the French Canadians. By Article 27 of Vaudreuil's Capitulation it was agreed that "the free exercise of the Catholic, Apostolic and Roman religion shall subsist entire, in such manner that all classes and peoples of the town and rural districts, places, and distant posts may continue to assemble in churches, and to frequent the sacraments as heretofore, without being molested in any manner, directly or indirectly." This clause of the capitulation was confirmed at the Treaty of Paris (see PARIS, TREATIES OF) with the condition "as far as the laws of Great Britain permit," but any restriction which might seem to be placed upon religious toleration by the foregoing phrase was nominal rather than real. The communities of nuns were not disturbed even at first, and after a few years of deprivation large estates were restored to the Sulpicians. The Jesuits also would probably have received a confirmation of title but for the special circumstances attending their

suppression in France shortly before the Treaty of Paris and their general suppression in 1773. As it was, the scrupulous care with which governors like Murray and Carleton (see CARLETON, SIR GUY) carried out the policy of toleration reassured the hierarchy and made it a firm supporter of British rule.

Had there been no other factors in the political life of the country than the government and the French Canadians, the first years of the new order would have been peaceful enough. It is true that the commission of Governor Murray (1763) was marked by ill-advised expressions. For example, the members of such an assembly as might hereafter be convened by the governor and council "shall, before their sitting, take the oaths mentioned in the act entitled 'An Act for the further security of his Majesty's person and government, and the succession of the Crown in the heirs of the late Princess Sophia, being Protestants,'" etc. In other words, every French Canadian who aspired to sit in the assembly of the colony must subscribe a declaration against transubstantiation, the adoration of the Virgin and the sacrifice of the mass. Such language (borrowed from the laws of England) would have seemed offensive had political life become active in the colony, but as no assembly was convened till 1791 it remained shorn of practical significance. Real difficulty sprang less from the disaffection of the "new subjects" than from the presence in Canada of certain "old subjects," that is to say, of the English who had come to Quebec and Montreal at the close of the war. Here was a fresh element in the population, small but active and bitterly opposed to the recognition of French institutions. Prior to the outbreak of the Revolution an influential proportion of the English living in Canada were natives of the American colonies who had moved to the northern part of the British dominions with the design of enriching themselves through the fur-trade. Their antagonism to the French was prompted partly by race and religion but also by dislike of French law and contempt for the conservatism of French character. Their plea was that since the fate of war had given Canada to the English the country should be made in the fullest sense a British possession. These "old subjects," but just arrived in the colony, would have uprooted French law, discouraged the use of the French language, destroyed or fettered the hierarchy, and incidentally have made themselves a dominant class. At no time before the passage of the Quebec Act could they have formed more than a fiftieth part of the population, but, owing to the strength with which they raised the cry of the ruling race, they enjoyed a position of great prominence. Unfortunately for the success of their program, they incurred the dislike of the local authorities by an extreme radicalism of utterance and demeanor. Carleton, in particular, discountenanced them and held them to be infected with the mutinous views which were becoming so increasingly prevalent in the English colonies.

Sir Guy Carleton, afterward Lord Dorchester, is the most striking figure in Canadian history from the Conquest to the days of responsible government. The close friend and confidant of Wolfe, he began his career as a soldier. Circumstances made him an adminis-

trator and he ended by reaching the full stature of a statesman. Those who approve the policy embodied in the Quebec Act will, of course, rank him higher than he will be ranked by those who deny the wisdom of that far-reaching measure, but regarding the quality of his mind, the firmness of his temper and the justice of his intentions, opinion is undivided. After serving with distinction in the campaigns of 1759 and 1760 he returned to Canada as administrator of the government in 1766. In 1769 he became governor-in-chief; and from this date until his final surrender of office in 1796 he remained among all Englishmen the leading authority on Canadian affairs. The Quebec Act was the fruit of information and advice which he supplied; it was he who repelled Montgomery's invasion, and the Constitutional Act of 1791 which gave the colony its first training in self-government was largely his work. During a formative period of 30 years his policy of generosity toward the defeated race was the policy of the British government. Murray, whose language reflects personal resentment, says of the "old subjects": "I report them to be in general the most immoral collection of men I ever knew." Carleton, though less severe in his strictures, formed a highly unfavorable opinion of them and expressed his preference for the French Canadians with perfect freedom. According to his forecast, which in this respect has not been altogether justified, the valley of the Saint Lawrence was unlikely to be inhabited by any large number of Englishmen. Most of the English who were then resident in Montreal and Quebec had come in the train of the troops and would probably return with them. The traders had not been successful and would soon disappear. To quote his own words, it remained that "barring a catastrophe too shocking to think of, this country must to the end of time be peopled by the Canadian race." The Canadians, he continues, "are not a migration of Britons, who brought with them the laws of England, but a populous and long-established colony." Thus believing that the French could never be supplanted he concluded that their customs, ecclesiastical and legal, should be retained. A detailed statement regarding the Quebec Act will be found elsewhere (see the article THE QUEBEC ACT). Here it need only be said that its territorial provisions were extremely distasteful to the English colonies and that its concessions to the French Canadians have supplied a solid ground work for their loyalty to the British Crown. Whether Sir Etienne Taché was correct when he said, "The last gun that will be fired for British supremacy in America will be fired by a French Canadian," must be termed matter of conjecture; but the sentiment which prompted him to speak so fervently was gratitude for the Quebec Act. This measure provided an unobjectionable oath of allegiance, sanctioned the Roman Catholic religion in so far as it did not conflict with the King's supremacy, and ordained that "in all matters of controversy relating to property and civil rights, resort shall be had to the laws of Canada as the rule for the decision of the same." Hence English criminal law and French civil law were established side by side in the regions covered by the act. When Upper Canada was constituted in 1791 it received the common law of England unmodified and un-

limited, but French civil law still survives in the province of Quebec.

At the same moment when Great Britain was endeavoring to meet the wishes of her French subjects, the question of Canada was becoming an additional source of friction between the mother country and her older colonies in America. Not only did the English colonies disapprove a policy which heaped such favors upon the French, but some of them resented the King's disposition of the recently acquired territory to the west of the Alleghenias. In the royal proclamation of 1763 nothing was said concerning the government of this valuable region, an omission which disappointed Virginia and other colonies ambitious of expansion. Worse still, the Quebec Act handed over the western country to Canada, shutting out the older colonies and rendering an immense area subject to the operation of French civil law. At any time such action would have provoked remonstrance; in 1774 it quickened the resentment which had been gathering force ever since the passage of the Stamp Act. How prominent Canada was in the eyes of the Continental Congress may be inferred from the decision, speedily formed, to gain control of it by force. The sequel was a severe blow to the Revolutionary cause. Montgomery (see MONTGOMERY, RICHARD), advancing by Lake Champlain and the Richelieu, occupied Montreal and nearly succeeded in capturing Carleton, who was the head and front of the defense. Simultaneously Benedict Arnold (q.v.) made his way through the woods of Maine to the valley of the Chaudière and despite dreadful privations appeared before the walls of Quebec. On the arrival of Montgomery from Montreal a siege was commenced, but the sufferings of the troops proved so intolerable that it was decided to carry the town by assault. On 31 Dec. 1775, the two generals made a desperate attempt to force a passage through the streets of the Lower Town. During the fight which ensued Montgomery was killed and after a sharp encounter Carleton drove out the invaders with heavy loss. The war in Canada dragged on during the greater part of 1776 but before the close of that year the Americans had been repulsed at all points and the issue, so far as it affected Quebec, was decided. On the British side the hero of this campaign is undoubtedly Carleton, who maintained his position against heavy odds; but considered historically the attitude of the French Canadians is no less interesting. The clergy and the *seigneurs* used their influence actively on behalf of the British; the *habitants* remained neutral. It seems clear, however, that without the aid which he received from Canadian volunteers, Carleton would have been beaten, and it is also manifest that the French peasantry did not respond with any heartiness to the appeals of the Continental Congress.

While Montgomery's invasion is an exciting and critical episode, the Revolution affected Canada still more profoundly by causing the emigration of the United Empire Loyalists (see AMERICAN LOYALISTS). Into the nature of their differences with the American patriots it is not necessary to go, beyond stating that each party represented a definite point of view and was separated from its opponents by the wide gulf of contrasted ideals. The Loyal-

ists represent the conservative element in the 13 colonies and undoubtedly embraced within their ranks a large proportion of distinguished, educated men. Including those who left their homes while the war was in progress and those who came northward after its close, we may place the total number of Loyalist emigrants in British North America at nearly 40,000. More than half of these newcomers settled in the neighborhood of the Bay of Fundy, particularly in the region which now forms the province of New Brunswick, but at least 10,000 of them made their way to Canada. It is at this period that important settlements are first established upon the northern shore of Lake Ontario, where a population exclusively English possessed itself of lands which the French had explored but never colonized. The population of Canada was further modified between 1783 and 1800 by the opening up of the Eastern Townships, a district situated on the northern border of New Hampshire and Vermont, with a short frontier on the northeastern corner of New York. Here the original settlements were made in part by Loyalists but more largely by emigrants from New England who moved north in quest of cheap land. At the close of the Revolution, then, the race question in Canada begins to assume a very different aspect from that which it had worn before the passage of the Quebec Act. Then the English population constituted a mere handful. Now, through the steady influx of immigrants from the United States fresh portions of the country are developed and a nucleus is formed round which later accessions of English-speaking colonists will range themselves. As the bulk of the new population professed the deepest affection for Great Britain, a separatist movement was not to be thought of, but it was equally certain that disagreement would arise within Canada over the issue of legal and ecclesiastical institutions. As early as 1785 the Loyalists resident on and near Lake Ontario sent a petition to England praying that they might enjoy "the blessings of British laws and British government and of exemption from French tenure of property." Carleton, now Lord Dorchester, was eminently suited to effect an arrangement between the Loyalists and the French Canadians, toward both of whom he was drawn by feelings of strong sympathy. After establishing in 1788 special regulations for the administration of districts inhabited by Loyalists, he assisted in the preparation of the Constitutional Act (1791), a measure which was designed to do away with the grievances of the Loyalists without creating a sense of grievance among the French. Under the Constitutional Act, which in the British Parliament received support from Pitt and Burke, a division was made between Upper and Lower Canada. For each of these provinces the act created a legislative council and an assembly, but no independent power with respect to tariff legislation was granted. Clergymen of whatever denomination were declared ineligible to sit either in the council or the assembly, but freedom of worship was guaranteed to the Catholics in perpetuity and the Protestant clergy received as an endowment one-seventh of all waste lands belonging to the Crown. Some idea of the relative importance of the two provinces at this date may be gathered from the fact that in Lower Canada the legislative council was to

consist of not less than 15 members, while in Upper Canada the minimum number was placed at seven. A still greater disproportion existed between the number of members in the assembly—the minimum of 50 in Lower Canada as opposed to a minimum of 16 in the other province. Although grave troubles afterward arose under the operation of the Constitutional Act, the measure seems to have encountered little opposition in Canada save from the English minority in Quebec, whose leaders looked forward with discontent to the prospect of political inferiority. No tests excluded Roman Catholics from the council or the assembly, and after the elections of 1792 the latter body in Lower Canada contained 34 French as against 16 English members.

Within six months from the day when the first Canadian legislature met, Great Britain joined Austria and Prussia in their war against revolutionary France. While British North America was not drawn into the vortex of England's contest with the Convention, the Directory and the Napoleonic empire, it felt the influence of that long struggle in more ways than one. Besides Canada's part in the War of 1812, which was a by-product of the larger strife, one must mention the attempt of French republicans to make trouble for England in Lower Canada, and a certain neglect of Canadian issues by the home government which may be ascribed to the pressure of more critical questions in Europe. At about the same time when Genet was endeavoring to raise the United States against Great Britain, agents of the National Convention sought to provoke a disturbance among the *habitants* of Quebec. The execution of McLane and the imprisonment of Fréchette for life are the chief incidents in this abortive undertaking. Of much more consequence was the failure of the colonial office to watch the working of the Constitutional Act in Lower Canada. The council, whose members were appointed by the governor, speedily became a stronghold of English interests. The assembly, whose members were chosen by popular vote, assumed no less speedily a French complexion. As the council considered itself to represent the dominant power and was quite free from the control of the assembly, it tended to assume a tone which was extremely offensive to the French majority in the other house. The Constitutional Act gave representation but did not recognize the principle of ministerial responsibility to the popular branch of the legislature. In an age of mounting democracy, this type of government was open to fierce attack, especially when the question was complicated by racial prejudice. Between 1791 and 1812 the most maladroit governor of Lower Canada was Sir James Craig, who for three years (1808-10) carried on open strife with the assembly and finally had recourse to a *coup d'état*. In his assault upon the *Canadien*, a Nationalist newspaper, he unwarrantably arrested Bedard as the publisher of treasonable articles, dismissed Panet, the speaker of the assembly, from the militia, and eventually imprisoned six of the leading members of the assembly. Craig's action was due to a sincere belief that the French Canadians were disloyal because they criticized the council, but the effect of his measures was most unfortunate, since the Colonial Office

could not fail to be identified with them in the public mind. The political life of Upper Canada during the same period was unmarked by any notable dissensions. Through no fault of her own, and simply by virtue of being a British possession, Canada was drawn into the War of 1812 (see UNITED STATES—THE WAR OF 1812). Among the causes of the war, the only one which concerned her directly was the ill-founded contention that English officials were trying to stir up an Indian attack upon the American colonists in the West. From the outbreak of hostilities till the conclusion of peace Canadians of both provinces conducted the defense of their country in a truly patriotic spirit. The Loyalists were stimulated by the memory of their expatriation and fought enthusiastically for the British cause under Brock and Sheaffe. The French Canadians guided by Bishop Plessis (see PLESSIS, JOSEPH OCTAVE) of Quebec, himself the descendant of a New England captive, displayed an attachment to England which had not been so clearly apparent at the time of Montgomer's invasion. De Salaberry's victory at Chateauguay showed that the French peasants had not lost their ancestral courage or their knowledge of the methods to be pursued in guerilla warfare. At Queens-town Heights (see QUEENSTOWN) and Lundy's Lane (see LUNDY'S LANE, BATTLE OF) the Loyalists acquitted themselves well in the open field. The War of 1812 contributed much to the formation of a patriotic sentiment which was independent of provincial bounds.

The political unrest which affected most civilized countries in the generation following the battle of Waterloo appeared in Canada under an acute form and was not quieted until after the rebellion of 1837. The Upper Province, free from the problem of a mixed nationality, had hitherto been undisturbed by violent disputes, but as time went on the Constitutional Act was found unsatisfactory—or rather, the act gave no redress of the grievances which grew up under the existing system of administration. In Lower Canada the claims of the assembly found an eloquent champion in Louis Joseph Papineau (q.v.), the most prominent French Canadian of his generation. It should be clearly pointed out that the grounds of discord were different in the two provinces, but the development of agitation went on simultaneously and the two movements, each proceeding from its own set of conditions, reacted strongly on each other. English radicals and French radicals were brought into close sympathy as agitators by their common opposition to the established order. In both cases there were minorities whose privileges depended upon the maintenance of the constitution and the bitterness of the struggle for responsible government was intensified by the presence of these vested interests. In Upper Canada the contest between officialism and reform did not centre round the first principles of politics so much as it did round the exercise of power by certain individuals. The main strife was one of old settlers against new, with several minor issues coming in to complicate the situation and render it disagreeable. A few families of Loyalist stock constituted a local oligarchy from which were drawn the chief officials of the colony. As the members of this ruling class belonged almost wholly to the Anglican

Church, and used their influence freely to benefit the Anglican clergy, they provoked the opposition of the dissenters who formed a majority of the more recent immigrants. The political solidarity of Anglicanism and the "Family Compact" led both to be denounced by the champions of responsible government—Robert Gurlay, William Lyon Mackenzie, Dr. Rolph and Egerton Ryerson. The clergy reserves were represented as a symbol of government by privilege and Roman Catholics united with Protestant dissenters to demand the application of their proceeds toward the support of schools. It will be seen that these sources of discontent were hardly of a fundamental character, but the population of Upper Canada was not one to bear political grievances lightly. In Lower Canada the situation was more intricate and more serious. When the excitement caused by the War of 1812 had died away, the relations between council and assembly resumed their former rancor, while the assembly and the executive became involved in a protracted dispute over the power of the purse. By the financial provisions of the constitution certain revenues were at the disposition of the Crown and the assembly had control of certain other revenues which originally were much smaller. Through the development of the colony, the assembly's share of the revenue kept growing larger in proportion to that of the Crown, and at the same time the Radicals discovered that they could place the government in a very awkward position by refusing their assent to appropriations. The advantage which the assembly possessed through its power to keep up a perpetual dispute over fiscal matters was used with much tactical cleverness, though perhaps with less genuine patriotism than might have been desired. The fight against privilege (and there can be no doubt that the council had excessive privileges) was accompanied by a revival of racial feeling among the French Canadians. With Papineau for their leader the Nationalist majority in the assembly used language which showed that their brightest ideal was not summed up in subjection to British sway. Gradually the English element was eliminated from the ranks of the reformers, and though a few politicians of English and Irish name supported Papineau during the disturbances of 1837 his sole hope of success lay in the support of the French. Under such a system of government as was provided by the Constitutional Act, the rôle of the governor assumed a degree of importance which it does not possess at present in any self-governing colony of the British Empire. Had able men than Sir Francis Bond Head and Lord Gosford represented the Crown in Upper and Lower Canada during the acrimonious debates of 1836, there might have been no breach of the peace. As it was risings took place in both provinces, the Radicals of Upper Canada being encouraged by some initial successes which the party of Papineau had gained in the autumn of 1837. The rebellion cannot be dignified by the name of a war since the engagements were accompanied by slight fatalities and the issue was never in doubt. The French Canadian peasants who took the field were defeated at Saint Charles and Saint Eustache, and in Upper Canada the appeal to force collapsed after a farcical skirmish at Montgomery's

Tavern, near Toronto. In 1838 fresh disturbances occurred at a few places in Lower Canada, only to be repressed with a promptness which showed the futility of further resistance. Apart from the domestic bitterness occasioned by these outbreaks, they were the cause of a diplomatic crisis, in that the activity of Mackenzie's American sympathizers led to strained relations between Great Britain and the United States. The burning of the *Caroline* (q.v.) and the fight at Pelee Island (q.v.) were international episodes of the first importance.

The best fruit of the rebellion was Lord Durham's report and the transformation of British colonial methods which followed it. In 1838 the Earl of Durham (see DURHAM, J. G. L., EARL OF) was sent to Canada as governor-general and given a commission to investigate the state of the country. The blue-book in which he described the causes of the rebellion and suggested remedies for obvious evils is held, by common consent, to rank first among the documents of the Colonial Office. Whether the text was written by Durham or Charles Buller, or by both in conjunction with Gibbon Wakefield, the report as it stands is a classic in political literature. The two essential recommendations which it makes are that responsible government be freely conceded and that the provinces of Upper and Lower Canada be reunited with a view of allaying the racial discord which had raged so fiercely in Quebec under the Constitutional Act. The Union Act of 1840 was the immediate sequel of Lord Durham's proposals and a first step toward the political consolidation of British North America. The salient feature of this constitution may be defined as the transfer of political power to an assembly which was chosen on a very democratic basis, though not by universal suffrage. The legislative council, with members appointed by the Crown, was retained, but real authority centred in the popular branch of the legislature. To the assembly each province contributed 42 members and it was provided that a general election should be held every four years, subject to the chance of a dissolution by the governor-general during the interval. The Union Act had imperfections and inconveniences which finally furnished a strong argument in favor of confederation, but under it (1840-67) Canada gained a political training which was invaluable and escaped from the worst of the anomalies that had provoked the rebellion. At first the act seemed to favor the English, inasmuch as French ceased to be an official language; but in 1848 it was restored to its former position of parity. With the establishment of democratic principles the party system reached a maturity which before had been unknown in Canada. Lafontaine (see LAFONTAINE, SIR LOUIS H.), Baldwin (see BALDWIN, ROBERT), McNab (see MCNAB, SIR ALAN N.), Macdonald (see MACDONALD, SIR JOHN A.), Brown (see BROWN, GEORGE), Cartier (see CARTIER, SIR GEORGE E.), and many other accomplished politicians found free scope for their talents in the ranks of Reformers or Conservatives. Much of the legislation which marks this period (for example, the abolition of seigniorial tenure in 1854) was designed to adjust the life of Canada to modern conditions, even at the cost of parting with a picturesque institution or discarding an ancient view of the

relations which should subsist between church and state. The Reformers, however, had no exclusive possession of the liberal spirit, for it was a Conservative administration which abolished the clergy reserves. Education in both provinces began to receive an amount of attention which had not been paid to it hitherto. Judged also by economic results the progress of Canada under the Union Act was extremely satisfactory.

As the confederation movement is considered separately (see the article on *THE CONFEDERATION*), it will be unnecessary to discuss here the causes which suggested to Canadians a larger political conception than is represented by the Union Act. But in conclusion some reference should be made to the progress of Canada as affected by its relations with England on the one hand and with the United States on the other. From 1840 onwards the country enjoyed self-government in all matters of a local or domestic character, but it remained a colony and never considered itself to be a co-ordinate part of the British empire. In the second quarter of the 19th century the fixed belief of English ministers was that colonies are a kind of fruit which drops off the parent tree when it has become ripe. The rebellion of 1837 coming when liberal principles were triumphant in the mother country prompted the adoption of a generous colonial policy which has never been abandoned, but its effect upon the rise of imperial sentiment was only indirect. Yet notwithstanding the absence of a full partnership between Canada and England, the loyalty of the colony was signally illustrated during the first century of British rule. Despite friction between races, the pressure of foreign invasion and the existence of political privilege in both provinces, the attachment of an overwhelming majority of the population to British institutions and the British connection remained firm even throughout the decade that preceded the rebellion. The division which the American Revolution created between the United States and British North America could not fail to affect the fortunes of Canada in the most vital manner. Apart from the importance of the Loyalist immigration, the rise of a new and powerful state on the southern frontier brought into being conditions which thenceforth could never be ignored. As early as 1775 a small but active minority would have preferred membership in the band of revolted colonies, and ever since there have been individual advocates of annexation. But this propaganda has never spread widely or gone beyond the theoretical stage. In addition to the War of 1812 and the irritation caused by the filibustering raids of 1838, the question of boundaries was for long periods together unpleasantly prominent. The Webster-Ashburton Treaty of 1842, though it was received with great dissatisfaction in New Brunswick and Quebec, did good rather than harm by settling an irritating dispute. The Reciprocity Treaty of 1854, which was largely due to the efforts of Lord Elgin, brought the two countries into more direct contact than ever before, promoted friendly intercourse and was a source of prosperity to Canada during the 13 years of its existence (1854-67). Its repeal by the United States was in large measure due to a resentment which

had arisen from Great Britain's attitude during the American Civil War. The fact remains that in its birth year the Dominion of Canada was excluded, by action not its own, from reciprocity in natural products with the United States. See the articles *UNDER FRENCH RULE*; *THE CLERGY RESERVES*; *SEIGNIORIAL TENURE*.

CHARLES W. COLBY,  
*Formerly Professor of History, McGill University.*

**7. THE MARITIME PROVINCES TO CONFEDERATION.** The early history of the three eastern seaboard provinces of Canada is an important incident in the long dramatic struggle between France and England for world-empire. Their place on the map linked their destinies with those of New France on the one hand, and of New England on the other. The tale of their settlement and organization into communities is part of a greater story, the overflow of European peoples into the New World. They have been profoundly affected by great events outside their borders, European wars and political changes on this continent; and if they have not as yet reacted on the history of the world, as a nation they are young; their history is yet to make.

**Nova Scotia.**—In 1604, Sieur de Monts, a Huguenot gentleman adventurer and trusted soldier of Henry IV, made a voyage to the great Atlantic peninsula, which is now called Nova Scotia (q.v.). He was to found a colony in return for his broad patent to trade in furs. After exploring the rugged eastern and southern coast-line, he discovered the beautiful Annapolis Basin, and wintered, suffering terribly, on the island of Saint Croix. The next year, after searching as far south as Cape Cod for a suitable place, he turned back to the Annapolis Basin, and planted his colony on its shores, naming the cluster of huts Port Royal. The colony did not flourish, and, in 1613, it was destroyed by a force under Argall from the newly-founded colony of Virginia.

The French name for the country was Acadie, a musical native word, often mistaken for Arcady. It means "abounding in," as in Shubenacadie, and covered an ill-defined tract of wilderness, comprising what is now Nova Scotia, New Brunswick (q.v.) and part of Maine. In 1621, this territory was granted by James I to Sir William Alexander (q.v.), a Scottish gentleman, to be colonized on a plan distinctly mediæval. Alexander was to parcel out his province in "baronies," six miles long by three deep, to gentlemen, who were to "plant" them with settlers. Each baronet was to have almost regal powers within his own domain, even striking his own coinage, and "repledging" criminals from the King's courts of law to his own. The colony was to be a new Scotland, even by a legal fiction, part of the county of Edinburgh. One small settlement was actually made on the Annapolis Basin in 1629, but it came to nothing, and the whole province was handed back to France in 1632, by the treaty of Saint Germain-en-Laye. Still, to this day, the baronets of Nova Scotia form a distinct order in the British aristocracy, and the provincial flag bears the azure saltire of Sir William Alexander and the ruddy lion of Scotland ramping in gold.

For 22 years, the French had undisputed

possession, and succeeded in planting a colony on the feudal pattern, as far removed as possible in principle from republican New England. The government was military and paternal; the land was held by seigniors and tilled by a docile tenantry. The *habitants* were chiefly unlettered peasants from the country about Rochelle. In Acadie, they found broad marsh lands beside tidal waters, resembling the country they had left. Here they settled, built long dykes of logs and earth on the river banks, and peacefully cultivated the rich fields the salt tides fertilized. Population grew slowly. In 1671, there were 378 persons in the colony; in 1683, 600, chiefly about Port Royal. An interesting census of Acadie was made in 1686 by de Meulles, intendant of New France, who visited the scattered settlements and numbered the families, acres of cleared ground, boys, girls, fusils, horned cattle, swine and sheep in each. The population had grown to 915, including 30 soldiers at Port Royal. Although thickest about the seat of government, the Acadians had spread along the coasts and so far as Beaubassin at the head of the Bay of Fundy. They were a race of husbandmen, growing wheat, pease and rye and raising cattle, sheep, swine and poultry; they also built small boats for the shore fisheries. An observer relates that when the manure-heaps beside their barns grew unmanageable, they moved the barns. Few women came with the first settlers, who married with the Indians, and always lived on friendly terms with them. Priests of the Sulpicians and Missions-Etrangères were their trusted guides both before and after the English conquest. See article ACADIAN REFUGEES.

Throughout this period, the chief interest lies in the shifting fortunes of one family. Claude de St. Etienne, Sieur de la Tour, a ruined Huguenot gentleman of Champagne came out early in the 17th century, with his son, Charles Amador, a boy of 14, to better himself in the new colony. After Argall's raid, the two lived for years like Indians among the Indians. Their stronghold was Fort Saint Louis at Cape Sable, on the inlet now known as Port Latour. In 1627, Charles petitioned Louis XIII to be made commander of the coasts of Acadie, and his father took the petition to the French Court. On his return voyage the next year, he was captured by Kirk's fleet and taken prisoner to England. Here he became a friend of Sir William Alexander, married a maid of honor to Queen Henrietta Maria and was made a baronet of Nova Scotia, as well as his son, with large grants of land to support their titles. With two men-of-war, he came back to Cape Sable, where Charles held the one solitary post for France in Acadie. By persuasion, and at last by force, he strove to win his son over. Failing in both, he begged permission to live in Acadie, rather than return to England in shame, or to France and lose his head. This Charles granted, and Claude with his bride, his effects, two valets and two *femmes de chambre* disembarked. In 1635 Denys the historian found them living there in comfort.

Louis XIII rewarded Charles' loyalty by making him his lieutenant-general in Acadie. In 1632, Isaac de Razilly took possession of the province in the name of France; his chief officers were La Tour the younger and D'Aul-

nay Charnizay. On the death of de Razilly in 1636, the territory was divided between the two; La Tour established himself in baronial state at the mouth of the Saint John, with his Huguenot bride, while D'Aulnay made Port Royal, across the bay, his headquarters. D'Aulnay intrigued against his rival at the court of France and procured his recall to answer charges of fraud upon de Biencourt, his former commander. La Tour refused to go to France, and tried to enlist the Puritans of Boston on his side. Failing them, he obtained help from Rochelle; the "proud city of the waters" sent him supplies, munitions of war and 140 soldiers in the *Clement*. When the *Clement* arrived in the spring of 1643, she found Fort Saint John closely beset by D'Aulnay and 500 men. Being closely pressed, La Tour and his devoted wife slipped through the blockade by night, reached Boston safely, returned with reinforcements and drove D'Aulnay back to Port Royal. But D'Aulnay's hate was not easily tired. He went to France to raise another force against his enemy. At the same time, Madame La Tour went to Rochelle, to gather aid for her husband. D'Aulnay heard of her presence there and tried to have her arrested, but she escaped to England. On her return voyage, she almost fell into his hands a second time, but at last she reached Saint John again in safety. In April 1645 D'Aulnay besieged her here, while La Tour was in Boston. After a gallant defense, the fort was taken by treachery. D'Aulnay, to his everlasting shame, broke the terms of surrender, hanged the garrison and forced Madame La Tour to witness the death-struggles of her faithful soldiers, with a rope about her neck. Three weeks later, the heroine died of a broken heart. La Tour became a wanderer on the face of the earth, exploring and border-fighting in New France, while his rival ruled his province unchecked and built it up with a strong hand until he was drowned in the Annapolis River in 1650. La Tour hastened to France, confuted the old charges against him and obtained his former possessions in Acadie. Returning he married the widow of D'Aulnay and seemed about to enjoy a period of prosperity, when the province was once more taken by a Cromwellian fleet, in 1654. Undismayed by the sudden change of fortune, La Tour sailed for England and secured a joint grant of the territory with two English colonels, Crowne and Temple, to whom he soon sold out his interests. At the Restoration he was made a baronet of Nova Scotia, and closed his chequered and adventurous career in 1672.

In 1667 Acadie was again restored to France by the Treaty of Breda. The story of the French administration is not a pleasant one. It is a tale of incompetence, corruption, pettiness and is told at length in the pages of Parkman. The priests accuse the officials, the officials accuse the priests. The luckless colony was raided time and again by pirates, and by expeditions from New England to avenge the Haverhill and Deerfield massacres. Canada could only be reached by long and dangerous traverse of the wilderness, but Acadie was only a few days' sail from Boston.

French rule came to an end during Marlborough's wars. In September 1710 a force from Boston, chiefly of provincial troops, under

Col. Francis Nicholson, took Port Royal after a brief but gallant defense by Subercase. Port Royal at once became Annapolis Royal, in honor of the reigning sovereign, but it was not until 1713, by the Treaty of Utrecht (q.v.), and sorely against the will of Louis XIV, that Acadie became finally a part of the British Empire.

From 1710 to 1749 a small British garrison at Annapolis Royal held the province tenaciously for England. The fort, though well placed, and a Vauban plan, was ruinous; the earthen walls were always crumbling into breaches; the gun-carriages would not bear the guns; the barracks were roofless; for years the men were without bedding, stockings, great-coats or medicines. Supply-ships from England came once a year and brought provisions for nine months instead of 12. The hostile population would not take New England money for their corn and cattle; the home authorities would not honor the governor's drafts; the Boston merchants refused credit. During Walpole's long peace England seemed to forget the lonely garrison, while the French priests were agents of the French government, undermining English authority. From 1720 on, Louisburg, the new French city on the island of Cape Breton, was yearly growing in power, millions of livres were spent on its defenses, for France was bound to win back her lost province. All the time, convinced of its importance to the empire, one discouraged English governor after another held doggedly to his post.

The government was military, not civil, for the Acadians being Roman Catholics were, by the laws of England, incapable of voting; but at least one official regretted that they could not be given representation. They were governed by their deputies, the "ancientest" and most reputable men of each parish, chosen every year on or about 11 October. These were responsible for the good behavior of their districts and for the execution of orders transmitted by the governor-in-council. Philipps, colonel of the 20th regiment, was governor for almost this entire period. He visited the province twice, but resided mainly in London, while lieutenant-governors, chiefly regimental officers, Armstrong, Cosby, Mascarene, administered the colony. The governor was supreme; but to assist him, he had a small council, whose functions were advisory and executive. These officials did their best to advance British interests, giving the litigious Acadians justice in their endless disputes, and making wise suggestions for the improvement of the colony, which must have been doomed to gather dust in the Duke of Newcastle's closet of unopened dispatches.

On the outbreak of the War of the Spanish Succession (see SUCCESSION WARS) the men of Massachusetts rose and by splendid audacity struck down the stronghold of French power, Louisburg; but that glorious adventure belongs to the annals of New England rather than of Nova Scotia. In the summer of 1744, gallant old Mascarene sustained two hot sieges in his ramshackle fort of Annapolis Royal; the first force was led by young Belleisle and other Acadians; the second, by Du Vivier, a descendant of Charles de la Tour. In 1746, Ramezay encamped against him, awaiting D'Anville's ar-

mada, but did not fight. The same winter, he surprised Noble's force at Grand Pré, and killed, wounded or took prisoner nearly 200 men.

When the war ended by the Treaty of Aix-la-Chapelle in 1748, Cape Breton was restored to France, and Louisburg, the Dunkirk of America, resumed its old attitude of menace to the very life of the English colonies. Then at last sluggish England moved to save the key to her possessions over-sea. Nova Scotia was to have an effective garrison to counter-check Louisburg. In June 1749 a fleet of 13 transports, bearing some 3,000 colonists, and escorted by the sloop-of-war, *Sphinx*, reached the great three-fold harbor of Chebucto, long known for its excellence to French and English mariners. The leader of the expedition was Col. Edward Cornwallis, twin brother of the gay archbishop of Canterbury, and uncle of the Lord Cornwallis, who surrendered at Yorktown. He had seen service at Fontenoy and Preston Pans, and although his military reputation was afterward clouded by his share in the Rochefort and Minorca fiascos, he did his work as a city-builder well. The new military post, Halifax (q.v.), was quickly laid out, the land cleared, the population organized into a militia and a rough line of stockade and block-house run around the streets of tents and log-huts. In spite of the character of the settlers, trade-fallen soldiers and sailors, and the plague that carried them off in hundreds; in spite of Indian massacres, opposition from local smugglers, extortions of Boston merchants, discouragements from the home government, Cornwallis made Halifax a place on the map of the world. The founding of Halifax brought about the second capture of Louisburg, leaving the way free for Quebec (q.v.) and the downfall of the French power in America. Emigrants from Old and New England flocked to the new city. In 1750 and again in 1752, some hundreds of settlers came from the Palatinate. After a brief stay in Halifax, they were transferred to the island-studded bay of the La Hève, the old headquarters of de Razilly, where they have grown into a race of hardy fishermen, whose town, Lunenburg, is the Gloucester of Canada.

In 1752, Cornwallis returned to England crippled by rheumatism, but his successors, Hopson and Lawrence, built strongly on the foundation he had laid. Their great problem was the growth of French power in the fortress of Louisburg and in the Acadian population. Under English rule, the *habitants* were far happier than under their old masters. The nominal government at Annapolis Royal had been powerless for good or evil. Its authority did not extend beyond a cannon-shot from the walls of Fort Anne. It was precisely under English rule that the Acadians increased and multiplied and, beginning to press upon the means of subsistence, spread outward, round the Bay of Fundy, to the marsh-lands on the further shore. Their law-suits were nearly always over disputed lands, or boundaries. In 1755, they numbered about 10,000 persons. England and France were then mustering all their forces for the coming struggle known to history as the Seven Years' War. No one could foretell that it would be final or which country would win. England seemed to be at the lowest ebb of fortune and spirit. Brown's lugubrious *Esti-*

*mate* predicted her immediate downfall. France seemed strong in the New World; she had hemmed the disunited English colonies in with a chain of posts from the mouth of the Mississippi to Louisburg. She had never ceased to regret the loss of Acadie or to plan for its recovery. The province was the pivot of the whole situation in the east. In these circumstances, the presence of the alien French population in it constituted a grave danger. The claim has been set up that they were neutrals; they had this idea themselves; but this strange notion was simply due to the impotence of the British government. They were no more neutrals than the people of Alsace and Lorraine were after their transfer to Germany in 1871. They were British subjects by conquest, by treaty, by the formal taking of an oath of allegiance and by the common law of nations, but they refused to consider themselves as such. They might be French subjects again by another war, or the return of the Pretender. Whether they left the province or remained in it was not a matter of indifference. If they stayed, they afforded a shield to hostile operations; if they were free to go, they would strengthen and feed the garrison of Louisburg. In this dilemma, the old proposal of Shirley's was renewed, their deportation. In the autumn of 1755, after Braddock's defeat gave the signal for war, this was done. The idea originated in New England and was carried out by New England men, acting under the orders of Governor Lawrence. At Grand Pré, Pisiquid, Chignecto and Annapolis Royal, the men were called together and made prisoners, and placed on board the transports; their families followed them. The embarkation consumed long weeks. Finally the ships sailed and distributed the unhappy people among the Atlantic colonies. In all, some 7,000 persons were in this way removed from the province. Opinions differ as to the measure. The French theory is the natural brutality of the English; one writer finds his reason for it in the greed of Lawrence to seize on the belongings of the poor peasantry. The general English view is that it was a war measure, cruel as all war is, but imperative for self-preservation; and this theory has the support of Parkman.

With the deportation of the Acadians came peace with the Indians. In 1761, Argimoosh, "the great witch," and his braves buried the hatchet in Halifax and washed the war paint from their bodies. Now for the first time settlers were safe outside the pickets of the city; and the country began to fill up. Emigrants from Connecticut occupied the waste lands of the Acadians. Highlanders from Caithness and the Western Isles settled about Pictou harbor. Presbyterians from the north of Ireland found homes in Colchester. Before and after the Revolutionary War, thousands of devoted Loyalists came to the province, some to remain, some to pass on. Shelburne, a city of these exiles, numbering 10,000 at one time, passed away like a gipsy encampment. The long wars of peace began with countless inroads upon the wilderness. In a century the Acadians had scarcely cleared 300 acres. Now farms and settlements were eating into the forest, and hamlets were springing up beside the empty harbors. Before the end of the century, the great industries of shipbuilding and the fishery were in

their vigorous infancy. The American Revolution left few marks on the history of the province: efforts were made to bring the colony into revolt with the rest; one daring man planned the capture of Halifax, and some sympathizers with the rebels were tried for treason. There was even something like a tea riot in Halifax; but the conservative forces held the province firm. Halifax prospered, as it always did in war-times, through supplying the army and navy, and the sale of the many prizes brought to port. With the return of peace, the tide of prosperity promptly ebbed. In three great wars since its founding, Halifax was a nest of privateers, which brought large returns to their owners.

Colonial government was at first military. All power was vested in one man, the governor, or his lieutenant-governor, who was usually a soldier. To advise him, he had a council, and his instructions contemplated a legislative assembly. As the Acadians were incapable of representative institutions, they were governed through their deputies. Members of the old council were sworn into the new one by Cornwallis, when Halifax became the seat of government. His large instructions empowered him to summon assemblies and make laws; but the first assembly was not elected until 1758. From this time, the chief power passed from the governor to the council, a small coterie of Halifax officials and merchants, appointed for life, who sat in secret session and were not responsible to the people. The powers of the assembly were curiously limited, and friction between the two bodies was constant. Governor succeeded governor, almost always an army officer with high Tory views of prerogative and military conceptions of his office. He was gently guided through his unfamiliar civic part by permanent officials in the council like Richard Bulkeley, who came out as aide to Cornwallis and died provincial secretary in 1800. The tone of society as well as government was conservative, not to say reactionary. This state of things lasted until well into the fourth decade of the 19th century. With its large military and naval population, and the merchants who lived by supplying them, Halifax was in many respects an English garrison town in America. In the first session of the House of Assembly, the Church of England was established by law; the first college was modeled on Oxford, and its statutes required subscription to the Thirty-nine Articles both at matriculation and on taking a degree.

The agitation for reform began outside, for the country was pitted against the city. Jotham Blanchard, editor of the *Colonial Patriot*, was perhaps the first critic of the existing order. The Rev. T. McCulloch, the Scottish "Seceder" missionary, who founded Pictou Academy and became the first president of Dalhousie College (q.v.), was another early reformer. But the man who brought reform to pass was Joseph Howe (q.v.), Nova Scotia's darling son, perhaps the most interesting personality in Canadian history. He was born at Halifax in 1804 of Loyalist stock. His father was King's printer, and, after some scanty schooling, he was apprenticed to his father's trade. In 1835 he was editor and owner of the *Nova Scotian* newspaper. On New Year's day it contained a letter signed "The People," accusing the Hali-

fax magistrates, in plain terms, of pocketing public money. Their indignation was extreme and they began a libel suit against the daring editor. If truth is libel, Howe had no case; and no lawyer would undertake it. Howe conducted his own defense, and by a brilliant address to the jury secured a triumphant acquittal. From that hour he was the idol of the people, whose cause he had espoused. On the other hand, several hot upholders of the existing order challenged him; he fought one duel, and, having proved his courage, wisely declined further argument by pistol. Howe was a good example of the popular tribune, emotional, eloquent, social, with the faults of such a nature, but possessing tact withal and the statesman's insight into great problems far beyond the ken of provincial politicians. On such questions as the union of the remaining British American colonies, communication between them, the federation of the empire, Howe was far in advance of his time, and his ideas were formative. Henceforth, his career was in politics, rather than in journalism. Elected member for Halifax in 1836, he at once attacked existing abuses in a series of resolutions, which served chiefly as a program of reform. Soon afterward he began an important correspondence with Lord John Russell, the colonial secretary, on the difficulties of local government. As a result, the latter instructed Sir Colin Campbell, the governor, to introduce certain of the changes suggested by Howe. This Sir Colin refused to do, and Howe began an agitation which led to his recall. He was succeeded by Lord Falkland, whose remedy for the trouble was coalition in the council. Four of the old council were dismissed, and four Liberals, Howe among them, took their place. But the two interests were irreconcilable: Howe and his friends soon resigned, and began to lay before the people the evils of the irresponsible system. In the election of 1847 Howe and his party swept the country. The new assembly passed a vote of want of confidence in the council, which thereupon resigned in disgust. A cabinet was formed of the triumphant Liberals and the principle of responsible government was established.

The situation of the colonies remaining to Britain on this continent in the first half of the 19th century was not cheering. Upper Canada was largely virgin forest, with struggling towns and widening clearings: Lower Canada was alien in speech and religion; both passed through the throes of rebellion. The great West was supposed to be uninhabitable. The provinces by the sea were poor, thinly settled, each with its own government and its own tariff wall against the rest. The 20th century dawns on a united and prosperous country stretching from the Atlantic to the Pacific. For years Howe pointed out the value of union, for the object lesson of the Great Republic was hard to mistake. But here, as in the case of the 13 colonies, before and after they achieved their independence, each province had its own pride, interests and jealousies. Besides these, the geographical barriers to union seemed insurmountable; but the locomotive engine changed the face of affairs and provided the solution of the problem. The universal fever for building railways reached the provinces. The first railway in Nova Scotia united Windsor, Halifax and Truro; the first in New Brunswick, Saint

John and Shediac. A bolder idea was to join the provinces, inland and seaboard, by an inter-colonial railway. If united for commerce, why should not the colonies be united for government?

It cannot be said that anywhere in the Maritime Provinces was there a popular movement in favor of union. It was the thought of a few strong, far-seeing men, with powers of persuasion, like Macdonald in the West and Howe in the East. Nova Scotia has the honor of leadership in bringing about the Charlottetown conference. When the question came up in 1867, Howe was in opposition, and Tupper carried the resolution through the House. By a curious irony of fate, Howe was now led to combat the very measures he had fought for so long. He took advantage of his opponent's failure to submit such an important measure to the verdict of a popular election and he roused the people into fury against confederation. They were bought and sold, he told them, "for 80 cents a head, the price of a sheepskin." In the next election, the great issue was repeal of the union, Howe carried the country, and Tupper was the only conservative returned. Howe tried every legal means to detach his province from the union, but the British government refused to reconsider the measure it had just sanctioned, and Howe would not appeal to Washington, or have recourse to arms. He sought "better terms" for his province from the Dominion government, and entered the Macdonald ministry to assist in working out the problems of the new experiment in government. Though not a consistent, Howe was a great man; with all his faults, he loved Nova Scotia well, and Nova Scotia will long cherish his memory.

**New Brunswick.**—The waterway of the Saint John as a greater Indian road, attracted the attention of the French fur traders early in the 17th century. La Tour fixed his headquarters at its mouth. It is still the main artery of the province. There were also French settlements on the rivers and harbors, such as the Miramichi, the Restigouche, Baie Verte. Petite Rochelle was partly fortified; the town at Beau-bien's Point had 200 houses and a chapel. These settlements were not permanent. There was a small colony from Massachusetts at Maugerville on the Saint John in 1760; but the history of New Brunswick as a political unity begins with the close of the American Revolutionary War.

In some respects, the struggle of the 13 colonies for independence was a civil war: for all the colonists were not of the same mind. Some of the best regiments on the King's side were raised in America. For instance, Fanning, the second governor of Prince Edward Island, at one time judge of the Supreme Court of North Carolina, raised and commanded "The King's American Regiment." When the British cause was lost, such forces were disbanded, and the citizen soldiers, impoverished by eight years of war, could not or would not live under the new government. Many of the official class, the Episcopal clergy and their humble followers were also on the losing side. For the defeated, there was no mercy; the fierce republicans would not let them live in the country. After the surrender at Yorktown (q.v.) thousands of these unfortunates flocked to New York and other seaports. No provision was made for

them in the terms of peace; but public sympathy was aroused on their behalf, the British Parliament took generous measures for their relief, Sir Guy Carleton stood their friend. Ships were provided to carry them away, large grants of land were made to them in the loyal colonies, with tools, supplies and provisions for one, two, or three years. Some went to England, but the great majority found homes in the northern wildernesses. There some 30,000 exiles, many of the educated and cultured classes, found refuge. In American history these are the Tories, traitors to their country; in Canadian history, they are the United Empire Loyalists, the makers of the new Dominion. More than any other class of emigrants, they formed present Canadian sentiment and institutions.

The great emigration took place in 1783. On 18 May a fleet of 19 transports, with some 3,000 Loyalists on board, reached the mouth of the Saint John. Here a great stream of 450 miles pours through a narrow breach in the rocks into a small harbor, where the flood-tide rises 26 feet, and ebb leaves the great ships aground. All round are desolate hills masking the fertile region beyond. This unpromising site the Loyalists chose for their city. They were men of the 8th, 98th, 194th regiments, the New Jersey Volunteers, and the Queen's Rangers. The grantees' list show good substantial English names. The "fall fleet" brought 1,200 more, and Parrtown, so called in honor of Governor Parr, of Nova Scotia, began its career with a population of 5,000. Politically, it was situated in Sunbury County, Nova Scotia. Soon the Loyalists showed active discontent at Governor Parr's delay in making out their grants, and in giving them representation in the House of Assembly and, in spite of his opposition, they succeeded in persuading the British government to erect their county into a separate province with a royal governor, council and House of Assembly of their own. This was done in 1784, and the province of New Brunswick was created by royal charter, with Col. Thomas Carleton, brother of the famous Sir Guy Carleton (q.v.) for governor. His commission and instructions were practically the same as those given to Cornwallis in 1749. This council of 12 members exercised both executive and legislative functions. The first House of Assembly, of 26 members, was elected, not without riot, in 1785, and met for the first time in the following January. In this year, Parrtown was incorporated as Saint John (q.v.); it was the first city in British America to receive a charter. It is modeled on the charter of New York, and gives the mayor the office of garbling spices and the right to appoint the bearer of the great beam. No emigrant or other person could sell goods without first obtaining the freedom of the city. From the founding of the province until 1832, no changes were made in the constitution. As in Nova Scotia, the prevailing ideas were high Tory; and popular rights received little attention.

New Brunswick's chief wealth is her great forests; and her two chief industries, lumbering and ship-building, soon sprang up: but agriculture languished. Population followed the waterways, the natural timber roads from the interior. Down to the time of the Crimean War, the timber trade was fostered by British legislation. The province grew, but not stead-

ily; periods of prosperity were followed by periods of depression. Many emigrants brought out by the timber-ships simply passed through to the United States. The Reciprocity Treaty of 1852 was a boon to the Maritime Provinces: its abrogation injured trade.

During the War of 1812, the provinces were harried by privateers; but they were not invaded, like Upper Canada, because New England was opposed to the war. In the provincial sea-ports privateering also thrived. Dalhousie College was founded with customs money taken at Castine by an expedition from Halifax. After 1815, settlers from the United States began to occupy disputed territory between New Brunswick and Maine. The boundary between the two, left vague by the treaty of 1783 almost led to war. The northwest line was to run due north from the source of the Saint Croix River to the height of land between the Saint Lawrence and the Atlantic. Instead of one chain of high lands, there are two chains: between them lay the disputed territory, comprising some 12,000 square miles. Under the Jay treaty of 1794, a commission was appointed to determine the line. The Americans wished to extend the due-north line to the M<sup>étis</sup> River in Quebec: the British wished to make Mars Hill the limit, and they could not agree. Another attempt at settlement was made by the Treaty of Ghent. The King of the Netherlands was appointed arbitrator, but his award was not accepted. In 1839, the difficulty became acute. Some lumber-thieves cut timber on the debatable land; the governor of Maine sent a sheriff and posse to drive them out, and New Brunswick lumbermen resisted the officers of the law. The squabble roused intense feeling on both sides. The governor of Maine called for 10,000 troops to guard the State's rights. The governor of New Brunswick, Sir John Harvey, sent two line regiments with artillery and volunteers to the scene of action. Nova Scotia voted all her militia and £100,000 to aid the sister colony; the Canadas also proffered help. Gen. Winfield Scott took command of the American forces. He and Sir John Harvey had fought against each other in the War of 1812. They agreed to a joint occupation of the disputed territory; and the war-cloud blew by. In 1842, Mr. Baring for England, and Webster for the United States, negotiated a treaty that at last delimited the frontier. On the disputed territory, Maine got 7,000 and New Brunswick 5,000 square miles. Mr. Baring was made Lord Ashburton for his success, and the treaty is known by his title.

One peculiarity of the colonial status was the appointment of colonial officials by the home government. New Brunswick's case is typical. The governor, the attorney-general, the provincial secretary, the judiciary, the customs and Crown land officials were all appointed from England and paid out of the revenues arising from the customs and Crown lands. In 1825, the Legislature was given control of the customs, when it soon discovered that nearly all the revenue went out in salaries. Not until 1848 did the province both receive the revenues and fix the salaries of this department. In 1837, the province took over the revenue arising from the Crown lands on condition of paying the governor, the judiciary and the other government officials. The last department to come under provincial control was the post office.

As in other colonies, the irresponsible council became an abuse, and many were the contests between it and the assembly. In 1832, a second council was established with executive, but not legislative functions. This was done by the home government in its desire for uniformity in the colonial governments; but the parliamentary principle of majority rule with an executive council or cabinet to carry out the will of the majority were slow in being understood. It was six years later before the executive included a member of the elected assembly. Slowly the province worked out the problem of self-government. In 1839, when Sir John Harvey read to his legislature, Lord John Russell's despatch on tenure of office, and unlike the governor or Nova Scotia was in accord with its proposals, the assembly, after full debate, actually refused the boon of responsible government. In 1848, however, the modern system was in essential particulars recognized by formal resolution. Charles Fisher, and L. A. Wilmot, afterward judge and lieutenant-governor, were the leading reformers, and two of the royal governors, Sir Howard Douglas and Sir John Harvey, were in complete sympathy with the popular movement.

New Brunswick was represented at the Charlottetown conference, where the preliminaries of confederation were discussed. At the Quebec conference, the leading men of the opposition as well as of the party in power were delegates. The 72 resolutions then agreed upon were to be submitted to the various legislatures for their approval. Before the New Brunswick assembly could vote on them, it was dissolved; and in the new House, a large majority were pledged to oppose them. This led Nova Scotia to withhold the resolutions, as no vital union could be effected with the upper provinces that left out New Brunswick. However, when the House opened in 1866, the majority committed themselves to the policy of union in the speech from the throne. The House dissolved on the issue, and, sentiment having changed, in the new election, the unionists were returned by a large majority. New Brunswick is one of the four original members of confederation. See article CONFEDERATION; also NEW BRUNSWICK.

**Prince Edward Island.**—The large crescent-shaped island in the southern part of the Gulf of Saint Lawrence is supposed to have been discovered by Cabot, and afterward by Cartier, who named it Isle Saint Jean. After the conquest, it was still called Saint John's Island until 1780, when the local legislature named it New Ireland, an act disallowed by the British government. In 1794, it was renamed Prince Edward's Island in compliment to the Duke of Kent, the father of Queen Victoria. After the Treaty of Utrecht, Acadians from the main land settled at the southern central harbor and named it Port La Joie, the present Charlottetown. It was governed from Louisbourg. In 1752 the population was 1,354. Three years later, after the fall of Beauséjour and the expulsion of the Acadians, many took refuge there. At the fall of Louisbourg in 1758, the population was at least 4,000 souls, in four thriving parishes. The fertile "Garden of the Gulf," as the islanders love to call their little sea-girt province, was even then worthy of the name. Casgrain calls it a second Acadie: for hence also the Acadians were expelled. When

Captain Holland made his survey in 1764, he found only 30 Acadian families "on the footing of prisoners," and a tiny British garrison in a miserable fort.

In 1763, the year of its cession to England, Lord Egmont proposed a plan of settlement worthy of Sir William Alexander in its feudal character. One feature was a chain of baronial castles from one end of the island to the other; but the plan was never carried out. In 1767, the entire island was divided into 67 lots or townships, of some 20,000 acres each, and granted, by lot, in one day to a number of influential Englishmen, on the old condition of settling so many emigrants within a certain time; they were to pay a perpetual quit-rent, or land-tax. Here began the curse of the absentee landlord, which laid the island under a blight for more than a century. At first, it was annexed to the government of Nova Scotia, but in 1768 it was, on the petition of a majority of the proprietors, erected into a separate province. In 1770, the first royal governor, Colonel Patterson, arrived with his official staff, whose salaries were to be paid from the quit-rents. The formative ideas here were also high Tory. Roman Catholics were not permitted to settle; no schoolmaster from England might teach without a license from the Bishop of London. Population grew slowly; for few of the proprietors fulfilled the conditions on which they got the land. In 1773, the first House of Assembly was elected. Its first act was to confirm all the past proceedings of the governor and the council.

On the outbreak of the Revolutionary War, two American vessels, sent to cruise in the Gulf for British ordnance store ships, raided Charlottetown and carried away some prominent officials. For this Washington cashiered the delinquent officers and released the prisoners with expressions of regret. Another raiding expedition from Machias came to nothing, and the island remained free from molestation till the close of the war. In 1781, proceedings were begun in the Supreme Court against the townships in arrears with quit-rents, and various holdings were escheated and sold, it was thought, without due notice to the landholders. The unimproved waste land was an obstacle to colonization; the owners neither planted settlers nor paid the quit-rents, on which the revenue depended. The landlords argued for the defense, that some of them were officers on active service, that the war had prevented settlement, and that the lands were sold to persons on the ground at absurdly low prices. In rebuttal, Patterson urged that in the midst of a disastrous war, both money and purchasers were scarce; the island might have been captured or ceded back to France. He admitted that he bought up escheated lands, but held he was within his rights as a citizen in doing so; he had also, at his own risk, saved out of the sales, various lots for the absentee owners. In response to various petitions from the proprietors, the home government granted them relief, and sent a draft bill to Governor Patterson, making the sales voidable. This he was to submit to the assembly, but he suppressed it for two years. A new assembly was elected in 1784. It resolved to complain to the King against the governor for disposing of the lands so hastily, when he dissolved it.

The war was now over; the exiled Loyalists were pouring into Nova Scotia, and Patterson hoped to divert the desirable stream of emigration into his own province. Many Loyalists came; by special favors he secured them to his interest, settled some of them on the lands sold in 1781, and in 1785, secured an assembly certain to support him. It passed an act approving his conduct in escheating the unimproved estates, but the home government disallowed the act and recalled the disobedient official. In 1786, the governor submitted at last the English Draft Act, already mentioned, to the assembly, which passed it with haste, as also another act of the governor's framing restoring the escheated lands to the rightful owners, but saddling them with heavy expenses; this the home government disallowed and dismissed the members of the council concerned in it.

The new governor, Edmund Fanning (q.v.) arrived in November, but Patterson refused to vacate his office, and the winter was spent in the quarrels of these two Kings of Brentford: but in the spring, Fanning was firmly established. The escheated lands remained in the quiet possession of their purchasers, some of whom came to terms with the original grantees. Fanning was a native of New York, a graduate of Yale, and a D.C.L. of Oxford. Through the Revolutionary War, he commanded the King's American Regiment and was twice wounded. In his administration, the land question smouldered. The chivalrous Earl of Selkirk, who also planted settlements in Upper Canada and the Northwest, brought out, in 1803, 800 of the Clan Ronald Macdonalds and settled them about Point Prim.

Fanning was succeeded by Des Barres, a Swiss officer in the British service, famous for his surveys, his amours and his great age; he jumped over a settle when he was more than a hundred years old. His administration was uneventful, but not so that of his successor. Charles Douglas Smith, brother of the famous Sir Sidney, who foiled Napoleon at Acre, was a fine example of the old-fashioned high Tory royal governor. His first address to the assembly, when it met in November 1813, was insolent and dictatorial. In the following January he prorogued it and did not convene it again until 1817. Between this and 1820 the legislature was three times assembled and dissolved, after short sessions, by this exponent of personal rule. His proceedings in regard to the quit-rents were also oppressive. In 1818, in opposition to the express commands of the home government, Smith enforced the payment of quit-rents in arrears. His action, however, the British government disallowed, and ordered part of the exactions to be refunded. Then, for three years, no attempt was made to collect the odious tax; in some instances payment was refused by the receiver-general. In 1823 another effort was made by the governor to enforce payment. The Gaelic-speaking Highlanders of King's County were required to pay dues that seemed obsolete, or give promissory notes at 10 days. In the depth of winter, they must haul their farm produce to Charlottetown and sell at a sacrifice to meet these demands. Without a legislature, the people petitioned High Sheriff MacGregor to call public meetings for the discussion of grievances. The gathering at Charlottetown drew up an address to

the King, rehearsing a long list of charges against the governor, and requesting his recall. Smith retorted by opening a libel suit in the Court of Chancery, over which he himself presided, against the committee on the King's address in Queen's County. His object was to prevent the petitions reaching England, but the custodian of them escaped to Nova Scotia. For merely publishing an account of the proceedings the editor of the local paper was brought into the Court of Chancery for libel. When he revealed the names of the writers they were admonished by the chancellor-governor in the vein of Judge Jeffreys. This energetic ruler, who shook his fist at the speaker of the assembly and gave him three minutes by the watch to adjourn the House, was recalled in 1824, when he had brought his long-suffering province to the verge of rebellion.

Governor succeeded governor; the island grew in population and prosperity; fisheries and husbandry thrived; but the land question was an open sore. It had now become complicated by the fact that the original proprietors had died and bequeathed or had transferred their rights in the island. In 1859 Sir Samuel Cunard (q.v.), the Halifax merchant who founded the famous line of steamers bearing his name, proposed that the whole question be referred to a commission of three members, one to be appointed by the Crown, one by the island Assembly and one by the proprietors. To this all agreed. Howe was the nominee of the Assembly. The commission sat in the Colonial Building in Charlottetown, examined many witnesses, though not on oath, and heard counsel on behalf of both parties. They afterward visited the shire towns and acquired a vast amount of information on the difficulties. Their report is dated 18 July 1861. It condemns the original method of granting the island, commends the land purchase act, by which the Selkirk and Worrell estates had been acquired for the people, and considers some such system to be the solution of the vexatious problem. It recommends the British government to guarantee a loan of £100,000, which would enable the local government to enter the open market for the purchase of estates. But the home government refused the loan, and the landlords refused to be bound by the findings of the commission. The old difficulty remained until the island came into the Confederation in 1873, when the Dominion government placed \$800,000 to the credit of the province for the purchase of estates and the local legislature made the sale of estates, on evaluation of commissioners, compulsory.

Charlottetown was the scene of the historic conference of delegates from the maritime provinces to discuss union, when the representatives of the Canadas came knocking at the door, but the islanders were not in favor of any change in their status. There was prejudice, the conception of a new nation was hard to grasp and the main issue was befogged by parish politics. Although islanders took part in the Quebec and London conferences also, the island remained outside Confederation until 1873, when the crippling of the provincial means by extensive railroad building led the people to a reconsideration of the matter. The Dominion government gave generous terms, and the little province, while losing nothing of autonomy, entered

into a larger national life. See articles in this series on CONFEDERATION; SINCE CONFEDERATION; CONSTITUTION; AGRICULTURE; FISHERIES; MANUFACTURES; THE FORESTS AND LUMBER INDUSTRY; MINERALS; GEOGRAPHY; PRINCE EDWARD ISLAND.

ARCHIBALD MACMECHAN,  
*Professor of English Literature, Dalhousie College, Halifax.*

**8. CONFEDERATION.** In 1837 there took place two rebellions: one in Upper and British, the other in Lower and French, Canada, simultaneous, but almost unconnected, and scarcely united in sympathy, since the British Protestants of the upper province were by no means fraternally linked with the French of the lower. In Upper Canada the rebellion was a rising of a democratic party, including many of the most recent colonists and some from the United States, against the personal rule of the imperial governor and the domination of a political circle nicknamed the Family Compact, and consisting largely of U. E. Loyalists, which monopolized public offices and emoluments. Its leader was Lyon Mackenzie, a man honest and right in his main aim, if responsible government is right, but wanting in wisdom and capacity as a leader. The object of the extreme wing was an independent republic or annexation to the United States. That of the less extreme wing was responsible government on the British model. The political crisis and the outbreak of civil war were brought on by the indiscretion of an inexperienced governor, Sir Francis Bond Head, who (1836-38) threw himself into the arms of the Family Compact and the Tory party. In Lower Canada the rebellion was a rising of the French, the conquered race, who formed the great majority, against the monopoly of office and power by the British and conquering race, exercised largely through a council appointed by the imperial governor. Its object was the assertion of French equality and right. It had been preceded by a series of angry controversies between the French patriots and the governor with his British councillors and the Colonial Office at their back. Both rebellions were quelled (1838) with ease and without much bloodshed; that in Upper Canada by the loyal militia, that in Lower Canada by the Queen's troops. There were few executions, but some of the leading insurgents were driven into exile. The constitution of Lower Canada was suspended, but that of Upper Canada was not.

The Liberal party in the mother country was now in the ascendant, having carried Parliamentary reform. It looked with sympathy on the struggle of the Canadians for free institutions. Lord Durham (q.v.), son-in-law of the Whig Prime Minister, Earl Grey, and though an aristocrat a strong Liberal, was sent out (1838) to study the situation. In a report of remarkable ability, which has been regarded almost as the gospel of colonial liberty, he decided in favor of extending to Canada responsible government on the British model, requiring the governor, instead of ruling personally, to be guided, like the British sovereign, by the advice of responsible ministers, who were to be designated by the choice of the people. The report at the same time recommended the reunion of the two provinces, a

measure the sure result of which its author imagined to be the complete ascendancy of the more powerful race, the destined heir, in his opinion, of the whole North American continent.

Durham, having exceeded the limits of his power, and incurred censure by condemning some ex-rebels to banishment of his own authority, his mission was cut short (1838) but his main recommendations were carried into effect (1839). The provinces were reunited, the measure being carried in the lower province, the constitution of which had been suspended by the fiat of the Crown; in the upper province, after some debate, by a vote of Parliament. Responsible government was introduced. The governor was instructed thenceforth to be guided, like the British sovereign, by the advice of his ministers, who were to be responsible to the people.

In a dispatch from Lord John Russell (q.v.) (5 Feb. 1841) the governor-general was instructed to call to his councils "those persons who, by their position and character, have obtained the general confidence and esteem of the inhabitants of the province," and "only to oppose the wishes of the Assembly when the honor of the Crown or the interest of the empire is deeply concerned." There soon followed a general amnesty, with return of exiles, and Lyon Mackenzie sat in Parliament under the new régime.

About the same time, and by the action of the same general forces, including the ascendancy of the Liberal party in Great Britain, responsible government on the same model was introduced in the maritime provinces. In Nova Scotia the change was brought about largely by the eloquence of the patriot leader Joseph Howe (q.v.) (1838).

The transition was smoothed by the wisdom of the new governor, Poulett Thompson, Lord Sydenham (1839-42), a man of business, trained in commercial life, who adapted himself steadily and with general success to the introduction and working of the new system. Sir Charles Bagot, who followed (1842-43), though a Conservative, took the same line. But the idea of colonial self-government had hardly taken root in the policy of the Colonial Office or in the minds of British statesmen. Sir Charles Metcalfe (1843-45), the next governor, had been trained in the imperial government of Hindustan, and brought with him the impression that in every dependency the governor was still personally supreme and responsible for the choice of his ministers and for their policy. Acting upon this principle, he attempted to form a ministry (1843) of his own without regard to party designation. A political storm, with furious pamphleteering and ministerial interregnum, were the results. The upshot was failure on the governor's part to form an effective ministry, and his consequent defeat. The Colonial Secretary, Lord Stanley, however, emphatically endorsed the governor's conduct, and was authorized with his own approbation to convey the personal approbation of the Queen.

The new system was finally installed and brought into order by Lord Elgin (q.v.) (1847-55), one of the best and wisest servants of the empire, who entered fully into the spirit of responsible government, contenting him-

self with the exercise of an informal influence, rendered important by his character and ability. He could even flatter himself that he did more in this way than he could have done with the formal powers of the governor. He came in, however, for the last of the storm. The Liberal party, now in power, passed an act called the Rebellion Losses Act (1849), indemnifying those who had suffered losses by the destruction of their property in the suppression of the rebellion. This the Tories regarded as the indemnification of the rebels. Their cry was taken up by the Tory party in Great Britain. Elgin gave his assent to the act, reluctantly it seems, in compliance with the rule which required him to be guided by the vote of Parliament and the advice of his responsible ministers. The Tories, now playing the part of insurgents in their turn, rose, burned the Parliament House at Montreal (1849), with its irreplaceable archives, and stoned the governor-general, who had a narrow escape from their fury. Elgin, however, remained firm and was supported by the home government. After this his reign, or rather his term, was peaceful and generally popular, though more popular with the Liberals than with the Tories. The triumph of the free trade policy in Great Britain, depriving Canada of her colonial privileges, while she remained fettered by the Navigation Laws and was excluded from the market of the United States, bred commercial depression and discontent. The consequence was a manifesto signed by leading commercial men and pointing to union with the American republic as a remedy in the last resort. To put an end to this movement by removing its cause, Lord Elgin went to Washington and negotiated a reciprocity treaty with the United States (1854). This, following the repeal of the Navigation Acts and the release of the Canadian trade from the fetters which they imposed, restored prosperity, allayed discontent and put an end to the desire of annexation.

After the Rebellion Losses Bill, the most hotly debated of the political questions was that of the secularization of the clergy reserves (1854) (see CANADA — CLERGY RESERVES), tracts of land, which, before the revolution of 1837, when the Church of England was established in Canada, had been set apart for the maintenance of the clergy of the state church. After a long struggle secularization was carried, and the state church, with its privileges, ceased to exist. King's College, Toronto, which, so far as the teaching staff was concerned, had, like Oxford and Cambridge, been Anglican, was turned into the University of Toronto (see TORONTO, UNIVERSITY OF), and thrown entirely open to all denominations. Under Bishop Strachan, the powerful Anglican leader of the day, high Anglicans seceded from the University of Toronto and founded the University of Trinity College (1852). Other churches, during the continuance of the exclusion, had obtained charters for universities of their own, and dissipation of resources not more than sufficient, if collected, to maintain one great university, was the result.

The abolition of the seigniories (1854) in French Canada (see article SEIGNIORIAL TENURE), relics of the old Bourbon regime, with the oppressive privileges of the seignior, was another change obviously demanded by the new

order of things. It was accomplished peacefully, without violation of the rights of property, and with entire success. Another necessary change was the abolition of the aristocratic custom of primogeniture in succession to land, for which was substituted the democratic principle of equal partition, "gavel-kind," as the movers called it. The Tory party, sympathizing with aristocracy, faintly resisted the change. The progress of democracy was further marked by a change in the constitution of the Legislative Council which formed the Upper House of Parliament. Instead of being nominated by the Crown, as it had hitherto been, it was in 1856 made elective.

The party system of government was now in full play, but the principles and relations of parties were far from being definite or stable. There was a Tory party representing the U. E. Loyalists, and the traditions of the Family Compact under the leadership of Sir Allan MacNab, who opposed the secularization of the clergy reserves and the abolition of primogeniture. There were on the other side moderate Liberals under Baldwin and more advanced Liberals under Hincks. But the lines of political party were crossed and perplexed by the nationality of French Quebec. The French Catholics, instead of succumbing politically to British predominance as Durham had imagined that they would, closed their ranks, showed their force, played on the balance between the British parties and put a Frenchman, in the person of La Fontaine, at the head of the government. For a time it became an understanding that a government, to hold its ground, must have a double majority; that is, a majority both in the British and the French province. The act of reunion had given to the provinces general representation in Parliament, though the population of the French province was much larger than that of the British. Presently the balance of population turned in favor of the British province. The Liberal leaders of the British province, the most pronounced of them at least, then demanded a rectification in its favor. With the political strife about representation by population, "Rep. by Pop.," as it was called, mingled the religious antagonism of the British Protestants of the upper province to the Roman Catholics of the lower. The great advocate of representation by population, and at the same time the extreme exponent of the feelings of the Protestants against the Catholics, was George Brown (q.v.), a Scotch Presbyterian, and founder of the *Toronto Globe*, the most powerful organ of the British Canadian press in those days. On the other side appeared Mr., afterward Sir, John Macdonald (q.v.), one remarkably gifted with the arts of party management, and with an address in dealing with men which in his chief antagonist, George Brown, was wanting. Macdonald supplanted in the leadership of his party the old-time Tory, Sir Allan MacNab (q.v.), Liberalized it, and set it free from all incumbrances in the way of reactionary principle by which, up to this time, it had been weighted in the struggle for place. It was a stroke of strategy something like that performed in England by Sir Robert Peel (q.v.) when, accepting the consequences of the Reform Bill, he changed his party from Tory to Conservative. Between Macdonald and Brown there was, and to the

end continued there to be, enmity, personal as well as political. But Brown was no match for Macdonald in playing the party game. Once for a moment, by a casual defeat of the government of which his rival was a member, he set his foot on the steps of power (1858); but he immediately fell again, Sir Edmund Head, then governor-general (1855-61), having, by an unwonted exercise of the prerogative, which Brown furiously resented, refused him the dissolution and appeal to the country which he demanded (1858). Questions and principles of all kinds were crossed by personal ambitions and connections, as well as by the national sensibilities of Quebec, which naturally carried her to the side of the Conservatives rather than to that of the advocates of representation by population, the hot Protestants and the Orangemen.

The end, after a rapid succession of changes of ministry, producing a total instability of government, was a ministry with a majority so narrow that it was said that the life of the government depended on the success of a page in finding a member at the moment of critical division. The upshot was a deadlock. The relation between the two races, owing to the persistent attacks of George Brown's party on the French Catholics, had at the same time become critical and dangerous. From this position an escape was sought by merging the antagonism of British and French Canada in a confederation of all the British colonies in North America. The credit of proposing confederation has been assigned to different politicians, to George Brown, to Sir John Macdonald, to Sir Alexander Galt. Of the party leaders, it was George Brown who first came forward holding out his hand to his rival, Sir John Macdonald, to propose coalition for the relief of the situation. But Mr. Brown's original proposal was not a confederation of all the provinces, but a substitution of a federal for the legislative union between the British and the French province. What Sir John Macdonald, as a strong Conservative and monarchist, preferred was not a federal but a legislative union of all the North American colonies under the British Crown. What all alike wanted was a relief from the situation, and for this purpose a coalition government comprehending the two rivals and enemies, Sir John Macdonald and George Brown, with followers of both, was formed (1864). The fact is that the real author of confederation, so far as British and French Canada was concerned, was deadlock.

The three maritime provinces, Nova Scotia, New Brunswick and Prince Edward Island, were inclined to a separate union among themselves, especially with a view to a reduction of the expenses of government. A conference of delegates from those three maritime provinces was held at Charlottetown (1864). To that conference delegates were sent by the coalition government of Canada to propose a wider union. The result was a conference at Quebec (1865), at which 12 delegates were present from Canada, 7 from New Brunswick, 5 from Nova Scotia, 7 from Prince Edward Island, 2 from Newfoundland. That conference sat for 18 days and passed 72 resolutions on which the act of union was afterward based and which each delegation undertook to submit to its own government.

By the Parliament of the two Canadas the scheme was at once accepted and by a large majority, though there was a long debate in which a speaker of the opposition glanced at the geographical unfitness of the long and broken line of provinces for political union. New Brunswick, not being adroitly approached, at first rejected the scheme, but presently acquiesced. In Nova Scotia the resistance was very strong, but it still remains a mystery by what arguments a legislature elected expressly to oppose confederation was brought round to its support. Brought round, however, the legislature of Nova Scotia was. Howe, after a vain appeal to the British Parliament to set Nova Scotia free, himself took office in the confederation government. Prince Edward Island held out, but came in at last. British Columbia threatened repudiation of the union, till the construction of the Canadian Pacific Railway, which was the condition of her entrance, was assured. Newfoundland still remains unfederated. But a great addition was soon afterward made to the Dominion by the purchase of the Hudson's Bay country now comprising the province of Manitoba and the Northwest Territories. The accession of Newfoundland alone is wanted to complete the scheme of confederation. The scheme having been framed by the colonial legislature, was laid for revision before the British government, and by it embodied in the British North American Act. (30 and 31 Vict. Cap. 3; 1867).

When confederation was passed, party lines were drawn again. Brown seceded from the confederation government and the political enmity between him and Sir John Macdonald became as bitter as before.

The Federal constitution was never submitted, like the Constitution of the United States, to the people. It was alleged that in a general election which followed, and in which the confederation government was sustained, the people virtually expressed their approbation. But it is obvious to remark that in this election other issues were submitted and other influences, that of party especially, played their part. So that it cannot be truly said that the constitution of Canada has even been distinctly ratified by the Canadian people.

GOLDWIN SMITH,

*Formerly Regius Professor of Modern History of the University of Oxford, and Emeritus Professor of Cornell University.*

**9. SINCE CONFEDERATION.** On 1 July 1867 there were great rejoicings in Canada for it was the birthday of the new Dominion. But at that time the work of founding a Canadian nation was only begun; much remained to do. As it stood on 1 July 1867 the Dominion included only four provinces: Nova Scotia, New Brunswick, Quebec and Ontario, (qq.v.) and of these Nova Scotia was profoundly discontented and, since her people had never voted upon the question, desired to withdraw from the confederation. Nor did Canada possess the entire East. The two important islands, New-

foundland (q.v.) and Prince Edward Island (q.v.) still held aloof; not until 1873 was Prince Edward Island persuaded to join the Dominion, while Newfoundland still stands apart. The vast Northwest, to-day the chief pride and promise of Canada, was not then included within her territory, nor was its entry brought about without discontent and bloodshed. It had long been a hunting preserve for the Hudson Bay Company, but in 1870 by paying to the company £300,000 to extinguish its rights Canada removed every obstacle to her absorption of those regions. In 1871 British Columbia (q.v.) consented to enter the Union, but was long restless and threatened to withdraw unless a transcontinental railway was promptly built. With all these jarring elements assuredly Canada, when confederated, had no real union, and the subsequent work of her statesmen has been chiefly to consolidate her scattered fragments.

The leader who played the chief part in this work of consolidation was Sir John Macdonald (q.v.). In many ways, in wit, in intellectual agility, sometimes in cynical carelessness as to the means he used to secure his ends, he was strikingly like Lord Beaconsfield; but whenever the vital political interests of Canada were concerned, invariably, according to his light, he showed a whole-hearted patriotism. He was filled with passionate devotion to the British Crown and treasured for Canada the ideal that she should be a kingdom modeled on that of Great Britain, taking her place on equal terms as an auxiliary of the United Kingdom. He did not favor federal government, and would have preferred to give Canada one all-powerful legislature like that of Great Britain. But in these respects conditions were too strong for Macdonald. His cherished "Kingdom of Canada" became the "Dominion of Canada" in deference to the supposed prejudices of the American republic against a monarchical neighbor, and he was obliged to assent to a federal system because the French in Canada insisted upon a measure of autonomy only to be secured in this way. It was the pending "Alabama" question that made Britain so anxious at this time to defer to the opinion of the United States. This and questions more directly affecting Canada were settled by the Treaty of Washington, 1871.

Macdonald was Prime Minister of Canada for the long period, 1867 to 1891, with the exception of an interval of about five years, lasting from November 1873 to October 1878. Inevitably he did the work of proving the federal system which he had helped to create. There was trouble from the first. When as a result of the bargain with the Hudson Bay Company Canada assumed jurisdiction in what is now Manitoba, some of the settlers already established there objected to being handed over like cattle to a new government. Surveyors sent in by Canada were turned back; officers going into the country to assert Canadian authority met with a like experience; and at last the half-breed inhabitants under their leader, Louis Riel (q.v.), set up a provisional government at Fort Garry, now Winnipeg (q.v.), and defied the Government of Canada. They tried and summarily executed Thomas Scott, a citizen who opposed their proceedings and they threw other leaders into prison. See RIEL REBELLION.

In 1870 it was not easy for Canada to assert her authority in the remote settlements on the Red River. She might not use for military purposes the territory of the United States, which offered the most convenient route, and she was therefore obliged to send troops through the vast wilderness lying north of Lake Superior. The late Lord Wolseley, then holding a military command in Canada, was chosen to lead a small army to Fort Garry and did the work with brilliant success. After a toilsome journey through hundreds of miles of wild and barren country Wolseley at length reached Fort Garry only to find that Riel and his provisional government had fled at the approach of the Canadian force. Rebellion crushed, the work of pacification was conducted partly with the aid of Mr. Donald A. Smith, later Lord Strathcona, an official of the Hudson Bay Company. Manitoba soon became a full-fledged province in the Canadian federation and has since played an important part. In view of the present status of Winnipeg, the third city in Canada, with perhaps 150,000 inhabitants, it is interesting to remember that it had not even the telegraph in 1870 and that the railway did not reach the town until 1878.

The trouble in Manitoba settled, Canada had next to pacify her remote Pacific Province, separated from her by an immense and almost unpeopled wilderness. In 1871 British Columbia entered the confederation on the condition that a railway across the continent should be begun within two years and completed within 10. At the time the province contained but a few thousand people of European origin, and there were complaints in eastern Canada that the vast expenditure involved in the bargain would burden too heavily the country's resources. But, on pain of her withdrawal from the union, British Columbia insisted angrily that the bargain should be carried out, and her attitude brought to the front the building of the trans-continental line which was to prove of supreme moment to Canada.

That Canada's small population should spend a hundred million dollars on this undertaking was a stupendous proposal; on the basis of the proportionate cost of each head of population a project for the United States to spend \$2,000,000,000 would be its equivalent. But to build the railway was the condition of national existence in Canada, and in the end the thing was done. Not, however, before the project had long disturbed Canadian political life and threatened to overwhelm its promoters with ruin. When the Canadian Pacific Railway (q.v.) was projected, Canada was face to face with the question that has perplexed all the progressive states of modern times. Should the railway be a government or a private enterprise? Though a similar line, the Inter-Colonial Railway, connecting the eastern provinces, was a state enterprise, the cabinet of Sir John Macdonald shrank from saddling the country with so vast a burden as a railway to the Pacific, and it was resolved to hand over the task to a private corporation.

In 1872 there was a general election in Canada, and in the session of Parliament which followed the Canadian Pacific Railway Company with Sir Hugh Allan as president, secured a charter to build the road. With this went also assurances of assistance from Canada amount-

ing to many millions. But when, as a result of the exposure by the opposition, the fact came out that Sir Hugh Allan had contributed more than \$350,000 to Sir John Macdonald's campaign fund for the recent election, this "Pacific Scandal" brought the downfall of the Government, which had accepted the obvious bribe. Amidst great excitement Sir John Macdonald resigned and the Liberals with Mr. Alexander Mackenzie (q.v.) as prime minister took office in November 1873.

For five years the Liberals remained in power. Throwing less energy into the construction of the Pacific Railway than had been promised, they met naturally with discontent in British Columbia. The menace of withdrawal from the confederation was renewed and at length the matter was referred for arbitration to Lord Carnarvon, the Colonial Secretary, in London. He decided that the original terms were too onerous and proposed new ones under which a trans-continental railway should be opened by the end of the year 1890. When the Liberal Government thought even this almost impossible of accomplishment, "Carnarvon Terms of Separation" became the war cry in British Columbia. Financial depression overtook Canada in 1876-78 and this heightened the difficulty of the question. But in 1876 the Governor-General of Canada, the Earl of Dufferin, visited British Columbia to soothe her discontent, and he helped to tide over the period of danger. It is interesting to speculate whether an attempt to withdraw from the Canadian union would have been resisted, if necessary, by force of arms. Probably the Canadian and Imperial governments would have agreed in using coercion.

The financial depression that helped to delay contentment for British Columbia produced effects in Canada even more far-reaching, for it led to the cleavage of political parties on the question of Protection (q.v.) or Free Trade (q.v.). In 1878 Canada had a tariff of 17½ per cent, which was hardly sufficient for her growing revenue requirements. During a generation she had tried to secure free exchange of natural products with the United States and in 1854 her governor, Lord Elgin, had succeeded in making a Reciprocity Treaty on this basis. But the treaty was not long in force and when abrogated at the close of the Civil War a heavy tariff upon Canadian products was soon imposed by the United States. Over and over again Canada tried to secure the reversal of this policy but always in vain. Meanwhile the low Canadian tariff permitted American manufacturers to supply the Canadian market at prices with which the necessarily smaller producers in Canada could hardly compete, and in time the cry for increased Protection was often heard. Had Mr. MacKenzie's Government taken it up in 1878 probably Sir John Macdonald would have rallied his forces under the banner of Free Trade. But when the Liberal leader refused tenaciously to adopt Protection, Sir John Macdonald proclaimed it as a "National Policy" for building up Canada, and the Canadian electorate, forgetting the discredit which attached to him in connection with the Pacific scandal, returned him to power by an overwhelming majority. Since that time Protection has retained its hold upon Canada, for though the Liberals favored free trade they disturbed the

system but slightly on their advent to power in 1896.

An era of great expansion followed the adoption of a protective tariff in 1879. A great many factories were established, and the building of the Canadian Pacific Railway was pushed on with unparalleled energy; in 1885, five years before the time named in the contract, the last spike was driven in the line connecting Western and Eastern Canada and British Columbia's grounds for discontent were finally removed. Once completed the road's value not only to Canada but to Great Britain was soon apparent. Not only did it unite the Canadian provinces; it furnished a ready all-British land route to the East. The Canadian Pacific Railway Company in time established lines of steamers crossing both the Pacific and the Atlantic, and the highway, looked upon as a doubtful possibility in 1878, has now become one of the chief arteries of world commerce.

The completion of the Canadian Pacific Railway was almost coincident with a second rebellion of half-breeds in the Canadian West. On the banks of the Saskatchewan, not far from a village called Prince Albert, there was a colony of these people. They had long lived remote from the larger world, and when their country was invaded by the pioneers of modern movement, they began to doubt whether they should be left in permanent possession of the lands they had long occupied. Upon these lands they were technically "squatters" for they had no patents and no surveys had been made. When at length Canadian surveyors came to lay out their fields on a uniform plan, disregarding the divisions which they had established, the half breeds protested and demanded that they should be granted patents for their lands as they stood. At Ottawa their protests were filed but remained unheeded. The official mind was aghast at the prospect of land grants not based upon the usual survey; the half breeds could get nothing done and they grew ever more restless at the supposed meretriciousness to their rights. Disinterested observers sent to Ottawa warnings of a probable rising but official supineness was invincible, and the result of neglect and delay was that in March 1885 the despairing half breeds attacked a body of police, killed 12 out of 40 engaged, and defied the authority of Canada. Since it was not unlikely that they would be joined by the Indian tribes the outbreak was serious.

The half breed leader was the same Louis Riel (q.v.) who had caused trouble in 1870. On its hands the Government now had a difficult task. As in 1870 it might not send troops through the United States, and the railway on the north shore of Lake Superior connecting Eastern and Western Canada was not yet completed. In bitter March weather, with the thermometer often below zero, the regiments of militia summoned from Eastern Canada, all unprepared by previous hardship to endure the cold, traversed the desolate shores of that frozen region. Sometimes in open flat cars, for more than a hundred miles on foot, they proceeded over the snow. An experienced officer of the expedition declares that the task was more severe than Napoleon's passage of the Alps, for Napoleon had a beaten road and an abundant commissariat, while both were wanting in the Canadian wilderness. The regi-

ments soon poured into the West in overwhelming force and though the few half breeds made a brave stand against great odds, they were quickly crushed. Their Indian allies the Canadian troops wearily followed to their almost trackless haunts, and so the rebellion was put down. A few of the rebels were hanged; a good many of the Indians were imprisoned; Riel, the leader was taken, and then his fate became a question of national concern in Canada.

With Riel the French Canadians had ties of faith and of blood. French Canadians had been pioneers in the Northwest and at times they had dreamed of holding that vast region for their language and faith. If fate was against them, if it was the Anglo-Saxon who was occupying the country and in influence was destined to dominate, none the less was chivalrous support due to the few people who stood in the West for the ideals of France and of the Roman Catholic Church. In 1870 Riel had appealed not in vain to the French in Quebec for help in his time of trouble and it was probably the strength of their sympathy which then saved him from the scaffold. Since in 1885 the men who took up arms had more real grievances the Church espoused their cause. In the Province of Quebec Liberals and Conservatives forgot their quarrels in the name of justice and French Canadian nationality against rigorous treatment of the rebel leader, Louis Riel. On the other hand the English demanded that the law should take its course. Riel had led a revolt in which law-abiding citizens were shot down. If he was a murderer the penalty of murder was his due. The demand was too urgent to be disregarded. Riel was tried; in the eye of the law the penalty of his crime was death, and in November 1885 he was hanged at Regina, the capital of the Northwest territories. See RIEL REBELLION; see also article JESUITS ESTATES ACT for another religious and racial question in Canada in 1888-89.

The government's course in regard to Riel was a defeat for the French Canadian bishops who had long played an active part in political life. They claimed that even in secular affairs the authority of the bishops was final and that when they spoke the laity were bound to obey. If the Church chose to indicate her desires in regard to the merits of candidates seeking election, it was the duty of the voter to heed the voice of his spiritual directors. Some of the bishops claimed the right to use spiritual censures to influence electors. Newspapers which opposed the wishes of the hierarchy must not be read by the faithful, and when *L'Electeur*, a daily newspaper in Quebec, opposed the bishops' *Mandements* in 1896 it was denounced from the altar, and under penalty of grievous sin and the refusal of the sacraments all the bishops forbade formally anyone to read it, to subscribe or contribute to it, to sell it or in any manner whatever to encourage it. The denunciation commanded obedience and made the continued existence of the paper under its existing name impossible. It promptly became *Le Soleil*, and seemed to suffer little real injury, but the incident showed the authority claimed and exercised by the bishops.

With this attitude on their part occasions of strife were not likely to be wanting. In 1890 the Manitoba government passed an act estab-

lishing a non-sectarian system of education. Owing to the peculiar conditions of older Canada the Protestant minority in the province of Quebec had secured the constitutional right to devote the taxes paid by them for education in support of their own schools. In Ontario the Roman Catholic minority possessed a similar privilege. For some time Manitoba had followed the example of Ontario, but, impressed by the obvious advantages of a uniform system, the legislature passed the Act of 1890 which deprived Roman Catholics of former privileges. At once a vehement agitation broke out. The Federal government possesses, within certain limits, the right of disallowing statutes enacted in the provinces and urgent demand was made upon the government of Sir John Macdonald to disallow the Manitoba School Bill. This, on the ground that Manitoba was acting within its constitutional rights, the government refused to do. Appeal was then made to the courts to determine the authority of the respective governments in the matter and the case was finally carried to the Privy Council in London, which decided that the Federal government possessed the right of intervention in regard to the Manitoba schools.

Extraordinary pressure was then brought to bear upon the Federal government. The hierarchy of the province of Quebec took up the question with much heat, while the Protestant province of Ontario was also aroused in support of the opposite side. In 1891, when Sir John Macdonald died, his successors were left with the legacy of the Manitoba school question. The agitation dragged on for five or six years. Retreat from their position the Manitoba government would not, and finally, in 1896, the Federal government endeavored to put through Parliament a remedial bill for restoring to the Roman Catholics of Manitoba the privileges which had been taken away.

It was this question that brought the downfall of the Conservative party so long dominant in Canada, a process accelerated by evidence adduced in 1891 of a share by responsible leaders in the province of Quebec in the misuse of public funds. In 1896 Sir Charles Tupper (q.v.) became Prime Minister and in a general election appealed to the country to do justice to the minority in Manitoba. On this question many of his Conservative allies broke away from him and he fought a stern but losing contest. The Liberals too were in a difficult position. When Sir John Macdonald's old rival, Mr. Alexander MacKenzie, retired from the leadership of the party in 1880 he was succeeded by Mr. Edward Blake, who, in turn, proved unable to overthrow the Conservative chieftain. In 1887 Mr. Blake retired and was succeeded by Mr., afterward Sir Wilfrid, Laurier. In personal charm and tact the new leader was not unlike his formidable rival, and he had, besides, remarkable gifts as an orator. French Canadian by birth and also a Roman Catholic, it was not easy for him to lead the Liberal party, which was committed unreservedly against interfering in Manitoba. In Mr. Laurier's own province of Quebec the hierarchy were still unanimous in demanding intervention to re-establish the Roman Catholic schools. The election of 1896, fought chiefly on this issue, resulted in a conspicuous Liberal triumph and it was in Quebec that Mr. Laurier found his most striking support. Either the

issue in regard to Manitoba had been obscured or the "*habitant*" wished to assert his right to pass judgment for himself in political matters independent of the views of the hierarchy. At any rate Mr. Laurier became Prime Minister of Canada. The Manitoba government made some minor concessions and the matter passed out of view, but an important warning against interfering with the authority of the province had been given to the Federal government.

The Liberal party had long championed the cause of freer trade and declared itself the enemy of Protection; it was therefore committed to some modification of the existing protective system. But, once in power, it found that, since important industries had grown up under the tariff, this could not be changed in any radical manner without ruin to those concerned. While doing something to reduce Protection the government took a further remarkable step. The year 1897 saw the completion of 60 years under Queen Victoria's sovereignty, and there was a general desire to draw more closely together the different sections of the empire, and thus to assert British unity. In pursuit of this idea Mr. Laurier's government announced that a preference of 25 per cent (later increased to 33½ per cent) would henceforth be allowed to countries whose tariff gave a favorable opening to Canadian products. Since Britain alone gave such treatment the preference was confined to her, though other countries might share in it on the terms laid down. Both in England and in Canada the preferential tariff aroused great enthusiasm and no doubt it aided in bringing to a head Mr. Chamberlain's scheme, announced a few years later, for a preferential tariff in the mother country for colonial products.

In 1898 the Liberal government had a renewed opportunity to proclaim its devotion to British connection. When war broke out in South Africa and soon proved more serious than had been thought possible, Canada promptly volunteered to send military contingents in reinforcement of the British troops. The contingents saw some service and a good many Canadian soldiers lost their lives. Naturally the French Canadian showed less enthusiasm for what was in large degree a racial war than did the British element. Only a few French Canadians served in the contingents, and some voices protested against Canada's participating in British wars. But the overwhelming opinion of the country supported the rally to Britain's aid; when the government appealed to the country in 1900 it gained an easy victory, partly upon this issue.

A little earlier the discovery of gold in remarkable quantities in the Yukon territory, arousing as it did world-wide interest, naturally attracted attention to a part of Canada hitherto thought of little value. The possession by the United States of the adjacent coast of Alaska (q.v.) through which lay the best route to the new gold country seriously impaired the value to Canada of the territory. The boundary between Alaska and Canada had long been the subject of dispute, the Canadians contending that since, under the terms of the determining treaty, the line should run from headland to headland, the land at the head of the inlets which furnished the most ready access to the Yukon were in reality British territory. Can-

ada's cause was prejudiced by the fact that (though not without occasional protest) she had acquiesced in the American contention that the boundary line followed the sinuosities of the shore. A disputed boundary is always dangerous. Besides this question there were other matters requiring settlement between the United States and Canada, and at last, in 1898, a Joint High Commission, including prominent representatives of both the American and British side, was appointed and sat for some weeks at Quebec and then at Washington. In addition to the Alaska boundary the commission was, if possible, to agree upon a settlement of the differences in regard to the seal fishery in Behring Sea and the Atlantic fisheries; and besides minor matters was to consider the general trade relations between the two countries. Points of variance proving too great, the commission effected nothing; but in the end the two governments agreed that six jurists of repute, three to represent each side, should be appointed with authority finally to settle the Alaska boundary. In the end a majority of the commissioners gave, in 1903, a decision favorable to the claims of the United States. Lord Alverstone, the British commissioner who supported the American contentions, was severely censured in Canada for an attitude that seemed more diplomatic than judicial, but in spite of a passing irritation there was general satisfaction that a troublesome issue had at last been settled. See ALASKAN BOUNDARY COMMISSION.

It has been said that the politics of Canada are railways. In a country so vast, means of transportation are of vital moment. Thus it happened that, after the Canadian Pacific Railway was completed, plans were soon on foot for other transcontinental lines. Since the Canadian Pacific Railway ran near the southern frontier, new lines, it was thought, should open up regions farther north. In 1903 Sir Wilfred Laurier announced that the government of Canada had plans for a new transcontinental railway. The government was to complete the railway from Moncton, New Brunswick, to Winnipeg, while from that point to the Pacific Coast, at what is now Prince Rupert, the Grand Trunk Pacific Railway Company was to build the line and it was to operate this section and also that from Winnipeg to the Atlantic to be leased to the company by the Canadian government. A little earlier a private firm, Messrs. Mackenzie and Mann, had matured plans for a similar line to cross the Rocky Mountains farther south. The firm had only the capital of remarkable energy. It was by means of government bonuses and guarantees of its bonds that the necessary money was to be obtained. In the end it secured guarantees of this kind amounting to about \$250,000,000. Efforts to unite the two plans and to build a single new line were, unhappily, not successful. At the present time (1918) both lines have been nearly completed. Their cost has been very great and it came at a time when taxation grew heavier as the great war approached. Three transcontinental lines in a country with a population of less than 8,000,000 were a heavy burden. In 1917 the Canadian government took over the Canadian Northern which could not meet the interest on its bonds and there is, at the moment of writing some

prospect that, to promote economy and efficiency, the government will, for the duration of the war and, it may be, as a permanence, control also the Canadian Pacific and the Grand Trunk Pacific with its parent company, the Grand Trunk. The government of Canada will then direct three vast railway systems, each of them stretching from the Atlantic to the Pacific.

The growth of the Canadian West was obvious in 1905 when, from a part of the former Northwest territories, were created two new self-governing provinces, Saskatchewan and Alberta, which together fill the gap between Manitoba on the east and British Columbia on the west. In the background of Canadian politics lurks always religious and racial strife, since two-fifths of the population are Roman Catholics and form a minority so powerful as to keep alive the suspicions of the Protestant majority. In creating the two new provinces, Sir Wilfrid Laurier proposed to allow the majority in a school district to determine the religion, if any, to be taught in the school, the minority to have separate schools with the same privilege and each school to be kept up by taxes on its supporters. Any government grant was to be equitably divided. Since 1875 the Roman Catholics had had the right to separate schools in the territory affected. The policy of the Prime Minister secured the strong support of the Catholic clergy of Quebec but it was as firmly opposed by a larger number of Protestants. A crisis in the government followed and, in the end, the bill was so modified as to place the proposed schools under effective state control. All through the West the demand for sectarian and racial privileges regarding education was pressed. Ruthenians, Poles, Germans and others, besides French in Manitoba, demanded the right to have schools conducted in their own language and declared that this was a sacred heritage, not to be denied to their children without gross injustice. For a time in Manitoba some half dozen languages were used in the schools with official sanction. The need was urged of requiring English in all the schools, if a common Canadian nationality was to be fostered. In 1915 the former Conservative government of Manitoba was defeated and in 1916 the new Liberal government passed a measure requiring the use of English as the teaching language in all the schools and, for the first time, making elementary education compulsory.

The strife in Manitoba angered the French element in Canada. They urged anew the rights guaranteed to their language. Without doubt the original constitution of Manitoba, created in 1870, had set up a bi-lingual system, with French and English on an equality. The truth is that, in a majority at first, the French in the province had by 1916 become relatively unimportant. It was undoubtedly a grievance that rights formerly enjoyed by them should be swept away. The strife spread eastward. Under what is known as Regulation 17, the province of Ontario took steps to ensure that, except in a strictly limited number of admittedly bi-lingual schools (French and English), English alone should be used. In Quebec where the majority is French no one challenged the right of the English element to schools using their own language. Though, in fact, in Ontario no constitutional provision supported bi-

lingualism, the French urged that, on any basis of justice, the French minority should have the rights in respect to their language which the English minority enjoyed in Quebec. The English element in Ontario, it was declared passionately, was persecuting those who used French. Their French press carried on a violent agitation, answered in kind by the Orangemen of Ontario, who feared that with the French tongue would go the dominance of the French-speaking priest. The claim that constitutional guarantees protected the right to use French in the Roman Catholic separate schools of Ontario was negated on appeal to the Imperial Privy Council, the tribunal to determine finally such constitutional disputes. Trifling as such questions seem, they yet served to make the French, dominant in the province of Quebec, resentful and suspicious, and this no doubt affected their attitude when the European War broke out in 1914.

In 1911 the government of the United States entered into negotiations with the government of Canada for a wide measure of reciprocity in trade. At first the proposal was welcomed by members of both political parties in Canada, but it soon became clear that financial interests in Canada feared the dominance of New York, that Canadian industries were alarmed lest a protective tariff should disappear, and that the Canadian railways, running for thousands of miles east and west, feared a loss through the diverting of the carrying trade southward to the lines of the United States. In the background was the fear of those attached to the political tie of Canada with Great Britain that Canadian trade would discriminate against Great Britain in favor of the United States with the result either of bringing Canada into the American Union, or, at any rate, of severing the tie with Great Britain and the setting up of a republic of Canada. The political campaign revealed the profound attachment of the Canadian people to Great Britain. An election in September 1911 resulted in the defeat of Sir Wilfrid Laurier, who had made the reciprocity pact with Mr. Taft. A Conservative government under Mr. (now Sir) Robert L. Borden came into power and the proposals for reciprocity were dropped.

In 1914 came the Great War and the whole life of Canada was soon to be focussed on this event, discussed elsewhere (see CANADA AND THE WAR). In 1917 Canada celebrated the 50th anniversary of the Federal union created in 1867. It had been a period of varied fortune, of reverses as well as of successes. The population had doubled and the 8,000,000 people of Canada in 1917 represented about the same number that the United States had had a hundred years earlier. Not until toward the end of the first decade of the 20th century had the development of Canada been very rapid. By 1911 a remarkable immigration movement was at its height. More than half a million settlers from the United States had by that time found new homes in Canada. Settlers from Great Britain and from continental Europe were also flocking in and the prairie country, hitherto almost tenantless, was filling up rapidly with varied types of human beings. Probably, considering the small population of Canada, they came too rapidly, for half a million newcomers in a single year could not be readily

assimilated when the new arrivals represented about 1 in 10 of the existing population. For the transport involved railways were built in the West too rapidly to be profitable. Even before 1914, depression in all parts of the Western world had tended to check the tide of immigration, and, for the time, the war, begun in that year, suspended it completely. Probably, on the whole, this suspension was in the best interests of Canada, since it ended a speculative fever in regard to lands and brought optimists face to face with stern reality. Already there is much talk in Canada of reconstruction after the war. In a world shattered by war's disasters it will be a problem for the wisest statesmanship to use the undeveloped resources of Canada to create homes for the landless and penniless who will turn from devastated Europe to the founding of a new life in the West. (See CANADA — POPULATION, IMMIGRATION AND DISTRIBUTION). In Canada, as in every belligerent country, the great war is producing far-reaching effects. Since the war began one by one the Canadian provinces from the Atlantic to the Pacific have imposed such restrictions and prohibitions on the traffic in intoxicating liquors as practically to annihilate it. At the time of writing, from Ontario westward every drinking place is closed. By May 1919 Quebec, including the great city of Montreal, will have done the same thing, and in the Maritime provinces, farther east, by local option, a similar result is nearly achieved. It is likely that by 1920 liquor will not be sold by retail anywhere in Canada except for medical purposes.

When the war broke out, in 1914, Canada had a party government, the result of the victory of reciprocity in 1911. In 1916 the term of five years for which a Parliament is elected expired, but, by agreement between the two great parties, the period was extended by a year. As the war went on, the need was felt of united support of the government so as to avoid the dissipation of energy by party strife. In the summer of 1917, Sir Robert Borden made proposals to Sir Wilfrid Laurier to unite in forming a Cabinet in which the two parties should be represented equally, but this offer the Liberal leader declined. He would not accept the policy, insisted upon by Sir Robert Borden, of compulsory military service in order to keep up the Canadian divisions in France. The French Canadians, who are more than a quarter of the people of Canada, had shown themselves hostile to conscription, and on this issue Sir Wilfrid Laurier stood with the members of his own race.

English-speaking Liberals refused, on this point, to follow the lead of Sir Wilfrid Laurier, and the autumn of 1917 saw the formation in Canada of a Unionist government, led still by the former Conservative Prime Minister, Sir Robert Borden, but composed in about equal proportions of Conservatives and Liberals. Since, without practically unanimous consent, the term of Parliament could no longer be extended, an election followed in December 1917, with conscription as the vital issue. Sir Wilfrid Laurier led the forces opposed to conscription. In his own province of Quebec he achieved a personal triumph, carrying 62 out of 65 seats. From the other provinces, however, he secured little more than a score of supporters, and the Unionist government was sustained by an over-

whelming majority. The policy of compulsory military service was pressed with energy and Canada has proclaimed to the world her resolve to make every sacrifice to stay in the war to the end.

The disappearance of party government is already producing far-reaching effects on the political life of Canada. The evils of the spoils system had long corrupted politics and this system the Union government has swept completely away. Appointments to the whole civil service are now controlled by a non-partisan Civil Service Commission. Purchases for the government service are made by a committee of experts without regard to party claims. In abolishing the old system, Canada has lagged far behind both Great Britain and the United States, but her reform now promises to be thorough. In respect to other changes Canada is likely to be conservative. Socialism has, as yet, produced little effect on a country where nearly every farmer owns the land he tills and the artisan and the laborer earn high wages. It is still problematical what effect the war will have on the relations of Canada with Great Britain. It has already demonstrated three things: Canada's resolve to settle for herself the part, if any, she shall take in British wars; the solidarity of Canadian opinion with that of the other British peoples on the issues of the present war; and the affection and mutual confidence which exists between the peoples scattered in all parts of the world who have a common British allegiance. Whether out of the welter of the war will come a closer political union of the peoples of the British empire for their common defense it is impossible now to say. The question will receive increased attention after the war. It is certain that a unity of aims already exists which will hold together these people whatever political form their union may assume.

GEORGE M. WRONG,

*Professor of History, University of Toronto.*

10. THE CANADIAN WEST. It is doubtful if a British sovereign ever made a more munificent grant to a company of his subjects than did Charles II, in the year 1670, to "The Governor and Company of Adventurers of England trading into Hudson Bay." The sweeping terms of the royal charter defined an area stretching from Hudson Bay to the Rocky Mountains, to which was given the name of Rupert's Land, in honor of the King's cousin, Prince Rupert, the company's first governor. In spite of the hostility of the French Canadian government and the competition of rival traders, the Hudson's Bay Company succeeded in holding this territory down to the date of its cession to Canada two centuries later. Although a century had elapsed since Sir Francis Drake had sighted the snowy peaks of the Pacific Coast, and half a century since the ill-fated Henry Hudson had discovered the bay which became at once his grave and the monument of his achievement, yet the history of the Canadian West may be said to date from the founding of the Hudson's Bay Company. See CANADA — THE HUDSON'S BAY COMPANY.

The presence of the English company upon the shores of Hudson Bay was from the outset a serious menace to French Canadian influence in the Northwest. The newcomers were draw-

ing off the trade of the northern tribes. English and French were face to face in a struggle for commercial supremacy in the West, and their rivalry was bound sooner or later to break into a clash of arms. The Hudson's Bay Company had strengthened its position by the establishment of four trading-posts: one upon the west shore near the Nelson, and the other three, Forts Albany, Hayes and Rupert, on the south arm of the bay. In the spring of 1686 the progress of trade was rudely interrupted. Chevalier De Troyes and a company of 80 adventurous Frenchmen, ascending the Ottawa, worked their way slowly by stream and lake over the height of land to the neighborhood of James Bay. So sudden was their coming, and so spirited their attack, that the three lower forts fell almost without resistance.

In 1697 Pierre le Moyne D'Iberville, who had been De Troyes' right-hand man, entered Hudson Strait, under orders from Quebec, to attack Fort Nelson, the most important trading-post on the bay. The *Pelican*, which carried the commander, became separated from the rest of the fleet and fell in with three English ships belonging to the Hudson's Bay Company. In the encounter which followed the *Pelican* sank one of the company's ships and disabled a second, while the third made off under full sail. Rejoined by his missing ships, D'Iberville soon forced Fort Nelson to surrender. In 1713 the Treaty of Utrecht put an end to hostilities and left the English traders in undisturbed possession of their posts.

Meanwhile French Canadian traders were extending their trade beyond Lake Superior. With these there was ever present the desire to find *La Mer de l'Ouest*, which they thought could not be far distant. The ambition to discover this "Western Sea" possessed the mind of Pierre Gaultier de Varennes de la Vérendrye, the commander of a little post on Lake Nepigon. It was late in August 1731 that Vérendrye and his party passed over Le Grand Portage leading over the height of land to the waters flowing toward Lake Winnipeg. The mouth of the Maurepas (Winnipeg) River had been reached when troubles began to crowd upon the unfortunate explorer. The merchants who were to forward supplies failed to do so; his nephew died; and, as a climax to his misfortunes, 21 of his company, including his eldest son, were butchered by a band of murderous Sioux. It was not until six years later that Vérendrye again turned his face westward. The course of his travels was marked by a series of trading-posts built at successive stages. Among these were Fort La Reine, near the site of the present town of Portage la Prairie, and Fort Rouge, whose name still clings to a suburb of the city of Winnipeg.

During the last century of the French régime the Hudson's Bay Company had held its own throughout the dangers of war and the competition of trade. Its forts had fallen into the hands of De Troyes or D'Iberville, but had been restored by the Treaty of Utrecht (q.v.). Though the dangers of war were past, the rivalry of the Canadian traders had still to be met. Despite the long overland journey, the latter penetrated to the neighborhood of Hudson Bay, attracting the Indians with showy trinkets, and too often with brandy. The ma-

jority of the natives, however, were not easily drawn away from the old company's forts. Every spring the rivers and lakes were dotted with fur-laden canoes making their way to Lake Winnipeg, the meeting place of the hundreds of natives who journeyed annually to Hudson Bay. As many as 500 canoes in a year made the long and toilsome journey to York Factory. Here they exchanged their dearly-earned furs for coats, blankets, kettles and tobacco, or for necessities of the hunt, such as guns, powder, powder-horns, shot, hatchets and knives.

The conquest of Canada by Great Britain brought about an immediate and complete change in the fur trade. With the passing of the French régime, monopoly and licenses disappeared. The officers of the French company withdrew from the country rather than live under the British flag. The *coureurs de bois*, suddenly cast adrift, lacked the capital necessary to continue the fur-trade. New employers, however, were soon at hand. The old route from the East, up the Ottawa and across Lake Superior to Grand Portage, had scarcely forgotten the passing of the French traders when it was traversed afresh by British merchants from Montreal. Alexander Henry, Thomas Curry, James Finlay and the Frobisher brothers were the hardy forerunners of a new race of traders, whose enterprise and daring soon carried them into the Saskatchewan and Athabasca districts. In order to compete the more successfully with their long-established rivals, the newcomers, who at first traded individually, decided upon union, a decision which led to the founding in 1783 of the Northwest Company. Under the stimulus of competition the operations of both companies quickly extended northward to Lake Athabasca and westward to the foot-hills of the Rockies.

The necessity of enlarging the field of trade gave a remarkable impulse to exploration. In penetrating the unknown lands, north and west, the pioneer traders rendered invaluable service to their country. The honor of leading the way into the northland belongs to Samuel Hearne, a servant of the Hudson's Bay Company. Setting out from Prince of Wales Fort, Hearne succeeded, after two failures, in reaching the Coppermine River. He was the first white man to arrive at the Arctic shores from the interior. The men of the Northwest Company were not slow to follow the example of their rivals. No name holds a prouder place in the annals of American travel than that of Alexander Mackenzie. Fort Chipewyan, situated upon the shores of Lake Athabasca, the trade centre of the north, was the starting point of his two great journeys. The "Western Sea," the elusive goal of Vérendrye's travels, was the object of Mackenzie's quest. His first journey, made in 1789, terminated at the Arctic Ocean. Choosing a more westerly stream for his second attempt, Mackenzie ascended the Peace River to its source in the Rockies, crossed the height of land, and, after descending the Fraser River a short distance, struck out across country for the sea. The successful issue of the journey was proclaimed by the following words inscribed upon the face of a rock overlooking the waters of the Pacific: "Alexander Mackenzie from Canada by land, the twenty-second of July, one thousand seven hundred

and ninety-three." Two other Nor'westers, Simon Fraser and David Thompson, also made their way to the Pacific Ocean, the former in 1806 by the river which bears his name, the latter in 1811 by the Columbia.

While British explorers were forcing a way across the continent, British seamen were making good their country's claim to the Pacific Coast. In 1778 Captain Cook touched at Nootka, on Vancouver Island. At this centre of trade Capt. John Meares 10 years later established a settlement, which unfortunately was soon destroyed by the Spaniards. In 1792 Capt. George Vancouver, being sent out to inquire into the action of the Spaniards, forced the latter to withdraw from the scene of their outrage. As the result of arbitration Great Britain received the entire coast line.

Down to the close of the 18th century the ruling interest of the West centred in the fur trade. Lord Selkirk it was who first conceived the idea of planting a settlement at the heart of the continent. From the Hudson's Bay Company he secured a grant of 110,000 square miles in the valley of the Red River, a district henceforth called Assiniboia. Settlers were hurried out from Scotland, and in 1812 a small company, 70 in number, made its way inland from York Factory.

The newcomers were looked upon as intruders by the Nor'westers, who suspected that Lord Selkirk, being a shareholder in the Hudson's Bay Company, had planted his colony to interfere with the trade of the Canadian company. The early years brought trying experiences to the settlers. So great was the scarcity of food that the governor, Miles Macdonell, issued a proclamation to the effect that "no provisions, flesh, fish, grain or vegetables were to be taken out of the lands of the settlement for a year." This action brought the hostility of the Nor'westers to the point of violence. Some of the colonists were bribed to desert, the remainder were driven out by a band of Métis, or half-breeds. Almost immediately, however, the refugees returned, reinforced by another company of immigrants. With the new arrivals came Robert Semple as governor.

Meanwhile Lord Selkirk had arrived in Canada. Hearing at Montreal of the misfortunes of his colonists, he had engaged the services of 100 discharged soldiers and set out for the West. While he was yet on the way, stirring events were happening in the Red River Valley. The Nor'westers, angered by the destruction of their fort on the Red, bestirred themselves to destroy the settlement. A strong band of half-breeds was gathered at Portage la Prairie under the leadership of Cuthbert Grant. On 19 June 1816 Governor Semple was informed that a body of horsemen was approaching over the prairie. Taking a small force, he marched out to inquire the purpose of the intruders. This move precipitated a skirmish at a spot now marked by the Seven Oaks monument. When the firing ceased Semple and 21 of his followers lay dead or mortally wounded. By this disaster the settlers were forced to again leave their homes.

The news of Seven Oaks was a signal for great rejoicing at Fort William, the headquarters of the Northwest Company. The joy of the Nor'westers, however, was rudely dispelled by the sudden arrival of Lord Selkirk. The latter,

acting in the capacity of magistrate, arrested several of the leading partners, and sent them down to York, Upper Canada. In the following spring he pushed on to the Red River, where he promptly restored the ejected colonists to their farms, settled his soldiers about Fort Douglas and made a treaty with the Indians.

When the news of the tragic death of Semple and his men reached England, the imperial government at once interfered. Both parties to the quarrel were ordered to give up all posts and property seized. The death of Lord Selkirk in the year 1820, though to be regretted, was beneficial to the West, removing as it did the last obstacle in the way of a union of the fur companies.

After the union, which took place in 1821, the management of the company's affairs rested with an official known as the governor of Rupert's Land, assisted by a council of chief factors and traders. A strong man was needed for the governorship, and such an one was found in the person of a young Scotchman named George Simpson, who ably guided the fortunes of the company during the next 40 years. To the enterprise of the Hudson's Bay Company, in no small measure, Great Britain owes her control of the Pacific Coast. From the north Russia, from the south the United States, were pressing vital claims which threatened to shut out Great Britain entirely from the sea. Under Simpson's aggressive administration the country between the Rockies and the Pacific was occupied. A fleet of six armed vessels protected the company's coast trade, of which Fort Vancouver was the centre.

Meanwhile the Selkirk settlement, clustering about the historic walls of Fort Garry, was winning its way to prosperity. The hardships of pioneer life in the East were here repeated. Spade and hoe, sickle and cradle, flail and quern, all told of the day of small things. A series of disasters, in the form of grasshoppers and floods, failed to shake the courage of the sturdy settlers. The growth of the colony made necessary a change of government. The people complained that the members of the council of Assiniboia were paid servants of the company, and did not, therefore, represent the popular will. Discontent was a sign of progress, a sign that the settlement was growing beyond the control of a fur company.

The steadily growing importance of the Pacific country made it imperative to determine the boundary line between America and British territory in the West. The 49th parallel was the accepted line as far as the Rockies, and it was agreed that for the time being the country beyond the mountains should be "free and open" to both nations. In 1846 the Oregon treaty continued the boundary line along the 49th parallel to the channel separating Vancouver Island from the mainland. The line was to follow this channel southwesterly to the Pacific Ocean. For several years the ownership of the island of San Juan was in dispute. The question was finally referred for settlement to the German Emperor, who gave his award in favor of the United States.

To maintain order among the lawless miners whom the discovery of gold had drawn to the Pacific Coast, a separate government was established on the mainland. New West-

minster, on the Fraser River, became the capital. This arrangement, however, proved unsatisfactory; and at times there was talk of annexing Vancouver Island to the United States. Fortunately a strong British sentiment prevailed, which led to the reunion, in 1866, of the island and the mainland, to form the province of British Columbia. Victoria was chosen as capital.

The British North America Act made provision for the admission to confederation at any time of British Columbia, Rupert's Land and the Northwest territories. The first Dominion Parliament petitioned the British government to hand over to Canada Rupert's Land and the Northwest. It was claimed that the rule of a fur company did not tend to the general development of the country, and, moreover, that the extension of the Dominion westward would be a safeguard against any aggression on the part of the United States. The Hudson's Bay Company finally surrendered to Canada its control of Rupert's Land and its monopoly of trade. The company, in return, received the sum of £300,000, one-twentieth of all land thereafter surveyed for settlement, and also retained its posts and trading privileges.

At the time of confederation (q.v.), the only occupants of the land beyond Lake Superior were roving bands of Indians, a few scattered traders and 12,000 settlers in the valley of the Red River. Ten thousand of these 12,000 were half-breeds, Scotch and French. Into this community, without warning, flocked Canadian surveyors to lay out roads and townships. The country had been handed over to Canada and the interests of the natives were to be sacrificed. Such was the thought of the half-breed element. The storm centre was the French half-breed party, the Métis, led by Louis Riel (see RIEL REBELLION). There was no one in the colony to restrain the latter's madness. Fort Garry was seized and a "provisional government" established. There was every prospect, however, of a bloodless settlement of the situation, when suddenly Riel, in a moment of recklessness, ordered the execution of a young Ontario immigrant named Thomas Scott. The news of this brutal murder raised a storm of indignation in the East. In a remarkably short time a volunteer force under the command of Col. Garnet Wolseley reached Fort Garry, only to find that the instigators of the rebellion had fled across the American border.

Out of the strife of rebellion arose a new province. Even while Wolseley's force was on its way up from the East, the Manitoba Act passed the Canadian Parliament. Manitoba was admitted into confederation as a full-fledged province. The claims of the half-breeds were fully met by a generous land grant. Many of Wolseley's men remained in the new province to share in its making. The little settlement about Fort Garry was soon transformed into the populous city of Winnipeg. Manitoba drew her first governor from the far East, in the person of a distinguished Nova Scotian, Adams G. Archibald.

A year later the westward expansion of confederation was continued. British Columbia became part of the Dominion, subject to a very important condition, namely, that a transcontinental railroad should be begun within two

years and completed within 10 years from the date of union. In 1872, therefore, Sir John A. Macdonald introduced the question in Parliament. The great enterprise was well under way when the ministry, charged with corruption, was forced to resign. Alexander Mackenzie, who succeeded Sir John, proposed to construct the road gradually, as the finances of the country allowed. This delay put a severe strain upon British Columbia's loyalty to the Dominion. The Macdonald government, returning to power in 1878, immediately took up again the railway question. Construction was begun from both ends; and with such vigor was the work pressed forward that the last spike was driven by Lord Strathcona in November 1885. The completion of a transcontinental railway cemented the bond binding the East and the West.

No sooner was order restored after the Riel rebellion than settlers began to flock into Manitoba. Many farmers from eastern Canada moved west, while from Europe came an ever increasing number of colonists, of British, Scandinavian and German stock. The newcomers spread beyond the limits of Manitoba, many finding their way into the valley of the Saskatchewan, a few even to the foothills of the Rockies. This Northwestern Territory was governed by the lieutenant-governor of Manitoba and a council of 11 members. In 1876 a change took place. The eastern section of the country, called Keewatin, was placed under the personal control of the lieutenant-governor of Manitoba, while the western was given a resident governor and a council of five members. A few years later four districts were organized, Alberta, Assiniboia, Athabasca and Saskatchewan. Regina, being situated upon the main line of the Canadian Pacific Railway then under construction, was chosen as the seat of government.

The advent of the railway gave promise of peaceful and rapid progress, when suddenly a second rebellion broke out. At the close of the Red River rebellion many of the Métis withdrew westward and settled upon the banks of the Saskatchewan, among their near relatives, the Cree Indians. Here they were disturbed by the encroachment of a hated civilization. Their unrest was increased by a fear of losing their lands through the failure of the Dominion government to issue title deeds. The sudden return from exile of Louis Riel was all that was needed to provoke rebellion. Near Duck Lake, within the angle formed by the North and South Saskatchewan, the first clash took place, between a band of Métis and a force of mounted police and volunteers.

The position of the white settlers of the Saskatchewan Valley was serious. The real danger lay, not in a revolt of the Métis, but in the possibility of a general rising of the Indians, of whom there were over 30,000 in the Northwest. Prince Albert, Battleford and Fort Pitt lay exposed to attack. The most serious risings of the Indians took place near Battleford and Fort Pitt, among the followers of Poundmaker and Big Bear. The heart of the rebellion was the village of Batoche, the centre of the Métis settlements. The news of the fight at Duck Lake was the signal for an outbreak among Big Bear's warriors, who massacred the male inhabitants of Frog Lake and

CANADIAN SCENERY

2 Lachine Rapids, St Lawrence River

then drove out the garrison of Fort Pitt. When the report of the rebellion reached Ottawa, the Dominion government took prompt action. The call for volunteers met with an eager response on all sides. In spite of the great distance, within less than two months 4,400 men were placed in the field, all save the Winnipeg contingent being from eastern Canada.

General Middleton, commander-in-chief of the Canadian militia, who arrived at Qu'Appelle in advance of the main force, made the Canadian Pacific Railway the base line of his operations, and prepared to crush the rebellion in all its centres at once. Three places were in immediate danger: Prince Albert, Battleford and Fort Pitt; three relief expeditions were provided for in the plan of campaign. General Middleton was to advance from Qu'Appelle to Batoche, Riel's headquarters, Colonel Otter from Swift Current to Battleford, and General Strange from Calgary to Edmonton. The three movements were successfully carried through, the divided forces converging upon Battleford. The bulk of the fighting fell to Middleton's column, which met with determined opposition at Fish Creek and Batoche. With Riel, Poundmaker and Big Bear finally in custody, the rebellion was at an end. Riel and eight Indians suffered the death penalty.

The rebellion was not without its good results. In recognition of their growing importance, the Northwest territories were granted representation in the Dominion Senate and House of Commons. The need of a stronger government in the Northwest became obvious. The old council was abolished and its place taken by an elective assembly, which first met in 1888, at Regina. But this was not of course a final settlement and in 1905 the vast district between Manitoba and British Columbia was divided into two self-governing provinces—Saskatchewan and Alberta.

The discovery in 1897 of rich deposits of gold in the Yukon (q.v.) was the signal for an influx of fortune-hunters. As a result the long standing dispute over the Alaskan boundary gathered new importance. In taking over Alaska from Russia in 1867, the United States secured all the rights of that nation as laid down in the treaty of 1825 between Russia and Great Britain. The interpretation of the terms of the treaty was left to a commission, composed of three representatives from the United States, two from Canada and Lord Alverstone, the chief justice of England. The commission met in London in September 1903. The decision was, upon the whole, favorable to the American claims. See ALASKAN BOUNDARY COMMISSION.

The growth of the West during the last 30 years has been very marked, the inevitable result of the expansion of the Canadian railway system and the resultant influx of settlers. Three railway systems now cross Canada from coast to coast: the Canadian Pacific (q.v.), the Canadian Northern (q.v.) and the Grand Trunk Pacific (q.v.), the eastern section of which is called the National Transcontinental (q.v.). These transcontinental railroads, with their branch lines, have opened up immense tracts of territory to the settler; and in addition a line is under construction from The Pas, on the Saskatchewan River, to

Port Nelson, on Hudson Bay, a distance of 410 miles.

DAVID M. DUNCAN,

*Author of 'The Story of the Canadian People,'  
Collegiate Institute, Winnipeg.*

**11. THE SETTLEMENT OF THE CANADIAN WEST.**—Without a just appreciation of the attractions and possibilities of the "Canadian West," as the larger half of the Dominion situated west of Lake Superior has commonly been called, neither the Canada of to-day nor that of the future will ever be understood. One of the first acts of statesmanship after the consummation of confederation (see CANADA—CONFEDERATION) was the purchase by the Canadian government from the Hudson's Bay Company (see CANADA—HUDSON'S BAY COMPANY) of the immense territory forming the basin of Hudson Bay and known as Rupert's Land, over which that company held proprietary rights. British Columbia, in 1871, entered the Dominion thus brought up to her borders. Some 14 years later followed the completion of the Canadian Pacific Railway (q.v.), an enterprise of splendid self-confidence in so young a country. A railway was needed to fulfil the conditions upon which British Columbia had joined the Confederation, and without it the vast territory between that province and Ontario could not be developed nor preserved to Canada. The purchase of Rupert's Land created the conditions which brought about and justified the building of the first transcontinental railway, and the prolonged discussions over the policy of the government of the day in respect to the public assistance given to that road began the process of popular education in eastern Canada in the extent and resources of the West. A seemingly limitless sphere for internal development gradually was revealed, and the necessity on two occasions for the employment of armed force against half-breed rebellions, with some sacrifice of blood, sealed the sense of possession. Pioneers proved the fertility of the soil and the richness of the mines, and with the assurance of a rapidly increasing population the whole national life received an access of vigor and hopefulness. External policy, as well as internal, was influenced. A country that could produce and export staple foodstuffs in quantities capable of indefinite multiplication, and had vast stores of timber, coal and metals could support great home industries and also become a prominent factor in international trade. It could work at home and bargain abroad. It could make choices. The idea of a trade union of the British empire, for example, presented itself in practical form largely because of the potentialities of the Canadian West. Population only was needed to show results, and the movement of population into this part of Canada is therefore a subject of interest and importance.

The country lying west and northwest of Lake Superior in Canada is of vast extent and great variety. It includes the extreme western end of the province of Ontario, the provinces of Manitoba, Saskatchewan, Alberta and British Columbia, while beginning again at the east and lying to the north of these districts are the Northwest territories and Yukon. Prior to 1905 the only provinces were Manitoba and

British Columbia. The remainder constituted the "territories." Now "the territories" signify the vast northern region stretching from Labrador to Yukon. The land area in these districts in acres is:

DISTRICT	Area in acres
Ontario (western end), approximate.....	20,000,000
Manitoba.....	41,169,898
Saskatchewan.....	155,092,480
Alberta.....	160,755,200
British Columbia.....	227,302,400
Northwest territories (Labrador to Yukon)...	1,197,475,200
Yukon.....	132,113,280

For present purposes the northern territories, with the exception of Yukon, may be disregarded, since they have not yet attracted population to any marked degree. The western end of the province of Ontario is rich in timber and minerals, and possesses stretches of good agricultural land. The prairie region begins at the eastern boundary of Manitoba and extends to the Rocky Mountains, embracing the provinces of Manitoba, Saskatchewan and Alberta: wooded prairie and open prairie, rolling and flat, broken by hills and some rocky ridges and drained by great rivers that flow eastward and northward into great lakes with outlets into Hudson Bay. No richer agricultural lands and no better grazing ranges exist than are here found. Of the 350,000,000 acres in this combined district it would be idle to estimate the proportion of good grain land. It is very large, as attested by the successful farms now scattered throughout the whole region. In 1903 only 5,073,424 acres had yet been put under crop. By the year 1917 the area under crop had grown to 24,938,700 acres. British Columbia is a land of magnificent mountains rich in minerals, and of valleys of the very highest agricultural possibilities, nearly the whole clothed with splendid forests. See the articles in this series: AGRICULTURE; MINERALS; THE FORESTS AND LUMBER INDUSTRY.

In 1901 the Canadian West, not including the portion of Ontario, was shown by the census to have a population of 645,517. In 1911 the Canadian West, not including the portion in Ontario, was shown by the census to have a population of 1,742,182. Out of this number 498,347, or 28.6 per cent, had been born in the West, 354,748, or 20.4 per cent, had been born in the eastern provinces of Canada, 341,960 or 19.6 per cent had been born in the British Isles, 509,509 or 29.2 per cent had been born in foreign countries, while 37,618, or 2.2 per cent had failed to give their birthplace or been born at sea. By origin 966,238 were of British stock, 152,137 of German stock, 114,877 of Austro-Hungarian stock, 95,106 of Scandinavian, 83,635 of French, 43,676 of Russian and 32,167 of Chinese and Japanese, and in addition to these 78,717 were Indians and 108,905 of unspecified origin. To understand the peculiar nature and the rate of the movement of population into the Canadian West indicated by these figures, many general considerations must be borne in mind. Conditions as they have existed in the United States are among the most important of these considerations. Until the closing years of the last century the United States was an irresistible magnet. It drew from the movable population of all countries. From Canada itself it attracted a larger proportion of the native population than from

any other country. Its relative advantages over Canada, in the eyes of those who sought to better their condition, consisted in its advanced stage of development. Not only were there more varied employment and larger opportunities in industrial and commercial life, but its fertile lands were opened up by railways from 10 to 40 years before those in the Canadian West and the mineral wealth of its western mountains was discovered and advertised to the world years before the riches of Canada in this respect were even suspected. The prairie regions of the Canadian West had to wait for transportation facilities, and then they had to wait until their profitability was established. Since people are not predisposed to believe in the security of agriculture in northern latitudes, this meant, practically, that they had to wait until the prairies in the United States were tested right up to the border. Before that time even official crop returns could not be widely effective as inducements to immigration. Moreover streams of migration are not easy to divert. Where many have gone others tend to follow.

To what extent the United States drew upon Canadians up to 1900 is shown in the census returns of that year which record the residence in that country of 1,181,255 persons born in British North America, that is, in Canada and Newfoundland. How little the United States had given in return appears from the comparatively small number of 127,899 natives of the United States resident in Canada when the Canadian census was taken in 1901. But the flow of population from Canada to the United States has been checked and the tide has turned, and from census returns of 1 June 1911 it is shown that there were 303,680 natives of the United States resident in Canada, of whom 168,278 were males and 135,402 females; and during the years 1912 to 1917, inclusive, the immigration returns show the arrival in Canada of natives of the United States to a total number of 538,815. Canada has made steady and substantial progress and her industries now provide opportunities for all her own people who desire industrial employment. But what is of more direct importance to the present subject, the cheap, good lands in the United States are now very largely occupied; prosperity and a good birthrate among the farming population have created a host of land seekers of native birth, and the price of land has rapidly risen. In the Canadian West, on the other hand, millions of acres of the most fertile land are obtainable at moderate cost; this land has been proved, and railway facilities and railway rates put the crops within profitable reach of the markets.

The history of the settlement of the Canadian West may conveniently be divided into three periods: the first embracing the time before railway facilities existed or, say, up to 1885; the second from 1885 to 1901; and the third beginning in 1901. So far as the prairie division is concerned fur traders visited it and dwelt in it from early times, but no attempt was made at colonization previous to that of Lord Selkirk in the decade succeeding 1812. That his venture, beset with misfortunes though it was, left a permanent result was shown by the fact that in 1873 as many as 530 of the original Selkirk settlers or their white children were

found to claim the grants of land offered by the Canadian Parliament. Other independent colonists had made their way into the country and there were, of course, the employees of the Hudson's Bay Company, but in 1869, when the purchase by Canada was made, the total white population numbered only a few hundreds. Some members of the military expedition of 1870 remained as settlers and other accessions were received at about the same time. In 1871 the Dominion government appointed the first immigration agents in the West, one in Manitoba and another in the Territories, and authorized the establishment of an "immigration shed" at Winnipeg, a hamlet then possessing 241 inhabitants. The work of promoting immigration to Canada had been undertaken by the Federal government in 1868, the provincial governments co-operating, and the appointment of agents in the West brought that section into direct touch with the general system having agents in Great Britain and Europe. It is interesting to note that in his annual report to the department for 1872 the agent at Winnipeg estimates the arrivals during the year at 1,400, of whom 954 came from Ontario, 78 from Quebec and 115 from the United States. During 1872 and 1873 the Dominion government entered into negotiations with a colony of German Mennonites living in southern Russia who desired to emigrate. Delegates visited Canada and in 1874 1,349 of these people settled in southern Manitoba. This is important, not only because it led to further immigration from the same source but also because the attention of the Dominion government was thus directed to the question of special colonization in the West. In 1874 Scandinavian and Icelandic delegates were shown through the country and a small beginning was made in Icelandic settlement through the moving up from Ontario of 285 Icelanders. The years 1874 and 1875 may be noted also because the Dominion government then first appointed Canadian immigration agents in the United States, chiefly for the purpose of effecting the repatriation of Canadians. Results were at once obtained and agents reported some 400 repatriated Canadians as immigrants into the West in 1876 and some 800 in 1877. In 1879 a delegation of tenant farmers of Great Britain visited the country and their reports resulted in an increase in immigration from the British Isles. The projected transcontinental railway had met with difficulties and delays, but in 1875 work was begun at Thunder Bay, the head of Lake Superior, on the section to Winnipeg, and in 1878 a line from the United States border at Pembina was completed to Saint Boniface, opposite Winnipeg across the Red River. Although the line from Lake Superior was not completed until 1883, the line from Pembina increased the facilities for reaching Winnipeg (q.v.), and the railway building combined with other not unnatural causes led to a "boom" in real estate, accompanied by a rush of speculators and prospective settlers. In 1881 the immigration agents estimated the arrivals in Manitoba at about 25,000, in 1882 at almost 70,000, and in 1883 at 50,000. Eastern Canada and the United States contributed the great proportion of these visitors, as most of them proved to be. The boom "burst" in 1883. By the census returns for 1881 some estimate of what was per-

manent in the immigration of the previous years can be reached. Manitoba was given a total population of 65,954, of whom 18,020 were born in Manitoba itself, and 6,422 in the Territories. Of these two classes 6,767 were Indians, but the half-breeds were not separately enumerated. From outside the largest number was furnished by the province of Ontario, namely, 19,125, Quebec supplying 4,085 and Nova Scotia 820. Natives of England and Wales numbered 3,457, of Scotland 1,836, and of Ireland 2,868. Russia supplied 5,651, chiefly Mennonites; Germany, 220; Norway, Sweden and Denmark, 121; and France, 81. The United States had contributed 1,752. In the same year the white population of the Territories was 6,974, of whom 517 were born in Ontario, 101 in Quebec, 98 in England and Wales, 136 in Scotland, 62 in Ireland, 27 in France and 116 in the United States. As the Canadian Pacific Railway was pushed through real settlement followed at a faster rate than ever before and in 1886 when the first train was run from Montreal to the Pacific Coast the net gain in population from the principal sources, over the figures just given for 1881, was: From Ontario 14,996, from Quebec 1,891, from Nova Scotia 497, from New Brunswick 363, from England and Wales 6,865, from Scotland 4,146, from Ireland 753, from Iceland 1,500, from the United States 570; while each of the other countries showed small gains. The chief sources of increases in the Territories were Ontario 8,300, Quebec 1,200, England and Wales 3,750, Scotland 2,000, and the United States 890.

It will not be necessary to follow in detail the records of the succeeding years up to 1901, which form the second period. The Canadian Pacific Railway Company, which had received large grants of land, became an additional agency in the organizing of immigration movements as also to a limited extent did the colonization societies which had purchased tracts of land in 1882, 1883 and 1884. A movement which began in 1889 and 1890 and ultimately attained considerable proportions was that from Austria-Hungary. The year 1890 was marked by a considerable immigration from Great Britain. Migration from the eastern provinces of Canada remained moderate until 1898. In 1899 over 7,000 Doukhobors were brought in and established in colonies. According to the census of 1901 Manitoba had a population of 238,934, not counting Indians and half-breeds. Those born in Canada numbered 164,582. Of the Canadians 67,566 were born in Ontario, 8,492 in Quebec, 1,536 in Nova Scotia, 820 in New Brunswick, 419 in Prince Edward Island and 167 in British Columbia. In England there were born 20,036, in Scotland 8,099, in Ireland 4,537, and in Wales 356; in Austria-Hungary 11,570, in Russia 8,854, in Iceland 5,403, in Germany 2,285, in Norway, Sweden and Denmark 2,090, in France 1,470, and in the United States 6,922. The Territories had a population of 185,335, exclusive of Indians and half-breeds. Of the 65,231 born in Canada, Ontario was the birthplace of 28,229, Quebec of 4,075, Nova Scotia of 1,169, New Brunswick of 669 and Prince Edward Island of 488. Those born in England numbered 10,752, in Scotland 4,226, in Ireland 2,158, and in Wales 186; in Austria-Hungary 13,407, Russia 14,585, Norway,

Sweden and Denmark 2,462, Germany 2,170, France 1,023, Iceland 424 and the United States 13,877.

Before touching the movement of the later years into the prairie region a few words may be said of the progress of settlement in British Columbia. In 1901 the population of that province was 149,708, again excluding Indians and half-breeds. The composition of the population of British Columbia differs from that of the districts we have just been considering in several interesting respects. In the first place, it contained in 1901 relatively a larger number born in the United States, namely, 17,164. Then there were 14,576 Chinese and 4,515 Japanese. Ontario contributed 23,642, but Nova Scotia came next among the provinces with 4,603. These features are easily explainable. The chief attractions of British Columbia have been its mines, its forests and its fisheries. The first named have in many different years caused rushes from the United States and they have been an added attraction to the people of the province of Nova Scotia. The man from Ontario is a good pioneer under any conditions. And the same causes that drew Chinese to California have operated in the case of British Columbia. The first gold rush to British Columbia occurred in 1858, nine years after the memorable rush to California. It is said that between 20,000 and 30,000 prospectors from California invaded the province in that year. Systematic exploration, however, was not attempted and the mining population came and went in waves, the years 1858, 1861, 1864, 1865, 1869 and 1872 marking the influxes. Up to 1893 nearly all the gold produced was placer gold and the values ran from \$705,000 in 1858 to \$3,913,563 in 1863, continuing at an average of over \$3,000,000 until 1868, when with variations a decline set in. The working of lode mines since 1893 has given an element of permanence to the mining population and the annual product of gold has for the past 10 years been between five and six million dollars in value. The copper, silver, zinc and lead mined exceed gold in their total value, copper in 1917 reaching the value of \$17,784,494. Coal, of which British Columbia has enormous deposits, shows a steady increase and the annual product now exceeds 2,000,000 tons. In 1917 2,084,093 tons of a value of \$7,294,325 were mined. The magnificent timber resources of the province have given employment to an increasing number of men and the yield of the fisheries has grown from \$104,697 in 1876 to \$14,637,346 in 1917. In 1871, when British Columbia became a province in the Dominion, the population was 36,247, of whom 25,661 were Indians. In 1881 it had increased to 49,548, in 1891 to 98,173, in 1901 to 178,657, in 1911 to 392,480.

The Yukon territory might perhaps be classed with British Columbia. In 1896 the gold discoveries were made there which caused the famous rush in 1897. The census of 1901 gave the Yukon a population of 24,357, exclusive of Indians and half-breeds. Natives of the United States numbered 6,707, of Ontario 1,940, of Quebec 1,349, of Norway and Sweden 1,265, of England 1,153 and of Germany 746; not specified 6,573. Pop. (1911) was only 8,512.

The part of Ontario included in the Canadian West has interests of its own in mines and fertile land, but its progress in settlement has

been largely bound up with that of the prairie region to the west. The mines in the Lake of the Woods district caused the establishment of the town of Rat Portage, now Kenora, the continued prosperity of which, however, came to depend to a great extent on the lumber industry for the supply of the demand in Manitoba and the territories. Port Arthur and Fort William on Thunder Bay, Lake Superior, are at the head of lake navigation on the Canadian route, and the summer traffic in goods for the West and in grain and flour from the West is there transhipped, the towns possessing immense storage and shipping grain elevators. These towns are growing rapidly, particularly since 1901, and their growth will keep pace with the development of the West. The completion of the Canadian Northern Railway between Port Arthur and the wheat fields, running through the southern part of the province, has not only assisted Port Arthur but has opened up the valley of the Rainy River and new centres for the lumber industry. In 1911 Rat Portage, now Kenora, had a population of 6,158 people, Fort William 16,499 and Port Arthur 11,220. Since that date the population, especially of the two last mentioned towns, has greatly increased and new towns have sprung up along the line of the Canadian Northern.

The third period in the settlement of Manitoba and the Territories began in 1901. Conditions to which reference has previously been made had developed and the time was ripe. In the United States a greater movement of land-seekers was taking place than at any previous time, with the exception perhaps of the early eighties, and good available lands for pioneers were fast becoming occupied. This movement was not directly from the more thickly settled Eastern and Middle States to new lands, but from these States to the Northwestern and Southwestern States. The newcomers were willing to buy lands under cultivation at prices which were comparatively high to the men who had broken them. It was the men who had entered the Northwestern States as pioneers 10, 15 or 20 years before who were offered tempting prices, and in thousands decided to become pioneers again. This movement of population was directed by the railway companies and by private land companies, the managers of which had their connections in all parts and thoroughly understood the business of land settlement. The new feature in the history of immigration into the Canadian West in 1901 was the advent of these United States land companies. As soon as prospects seemed to indicate a good crop in that year, their agents appeared in considerable numbers and purchased large tracts. This continued in 1902. To show the magnitude of the operations it may be mentioned that one of these companies purchased in one block about 1,100,000 acres. The lands thus secured could be offered to land-seekers in the United States at from \$4 to \$10 per acre. In certain localities, or in the case of improved farms, the price was higher. The man who could sell his farm in the Dakotas, Minnesota or Iowa, for example, at from \$30 to \$75, or even \$100 per acre was offered land in Canada, which returns showed was capable of producing more bushels to the acre, for a price which would not only pay the expenses of the transfer but leave him with a

bank account. In most cases the large blocks of land purchased were sold in smaller lots to middlemen and the number of agents thereby largely increased and distributed. Enterprising Canadian land companies also existed and greatly increased in numbers. By 1903 the first phase of this new development, that is, the purchase of large blocks of land by speculating settlement companies, had almost come to an end. The policy of the government is opposed to selling except to the actual settler and the Canadian Pacific Railway Company, the Hudson's Bay Company and the Canadian North-west Land Company, the other largest owners of land, were likewise unfavorable to the too extensive operations of speculative middlemen. It was to the interest of the railway company, particularly, to secure the actual settler as soon as possible and it was believed that prices could most effectually be kept at an attractive level by retaining the retail selling of the lands in the hands of the company. Large sales were, however, made by these Canadian companies in blocks as well as in farms, and it is of interest to note how great an increase in land values accrued as shown by the report of the land sales department of the Canadian Pacific Railway Company for the years 1901 and 1910. During the first year, a total of 831,732 acres was sold for \$2,646,237, the average return being \$3.18 per acre. In 1910, the sales of agricultural land aggregated 975,030 acres, for \$14,468,564.33, being an average of \$14.84 per acre. Included in this area were 145,421 acres of irrigated land, which brought \$26.59 per acre, so that the average price of the balance was \$12.78 per acre. The Canadian Northern Railway Company has also an extensive land grant, from which there were sold in 1910 246,966 acres at an average price of \$10.36 per acre, compared with 116,662 acres for \$1,091,722.37, an average of \$9.36 per acre, in 1909.

Among the factors at work during this period, the immigration department of the government must be given a chief place. The

States. To this fund the Dominion government, the government of the province of Manitoba and the city of Winnipeg gave contributions. The effect of the increased immigration from the United States was not alone in additions to population from that source, but the fact that United States farmers were seeking Canadian lands was an excellent advertisement in Europe. The most telling advertisements of all, however, were the splendid crops of 1901 and 1902. The government returns of wheat, oats and barley for Manitoba and the Territories, now the provinces of Alberta and Saskatchewan, for the years 1900, 1901, 1902, 1910, 1915, 1916 and 1917 are as follows:

YEAR	WHEAT		
	Acres	Bushels	Yield per acre
1900	2,495,474	23,456,985	9.48
1901	2,516,532	62,820,282	24.90
1902	2,605,698	67,034,117	25.16
1910	7,867,432	110,166,704	12.73
1915	13,867,715	360,187,000	25.97
1916	14,362,809	242,314,000	16.87
1917	13,619,410	211,953,100	15.56
OATS			
1900	833,410	16,654,322	19.98
1901	919,390	38,909,654	42.32
1902	1,035,427	45,139,455	43.59
1910	3,880,606	106,163,510	27.35
1915	6,480,681	279,692,000	43.77
1916	7,359,487	313,916,000	42.52
1917	8,559,500	254,877,200	29.78
BARLEY			
1900	152,569	3,141,357	20.58
1901	215,711	7,331,255	33.98
1902	366,204	10,549,536	34.71
1910	667,171	12,057,806	18.07
1915	1,171,082	36,003,000	30.74
1916	1,391,296	33,419,000	24.02
1917	1,850,000	40,384,100	21.83

The area under wheat, oats and barley in what are now the provinces of Manitoba, Saskatchewan and Alberta was in 1900, 3,481,453 acres, and in 1917, 24,028,910 acres. The total production was, respectively, 43,252,664 bushels and 507,214,400 bushels.

For the year 1917, the field crops of the Dominion were as follows:

CROPS	Area (acres)	Total yield		Total value
		Bushels per acre	(bushels)	
Fall wheat	725,300	21.50	15,533,450	\$32,336,900
Spring wheat	14,030,550	15.50	218,209,400	420,701,700
Oats	13,313,400	30.25	403,009,800	277,065,300
Barley	2,392,200	23.00	55,057,750	59,654,400
Rye	211,880	18.25	3,857,200	6,267,200
Peas	198,881	15.25	3,026,340	10,724,100
Beans	92,457	13.75	1,274,000	9,493,400
Buckwheat	395,977	18.00	7,149,400	10,443,400
Mixed grains	497,236	32.50	16,157,080	18,801,750
Flax	919,500	6.50	5,934,900	15,737,000
Corn for husking	234,339	33.00	7,762,700	14,307,200
Potatoes	656,958	121.50	79,892,000	80,804,400
Turnips, etc.	218,233	290.75	63,451,000	29,253,300
		Tons	Tons	
Hay and clover	8,225,034	1.66	13,684,700	141,376,700
Fodder corn	366,518	7.34	2,690,370	13,834,900
Sugar beets	14,000	8.40	117,600	793,800
Alfalfa	109,825	2.39	262,400	3,041,300
Totals	42,602,288			\$1,144,636,450

number of agents in Europe and the United States had been increased and more money than ever before was spent in advertising Canada. In January 1904 the United States and Canadian land companies interested in western Canada and leading business men in Winnipeg and elsewhere organized what is called the Western Canada Immigration Association and raised a fund of \$50,000 for a two years' campaign of education through the press of the United

The area in field crops in the Dominion increased from 19,763,740 acres in 1900 to 30,556,168 acres in 1910, and to 42,602,288 acres in 1917; and the total values of field crops from \$194,953,420 in 1900 to \$384,513,795 in 1910, and \$1,144,636,450 in 1917. According to official estimates for 1916 the average value of farm lands in Canada was \$40.95 per acre; the average wage of farm help (including board) was \$43.23 per month for males and \$22.46 for fe-

males, and per annum it was, respectively, \$396.88 and \$227.86. The total value of farm animals in 1916 was \$903,685,700 as against \$749,640,000 in the year previous.

**Immigration.**—The total immigration into Canada during the seven fiscal years, 1911–17 inclusive, was 1,620,312, of which 614,520 came from the British Isles; 659,705 from the United States and 346,087 from other countries. Of these 890,068 were destined to the eastern provinces and 730,244 to the west.

The growth of railways in Canada is indicated by the following table:

Year	Mileage	Year	Mileage
1850	66	1900	17,657
1860	2,065	1910	24,731
1870	2,617	1915	35,582
1880	7,194	1916	37,434
1890	13,151		

Of the 24,731 miles of railway in Canada in 1910, 9,473 or 38.3 per cent was in western provinces and in the year 1916 of the total 37,434 miles, 17,185 or 45.9 per cent was in the west.

W. SANFORD EVANS,

*Chairman Georgian Bay Canal Commission,  
Ottawa.*

**12. THE CONSTITUTION.** In the Canadian draft of the bill, Canada was styled a "Kingdom." For that title "Dominion" was substituted at the instance of Lord Derby, who thought that the title "Kingdom" might be offensive to the Americans. Sir John Macdonald, as a strong monarchist, deplored the change, feeling that had the title "Kingdom" been adopted the Australian colonies would have been applying to be placed in the same rank as the kingdom of Canada. As it is, the Australian colonies have adopted the title "Commonwealth," suggestive rather of progress in democratic sentiment.

The term Confederation has been applied to two forms of polity materially different from each other. One is confederation proper; the other is nationality with a Federal structure. The instance of confederation proper in ancient history is the Achæan League; in modern history, instances are the original Swiss Bund, the United Netherlands, and the Union of the American colonies during the Revolutionary War. Instances of a nation with a Federal structure are the United States of America under their present constitution and the present Swiss Bund. A confederation proper is formed for a special object, usually that of common defense. The several states entering into it do not resign their sovereign power. Nor does the Federal council exercise, like a national government, authority over the individual citizen, but only over the States. Its legislative power is confined to the fulfilment of the special object of the federation. Nor has it any power of taxation, but only a power of requisition. In the case of a federation proper, the Federal government is an organ of the states governments collectively. In the case of a nation with a Federal structure, the states are severally organs of the Federal government. The Canadian confederation belongs, as its name Dominion of Canada imports, to the class of nations with a Federal structure. So does the newly formed Commonwealth of Australia.

The Canadian constitution is embodied in the act of the British Parliament called the British North America Act, which can be amended only by the power by which it was passed. In common with the other colonies, self-governed as they are styled, Canada remains in the allegiance of the British Crown, retains the constitutional forms and nomenclature of the monarchy, and is, to a certain, though of late years diminishing, extent, under the actual control of the Imperial government. The legislation of the Imperial Parliament is, with certain exceptions, binding upon Canada. To the King's government under the control of the Imperial Parliament belong the treaty-making power—with the exception of commercial treaties—and the power of peace and war. By the Imperial government the governor-general, the legal head of the Dominion is appointed. The supreme jurisdiction is still the British Privy Council, and in it is vested the interpretation of the Canadian constitution. The fountain of honor is Imperial. The territory of the Dominion is part of the domain of the empire, at the disposal of the Imperial government, which has exercised its power in boundary cases. The tendency, however, since confederation, has been constantly toward practical independence. The veto power has been very sparingly exercised, and only in special cases, as in that of copyright where the colonial act conflicted with the Imperial law. Appeal from the colonial courts to the Privy Council has been restricted. Military occupation has ceased. The military administration has passed, not without friction, into the hands of the Canadian Minister of Militia, and the Chief of the General Staff, as the principal military officer is called, is his subordinate. In commercial relations Canada is autonomous. The dispensation of titles and decorations, to which great influence is attached, still remains Imperial, though even in this the wishes of the Canadian government probably make themselves felt.

The Dominion of Canada and the other self-governing dependencies of the British Crown faithfully reproduce the forms of monarchy. The governor-general of Canada, as the representative of the British sovereign, has the prerogative of calling and dissolving Parliament, of appointing the members of the Privy Council, of nominating the Senate. Parliament is opened by him with a "speech from the throne." But, like the monarch whom he represents, he reigns but does not govern. Very rare have been the instances since the confederation, and those not cases of general policy, in which he has exercised his personal power. Only of the pageantry of his office and of his assumption of state has there since confederation been an increase, favored by those who desire to foster the monarchical sentiment. The lieutenant-governors of provinces, nominally appointed by him, are really appointed by his ministers, and almost invariably from the ranks of their own party. When one of them was dismissed it was apparently against the wish of the governor-general and manifestly on party grounds; yet on reference to the home government the governor-general was directed to conform to the opinion of his constitutional advisers.

The legislative power is divided between the

central legislature and those of the provinces, the subjects of legislation assigned to each being set forth in the Act. The exclusive legislative authority of the Parliament of Canada extends to (1) the public debt and property; (2) the regulation of trade and commerce; (3) the raising of money by any mode or system of taxation; (4) the borrowing of money on the public credit; (5) postal service; (6) the census and statistics; (7) militia, military and naval service and defense; (8) the fixing of and providing for the salaries and allowances of civil and other officers of the government of Canada; (9) beacons, buoys, lighthouses, and Sable Island; (10) navigation and shipping; (11) quarantine and the establishment and maintenance of marine hospitals; (12) the coast and inlet fisheries; (13) ferries between a province and any British or foreign country, or between two provinces; (14) currency and coinage; (15) banking, incorporation of banks and the issue of paper money; (16) savings banks; (17) weights and measures; (18) bills of exchange and promissory notes; (19) interest; (20) legal tender; (21) bankruptcy and insolvency; (22) patents of invention and discovery; (23) copyright; (24) Indians and lands reserved for the Indians; (25) naturalization and aliens; (26) marriage and divorce; (27) the criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters; (28) the establishment, maintenance and management of penitentiaries.

To the provincial legislatures are assigned (1) the amendment from time to time, notwithstanding anything in the act, of the constitution of the province, except as regards the office of the lieutenant-governor; (2) direct taxation within the province in order to the raising of a revenue for provincial purposes; (3) the borrowing of money on the sole credit of the province; (4) the establishment and tenure of provincial offices, and the appointment and payment of provincial officers; (5) the management and sale of the public lands belonging to the province, and of the timber and wood thereon; (6) the establishment, maintenance and management of public and reformatory prisons in and for the province; (7) the establishment, maintenance and management of hospitals, asylums, charities and eleemosynary institutions in and for the provinces, other than marine hospitals; (8) municipal institutions in the province; (9) shop, saloon, tavern, auctioneer and other licenses, in order to the raising of a revenue for provincial, local or municipal purposes; (10) local works and undertakings other than such as are of the following classes: (a) Lines of steam or other ships, railways, canals, telegraphs and other works and undertakings connecting the province with any other or others of the provinces, or extending beyond the limits of the province; (b) lines of steamships between the province and any British or foreign country; (c) such works as, although wholly situate within the province, are before or after their execution declared by the Parliament of Canada to be for the general advantage of Canada or for the advantage of two or more of the provinces; (11) the incorporation of companies with provincial objects; (12) the solemnization of

marriage in the province; (13) property and civil rights in the province; (14) the administration of justice in the province, including the constitution, maintenance, organization of provincial courts, both of civil and of criminal jurisdiction, and including procedure in civil matters in those courts; (15) the imposition of punishment by fine, penalty or imprisonment for enforcing any law of the province made in relation to any matter coming within any of the classes of subjects enumerated in this section; (16) generally all matters of a merely local or private nature in the province.

Powers not specifically given to the provinces are reserved to the Dominion, whereas under the American constitution powers not specifically given to the Federal government are reserved to the States or to the people.

The judges are appointed by the Federal government and, as in Great Britain, for life or during good behavior, in contrast with the practice of the United States, where judges are elected for a term of years. They can be removed only by the governor-general on an address from both houses of Parliament.

The Canadian Parliament consists, like the British, of two houses. The House of Commons, in which supreme legislative power practically resides, is elected almost by manhood suffrage; but by the Military Voters Act of 1917 the wives, widows, mothers, sisters or daughters of men who had served in the military or naval forces of Canada or Great Britain during the Great War were given the right of voting in the election of that year. The North America Act apportions representation to the several provinces on the principles of population and provides for decennial readjustment to meet changes in the balance of population. Members of both houses are paid; in Great Britain only members of the House of Commons. The senators are appointed nominally by the Crown, really by the head of the party in power, and almost invariably on party grounds. Senatorships are for life, not hereditary like seats in the House of Lords, so that the political analogy is imperfect. On the other hand, party which appoints the Canadian Senate, controls it. It might otherwise block legislation and there would be no remedial force, while the British House of Lords, it is well understood, must give way to the will of the nation when persistently declared. As it is, when the outgoing party happens to retain a majority in the Senate, there is danger of a block. The House of Commons is elected for a term of five years, subject, however, to the prerogative of dissolution. An amendment to the British North America Act was, owing to war conditions, passed in 1916 specially extending for one year the term of the Parliament then expiring.

The provincial legislatures are miniatures of those of the Dominion. The forms like those of the Dominion Parliament are monarchical, the lieutenant-governor formally nominating the ministers, as does the governor-general those of the Dominion. The practical working is popular, elective and partisan. The party divisions run through the provinces severally as well as through the Dominion at large. Quebec and Nova Scotia, like the Dominion Parliament, have each two chambers; the rest have only one. The Federal government has a veto on provincial legislation.

The treatment of the Northwest territories, as provinces, presents a certain analogy to that of the Territories of the United States, executive and legislative powers being given to a lieutenant-governor with an elective council subject to instructions by order under Federal council or by the Canadian Secretary of State.

The Parliament is by law bi-lingual; the French language as well as the English being recognized, though practically English prevails. The civil law, in which the *Coutume de Paris* and the Code Napoleon are blended with the common and statutory law of Great Britain, remains the law of Quebec.

In its generally democratic character the Canadian constitution approaches to that of the American republic, but in their structure they materially differ. The American constitution, in accordance with the principle laid down by Montesquieu (q.v.), separates the executive from the legislative. The members of the President's council, miscalled a cabinet, have not seats in the legislature, nor is their continuance in office dependent on its support. They are the nominees of the President alone. Under the Canadian constitution, as under the British, the members of the Cabinet have seats in the Parliament, on the confidence of which their tenure of office depends, and in which they initiate and control legislation. The head of the American republic is elected for a term certain. The terms of members and the times of election are fixed by law, whereas the Canadian Parliament is called in the name of the Crown by the Prime Minister, the head of the party in power, who wields in the interest of his party the prerogative of summoning and of dissolution. The members of the Canadian Senate are chosen by the head of the party in power, whereas the American Senate, formerly elected by the legislatures of the several States, are now (since 1913) elected by popular vote. Thus the Canadian constitution lends itself more aptly to the working of the party system of government, which, with all its accessories, political and moral, has prevailed, though the general influence of party cannot be stronger than it is in the United States.

In Great Britain the Cabinet, in which the real power of government resides, is a growth of political party unrecognized by law, while the Privy Council, recognized by law, has become honorary. In Canada the Privy Council is the Cabinet, at the same time conferring the honorary rank, but the relation to the Crown, the relation to Parliament and the working of the system in both cases are the same.

The British North America Act does not, like the American constitution, prohibit the establishment of a particular religion by the state. It leaves untouched to the Roman Catholic priesthood of Quebec the power of levying tithes on the people of their own communion. In the section respecting education it perpetuates the privilege of denominational schools. Since confederation the government of Ontario has practically aided a denominational university. But since the secularization of the clergy reserves and the opening of the University of Toronto, non-interference of the state with religion may be said to have been established as a general principle and may be regarded as practically part of the constitution. See the articles in this series: CONFEDERATION;

LOCAL GOVERNMENT; IMPERIAL FEDERATION; UNDER FRENCH RULE; UNDER BRITISH RULE.  
GOLDWIN SMITH.

13. LOCAL GOVERNMENT. Under the British North America Act of 1867, which is virtually the constitution of the Dominion of Canada, the organization of local government is placed within the jurisdiction of the several provinces. There is consequently considerable variety in the structure of rural and urban government in the different parts of the Dominion. Certain general features are, however, to be observed. The fundamental principle of organization is that of local autonomy by the means of representative elected bodies. The provinces are divided into counties, subdivided into townships, in which again school sections are formed. The county and the township are not everywhere found side by side. Indeed, the provinces of Canada present the same contrast between the predominance of the township and the county as is found in the United States. In Nova Scotia and New Brunswick the county is the unit of local government; in Ontario and Quebec both township and county are found; throughout the West the township system prevails, the county being only a judicial area. In addition to these rural areas of government, there are found incorporated villages, towns and cities. In Ontario and Manitoba incorporation takes place by virtue of a general statute; elsewhere it is done by special legislation. The details of local government may best be understood by first passing in review the organization and powers of rural governing bodies in the different provinces, and treating separately the question of town and city government and municipal franchises. Ontario, the most populous of the provinces, contains 38 county corporations and 423 townships. Both of these divisions vary greatly in size and population. The largest county (Grey) contains 1,092,027 acres, the smallest (Brant) only 213,905 acres. Thirty-two townships contain less than 20,000 acres, 11 of them more than 80,000 acres each. There are in addition the districts of Muskoka, Parry Sound, Nipissing, Manitoulin, Algoma, Thunder Bay, Kenova, Sudbury, Temiskaming and Rainy River, not yet organized as counties, but in the settled portions of which over 200 townships have been incorporated. The affairs of the townships are managed by a reeve and from one to four deputy Reeves, according to population, elected yearly. For the county there is a county council, composed of the Reeves and deputy Reeves of the towns, not being separated towns, and of the villages and townships in the county. The franchise for all local elections is extremely wide. It includes every person of 21 years and upward, rated for real property to an extent varying from \$100 in the townships to \$400 in the cities; those assessed for an income of \$400, and farmers' sons of full age living at home. The township council is chiefly concerned with the maintenance of roads and bridges, the levy and collection of school taxes and the collection of the county tax. Assessors appointed annually by the township council make a valuation of real and personal property. The other principal officers of the township are the treasurer and the township clerk. The latter, though legally holding office at the pleasure of the council, enjoys a practically permanent tenure. He prepares the collector's rolls, statute

labor lists, voters' lists, etc., registers births, deaths and marriages and performs many other duties assigned to him by separate statutes. The county council meets at the "county town," under the presidency of a warden whom it elects annually. It acts largely through committees, both standing and special. It appoints a treasurer, a county clerk, an engineer, a public school inspector and two auditors. The county council provides accommodation for the courts of justice, maintains county buildings, roads and bridges, houses of refuge, etc. The county rate is collected with the local taxation, but the county council has power to "equalize" the valuations of the local assessors if it thinks necessary. For organization of school districts, and control of schools in Ontario and elsewhere, see article on PUBLIC EDUCATION IN CANADA. Local government in the province of Quebec is organized under a municipal code enacted by the legislature (24 Dec. 1870), and revised in 1888. The larger towns and the cities are incorporated under special charters granted by the legislature. Of the counties some are divided into parishes, others into townships. For each county there is a council composed of all the mayors of the included municipalities. At its head is a warden (*préfet*) whom it annually elects. The county council meets in regular session four times a year; its duties consist chiefly in the construction and maintenance of roads, bridges, etc., the locating of the Circuit Court, provision against forest fires, etc. The subordinate local councils (parish, township, united township, village and town) consist of seven councillors elected annually throughout the province, each council having a mayor as its head. The powers of these minor councils extend to highways, bridges, ferries, regulation of public health, etc. For all local purposes direct taxes are levied on all real estate, except the property of the government and that of religious and educational institutions. (For organization, etc., of schools, consult article on PUBLIC EDUCATION). The Seigniorial tenure of land, which once carried with it certain powers of local administration, is also treated in a separate article. The local government of New Brunswick is regulated by a consolidated statute of 1898. Each county has an elected council, meeting twice a year. The larger cities have a representative in the county council as well as their own local council. The officers of the parishes are appointed by the county council. In Nova Scotia there are elective county councils, choosing its own wardens. Their by-laws are subject to the approval of the legislature. The counties of Prince Edward Island are electoral and judicial areas, but owing to the small size of the province the legislature itself acts as the organ of local government; villages and towns are, however, incorporated with elective councils. In Manitoba, Alberta, Saskatchewan and British Columbia local government centres in the township, administered by a council of four to six members, with a reeve at its head. The unorganized territories (Yukon, Mackenzie, Keewatin and Ungava) are controlled by the Dominion government, and have no representative institutions. The government in Canadian cities is regulated by statutes of the provincial legislatures. This fact permits of frequent change, and a continuous development of organization to meet the circumstances

of the hour. In Toronto, for example, and in many other cities, it is the practice to suggest to the Parliament from year to year such alterations of the city charter as seem advisable. In the majority of the Canadian provinces, towns and cities are incorporated by special legislation; in Ontario and Manitoba, by virtue of general statutes on proclamation by the lieutenant-governor. Even in these provinces, however, special acts of incorporation are usually passed in order to provide borrowing powers. The typical form of Canadian urban government consists of a single chamber of aldermen (varying in number from 9 to 26) with a mayor. Both the mayor and council are generally elected for one year. In Montreal and Quebec the mayor is elected for two years, and in the latter city is chosen from among the aldermen. In Montreal, Quebec, Winnipeg, Brandon and Vancouver the aldermen are elected for two years. A board of control (the mayor with four aldermen), whose function it is to prepare the annual estimates, has been adopted for the cities of Ontario having a population of more than 45,000. In Montreal the affairs of the city are administered by the mayor and four controllers, specially elected for four years, the council of aldermen acting in a legislative and supervising capacity. Municipal offices are, in most cases, filled by appointments made by the mayor or the council. In the cities of Ontario and British Columbia, in Winnipeg, Charlottetown and Saint John, police appointments are made by commissioners independent of the civic government. The liquor licenses are almost everywhere under the control of the provincial authorities. The municipal suffrage in Canada is more restricted than the rural or parliamentary. Throughout Ontario, in Montreal, Quebec, Calgary and the four largest cities of British Columbia a special qualification of real property or income is demanded. The chief sources of civic revenue are found in taxes on real property, betterment taxes, and, in some cases, license taxes and percentage receipts from city franchises. Municipal indebtedness, incurred mainly for streets, sewers, waterworks and education, has much increased of late years, and in Montreal, Toronto, the cities of Quebec and the western provinces it grew rapidly from 1910 to 1917 concurrently with an amazing growth in assessment values. The net debt of Montreal at the beginning of 1917 was \$97,790,779, of Toronto about \$44,000,000. Except for waterworks there is but little municipal management of public works. Winnipeg, New Westminster, Three Rivers and a number of minor towns in Ontario own and operate electric plants; Calgary and Brandon operate their own street railways. Street railway franchises are granted for periods varying from 15 to 30 years; in Toronto, Montreal, Hamilton, Ottawa and Halifax the city receives a percentage of gross receipts.

**14. IMPERIAL FEDERATION.** Imperial federation is the name given to the various projects for revising the relations between Great Britain and her colonies, so as to give to the latter a share in the government of the empire. The growth of the colonies, and the increasing burden of national defense, naturally suggest that the colonies should contribute to the Imperial revenue; on the other hand, such a contribution, unless accompanied by a voice in the councils of the mother country, would constitute that "taxation without representation" so abhorrent to Anglo-Saxon ideas. Such was the situation during the great controversy of the 18th century between Great Britain and her North American dependencies, and such is again the situation at the present day. Even in the 18th century various proposals were made for solving the colonial difficulty by admitting American representatives to the British Parliament. Governor Pownall (see POWNALL, THOMAS), Edmund Burke (q.v.), and Adam Smith (q.v.) made suggestions of this sort. But the difficulty of communication rendered any such federation impracticable. During the middle period of the 19th century it was currently believed that the manifest destiny of the colonies was independence. With the passing of that idea has arisen the demand for a closer bond of union. The Imperial federation movement originated in the early '70s, an informal conference for discussing the subject being held in 1871. In 1884 the Imperial Federation League was founded, its first chairman being the Right Hon. W. E. Forster (q.v.). Lord Rosebery (q.v.), the Right Hon. Ed. Stanhope (sometime Secretary of State for the colonies), and Sir Frederick Young (q.v.) (whose work, 'Imperial Federation,' had appeared in 1876) were interested in the movement from its inception. A significant event was seen in the London colonies conferences of 1887, to which representatives of both the self-governing and the Crown colonies were summoned, and at which the subjects of Imperial defense and trade were discussed. In 1892 a committee of the Imperial Federation League presented a practical scheme of federation. It recommended the institution of a council of the empire, to which delegates should be summoned from the self-governing colonies, the Crown colonies and India. The function of the council was to consist in the regulation of Imperial defense. It was recognized, however, even at this stage of the movement, that there was no sufficient unanimity among the members of the league in reference to the details of the plan to be adopted to enable them to work effectively toward a common end. The league, whose work was declared to be only preliminary and preparatory, was dissolved in 1893 and its place was taken by a number of organizations having each a more definite purpose. Of these the United Empire Trade League became the advocate of the commercial union of the empire by means of protective duties. The Imperial Federation (Defense) Committee urges combined action for defensive purposes, the establishment of a navy supported by joint contributions being its immediate object. Most important, perhaps, is the British Empire League, established in 1894 and extended to the Dominion of Canada. The program of the league aims at the permanent unity of the empire, the promotion of trade

and inter-communication, the holding of periodic conferences and co-operation in national defense. In Canada, indeed, the movement had already made considerable progress. The Imperial Federation League in Canada had been formed at Montreal in 1885, with branches subsequently established at various places in the Dominion. Under the auspices of the organizing committee of the league a distinguished Canadian, George Parkin, delivered addresses throughout Canada, and in 1889 was sent, on behalf of the parent league, on a tour of the Australasian colonies. In 1894, at the instigation of the Canadian government, a conference was held at Ottawa to discuss intercolonial trade and communication. The Imperial government, Canada, Cape Colony and the Australasian colonies were represented. Resolutions were adopted in favor of reciprocal preferential duties among the colonies. A still more important conference was held in London in 1897 on the occasion of the jubilee celebration of that year. At this meeting the premiers of Canada, Newfoundland, New South Wales, Victoria, Queensland, South Australia, West Australia, Tasmania, New Zealand, Cape Colony and Natal discussed with the Right Hon. Joseph Chamberlain (q.v.), Secretary of State for the colonies, both the commercial and political relations of the mother country with the colonies. In reference to the former, a resolution was unanimously adopted favoring the "denunciation at the earliest convenient time of any treaties which now hamper the commercial relations between Great Britain and her colonies." The premiers also undertook to confer with their colleagues to see whether a preference could advantageously be given by the colonies to the products of the United Kingdom. In reference to political relations, the majority of the premiers endorsed the following resolutions: (1) "That the present political relations between the United Kingdom and the self-governing colonies are generally satisfactory under the existing condition of things." (2) "That it is desirable, whenever and wherever practicable, to group together under a federal union those colonies which are geographically united." (3) "That it would be desirable to hold periodical conferences of representatives of the colonies and Great Britain for the discussion of matters of common interest." From the first of these resolutions Seddon of New Zealand and Sir E. N. Braddon of Tasmania dissented, on the ground that the time had already come for a reconstruction of political relations. The Canadian government in the next year (1898) extended to Great Britain and to such British colonies as should reciprocate a tariff preference of 25 per cent, increased in 1900 to 33 1/3 per cent. In the summer of 1902, on the occasion of the coronation of King Edward VII, a further colonial conference was held between Secretary Chamberlain and the premiers of the self-governing colonies. The meetings of the conference, of which there were 10 in all, were also attended by several ministers of Australia and Canada then present in London, and by the members of the British Cabinet whose departments were concerned in the discussion. Chamberlain submitted a paper showing the disproportionate share of the burden of Imperial defense at present borne by the United Kingdom. "If you are prepared at any time," he

said, "to take any share, any proportionate share, in the burdens of the empire, we are prepared to meet you with any proposal for giving to you a corresponding voice in the policy of the empire." No definite conclusion was reached for the alteration of present political relations beyond the following resolution: "That it would be to the advantage of the empire if conferences were held, as far as practical, at intervals not exceeding four years, at which questions of common interest affecting the relations of the mother country and His Majesty's dominions over the seas could be discussed and considered as between the Secretary of State for the colonies and the prime ministers of the self-governing colonies. The Secretary of State for the colonies is requested to arrange for such conferences after communication with the prime ministers of the respective colonies. In case of any emergency arising upon which a special conference may have been deemed necessary, the next ordinary conference to be held not sooner than three years thereafter." On behalf of the Commonwealth of Australia £200,000 a year was offered toward the cost of the Australian Naval Squadron and naval reserve, from New Zealand £40,000 for the same purposes, from Cape Colony £50,000, and from Natal £35,000 for the Imperial navy generally, and from Newfoundland £3,000 for maintaining a branch of the Royal naval reserve. The grants were subject to ratification by the colonial legislatures. Resolutions of a general character in favor of preferential trade were also adopted by the congress. The Australian contribution met with sharp criticism from the Melbourne *Age* as involving taxation without representation. In February 1903 the British Empire League in Canada passed a resolution against the abstention of Canada from naval contributions, and declared that "it would be proper for her . . . to contribute a fair and reasonable share toward the annual cost of the navy of the United Kingdom."

During the period that elapsed between the conference of 1902 and the outbreak of the European War the movement of opinion in regard to Imperial organization was very noticeable. It was especially stimulated by (a) the continued discussions of the question of tariff reform in England, which involved the possibility of preferential and reciprocal duties in favor of the colonies, (b) the increasing imminence of war with Germany which would necessitate a common effort of Imperial defense and (c) the periodic assemblage of the conferences which naturally called forth public discussion throughout the empire. Four distinct currents of opinion became more and more clearly defined in the ebb and flow of debate. One of these favored the retention, indefinitely, of the status quo. Another opinion of a kindred nature, which gained ground very rapidly with the progress of the century, favored the reorganization of the empire, not in the form of a centralized Federal state, but as a group of separate units in permanent alliance, no single body holding the sovereign power. This scheme is best set forth in Mr. Richard Jebb's 'Britannic Alliance' (1913). It may be said to represent the views during the period in question of Sir Wilfrid Laurier (consult Imp. Conference Report 1911, esp. pp. 122, 123) and of the South African party led by General

Botha in South Africa, and of the Labor and Socialist parties throughout the empire. A third current of opinion revived the idea of Imperial federation in the sense of a central government with supreme power over defense and taxation. This view was supported by such influential leaders as the late Lord Grey (d. 1917), Lord Milner, Sir J. Ward, Premier of New Zealand, the late Sir Starr Jameson (the Dr. Jameson of the "raid") and others. It led to the formation throughout the empire of a powerful chain of affiliated associations known as the Round Table Group, organized originally for impartial study but leaning heavily toward centralization. The leading spirit of this movement was Mr. Lionel Curtis, who had been one of those instrumental in forming the Union of South Africa (1910) and who spent some years in visiting all self-governing parts of the empire to organize the Round Table Groups. On the basis of the work of the groups Mr. Curtis published in 1916 a volume called 'The Problem of the Commonwealth,' a brilliant presentation of the case for centralization. A fourth and last current of opinion, necessarily somewhat veiled, is that favoring the breaking up of the empire into independent states. This is presumably the goal of Mr. Henri Bourassa and the party of French Canadian Nationalists who follow his lead. (Consult Bourassa, 'Que Devons-Nous à l'Angleterre' (1915); 'National Problems' (1916), etc.). Independence is generally held to be the aim, proximate or distant, of the Nationalist party of South Africa headed by (General) Judge Hertzog. A proper appreciation of these divergent views enables one to understand the full significance of the great Imperial conferences of 1907 and 1911 and the subsidiary conferences of 1909 (consult Reports of Conferences, also Jebb, R., 'The Imperial Conference' 1911). The conferences of 1907 and 1911 showed a strongly marked divergence between the partisans of nationalism and those of federalism. The adoption of the name *Imperial Conference* in place of *Colonial* (1907) marks the opening of a new era. The proposal of a central body to be called the Imperial secretariat, advocated by the New Zealand and Australian delegates and those from the Cape and Natal, in 1907 was opposed by the (then) Liberal British government and by the Canadian delegates and those from the Transvaal. But it must be remembered that under the existing Cabinet system the delegates to the conference represent at a given time only one colonial party. In the place of a secretariat there was created a division of the colonial office known as the Dominions department, and the name "dominion" replaced colony in the official designation of the self-governing dependencies. In 1909 a special naval conference was summoned. A grave situation had been already officially declared to exist, by Sir Edward Grey as Foreign Secretary speaking in the House of Commons, and "emergency" offers of assistance had been made by New Zealand and Australia. In the conference of 1909 the principle of centralized control of maritime defense was abandoned in favor of a scheme of "fleet units" presented, perhaps reluctantly, by the Admiralty (consult Report of Conference, Cd. 4948). The conference of 1911 witnessed a pitched battle on the subject of Imperial re-

organization, Sir J. Ward bringing forward a complete Federal scheme which was overwhelmed by the powerful opposition of Mr. Asquith (then British Prime Minister), Sir Wilfrid Laurier and their followers. The much-quoted statements of Mr. Asquith to the effect that Imperial responsibility cannot be shared, and of Sir Wilfrid Laurier "Canada need not necessarily take part in a British War" should be read in their context (consult Report of Conference). The conference left the Imperial situation still in the same dilemma (no taxation without representation and no representation without taxation) in which it had been since the Imperial Federation Movement began. Meantime certain definite steps were being attempted toward more adequate Imperial defense on the lines suggested in the conference of 1909. The Canadian government (Liberal) passed in 1909 a Naval Act for the creation of a separate Canadian navy. The incoming Conservative government (1911) repealed the Act; but found their own naval program (that of presenting dreadnoughts to the British government for an indefinite period) defeated in the Senate, that body being still Liberal. During the same period a separate "Royal Australian Navy" was brought into being, the principal ships completed during 1913 and the naval establishments at Sydney and elsewhere in Australia taken over by the Commonwealth (1 July 1913).

The advent of the war has obviously altered the whole situation. The war efforts of the dominions have been made entirely on a voluntary basis, the nominal legal sovereignty of the British Parliament not being brought into play. The consultations and conference, and especially the general Imperial conference of 1917, were devoted to the immediate aim of the prosecution of the struggle, the question of reorganization remaining in abeyance. But it is generally agreed that at the close of the war the time will have come for a reopening of the whole question of future Imperial relations. **15. CANADA AND THE EUROPEAN WAR.** Though the world at large was surprised by the outbreak of the great war, there was, in fact, for this little justification. Alarms enough had been given. In 1909 there was in England an acute crisis in regard to expenditure to meet Germany's naval preparations. The crisis extended to Canada, which was without either an army or a navy. Appeals were made in the Canadian Parliament that the

country should put itself in a position to do something effective in case of a conflict. These demands embarrassed the government of Sir Wilfrid Laurier. His strength was in the French-speaking province of Quebec, where the people, detached for a century and a half from France, the mother-land of their race, and not stirred by the sense of unity with British ideals felt in English-speaking Canada, were disposed to make preparations only to meet the dangers of a direct attack on Canada. The most violent spokesman of this school of thought was M. Henri Bourassa, grandson of a former stormy leader in Canadian politics, Louis Joseph Papineau. When Sir Wilfrid Laurier submitted to Parliament plans for the creation of a Canadian navy, M. Bourassa attacked him as a jingo-imperialist. Like many others, Sir Wilfrid Laurier hoped that the dread of the horrors of war would lead to effective restraint by the more sober-minded people in Germany and elsewhere to prevent an actual outbreak. He proceeded reluctantly to spend money upon a navy and in 1911, when he fell from power, had gone no farther in concrete results than to create a naval college at Halifax and to purchase from the British government and to man two small warships.

During the election of 1911, M. Bourassa had assailed with great bitterness the policy of creating a Canadian navy as likely to drag Canada into imperialistic wars in which she had no vital interest. In the election, the Conservative party, though, in fact, imperialistic in spirit, had worked in a loose alliance with the anti-imperial Nationalists of Quebec. Conservatives had attacked Sir Wilfrid Laurier's naval policy but, unlike the Nationalists, on the ground that it aimed at too little rather than too much. When in power, with an adequate majority, the new Prime Minister, Sir Robert Borden, had to formulate his naval policy. To meet Nationalist demands, he rejected the naval policy of his rival, not on the ground that it was not needed but that it was inadequate. As a first step, and to show the earnestness and sincerity of Canada to give aid in the great crisis which he declared was near, he passed through the Canadian House of Commons in 1913 a measure providing for the immediate building, at a cost of about \$35,000,000, of three dreadnoughts to be placed at the disposal of the British government until such time as Canada should have a navy of her own. This would, he said, give time to mature an adequate naval policy while she would meanwhile be giving effective assistance in naval defense. After prolonged discussion the Senate of Canada, which still contained a Liberal majority, rejected the new naval bill. Before this impasse between the House of Commons and the Senate had ended, war broke out on 4 Aug. 1914, while Canada was still without any naval equipment that would count in the great struggle.

It may be that this helplessness in regard to effort on the sea made the Canadian people the more zealous to equip a great army when once they realized the issues raised by the war. At any rate the outbreak of war was met in Canada by astonishing resolution and enthusiasm, to take part in what the Canadian people believed to be a vital struggle for liberty. It is a mistake to say that the motive was chiefly to help Great Britain. Help to Great

Britain Canada was most ready to give, but Canada did not enter the war as a child coming to the help of a parent. It was in the spirit of partners in a great crusade that the Canadians wished to join English, Scotch, Irish, Australians and others in fighting side by side with the French and other allies. No doubt it was due to Canada's political tie with Great Britain that her people saw so quickly the issue involved. They had no suspicion of aggressive designs on the part of Great Britain and thus met with quick sympathy her resolve, after the invasion of Belgium, to declare war. On the nature, however, of the issue itself and not through any compulsion to follow Great Britain, Canada fought. It was certain that, in time, the people of the United States would view the war exactly as the Canadians viewed it.

The outbreak of war saw stirring days in Canada. The Minister of Militia and Defense, General Hughes, later Sir Sam Hughes, had great energy and force, though he was attacked by critics for rashness in words and for ill-considered, impulsive and arbitrary actions. In the end these attacks led to his retirement. In his support it must be said that he brought a fiery enthusiasm and energy to his task of making preparations for war. Under his direction a military camp was formed at Val Cartier, near Quebec. When the war broke out few realized the long, desperate struggle that lay ahead and the Canadian government planned to send to Europe only a single division of 20,000 men, fully equipped for war. So eager, however, were the volunteers for service that by 7 Sept. 1914, a month after the outbreak of war, Canada had under arms 43,000 men. On 3 Oct. 1914, there steamed out of Gaspé Basin on the lower Saint Lawrence, escorted by a formidable array of warships, the greatest force which, as yet, had ever crossed the Atlantic. On board were 33,000 Canadian soldiers, most of whom, two months earlier, had been civilians with little thought of ever taking part in war. At the moment when this fleet sailed, the Canadian government announced the recruiting of a second division and, by April 1915, the movement to Europe of this force began. At the end of 1915 Canada had more than 200,000 men under arms. By this time it was clear that there could be no reserve in regard to Canada's participation in the war and that she was committed to the full extent of her men and resources. By the end of 1917 she had sent 400,000 men over-seas and was raising an additional 100,000. At the time of writing she has four divisions in the fighting line, her casualties alone amount to many more than the total number of men in the four first divisions which she sent over seas, and a steady stream of new men is still flowing to Europe, together with another and sadder flow of thousands of wounded and disabled men back to Canada from the battle-front. If the United States is forced to take part in the war on the same scale, the republic will send to Europe six or seven million men. Australia and New Zealand have sent an even greater proportion of their manhood.

It was one thing to send men across the sea, another to train them so that they should be able to take a worthy place in the battle line in front of the disciplined battalions of a military nation like Germany. For a long time the professional soldier had been contemptuous

of civilian levies and the saying was often repeated that, for actual fighting, one trained soldier was worth more than a dozen of raw militiamen, with inexperienced officers, ignorant of war as a science. Remembering this, we can realize the anxiety, the fears and hopes, with which the unprofessional army was watched in Canada, when at last it reached the scene of war. The first Canadian division was sent to the front about Ypres, in Belgium, ground fought over the most bitterly, perhaps, of any part of the long front. On another front in the battle of Neuve Chapelle, 10 March 1915, Canadian artillery took part but not Canadian infantry.

The first great trial of Canadian arms was to come six weeks later. In April 1915, the resolve of the Germans was to force their way through to Calais and thus menace communications between England and France with greater effect than could be secured from Ostend, already for months in German possession. The Canadians were at a critical point on the line, in front of the villages of Saint Julien and Langemarck, near Ypres, in the defense against the advance of the German army to Calais. At about five o'clock in the afternoon of 22 April 1915, the Germans discharged poisonous gases, slowly carried by a favorable wind to the allied lines, and followed with an attack in great force. In the front line on the Canadian left were French regiments of Turcos and Zouaves. The deadly gas not unnaturally caused a panic among these troops and they fled to the rear in great disorder with the wild eyes and anguished, distorted faces of men who had breathed invisible death and were in terrible agony. With this support gone the Canadian left was "in the air." Had the Canadian line broken, it is altogether likely that the German divisions, numbering 150,000 men, could have pressed through to Calais with all the dire consequences to the allied cause which this would have involved. The Canadian line gave a little. The left was bent back so that the two fronts were almost at right angles. For two terrible days and nights, fighting in shell holes and behind any defenses which the ground provided, the small force held on until adequate relief came. The Canadians lost 6,000 men, about one-third of all the Canadians then on the front, but they had baffled the enemy designs. "It is not too much to say," wrote Sir John French, the commander-in-chief, "that the bearing and conduct of these splendid troops averted a disaster." At Festubert (9 May) and Givenchy (15 June) the Canadians had further hard fighting. The three battles formed a terrible ordeal for troops hitherto untried.

The battle of Saint Julien, the name now generally used, and those which immediately followed are momentous in the history of modern war. They showed that newly-levied forces of good mettle can, after six or eight months of training, hold their own against the fiercest onslaught of professional armies. Not only so, but the training in initiative learned in civilian life made such men specially resourceful fighters. It was the Canadians who first kept enemy nerves on edge by trench raids and they proved good bombers, woodsmen, roadmakers and generally handy men as need arose. As we have seen there had been

nervousness in Canada as to the bearing of troops on the battle-line who, officers and men alike, had been untrained civilians less than a year earlier. Saint Julien and the experience which followed relieved anxiety on this score and since that day Canadians, civilians and military alike, have had calm confidence in the capacity of the Canadian divisions at the front. During the first years of the war the chief command of the Canadian forces was held by an officer of the regular British army, at first General Alderson and later, from 9 May 1916, Gen. Sir Julian Byng. But at the time of writing the Canadians have been, since 19 June 1917, under the supreme command of Gen. Sir Arthur Currie, who, three and a half years ago, was a business man in the Canadian West. His success is one chief proof furnished by Canada of the rapidity with which, in conditions of war, the civilian soldier may become effective.

After the first trying test at Saint Julien, the Canadian army settled down to do its share in holding a part of the long line in France and Flanders. The three chief scenes of war in which the Canadian divisions took part were at Ypres; on the Somme, in the great offensive of the summer of 1916; and before Lens, chiefly in the fighting of 1917. In what is now known as the battle of Saint Eloi, on the Ypres line, beginning on 3 April 1916 and lasting many days, the Germans made a terrific concentration of artillery fire on the Canadians. There were three Canadian divisions in the line of battle. The hoped-for British advance did not succeed, in spite of local successes. The battle of Sanctuary Wood, in the same area, a terrible struggle, was fought in June 1916, and the Canadians held the ground after incurring fearful losses. The outstanding result of the long fighting was that the British continued to hold the Ypres salient upon which the Germans had concentrated their fiercest attacks. In September of that year the Canadian divisions were on the Somme where in many weeks of hard fighting their most conspicuous victory was at Courcellette. The Somme offensive was not the striking success which had been hoped for, but it was successful enough to cause a considerable German retirement in that region early in 1917.

While the Ypres salient will probably always be regarded as the chief battlefield for the Canadian troops during the war, the city of Lens is an objective for which they went through very hard fighting, after being withdrawn from the Somme. In the early spring of 1917 the British planned a great offensive and, by the fortune of war, the Canadian troops were in the hottest part of the attack. On 6 April 1917, the allied forces were cheered by the entrance of the United States into the war. Three days later, as if to celebrate it, they made the great attack at Vimy. Nearly 20,000 prisoners, 200 guns and some 300 machine guns fell to the British. The Canadians took part in the attack on the portion of the line called Vimy Ridge and captured 3,000 prisoners. It was then that Vimy became a great name in the military annals of Canada. The city of Toronto has undertaken, when the war is over, to restore the village of Vimy as a memorial of Canada's part in a striking military success.

By midsummer of 1917 the British had

fought their way to points close to Lens and then prepared for a new offensive in that region. This took place in the last days of October and early in November. The most striking feat of the Canadians in this offensive was the capture on 6 Nov. 1917 of the strongly defended village of Passchendalle. This furnished the dramatic close to the Canadian fighting of 1917, beyond which the present record does not go.

Before the close of the year 1917 the Canadian casualties amounted to about 6,000 officers and 124,000 men. A good many of the wounded returned to the fighting line, but the list of final losses in the Canadian army makes a grim record. Exact figures are not yet available, but by the end of 1917 the dead, including those killed in action, dead of wounds or disease, and missing and counted dead, amounted to some 2,000 officers and 38,000 men, a total of 40,000 men—numbers slight compared with the losses of the nations in Europe, but yet appalling. To such great losses indeed must be added those of wholly or partially disabled men of whom the number must be nearly as many.

In spite of such losses, the war has had a stimulating effect upon Canadian character and production. For the first time in the history of the world a great army from America has fought in Europe to redress that balance of the Old World which, a century ago, England redressed in the new, by coming to the support of the Monroe Doctrine. It marks an epoch in the history of mankind that Canadian divisions, to be followed in 1918 by divisions from the United States, should thus fight in Europe in a cause in which neither of them had any thought of direct gain beyond their own security. "Nothing in the history of the world has ever been known quite like it," said a distinguished French general. "My countrymen are fighting within 50 miles of Paris . . . But . . . the Canadians at Ypres fought with supreme and absolute devotion for what to many of them must have seemed simple abstractions; and that nation which will support for an abstraction the horrors of this war of all wars will ever hold the highest place in the records of human valor." Precisely the same spirit brought the United States into the war. Facility of communication has made the whole modern world a unit. The idealism of the western peoples is practical, for, to each of them, danger and security alike involve a world-wide range of forces.

Not less on the material than on the moral side has Canadian life been stimulated. Canada has supplied vast quantities of munitions for the allied armies fighting in Europe and the skill and enterprise of her industrial leaders have made marked advances. In spite of the drain of war upon her male population, agricultural production has been increased and Canada remains one of the chief exporters in the world of food supplies. The enhanced value of her commodities has been so great as almost to counterbalance the cost to her of the war. For the first time in history the Canadian government has secured huge loans from the masses of the Canadian people. For the first time also Canada has a heavy trade balance in her favor, due chiefly to the export of munitions. It is an unexpected result of war that this former

debtor state, borrowing large sums, has now become a creditor state financing great supplies of munitions for the Allies. See also *SINCE CONFEDERATION* (article 9).

The full story of Canada's part in the war has not yet been told. (For later details see *WAR, EUROPEAN*). The 'Canada Year-Book' published annually by the Minister of Trade and Commerce at Ottawa contains much statistical information. 'Canada in Flanders' by Sir M. H. Aitken, now Lord Beaverbrook (New York), is a semi-official account of Canada's part in the war. Two volumes have been published bringing the narrative to the end of 1916.

*Professor of History, University of Toronto.*

### 15a. CANADIAN WAR ECONOMICS.

In common with most commercial countries, Canada had enjoyed a period of remarkable expansion and prosperity, for at least 10 years previous to 1913. During this period her internal economic expansion and external trade increased in an exceptional ratio. This was chiefly due to the fact that Canada presented the largest remaining area of unoccupied lands and other virgin natural resources, under climatic and social conditions attractive to European and American settlers. With an influx of over 2,000,000 immigrants, accompanied by over \$1,000,000,000 of foreign capital, it was inevitable that values, even on the soundest basis, should very rapidly increase, and equally inevitable, under conditions of free individual investment, that speculative values should rise still higher. The growth of western towns and cities in particular, and some of the newer railroad developments, outran the adjoining agricultural developments on which, however, they must ultimately depend. When, therefore, the optimistic spirit of investment which pervaded the older countries had received a check in 1912-13, and the pendulum began to swing toward greater caution in investments, many Canadian enterprises were caught in an incomplete or relatively unproductive condition. The sudden arrest of a number of these undertakings not only checked general speculation, but brought about a rather severe reaction in the older industries dependent on the regions of special expansions. These in turn checked enterprise in many other lines of trade. In brief, a period of stagnation and readjustment had set in during 1913-14.

Such was the condition of Canada when the European War burst upon the world. Naturally the Canadian situation was not improved by the initial paralysis produced by the declaration of war, and the dislocation of international trade. Within a few months, however, the demand for men and equipment relieved the growing stagnation of the labor market and stimulated those industries and trading houses which were able to furnish the various lines of army equipment, or could most rapidly adapt themselves to the new and urgent demands occasioned by the war. The rapid enlistment of many thousands of men involved the employment of many others in furnishing sustenance, equipment and transportation. The Canadian forces when equipped were rapidly sent overseas. The government, for the first time in its history, undertook to bear the whole expense of equipping, trans-

porting and maintaining at the front its entire force. This involved very important consequences for Canadian trade and exchange, and, incidentally, for the statistics of import and export.

The expansion of Canada for the decade from 1903-13 having been accomplished very largely through foreign capital, practically the whole of this capital came to the country in the shape of goods, thus enormously increasing the imports. Since, however, only a limited number of immigrants were at first employed in meeting their own primary wants, the feeding, housing and general maintenance of a rapidly increasing population made great demands upon the agricultural and other products of the country which would otherwise have been sent abroad increasing the export returns. Thus the epoch of internal prosperity and expansion of 1903-13 was marked by rapidly increasing imports, without any corresponding increase in exports. For the fiscal year 1912-13, the excess of imports over exports amounted to \$298,750,000, on a total trade of \$1,095,000,000. The sudden arrest of imports through the falling off of foreign investment and the corresponding release for export of much Canadian produce formerly required in the country rapidly readjusted the balance of trade. Within two years, including the first eight months of the war, the adverse balance of imports had been reduced from \$298,000,000 to \$36,000,000. Thereafter the effect of the war became very evident. Supplies for the maintenance of the men abroad, and the war equipment sent to them, so far as produced in Canada now appeared as exports. On the other hand, such foreign supplies as they were furnished with in Europe did not appear as imports to Canada. Taking the latest returns available, we find that for the 12 months, ending November 1917, the Canadian exports exceeded the imports by over \$563,000,000 in a total trade of \$2,586,000,000. In point of percentage this slightly more than reverses the exceptional excess of imports over exports before the war. Nothing more directly illustrates the remarkable revolution in Canadian external trade in passing from a condition of domestic expansion, through immigration and foreign investment, to the participation in a world war requiring the export of all available resources for the supply of the Canadian army and the needs of the Allies.

The great volume of Canadian recent aggregate trade was due chiefly to three factors, in addition to the central one already indicated. The first and most obvious is the great increase in prices, the usual accompaniment of war conditions. Second is the fact that the munition and other industries connected with the war have required the import of large quantities of machinery, raw materials and partly manufactured goods, which enter into the production of the finished articles as finally exported. The other factor is the greatly increased import, during the past two years, of articles of use and luxury for home consumption, due to the exceptional prosperity and spending power of that large section of the community which has benefited financially by the operations of the war.

This last factor is a rather interesting and important one, not by any means confined to Canada; but, in conjunction with the other

forces, accounting for a very considerable element in the general increase in prices and the higher cost of living generally. As has been already pointed out, the first effect of the war was to aggravate the depression which the recent reaction from exceptional prosperity had produced, but the double demand for men, on the one hand to enlist for military service and on the other to furnish the supplies and services incidental to their participation in the war, led, before many months, to the absorption of all the efficient man-power of the country. The demand, however, being far from satisfied, not only did wages rise in all activities directly or indirectly connected with the war, but, to an increasing degree, other elements in the population, such as women and youths of both sexes, and elderly persons, found employment at hitherto unknown rates of remuneration. Thus, not only was the family income increased through its head, but often doubled and even trebled through the remunerative employment of several of its other members. Further, while over 400,000 men were taken overseas for military service, their families or those dependent on them were provided for by separation allowances, assigned pay and special contributions from the Patriotic Fund, while many of their relatives and dependents were among those who received extra employment, and, as was just and proper, in proportion to their qualifications, were given the preference in such employment. It goes without saying that those who were fortunate enough to control or have investments in munition industries, or other enterprises favorably affected by the war, receive as a rule profits and incomes much beyond what were customary, even in the days of expansion before the war. Some of these capitalists and merchants, it is true, have had to contribute various percentages of their gains through the war profits and income taxes, but the very volume of the taxes is an index of the exceptional revenue remaining with those who pay them.

It cannot be forgotten, however, that one considerable element in the community suffers more or less heavily from the war without any appreciable redress. This is made up of those living on fixed incomes or annuities, and certain professional or other salaries, which, for various reasons, have not been increased; also those furnishing services, or conducting various lines of business which have not been benefited by the war, but perhaps the reverse. Such persons, according to their previous social status, must meet the steady increase in the cost of living, and the many other calls upon their means without any offset. Their only resource is to continually curtail, as best they can, their former standard of living, while the majority of their neighbors are at the worst holding their own, but in most cases enlarging their expenditure.

With the government and its colossal expenditure, on the one hand, and hundreds of thousands of war-prosperous citizens on the other, competing for the products of agriculture and industry, it is inevitable that prices must soar, the volume of money and bank returns expand, and imports for domestic consumption increase not merely in value but also in quantity. Presuming that people indulge in luxuries only after the necessities of life are secured in suf-

ficient measure, and that even in the necessities they may pass from lower to higher grades of quality, the Canadian trade returns for the past two years indicate that not only does the prosperous element in the country completely offset those who are forced to curtail their former scale of living, but rolls up a large balance on the other side. It is true that only certain imports can be cited in proof of this situation, inasmuch as, in many lines, the quantity and value taken for domestic consumption cannot be separated from the quantity and value taken for manufacturing purposes, or for reshipment to the troops overseas. Thus, only for the past two years have passenger automobiles been separated, in the trade returns, from all forms of automobiles and motor trucks; hence only for that time can one safely determine to what extent the increased import represents commercial or war needs as distinguished from personal use and enjoyment. So in the tobacco imports, it is impossible to accurately distinguish between the increased consumption in the country by a considerably diminished male population and the amount which is sent overseas to soldiers at the front. We must also recognize that much of what goes to the soldiers at the front is not sent directly from Canada, but furnished from Britain and France or purchased at the canteens, from funds contributed for that purpose. In the case of many other articles, however, whether of ordinary supply or of pure luxury, what the trade returns show, alike in actual volume of goods and in the money values of these, is that the actual as well as the relative purchasing power of the people has very greatly increased during the war. A few typical articles may be mentioned, the increased import of which will serve to indicate this interesting economic effect of the war. Boots and shoes, gloves, hats, various fancy articles, furs, glass ware, phonographs, piano parts and musical instruments generally, cheap pictures, precious stones, carpets, shirts, stockings, especially silk stockings, underwear, cottons, lace, embroidery, knitted goods, silks of all kinds for personal wear, tweeds, passenger automobiles, etc. The last is a typical case. Leaving values out of account we find that for the eight months ending November 1915, the total number of automobiles, including freight and passenger automobiles and motor trucks, was 4,887. For the next two years, taking the same eight month periods, the numbers of passenger automobiles alone were for 1916, 8,491, and for 1917, 12,156.

Notwithstanding, however, the increased expenditure of the Canadian people as a whole, a sufficient surplus of funds has been available from their incomes to enable them to raise, without any serious difficulty, increasingly large domestic loans for the use of the government in the prosecution of the war. The following have been the special domestic war loans effected by the government; in November 1915, \$100,000,000, September 1916, \$100,000,000, March 1917, \$150,000,000, November 1917, \$400,000,000. Large additional amounts have been supplied to the government in the purchase of war certificates and in special loans. Most of the increased capital for war industries has been supplied from within the country, while the banks have aided in financing British and allied purchases in Canada. There are also the loans for

municipal and provincial purposes which have been largely taken up within the country.

As regards the direction of Canadian trade, it has been the good fortune of the country not to experience any appreciable dislocation of its normal trade connections since the outbreak of the war. Before the war nearly 90 per cent of Canada's export trade was with the two countries, Great Britain and the United States, and during the war that percentage has been practically maintained. Before the war 85 per cent of Canadian imports came from the same countries, and the only effect of the war has been to raise the percentage to a little over 90 per cent. At the same time, the details of the trade with these countries has naturally been considerably altered. There has been a very considerable diversion of the exports of Canada to Britain, and a corresponding transfer in the source of Canadian imports from Britain to the United States. When the war is over, therefore, we may expect very little change in the direction of nine-tenths of our world trade, beyond a readjustment of details as between Canada and her two chief trading allies. The loss of trade with the enemy countries has been of no material importance to Canada as a whole, though it naturally affected somewhat seriously a few trading houses.

As to the changes in the nature of the products called for owing to the war, it is to be observed that a veritable revolution has been wrought in one department of Canadian export, that of manufactures. Fifty-four million dollars represented the value of the export of the Canadian manufactures in 1913, increasing to \$69,000,000 for 1914, \$191,000,000 for 1915 and \$440,000,000 for 1916; while for eight months to November 1917, the amount was \$489,000,000. This of course represents munitions of war of all kinds and involves a correspondingly great increase in imports of materials and equipment which enter into their production. The usual allowance must of course be made for increased prices. Incidentally the prosperity of the munition industries and their subsidiary dependents indicates the difficulty of inducing labor and capital to turn, during the war at least, from these tempting fields of sure profits and high wages to the more uncertain realm of agriculture. At the same time the next largest export has been in agricultural products, which, though less in aggregate value than manufactures, indicates a larger actual return from the point of view of the trade balance, apart from individual profits. The increase in agricultural exports has been due more to the proportion of certain products sent abroad, and the high values attached, than to an actual increase in the agricultural production of the country, which naturally varies with the harvests. The great harvest of 1915 has not been since approached. The exported agricultural products, apart from animal products, increased from \$127,000,000 in 1914 to \$364,000,000 in 1916, and for the eight month period to November 1917, amounted to \$384,000,000. Next came animal products; increasing from \$68,000,000 in 1914, to \$117,000,000 in 1916, and \$124,000,000 for the eight months of the past year. The export of the products of the mine, the fisheries and the forest have not materially increased for the past couple of years.

Altogether a close survey of the economic

conditions in Canada, since the outbreak of the war, compels the general conclusion that, whatever reaction may require to be faced at the close of the war, whatever may be the subsequent effect of the great national debt which Canada in common with the other belligerent nations is piling up, and whatever readjustment may be necessary to meet the changed economic conditions and relationships of the outside world, the chief effect of the war up to 1918 has been to increase the prosperity of the Canadian people as a whole, to increase their command of ready money, and, in consequence, to raise, for large numbers at least, their physical standard of living.

Public Archives of Canada.*

## 16. DIPLOMATIC RELATIONS OF THE UNITED STATES WITH CANADA.

The long Anglo-American peace, beginning in 1783, broken only once by a short period of war, and reinaugurated in 1814 by the Treaty of Ghent, is the more remarkable and significant because it has been maintained across the longest international boundary in the world without costly fortifications or armaments, in a period of national youth and aggressive westward movement, and in the face of repeated friction and irritation arising from a long series of international problems—many of which were serious in their nature and difficult of solution or adjustment, sometimes even threatening actual collision. In the war of the Revolution and in the negotiations of peace at its close the United States hoped to obtain Canada, but in the end was able to get only the region north of the Ohio which had been annexed to Canada by the Quebec Act (q.v.) of 1774 and was regarded as necessary for the future growth and safety of the Union. Great Britain rather reluctantly agreed to the water boundary through the lakes. The Canadians objected to this line of boundary and especially to the amputation of the territory north of the Ohio which under American control might be subject to conditions injurious to the Canadian fur trade and export trade to the Indians. They also desired to exclude the United States from the Saint Lawrence and all tributaries by making the boundary at the height of land, or at least to limit the size of American vessels upon the lakes.

The early British trade policy in relation to the United States was largely determined by a desire to stimulate Canada to furnish the British West Indies with American products carried via the Saint Lawrence, thus reversing geographic conditions with a view of attaching Canada to Great Britain.

Canada's remaining hope to continue the control of the interior Indian trade received its first shock by the American organization of the Northwest Territory under the ordinance of 1787 and the consequent plans of future roads and river improvements.

Serious questions and complications confronted the new American government which was inaugurated under the new Federal constitution in 1789. The boundary was unmarked. Influenced by Canadian traders who urged that the boundary should have been established south of the lakes, the British government still held

the lake posts on American territory which it had agreed in 1783 to abandon without delay. British officers also seriously interrupted the fur trade of American citizens, by duties levied on American vessels and by the exclusion of American citizens from the navigation of the American side of the boundary waters, although at one time in 1790 Lord Dorchester suggested that the British government favored an alliance with the United States.

Washington, believing the retention of the posts prevented the possibility of securing a perfect tranquility of the Indians of the Northwest and fearing that the retention would result in retaliatory legislation against commercial relations with Great Britain, sent Jay to negotiate a treaty. This treaty provided for evacuation of the posts by 1796, freedom of intercourse and trade across the border and a commission to determine the boundary. In the United States this treaty was strongly opposed by certain citizens who advocated prevention of trade with Canada and were disappointed in failing to get egress of American vessels from the lakes to the Atlantic via the Saint Lawrence, and the prohibition of the importation of arms and warlike stores by way of the lakes.

The international boundary, although defined by the treaty of 1783, was not easily marked by the surveyors whose governments were not able to agree upon a starting point at the extreme eastern end of the line, and who encountered other difficulties all the way to the Lake of the Woods. Not until 1798, after 15 years of controversy, was the identity of the Saint Croix River determined, the agreement being reached through a joint commission as arranged by a provision of Jay's treaty, and this was the limit of progress made on the determination of the boundary before the War of 1812.

New sources of irritation on the lake frontier continued to arise. Canadians regarded the Louisiana Purchase as a step toward acquisition north of the lakes and, although they still attracted a large part of the Indian trade of the Northwest they induced the British government in 1807, in the negotiations of a treaty to replace the temporary provisions of the Jay treaty, to request an amendment which would admit their traders and the Hudson Bay Company to participation in the Indian trade of the Louisiana Purchase. By 1808, relations became much strained. Canadian traders asked redress for injuries resulting from exclusion from Louisiana, from American assessment of portage duties and from American interference with Canadian boats which had approached too near to particular American lake ports or shores.

Finally, the Indian troubles of 1811 aroused the American frontiersmen of the Northwest to demand the prevention of further relations between the Indians and the Canadian traders; and the lake frontier became the theatre of the principal military operations of the War of 1812, begun largely with the purpose of the conquest of Canada as a means of terminating British-American trade with the Northwest Indians and giving Americans control of trade on the lakes. See BOUNDARIES OF THE UNITED STATES.

One of the most important struggles in the

peace negotiations which resulted in the Treaty of Ghent was to secure the continuation of American rights upon the lakes, where the British sought exclusive control, and upon the adjacent southern shores where the British by an ultimatum sought to establish an Indian barrier against future American aggression upon Canada. The boundary remained as before the war. The part of Maine occupied by the British during the war was returned. See GHENT, TREATY OF.

Meantime, there was an increase of American trade across the northern boundary east of Lake Ontario which was not stopped by the Embargo Act of 1808 nor by the later war embargo by which the Madison government sought to prevent trade with the enemy. The Treaty of Ghent, without mention of the ostensible causes of the war, provided for arbitration of various matters in dispute. It contained a provision for the definite establishment of the exact boundary line by joint commission. In 1817, as a supplement to the peace, to prevent the danger of future collision and sources of misunderstanding from rival navies on the lakes, an agreement was negotiated providing for mutual disarmament on those waters, except four vessels on each side restricted as to size and duties. Although peace existed in fact, there were many unsettled questions, some of which naturally became more important and more serious by the changes of time — influenced not only by development at the East but by the extension of virile peoples westward to the Pacific. The meaning and import of certain words, used in the treaty of 1783, relating to boundaries were still unsettled and continued a source of dispute between the nations for nearly 30 years. There were also new sources of irritation resulting from the war, and from economic and political policies. Canada could not forget that the closed war was an expression of an American policy of territorial absorption which had long been apprehended by Canadian authorities.

Among the most important subjects of disagreement or possible sources of friction were the ownership of some comparatively worthless islands in Passamaquoddy Bay, the northern boundary of Maine, the boundary through the lakes, claims for slaves carried by British war vessels during the war, other general claims, the use of the fisheries, questions relating to commerce with the British West India Islands, the restitution of territory taken during the war and the Northwest boundary. To these were later added the border troubles along the Maine boundary, the border troubles along the Niagara frontier at the time of the *Caroline* affair, the case of McLeod, trade relations with Canada, the use of Canadian canals, the operations of Confederates from Canada during the American Civil War, the connection of Canada with the *Alabama* claims dispute, the San Juan boundary, new phases of the fisheries dispute relating to the Atlantic Coast, the Bering Sea seal fisheries, the Alaska boundary, the obstruction or diversion of boundary waterways and the persistent question of reciprocity in trade relations.

Commercial relations were unsatisfactory. Although Great Britain by government regulations until 1822 allowed the privilege of trade enjoyed by northern New York and Vermont

with Montreal and Quebec under the provisions of the Jay treaty which were extinguished by the war, she would make no new permanent agreement on the subject. She also refused to recognize the principle of the American claims to a natural right to navigate the Saint Lawrence to the sea. Fortunately the importance of the latter question was later diminished by the completion of canals which connected Lake Champlain and Lake Erie regions with the Hudson River, and thereby with the sea.

Commercial relations, as defined by the treaty of 1815, remained unsatisfactory until 1831 when the United States, after persistent efforts, obtained the privilege of trade with the British West Indies. Fishing rights were defined by a treaty of 1818 which also postponed a dangerous dispute by providing for joint occupation of distant Oregon until later provisions could be made for the adjustment of the boundary there. So, until new conditions produced the need of new adjustments, the people of each country fished together in the unsettled parts along Nova Scotia and hunted fur animals together in the unsettled territory bordering the Pacific Ocean north of the Columbia. At the same time the American claim to Oregon was reinforced by a provision of the Spanish (Florida) treaty of 1819, ratified in 1821, erecting the first international boundary line which touched the Pacific Ocean. The Passamaquoddy question was settled in 1817 by actual agreement of two commissioners, one selected by the King of England and the other by the President of the United States. The line of the northern boundary of the Louisiana Purchase was settled at the 49th parallel westward from the Lake of the Woods to the Rocky Mountains, in 1818. The boundary through Lakes Ontario, Erie and Huron was satisfactorily settled by two commissioners who met at Utica in 1822.

The claim for slaves carried away, referred after 1818 to the Emperor of Russia who made a compromise award, was later (1822) referred to four commissioners to determine the amount, and was finally terminated by the payment of a lump sum determined by the two governments.

The Northwest boundary question, the running of a line from the head of the Saint Croix along the highlands and the 45th parallel to its intersection with the Saint Lawrence, proved most difficult. In accord with the Treaty of Ghent it was submitted to a commission which toiled five years, 1816-21, only to reach a hopeless disagreement, the point selected for the "northwest angle of Nova Scotia" by differing opinions being 105 miles apart. By a subsequent convention of 1827 the question was referred to the King of the Netherlands, who in 1831 made a compromise decision which neither country would accept. By 1838, it reached an alarming stage in the Maine-New Brunswick controversy, coincident with the excitement of the Upper Canadian rebellion of 1837-38 and incidents resulting therefrom, including the dangers of lawless violations of American neutrality along the Niagara frontier illustrated by the case of the *Caroline* which for its unneutral service was seized on the American side of the Niagara by a small British expedition. Later, in 1840 it was further complicated by a new source of friction resulting from the

arrest of Alexander McLeod, a Canadian deputy sheriff who was arrested on the American side of the river and tried for arson and a murder which had occurred in connection with the seizure of the *Caroline*. The acquittal of McLeod, in 1841, terminated a serious source of international embarrassment and smoothed the way for the friendly conferences between Webster and Ashburton who both exerted the wisdom of diplomacy to maintain peaceful relations. Finally, in 1842, after three years of great activity in search for the Northeast boundary, accompanied by a display of vast ingenuity in treaty interpretation, topographical theories and cartographic controversy, the question was settled by the Webster-Ashburton treaty which each country regarded as a capitulation. British-Americans who were debarred by the treaty from the most direct and practical line of railway communication between Halifax and Quebec long continued to feel that their interests had been sacrificed to an exaggerated fear of breach with the United States. The State of Maine which mourned the loss of jurisdiction, and Massachusetts which mourned the loss of lands in the disputed area, each received a solace of \$150,000 from the United States government.

In 1846 the Oregon boundary question, which was an increasing source of dangerous tension between the two countries, was settled by the American acceptance of the British offer of the 49th parallel west of the Rockies, but reserving to the British-Americans all of Vancouver Island—a geographical exception which contained the germ of another boundary dispute which was settled in 1872. General claims of citizens of each country were submitted to arbitration by a convention of 1853, which provided two commissioners and an umpire or arbitrator chosen by the two. The commissioners in 1854-55 settled all claims successfully, and entirely satisfactorily to everybody except some who lost. It gave important decisions regarding fishery rights and rendered awards in the McLeod and Creole cases.

Meantime, for nearly a decade the conditions of international amity had steadily improved except in certain sections of the United States influenced by immigrants from Ireland who preached the antipathy aroused by O'Connell's agitation and subsequent Irish misfortunes.

From 1815 for nearly four decades, during which fishery and boundary questions were also prominent subjects of discussion, Canada persistently solicited commercial reciprocity with the United States. Finally, after the repeal of the English corn laws in 1846 and the repeal of the navigation laws in 1849, she expressed a growing sentiment in favor of closer relations, commercial and political; and many, both in England and America, seemed to consider that by her own consent she would ultimately be annexed to the United States. In 1850, certain Englishmen, interested in checking and diverting the trend of events, urged that the construction of Whitney's proposed railroad through the western part of the United States to the Pacific would result in the inevitable loss of Canada. In 1854, a reciprocity treaty was negotiated with the expectation that it would result in the gradual, quiet and peaceful settlement of the Canadian question by growth of close relations which possibly would develop

into annexation; but conditions were soon changed with the rise of a protective tariff movement in Canada, under leaders who after 1859 affirmed the right of Canada to regulate her own tariffs without interference from England. In 1866, the reciprocity treaty was terminated by notice of the United States, partly under the influence of a feeling of resentment originating in certain Confederate operations from Canada during the American Civil War.

In the meantime, new conditions on the Pacific and west of Lake Superior threatened to complicate Anglo-American relations and finally induced the British government and Upper Canada to take steps to secure confederation and consolidation of the British-American provinces in order to counteract the danger of American annexation of the West. The later American acquisition of Alaska, which was regarded as a counter movement against British-American consolidation, contributed much to stimulate a determined Anglo-Canadian policy to complete the scheme of confederation by including British Columbia and the northwest territory of the Hudson Bay Company, and by opening a trans-Canadian railway to the Pacific. The latter was conceived as a Canadian counter-movement to frustrate American influence in British Columbia. In 1869-70, Irish Fenians threatened to complicate international relations by plans to invade Canada. In spite of the proclamation of the President, they persisted until their collections of money were exhausted and their intoxicated sentiment was sobered by a dawning consciousness of the seriousness of their project. At the same time Senator Sumner, influenced by Cobden's views of 1849 in regard to closer relations between the United States and Canada and especially stimulated by the question of the *Alabama* claims and by the danger of Fenian disturbances which were excited by the proximity of the British flag, proposed to remove all causes of international dispute with Great Britain by the withdrawal of the British flag from all British America, but his views were not sustained by Secretary Fish and the Grant administration. The Treaty of Washington, negotiated after the United States dropped her flag-withdrawal proposal, was a great landmark in the adjustment of international questions. It submitted to arbitration three disputed questions: *Alabama* claims, the San Juan boundary and the Northeastern fisheries. It also contained several clauses which directly affected subsequent relations between Canada and the United States. It established agreements in regard to bonded transit, certain features of the coasting trade, the navigation of certain rivers and canals (including the Welland and Saint Clair flats canals) as roads of commerce, and the use of the Saint John River by American lumbermen. It recognized the Saint Lawrence as forever free, and gave to Canada the right to navigate Alaskan waters. It failed, however, to renew the principle of the reciprocity treaty, which was requested by the British-Canadians and declined by the Americans. Although there was a marked improvement of international feeling, various controversies continued to arise at different times. Canadians complained because they did not get the free use of certain State canals which they supposed they had secured by the treaty of 1871. When Canadian authorities protested,

the United States government replied that it had no control over State canals and could not compel States to act in the matter. Because in 1885 the United States refused to pass through the Sault Saint Marie Canal a Canadian vessel loaded with troops on their way to suppress the Riel rebellion, and because in 1892 President Harrison in order to retaliate for discriminating tolls on freights passed through this canal bound for Canadian ports, the Canadians were led to build a canal of their own on the other side of the river. Tariffs often ruffled the temper of the people on the border. Canada by various pilgrimages to Washington made persistent efforts to secure a renewal of the reciprocity treaty; but to these friendly advances the American government declined to respond with equal ardor, probably influenced largely in this policy of reserve by the fact that Canada possessed no treaty-making powers except through the British government. After 1873 the demand for protective duties became general among large classes of Canadian people. In the fall election of 1878 the protectionists were successful in Canada; and at the next session of the Dominion Parliament, a tariff was enacted. Since that time, both countries have found occasion to complain of new tariff bills. The American Congress placed duties on coal, lobsters, eggs, etc.; Canadian legislation excluded American cattle, and laid a retaliatory tax on lobster cans. Americans responded to Canadian retaliation by threatening to stop the transmission of goods in bond, and by new tariff provisions. New tariffs thereafter continued to be a source of more or less irritation. Incidentally, it may be stated that complications of threatening relations have often been largely the result of the necessity of indirect negotiations through the mother country, thus taking the feeling of responsibility from Canada who complains that her interests have been sacrificed by British diplomacy. A former Canadian official, summarizing the history of treaties affecting Canada, once said: "Like animals doomed to vivisection for the good of science, Canada has been unsparingly operated upon for the good of the Empire." In 1887, the right of Canada to negotiate her own commercial treaties with foreign powers was conceded by Great Britain by a provision that negotiation of such treaties should be conducted by the British Minister and the Canadian envoy acting together and with equal powers. In 1890, the Canadian Dominion government, by its protest to the British Colonial office, prevented the execution of the Blaine-Bond reciprocity treaty between the United States and Newfoundland, and proceeded first through the British Minister at Washington and later through Secretaries Foster and Blaine, to renew previous efforts to secure commercial reciprocity.

Some more recent questions may here be sketched very briefly. The Bering Sea controversy, arising in 1886, finally found a way for settlement by arbitration in 1893. There still remained several questions for international negotiations, including protection of fur seals, the fisheries, the Alaskan boundary, reciprocity, transit questions, alien labor laws, mining rights and naval armaments on the lakes. An attempt to settle these questions was made in 1898-99 through a joint high commis-

sion, of which Lord Herschell was chairman, consisting of six members from each country. Although it practically reached an agreement on several subjects it made little progress on others (including reciprocity) and finally split and suffered shipwreck on the Alaskan boundary on which the Canadian commissioners demanded a settlement before they would enter into any agreement on other questions. Some one, perhaps with facetious intent, has explained the failure of this commission in contrast with the success of that of 1871 by stating that the latter contained only one Canadian and four English statesmen, while the former contained only one English and four Canadian statesmen. But the action of the Dominion members concerning Alaska does not seem strange to one familiar with the history of American-Canadian relations in regard to boundaries—a source of almost constant discussion, punctuated by bitter contentions, for over a century. Fortunately, in the case of the Alaskan boundary a temporary adjustment was secured by a *modus vivendi* effected in 1899; and after long negotiations, the question was in 1903 submitted to the arbitration of a joint commission of six "impartial jurists of repute" (three Americans, one Englishman and two Canadians) who settled it by a decision which perhaps may be regarded as a reasonable compromise.

For several years, the North Atlantic Coast fisheries threatened to disturb friendly commercial relations. The fishery agreement of the Treaty of Washington was terminated in 1885 by the required notice given by the United States in 1883, thus restoring the conditions existing under the treaty of 1818, and soon resulting in Canadian enforcement of irritating restrictions on the fishing grounds. In 1888, a *modus vivendi* was reached by an international commission (of three Englishmen and three Americans). This *vivendi* was continued both by Canada and by Newfoundland until the question was settled by The Hague tribunal in 1910, although Premier Bond of Newfoundland proposed to abrogate it after the failure of the Hay-Bond treaty in 1905. The chief remaining obstacles to friendly relations between Canada and the United States have recently been removed. Additional security for the future was made by the negotiation and ratification of an arbitration treaty in 1908, 11 years after the Senate had refused to approve a similar treaty. This treaty provides, with some restrictions, that differences of legal character, or relating to treaty differences which cannot be settled by diplomacy, shall be referred to the permanent court of arbitration established at The Hague in 1899. The settlement of the various points at issue had a fortunate culmination in the recent settlement of the fishery dispute by The Hague award. In conformity with the provisions of the treaty of arbitration, a special agreement of 1909 was arranged with the concurrence of the governments of Canada and Newfoundland, submitting to The Hague court of arbitration any question relating to the fisheries of the North Atlantic coast arising under the Treaty of 1818. The board appointed to consider the case contained six members, of which one was the chief justice of Canada and another a justice of the United States Circuit Court of Appeals, acting with an Austrian, a Hollander and an Argentine. The result

seemed to satisfy both Canada and the United States, each of whom appeared to have won a victory.

Sources of future dispute have been lessened by a Waterways Treaty of 1909 which provides for the establishment of an international joint commission of the United States and Canada (a miniature Hague tribunal) consisting of six members (three appointed by each government) to exercise jurisdiction in cases involving the use, obstruction or diversion of boundary waters, and with authority to inquire and report on other matters of difference along the frontier or to decide upon such questions as may be referred to it.

The question of trade relations between Canada and the United States remains unsettled. The efforts of the United States to remove certain difficulties, arising from the passage of the Payne-Aldrich tariff bill of 1909 by the American Congress, resulted in the appointment of a commission and the negotiation of an agreement (January 1911) to secure restricted reciprocity by concurrent legislation at Washington and Ottawa. This agreement, which aimed at fuller and freer trade relations, and which after a sharp political struggle passed both houses of Congress, became the chief issue of a keenly fought campaign in Canada and was lost (September 1911) by the overwhelming defeat of the Liberal Laurier government which had held power for 15 years. The feeling of mutual respect and cordiality between the two countries has been strengthened by their conviction of common interest and by their practical co-operation to preserve the world peace against the attacks of Germany and her allies. See ALABAMA CLAIMS; ALASKA BOUNDARY COMMISSION; BERING SEA CONTROVERSY; BOUNDARIES OF THE UNITED STATES.

**17. PRIMARY EDUCATION.** Previous to 1867 there existed in Canada four provinces, practically independent of each other. These were Ontario, Quebec, Nova Scotia and Prince Edward Island. These provinces especially Ontario and Quebec, differed very greatly. Speaking generally the people in Quebec were of French origin and spoke the French language. They were nearly all Roman Catholics. In Ontario most of the people were of British descent. The English language was the ordinary medium of communication. The great majority were Protestants—Anglicans,

Presbyterians and Methodists being most numerous. When in 1867 confederation was effected, education was entrusted to each of the provinces, the Federal government merely retaining the right to introduce remedial legislation when rights or privileges of minorities were interfered with. Naturally, the systems worked out in each of the provinces differed in essential details—the governing bodies, the form of administration, the programs of studies and methods of instruction, varying to suit local conceptions.

Since 1867, five other provinces have joined confederation—New Brunswick, British Columbia, Manitoba, Saskatchewan and Alberta. These have in turn developed systems suited to their needs.

**Education Free.**—Generally speaking, primary education is free to all pupils of school age, that is, from 5 or 6 years to 18 or 21. In one of the provinces a fee may be charged, but this is merely nominal. In kindergarten schools and secondary schools, the payment of fees as supplementary to state, municipal, and district aid is sometimes permitted.

**Central Governing Bodies.**—In every case the system is administered by a central authority. In Prince Edward Island the board of education consists of the executive council, the principal of Prince of Wales College and Normal School, and the chief superintendent of education, the last-named officer being appointed by the lieutenant-governor in council. In New Brunswick the board of education consists of the lieutenant-governor, the executive council, the chancellor of the provincial university and the chief superintendent of education, who is appointed by the lieutenant-governor in council. In Nova Scotia the council of public instruction consists of members of the executive council, of whom five shall form a quorum, and the chief officer is a superintendent of education appointed by the lieutenant-governor in council. He is assisted by an advisory board of seven members, appointed by governor-in-council or elected by the teachers. In Quebec the council of public instruction consists of (1) the Roman Catholic bishops of the province, (2) an equal number of Roman Catholic laymen, (3) an equal number of Protestants. The last two classes are appointed by the lieutenant-governor in council. This council of public instruction is divided into two committees known as the Roman Catholic and the Protestant committee, each being concerned with the administration of schools of its own kind. The two committees may have associated with them persons chosen or elected because of expert knowledge. The practical administration of schools is carried on through a superintendent of education, who is appointed by the lieutenant-governor in council, and through two secretaries, one for each section of the council of public instruction. In Ontario the department of education consists of the executive council or a committee thereof, and the head of this department is known as the minister of education. The practical administration is conducted by a superintendent of education who is assisted by chosen specialists and specially qualified school inspectors. In Manitoba the executive council forms the department of education. One of the members of the executive council is known as the minister of education. Under his direction, a superintendent

of education and a body of specially chosen workers assist in the work of administration. An advisory board consisting of members chosen by the government, the inspectors and the teachers of the province, has authority in such practical matters as the framing of a program of studies, the certification of teachers, the authorization of textbooks.

In Saskatchewan and Alberta the form of government and administration is quite similar to that of Ontario. In British Columbia the council of public instruction is composed of the executive council, and the work under its direction is carried on by a superintendent of education. Recently steps have been taken looking toward closer co-operation among the four western provinces in all matters pertaining to elementary and secondary education and education of defectives.

**Local Self-Control.**—Though the governing bodies just mentioned regulate education as regards the organization, government, examination and inspection of schools, the certification and training of teachers, the authorization of textbooks and other matters of like importance, yet much power is given in most of the provinces to local school boards. Each district selects its own teacher, but must not take any one who has not a certificate to teach in the province. Within limits each district erects the building it considers most suitable under the circumstances and equips it as it may desire. There is wise supervision in matters of this kind to prevent undue expenditure and to guard against overcrowding of pupils, unsanitary conditions and lack of apparatus. In British Columbia the council of public instruction is supreme in all matters, virtually doing away with district control, except in the selection of teacher. In certain districts in Manitoba and Alberta the settlers are non-English and in some cases are not well enough acquainted with Canadian ways to organize and administer their own schools. A public trustee is appointed by the government to act in such cases, with the result that the schools and teachers' residences in these districts are fast becoming quite as good as any in the country.

**The Religious Difficulty.**—The constitution of the governing bodies in education indicates that there has been difficulty in establishing and administering school systems because of the conflicting religious beliefs of the people. A closer examination emphasizes this fact. In Quebec there are two systems of schools—one for Roman Catholics, one for Protestants. In Ontario there is a system of separate schools. In Manitoba, which until 1890 had Protestant schools and Roman Catholic schools, there is now but one system. There are in the province many schools conducted by religious communities. Some of these have regularly qualified teachers and are ranked as ordinary state schools, receiving a share of the legislative grant. In Winnipeg, and at other points, the Roman Catholic ratepayers support, at their own expense, an independent system of schools. In Alberta and Saskatchewan there is provision made for separate schools, but all schools follow the same program of studies, are under the same inspection and teachers must qualify in the same way. In Nova Scotia, British Columbia and Prince Edward Island the schools are strictly non-sectarian. The complaints

arising from changes made in the school acts, especially in Manitoba, have led to prolonged controversies and interesting court decisions.

**Religious Exercises and Religious Teaching.**—Closely connected with the separate school question is that of religious teaching and religious exercises. In British Columbia, schools must be conducted on strictly secular and non-sectarian principles. No religious dogma or creed shall be taught. The Lord's Prayer may be used in opening or closing school. No clergyman of any denomination shall be eligible for the position of superintendent, teacher or trustee. In Manitoba, schools may close with the reading of the Bible without comment and the recitation of the Lord's Prayer, and it is possible for clergymen or their appointee half an hour before closing to give religious teaching to those of their own denomination. In Ontario every public school shall be opened with the Lord's Prayer and closed with the reading of Scriptures and the Lord's Prayer, or the prayer authorized by the department of education. Teachers who have conscientious scruples in this matter may be relieved. Attendance during religious exercises is not compulsory. Religious teaching may be given by the clergy or their representatives after the regular hours of school. In Quebec, in the Roman Catholic schools, there is daily prayer and systematic daily instruction in the catechism. In Protestant schools the first half hour is devoted to prayer, Scripture reading, instruction in morals and Scripture history. No denominational teaching may be given. A conscience clause is operative. In New Brunswick the teacher may open and close the school by the reading of Scripture and by offering the Lord's Prayer. In Prince Edward Island the school is opened with Scripture reading, but no comment or explanation is permitted. In Nova Scotia the law is practically the same as for the last two provinces, local option being permitted. In Saskatchewan and Alberta the school may be opened by recitation of the Lord's Prayer. Religious instruction may be given during the last half hour of the day, but attendance is not compulsory for pupils.

**The Language Problem.**—There has been not a little difficulty with regard to the language employed as medium of instruction in the schools. In Quebec, both English and French are officially recognized. In Ontario the school act provides that English shall be the language of instruction, except where this is impossible

because of the pupil's unfamiliarity with the language. An attempt in 1912 and 1913 to make regulations covering this point led to a heated discussion. The famous "Ottawa case" was fought out in the courts. In Saskatchewan, Alberta and Nova Scotia those of French origin have special privileges, and in the first two provinces any language may be taught at the expense of the ratepayers concerned. But the medium of instruction in regular school hours is English. In Manitoba the Laurier-Greenway compromise made it possible, in any school where 10 or more pupils speaking any language were enrolled, for the parents to demand teaching in that language. This gave rise to what were known as bi-lingual schools with bi-lingual teachers. In some districts teaching in as many as four different languages could have been asked for, and in several schools teaching in three languages was demanded. In 1916 the school act was amended so as to do away with bi-lingualism as a system. English must now be the medium of instruction in all state-aided schools. This would not prevent French, German and other languages from appearing on the program of studies for elementary schools as they now are found on the high school curriculum.

**The Support of Schools.**—The schools of the Dominion are maintained by a fund drawn from three sources—a state fund, a municipal or county fund and a fund yielded from district assessment. The government aid is distributed in different ways. In Prince Edward Island and New Brunswick the grant depends upon the sex and the grade of certificate of the teacher. In Nova Scotia it depends upon grade of certificate and the number of days school is open. In Quebec the sum depends upon the population of the district, and in Ontario it is divided among the counties, townships, cities, and towns in a similar manner, special grants recognizing the grade of teachers' certificates and length of experience, and grants to rural schools recognizing school accommodation, equipment, teachers' certificates and experience and the municipal aid rendered the school. In Manitoba a definite sum depending upon the total grant available is given to each school open the full year, and a proportionate sum to schools open for less time. In Saskatchewan and Alberta the grant depends upon the size of the district, the number of days school has been kept open, the grade of certificate held by the teacher, and the percentage of attendance. In

British Columbia the government meets practically all the expense of education except in the case of cities. Here a per capita grant is given, the smaller towns getting a higher rate than the larger cities. In Manitoba, Saskatchewan and Alberta no less than one-eighteenth of the whole land is set aside for school purposes.

**The Salaries of Teachers.**—In the older provinces, when free schools were introduced and districts began to be formed, it was natural that every settler should wish to be near the schoolhouse. This led to small school districts. When the burden of supporting the small district fell upon the small district there was a tendency to reduce the salary of the teacher to the lowest amount possible. The result has been most unhappy. In spite of excellent provision for the instruction and training of teachers it is now sometimes impossible to get as many who are fully qualified for their work as there are schools; and the male members of the profession are becoming fewer every year. This is particularly true in those communities where there is great industrial activity and consequent openings for men. Relief can come about in only two ways: (1) There must be an increase of legislative aid; (2) there must be increased local support. The former is probably an impossibility in some of the provinces because of the limited resources; the latter will come only as a matter of education. No people are in a better condition financially than the Canadian farmers. The burdens of taxation are comparatively light. Yet the salaries paid to teachers are very meagre. In Prince Edward Island the average salaries in 1910 ran from \$146 to \$289 for women, and \$201 to \$487 for men. In Nova Scotia the salaries vary from \$562 for male teachers of the "B" grade and \$358 for female teachers of the same grade, to \$222 for males of "D" grade and \$198 for females of the same grade. In Ontario the salaries average \$711 for males and \$483 for females. In Manitoba the average for all is \$628—an increase of \$134 since 1902. In the new Province of Saskatchewan the rate in 1910 was \$1,052 for males and \$730 for females holding first-class certificates. In Alberta the similar average was \$1,092 and \$749 respectively.

Wherever salaries are small two things are noticeable: (1) The percentage of female teachers is large; (2) the percentage of trained teachers is small. In Saskatchewan very few of the teachers are untrained; in Manitoba conditions are almost equally satisfactory. In Nova Scotia about 43 per cent of the teachers have taken normal training. In New Brunswick where salaries are small less than 20 per cent of the teachers are men; in Nova Scotia about 18 per cent; in Ontario 24 per cent; in Manitoba 30 per cent; in Saskatchewan about 43 per cent. In the older provinces teachers' pension schemes are in operation and other provinces are considering the matter. The city of Winnipeg has worked out a very satisfactory schedule.

**Training of Teachers.**—The training of teachers is something to which all the provinces have given much attention, though the system followed is not uniform throughout. In Ontario and the four western provinces, the course was designed to be purely professional based on academic preparation in the high schools or

university. It has not been found possible to adhere to this intention as there are always some branches in which academic instruction has to be given, such as history, geography, the school arts and the newer subjects on the elementary school program. In the eastern provinces the tendency is to combine academic and professional instruction as in American Normal schools. (See **TEACHERS, PROFESSIONAL TRAINING OF; SCHOOLS, COUNTY TRAINING**). In some of the provinces a short course of training followed by actual school room experience of a year or two, precedes the longer and more philosophic training. The fact that all certificates are granted by provincial rather than local authorities does much to elevate the standard of the profession.

**Teachers' Institutes.**—The work of the normal schools is supplemented by teachers' institutes which are of two kinds, (1) Those arranged for and carried on under the direction of the department of education; (2) those which are purely voluntary on the part of the teachers. These institutes do much toward developing a professional spirit, toward bringing teachers into touch with educational progress in other lands, and toward bringing school and home into closer relationship. The most important gatherings are the provincial conventions held each Easter. An attempt to hold a Dominion educational association has not met with marked success. Either the territory is too great or provincialism is too marked. Yet such an association could have great value. Such an association and a national bureau of education are two things that have yet to be worked out in Canada.

**School Inspection.**—In all provinces inspectors appointed or approved by the departments of education report on the conditions of the schools, not only to the central authorities but to the local school boards. In the cities superintendents are employed, and in some of the provinces their reports are accepted by the department of education. The inspectors or superintendents have to be professionally qualified in order to serve. In Canada the machinery of politics is not permitted to control school appointments.

**School Libraries.**—It is recognized throughout Canada that school libraries are a necessity in education. In most of the provinces grants are made to supplement the grants of trustees. The newer provinces have made the most complete provision by making it compulsory for trustees to spend annually a portion of the regular grant in the purchase of books for library purposes.

**Coeducation.**—A distinctive feature of Canadian elementary schools is the coeducation of the sexes. There are exceptions to this rule in Quebec and in a few leading cities of the other provinces. In all rural communities coeducation must continue to be the practice, and it is doubtful whether there will be any departure from customary procedure in cities and towns. The results morally and intellectually under present conditions seem as satisfactory as in lands where separation of the sexes is considered a necessity.

**Consolidation of Schools.**—In most of the provinces the School Act makes provision for consolidation of schools, but in Manitoba alone has the legislation been followed by consider-

able action. There are about 50 consolidated schools in operation, one operating in a school district of 120 square miles. The children prefer driving seven or eight miles to walking three miles. The idea is gradually gaining ground that it is easier and better to convey the children to the schools, than to bring the schools merely within walking distance of the homes. Consolidation can not include all the schools of a province. The little district school will always exist, but the influence of a neighboring consolidated school with its higher organization and better equipment will always urge to greater efficiency.

**Compulsory Education.**—In all the provinces with one exception education is compulsory. The acts are now enforced more rigidly than ever before. The openings in commercial and industrial life tempt young people to leave school early; some parents, particularly immigrants, are careless; and in many cases the distances from home to school are very great. Nevertheless the "percentage of attendance" is increasing from year to year, there are very few native born who cannot read and write and the incoming settlers are becoming more and more anxious to give their children the advantage of a school education.

**Courses of Study.**—The course of study pursued in the various provinces does not differ very greatly from that followed in other civilized lands, though emphasis may not be placed on the same subjects. Though direct moral instruction is not systematically given in all the provinces, it is doubtful if anything could be more salutary than the influence of the schools. The high moral standing of the average Canadian citizen must be attributed in a measure to the faithful labor and supervision of the public school teacher. In addition to the study of the five central subjects,—language, literature, mathematics, geography and history,—emphasis has of late been given to manual training (q.v.), and nature study (q.v.). The former branch received prominent notice owing to the liberality of one of Canada's most worthy citizens—Sir William MacDonal. The work in nature study is carried on successfully in several of the provinces and with excellent results. In the cities and towns particularly music and drawing are taught. The play impulse is recognized in the games of the school. In these the teacher frequently takes a prominent part. Many of them at summer schools and on school playgrounds have become acquainted with the method of organized play, and are capable of exercising skilled leadership. In most of the provinces provision is made for medical inspection of schools, not only in the cities but in rural districts. Physical training usually according to the syllabus of the Strathcona Trust is given in all the provinces. Cadet companies are numerous especially in Ontario. Instruction in hygiene is compulsory. The temperance wave in the Dominion is said to be owing in part to the teaching given in the schools in the use of alcoholic beverages. A great interest is being taken in rural schools in school-gardening and elementary agriculture, and this interest is on the increase. Vocational education is not attempted below the high school, unless the domestic science, sewing and manual training, given in the senior grades of the elementary school, be counted as such.

It is generally recognized in elementary schools that the method of study, and the mental attitude developed in pupils, are of as much importance as the facts learned. The power for self-direction developed in Canadian youth, is amply proven by the behavior of manhood. The method of classification even in the large city schools, does not appear to have crushed out the individuality of the pupils. It may have removed idiosyncrasies, but it has still left power for independent action. The ideal of school government in Canada, though not fully realized in many cases, is that of a kindly authority which induces power of self-control. In this, the temper of the Canadian people is expressed. However, in the home as well as in the school, well-meant liberty often develops into license. Intelligence, right habits of thought, and good morals are often noted where manners and good taste are in a marked degree lacking. Yet on the whole the type of life represented in Canadian elementary schools is of a very high order.

Canada may be considered the land of the common school. With the one unfortunate exception already noted, there is nothing in the public school system which recognizes class, race or creed. The school is the most potent agency for unifying the diverse elements of the population. See articles in this series **SECONDARY EDUCATION**; **HIGHER EDUCATION**; **CATHOLIC EDUCATION**; **PUBLIC EDUCATION**. See also the section *Education* in the articles on the different provinces.

W. A. McINTYRE,

*Normal School, Winnipeg.*

**18. SECONDARY EDUCATION.** The public high schools of the English-speaking provinces have been modeled more or less upon those of Ontario, which was the first (1844) to organize a system of public instruction. As a result, there is a very general similarity amongst them. Quebec, however, which is largely French and Roman Catholic, with an English-speaking Protestant minority, has organized its high, as well as its elementary schools, in accordance with its exceptional conditions.

Secondary education in Canada is provided for in three main classes of schools which are well distributed geographically and are known sometimes by different names in the different provinces:

(1) Public high schools, in which secondary education alone is provided for. A few take up also the first year or the first and the second year work of the universities. Besides the day high schools, night and summer schools are provided generally.

(2) Public high school grades in connection with the elementary schools, known sometimes as construction, superior or intermediate schools. A few of such grades are as good as the smaller high schools, and often gradually develop into separate institutions.

(3) A small number of private secondary schools. These have usually elementary grades attached and occasionally do the work of the earlier years of the universities. Their fewness is due chiefly to the efficiency of the public systems, which were organized early in the history of most of the provinces. As, however, the wealth increases, more of such schools are established, but they are now, and will likely con-

tinue to be, comparatively unimportant factors in the education of the Dominion.

The public high schools differ markedly from those of the United States in being organized into one system in each province and in being controlled and supported by the province as well as by the locality. The causes which thus tend to uniformity in the individual systems have in most been reinforced by uniform examinations of the different grades, conducted by the central authority. The state-control is exercised by a minister of education, who is a member of the provincial Cabinet, or by a superintendent of education, responsible to the Cabinet, or by both. Sometimes such controlling officers have associated with them an advisory council, variously constituted, with more or less important powers. The functions of the state are legislative and general. Subject to this oversight, which is exercised both directly and through government inspectors and which prescribes textbooks, courses of study and school regulations, local boards of trustees or commissioners have complete control, appointing the teachers and managing the finances. The boards are thus able to deal with local conditions, while the state connection has secured a measure of uniformity and general efficiency of courses and standards. The state contributes often very liberally to the support of the public high schools, the expense of establishment and the rest of the expense of maintenance being provided for by local taxes imposed by the municipality or district in which the school is situated, and, with few exceptions, by the county. Sometimes small fees are charged, but the general tendency is towards free schools.

The private schools are generally proprietary and of denominational origin; and, as a result, nearly all of them are under denominational control. Although affected in their courses and organization by the denominating public systems, they have no connection with the state, except in the case of a few which are affiliated with state universities, or of some Quebec schools which are subsidized under certain conditions. Except also in Quebec, the public high schools are open to and attended by all denominations. The private schools, on the other hand, are usually sectarian, but the religious training given in most of the Protestant schools is such that they are patronized by the adherents of other churches than those with which they are connected.

All the secondary schools have more or less extended curricula, corresponding to those of the United States high schools; but, as there, the entrance and the leaving standards vary according to the system of organization, the efficiency of the elementary schools, the requirements of the universities, and the wealth and population of the different provinces. The Ontario secondary schools are the best developed and the most efficient, being, as regards standard, on a par with the best in the United States. Besides providing a general education, the Canadian secondary schools prepare for university matriculation, for commercial pursuits, for teachers' academic certificates and some of them for industrial and technical occupations. In one important and far-reaching respect they differ from the high schools of the United States: their teachers must all hold certificates

of academic and professional competency, authorized by the respective State Departments of Education, and varying somewhat in standard and character according to the conditions of the system. Such teachers are usually obliged to attend professional schools. Ontario, however, is exceptional in providing for the professional training of its first class public school and high school teachers in two faculties of education: (1) in the University of Toronto (provincial), (2) and the other in Queen's University, Kingston. Both of these faculties receive provincial aid on condition that they provide courses approved by the Department of Education. In the other provinces the normal schools provide the general professional training for all grades.

Following are additional details in regard to each of the provinces:

**Ontario.**—The special secondary schools in Ontario are of two classes, high schools and collegiate institutes. The teachers are of two classes: those with ordinary certificates and those with specialists' certificates, each of the latter having taken an advanced course in his department. The principal of a high school or collegiate institute must be a graduate in arts of a university in the British dominions. The staff of a collegiate institute must consist of specialists with honor university degrees in classics, mathematics, moderns and history (including English), and science, and specialists in art and physical culture; and, where the optional subjects, agriculture, household science and the commercial subjects are taken up, with specialists in these departments also. The staffs of the high schools may consist of teachers with ordinary certificates, but many of them are specialists. Some of the collegiate institutes have as many as 35 teachers and only a few of the high schools have not more than two. Both classes of schools must have good accommodations with a minimum equipment of \$750 for a high school with two or three teachers; \$1,125 for one with four or more teachers; and \$1,675 for a collegiate institute. A collegiate institute must have, and a high school may have, a gymnasium, for which the former may receive a maximum grant of \$96 a year and the latter of \$48.

A high school may be established by a county or a city municipal council with the approval of the minister of education, and such establishment entitles it to a maximum grant of from about \$600 to \$1,300, according to the grade of the schools, as well as proper maintenance by the county or the municipality in which it is situated. After providing for a minimum grant for each school, the rest of the legislative grant is distributed on the bases of the value of the equipment, the amount of the teachers' salaries, and the character of the accommodations, a system of apportionment which has been adopted generally and which has greatly stimulated local expenditures and has done much to secure the efficiency of the schools.

Some of the boards of high school trustees are separate from those of the public schools and others, called boards of education, have charge of both classes of schools as in the United States. In constitution, however, they are peculiar in containing a representative of the (Roman Catholic) separate elementary schools, if there should be any such school in a municipi-

pality (the large city of Toronto has two such representatives).

Besides the separately established high schools, there are in connection with the elementary schools, in localities which cannot maintain a high school, continuation schools which also do high school work of a character sometimes as good and as comprehensive as is done in many of the high schools. Continuation schools may be established with the approval of the Minister of Education by a public or a separate school board or by a union of such boards under conditions which ensure their proper maintenance. Of these schools, there are three grades: Grade A with three teachers, grade B with two, and grade C with one; of these, the grade B schools are the most numerous. The teachers of grade A schools must have the same qualifications as the teachers of high schools; those of grades B and C must hold at least first class public school certificates, many, however, being university graduates. The legislative grants to these schools are proportionately even more generous than those to the high schools, and as, being situated in the rural districts, they commend themselves strongly to the county councils, the support from this source is often proportionately larger than in the case of the high schools.

Pupils pass from the fourth grade of the elementary schools, called public or (Roman Catholic) separate schools (ages 12 to 14 or 15), into the secondary schools on uniform examination papers set by the department of education, the answers to which are read and valued by local boards. Permission, however, is granted to boards to set their own papers or to accept under certain conditions the promotion examinations of the elementary school staffs. The standard of entrance into the secondary schools in Ontario is at least as high as that of the best high schools of the United States.

A number of years ago, the department of education held uniform leaving examinations at the end of the courses of each main division of the secondary schools. As a consequence, however, of the evils associated with so much uniformity, these examinations have been discontinued and the department itself holds only those that are necessary for teachers' certificates. It continues, however, to conduct through a matriculation board, representing the universities of the province, the uniform matriculation examination prescribed by these universities.

The following statistics set forth the general condition of the high and continuation schools: Total number of high schools (1918), 162, of which 47 are collegiate institutes and 76 are free. Number of teachers, 1,051, of whom 763 are university graduates, and 507 hold honor degrees or the equivalent. Highest salary, \$3,500; average for principals, \$1,884; for assistants, \$1,412. Number of pupils, 28,833 (1917). Total amount expended during the year 1916, \$2,488,254, of which \$1,509,227 was for the salaries of teachers. Cost per pupil (on average attendance), \$109.22. Total number of continuation schools (1918), 137, with 241 teachers, of whom 77 are university graduates. Highest salary, \$2,000; average for principals, \$1,117; for assistants, \$778; total number of pupils, 5,082 (1917). Total amount expended for continua-

tion schools in 1916, \$306,148; of which sum \$224,464 was expended for teachers' salaries. Cost per pupil (on average attendance), \$82.09.

The public secondary school system is so efficient and so popular with all classes that there are only a few private schools. Of these the chief is Upper Canada College (which, however, is only semi-private), an old historic residential and day school at one time under government control, but now under a board of governors partly nominated and partly elected by the "Old Boys," the state connection being maintained through the Minister of Education, who is an ex-officio member. This college has still a small endowment, but is supported chiefly by fees. It does general and university matriculation work for boys, and is attended by pupils from all parts of the Dominion and even from the United States. Besides colleges for young women, some of which take up the same courses as the high schools, there are a few other colleges for boys, doing general work and that for university matriculation. Of these, the most important are Saint Andrew's College, Toronto; Bishop Ridley College, Saint Catharines; Trinity College, Port Hope, and the De La Salle Institute, near Toronto. A few also have mixed classes, the chief being Albert College, Belleville, at one time a university, but now affiliated with the University of Toronto (q.v.), which provides courses of various kinds and grades, as far as the end of the university work of the first year. With very few exceptions, all the private schools are connected with religious denominations.

The courses of study are the same for the different grades of public secondary schools: the general courses, the courses for admission to the professional schools for teachers, and the courses for matriculation into the universities. The evolution of the content of the general courses during the last 10 years has proceeded on modern lines; vocational and prevocational courses have been duly provided in connection with the high and continuation schools and in separate establishments.

There are 86 manual training centres and 84 household science centres attended by 14,130 boys and 13,552 girls from the fourth grade (seventh and eighth years) of the public schools and the first two years of the high schools. These centres are well equipped and liberal grants are made by the Department of Education on the usual bases: salaries, equipment, accommodations, with minimum fixed grants. In 1915 the total amount of the legislative grant was \$30,200. In 1913 agriculture was introduced into the secondary schools as an optional course covering two or four years. At present 21 schools carry on the work, most of them, however, attempting only the two years' course. These schools also are generously aided by both the Dominion and the Ontario Government.

The Industrial Act of 1911 provides for a system of industrial and technical schools with courses as follows: Day schools: General industrial schools for subjects basal in the trades; special industrial schools for particular trades; technical high schools and high school courses; part time co-operative industrial courses for apprentices; schools for instruction in the fine arts. Evening schools for day workmen and workwomen.

The day and evening schools are liberally supported by legislative grants apportioned on the usual bases; the maximum grant on salaries for day schools being \$5,000 and for night schools \$3,000; on equipment for day schools, \$2,000, and for night schools, \$1,000. The maximum grant for co-operative classes is \$875. The total attendance at the industrial and technical schools in 1917 was 16,668. In some urban centres large sums are expended on capital account; for example, at Hamilton a site for a new technical school has been bought at a cost of \$75,000; Toronto recently opened a new technical school costing at least \$2,000,000, and London has a new building for a technical school costing \$250,000.

The day technical departments of the high schools adapt the ordinary courses to the vocational needs of the communities. At Haileybury, a mining centre, for example, the high school has a mining department in which, since its opening in 1910, 104 boys have been enrolled. And some of the technical schools have already courses nearly as comprehensive as those of the best schools in the United States.

The agricultural, commercial, and industrial and technical schools and classes are managed by advisory committees consisting of representatives of the high school and collegiate institute boards and an equal number of persons engaged in industrial pursuits approved by said boards. The advisory committees may also co-opt persons engaged in such pursuits who are not members of the school board. The proposals of such committees, however, are subject to the approval of the school boards concerned.

**Quebec.**—Secondary education in Quebec is organized on somewhat different lines from those followed in the other provinces. The Roman Catholic Committee of the Council of Public Instruction names the three chief kinds of public schools, respectively the "primary elementary," "primary intermediate" or model, and the "primary superior" or academy. There are four years of work in the elementary schools, two in the model schools and two in the academies. The model schools and academies frequently teach also some of the lower grades. The majority of the Catholic model schools and academies are French, the others being English. Secondary education proper is that of the classical colleges.

There are three kinds of Protestant schools, namely, elementary, model, and academy, some of the last mentioned being designated "high schools." Beginning in the year 1915-16 the Protestant Committee adopted a new classification of the grades as well as a new course of study. There are 11 grades, numbered from 1 to 11. The elementary schools teach the first seven grades, the model schools the first nine and the academies the whole 11 grades. Successful examination at the end of grade 10 admits to the Macdonald School for Teachers, for the elementary diploma course, and at the end of grade 11 to the model diploma course in the same institution. Grade 11 also affords matriculation to McGill and Bishop's universities. The principals of the chief Protestant academies are men. The Protestant model schools are practically "intermediate" schools. The academies are secondary schools proper, although including all the earlier grades.

Summarized statistics, 1915-16: Catholic

model schools, 680; Catholic academies, 308; Catholic classical colleges, 21. Pupils in Catholic model schools, 108,475, of which 239 were Protestants. Pupils in Catholic academies, 83,227, of whom 339 were Protestants. Total of lay teachers in Catholic model schools and academies, 1,315. Total of religious teachers, 5,388. Protestant model schools, 58; Protestant academies, 41. Pupils in Protestant model schools, 5,416, of whom 334 were Roman Catholic. Pupils in Protestant academies, 12,038, of whom 356 were Roman Catholics. Total of teachers in Protestant model schools and academies, 602; of these 66 are without diploma, but in nearly every case the teacher is merely an instructor in physical drill, etc.

The courses of study in all schools are prepared by the Catholic or the Protestant committee, as the case may be, but the general school law of the province makes drawing and agriculture compulsory in all schools. Both of these subjects are extensively taught, and there is a director of drawing for the Catholic schools. An extensive program in household science has been carried out for several years now in some of the Catholic normal schools (Ecoles Normales Menageres), and the subject receives much attention in the convent schools. Manual training is practically confined to the Montreal schools. The Protestant school board of that city maintains also a large commercial and technical high school, at which the yearly attendance averages about 1,600. The technical schools proper of the province, the large ones at Montreal and Quebec particularly, come under the supervision of the provincial secretary, not under that of the Department of Public Instruction. The attendance at these two institutions is not yet as satisfactory as the splendid equipment and the qualifications of the staffs call for: the school at Montreal cost \$636,187; that at Quebec \$405,359. The Polytechnic School of Montreal, which has been in existence many years and which gives courses in engineering, architecture and the industrial arts, had an attendance of 140 in 1916-17. The teaching of agriculture in the Protestant and Catholic superior schools has received considerable impetus of late from the aid given by the county demonstrators (graduates of Macdonald College, Sainte Anne de la Pocatiere and Oka) in the form of lectures. In 1910 the Ecole des Hautes Etudes Commerciales (School of Commercial Higher Studies) was opened in Montreal. It is now affiliated with Laval University (q.v.). All the classical colleges are affiliated with Laval University and give the university courses in arts and science; and their students take university examinations, and receive the university degrees.

**Manitoba.**—The terms, intermediate schools, high school, collegiate department, collegiate institute and technical high school are used in Manitoba to denote secondary schools. Intermediate schools are secondary departments of graded schools, the principal devoting his whole time to secondary school work. High schools have two, collegiate departments three and collegiate institutes four or more teachers engaged exclusively in secondary school work. There were (1917) 72 intermediate schools, 23 high schools, 4 collegiate departments, 7 collegiate institutes and 2 technical high schools. The whole number of teachers in high and

collegiate schools was 173, which with the 72 teachers in the intermediate schools gives a total of 245. In the intermediate schools there were, in 1916-17, 6,294 students of high school grade, of whom 4,096 were enrolled in high and collegiate schools and 2,198 in intermediate schools and the upper grades of rural elementary schools.

The secondary school program covers three years and includes several courses. The intermediate schools invariably give the course for teachers' certificates and occasionally that for university matriculation. In the high schools the student can pursue the teachers' course, the university matriculation course or a "combined" course, which admits to the university and to the normal school. In some of the larger collegiate schools a commercial course of two years is given in addition to the preceding. In certain rural centres a course is given in agriculture.

Special grants are paid by the Department of Education as follows: Intermediate schools, \$200; high schools, \$300 fixed grant, \$8 per annum per capita grant and \$50 for apparatus and library; collegiate departments, \$450 along with per capita, library and laboratory grants; collegiate institutes, special grants to the amount of \$1,600 in all in addition to capitation grant of \$5 per pupil.

Principals of intermediate and high schools must hold first class certificates; principals of collegiate schools must in addition be university graduates; professional certificates are required in all cases.

The Winnipeg technical high schools, which cost over half a million each, were opened in 1912. So far as their day school work is concerned these are really manual training high schools, but as evening schools they are continuation schools for adult pupils along industrial and technical lines. Household science, art and physical culture are taught in both the day and the evening classes. In the day school there is a special course for girls, known as the practical arts course, which contains a maximum of work in household science and household arts and which leads to the normal schools. The percentages in the different courses in 1917 were as follows: Teachers' course, 20 per cent; university course, 19 per cent; combined course, 37 per cent; commercial course, 10 per cent; boys' technical, 4 per cent, and girls' practical arts, 8 per cent. The special work in household science and manual training is provided for students in the Collegiate Institute at Brandon and at Stonewall. The manual work of the technical schools of Winnipeg is recognized in the requirements for matriculation to the engineering course of the university, and it is probable that some allowance will be made for it in the other matriculation courses also.

**Prince Edward Island.**—There are no high schools proper in Prince Edward Island, but provision for the work has been made in about 29 schools with high school departments, in 32 graded schools and in some of the best conducted primary schools. In these grades about 500 pupils are prepared for entrance into Prince of Wales College and Normal School in Charlottetown (the capital) in a course which corresponds to that of the first two years of a high school. Properly speaking the college is the only secondary public school. All the other

schools aim to matriculate pupils into it. All the schools are supported by legislative aid and district assessment, of which the former constitutes about three-fourths of the expenditure. No special grant is made for high school purposes. Whatever is paid extra comes by voluntary vote of the ratepayers of the district. Manual training, household science, physical culture and agriculture are taught in the Prince of Wales College and the Normal School. The teachers so trained, in turn instruct all the pupils in the public schools in physical culture and agriculture or nature study. Physical culture is greatly stimulated by prizes from the Strathcona Trust Fund and agriculture is assisted by the Department of Agriculture. With the exception of the Charlottetown and Summerside schools no instruction is given in manual training and household science.

**New Brunswick.**—Secondary education in New Brunswick is provided for in grammar and superior schools. The number of the former is 14, with 41 teachers and an enrolment of 1,281. Teachers holding license of the grammar school class receive from the government from \$350 to \$400 a year, according to the length of service of the teacher, and under conditions provided by the Board of Education, but not more than four teachers in any one grammar school can receive this legislative grant. These schools are free to all pupils in the county in grades 8-12. University matriculation examinations are based on the requirements of the high school course, as completed in grade 11. Superior schools may be established in every county—one for every 6,000 inhabitants, and a majority fraction thereof. The principal of a superior school must hold a first class superior license, and receives from the government a grant of \$250 to \$300 a year, according to the time of service of the teacher, provided the trustees pay the teacher a salary from the district at least equal to the government grant. Superior schools in grade 7 and upward are free to all pupils living within the parishes in which the schools are situated. Most of the superior schools provide courses in high school work of the same character as the grammar schools. Little progress has been made in secondary vocational education. There are five consolidated schools in the high school departments of which agriculture, manual training and household science are taken up. In most of the cities and towns these subjects are taught in grade 9; that is, the first year of the high school, and at the normal school. As yet, however, there is no provision for purely vocational training.

**Nova Scotia.**—In the public schools of Nova Scotia there are 12 grades, 9, 10, 11 and 12 being high school. Very many of the rural elementary schools have superior grades which do the first and the second year and even the third year work of the high schools. In the towns and larger villages the high school departments are separate. The law allows one high school, called the county academy, in each county, to share in the \$10,000 which the legislature grants for secondary education, in addition to the other grants to which they are entitled in common with the high school grades generally; provided the county academy is free to each pupil of the county who passes the uniform departmental entrance examinations.

Should, however, the shire town fall below the standard in equipment and accommodations, another may be made the county academy by the council of public instruction. Besides the uniform entrance examinations the education department holds uniform examinations in the courses of all the high school grades, and the universities and colleges of the provinces accept for matriculation the certificate of having passed grade 11 when it indicates a high pass in the subjects they prescribe, or of grade 12 with a 50 per cent pass on the essential matriculation subjects. The grade 12 pass is expected to displace eventually the old grade 11 pass. There are 18 county academies with 59 teachers, of whom 39 are university graduates, class academic being the necessary professional qualification for the high school teachers drawing academic grants. In 1917 the total enrolment in all high schools was 9,088. Of the total attendance 1,853 belonged to the county academies. There were 2,949 pupils in the technical schools. Nova Scotia has a number of private schools which report an attendance of 450 as doing high school work.

Academic teachers must henceforth be graduates of *recognized* universities, who must after graduation have passed the provincial university graduates' testing examination in six subjects, one of which (the major) must be of the standard of university honors distinction. After 30 or 35 years' service they can retire with an annuity not exceeding \$600 per annum.

So far, except in some progressive centres, very little special attention has been paid in the secondary schools to vocational education. Art is an optional subject in the high school course and in the Halifax County Academy there is a three years' commercial course. In the Nova Scotia Technical College there are two sets of courses, the long course being of university grade and the short course partly of secondary grade. There were also in 1917 local technical schools in seven cities and towns and coal mining and engineering schools. For the school year ending July 1917 the following was the attendance at the different classes of schools: Rural Science School, 148; Agricultural College (regular), 63; Agricultural College (short course), 290; Nova Scotia Technical College, 67; evening technical schools, 1,643; coal mining schools, 536; Normal College, 263; total, 2,949.

**Alberta.**—The administrative unit of the educational system of Alberta is the school district. Any district, when conditions warrant, may, in addition to providing for the elementary or public school grades (1-8), provide for any or all of the high school grades (9-12), with the usual secondary school courses, all being under one school board. The government provides an increased grant for the secondary grades. Grade 11 gives university matriculation standing and admits to a normal school for training as second class teacher, while grade 12 gives first year university standing and admits to normal school for training as first class teacher.

Provincial normal schools containing large practice schools are located at Calgary and Camrose. The other educational institutions which take up secondary school work are the Alberta (Theological) College, the Robertson (Theological) College, the Jesuit College, all

of Edmonton; Mount Royal College; Western Canada College; Saint Hilda's College, all of Calgary; Alberta Ladies' College at Edmonton; and Knight's Academy at Raymond.

As in most of the other provinces, the vocational side of education is emphasized in Alberta. The board of every district has power to make provision for instruction in both the primary and secondary grades in manual training, domestic science, physical training, music and art, and courses are given during each summer vacation for teachers of these subjects. An optional commercial high school course of two years has also been established. As to agriculture: The subject is taken up in the last two years of the elementary school course and is supplemented in the higher grades after a course in elementary science; and summer schools are provided for both teachers and inspectors. Moreover, in order to provide for very many young men and women who in their earlier years were deprived of school facilities, three schools of Agriculture, managed by the Department of Agriculture, have already been located on three of the demonstration farms of the Department of Agriculture. The courses include scientific and practical agriculture and household science and art, along with the more essential subjects of the ordinary public and high school grades. Pupils who take the two years' course offered, and who possess the necessary academic standing, may continue their course for a degree in agriculture in the University of Alberta.

In some of the larger centres technical schools have been established whose courses cover a wide range of industrial trades. Night schools have also been established, especially in the mining centres. In order also to correlate efforts in these various directions and to afford opportunities for more advanced training, an institute of technology has been established at Calgary.

**Saskatchewan.**—Since the passing of the Secondary Education Act in Saskatchewan in 1908, 21 high schools have been established, 7 of which have since been raised to the rank of collegiate institutes. In these, 138 teachers were employed in 1916 and the total number of pupils was 3,849. A residential college for boys and girls has been established by the Methodists in Regina and one for boys by the Presbyterians in Moose Jaw.

The total outlay from general revenue in aid of education increased from less than \$200,000 in 1904 to approximately \$1,000,000 in 1916.

Being a comparatively young province, Saskatchewan has been devoting most of its energy to its public schools. It has, however, made a beginning in elementary industrial training. A board of any district has authority to provide for manual training, household science and industrial training in both day and night schools. The only secondary schools, however, giving courses in these subjects are the collegiate institutes at Regina, Moose Jaw, Prince Albert, Saskatoon, Yorkton, Weyburn and Swift Current. As Saskatchewan is almost purely an agricultural province, special stress is being laid upon agriculture in both the public and the high schools. So far not much has been done in the latter, but the indications are that a majority of them will provide for the subject in the near future. For commerce and the trades little pro-

vision has so far been made in the secondary schools. Three collegiate institutes, however, have been giving exceptionally good courses for a number of years. There is very close cooperation between the Department of Education and the University of Saskatchewan; especially valuable work has been done through the medium of summer courses for teachers and others held at the university during the months of July and August.

**British Columbia.**—Secondary education in British Columbia is provided for in superior and high schools. A superior school may be established where there are at least 10 qualified pupils available. The subjects taught are those of the junior and senior fourth classes of the public schools and the first two years of the high schools. The teacher must hold at least a first-class B. C. certificate. A high school may be established in any municipal school district where there are at least 20 qualified pupils available. The teacher must hold a B. C. academic certificate, and the subjects of the course of study are those usually taken up in the high schools of the other provinces. Government assistance to superior and high schools is the same as for other schools, the grant being so much per teacher according to the class of the district, from \$360 per teacher in cities of the first class to \$480 per teacher in rural municipal districts, with an additional maximum grant of \$100. A grant on the same scale is also paid on account of teachers of manual training, domestic science, art and other special subjects, provided such teachers hold B. C. certificates of qualification. Special grants are also made for agricultural education, the greater part, however, being met by a proportion of the special Federal grant. As in the other provinces, the secondary schools are controlled by the Provincial Department of Education and by boards of school trustees, and are visited by provincial inspectors.

The King Edward School, Vancouver, which was established in August 1916, is the only school in the province undertaking a comprehensive technical course. It is intended that at the end of the third year of the course the pupil shall be able to matriculate into the engineering course of the University of British Columbia. Of manual training centres there are 49, with 40 instructors, attended by 992 pupils from the high schools, and of domestic science centres 39, with 29 instructors, attended by 1,406 pupils from the high schools. A commercial course of a thoroughly practical character, covering three years, has been established in the larger high schools. In order to provide for the study of agriculture, the Department of Education proposes to establish classes for both boys and girls in certain high and superior schools. Arrangements have already been made to carry on these classes at three high schools and two superior schools. Extensive courses, suitable to the different localities, have also been provided for young men.

JOHN SEATH,

*Superintendent of Education, Ontario.*

**19. HIGHER EDUCATION.** The history of higher education in Canada is by no means a homogeneous development in all the provinces. Each province, possessing its own

machinery of local government and peculiarities of social and economic condition, has, as might be expected, evolved its own system of higher education. It is, therefore, the more remarkable that the beginnings of university education were almost identical in all the older provinces. This was due to the enlightened policy of the British government, which through the executive heads of the colonies began very early to make provision for future educational needs. In Upper Canada (now Ontario) and New Brunswick this provision took the form of an endowment out of Crown lands for the purposes of higher education. In Nova Scotia, already a self-governing colony, the legislature was encouraged to devote a special grant of money to establish a university and to make an annual appropriation in support of it thereafter, while the Imperial Parliament endorsed this action by voting much more substantial sums both for establishment and for annual maintenance. In Lower Canada (now Quebec) a proposal was made to create an undenominational state university, but the uncompromising hostility of the Roman Catholic Church to the idea prevented it from being carried out. Thus in each of the four colonies or provinces which at the end of the 18th century made up the settled portion of British North America the policy was inaugurated of establishing state universities, either with large land endowments or with the pledge of support by the provincial legislature. The next stage was also alike in all the provinces of older Canada except Lower Canada. In these a narrower view prevailed, and the state college in each, when established, discriminated in favor of the Church of England against other religious denominations. It was an attempt to implant in the colonies the English institution of an established Church, but the conditions in Canada were very different from those in England; the Church of England was numerically hardly stronger than the Presbyterian, Methodist or Baptist bodies separately, and certainly no exclusive right to control the state universities should have been given. The other denominations accordingly, seeing the doors of the state institution closed to their members, or open perhaps but with reservations in favor of a rival Church, established their own institutions of higher education. Thus, instead of a single well-supported university in each province there were several universities of a small calibre, none of them, not excepting the state university, coming up to the standard that had been anticipated when the policy of a single state-supported institution for each province was framed. In course of time the disadvantages of division became more apparent. The denominational character of the state universities was altered and negotiations for alliance were seriously begun. Up to the present time these negotiations have had no result in Nova Scotia or New Brunswick. But in Ontario a third stage has been reached, and the movement to combine resources has met with partial success. In western Canada the history of higher education is different. Profiting, perhaps, by the experience of the older provinces, the state universities in Manitoba and other western provinces have been established under conditions that prevent them from being controlled in the interests of any denomination.

**Nova Scotia.**—Taking each province in turn, for a more detailed account, we begin with Nova Scotia, the earliest settled of the English-speaking provinces of Canada. The first attempt at establishing a university was made by act of the legislature in 1789 incorporating King's College at Windsor, where a seminary had been founded a year before by legislative aid. A grant of £500 for a site was also made and an annual appropriation of £400 for maintenance. In the following year the British Parliament gave £4,000 in further aid of the infant institution. It does not appear that actual university powers were obtained until 1802, when a royal charter was granted. At the same time an annual subsidy of £1,000, which was not discontinued until 1835, began to be made by the British Parliament. The charter gave control of King's College to the authorities of the Church of England in the province, and at the beginning of its career the governing body unwisely restricted to members of that Church the right of entering the college as students, thus completely establishing the sectarian character of the state institution. A majority of the inhabitants of the province were now debarred from sharing in the benefits to which they had looked forward, and agitation began for a freer system. In response to this demand Dalhousie College was founded at Halifax in 1821 out of funds at the disposal of the governor for provincial purposes. Attempts at fusion of the two state-endowed colleges were subsequently made from time to time but without success. It was as a result of the refusal in 1835 of the governors of King's College to surrender their charter and amalgamate with Dalhousie College that the Imperial grant of £1,000 was withdrawn. Dalhousie College, though founded in 1821 and soon afterward provided with a building, was not opened for academical instruction until 1838, when sufficient funds had accumulated to enable a beginning to be made. In 1841 university powers were conferred by act of legislature and control was vested in a board appointed by the lieutenant-governor. But a similar mistake had been made as in the case of King's College, and Presbyterian influences had been allowed to preside at the organization in 1838. The Baptist body, therefore, seeing one of the state institutions avowedly under Anglican control, the other practically Presbyterian, proceeded to establish a college of its own at Wolfville. It was named Queen's College, and was formally opened in 1839. The act of incorporation conferring university powers was not passed, however, until 1840, and another act in 1841 changed its name to Acadia College, which it still retains, with the alteration of "university" for "college." The Roman Catholic Church, which had always stood apart from any system of higher education under state control, established somewhat later Saint Francis Xavier's College at Antigonish, in the year 1855. Under varying conditions higher education in the province continued to be carried on for a number of years by the institutions named, two of them being the recipients of government bounty. Dalhousie College, indeed, for want of funds was closed from 1845 to 1863, and on reorganization at the latter date was given a strictly non-denominational character. But the

hope of uniting all the existing colleges in a single state university has not been given up. In 1876 an act of the legislature established the University of Halifax, which should examine and confer degrees upon candidates sent up by the colleges. The latter, however, gave it no support, and continued to exercise their university functions. In 1881 the legislature withdrew its financial support and at the same time discontinued the annual grant which had hitherto been made to King's College. University federation in Nova Scotia had proved a failure, and no scheme to that effect has since been proposed. A second Roman Catholic college, Collège Sainte Anne, was established in Digby County in 1890; and the Seminary of the Sacred Heart, at Halifax, in 1895.

**New Brunswick.**—As early as 1786 an endowment of 2,000 acres near Fredericton, the capital, was set aside for the foundation of a provincial Academy of Arts and Sciences, which became incorporated in 1800 as the College of New Brunswick. In 1805 an act was passed authorizing an annual grant of £100 in addition, which was subsequently increased from time to time up to \$8,844, at which sum it has stood since 1829. In 1828 the provincial charter was surrendered and a royal charter obtained incorporating the institution under the favorite name of King's College, with university powers. In the following year a suitable building was erected and academical work begun. The royal charter contained, however, the same provision for Church of England control which had already begun to work so disastrously in Nova Scotia, and almost from the moment of its inception the sectarian character of the new college was strongly opposed by other religious denominations. In 1842 the Wesleyan Methodists succeeded in establishing an institution of their own, Mount Allison Academy, at Sackville. At first only a secondary school, it received in 1858 university powers, which came into operation four years later. Meanwhile agitation against the existing constitution of the provincial college began to bear fruit. In 1845 religious tests were abolished, and in 1859 reorganization on a non-denominational basis was effected and the name changed to University of New Brunswick. A third university for the province was added in 1864, when the Roman Catholic College of Saint Joseph was founded at Memramcook.

**Quebec.**—Before the cession of Canada to Great Britain in 1763 the control of all education in the French colony had been in the hands of the Roman Catholic religious orders. Laval, first bishop of Quebec, had established the Grand Séminaire at Quebec in 1663, which is perpetuated as Laval University of the present day. The Grand Séminaire, however, was not a university, but a theological training college for the priesthood. The first suggestion of a university in the province was made in 1789, when a committee of the executive, in reporting on the condition of education in the province of Lower Canada (now Quebec), recommended the establishment of a non-denominational university at Quebec. The opposition of the Roman Catholic bishop prevented the suggestion from being carried out, and though the hope was long cherished that the project would be renewed under more favorable conditions, no subsequent proposal to that effect was ever

formally made. It was left to private enterprise to establish the first university in Lower Canada. In 1813 the Hon. James McGill of Montreal died, leaving by will a piece of land as a site for a university or college and the sum of £10,000 for maintenance. A royal charter was obtained in 1820, but the college, bearing its founder's name, was not opened until 1829, and on the day of its inauguration the Montreal Medical Institute was united to it as its medical faculty. For more than 20 years the college had a precarious existence, its expansion being, to a certain extent, hampered by the constitution of its governing board, but a new charter was obtained in 1852 entirely freeing it from official control. The history of McGill University (q.v.) since that time is a record of steady improvement. It is not identified with any religious body, but there are four affiliated theological colleges—Congregational, Diocesan, Presbyterian and Wesleyan. It owes its present position as one of the leading universities, not only of Canada but of the continent of America, to the generosity of the merchant princes of Montreal, and to the wise and able guidance of Sir J. W. Dawson, principal from 1855 to 1893, and of his successor, Sir William Peterson.

The second university to be established in the province in the interests of the English-speaking inhabitants was in the Church of England institution at Lennoxville, called Bishop's College. It was incorporated in 1843, but a royal charter conferring university powers was not obtained until 1853. In the previous year, 1852, a royal charter had also issued to the corporation of the Grand Séminaire of Quebec empowering it to confer degrees and exercise other university functions, under the name of Université Laval. The university thus established remains the sole Roman Catholic university of the province, with faculties of divinity, law, medicine and arts, having affiliated colleges and seminaries in various towns, and an integral branch of itself at Montreal under the name of "Succursale de l'Université Laval." Saint Mary's College at Montreal, under control of the Jesuit order, incorporated in 1852, has since 1889 been entitled by papal brief to confer degrees of Laval University. There are numerous Roman Catholic colleges affiliated to Laval University, some of them of considerable antiquity. The oldest are Saint Raphael's College at Montreal, established by the Sulpicians in 1773; those at Nicolet, founded in 1804; Sainte Hyacinthe, in 1812; Sainte Thérèse in 1824; Sainte Anne de la Pocatière, in 1827; and L'Assumption, in 1832. The higher education given at these colleges is chiefly theological. JAMES LOUDON.

**Ontario.**—The history of higher education in Ontario shows a somewhat different development from that in the older provinces. In 1798 the legislature set aside an endowment of 500,000 acres of Crown lands for the purposes of higher education, but nothing further was done at that time to carry the project into effect. In 1827, however, a royal charter was granted for the establishment of a university under the name of King's College. By the terms of the charter, the institution was to be under the control of the Church of England. It was natural that the other religious bodies

should enter a vigorous protest against these terms, and when this proved unavailing, should take steps to establish independent colleges. Consequently in 1830 the Methodist Church of Canada resolved to found an institution of higher learning in Upper Canada. That this resolve was not due to narrow sectarian prejudices is vouched for by the fact that religious tests were not to be required for admission, and, further, that a distinct stipulation was made with the early subscribers that "this shall be purely a literary institution" and that "no system of divinity shall be taught therein." In 1836 the college was established in Cobourg under the name of Upper Canada Academy. It was incorporated by letters patent on 12 Oct. 1836—the first royal charter granted to any Nonconformist institution of learning in the British dominions. In 1841 the first Parliament of Canada extended the charter and changed the name to Victoria College, with power to grant degrees in the various faculties. Work in the faculty of arts was begun in the same year. This was therefore the first university in actual operation in the province. The Presbyterian Church, which some years previously had petitioned the provincial government "to endow without delay, an institution or professorships for the education and training of young men for the ministry in connection with the Synod" had received but little encouragement, and so steps were taken to found a college somewhat after the model of the Scottish national universities. A royal charter was granted on 16 Oct. 1841 for the establishment of Queen's College at Kingston, and the first classes were opened there in March of the following year.

In the meanwhile affairs at King's College had been almost at a standstill. Owing to the pressure of public opinion a modification of the charter had been made by the legislature in 1837, but the chief grievances had not been removed. Teaching was not actually begun until 1843, that is, not until after the two other colleges had been established. The agitation increased in volume and bitterness until in 1849 it effected a complete change in the constitution of the university. The special privileges accorded to members of the Church of England were abolished. From this time on the University of Toronto, as it was now called, was non-sectarian. The immediate effect of this reorganization seemed at first disastrous. Within three years a charter had been granted to a new university in Toronto entirely under Anglican control. Trinity College began work early in 1852, and the university constituency was still further divided. In 1866 three more denominational colleges were opened in Ontario, namely, Ottawa College (Roman Catholic), which in this year was granted the power of conferring university degrees, and in 1889 became the University of Ottawa; Regiopolis College (Roman Catholic), at Kingston; and Albert College (Methodist Episcopal), at Belleville. In 1878 Huron College (Anglican) at London became Western University, and in 1887 Toronto Baptist College and Woodstock College were united under the corporate name of McMaster University with full university powers. Not all of these have survived, however. Regiopolis College closed its doors in 1869; and in 1884, in consequence of the union

of the various branches of Methodism in Canada, Albert College was incorporated in so far as its undergraduate work was concerned with Victoria College, and the name of the latter was changed to Victoria University.

The evils of the multiplication of small colleges brought about their own cure. The enormous expansion of modern science imperatively demanded large expenditures for both buildings and equipment, and none of the existing institutions was able adequately to meet the demand. It was natural therefore that an effort should be made to devise a plan by which the ruinous duplication of expensive apparatus and plant could be avoided. Accordingly in 1884 the Minister of Education called a meeting of the heads of the various colleges and universities of the province for the purpose of discussing ways and means to accomplish this end. The result of these deliberations was that an act was passed by the legislature in 1887 reorganizing the university in order to permit of the federation of the various institutions involved. Queen's University, which at one time had seemed ready to accept the federation idea, finally decided to retain its independence at Kingston. The only Arts colleges, therefore, to carry out the scheme were Toronto and Victoria. The latter agreed to hold in abeyance its degree conferring power in all departments except Divinity, and in 1891 moved from Cobourg to Toronto. In 1903 Trinity College entered into federation and in 1907 Saint Michael's College (Roman Catholic) also began work as an Arts college of the University of Toronto.

The first 14 years of the 20th century were years of extraordinary expansion for Canadian universities. Queen's University had now a clear field in eastern Ontario and under the late Principal Grant became one of the great universities of the Dominion. The University of Toronto under the late President Loudon, and since 1907 under President R. A. (now Sir Robert) Falconer grew to be one of the largest universities in the British Empire. At the outbreak of the war, which swept it almost clean of men students, as it did most British universities, the enrolment stood at 4,428.

**Western Provinces.**—Higher education in Manitoba is of recent date. By act of legislature in 1877 the University of Manitoba was established, with the sole power of conferring degrees in arts, law and medicine in the province; degrees in divinity may only be conferred by colleges affiliated with the university. In its early years the university was an examining and degree-conferring body only, all teaching being left to the affiliated colleges. Later, however, a grant of land was made by the provincial government for the erection of a building for purposes of instruction in the departments of science and for a university library.

There are seven colleges affiliated with the University of Manitoba: Saint Boniface College is a Roman Catholic institution and was established as a small school so early as 1818; Saint John's College (Church of England) was founded in 1866; Manitoba College (Presbyterian) in 1871; Wesley College (Methodist) in 1888; Manitoba Medical College was affiliated in 1882; the College of Pharmacy in 1902; and the Agricultural College in 1907. All are in Winnipeg except Saint Boniface College, which

remains at the town of Saint Boniface, where it was first established. The growth of the institution necessitated new buildings and a site was chosen at Tuxedo Park and buildings erected.

In 1903 an ordinance was passed to establish a university for the Northwest territories, which has developed into the University of Saskatchewan. The corner-stone of the first building was laid by Sir Wilfrid Laurier at Saskatoon in 1910 and the building opened for students in 1912. Emmanuel College, founded in 1879 at Prince Albert by Bishop McLean for the training of native helpers, and transferred in 1909 to Saskatoon, was the first of the affiliated colleges. A place of special prominence is given to agriculture at this university. A university for Alberta was founded at Edmonton and the first session opened in 1908. Since then permanent buildings have been erected, and various theological colleges and professional societies affiliated to the university. From 1899 to the opening at Vancouver in September 1915 of the University of British Columbia, the interests of higher education in that province were served by the McGill University College of British Columbia, an institution which had two branches, one at Vancouver and the other at Victoria, and both affiliated to the McGill University at Montreal.

A. E. LANG,

*Victoria College, University of Toronto.*

**20. PUBLIC EDUCATION.** Under the provisions of the British North America Act, control of public education in Canada is vested in the provincial governments. The position of dissentient denominational schools is, it is true, specially safeguarded under the Act (30-31 Vict., c. 3, par. 93), and on their behalf the Dominion Parliament may interpose remedial legislation, but, with this exception, the whole organization, conduct and maintenance of education lies with the provinces. At the time of confederation the provinces then existing had already in operation a system of free elementary schools, which has since been expanded into the present efficient organization. In general there are two fundamental systems of education throughout Canada, one that of the Protestant communities, free from the control of religious bodies, and the other that of the Roman Catholic French and Irish communities in which education is united with the religious teaching of the Roman Catholic Church. In Ontario, Roman Catholics have the right to form what are known as "Separate Schools" for elementary education, the local rates for the support of these schools being separately levied and applied. In Quebec, Saskatchewan and Alberta similar provisions apply. In the remaining provinces there are no separate schools for Roman Catholics with state support. The figures of the census of 1911 show the high standard obtained in public education in Canada. In a population of 6,319,160 persons over five years old, only 11.02 per cent are illiterate; in the province of Ontario of the persons over five years old, the illiterates number 8 per cent. The percentage of illiteracy is highest amongst the foreign-born and lowest amongst the British-born population. The latest reports available in 1917 show 1,250,000 pupils in 24,871 primary and secondary schools of Canada with about 36,000 teachers. Except in

the province of Quebec all but a small fraction of these schools are government institutions. Throughout the Dominion the cost of education is defrayed from the public revenues, provincial and local, and public elementary education is free, except for certain small fees which are payable in parts of the province of Quebec. With the exception of Quebec all the provinces have laws of compulsory education, but under conditions that differ between one province and another. The schools are co-educational and are controlled (within the scope of provincial statutes and regulations) by locally elected trustees. Secondary schools or departments and colleges or universities for higher education, exist under government control in all the provinces, and the three classes of teaching institutions are more or less co-ordinated to allow of natural transition from the lower to the higher. Recent movements in the direction of nature study, manual instruction, school gardens, agriculture, domestic science and technical education are all energetically in progress.

For the organization of education it is necessary to consider the provinces separately. Ontario, the most populous of the provinces and the most advanced in matters of education, having largely influenced the educational systems of the other Protestant parts of Canada, deserves the most detailed treatment. The system of public education in Ontario includes kindergartens, public (primary) schools, continuation schools, high schools and collegiate institutes, and a provincial university, the whole forming an organic unit. There are, in addition, night schools, art schools, model schools, normal schools, teachers' institutes, libraries and technical and industrial schools. Kindergarten schools, admitting children between the ages of four and seven, may be organized at the option of boards of school trustees in cities, towns and incorporated villages. There are at present 216 such schools in the cities and towns of Ontario, with an enrolment of 25,554 pupils. The exercises consist of singing, marching, sewing, object lessons, etc. Above these are the public schools of the province, whose organization (first placed on a comprehensive basis in 1844 by Egerton Ryerson, superintendent of education), owes much to the education system of the State of New York. Every township is divided by its council into school sections, and for each section, each incorporated village, town and city there is a board of trustees. The latter are elected by the ratepayers, both male and female. Within the provisions of the statutes of the province, and the regulations of the education department, the trustees appoint the teachers, determine the salaries and provide and maintain buildings and equipment. The provincial government makes an annual grant of money to each school according to the average number of pupils in attendance. For the rural schools the county council adds an equal grant, the township council contributes \$100 (\$150 for a school with two teachers), and the remaining funds needed are raised from the ratepayers. In cities, towns and villages the legislative grant is supplemented by funds raised by the municipal council. All the public schools are free, and under an Act of 1891, trustees are empowered to supply textbooks either free or at reduced

prices. In the uniform course of study prescribed by the education department, chief stress is laid on reading, writing, arithmetic, grammar, geography and drawing. In the upper forms British and Canadian history and commercial subjects are taught; agriculture is taught in rural schools. Periodic talks are given on temperance and hygiene. Only textbooks authorized by the education department are allowed. Attendance is obligatory for all children between the ages of 8 and 14 years, not attending separate schools and not under efficient instruction at home. The public schools are strictly nonsectarian, but the schools are opened and closed with the reading of the Lord's prayer and portions of the Scriptures are read daily. The clergy of any denomination may arrange with the trustees to give religious instruction in the school after the regular hours. Any group of five or more heads of families may, upon giving notice to the municipal clerk, cease to pay school rates, and become supporters of a separate school. This privilege may be used by any religious sect or by persons of color; in actual fact, of the 542 separate schools existing in Ontario all but five are Roman Catholic institutions. The course of instruction given in the separate schools is almost identical with that of the public schools, with the addition of special religious teaching. Separate schools share in the legislative grant. In 1916 there were 6,600 public schools (including 537 Roman Catholic separate schools) with 11,850 teachers (including 1,389 in Roman Catholic separate schools) and 505,074 pupils, 67,481 of whom attend the Roman Catholic separate schools. The average salaries in public schools are as follows: Province—male \$902, female \$613; urban—male \$1,310, female \$696; rural—male \$621, female \$549. For secondary education Ontario has an admirable system of high schools and collegiate institutes; these are almost identical in character, the collegiate having a larger and more highly qualified staff, special facilities in regard to apparatus, etc., and receiving a larger government grant. Any high school may become a collegiate institute on fulfilling the requirements. High schools and collegiate institutes are created by municipal and county councils and managed by elective boards of trustees. The original cost, and the cost of permanent improvements are defrayed by the local authorities. For current expenditure, the provincial government contributes a yearly grant varying according to situation, attendance, etc., but with a fixed minimum. The grants average from \$500 to \$800. The county contributes an equal amount. The remaining expense is met by the municipality. About one-third of the schools are free, in the others the annual fee varies from \$2.50 to \$26. A uniform examination is prescribed for admission. A graded series of four forms leads to the uniform "leaving" examinations (junior and senior) conducted by the department, on the results of which certificates are granted. The matriculation examination for the provincial university is almost identical with the junior leaving examination. In 1916 there were in Ontario, 160 high schools and collegiate institutes, with 1,023 teachers and 38,426 pupils. Co-education obtains in all of them, approximately 20,000 of the registered pupils being

girls. The total expenditure was \$3,444,940. One hundred and thirty-two continuation schools intended to provide an education suited to the needs of the youth of the agricultural communities have been established. The number of pupils in 1916 was 6,800 with 237 teachers. The total expenditure was \$294,125. The total school expenditure for all classes of schools was \$17,049,244, the provincial government grant amounting to \$1,104,775. Special attention is paid in Ontario to the uniform qualification and training of teachers. The lowest grade of public school teachers (third class) must pass the high school primary examination (Forms I and II) and attend a county model school. Teachers of the second class must pass the junior leaving and attend the provincial normal school. Teachers of the first class must pass the senior leaving examination, and attend the school of pedagogy in Toronto. To hold a position in a high school a teacher must hold a first class public school certificate, or have passed at least equivalent university examinations. For special positions in collegiates, higher university standing is demanded, varying according to the subject. Unless by special permission of the department, only the certificates of the universities in Ontario are accepted. At the head of the system is the Minister of Education, a member of the Provincial Cabinet.

The problem of public education in the Province of Quebec, owing to the division of the population between the French and English races, and the Roman Catholic and Protestant religions is one of peculiar difficulty. The difference of creeds has led to the establishment of a dual system of elementary, secondary and superior schools. The Roman Catholics of the province, numbering (census of 1911) 1,724,683, had 6,119 schools of all kinds; the Protestant population of 378,549 had 897. At the head of the educational system is a superintendent of public instruction with a council composed of all the Roman Catholic bishops whose dioceses or parts of whose dioceses are in the Provinces of Quebec, now numbering 15, an equal number of Roman Catholic laymen appointed by the Crown and an equal number of Protestants similarly appointed. Within the council are a Protestant committee and a Roman Catholic committee which control the schools of their respective denominations. Each has its elementary, model, normal and high schools and academies. School attendance is not compulsory. In each parish or township there is a board of school commissioners elected by the owners of real estate. These erect and maintain schools, appoint teachers and levy the school tax, which falls on real property only. But in any such district a dissentient minority professing a religious faith different from that of the majority, may organize themselves separately, elect a board of trustees and conduct a school of their own. In the cities and towns there are separate Protestant and Roman Catholic boards of school commissioners. Real estate is taxed for school purposes according to the religious faith of its owners. The financial resources of the school municipalities comprise (1) the sums raised by local rates, and (2) grants made by the Legislature. The former consists of the school assessment, which is levied on all ratable property of a school

municipality and the monthly fee, which is collected for every child who attends or who should attend the public schools. The grant of the Legislature is divided proportionately to the number of the children enrolled. In 1916 there were 5,998 elementary schools, with 7,982 teachers and 251,492 pupils. The average salary for elementary teachers is male \$938 and female \$236. There were 1,042 academies, high schools and model schools, with 196,595 pupils. The public schools mentioned above are practically Roman Catholic schools with 897 separate schools attended by 54,745 pupils, of whom nearly all are Protestants. The total school expenditure for the province in 1916 was \$11,564,043.64, the government grant amounting to \$1,882,837.73.

In each of the three maritime provinces (New Brunswick, Nova Scotia and Prince Edward Island) there is a system of public elementary schools, normal schools, high schools and academies (grammar schools in New Brunswick), whose organization closely resembles that of the Ontario schools. In each province the executive council, acting through its superintendent of education is at the head of the system. The elementary schools are free, co-educational, non-denominational, with compulsory attendance, placed under trustees elected in each school district, and supported partly by provincial, county and municipal grants, partly by local assessments. In these provinces the annual "school meeting" of rate-payers which elects the trustees, also votes the amount of money to be locally assessed. In Prince Edward Island in 1916 there were 476 public schools with 595 teachers and 18,362 pupils. The average salary for primary school teachers is male \$276-\$543 and female \$220-\$371. There were 28 first class schools (doing high school work) with 1,563 pupils. The total school expenditure for the year was \$244,572.29, the provincial expenditure amounting to \$173,962.56. In Prince Edward Island the Prince of Wales College at Charlottetown is a secondary school with governmental support, having a normal school department for the training of teachers. In New Brunswick in 1916 there were 2,020 public schools with 2,141 teachers and 66,044 pupils. The average salary for public school teachers is: Male \$290-\$873, female \$261-\$482. There were 39 grammar and superior schools (high school grades) with 2,365 pupils. The total school expenditure for the year was \$1,221,224.71, the government grant amounting to \$280,827.35. In certain towns and in some French Canadian settlements there are separate schools for Roman Catholics, attendance at which satisfies the requirements of the provincial law, but the schools are neither supported nor controlled by the state. New Brunswick has a provincial university, whose president is adjoined to the executive council in its capacity of board of education. In Nova Scotia in 1916 there were 2,837 public schools with 3,019 teachers and 99,463 pupils. The average salary for public school teachers is: Male \$262-\$872 and female \$238-\$482. There were 64 high schools (including 18 academies) with 9,726 pupils. The total school expenditure for the year was \$1,620,154, the provincial government grant amounting to \$414,738.

In Manitoba the executive council, or cab-

inet, is at the head of public education. There is a minister of education who is advised and assisted by a deputy minister and a superintendent. An advisory board, partly appointed, partly elected by the teachers, aids the government in organizing the school curriculum, establishing teachers' qualifications, etc. The provincial system includes public (primary) schools, a higher grade of which are called intermediate schools, and secondary education is provided for in high schools and collegiate institutes. Schools are free and are supported by provincial grants, municipal grants and a local school tax levied by the trustees. School districts are erected by local municipalities and trustees are elected therein. The whole system closely resembles that of Ontario. (For the provincial university see article CANADIAN UNIVERSITIES). The question of separate schools for Roman Catholics was long a subject of acute controversy. Established in 1871, they were abolished in 1890. The agitation in favor of their restoration reached an alarming crisis in 1895. A compromise was made in 1896 whereby religious instruction may be given during the last half hour of the school day, and which permits the Roman Catholic school children of a district, if numbering 25 or more, to have a teacher of their own denomination. Manitoba has two provincial normal schools for the training of teachers, one in Winnipeg and the other in Brandon. In 1916 there were 1900 public schools with 2,991 teachers and 97,100 pupils. The average salary for a public school teacher is \$768. There were 102 high schools and collegiate institutes with 6,696 pupils. The total school expenditure for the year was \$6,658,229, the provincial government grant amounting to \$901,117.40.

British Columbia has a system of free, non-denominational public schools, controlled by the provincial government through a superintendent of education. The schools are supported partly from the provincial treasury and partly by the sums raised by the district assessment. In British Columbia in 1916 there were 808 public schools, with 1,984 teachers and 64,570 pupils. The average salary for public school teachers is \$800. There were 40 high schools, controlled by local boards of trustees, with 4,770 pupils. The total school expenditure was \$3,216,350, the provincial government grant amounting to \$1,591,322. British Columbia has two normal schools and a provincial university.

The provinces of Alberta and Saskatchewan have systems of public schools administered by a Department of Education presided over by a minister of education, who is assisted in the case of Saskatchewan by a superintendent of education, and in Alberta by a deputy minister as permanent administrative head. The organization is similar to that of Ontario. In the provinces of Alberta and Saskatchewan the minority ratepayers in any district, whether Roman Catholic or Protestant, may establish separate schools and become liable only to assessment at such rates as they impose upon themselves in respect thereof. In practice this privilege is but little used. In 1917 there were in Saskatchewan only 19 separate schools out of a total of 4,022 elementary schools, and in Alberta only nine separate schools. There are normal schools at Regina, Saskatoon, Edmon-

ton and Calgary, and universities at Regina, Saskatchewan and Strathcona, Alberta.

STEPHEN LEACOCK,  
*Professor of Economics and Political Science,  
McGill University.*

**21. TECHNICAL EDUCATION IN CANADA.** The term technical education is used with a variety of meanings. The general idea seems to be the use of schools and industrial appliances in preparing young men and women for skilled occupations. "Even in Germany," we are told, "the old apprenticeship is dead." However even the narrower statement seems to be becoming still more limited, for the legal and clerical professions, which seem still to require education and apprenticeship, and even the medical profession, which demands a time course and fixed laboratory work, are not now regarded in the public mind as coming under the heading of technical education. Technical education, in its present more limited use, seems to be regarded as a joint course of proportionate time in the class room and another period of time in the practice of handicraft — sometimes spoken of as a "trade" or "industry." Whether this definition be generally accepted or not, we shall follow it in this article.

In Canada the most notable event in connection with this specific education is found in the appointment in 1910 of the "Royal Commission on Industrial Training and Technical Education." As one of the commissioners on this body the writer may state that it was constituted as a court with seven members from different parts of Canada with a skilled secretary. This body, under the direction of the Dominion government, spent two years or more in (1) taking sworn evidence in Canada from 1,400 witnesses of every class (including in the evenings representatives of the "labor organizations") as to their industrial needs. (2) Visiting manufactories, schools and universities in Canada. (3) Going, under government direction, to other countries, including the United States, and in Europe, the British Isles, France, Germany, Switzerland, Holland, Belgium and Denmark. (4) Embodying their report in four large octavo volumes aggregating in all nearly 2,000 pages. In their report the Royal Commission gave an elaborate sketch of what they had seen in all these lands and made a recommendation that \$3,000,000 a year for 10 years, making a total of \$30,000,000, should be appropriated for securing "industrial training and technical education" for as many as sought it among the Canadian people.

In the Canadian Confederation the matter of education is reserved to the nine provinces of the Dominion, viz., Nova Scotia, New Brunswick, Prince Edward Island, Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia. To meet this case, the proposal of the Royal Commission is that while the Dominion will give the money to be supplied and administered by a "Dominion Government Commission" appointed by itself, yet it is to be given through the medium of boards and committees under the authority of the several provinces. The suggestion has been cordially received by the various provincial governments, and but for the European War, in which Canada as a part of the British empire is involved, would have been almost certainly carried out.

**The Objects of the Royal Commission.**—These are: (1) The education of trained teachers and demonstrators to carry out the purposes of the commission. (2) The establishment of classes, courses and schools for industrial training and technical education. (3) Provision to be made for laboratory apparatus and teaching equipment. (4) Scholarships to be given to deserving pupils. (5) Provision for traveling experts to visit institutions. (6) Help for institutions, such as universities and colleges. (7) Promotion of diffusion of scientific and industrial research.

#### CANADA'S PRESENT EQUIPMENT.

**I. Under University Control.**—Commencing with the Atlantic coast, the Halifax Technical College is affiliated with several of the universities of Nova Scotia and New Brunswick. It has a competent staff of professors and assistants. Engineering students who take two years in the universities in a suitable course enter in their third year and finish in their fourth in the technical college. This arrangement has proved very successful. An excellent engineering department is found in McGill University, Montreal. This department receives efficient support from the Canadian Pacific Railway. Queen's University, Kingston, Ontario, especially in its mining school, has excellent courses in practical science. Toronto University—the provincial university—has a strong faculty of applied science. The several departments of the faculty distributed in various buildings are: Civil engineering, mining engineering, mechanical engineering, architecture, analytical and applied chemistry, chemical engineering and electrical engineering.

**II. Government and Municipal Technical Schools.**—The several provinces of the Dominion have their different methods of dealing with technical education, and the newer provinces are much alive to the necessity of such schools. Nova Scotia, though not a large province, has been forward in providing various kinds of science schools. Much attention has been paid to continuation and night schools. The coal mining schools have been efficiently used in this province. Other mining schools also are maintained. Technical schools are maintained in Truro, Amherst, Yarmouth, New Glasgow and Sidney. The province of Quebec has two notable technical schools maintained by the provincial government, besides a number of smaller local schools of this type. (1) *Montreal.*—This technical school, opened in 1911, is declared to rival any technical school of its class in America or Europe. It was erected and is maintained by the Quebec provincial government. The city of Montreal also assists it. Day and night classes of every variety are maintained. (2) *Quebec City.*—A replica of the Montreal school, erected and supported by the government of the province, is three-fifths of the size of the Montreal school. (3) The Shawinigan Technical Institute, on the Saint Maurice River, is a remarkably complete school, maintained in part by the Quebec government in a thriving manufacturing town. In the province of Ontario, in 1915, a magnificent technical school was erected in Toronto, at a cost of \$1,400,000 exclusive of site and equipment, to take the place of one limited in size and efficiency. The new school (with seven

acres of floor space) can accommodate 2,500 day pupils and a vast number of night pupils, giving instruction in a great variety of subjects. It represents the aspiration of Toronto to be a great manufacturing centre. (4) Hamilton City, also aiming at being a leading trade city, in 1909 erected a building, costing \$100,000, exclusively for technical education. Here, adjacent to a regular collegiate school efficient teaching is given in wood-working, machinery, forging, electrical work, household science, drafting, printing and in fine arts. Brantford, called the "Sheffield" of Canada, has lately finished a commodious technical school. Woodstock, Kitchener (late Berlin), Peterborough and Saint Thomas are industrial centres with excellent educational facilities. In most of these schools wood-working, building construction, mathematics, mechanical drawing, applied sciences, dressmaking, millinery, commercial work and practical English are largely taught. Many other Ontario towns have technical evening schools. In the mineral region of Ontario on Lake Huron are two towns—Sault Sainte Marie and Sudbury, in which apprentices and workmen receive training in their craft.

In Winnipeg, Manitoba, now the third city in size of the Dominion, two great technical high schools—called respectively the Kelvin and the Saint John's—erected by the city itself at a cost of \$450,000 each without site, are in full operation, and of the night schools of the city numbering 5,000 in attendance half are in these technical schools. Calgary, a considerable city of Alberta, has shown great enterprise in this direction and has large and very successful schools in many technical subjects.

On the Pacific Coast the city of Vancouver, British Columbia, has gained a high reputation, especially for its technical night schools.

**III. Railway Employee Schools.**—In Stratford (Grand Trunk shops), in Saint Thomas (New York Central shops), in Montreal (Canadian Pacific shops). A successful training is given to young lads who enter the shops about the age of 13 to 15. The hours in the morning are taken from the company's time, and the teaching is done in the shop precincts. Shop mechanics, workshop practice, mechanical drawing—also mechanics, electricity, car construction, and, if desired, telegraphy and shorthand are taught.

**IV. Agriculture and Horticulture.**—The cry of the agriculturist preceded that of the manufacturer and the first ambitious design of Canadians was to improve agriculture. Hence the provincial demand in almost every case is for technology on the farm. After several weak attempts in Nova Scotia at agricultural teaching the college at Truro was begun there in 1905. It has been a popular institution and draws its pupils from the three maritime provinces of Nova Scotia, New Brunswick and Prince Edward Island. The summer school of science, which has existed in Nova Scotia for some 30 years, has been merged into the Agricultural College at Truro, which for the last 10 years (1908-18) has been well maintained in this town. From 200 to 500 teachers of public schools attend the six weeks' course in training supplied by the Agricultural College at Truro. The province meets the expense of traveling and maintenance for the session and is doing a large work for the maritime prov-

inces of Canada. Two excellent agricultural colleges are found in the province of Quebec, viz., the Macdonald College at Saint Anne and the Oka College in the Ottawa River District. The former of these is 20 miles from Montreal and its farms and beautiful buildings are the gift of Sir William Macdonald, a wealthy manufacturer of Montreal. It is divided into three parts: a school of agriculture, a school for teachers and a school for household science. Registration, tuition, board and laboratory fees are charged. Various courses are given in horticulture, farming, etc., making the institution a boon to the province and attracting considerable numbers from other provinces. Chiefly for the benefit of the element of French-speaking people in Quebec, who are largely farmers, the Oka College was, after some 14 years of more or less successful existence, reorganized in 1909. It is affiliated with the French University (Laval) in Quebec. It is well housed and has a farm of 1,800 acres, 700 under cultivation. Its laboratories are well equipped and it has a good technical laboratory. Both the French and English languages are taught in the college. Forestry is taught and Quebec has the most complete fire protection of its forests of any province of the Dominion. The college announcement says: "Agricultural tastes and agricultural education produce a virile nation!" The examinations are conducted by the authorities of Laval University. In Ontario, the Provincial Agricultural College of the province is situated near the city of Guelph. It is one of the most notable agricultural colleges on the American continent. It has a staff of 46 instructors, and lately a branch for women was opened. In 1909 there were 1,296 students in attendance. It gives courses for rural teachers. The college course that leads to a degree at Toronto University is four years. There are over 5,000 members of the Farmer's Union who are conducting agricultural experiments and reporting each year to the college authorities. This college has been the alma mater or educator of professors in agriculture in the other provinces of the Dominion, and also in many of the agricultural colleges in the United States. The Agricultural College of the province of Manitoba, with its 8 or 10 buildings, is the most magnificent of the agricultural colleges of the Dominion, costing some \$4,000,000. It is affiliated with the University of Manitoba, Winnipeg, and has a complete staff. It has educated bands of students and conducts extensive courses, lectures, etc., throughout the province. It aims at reaching large numbers of the people by holding summer schools, uniting several professions and devoting itself heartily to prairie life. The Saskatchewan Agricultural College is a part of the University of Saskatchewan, which is located at the city of Saskatoon. Its extensive work has been very widespread. The faculty proposes to develop along lines of investigation, teaching and extension work. Its extension work has taken the following forms: Encouraging agricultural societies and competition in stock and farming, farmers' institutes, excursions to experimental farms and seed-grain farms, institutes, farmers' and women's clubs. The government gives a liberal appropriation for this work. Alberta and British Columbia are newly established universities and both have agricultural farms maintained by the

Dominion. No doubt they will develop largely along the line of those of the provinces of Manitoba and Saskatchewan. The Conservation Commission of Canada, with its headquarters at Ottawa, has done in its seven years of service in agricultural problems, health, town-planning and forest protection, protection of game and fish, notable work in technical research.

**V. Special Features.**—In different provinces are found special features: (a) Mining schools with 673 pupils in attendance are found in 29 places in Nova Scotia; (b) in connection with Saskatchewan agricultural department of the University at Saskatoon extension work takes place for experimental farms, farmers' institutes, agricultural societies, farmers' and women's clubs, etc. This is a peripatetic experiment. In 1916 the Dominion government urged on by learned societies established an Honorary Advisory Council of Scientific and Industrial Research in Canada. This council was closely attached to leading departments of the Dominion government at Ottawa. Several scientists of world-wide reputation, such as Dr. Macallum, Dr. F. D. Adams, Dr. J. C. McLennan and Dr. A. S. Mackenzie were placed on it. Leaders in trade, agriculture, labor and research were chosen to deal with natural resources, waste products, forestry, farming and pressing industrial problems. This movement has been viewed in Canada with universal approbation.

GEORGE BRYCE,

*Member of Conservation Commission of Canada; Royal Commission on Technical Education (1910-13), and of Royal Society Committee on Research (1916).*

**22. CATHOLIC EDUCATION. The French Regime (1608-1760).**—During this period education in Canada was almost entirely under the control of the Catholic Church. The first permanent school was the "Little School" founded by the Jesuits at Quebec in 1635. The first institution of higher learning was the Jesuits' College, also at Quebec, opened in 1636 or 1637. It maintained a classical course similar to those of the famous Jesuit colleges of France, and, after 1707, when the public School of Hydrography was attached to it, became a scientific centre of some importance. In 1663 Bishop Laval founded the Seminary of Quebec; in 1668 the Little Seminary, a preparatory school for boys aspiring to the priesthood; and about the same date the model farm and industrial school of Saint Joachim at Cap Tourmente. From 1666 schools for boys were maintained in Montreal by the Sulpician Fathers, and in several smaller towns and villages schools were established by the Récollets. From 1718 to 1730 the Hospitaller Brothers of Montreal, assisted by a royal grant, maintained a kind of normal school, and supported eight teachers in Montreal and neighboring parishes. Convent schools for girls were conducted by the Ursulines at Quebec (1639) and Three Rivers (1697), and by the Congregation of Notre Dame, founded at Montreal in 1659 by Marguerite Bourgeoys and represented by branches in many of the larger villages. Moreover, by the middle of the 18th century parochial schools existed in the majority of the country parishes. After 1727

teachers were by ordinance placed under the supervision of the parish priests, and were required to obtain licenses both from the King's Intendant and from the Bishop or Archdeacon of Quebec. Some country schools had Latin classes. In general, education was more widespread than might be assumed. A majority, or at least a very large minority, of the *habitants* could read and write. All this was accomplished by the free efforts of Church and people; no assistance was obtained from government, except a few slight subsidies and some grants of land to religious teaching orders. In Acadia (now Nova Scotia and New Brunswick) education was more backward than in Canada. We hear of a seminary and a girls' school at Port Royal (now Annapolis) before 1640, and, after the temporary English conquest of 1654, of schools for boys and girls. These disappeared on the final conquest in 1710. In Cape Breton the fortress-town of Louisbourg had its own schools, including a convent of the Sisters of Notre Dame, but town and schools alike disappeared after the capitulation to the English in 1758.

**Canada 1760-1867.**—The British conquest was followed by a decline in education. The Church in Canada was thrown on its own resources by the break with France, and hampered by the prejudices of alien rulers. The British government tolerated the religious orders of women, but directed the gradual extinction of those of men and the confiscation of their property, property which Canadians believed to have been granted, in large part, as an endowment for education. The Jesuits' College was abandoned in 1768. Both Jesuits and Récollets disappeared at the beginning of the 19th century, but Sulpician exiles from Revolutionary France were admitted to Canada, and henceforth that order revived. The government had ordered measures to be taken—especially the establishment of Protestant schools—to win the Canadians to Protestantism, but in fact little attempt at proselytism was made. Nevertheless the suspicions of the inhabitants were aroused, and there was made permanent under British rule that close union of religion and national culture which is so marked a characteristic of the French Canadian people. In 1791 the colony was divided into the provinces of Lower Canada, mainly French and Catholic, and Upper Canada, where the inhabitants were chiefly newly-arrived English-speaking Protestants. Parliamentary institutions were conceded, and through these the Catholic people of Lower Canada gradually obtained control of their schools. An attempt in 1818 to give a monopoly of education to the Royal Institution for the Advancement of Learning, a body mainly English and Anglican, was defeated by the hostility of the people themselves. In 1824 the independent religious schools, Catholic and Protestant, were recognized by the Legislature, and in 1829 they received state aid. After 1829 the revenues from the Jesuit estates were devoted to educational purposes, and in 1839 the Sulpician estates were confirmed to that order. In Upper Canada Catholics were not numerous. Only a few schools were established, several by the Rev. Alexander Macdonell (consecrated Bishop of Kingston in 1826), who brought teachers from Scotland and obtained a small subsidy from the British government. In 1840

the two Canadian provinces were reunited. Contrary to expectations, this strengthened the position of the French, and, because of their support, of the Catholics of Upper Canada. The period which followed was one of conflict between the ideal of educational uniformity—the imposition on all classes of a uniform system, more or less secular in character—and that of freedom—the preservation to each locality, and especially to each religious denomination, of a large liberty in shaping the teaching of its children. The Act of 1841 organizing primary schools allowed the religious minority in any locality to establish a separate school and receive its due proportion of state aid. Thence sprang the Separate Schools of Upper Canada and the Protestant Schools of Lower Canada. The independent denominational school system was fully established in the lower province by 1846, but in Upper Canada a bitter struggle preceded the complete recognition of Separate Schools, which was accomplished by the Scott Act of 1863. The latter part of this epoch was marked by the founding in Canada, or the introduction from abroad, of a large number of religious teaching orders, and also by the opening of many of those classical and commercial colleges which play so large a rôle in education in Quebec. In 1852 the Seminary of Quebec founded Laval University, and in 1866 in Upper Canada Regiopolis College (founded at Kingston, 1846) and Ottawa College (founded as the College of Bytown, 1849) received charters as universities.

**The Maritime Provinces, 1760-1867.**—After the British conquest only a few Catholics—Indians, refugee Acadians and Irish settlers—remained in these regions. From 1766 to 1786 all teaching by "popish recusants" was sternly prohibited by law, and even after that date Catholic schools were few and irregular. The repatriation of the Acadians, and Irish and especially Scottish immigration, gradually improved the Catholic position. In 1802 Father Edmund Burke, afterwards bishop, built a college at Halifax but could not find teachers. In 1820 he had two flourishing schools in that city, and the beginning of a seminary. As time passed other institutions of higher learning were opened, religious teachers brought in, and Catholic primary schools established, receiving in some places state aid.

**The West 1760-1870.**—In 1818 Father—afterward Bishop—Provencher established a mission on the Red River and opened schools at Saint Boniface and Pembina. He and his successor, Bishop Taché, labored earnestly in the cause of education. At Saint Boniface Latin classes were begun about 1823, a girls' school was established in 1829, and an industrial school in 1838. By 1845 five Catholic schools were in permanent operation in the West, besides several of irregular character. Father Lacombe opened a school at Edmonton in 1862, and about the same time the foundations of Catholic education were being laid in British Columbia, where colleges were opened at Victoria, 1863, and at New Westminster, 1866. The College of Saint Boniface had been established in 1857. In 1845 the Grey Nuns came to Saint Boniface, and in 1859 the Sisters of Saint Anne to Victoria. These measures were for the benefit of whites and *Métis*. Indian mission schools were established

from 1833 on; a great impetus to this missionary work was given after 1845 when it was largely taken over by the Oblate Fathers.

**Confederation (1867).**—By the British North America Act of 1867 the provinces of Canada (Upper and Lower Canada becoming Ontario and Quebec), Nova Scotia and New Brunswick were united in federal union to form the Dominion of Canada. Other provinces have since been added. Education was assigned to provincial control, but the provinces were prohibited from interfering with denominational rights as existent at the union, and the Dominion Parliament was empowered to redress any other infringements on the educational rights of religious minorities.

**Ontario.**—Elementary education is free and compulsory, and is provided by public and separate schools, both under state control. Since confederation the essential elements of the Catholic Separate School system have not been changed. Five or more Catholic heads of families in any locality may maintain a separate school and be exempted from public school rates. Trustees elected by the school supporters administer school business. Their revenues consist of (a) provincial grants, based on attendance, efficiency, etc., and distributed impartially among public and separate schools; (b) county and other municipal grants distributed on similar bases; (c) rates levied by the trustees on the property of separate school supporters; (d) voluntary contributions, chiefly from church funds. Teachers must have the same qualifications in separate as in public schools. By a decision of the Privy Council in 1906 religious teachers were made subject to this rule, from which they had hitherto been exempt. The older religious teachers were, by legislation of 1907, given, on certain conditions, permanent qualification. Religious instruction is under the supervision of the parish priests. Secular instruction is identical with that in the public schools, and the same standards of efficiency are imposed by the provincial Department of Education. Textbooks are the same, except in English literature, in which extracts from Catholic authors are more largely used, and to some extent in history. Since 1882 the Department has maintained a distinct board of separate school inspectors.

Secondary education is supported by the province partly through advanced classes in public and separate schools, but mainly through high schools. No separate high schools are recognized. Catholic secondary education is offered by private institutions, conducted generally by religious orders. There are 32 of these Catholic high schools, academies and colleges. Almost all such schools prepare candidates for the examinations set by the Department of Education, and many are inspected by provincial high school inspectors. The University of Ottawa, conducted by the Oblate Fathers, which was canonically erected by Pope Leo XIII in 1889, is the only active Catholic university. There are English and French courses in arts, and a course in theology. Regiopolis College, closed in 1869 and reopened 1896, offers only secondary instruction. Saint Michael's College, one of the federated arts colleges of the provincial University of Toronto, is the most important centre of higher education for English-speaking Catholics. It

has the full benefit of the lectures and equipment of the university. University boards, on which Saint Michael's is represented, conduct the examinations—except that the college sets its own papers in philosophy—and confer the degrees. There are 9 professors and 140 students. Women students reside in Loretto Abbey College and Saint Joseph's College. Other colleges doing university work are Assumption College, Sandwich (founded 1855) and Saint Jerome's, Kitchener (1865). In northern Ontario colleges have been opened at North Cobalt (1912) and Sudbury (1913). The principal theological seminaries are Saint Augustine's, Toronto (1913), Saint Peter's, London (1912) and that attached to the University of Ottawa. In 1915 Ontario had 537 Catholic separate schools, with 1,389 teachers, 67,481 pupils and an average daily attendance of 45,733. The total receipts for the maintenance of these schools in the same year were \$1,347,502, of which \$42,131 was derived from provincial grants and \$879,903 from municipal grants and assessments. The total expenditure in the same year amounted to \$1,183,847, of which \$503,946 was for teachers' salaries and \$366,625 for sites and buildings. The expenditure per pupil enrolled amounted to \$17.54.

**Quebec.**—The primary school system is denominational and separate: it is based on religion, and Catholics and Protestants have each a complete and independent organization, receiving equal proportional assistance from government. State control is exercised through the Council of Public Instruction as reorganized in 1876. It is divided into two committees, Catholic and Protestant. Everything relating specially to Catholic schools, is within the exclusive jurisdiction of the Catholic committee. The committees meet together to consider matters of common interest. The Catholic committee consists of the superintendent of public instruction, the bishops of Quebec, an equal number of laymen appointed by the lieutenant-governor, and, since 1906, four associate members chosen from the primary school teachers. Primary schools include elementary schools, giving a four years' course; intermediate or model, two years; and superior, or academies, two years. They are "under control" or "independent and subsidized" according as they are administered by elected school boards or by other bodies. The province is divided into school municipalities, each electing its school commissioners. The revenues consist of (a) rates levied on property of Catholics; (b) fees; (c) provincial grants; (d) private funds of independent schools. Lay teachers must hold diplomas granted by the central board of examiners. The moral and religious supervision of Catholic schools is exercised by the parish priests. Secular studies are prescribed by the Catholic committee. Under it are a Catholic inspector general and divisional inspectors. Although education is neither free nor compulsory, the school attendance is good. In 1912-13, with a Catholic population of 411,701, of the ages 5 to 16 years, there was an enrolment in primary schools of 362,934 (including 4,520 over 16 years) and an average attendance of 287,403.

Secondary education is not under state control, but the province maintains a number of special schools. Among such Catholic institutions are normal schools—nine for women

have been opened since 1905,—agricultural schools at Oka and Ste Anne de la Pocatière, a school for higher commercial studies at Montreal, schools for deaf-mutes and the blind, domestic science schools, night schools and schools of arts and manufactures. Catholic secondary education is offered by classical and commercial colleges conducted by ecclesiastics, 19 of which receive an annual subsidy of \$1,000 each, and by convent academies for young ladies. The only university is Laval, which was canonically erected in 1876. It has faculties of theology, law, medicine and arts and affiliated professional and technical schools. A complete branch of the university was established in Montreal in 1879. Each branch receives a grant of \$25,000, and the affiliated Polytechnic School \$30,000. The Seminary of Quebec and the Grand Seminary of Saint Sulpice at Montreal constitute the theological faculty, and there are affiliated seminaries. The Sulpician Fathers, besides a college, a philosophical and a theological seminary in Montreal, have since 1888 maintained the Canadian College in Rome for advanced ecclesiastical studies. In 1915 there were 5,231 elementary schools, controlled 5,151, independent 80; with an enrolment of 211,672, and an average attendance of 166,125. There were 5,576 lay and 949 religious teachers. The model schools numbered 673; controlled 552, independent 121, with an enrolment of 105,831, an average attendance of 89,013; and 3,206 teachers, lay 922, religious 2,284. The academies were 283 in number, of which 128 were controlled and 155 independent. The student enrolment was 75,482, with an average attendance of 65,846; and 286 lay and 2,793 religious teachers. There are 13 normal schools, 2 for men and 11 for women; with 1,134 pupils and 173 teachers. There are three schools for the deaf, dumb and blind, with 515 pupils and 115 teachers. Schools of arts and trades number 11; with 2,515 pupils and 45 teachers. There are 48 night schools, with 3,640 pupils and 107 teachers. Universities and classical colleges comprise \*Laval University, Quebec, 87 teachers, 474 pupils; \*Laval University, Montreal, 234 teachers and 1,786 pupils; 21 colleges with 737 teachers and 7,788 pupils.

**Nova Scotia.**—Elementary schools are supported and controlled by the state, and no separate schools are recognized by law. Nevertheless in practice many of the public schools, especially in the cities and in Acadian districts, are really Catholic. The law permits the school boards to direct religious exercises to be held for a brief period within school hours, or, if objection is made, after school hours. By a good understanding among all classes, over 30 urban schools, accommodating about 10,000 pupils, are recognized practically as being Catholic, and are so conducted. Many of them are in charge of religious teachers. There are two academies for boys and 12 for young ladies. That attached to Saint Francis Xavier University is the county academy of Antigonish, and receives state support. Saint Francis Xavier University, Antigonish, though a small institution, maintains high educational standards. It has faculties of arts, law and applied science. Saint Anne's College, Church Point, is the chief

centre of higher education for the French population. A theological seminary is maintained at Halifax. The four Catholic institutions of university rank in Nova Scotia have 54 professors and 500 students and the principal secondary schools, including Antigonish Academy, Mount Saint Vincent College and Sacred Heart College, Halifax; Our Lady of Lourdes School, Pictou, and Saint John Baptist Academy, New Glasgow, have 68 teachers and 1,105 students.

**New Brunswick.**—In 1871 the legislature, which had hitherto granted some assistance to Catholic education, established a non-sectarian system of public schools. The Catholic authorities unsuccessfully sought redress from the Dominion under the terms of the British North America Act. In 1875 a compromise was effected: urban school boards were permitted to lease Catholic school buildings, open public schools therein, and employ qualified religious teachers and others having the confidence of the Catholic clergy. Much the same working arrangement prevails in the towns and cities of New Brunswick as in Nova Scotia. There are 14 convent academies for young ladies, several preparatory boys' schools, and three classical colleges—Saint Joseph's, Memramcook (1864), which has the status of a university and forms an educational centre for the Acadian people; Sacred Heart College, Caraquet (1899), and Saint Thomas, Chatham (1910).

**Prince Edward Island.**—This province entered confederation in 1871, having then a public non-sectarian school system. There are no separate schools, but Catholics maintain a few private schools, including seven convent academies of the Congregation of Notre Dame and the classical college of Saint Dunstan's at Charlottetown.

**Manitoba.**—This province was created by an act of 1870 which, in terms resembling those of the British North America Act, guaranteed the permanence of all rights to denominational schools as then existent, and provided for an appeal to the Dominion against infringements of any other educational rights of the future religious minority. In 1871 a school system modeled on that of Quebec was established, with a board of education divided into Catholic and Protestant committees, 12 Catholic and 12 Protestant school sections, and an equal division of provincial subsidies. Later these grants were divided in proportion to school population. By 1890 Protestant school sections had increased to 629, Catholic to 90. In that year the legislature created a political department of education, and absorbed all schools into one non-sectarian system, to be supported by taxes which should be levied equally on all property-holders but applied only to schools conducted in accordance with the new regulations of the department. These prohibited all religious exercises except certain scriptural readings and prayers, approved by Protestants but not acceptable to Catholics. The judicial committee of the Imperial Privy Council decided in 1892 that the new laws were valid, as not infringing any right in existence in 1870. The Catholics then sought the other means of redress provided, an appeal to the Governor General. In 1895 the Privy Council declared their appeal to be, legally and materially, well founded, since there had been an infringement of rights acquired after 1870. In 1896 the Dominion government

\* Figures for 1914. The totals for 1915 are: teachers 226, pupils 2,295.

introduced into Parliament a bill to remedy the disabilities of Manitoba Catholics. Parliament's term expired before the bill was passed, and in the subsequent elections Wilfrid Laurier and the Liberal party, who had opposed the bill, were returned to power. Laurier, as Prime Minister of Canada, arranged a compromise under which the Manitoba schools are still administered. The trustees of a school may authorize some slight Catholic religious teaching, and one Catholic teacher must be employed in an urban school containing 40, or a rural school containing 25 Catholic pupils. The Pope, on the report of his special delegate, Mgr. Merry del Val, declared of the new settlement: "We have no doubt that these measures have been inspired by a love of fair dealing and good intention. But we cannot conceal the truth. The law made to remedy the evil is defective, imperfect, insufficient." Catholics have never accepted the settlement as satisfactory, but have been compelled to acquiesce in it. The French bilingual school districts, 137 in number in 1916, enjoy considerable liberty and maintain schools practically Catholic. In Winnipeg, Brandon, and a few other centres, private parochial schools are kept open under great difficulties. There are Ruthenian parochial schools in Winnipeg and Sifton. Seventeen convent schools offer secondary education for girls. In 1909 a Lesser Seminary for boys aspiring to the priesthood was established at Saint Boniface. Higher education is offered by Saint Boniface College, which since 1877 has been a federated college of the University of Manitoba, holding a position somewhat analogous to that of Saint Michael's in the University of Toronto.

**British Columbia.**—British Columbia entered confederation in 1870. Neither then nor since have separate schools been recognized. Catholics accepted without serious opposition the Public School Act of 1872, which organized a non-sectarian system, but protested strenuously, though unsuccessfully, against the School Tax Bill of 1876, which levied a special head tax for the support of these schools. Catholics maintain a number of private schools: 11 parochial schools, six academies for young ladies, and two colleges.

**Saskatchewan and Alberta.**—That portion of the Canadian West lying between Manitoba and the Rocky Mountains was in 1875 granted a certain local autonomy by the Northwest Territories Act, and in 1905 was formed into the provinces of Saskatchewan and Alberta. The Territories Act guaranteed to the majority in each district the right to establish such schools as they thought fit, with the concurrent right of the minority to establish separate schools. In 1884 the local legislature organized a school system resembling that of Quebec, with a Catholic and a Protestant section of the board of education, each supervising its own schools. Gradually this system was changed into one approximating to that of Nova Scotia, with the addition of a minority right to separate schools as in Ontario. Under the ordinance of 1901, which was the school law when the new provinces were created, education was administered by a political department of state, with a purely advisory educational council, two members of which must be Catholics. Religious instruction as directed by the trustees

might be given during the last half-hour of the school day in public or separate schools. The religious minority in any section might establish a separate school. Thus the public school in a section predominantly Catholic may be as much a Catholic school as the separate school in one predominantly Protestant. These rights to religious instruction and to separate schools were made permanent by the Dominion acts creating the provinces of Saskatchewan and Alberta. In each province all government schools, Catholic and Protestant, public and separate, are under control of the provincial department of education, are subject to the same regulations and the same inspection, use the same courses of study and the same textbooks and receive grants on the same conditions from the provincial treasury. In Saskatchewan the Catholic ratepayers of a section must support the Catholic school, if there is such. Complete statistics regarding these schools are not available. In 1915 there were in Saskatchewan 14 Catholic separate schools. There is a considerable number of private educational establishments, chiefly convent boarding schools. In Alberta there is a college, Saint Francis Xavier's, at Edmonton West, and a "Little Seminary" at St. Albert.

JAMES F. KENNEY,

*Public Archives of Canada, Ottawa.*

**23. LITERATURE.** In any discussion of Canadian literature the first point one must settle is, What is Canadian literature? What are its essential characteristics? Is it the work of men and women living in Canada, whether born there or not; or must we confine it to the writings of native Canadians; is its essential characteristic to be that its matter relates in some way to Canada, whether the author be native or otherwise; or is it to be restricted to work that is in its distinctive manner Canadian? And, in any of these cases, is it to be understood as including the quite respectable body of French-Canadian literature? In one of the older countries, the first definition would of course be rejected at once as inadmissible; but the conditions are somewhat different in a young country such as Canada, where one must come down to comparatively recent times to find anything like a large proportion of its writers native born. Yet even in Canada it would be undesirable to accept the first definition without reservations. The second would obviously give but a very limited and inadequate view of the literary product of the country. The third both includes too much and excludes too much. The fourth definition has much to recommend it, but would be exceedingly difficult to apply, and if strictly adhered to would necessarily exclude many important books written by Canadians. Probably the safer plan to adopt here, as in so many other cases, is a compromise, to include the best of what is distinctively Canadian in tone, whether by native Canadian or by adopted Canadian, without excluding that which, otherwise meritorious, is not peculiarly Canadian either in manner or matter. Finally, one can not justly or logically confine a survey of Canadian literature to that which has been written in English. Quebec is as much a part of the Dominion as Ontario, and the literature of the French-speaking province cannot be ignored unless one is

prepared to set aside a large and important part of the intellectual product of the country.

Canadian literature, both English and French, has the weaknesses, as well as some of the elements of strength, of a young country. Much of it is crude, particularly that produced in the early pioneer days of the colony. At the same time one finds evidence of a broader outlook, a tone and treatment less trammelled by artificial conventions, than is always noticeable in the literatures of older countries. As the country has developed, the crudity has largely disappeared, and at the same time much of the best of what has been produced in Canada since confederation, that is, within the last 50 years, retains the freshness, the atmosphere of youth, the virility, that helped to redeem the literary product of pioneer days from hopeless mediocrity. With a few exceptions, this sketch of Canadian literature will be confined to the confederation period. No attempt will be made to include all the writers, or even all the meritorious writers, of the last half century; the object the writer has in view is rather to consider briefly the work of a few, whose achievement may be taken as fairly representative of the quality and development of Canadian literature.

Of Canadian writers whose work was produced in the years before confederation, one stands preëminently first—Thomas Chandler Haliburton (q.v.). Indeed, it would be equally true to say that Haliburton stands head and shoulders above any other writer that Canada has produced up to the present time. He approached more nearly to the rank of true genius than any other Canadian. He was born in Windsor, Nova Scotia, in 1796; was educated at King's College, in his native town; practiced law in the ancient town of Annapolis; for some years sat on the Supreme Court bench of his province; removed to England in 1856, and became a member of the British House of Commons. He died at his beautiful home on the banks of the Thames in 1865.

Haliburton's life was in every sense a full one. In law, politics and literature, his brilliant intellect and forceful personality put him among the leading men of his generation. He was an ardent Imperialist, and at the time when the Little Englander had things all his own way in the British Parliament, he preached the doctrine of a Greater Britain, and blazed the way for a closer union between the mother country and her overseas dominions. As a Nova Scotian, he was a firm believer in the human and material resources of his native province, and used all the power of his virile pen to stimulate the ambition of his fellow-countrymen and drive them out of the narrow groove of provincial self-sufficiency into which they had fallen. The influence of Haliburton's writings extended far beyond the boundaries either of his own province or his own generation.

Haliburton was the author of three works of an historical nature, 'Historical and Statistical Account of Nova Scotia' (1829), 'The Bubbles of Canada' (1837) and 'Rule and Misrule of the English in America' (1851). His lasting reputation, however, rests upon his works of fiction, or rather of humor. He has been called the "father of American humor." It is hardly too much to say that he was the greatest humorist America has yet produced. He did not

depend upon exaggeration to produce the effects he sought. His writings are marked by both wit and wisdom. His humor is always genial. His satire is kindly, constructive rather than destructive. He can be caustic enough when laying bare hypocrisy, but never loses sight of the generous purpose that actuated all his works. There is very little plot in any of his books, but his character drawing is inimitable. Sam Slick has been rightly described as "among the best imaginative creations of modern times." But Haliburton will probably be remembered chiefly by reason of the aphorisms and epigrams that abound in his works. Many of them have become part of our everyday speech. He indeed anticipated more than one famous saying of later writers. The remark of the country girl in 'The Clockmaker,' "I guess I wasn't brought up at all, I grewed up," appeared a dozen years before it was repeated in 'Uncle Tom's Cabin'; and Sydney Smith's famous aphorism really belongs to Sam Slick, whom we find saying, "Ain't this a hot day? I do wish I could jist slip off my flesh and sit in my bones for a space, to cool myself." It would be idle to attempt to bring together here, even if it were desirable, the many wise and witty sayings that Haliburton puts into the mouth of Sam Slick and his other characters. Two or three examples will serve the purpose: "The sk'n is nearer than the shirt"; "power has a nateral tendency to cor-pulency"; "what people hope for, they think at last they have a right to"; "a nod is as good as a wink to a blind horse"; "a man who is a slave to his own rules is his own nigger"; "a woman has two smiles that an angel might envy; the smile that accepts a lover before words are uttered, and the smile that lights on the first-born baby and assures him of a mother's love." Haliburton's first book of humor was 'The Clockmaker; or, The Sayings and Doings of Sam Slick of Slickville,' which first appeared in book form in Halifax, in 1837. It was followed by 'The Attaché' (1843-44); 'The Old Judge' (1847); 'Wise Saws and Modern Instances' (1853); 'Nature and Human Nature' (1855). There were several others, but these contain his best work. 'The Clockmaker' was translated into German, and 'The Old Judge' into both French and German.

Putting aside several more or less feeble essays in Canadian history, we find in Christie's 'History of Lower Canada' (1848-55) the first noteworthy attempt, after Haliburton, to tell the story of a portion of British North America. Robert Christie (1788-1856) was, like Haliburton, a native of Windsor. He also practised law, and took an active part in the political life of his country. But there the resemblance ceased. As a writer he is almost unbelievably dull. Yet his history is valuable, for Christie was a careful and impartial historian, and made full use of the documentary material that he had collected, and much of which has since been lost.

John Charles Dent (1841-88), in his 'Last Forty Years' (1881), deals with the history of the country from the Union of 1841, where Christie leaves off, down to the year 1881. Dent was as conscientious and painstaking as his predecessor, and had the added qualification of a clear and attractive literary style. He also wrote 'The Story of the Upper Canadian

Rebellion' (1885), an admirable work, though somewhat controversial in tone. Dent was no admirer of the fiery leader of the rebellion, William Lyon Mackenzie, and lost no opportunity of expressing his feelings.

The most ambitious work of history yet produced in Canada is 'The History of Canada' of William Kingsford (1819-98). Kingsford was 65 years of age when he began the preparation of his great work, and he toiled at it continuously for over 13-years, living to see its completion, in 10 bulky volumes. His history is heavy in style, and not always to be relied upon on minor points, but generally speaking it is authoritative, and indispensable to the student of Canadian history.

A number of short popular histories of Canada have been written within the last 20 or 25 years, a few of which only are of sufficient importance to mention here. George Bryce's 'Short History of the Canadian People,' first published in 1887, and recently brought down to date, is a useful and readable work, in the manner of Green's history, though hardly comparable in style. Charles Roberts, better known as a Canadian poet and novelist, is also the author of a very readable 'History of Canada.' A third work of the same class is Sir John Bourinot's 'Story of Canada,' in the 'Story of the Nations' series.

Among more recent works dealing with individual phases of the history of Canada, much the most notable is 'The Siege of Quebec,' by Arthur G. Doughty, the Dominion archivist, and George W. Parmelee. The work, in six large volumes, is a monument of research, and must always remain the unquestioned authority in its particular field. It covers, with most minute care and scholarly accuracy, every detail of the historic siege of 1759, so far as the land operations are concerned. A companion work is William Wood's 'Logs of the Conquest of Canada,' dealing in the same scholarly way with the naval side of the siege. Colonel Wood has told the story of the siege, with equal charm and accuracy, in his 'The Fight for Canada.'

Dr. Doughty has shown in his three shorter works, 'Quebec under Two Flags,' 'The Cradle of New France' and 'The Fortress of Quebec' that an archivist, without sacrificing any of his scholarly principles, may, when he possesses the ability, put life and color into the dry bones of history.

The War of 1812 has been the subject of a number of histories written by Canadians and from a Canadian point of view. In fact, the most serious criticism that must be brought against most of them — a criticism that applies equally to many of the attempts by American writers to deal with the same conflict — is that they are hopelessly partisan and one-sided. To this class belong the histories of William F. Coffin, Gilbert Auchinleck and James Hannay. A much better piece of work is the 'War of 1812' of Major John Richardson (1796-1852). It inevitably has the defects of a book written by one who had taken part in the campaign, but Richardson, like most honest soldiers, was not a bitter partisan, and he had the advantage of being a trained writer as well as a soldier. In 1902 A. C. Casselman brought out a new edition of Richardson's History, enriched with copious notes, an excellent biography and a full bibliography. Another very readable and

useful book of Richardson's is his 'Eight Years in Canada,' which covers the period of Lord Durham's mission to Canada, and the administrations of Sydenham and Metcalfe.

Two words that admirably illustrate the modern scholarly method of writing history, are Sir C. P. Lucas' 'Canadian War of 1812,' and 'A History of Canada, 1763-1812.' Lucas has made excellent use of the splendid collections of documentary material in the Dominion Archives, brought together by the late Douglas Brymner and his worthy successor, Arthur G. Doughty, and on the whole, for the two periods of which he treats, his works will probably remain, for some time at least, the best available. With Wood's 'Fight for Canada' they form an entirely satisfactory treatment of the history of Canada from the Conquest down to the close of the War of 1812.

Charlevoix and Lescarbot, Champlain, Lahontan and Hennepin, although their books relate to the earliest history of Canada, can scarcely be regarded as Canadian writers. The first noteworthy history by a French-Canadian was the 'Histoire du Canada sous la domination Française' (1843), followed the next year by 'Histoire du Canada sous la domination Anglaise,' both by Michel Bibaud (1782-1857). Between 1845 and 1848 appeared a much more important work, one that still ranks as the best general history of the country in French, the 'Histoire du Canada' of François Xavier Garneau (1809-66). Garneau's influence was marked upon the intellectual life of French Canada. In 1852 he brought out a new edition of his work, carrying the narrative down to the year 1840, the first edition having stopped at 1792. The history is now being reprinted, with an introduction and very full notes by the historian's grandson, Hector Garneau, and a preface by Gabriel Hanotaux. It has also appeared in an English translation, by Andrew Bell.

Other notable historical works in French, are the 'Cours d'Histoire du Canada' of the Abbé J. B. A. Ferland (1805-65); 'Dix ans d'Histoire du Canada, 1840-50,' by Antoine Gérin-Lajoie (1824-82); 'Canada sous l'Union,' by Louis Philippe Turcotte (1842-78); 'L'Histoire de Cinquante Ans' of T. P. Bedard (1844-1900); and the 'Histoire des Canadiens Français,' by Benjamin Sulte. The Abbé H. R. Casgrain (1831-1904) was the author of several historical works, dealing with special phases of Canadian history, and marked by charms of style that make them delightful reading.

With a few exceptions, biography in Canada has been confined to the lives of men closely identified with the political history of the country. An important series of biographies, published in 1906, is 'The Makers of Canada,' in 20 volumes, each by a well-known Canadian writer. While inevitably unequal in style and treatment, they are all readable and trustworthy. Adam Shortt's 'Lord Sydenham,' D. C. Scott's 'John Graves Simcoe,' Jean N. McIlwraith's 'Sir Frederick Haldimand,' W. D. LeSueur's 'Frontenac,' George R. Parkin's 'Sir John Macdonald' and John Lewis' 'George Brown,' are particularly worth mentioning. Of earlier works of biography, two of the most valuable are Sir Joseph Pope's 'Memoirs of Sir John Alexander Macdonald,' and Sir J. S. Willison's 'Sir Wilfrid Laurier

and the Liberal Party.' Another admirable piece of biography is Charles Lindsey's 'Life and Times of William Lyon Mackenzie.' Several attempts have been made to write the life of the brilliant Nova Scotian statesman, Joseph Howe, but none are altogether satisfactory. The best, at any rate from a literary point of view, is the sketch by the late Principal Grant, published in 1904. One of the best of more recent Canadian biographies is George M. Wrong's 'Life of Lord Elgin.'

Biography in French Canada has generally been in the form of brief sketches, or collections such as Abbé Casgrain's 'Biographies Canadiennes,' Bibaud's 'Le Panthéon Canadien' and David's 'Biographies et portraits.' Notable exceptions are the lives of Papineau and Cartier, by the learned Librarian of Parliament, Dr. A. D. DeCelles; and Thomas Chapais' 'Jean Talon' and 'Montcalm.' Gravier's 'Vie de Samuel Champlain' is an admirable piece of work, but can hardly be classed in Canadian literature.

Some of the most important books of travel are associated with the early history of Canada, or of what is now Canada. Excluding the entertaining narratives of those who were merely visitors, there remain such remarkable works as Alexander Mackenzie's 'Voyages from Montreal through the Continent of North America' (1801); Bouchette's 'British Dominions in North America' (1832); Franchère's 'Voyage to the Northwest Coast of America' (1854); Harmon's 'Voyages and Travels in the Interior of North America' (1820); Paul Kane's 'Wanderings of an Artist among the Indians of North America' (1859); Grant's 'Ocean to Ocean' (1873); Mrs. Moodie's 'Roughing it in the Bush' (1852); and among more recent works, J. W. Tyrrell's 'Across the Sub-Arctic of Canada'; Coleman's 'The Canadian Rockies'; S. E. Dawson's 'The Saint Lawrence Basin and Its Border-Lands'; and L. J. Burpee's 'Search for the Western Sea.'

French-Canadian books of travel are represented by such readable works as the Abbé Casgrain's 'Un pèlerinage au pays d'Évangéline' (1887); Sir Adolphe Routhier's 'En Canot' (1881) and 'De Québec à Victoria' (1893); Faucher de St. Maurice's 'De Québec à Mexico' (1866); and Arthur Buies' 'Récits de Voyages' (1890) and 'Au Portique des Laurentides' (1891).

English-Canadian verse seems to have had its beginning in Nova Scotia, where in 1825 Oliver Goldsmith, a distant relative of his more famous namesake, published 'The Rising Village.' The poem, in manner an imitation of 'The Deserted Village,' records not unsuccessfully or without a certain effectiveness the rude pioneer life of the author's native province. With Charles Sangster (1822-93) came something more of skill in the art of poetry. His 'Saint Lawrence and Saguenay' (1856) and 'Hesperus' (1860), contain patriotic and other verse of some merit, simple, unpretentious, not very rich in ideas, but eminently sincere. A poet of an entirely different type, and of much greater power, was Charles Heavysege (1816-76). Heavysege published several volumes of verse, including a number of remarkable sonnets, but the work by which he is remembered is his dramatic poem 'Saul,'

first published in 1857. This is an elaborate piece of work, divided into three parts, each of five acts, and altogether about 10,000 lines. Heavysege was not an educated man, in the ordinary acceptance of the term, but his mind was saturated with the Bible and Shakespeare, and there are passages in 'Saul' not unworthy of either the sacred book or the great Elizabethan. Saul's vision, on the eve of his death, forms one of the most dramatic passages in English literature. Longfellow described Heavysege as the greatest dramatist since Shakespeare, and Coventry Patmore, perhaps a more discriminating critic, praised 'Saul' scarcely less unreservedly. Isabella Valancy Crawford (1851-87) published one slim volume of verse during her lifetime which, though it won her no recognition, contains verse of quite exceptional quality, sincere, musical, instinct with the poetry of common things. George Frederick Cameron (1854-85) was the author of a number of poems, which were collected and published after his death. He was a passionate opponent of tyranny and oppression, and one finds in many of his verses the lyrical expression of his sympathy with lost causes.

The year 1880 has been said to mark the Canadian Renaissance, because in that year appeared the first volume of poetry of one of a group of singers destined to put Canadian literature on a higher plane than it had hitherto reached. In this group are included Charles Roberts and his cousin Bliss Carman, Archibald Lampman, William Wilfred Campbell, and on or two others. Roberts' versatile genius has found expression in history, fiction and essays, but he is pre-eminently a poet. His verse, always scholarly and polished, gained steadily in power with the years. At first limited to classical themes, and more or less imitative, Roberts' more mature work gives expression to the atmosphere and color of Canadian woods and hillsides, the salt sea air of the Tantramar perhaps, and the problems of man's physical and moral contact with nature. The development of his genius may be readily traced from his earliest work in 'Orion' (1880), through 'In Divers Tones' (1886) and 'Songs of the Common Day' (1893), until it reached its highest point in 'The Book of the Native' (1897). Equally striking in their lyrical interpretation of Canadian scenes are the poems of Carman, contained in such of his books as 'Low Tide on Grand Pré' (1893), 'Behind the Arras' (1895), 'Ballads of Lost Haven' (1897) and 'Pipes of Pan' (1905). Carman's verse, like that of Roberts, reveals the influence of Shelley and Keats, and perhaps Tennyson; but each of these Canadian singers has a voice that is essentially his own. Each sat at the feet of the masters as humble student, but with the growth of knowledge and experience put his own distinctive personality into the interpretation of themes old and new. Campbell's earlier work, in 'Lake Lyrics' (1889) reveals many of the qualities that mark the verse of Roberts and Carman. What they had done to interpret the spirit of the Fundy shore, he achieved for the great inland seas. In his later books, 'The Dread Voyage' (1893) and 'Beyond the Hills of Dream' (1899), he strikes a more definitely human note, and touches with an assured hand many of the great problems of life. His

two dramas, 'Mordred' and 'Hildebrand' (1895) are powerful in conception, though somewhat unequal in treatment. Of all this group of modern Canadian poets, Lampman (1861-99) probably stood first as an interpreter of Canadian scenery. He was a poet first and always. Most of his short life was spent in and about Ottawa, and he knew intimately every beautiful nook and corner of the countryside. His gentle personality breathes through every line of the almost flawless lyrics he left behind. As William Dean Howells said of him: "His pure spirit was electrical in every line; he made no picture of the Nature he loved in which he did not supply the spectator with the human interest of his own genial presence, and light up the scene with the lamp of his keen and beautiful intelligence." Only two slim volumes of verse were published during his lifetime, 'Among the Millet' (1888) and 'Lyrics of Earth' (1896); but after his death his friend and fellow-poet, Duncan Campbell Scott, gathered together with loving care all of his work that seemed worthy of preservation and published it with an admirably judicious memoir.

Two other Canadian poets must be mentioned here. Each stands in a class by himself. Robert Service has put into his three books of verse, 'Songs of a Sourdough,' 'Ballads of a Chechako,' and 'Rhymes of a Rolling Stone,' much of the strange fascination of the Yukon, its magnificent mountain scenery, the cruel beauty of its winter nights, the brutality as well as the primitive virtues of the mining camps. William Henry Drummond (1854-1909) discovered to the world the simple, picturesque figure of the Canadian *habitant*, the peasant of French Canada. In 'The Habitant,' 'Johnny Courteau' and 'The Voyageur,' he interpreted with kindly sympathy, tender pathos and inimitable humor the life and character of the shrewd and simple-minded farmer of Quebec.

As one finds in the poetry of English-Canadian writers evidence of the influence of Shelley, Keats and Tennyson, so the work of French-Canadian poets reveals their indebtedness to Victor Hugo, Lamartine and Musset. Octave Crémazie (1827-79) is justly regarded as the father of French-Canadian poetry. He has only one volume of verse to his credit, and that was published by his friends after his death, but the sincerity and lyrical quality of his poems, no less than the spirit of patriotism with which they are instinct, have made them an inspiration to his fellow-countrymen. Louis Fréchette (1839-1908), more versatile and polished than Crémazie, left behind him a larger body of credible verse than any of his contemporaries. His first volume of poetry, 'Mes Loisirs,' appeared in 1863, and this was followed by 'Voix d'un Exilé' (1869), 'Pêle-Mêle' (1877), 'Fleurs boréales' and 'Oiseaux de Neige' (1879); 'La Légende d'un Peuple' (1887), and 'Feuilles volantes' (1891). Before his death he prepared a collected edition of all his verse that he wished to be preserved. He was essentially a lyrical poet, but, like Crémazie, avoided the passion of human love, making in this sense the sharp line of cleavage between the romantic school of France and the poets of French Canada, who in other respects looked to them for inspiration. Fréchette was beyond question the greatest poet that French Canada

has yet produced. A contemporary of his, Pamphile Le May, with less fine craftsmanship and versatility than Fréchette, but a more vivid imagination, has won for himself a secure place in the hearts of Canadians. He sings the songs of the people, he is a poet of the soil. In 1865 he published his 'Essais poétiques.' This was followed by a fine translation of 'Evangeline' (1870); 'Les Vengeances' (1875); 'Fables Canadiennes' (1881); 'Petits Poèmes' (1883), and 'Gouttelettes' (1904), the last a remarkable collection of sonnets. Another member of the same group was William Chapman—a true French-Canadian despite his English name. Chapman (1850-1917) put much very creditable verse into his four books, 'Les Québécoises' (1876); 'Feuilles d'érable' (1890); 'Aspirations' (1904), and 'Les Rayons du Nord' (1910). In 1895 a new school of French-Canadian literature had its birth in Montreal, of which Emile Nelligan and Albert Lozeau are the most notable exponents. These modern Canadian poets have attempted to transplant the spirit of Verlaine and Beaudelaire in the not altogether congenial atmosphere of Quebec. Yet they have produced some work of much more than passing interest.

It is impracticable here to do more than indicate very briefly the work in fiction thus far achieved by Canadians. James de Mille (1836-80) found leisure amid the preoccupations of his life as a college professor to write a number of romances and tales, the best of which were 'Helena's Household' and 'The Dodge Club.' William Kirby (1817-1906) was the first Canadian novelist to make use of the rich mine of romantic material offered by the early history of his country. His one romance, 'The Golden Dog,' still remains in many respects the best thing of its kind produced in Canada. Sir Gilbert Parker stands easily first among Canadian novelists. Since the publication of 'Pierre and His People' in 1892, he has written a succession of novels, romances and short stories, all good of their kind, and most of them dealing with some phase of Canadian life or history. Charles W. Gordon (Ralph Connor) has given us in 'Black Rock,' 'The Sky Pilot,' and his later novels, admirable pictures of life in the backwoods, lumber camps and mining camps of Canada. Norman Duncan in 'Dr. Luke of the Labrador,' and his fine series of boys' stories, has written of the sea and those who make their home upon its waters. Charles Roberts, already considered as a poet, is also favorably known as the author of a large number of very readable romances and short stories. Lucy Maud Montgomery (Mrs. McDonald) has made the little province of Prince Edward Island famous by her altogether delightful stories, 'Anne of Green Gables' and its successors. It may be convenient to include here the works of Stephen Leacock, who is perhaps rather a humorist than a novelist, and perhaps rather a wit than a humorist. His 'Literary Lapses,' 'Nonsense Novels' and 'Sunshine Sketches of a Little Town,' are brilliantly clever essays in a field that has hitherto been untried in Canada.

In French-Canadian fiction Philippe Aubert de Gaspé stands pre-eminent. He wrote only one romance, 'Les Anciens Canadiens,' but that is almost a national epic, and altogether a remarkable piece of work. He began to write it in his

74th year. "De Gaspé," says Camille Roy, "is at once the most eloquent, the most simple, the most charming narrator of Canada's past—the true epic singer of a marvellous phase of its history." "Les Anciens Canadiens" was translated into English by Charles Roberts. P. J. O. Chauveau wrote in 1853 one of the first Canadian novels, "Charles Guérin," a not very remarkable novel of manners. Antoine Gérin-Lajoie's "Jean Rivard" is of the same type, but more successful as a true picture of the life of a French-Canadian *habitant*. G. B. de Boucherville was the author of a very readable novel, "Une de perdue et Deux de trouvées." Other novels with a purpose are J. P. Tardivel's "Pour la Patrie"; Ernest Choquette's "Claude Paysan," and Hector Bernier's "Au large de l'Ecueil." Among the best examples of the historical novel in French Canada are Joseph Marmette's "Charles et Eva," "François de Bienville," "L'Intendant Bigot," and "Le Chevalier de Mornac"; Napoleon Bourassa's "Jacques et Marie"; Mlle. Angers' "L'Oublie"; and Sir A. B. Routhier's "Le Centurion."

What Camille Roy has written of French-Canadian literature may very fairly be said of the entire body of Canadian literature. It has no doubt at times been unduly imitative, yet "it must be acknowledged that, taken as a whole, the literature is indeed Canadian, and that in it the life of the people is reflected and perpetuated. Many of its works, the best in prose and in verse, breathe the perfume of the soil; and are the expression—original, sincere and profound—of the Canadian spirit."

In closing this sketch it is proper to refer to some of the intellectual influences that have helped to make Canadian literature what it is. First of these are the universities. McGill and Laval in Quebec, Toronto and Queen's in Ontario, King's and Dalhousie in the maritime provinces, to mention but a few of the more prominent colleges, have had an increasing influence in moulding the intellectual life of the Dominion. The establishment of the Dominion Archives at Ottawa, and provincial archives at Toronto, Victoria and other provincial capitals, with their growing treasures of documentary material, has helped to turn Canadian historians from secondary to original sources, and to make their product more scholarly and more accurate. In this and other ways one sees also the influence upon Canadian writers and Canadian literature of such societies as the Royal Society of Canada, the Ontario Historical Society, the Royal Canadian Institute, the Quebec Literary and Historical Society, the Nova Scotia Historical Society and the Champlain Society; and of such periodicals as the *University Magazine*, *Revue Canadienne* and *Canadian Magazine*, and the annual *Review of Historical Publications Relating to Canada*. Nor, finally, should we overlook the peculiar influence of two great writers who for many years were closely associated with Canada, and who each in his own way did much for Canadian scholarship—Francis Parkman and Goldwin Smith.

**Bibliography.**—Among a number of books and articles dealing with Canadian literature the following are worthy of particular mention: Adam, G. Mercer, "An Outline History of Canadian Literature" (in Withrow's "History of Canada," Toronto 1887); Bourinot, Sir John, "Intellectual Development of the Canadian

People" (Ottawa 1881); Hopkins, J. C., and others, "Canadian Literature" (in "Canada, an Encyclopædia of the Country," Toronto 1898); Lareau, Edmond, "Histoire de la littérature Canadienne" (Montreal 1874); McMurchy, A., "Handbook of Canadian Literature" (Toronto 1906); Marquis, T. G., "English Canadian Literature" (in "Canada and Its Provinces," Toronto 1912); Roy, Camille, "French Canadian Literature" (in "Canada and Its Provinces," Toronto 1912).

LAWRENCE J. BURPEE,

Secretary Canadian Section of International Joint Commission, Ottawa.

**24. CANADIAN UNIVERSITIES.** There are in Canada 22 universities, and some of these have federated and affiliated colleges. As each of the universities and colleges mentioned in this article is separately dealt with under its own name only a general summary, following the line of the provinces from east to west, is attempted here.

**Maritime Provinces.**—The University of King's College, Nova Scotia—the oldest university in the British overseas dominions—had its rise in the foundation of an academy at Windsor in 1788 by the provincial legislature. In the following year an act was passed incorporating King's College, and in 1802 it received a royal charter and a provincial grant. It was founded as an Anglican institution—a character it still retains. One of its statutes provided that "no member of the university shall frequent the Romish Mass, or the meeting-houses of Presbyterians, Baptists, or Methodists, or the Conventicles or places of worship of any other dissenters from the Church of England." As three-fourths of the population came under this comprehensive "test," an agitation was speedily set on foot for its removal, which failing, Pictou Academy was founded in 1816 as an undenominational college. Two years later Dalhousie College was founded at Halifax as a provincial university modeled on the Scottish pattern, and was opened for teaching in 1838. An applicant for a position on the original teaching staff of Dalhousie College was a distinguished Baptist, the Rev. Dr. Crawley, but as his application was not entertained—it was alleged on sectarian ground—and the Baptists were unrepresented on the staff, the drastic remedy was taken of founding (1838) a denominational institution, Acadia College, Wolfville. The Presbyterian College, established in affiliation with Pictou Academy in 1820, has made no fewer than four migrations, and is now located at Pine Tree Hill, near Halifax. Saint Francis Xavier College was founded at Antigonish in 1854, and is the chief Roman Catholic foundation in the maritime provinces. Other institutions belonging to the same communion in Nova Scotia are Saint Mary's College, Halifax, founded in 1860; College Sainte Anne, founded on behalf of the French population by the Eudist Fathers in 1890; and the Seminary of the Holy Heart, founded at Halifax in 1895, also by the Eudist Fathers. Two attempts have been made to unify the university system of the province by the foundation of a University of Halifax, embracing all the degree-conferring colleges of the province, but these have been unsuccessful. New Brunswick College was founded at Fred-

erected in 1800 as an Anglican institution; in 1829 it received a charter as King's College, and in 1859 it became undenominational and received a charter as the University of New Brunswick. The University of Mount Allison College was founded in 1862 to serve the higher educational needs of the Methodists of the maritime provinces; and in 1864 Saint Joseph's College, Memramcook, was established by the Roman Catholics for the Acadians and others of that communion.

**Quebec.**—McGill University, Montreal, had its origin in the bequest by James McGill, a public-spirited citizen of Montreal, of land and buildings on the outskirts of Montreal, and the sum of £10,000 for university purposes. The college received a royal charter in 1821, was formally opened in 1829, and has always been undenominational. The University of Bishop's College, Lennoxville, is an Anglican institution, was founded as a high school in 1843, and received a royal charter as a university in 1853. Laval University, Quebec, was founded in 1852 and named in honor of the first bishop of New France, who founded the seminary of Quebec in 1663, and of which it is the legitimate descendant. This university has a branch establishment, or second seat, at Montreal.

**Ontario.**—Governor Simcoe was the first to propose the establishment of a university in Upper Canada, but it was long after before any scheme took definite shape. The contiguity of the province to the United States, the high educational standard even then attained in that country, and the absence of educational facilities in upper Canada, forced the well-to-do to send their sons across the border for education, where, at the formative period of their lives, they were subjected to the influence of American textbooks and American teachers and breathed the atmosphere of an anti-British democracy—a condition of affairs that was little to the liking of the zealous church-and-state men who formed the official class in Upper Canada. John Strachan afterward Anglican bishop of Toronto, obtained in 1827 a royal charter for the founding of King's College, which was to be an Anglican institution, subscription to the Thirty-nine Articles being a condition for the holding of office by the staff and council. This attempt to establish an Anglican monopoly in higher education was as hotly resisted by the majority of the people of Upper Canada was the endeavor to create a monopoly in religious endowments, and gave rise to an educational controversy that continued for 22 years. Little was accomplished toward founding the college for a number of years; in 1837 an amended charter abolished the denominational test, but left the sore open by permitting the theological chair to remain in Anglican control. In 1843 King's College began operations in Toronto. Other colleges were concurrently founded under denominational auspices. Regiopolis College was founded by Bishop Macdonell at Kingston as a Roman Catholic institution in 1837, but owing to financial difficulties, closed its doors in 1869. Queen's College, Kingston, a Presbyterian institution, was incorporated in 1839 and began the work of teaching in 1842 in a "clapboard building." Victoria College, a Methodist institution, was incorporated by act of

Parliament in 1841 and opened at Cobourg in 1843. Knox College, Toronto, which derived its impulse from the Scottish Church disruption of 1843, was opened by the Free Church of Scotland in 1844. Saint Joseph's College, Ottawa (College of Bytown), was founded by Bishop Guigues of Ottawa as a Roman Catholic institution, and erected into the University of Ottawa in 1866. Between 1843 and 1849 five legislative attempts were made to deal comprehensively with the university problem, and in the latter year the Baldwin Act completely secularized King's College and transformed it into the University of Toronto. Bishop Strachan, now an old man of 72, faced the new situation, which imposed a "godless university" on the province, with indomitable courage; he proceeded to England and after a vigorous campaign obtained a royal charter in 1852 for the University of Trinity College, which remains to this day a monument to his pertinacity and embodies his ideals in higher education—a denominational, collegiate and residential institution modelled on Oxford and Cambridge, in preference to the professorial teaching of the Scottish university system of which he was himself the product. Huron College (now the Western University) was established at London in 1863, and Wycliffe College, Toronto, was founded in 1879 by the Low Church party, both being offshoots of Trinity College. Saint Michael's College, Toronto, was founded as a Roman Catholic institution by Bishop Charbonnel in 1851. A bill introduced into the Parliament of United Canada, by Mr. (afterwards Sir Francis) Hincks, providing for the separation of the teaching function from that of examining and conferring degrees, received the royal assent in April 1853, and from that date until federation University College represented the teaching side of the University of Toronto. In 1860 a Baptist college was opened at Woodstock, the theological teaching in which was later merged in McMaster University, Toronto, founded by the munificence of Senator William McMaster, and which obtained a charter in 1887. The provision of denominational colleges in Ontario was thus more than ample and had vastly outrun the means of subsistence, and meantime adequate funds with which to finance the expensive modern equipment in science and medicine were urgently required. A movement for federation had been gathering force since 1874, and 10 years later it took active shape when Mr. G. W. (afterwards Sir George) Ross, the then provincial minister of education, summoned a meeting representative of the various colleges, to consider the question. Following on a series of discussions extending over three years, a federation act was passed in 1887, under which all the federating colleges find representation on the senate of the University of Toronto. The theological colleges of Wycliffe, Knox and Saint Michael's were the first to accept federation; Victoria entered in 1890; and the medical faculty of Trinity University was incorporated in 1903. Queen's University, which ceased to be a distinctly Presbyterian institution in 1912, and McMaster University remain outside federation.

**Prairie Provinces.**—The University of Manitoba was first established at Winnipeg in 1877 as a federation of denominational colleges

on the model of London University—the constituent colleges being those of Saint Boniface (Roman Catholic), Saint John's (Anglican), and Manitoba (Presbyterian). Wesley College (Methodist) became affiliated in 1888. The University of Saskatchewan was founded at Saskatoon in 1909, when Emmanuel College, Prince Albert, which was originally founded by Bishop McLean in 1879 as a college for native helpers, was transferred to that city. The University of Alberta was founded by the provincial legislature in 1906, provision was made for a site at Edmonton in 1907, and the first session opened in 1908.

**British Columbia.**—In 1907 an act was passed by the provincial legislature setting apart lands as a university endowment, in the following session the institution was incorporated, and in 1915 it was opened at Vancouver.

D. S. DOUGLAS,

*Editorial Staff of The Americana, Toronto.*

**25. RELIGIOUS CONDITIONS.** The religious and ecclesiastical life of Canada cannot be understood without some reference to the sources from which it sprang. The same great forces and influence which molded the history of the Old World re-appear here, but modified in their action and combinations by the new and freer environment in which they work. Broadly speaking, the three great British peoples which form the bulk and basis of the Dominion, brought with them the Anglican, Presbyterian and Methodist forms of religion, while latterly the tides of alien immigrants have brought with them varieties of the Eastern and Western Catholic churches. The dominating religious life of Canada is Protestant, save in the province of Quebec which is almost exclusively Roman Catholic and French-speaking. As a whole Canada is distinctively a Christian country, not so conservative on the one hand as Great Britain, or on the other hand so liberal as the United States, 85 per cent of the population belonging to the Roman, Presbyterian, Methodist and Anglican churches.

**General History.**—The Roman Catholic Church is the oldest and largest of the ecclesiastical bodies in Canada. It has its chief seat in the province of Quebec. In Canada, under French rule, it was all-powerful, and in its origin it was distinctively missionary. The Jesuits were the pioneers and, from the Saint Lawrence to the Rockies, have left an imperishable record. While to-day the largest section by far of the Roman Catholic is French speaking, a considerable body of Roman Catholics is found in the other provinces representing in their lineage and traditions the Catholics of the north of Scotland and south of Ireland. In the western provinces from Winnipeg to the Pacific the Roman Catholic Church is strong in influence and membership. See the article on the **ROMAN CATHOLIC CHURCH.**

*The Church of England* in Canada began with the settlement in Nova Scotia (known of old as Acadia) of certain English immigrants who came in government ships to Halifax in 1749, and built Saint Paul's Church for the peoples' worship (1750). The incoming of the United Empire Loyalists (Americans who determined to remain loyal to the Brit-

ish Crown) in 1783-84 gave a great impetus to the Church of England, for the vast majority of them were Episcopalians, and in 1787, Dr. Chrales Inglis was consecrated in Lambeth in England, as bishop of Nova Scotia, the first bishop of the Church of England in Canada. His diocese included New Brunswick, Newfoundland, Prince Edward Island and Upper and Lower Canada. In the year 1793 Dr. Jacob Mountain was consecrated as bishop of Quebec, and all Canada west of Quebec was under this jurisdiction until 1839 when Dr. John Strachan was made bishop of Toronto, the Anglican population of Upper Canada comprising his episcopate. About this time the new Canadian spirit of the church began to manifest itself. Before this the Anglican Church had depended for its support largely upon the charity of the missionary organizations of the mother church in England, especially the Society for the Propagation of the Gospel, but in 1842 it was felt that self-respecting Canadian churchmen should begin to support their own church and ministry, and the Church Society of the Diocese of Toronto became the pioneer of the system of parochial self-support now almost universal in the Canadian church. Another very remarkable event in the life of the Canadian church was the emergence of the democratic and independent spirit of self-government. All the bishops of the Anglican Church in Canada were accustomed to receive their commission from the British government, and their consecration in England, and the members of the church had nothing whatever to say in the matter. But after no little discussion and difficulty the Canadian bishops determined to have their own jurisdiction and synods, and in the years 1857-59 asserted their ecclesiastical independence by holding synods in Toronto and Quebec where the clergy and laity meeting on equal footing might transact the affairs of the church. The year 1862 marked also a new era in the history of the Canadian Church, for in that year Dr. Lewis was elected bishop of the diocese of Ontario, and instead of crossing the ocean for consecration at the hands of the archbishop of Canterbury was consecrated on Canadian soil by Canadian bishops. From that time the church expanded remarkably, and whereas a little over a century ago there was only bishop and a few scattered clergy for all Canada there are now 28 dioceses with 1,750 clergy, nine church colleges and three church universities; two missionary dioceses in China and Japan, a large body of missionaries in Japan, China, India, Africa, Palestine and South America with native workers, and Christian schools and orphanages and hospitals; over 2,000 churches and Sunday schools; and over \$3,500,000 contributed annually for church purposes and missions. The laws of each diocese are under the control of the Synod of the Diocese which as a rule meets annually and is composed of the clergy and lay representatives from each parish and mission. The whole church in Canada is represented in the General Synod which meets once every three years, presided over by the leading archbishop, who is the Primate of the Church of England in Canada. The outstanding features of the progressive life of the Anglican (or Protestant Episcopal) Church in Canada during the past few years, have been the remarkable progress

of the missionary life of the church at home and abroad, the stimulation of the Sunday school and educational work by the establishment of the Sunday school commission, the authorization of the new Canadian Church Hymn Book (the Book of Common Praise) as the one book for use in all the churches, and the revision of the Prayer Book as the Canadian Book of Common Prayer approved by the General Synod held in Toronto, September 1915.

*The Presbyterian Church in Canada* traces its descent to several distinct sources. The attempt made in the 17th century to found Huguenot settlements failed disastrously and few traces remain of their existence. Among the Presbyterian Loyalists who came to Canada at the close of the Revolutionary War there was a goodly number of descendants of Huguenots. In 1749 Protestant colonists were brought into Nova Scotia from England and the Continent, in order to counteract the disaffection of the Acadians. Again in 1755, after the expulsion of the Acadians, many Protestants from Great Britain and older colonies along the Atlantic coast were induced, by the promise of liberty of conscience and of worship, to occupy the vacant lands. Then there was a large influx of immigration from the north of Ireland and from Scotland. Some districts, such as the county of Pictou, were almost exclusively occupied by Scotch Presbyterians. These people naturally clung to the various ecclesiastical bodies into which Scotch Presbyterianism was divided. And accordingly there were Presbyteries constituted with relations to the Kirk of Scotland and the Secession Church in its two subdivisions of Burgher and Anti-Burgher, and also adherents of the Reformed Presbyterians or Covenanters. The great disruption of the Church of Scotland in 1843 extended to the colonies and added to the existing divisions the Free Presbyterian Church. But in 1861 the process of reunion began with the union of the United Secession Church (inclusive of both Burgher and Anti-Burgher) and the Free Church of the Maritime provinces into one synod.

The history of the Presbyterian Church in the Western provinces followed similar lines but with new complications. Soon after the conquest, Presbyterian congregations were organized in the cities of Quebec and Montreal. Among the Loyalists were not a few Presbyterians. But there was scanty provision for their religious needs. Applications for ministers made to the churches in Scotland met with no response for many years. A similar appeal made to the "Associate Reformed Church" in the United States resulted in the incoming of a number of ministers from that country. Other ministers followed from Scotland and Ireland. In 1818 was organized "The Presbytery of the Canadas." In 1831 there was organized a synod in connection with the Church of Scotland. In 1840 the two synods were united into one. But in 1843 the great disruption in Scotland again rent it assunder and two synods resulted, one in connection with the Established Church of Scotland and the other in connection with the Free Church of Scotland. Besides these there were other independent Presbyteries, one at Niagara and the other at Stamford, composed of ministers from the United States, and a third

originated by ministers from Scotland and from Nova Scotia, connected with the "United Presbyterian Church." The first two were disbanded and absorbed into the larger bodies. The third, in 1861, united with the Free Church and the combined body received the name of the Canada Presbyterian Church. In 1875 the greater union was consummated by which all the Presbyterian bodies throughout Canada from east to west, were united in one great Canadian Presbyterian Church. This was an epoch making, and epoch-marking event in the history of Canadian Presbyterianism. It unified the life of the church, and became the starting point of its missionary energy both in the Canadian and world-wide field.

Until the greater union was consummated little had been attempted by the Presbyterians in the evangelization of the Northwest. In 1812 and 1816 a large body of Highlanders had settled in the Red River district, but the only ministers they had were those of the Church of England until 1852, when the Rev. John Black, a devoted missionary, organized them into a congregation. Little more was done until after the federation of Canada and the complete union of the Canadian Presbyterians. In 1881 the General Assembly appointed the Rev. Dr. James Robertson to be superintendent of Presbyterian missions in the Northwest. This remarkable man laid the foundations of Presbyterian organization throughout those vast territories and covered the whole country with a network of Presbyterian missions, so that now (1916) in place of one there are eight district superintendents. The Presbyterian Church in Canada is one of the dominating religious forces of the Dominion, and to-day with 1,899 ministers, 3,815 Sabbath schools, 333,457 communicants, eight theological colleges, church property valued at \$23,447,000, it stands at the very forefront of the Protestant life of the Dominion. The Presbyterian Church in Canada was the first branch of the church in the world to put social service and evangelism together, having evangelical social settlements and redemption homes from Sydney and Montreal and Toronto to Winnipeg, Calgary and Vancouver.

*The Methodist Church in Canada* traces its origin to two distinct sources, England and the United States. In 1770 Lieutenant-Governor Franklin sought English settlers for the province of Nova Scotia in the East Riding of Yorkshire. Among them were the earliest Methodists of Canada, one of whom was the noted preacher and evangelist, John Black. In 1784 he went to the United States, and his appeal to the Baltimore conference led to the coming of a number of Methodist ministers to the Maritime provinces. In Quebec the first Methodist preachers were connected with the British regiments. As early as 1778 Methodists from New York State came to the Eastern Townships and to Upper Canada. The Methodists did a noble work in laying the foundation of religious life and worship in many districts in Canada, especially in the province of Ontario, a great impetus being given by the labors of Barbara Heck. Until the War of 1812 Canadian Methodism was closely connected with that of the United States. Negotiations were then entered into with the British Wesleyans. Unhappy dissensions followed. While

one party was anxious to maintain the American connection, the other insisted that, as loyal British subjects, they should look to the mother land. A compromise was arrived at by which the American connection was to be observed in Upper Canada, while the British missionaries were to be free to enter Lower Canada, and the Maritime provinces. This compromise was of short duration; for when, in 1828, the American conference relinquished its jurisdiction over the Canadian conference and the latter was independently organized under the name of the Methodist Episcopal Church in Canada, the British conference decided not to confine its work to Lower Canada. After much controversy, in 1833 a union between these two branches of Methodism was consummated under the name of "The Wesleyan Methodist Church in North America." But, notwithstanding this union the Methodist Episcopal Church survived in a new form and increased very rapidly.

Methodist missionary work had its origin among the Indians of Ontario in 1829, and in the Northwest began about 1840. Its annals abound with noble achievements. There then existed in Canada five principal Methodist bodies. In addition to the two main bodies already mentioned, different branches of British Methodism had been brought into the country, namely, the Methodist New Connection, the Primitive Methodist body and the Bible Christians. All these became firmly rooted in Canada and developed into strong bodies. The need of unification began to be earnestly discussed as early as 1866. In 1873 a union was consummated between the Wesleyan, the New Connection, and the Eastern British-American Conference, but it was not until 1883 that, at a general conference held in Belleville, the union was consummated. Then all the Methodist bodies, hitherto locally or ecclesiastically separated, were brought together; and, from the Atlantic to the Pacific, there is now one great Methodist Church of Canada, with 2,337 ordained ministers, 3,821 churches and 1,639 other preaching places, 376,761 church members, and 3,824 Sunday schools, with 41,929 officers and teachers and 420,210 scholars. There was contributed for all missionary work, through her various boards and funds, \$1,170,434; she has invested \$7,200,391 in her educational institutions, and her activities seek the evangelism of both the individual and society, and the application of the principles of the gospel of Jesus to all the moral, economic, social and political relations of life.

*The Baptist Churches* derived their origin from the American Baptists. From 1760 onward there are traces of individual Baptists in different localities in Nova Scotia. In 1820 the first Baptist association was formed for the Maritime provinces. The first Baptist Church in Lower Canada was formed in 1794, and consisted chiefly of Loyalist refugees from Connecticut. In 1795 another was organized in Upper Canada. The first Baptist Church in Montreal was not organized until 1830. The Baptists of Canada to-day (1917) occupy a very strong position. With 885 ordained ministers, 1,335 churches, and a membership of 138,197, they represent a very strong religious force in the life of the Dominion. Their leading educational institutions are the Acadia University and Seminary in Wolfville, Nova Scotia, the

Woodstock College in Woodstock, Ont., the Brandon College in Brandon, Manitoba, and chiefly the McMaster University in Toronto. In Sunday school work, missions both home and foreign, and in social service, the Canadian Baptists are always to the fore.

*Congregationalism* has never found a strong footing in Canada. A few scattered adherents came from New England to Nova Scotia in 1758. In the eastern townships Congregationalism was founded in 1811 by settlers from Massachusetts, and in Ontario some 10 or 12 years later. Nothing was done west of Ontario until 1879, when work was begun in Winnipeg. There are in Canada about 13,000 members, and 100 ministers mostly in Ontario, with a few congregations in Nova Scotia, Quebec and the Northwest.

*The Evangelical Lutheran Church* in Canada dates from the middle of the 18th century. The first German Lutheran landed at Lunenburg, Nova Scotia, in 1749. The first Lutheran congregation in Upper Canada was founded in 1775. Others came in with German immigration. In 1853 the Canada Conference of the Lutheran Church was founded. The main body of Lutherans is in the district of Ontario near the city of Berlin (in 1916 changed to Kitchener) and in the Northwest where large numbers of Swedes and Norwegians are found. There is an Icelandic branch of the Lutheran Church in the Northwest.

There are a number of small religious bodies in Canada, none of which exercises any appreciable influence upon the religious life of the country; chief among them are The Disciples and The Brethren, The Adventists and Mennonites. There are a few Unitarians and Quakers, and the Russellites, Theosophists and Christian Scientists have increased not a little, especially in the cities. The Salvation Army has acquired a considerable foothold in the larger cities and towns, and has latterly given much of its strength to the development of social work in the towns and cities.

There are four paramount considerations which have profoundly affected the whole religious history and development of the Dominion namely, the relations of the churches to the state and to education, their beneficent and missionary activities, and the problem of church union.

**Church and State.**—In the 18th century the authorities believed that an Established Church was necessary in order to secure the loyalty of the colonists, and it was, without doubt, the intention of the British government to maintain an Anglican establishment in Upper Canada the counterpart of the Roman Catholic establishment in Lower Canada. In 1791 the Constitutional Act was passed reaffirming the provision of previous legislation which gave the King the right to set apart for the support of the "Protestant clergy" the seventh part of all ungranted Crown lands. This was the origin of the "clergy reserves" (see CANADA—THE CLERGY RESERVES). The ambiguity of the term "Protestant clergy" admitted of a variety of interpretations. The Anglican clergy maintained that they alone were intended by the designation. The few clergy connected with the Established Presbyterian Church of Scotland contended that they had an equal right to it, and their claim was supported by eminent

legal authority in England. The Methodists, in general, resisted such an appropriation of the public lands, but the British Wesleyans urged an acceptance of a portion of the "clergy reserves." After years of fruitless ecclesiastical strife, an act was passed by the legislature of Upper Canada, by which the lands were handed over to the municipal corporations of the province for secular purposes, provision being made to satisfy the claims of existing incumbents. In lieu of these claims there was paid over to the Church of England the sum of \$1,103,405; to the Church of Scotland, \$509,739; to other Presbyterians, \$8,962; to the Wesleyan Methodists, \$39,074; and to the Roman Catholics in Upper Canada, \$83,731. The Anglican Church was thus delivered from what might have been its ruin in Canada, and the people of the province released from a grievous injustice and a source of political discontent and strife. In those days the representatives of the churches of England and Scotland, especially the former, had a certain status accorded to them, denied to other denominations. The Methodists were most unjustly charged with disloyalty, to which their connection, in origin and government, with the United States gave some color of plausibility. Until 1830 the Methodists and other dissenters had no right to hold land for places of worship or for the burial of their dead, nor had the Methodists and their ministers the right to solemnize matrimony, even among their own people. It was only after long and bitter controversy that laws were passed authorizing the various religious bodies to hold land for churches, parsonages and burial grounds, and empowering their ministers to celebrate marriages. At the present time all the leading Christian bodies are in a position of practical equality, and marriages can be performed by members of every church and religious denomination duly ordained, and also by any elder, missionary or evangelist of the so-called Congregation of God and of Christ, the Disciples of Christ, the Brethren or any duly appointed commissioner or staff officer of the Salvation Army. Marriages by a magistrate or justice of the peace are unknown in Canada. No civil official is qualified by any legislative act in Canada to celebrate marriage. It is evident then that there is throughout Canada complete separation of church and state, with the exception of the peculiar position held by the Roman Catholic Church in Quebec, secured by treaty and the terms of British occupancy of that province. Canadians believe in a church-supported state, not in a state-supported church, and with a few exceptions the religious spirit of the Dominion is remarkably free and democratic.

**The Church and Education.**—So long as France held Canada, education was entirely in the hands of the Roman Catholic Church. The Jesuits, Franciscans and other orders laid the foundations of the colleges and seminaries which hold an important place in the education of Lower Canada. Thus the system of education was entirely ecclesiastical. Under British rule the attempt was made to establish free schools common to the whole population and unsectarian in character. This was found to be impracticable. With the union of the two provinces in 1841 separate schools had to be conceded to the Protestants in Lower Canada

because the public school system was essentially Roman Catholic; and when, in the same year, the first attempt at a general system of public schools was made in Upper Canada, the Roman Catholics there secured the concession of separate schools, but in a very limited way. This, for many years, was a subject of controversy, political as well as religious, the Liberal party demanding the abolition of separate schools and the Roman Catholic authorities seeking the complete control of the education of their children. Finally, on confederation in 1867, the separate school system was bound upon the province of Ontario; although, as is noteworthy, there are more Roman Catholic children in the public schools of Ontario than in the separate schools. In the Maritime provinces and in northwestern Canada there are no separate schools.

While public school education has been removed from the control of the churches (except in Quebec) the great body of the people are anxious that it should not be divorced from the sanctions and influences of religion. In the province of Ontario, the public schools are, with few exceptions, opened daily with prayer and the reading of the Scriptures. In not a few, the Bible is carefully taught. But much depends not only upon the character of the teachers, but also upon the disposition of the school trustees, to whom the law gives a large discretion in this matter. There is a strong feeling growing in the community at large and expressed by resolutions of the different church legislatures that there is urgent need of more ethical and Biblical teaching in the schools and that it is possible to secure it upon lines acceptable to the great majority of the people and with proper regard for the conscientious convictions of those who may differ from them.

Sectarian jealousies greatly hindered the development of higher education in all the older provinces. The struggle in Ontario occupied a very large place, both in the politics and the religious life of the province. The attempt to create a national university was for a long time prevented by the exclusive policy of the Anglican authorities, who used public funds for the establishment of King's College in 1843 (the charter was obtained in 1827) upon an exclusively Anglican basis in spite of the desire of the first bishop who desired to have it upon a broader national line. In 1849 King's College became the University of Toronto, upon a broad undenominational basis, but not until the Church of Scotland, shut out from King's College, had established Queen's University, and the Methodists founded Victoria University, which is now federated with the University of Toronto. Other denominational colleges sprang into existence. After the secularization of King's College, Trinity University was established by Bishop Strachan, upon an exclusively Anglican basis. The leaders of the broader policy had been broad-minded Anglican laymen, and it was laymen of the same type who, in 1877, established Wycliffe College, federated with the University of Toronto and upon a distinctively evangelical or Low Church basis, as opposed to the High Church position of Trinity University. The latter has not realized the expectations of its founders, and in 1904, abandoned its position of isolation and connected itself with the University of Toronto as

a federated college. The result is that, in Ontario to-day, there are Church of England, Presbyterian, Methodist and Roman Catholic colleges federated with the Provincial University; while, apart from it, there still stand the Presbyterian University of Queen's, the Baptist University of McMaster and several Roman Catholic institutions. In Montreal, McGill is virtually a Protestant university, and has affiliated with it Presbyterian, Methodist, Congregational and Anglican schools of theology, which are themselves affiliated in a measure of theological teaching. In Quebec, Laval University is a Roman Catholic institution and the oldest in Canada. In each of the provinces of Nova Scotia and New Brunswick a university was founded under the name of King's College and sustained by means of land and money from the public treasury, but upon an exclusively Anglican basis. The one in Fredericton was remodeled and became the University of New Brunswick, upon a broad, undenominational basis; the other, in Windsor, Nova Scotia, ceased to receive provincial support but remained an Anglican university and theological college. Dalhousie University, in Halifax, while undenominational, has not the status of a provincial university. The Presbyterians have a theological college in connection with Dalhousie. The Baptists have a university in Acadia, Nova Scotia; and the Methodists a university and theological college in Sackville, New Brunswick.

**The Work of the Churches.**—The Roman Catholic Church carries on a great variety of charitable work in asylums, houses of refuge and reformatories. In the province of Quebec all the provincial institutions are under Roman Catholic control. In the cities the Protestants have distinct institutions controlled by boards representative of the chief Protestant churches. In Ontario, the Roman Catholics are upon the same footing with Protestants in the provincial institutions. In many cities and towns the former have their own hospitals and reformatories, which receive provincial aid in proportion to the number of patients treated. This plan also prevails in the other provinces to a less extent. In other cases, special provision is made for Roman Catholic religious services in addition to the Protestant services.

The charitable work of the Roman Catholic Church is carried on by the various religious orders, many of which are specially devoted to the relief of the poor, the sick, and the fallen.

The work of home missions within the Dominion in connection with the different churches reaches out to every corner of the land, and to the Indians and Eskimos. Foreign missionary work is prosecuted with great vigor by all denominations. Among other good works of an inter-denominational character may be mentioned the Bible Society, the Religious Tract Society, the Evangelical Alliance, the Young Men's Christian Association, the great Christian movement organized by Mr. Mott among university students, the young people's societies, such as the Christian Endeavor, the Epworth League and the Saint Andrew's Brotherhood, and above all the Laymen's Missionary Movement which has done so much to unify the evangelical forces of the Dominion, and to stimulate the missionary and evangelistic life of all the churches in Canada. The or-

ganization of women in the home and foreign missionary work of all the churches and in various other associations has greatly stimulated religious life and work. The reverent observance of the Lord's Day throughout Canada has been a marked feature in its religious life. Church attendance has, on the whole, been well maintained. The laws against Sunday excursions and other violations of the Sabbath rest are effectively enforced. The Lord's Day Alliance has the co-operation of the labor unions as well as of the churches in the protection of the Lord's Day. The Protestant churches in Canada exercise a very strong influence upon legislation, education and the press. While not unaffected by modern controversy, their attitude generally has been, on the whole, conservative, while the general tone is more liberal and less acrimonious than in the past.

Old prejudices are passing away. A noteworthy illustration of this is furnished in the public worship of the Presbyterian Church, one section of which refused to use anything except the metrical version of the Psalms, regarding even the use of the paraphrases as a serious and hurtful innovation. Now all are united in the use of a hymn book which contains hymns of all sections of the Church of Christ. In many cases the worship has become more liturgical even in non-liturgical churches. Old controversies have passed into oblivion. Greater liberty both in action and in thought is found in all communions.

It is more than possible that with this enlargement and liberty, there has been a corresponding diminution in the intensity of the religious spirit and a growing laxity within the churches which many regard with apprehension. Family worship is not observed as it once was, the children are not as familiar with the Scriptures as were their parents, and many things are tolerated in professedly Christian families which would a generation ago have been rigidly excluded. It is a time of unrest and transition. But in the midst of much change, the churches in the main hold firmly to the fundamentals of the Christian faith, and in all are found devoted men and women who earnestly follow after the ideals of truth, purity and righteousness.

Among the Anglicans, while the Oxford or Tractarian movement has exercised considerable influence, especially among the clergy, it has seldom reached the extremes seen in England. The majority of the laity have only been slightly affected by it, and they have continued decidedly Protestant. The Presbyterians have exercised a strong influence upon the national ideals of righteousness, and have set a high standard in the education of the ministry. The Methodists have been leaders in Christian liberality and in benevolent enterprises. The Baptists and Congregationalists have borne consistent testimony to the supremacy of the individual conscience and the independence of the Church from state control. Thus each denomination has contributed essential elements to the general religious well-being of Canada, each has in its own sphere accomplished a good work and manifested distinctive excellence, the value of which is coming, more and more, to be recognized by all.

**Church Unity.**—The general tendency among the Protestant denominations has been toward the unifying of the Christian churches,

and this appears the more remarkable when the present religious condition is compared with that of 100 or even 50 years ago, with its polemics and antagonisms. There has been a breaking down of barriers and a marked diminution of the jealousies and rivalries of the past. The old sectarian spirit has, to a large extent, disappeared and a cordial spirit of goodwill has manifested itself even in those bodies which special privileges or exclusive theories had tended to separate from others. This is seen in the increasing co-operation in good works, in the frequent inter-denominational comity and in the general attitude of the churches toward each other. It is remarkably manifested, as we have seen, in the changed attitude of most of the churches in regard to higher education. Federation of denominational colleges in a common state university has been accepted by many who were once strenuously opposed to it, as the best solution of our educational problems. In the three chief Protestant churches of Canada, the Methodist, the Presbyterian and the Anglican (they are named in the order of their numerical strength), which are each now a unit throughout the Dominion, the tendency is toward a still larger union. In 1902 a joint committee of the Presbyterian and Methodist churches met to consider the problem of co-operation, and commended the principles of comity and non-intrusion, until some scheme of organic union was agreed upon. For some years after this the union movement progressed, the Anglicans and Baptists favoring co-operation and fraternal comity, the Presbyterians, Methodists and Congregationalists an organic union of their churches. In 1909-10 the Congregational and Methodist bodies approved of the union scheme by large majorities, the Presbyterian Church referring the basis of union to the presbyteries, 793 of which approved and 476 opposed. The general assembly of the Presbyterian Church in Canada, which met in Winnipeg June 1914, definitely committed their Church to union with the Methodist and Congregational churches by a very large majority. The name of the church formed by the union is to be "The United Church of Canada," with 20 articles of faith as doctrine, and an accepted polity of church government, administration and ecclesiastical laws. There is however a small but powerful minority in the Presbyterian Church opposed to the unity movement, and it is possible that the protest of this opposing section and the existence of various practical difficulties may prevent the consummation of the scheme for some years to come.

DYSON HAGUE,

Professor of Liturgics, Wycliffe College, Toronto;  
Sometime Canon of Saint Paul's Cathedral, London, Ontario.*

**26. ROMAN CATHOLIC CHURCH IN CANADA** will be treated in this article under three headings: 1. The Church under the French, from the discovery of Canada until the conquest by England (1534-1763); 2. The Church under the rule of Great Britain, from 1763 until the present day; 3. Present condition.

1. **Before 1763.**—Catholicism was planted in Canada by France, through whose sailors, Au-

bert de Dieppe (1508), Verazzano (1522), and especially Jacques Cartier (1534), it was discovered about the beginning of the 16th century. Cartier penetrated the estuary of the Saint Lawrence (10 Aug. 1535), and took possession of the country in the name of King Francis I. While endowing his fatherland with new countries, he proposed also to disseminate therein the Catholic faith, as related in the account of his travels inserted in the 'Histoire de la Nouvelle France' by Marc Lescarbot (Paris 1609).

From Cartier to Champlain (1542-1608) a few attempts at colonial settlement in Acadia were succeeded by the foundation of Port Royal (now Annapolis, N. S.). There appeared the first missionaries, Jesuits and secular priests. Champlain visited Canada in 1603, and in 1608 founded the town of Quebec and settled there. In 1615 he invited Recollet Fathers from France, who became the first apostles to the Indians, and inaugurated those missions in the interior of Canada so famous during the 17th century, and in which the Jesuits (1625) and the Sulpicians (1657) soon took such a glorious part.

Two distinct and savage races, the Algonquins and the Huron-Iroquois, inhabited the countries just opening up to missionary zeal. To the Algonquin race belonged the Abenakis, the Montagnais, the Attikamegues or Poissons-Blancs, the Otawawas, and several other tribes scattered from Hudson Bay to the western prairies. From the Huron-Iroquois source sprang two great branches: the Yendats or Hurons established between Lakes Huron, Erie, Saint Claire and Simcoe, and the Iroquois who dwelt south of Lake Ontario, and were divided into five nations: Mohawks, Onondagas, Senecas, Oneidas and Caiyoquos. It would appear that the total population of these tribes was not above 100,000 individuals.

The Recollets were the first to devote themselves to evangelization among the Indians. Father d'Olbeau instructed the Montagnais; Father Le Caron penetrated deeply into the land of the Hurons to carry them the true faith, while several fathers remained at Quebec preaching among the colonists and the surrounding savages. During 10 years they multiplied their travels, their preachings, opened schools for Indian children, called to their assistance new recruits, and among them Father Viel, who perished in the Ottawa River, victim of the perfidy of a Huron. Consult Sagard, F., 'Histoire du Canada' (Paris 1686); Beaubien, Ch., 'Histoire du Sault-au-Récollet' (Montreal 1897). Unable to fill the wants of the missions alone, the Recollets called upon the Jesuits (1625), and on their invitation Fathers Brebeuf and Lalemant with other missionaries came to Canada. Their efforts for the conversion of the savages were not attended with the success hoped for, owing to the opposition of the Company of Merchants, to whom the French King had conceded the monopoly of traffic in these regions, on the condition of founding a colony. Louis XIII and Richelieu replaced them (1627) by the Company of New France who engaged to lead "the people inhabiting Canada to the knowledge of God, and to instruct them in the Catholic, Apostolic and Roman religion." There was no time to see the effects of these good intentions, for less than two years later

(1629), Quebec and the colony fell into the power of David Kerth, who fought on the side of England. The missionaries and their helpers were obliged to return to France.

When Canada was returned to France by the Treaty of Saint German-en-Laye (1632), the Jesuits at the request of Cardinal de Richelieu again took up their missions. Father Lejeune organized religious service at Quebec and opened the college of that town (1635), then he plunged into the interior in search of the wandering tribes of Montagnais. Others established a mission at Miscou, and from there branched forth into the peninsula of Gaspé, into Acadia and Cape Breton. Trois Rivières and Tadousac on the banks of the Saint Lawrence became centres of evangelization. Consult 'Les Jésuites et La Nouvelle France au XVII<sup>e</sup> siècle,' par le Père de la Rochemontaix, S. J. (Paris 1895).

Meanwhile hospital religious and Ursulines arrived at Quebec (1639), the first to direct a Hôtel-Dieu endowed by the Duchess of Aiguillon, niece of Richelieu; the second at the head of whom was Marie de l'Incarnation, to provide for the education of the girls. These heroic women were rivals in zeal for the conversion of the savages. Consult Abbé Casgrain, 'Histoire de l'Hôtel-Dieu de Québec' (Quebec 1878); id., 'Histoire de la Vénérable Marie de l'Incarnation' (Quebec 1880); 'Lettres de Mère Marie de l'Incarnation' (Paris 1681).

About this time the Company of Montreal was formed. Its originators were two men of God, M. Olier, founder of the Seminary of Saint Sulpice, and M. de la Dauversière, a pious laic. Its sole aim was the "glory of God and the establishment of religion in New France without charge to the clergy or to the people." Encouraged by Urban VIII, it found in Paul Chomedey de Maisonneuve a faithful executor of its intentions. This illustrious man landed on the island of Montreal which the Society had acquired, 18 May 1642, and laid the foundations of Villemarie, now Montreal. With him came Mlle. Mance, foundress of the Hôtel-Dieu, and they were soon joined by Marguerite Bourgeoys, an energetic and saintly woman, who organized the religious of the Congregation of Our Lady (1653) for the education of Canadian girls. In 1657, Mr. Olier, when dying, sent to the colony the first four Sulpicians: de Queylus, Souart, Gallinier and d'Allet. Consult Dollier de Casson, S. S., 'Histoire du Montréal,' published by the Historical Society of Montreal (1869); Faillon, S. S., 'Histoire de la colonie française en Canada' (Montreal 1865); id., 'Vie de la Vénérable Mère Bourgeoys'; 'Vie de Mlle. Mance' (Paris 1854); id., 'Vie de M. Olier, founder of the Seminary of Saint Sulpice' (3 vols., Paris 1873); P. Rousseau, S. S., 'Vie de Paul Chomedey de Maisonneuve' (Montreal 1886).

The hour of martyrdom sounded for the Jesuits. After escaping twice from the ferocious Mohawks, Father Jogues died beneath their blows (1646). Two years later (1648), the flourishing mission among the Hurons was completely destroyed by the Iroquois, and five Jesuits, Fathers de Brebeuf, Daniel, Lalemant, Garnier and Chabanel, were overwhelmed in the massacre of their neophytes. Father Buteux also fell a victim to the Iroquois when

going to the Attikamegues (1652), and Father Bressani escaped with difficulty from these barbarians. Consult Charlevoix, 'Histoire et Description générale de la Nouvelle France' (Paris 1744); 'Rélation des Jésuites' (Quebec 1858); these two works with the 'Relations inédites de la Nouvelle France' (1672-1779), and other documents have been collected and published with an English translation in the edition of Reuben Thwaites, Cleveland, 1897, under the title: 'Travels and Explorations of the Jesuit missionaries in New France' (1610-1791); Parkman, 'The French pioneers in North America.' These attacks of the Iroquois became the terror of the colony. Montreal owed its salvation only to the bravery of Maisonneuve and to the heroic devotion of young Dollard, who at the head of 16 companions for several days faced over 700 Iroquois, and resisted them to the death.

The year 1659 marks the commencement of the ecclesiastical hierarchy in Canada. Monsignor François de Montmorency-Laval was named bishop of Petrea and apostolic vicar of New France by Alexander VII. The prelate had numerous difficulties with the governors d'Avangour and de Mézy (1663-65) over the traffic in brandy which was causing ruin among the Indians. He opened a small seminary for the training of future clerks, and 10 years later (1678) laid the foundations of a large seminary for preparation for the priesthood. In 1674 Quebec was created a bishopric by Clement X; the jurisdiction of the new see extended over all North America until 1789, the year in which the bishopric of Baltimore was created. To Monsignor Laval are also due the creation of charges with resident priests, the incorporation of the Seminary of Quebec and its union with the Seminary of Foreign Missions at Paris, the creation of a chapter of canons; in one word a good diocesan organization. He came in conflict with Governor Frontenac and Intendant Talon to maintain the rights of the Church and to extirpate the abuse of the liquor traffic.

Under his episcopacy the missionaries continued their work. The Sulpicians saw two of their number fall beneath the blows of the Iroquois at Villemarie (1663). Shortly after Messieurs Trouvé and de Salignac-Fénelon, brother of the illustrious archbishop of Cambrai, founded the mission of Kenté (1668), at the point on Lake Ontario where debouches the Saint Lawrence. During 14 years it was a centre whence the true faith radiated throughout all the surrounding region as far as Niagara. The following year (1669) Messieurs Dollier de Casson and Bréhan de Gallinée, Sulpicians, left Villemarie in the company of Cavalier de La Salle with the resolution of advancing west to the Mississippi. Abandoned by the discoverer they traversed alone the region of the Great Lakes, and returned to Montreal after one year of exploration and research; there M. de Gallinée prepared a relation and made a map of the expedition. We should mention also the Sulpician missions of la Montagne, Gentilly, l'Île-aux-Tourtes and Lac-des-Deux-Montagnes, all in the environs of Montreal. The Jesuits on their side prosecuted arduously their missions. Father Menard evangelized the Outaouais, Father Allouez penetrated as far as Lake Superior (1665) and Fathers d'Ablon

and Marquette planted the cross at Sault Sainte Marie. Other Jesuits joining the explorers Saint-Lusson and de La Salle, took possession of the banks of Lake Huron; and two years after (1670) Father Albanel penetrated, while traveling by the Saguenay, as far as Hudson Bay. The missions to the Iroquois were resumed, but without great success. In 1669 the sedentary mission of the Prairie de la Madeleine was founded to the south of Montreal. There expanded the lily of Canada, that Catherine Tegakouita, who died in her 23d year, and for whom the III Council of Baltimore has asked the process of canonization. This mission transferred to Sault-Saint-Louis, now Caughnawaga, is still flourishing (having over 2,000 members), and after numerous vicissitudes has again come into the hands of the Jesuits. From Canada also went Joliet and Father Marquette on their discovery of the Mississippi (1673). Consult 'Récit des voyages et découvertes du Père Marquette' (New York 1855); Thwaites, Reuben Gold, 'Father Marquette' (New York 1902).

Recalled to Canada by Talon, the Recollet Fathers (1670) established themselves at Quebec and had four missions: Trois-Rivières, l'île Percée (Gaspé), Saint-John River and Fort Frontenac on Lake Ontario. In 1682, Mr. Dollier de Casson called them to Montreal, and in 1692 the missions of Cape Breton and of Plaisance in Newfoundland were confided to them.

Meanwhile Monsignor Laval, worn out with his administration, gave in his resignation to Louis XIV (1684). After four years' sojourn in France, he returned to Quebec (1688), where he lived in profound retirement until his death in 1708. The episcopacy of Monsignor Laval marks one of the most prosperous epochs of the Canadian Church and of the colony. Between 1665 and 1680, thanks to the intelligent activity of Colbert and de Talon, more colonists came to Canada than in the preceding half century. A strict supervision was exercised in the choice of the young women sent, as much as regarded their physical as their moral qualities. Several whose loose manners might have become a cause of corruption and decadence rather than of growth were rejected. Consult Gailly de Taurines, 'La nation canadienne' (Paris 1894); Ferland, 'Cours d'histoire du Canada'; Verreau, 'Des Commencements de l'Eglise du Canada — Archives Société Royale' (Mai 1884); 'Souvenir des fêtes du 2<sup>me</sup> centenaire de François de Laval' (Quebec 1908); Gosselin, 'Evêques de Quebec.'

Monsignor de Saint-Vallier succeeded Monsignor Laval. The new bishop founded the general hospital of Quebec, endowed it with his own contributions, built the episcopal palace, published a catechism for the diocese, established ecclesiastical conferences and held the first synods. In 1690, the American Phipps, having attacked Quebec with 32 vessels the prelate in a pastoral letter exhorted the Canadians to bravely do their duty. When after useless efforts the enemy had departed the bishop dedicated to Our Lady of Victory the church in the Lower Town, still standing, as a monument to Heaven's protection.

The era of great missions passed; nevertheless Cadillac and a missionary founded the town

and colony of Detroit (1700); the priests of the Seminary of Quebec became the apostles of the Tamarois, between the Illinois and the Ohio rivers; the Jesuits evangelized the Miamis, the Sioux, the Otawawas, the Illinois and held their ground amid the Iroquois. With the opening of the 18th century, commenced the furious and repeated assaults of England and its American colonies against the little Catholic colony, in which the French government, careless of the future, became less and less interested. The emigration to New France ceased toward the end of the preceding century. No more were to be seen the great convoys setting sail for America crowded with new populations full of faith and energy. In 1713 the French Canadian population was 18,000, and in 1739 scarcely reached 42,000. It was a small number to resist an adversary which counted in 1706 260,000 individuals, and which was increasing each year.

Acadia especially was weak, having but 2,000 inhabitants of French origin. The first attacks were directed against her. After having resisted in 1704 and in 1707, she fell (1710) into the power of the English colonists, and three years later, the Treaty of Utrecht (q.v.) (1713) ceded Acadia, Newfoundland and Hudson Bay to England. From this epoch to that of the violent dispersal of the Acadians by Lawrence (1755), the Catholics found devoted support in the Sulpicians and the priests of the Seminary of Quebec who were their missionaries. The names of Geoffroy, Baudoin, Trouvé, de Breslay, Metivier, de la Goudalie, de Miniac, Chauvreuse and Desenclaves, of Saint-Sulpice; of Petit, Thury, Gaulin, of the Seminary of Quebec, deserve to be remembered by posterity. Mention should also be made of Father Rasles, S. J., missionary to the Abenakis, who was killed by the English. We will not recall here the incredible atrocities which have relegated Lawrence's memory to the execration of humanity, and which Longfellow has immortalized in his touching poem 'Evangeline.' Consult Richard, 'Acadia, Missing Links of a Lost Chapter of American History' (Montreal 1895); Abbé Casgrain, 'Les Sulpiciens en Acadie' (Quebec 1897); id., 'Un pèlerinage au pays d'Evangeline' (Quebec 1885).

These painful events only too plainly foreshadowed the fate awaiting the Canadian colony. Instead of sending men, France persisted in raising at great expense useless fortifications at Louisburg and at Quebec. Canada was to fall through lack of foresight.

The episcopacy of Monsignor de Saint-Vallier lasted until 1727. The endowments with which he enriched the various religious establishments of the country have been estimated at \$600,000. His successor, Monsignor Duplessis-Mornay, never came to Canada. He governed his diocese by an administrator. Resigning in 1734, he was replaced by Monsignor Dosquet who devoted himself to promoting the education of youth and the religious life in the communities. Monsignor de Lauberivière, who succeeded him, died a month after his arrival in his diocese, victim of his charity in attending soldiers attacked with scurvy (1740). His successor was Monsignor de Pontbriand (1741-60), the last bishop under the French régime. He built a cathedral, restored the Ursuline

monastery at Trois-Rivières and the Hôtel-Dieu of Quebec, which had been destroyed by fire, established ecclesiastical retreats, and by his science and virtue was the model of his clergy.

Among eminent priests of this epoch should be mentioned M. de Belmont, superior of Saint-Sulpice at Montreal (1701-32), who covered the region with his liberalities and his works; M. Normant du Faradon, his successor (1732-59), who with the Venerable Mother d'Youville shares the glory of having founded the admirable charitable institution of the Grey Sisters. Consult Faillon, S. S., 'Vie de la Vénéralable Mère d'Youville' (Montreal 1852). To Saint-Sulpice belonged also that abbé Picquet to whom the town of Ogdensburg erected (1899) a monument, as well as to its founder. Consult 'Lettres édifiantes et curieuses' (Lyon 1819); 'Mémoire sur la vie de M. Picquet' by M. de la Lande, of the Academy of Sciences, p. 262; 'Biographie universelle ancienne et moderne' (Paris 1823, Vol. XXXIV, p. 289); 'Revue canadienne, janvier et février 1870,' Vol. VII; 'l'abbé Picquet,' by J. Tassé.

The events which precipitated the fall of Canada are well known. Quebec was taken (1759), but the bishop, Monsignor de Pontbriand, died at Montreal (1760) without seeing that town in the hands of the English. M. Briand undertook the administration of the region of Quebec; M. de Montgolfier, Sulpician, of that of Montreal. The Treaty of Paris which ceded Canada to England was signed 10 Feb. 1763. The period of establishment closed for the Canadian Church, and that of conflicts and of progress opened.

2. After 1763.—All the natural chiefs of the Canadians recrossed the ocean with the French flag. A population of 70,000 souls was abandoned without a guide. The clergy alone remained, invested with the double mission to preserve the ancestral faith and direct the people in the attainment of their civil and political rights. They understood their mission and it can be truthfully said that they did not fail therein.

The Treaty of Paris, it is true, guaranteed the Canadians "the free exercise of their religion," but with the addition "so much as the laws of Great Britain will permit." This restriction left a great latitude in the interpretation of the treaty. In fact it was a species of persecution. The government of London thought to substitute the Anglican hierarchy and religion for the Catholic hierarchy and religion and flattered itself in easily overcoming the conscience of a handful of colonials. The French laws were abolished and the oath of allegiance exacted from all Canadians. They notified the priests that they would have to subscribe to it or prepare to leave Canada. It was a demand to abjure and rebel against the authority of the Roman See. At the same time they prepared a list of the churches, the priests, their charges, their revenues, their property, also one of the religious communities with their constitutions, rights, privileges and properties. In addition George III encouraged the governors to found Protestant schools so that the Church of England could be established in principle and in practice, and the inhabitants gradually be brought to embrace the Prot-

estant religion, and their children educated in the principles of that religion.

The communities of men were also condemned to die out. Recollets, Jesuits and Sulpicians were prohibited from recruiting in the country or from receiving members from abroad. They took possession of the properties of the first, and as to the Sulpicians, they were reduced from 30 which they were in 1760, to two septuagenarians, whose deaths they awaited to take possession of their effects, when the French Revolution broke out. The English government then relaxed its rigorous attitude and offered the victims of the furious revolutionists an hospitality which does them honor. The people though were not better treated. For them there were no public positions, no place in the councils of the colony. A species of ostracism followed them everywhere. In the midst of these painful conjunctions the Catholics did not despair; they sent to London petition upon petition claiming on the faith of the treaties the preservation of their religion, their priests, their language and their civil rights. At last in 1766, George III consented to the consecration of Monsignor Briand, as bishop of Quebec, without recognizing any other title, however, than that of superintendent of the Catholic cult.

Meanwhile a storm was arising in the Anglo-American colonies. The metropolis understood that it should conciliate the Canadians. The Act of Quebec (1774) restored the French civil laws, dispensed with the test-oath and recognized their civil and political rights. During the war which followed and which terminated with the death of Montgomery (1775) under the walls of Quebec, the Canadian people, docile to the voice of their clergy, remained faithful to the sovereign which Providence had given them.

During these years the Catholic population had grown: in 1784, it numbered 130,000 French-Canadians; the Maritime provinces were being peopled by Irish and Scotch Catholics, and the Acadians, dispersed in 1755, were grouping silently and multiplying, supported by such apostles as the abbés, Desjardins, Sigogne, de Calonne and Ciquart, Sulpician. "To these confessors of the faith the Acadian race owed its organization; these were the true founders of its nationality." Consult 'Vie de l'abbé de Calonne' (Trois-Rivières 1892); Casgrain, 'Pèlerinage au pays d'Évangéline.'

After having courageously combated, Monsignor Briand resigned in 1784. His successor, Monsignor d'Esglis, was an old man of 75 years. He speedily took a coadjutor in the person of Monsignor François Hubert, who became titular bishop in 1788. In a remarkable memoir to the Holy See (1794), the prelate states that his diocese contained 160,000 Catholics; that the efforts of the Anglicans to win the Canadians to their religion were in vain; that his diocese is too vast for him to administer conveniently. But, he added "every plan of division would find insurmountable obstacles on the part of Great Britain which is occupied on the other side in the means to establish in this country a Protestant clergy." Consult 'Mandements des évêques de Québec,' Vol. XI, p. 474.

Monsignor Denaut (1797-1806) succeeded Monsignor Hubert. Under his episcopacy the

fight against Anglicanism is summed up in the Royal Institution. Thus was named a cleverly composed organization designed to monopolize instruction of every degree by concentrating the power in the hands of the governor. The Anglican Bishop Mountain was chosen as president of the institution. Profiting by a legal restriction the Catholics prevented its success. Consult Pagnuelo, S., 'Études historiques et légales sur la liberté religieuse en Canada' (Montreal 1872).

From 1806 to 1825 the Episcopal See of Quebec was occupied by Monsignor Octave Plessis, a prelate distinguished as much by the breadth of his intelligence and the force of his character, as by his courtesy in all proceedings. He had to hold his own against a powerful oligarchy which would not recoil from extreme measures, and which was resolved to make the Church the vassal of the civil power, the slave of the government; in fact to lead insensibly Canada to Anglicanism by the governmental channel. The soul of this plan was a certain Witzius Ryland, secretary of the governors of Canada from 1790 to 1812. It would take too long to enter into the details of this struggle, into which Sir James Craig was weak enough to enter; it suffices to say that Monsignor Plessis by his individuality embodied Canadian resistance without ever wounding English sentiment; that he obtained for himself official recognition of his title, bishop of Quebec (1818); that he removed the pretensions of the government to nominate rectors; that he ensured the independence of the Church against the State; and that he inspired his adversaries, even, with respect and admiration for his great character. Faithful besides to the Crown of England, his was the act of a loyal subject in calling to arms his diocesans, on the occasion of the invasion of the United States in 1812. Well and justly could Lord Bathurst reply to the Anglican bishop of Quebec, J. Mountain, who protested again the favors accorded Monsignor Plessis by the London government. "It is not when Canadians are fighting for England that such questions should be agitated." Consult Pagnuelo, 'Études sur la liberté religieuse en Canada,' c. IX-XI, p. 86-120; 'Le Correspondant,' April 1877; 'La France Canadienne,' by J. Guérard; Garneau, 'Histoire du Canada,' t. III, l. XIII, c. 11 and l. XIV, c. 1; 'Mandements des évêques de Québec,' t. III; 'Conversation entre Sir J. Craig et Mgr. Plessis,' p. 59; 'Mémoire au gouverneur,' p. 79; French, 'Biographical notice of J. O. Plessis, Bishop of Quebec' (Quebec 1864); L. O. David, 'Biographies et portraits' (Montreal 1876, p. 80); Bédard, 'Histoire de Cinquante ans' (1791-1841), (Quebec 1869, c. IV et V).

Monsignor Plessis understood the necessity for dividing his vast diocese so that it might be efficiently administered. Already in 1817 New Scotland was detached with Monsignor E. Burke as apostolic-vicar. This did not suffice. Soon the apostolic-vicariates were created of Upper Canada with Monsignor MacDonell as titular; of New Brunswick and Prince Edward's Island, with Monsignor MacEachern; of the Northwest with Monsignor Provencher; of the district of Montreal with Monsignor Lartigue, Sulpician (1820). These divisions were completed after the death of Monsignor

Plessis, by the creation of the sees of Kingston (1826); Charlottetown (1829); and of Montreal (1836).

In the course of years the number of French-Canadians kept on increasing. In 1831 it attained 380,000. In less than 50 years, it had increased by nearly 280,000 souls. This progress was not of a nature to reassure the intolerant and exclusive set which existed on the side of the Anglo-Protestants. Already, about 1820, they had tried to abolish the constitution of 1791, which assured an independent existence to the province of Quebec, and wished to unite Upper and Lower Canada, with the scarcely veiled object of outnumbering the French Catholic population. This plan had failed, thanks to the firmness of Bishop Plessis and his clergy, who, rallying the forces of the country, victoriously opposed Protestantism. Unfortunately, after the death of the bishop, several influential members of the legislative body deserting the sure ground of legal resistance, slipped upon the slope of revolution, fanned the spirit of revolt by their indignant philippics, and provoked the troubles of 1837-38, when several hundred countrymen, led astray by their representatives, flew to arms. Nevertheless, let us say that the voice of the Catholic clergy was sufficiently powerful to keep the mass of the population in the path of duty. The result of this insurrectional movement was the union of the two Canadas. The Act of Union was passed by the Britannic Parliament 23 July 1840.

Before this act of despotism (consult Turcotte, 'Le Canada sous l'Union,' p. 60), which marks an important date in the history of Canada, several works had been created, several deeds accomplished which interest the Church. The seats of education had multiplied: the College of Montreal (1767) founded by M. CuratEAU, priest of Saint-Sulpice, and then (1806-28) so prosperous under the direction of M. Roques; the colleges of Nicolet (1804), of Saint-Hyacinthe (1811), of Sainte-Thérèse (1825), of l'Assomption (1832), of Sainte-Anne de la Pocatière (1827). Mention should be made also of the formation of the Société d'éducation of Quebec, to promote primary instruction, and the acceptance of "Fabriques" Schools Law (1824), so favorable toward the same end. To this same period belongs the acknowledgment of the properties of the Seminary of Saint-Sulpice at Montreal by the government of Queen Victoria (1839). This act of justice allowed this venerable institution to follow the course of its charities and to cover the Montreal region with its intelligent liberalities.

To Monsignor Panet, who had replaced Monsignor Plessis (1825-32), succeeded Monsignor Signay. His episcopacy was marked by many misfortunes: cholera (1832), civil war (1837-38), two fires in Quebec (1845), typhus brought by the Irish driven from their country (1847). The 15 years which followed 1840 were more fruitful for the Canadian Church. Five communities of men, and 15 of women dedicated to the ministry, to teaching or to charity, came from France to settle in Canada. The Oblate Fathers of the Immaculate Mary (1841), the Jesuits (1842), the clerks of Saint-Viateur, the Congregation of Sainte-Croix (1847), and the

Brothers of the Christian schools answered to the call of Monsignor Ignace Bourget, bishop of Montreal (1840-79). Then were founded the Sisters of Providence (1843), of the Holy Names of Jesus and Mary (1843), of Mercy (1848), of Saint Anne (1849). At the same time the Episcopal Sees were multiplied: Toronto with Monsignor de Charbonnel, S. S. (1842); Saint John, N. B. (1842). Quebec elevated to the dignity of an archbishopric received as suffragan sees Montreal, Kingston and Toronto. The same year (1844) the bishopric of Arichat, N. S., transferred to Antigonish since 1886, was created: in 1847 the see of Bytown or Ottawa and of Saint John, Newfoundland. United in council at Quebec (1851), the bishops decided on the foundation of Laval University and asked the Holy See to establish the sees of Trois Rivières and Saint Hyacinthe (1852). Let us mention also the foundation of societies for colonization, for temperance, of Saint-Vincent de Paul and of an educational system for separate schools for Catholics.

Meanwhile the Catholic population had increased considerably. In the province of Quebec it more than doubled in 30 years; in 1831 it counted 425,000, in 1861, 942,800 souls; in Ontario it attained 260,000. This development demanded the multiplication of primary schools. This was the work of J. B. Meilleur, of whom it can be said, "he undertook the direction of Public Instruction from its cradle; that he had to create everything even to the love of instruction among the people." Consult Meilleur, J. B., 'Mémorial sur l'éducation au Bas-Canada' (Quebec 1876). The Catholic colleges were opened of Joliette (1846), of Rigaud (1850), of Saint-Lawrence (1847), of Saint Mary of Monnoir and Levis (1853). That same year (1853), the Seminary of Quebec undertook the heavy but glorious task to build Laval University which was inaugurated in the presence of Lord Elgin, 14 Sept. 1854, and which since has rendered such immense services to the Catholic cause and to the country. Consult Roy, C., 'L'Université Laval et les fêtes du Cinquantenaire' (Quebec 1903).

While these works were being accomplished in the East, the West was opening to evangelization. With Monsignor Provencher, the first apostles of these districts had penetrated along the Red River. Wishing to ensure the future of these missions, the bishop of Sainte-Boniface called to his assistance the Oblate Fathers and even chose from them Father Taché as coadjutor. Monsignor Provencher died in 1853 and was succeeded by Monsignor Taché. He had to expend his intelligence and his strength during 40 years (1853-94). It does not enter into the limited scope of this essay to recount the works of the Oblates in the Far West, although they constitute one of the most remarkable chapters of the Catholic missions. The apostolic-vicarates and the Episcopal sees embrace in their jurisdiction every point in these distant regions which came under the indefatigable zeal of these missionaries. Consult Dugas, G., 'Monsieur Provencher et les Missions de la Rivière-Rouge' (Montreal 1889); Piolet, S. J., 'Les missions Catholiques françaises' (Paris 1902); Monsignor Taché, 'Vingt années de missions dans le Nord-Ouest de l'Amérique' (Montreal 1869); Don Benoit, 'Vie de Mon-

signeur Taché' (Saint Boniface 1904); Père Jonquet, O. M. I., 'Vie de Monsigneur Grandin' (Montreal 1904); Cooke, R., O. M. I., 'Sketches of the Life of Monsignor de Mazenod' (London 1879); 'Dictionnaire des Canadiens de l'Ouest,' par Rev. P. Morice (Quebec 1908); 'Histoire de l'Eglise Catholique dans l'Ouest Canadien,' 1659-1905 par Rev. P. Morice (Montreal 1912).

The years which followed 1860 were full of solicitude for the Catholic clergy. The councils of Quebec show us the bishops preoccupied with the progress of impiety, with evil books, with the weakening of the faith, and painfully affected by the events which led to the invasion of the pontifical domains by the armies of Victor Emmanuel. The Canadians flew to arms and several detachments of zouaves offered their services to Pope Pius IX (1866).

The Catholic hierarchy had developed in the course of years. In 1852, Halifax was created an archbishopric with Charlottetown, Saint John, N. B., Arichat, N. S., and soon after Chatham, N. B. (1860), as suffragan sees. The year 1871 marked the creation of the ecclesiastical province of Saint Boniface (Manitoba), with the bishopric of Saint Albert (1871), and the apostolic-vicarates of Athabasca-Mackenzie and of Saskatchewan for suffragans. In the preceding year (1870) Upper Canada was created an ecclesiastical province with Toronto for archbishopric and Kingston and Hamilton for suffragans. Since then Kingston has become an archiepiscopal see (1878) with two suffragans: Peterboro (1882) and Alexandria (1890). In the province of Quebec, Sherbrooke (1874), Chicoutimi (1878), Nicolet (1885) became bishoprics. In 1886, Montreal was created an archbishopric under Monsignor Fabre, with Saint Hyacinthe and Sherbrooke as suffragans, to which have since been added Valleyfield (1893), and Joliette (1904). The same year Leo XIII created the ecclesiastical province of Ottawa, which received as suffragan the Episcopal See of Pembroke (1898). To crown this flourishing hierarchy, Leo XIII honored with the cardinal purple Monsignor Taschereau, archbishop of Quebec (1886). To conclude the study of the second half of the 19th century, mention must be made of three particular points: (a) The Awakening of the Acadian Race, which had expanded imperceptibly.—From the 25,000 that they were in 1815, the Acadians increased to the number of 80,000 (1864), and 125,000 (1899). To Father Lefebvre, a Canadian priest, is due the merit of having amalgamated them and, in founding the college of Memramcook, N. B., of having contributed powerfully to render them a force for Catholicism in the Maritime provinces. Today the Catholics of French origin in that region amount to 155,000. Consult P. Poirier, 'Le Père Lefebvre et l'Acadie' (Montreal 1898). (b) The Schools of New Brunswick and of Manitoba.—In 1867 when the Canadian Confederation was founded, the educational system of New Brunswick allowed the Catholics of that province to have separate schools. This right was refused them in 1871, the aim being to compel them to send their children to the public schools, that is to say, Protestant schools. An organized resistance spread everywhere and to avoid a sanguinary conflict a compromise was

1 Most Rev. Paul Bruchesi, D.D., Archbishop of Montreal

2 Most Rev. Jos. Thos. Duhamel, D.D., Late Archbishop of Ottawa

3 Most Rev. L. N. Begin, D.D., Archbishop of Quebec; Cardinal since 25 May 1914

4 Most Rev. Charles Hugh Gauthier, D.D., Archbishop of Kingston; translated to Ottawa, 6 Sept. 1910

5 Most Rev. Denis O'Connor, D.D., Late Archbishop of Toronto

effected. The unjust law was not abrogated but the concessions were of such a nature that peace was re-established (1874).

An injustice of the same kind wronged the Manitoban Catholics in 1890. Despite the vigorous fight led by Monsignor Langevin, successor to Monsignor Taché in the see of Saint Boniface, the iniquity was not amended, but a compromise was arranged between the Laurier government and the Holy See, which for want of a better softened without destroying the disastrous effects of the law. This question which so impassioned the minds in 1896 gave rise to the creation of the Apostolic Delegation to Canada. (c) The foundation of Laval University at Montreal.—For a long time Montreal was in want of a Catholic university. Monsignor Bourget applied to the Propaganda. Not to injure the rights of Quebec, a branch in Montreal was granted by the pontifical bull *Inter varias sollicitudines* (1876). The powers and the autonomy of this branch were signally increased by Leo XIII (1889). In need of the necessary buildings, the liberality of the Seminary of Saint Sulpice, governed then by M. Colin, filled this void. Laval University at Montreal now has spacious premises and numerous professorships.

3. Present Condition.—(a) *Ecclesiastical provinces.*—The total Canadian population in Canada is estimated at 2,230,008 by the census of 1901. Since then it has increased about 100,000 through immigration. With 1,430,000 Catholics, the province of Quebec alone comprises three-fifths of the faithful followers of Rome in Canada. Nearly 900,000 are scattered throughout the other provinces. Everywhere, except in Ontario, in Manitoba and in British Columbia, Catholicism exceeds in the number of its adherents any of the separate Protestant sects. It embraces 42 per cent of the total population of the Dominion, which is 5,371,315. From 1890 to 1900 the Catholics increased by over 250,000 souls. This gain was effected despite a very pronounced emigration movement of French Canadians to the Northeast of the United States. The following table gives at a glance the ecclesiastical divisions of the Dominion of Canada:

ARCHBISHOPRICS SUFFRAGAN BISHOPRICS	Titulars in 1916	Catholics	Priests	Churches and Chapels

Yukon.....	P. Bunzl.....	.....	10	12

The Catholics number about 2,873,700, for the whole Dominion, the province of Quebec having about 1,766,000. The other eight provinces have about 1,107,700. It is to be remarked also that of the 1,107,700 Catholics disseminated throughout the eight provinces, a little over one-third (400,000) are Catholics of French descent.

On the death of a bishop, the bishops of the province send a list of three names to Rome and the Pope chooses and names a successor. The bishop-designate cannot be consecrated before receiving his bull from the Holy See. He enters immediately on his functions without having to fulfill any civil formality, and the diocesan render their homage and obedience as to his predecessor. The state recognizes in him the rights of a civil corporation. He enjoys besides the greatest liberty while regarding canonical rules, in nominating vicars, creating parishes, erecting churches and parsonages. Each vicar keeps a registry of births, marriages and deaths. In French-Canada the vicar has the right of tithes for his maintenance. This title in spite of its name is but a twenty-sixth part; it is raised on grain alone, and the tendency is more and more to pay it in money. No vicar is irremovable.

(b) *Religious Communities.*—There are today in Canada about 38 communities of men, either priests or brothers; and about 83 communities of women. The priests devote themselves to various forms of charity, of teaching, to parochial ministry or to preaching. They include Sulpicians, Jesuits, the Oblate Fathers of Mary the Immaculate, the clerks of Saint Viator, Dominicans, Franciscans, Redemptorists, the Fathers of the Holy Cross, of the Company of Mary, Eudistes, Basilians, of the Holy Sacrament and several others. (c) *Universities and Seminaries.*—There are three Catholic universities in Canada: Laval in Quebec, Laval in Montreal, and the University of Ottawa, founded by Monsignor Guigues. The first two comprise all faculties except sciences. Medicine, law and letters have well-endowed chairs. Theology has distinctive faculties in the great seminaries of Quebec and of Montreal, the last opened by the Sulpicians in 1840. The University of Ottawa has only the faculties of theology and arts. Secondary education is disseminated by 17 colleges in the province of Quebec, all affiliated to Laval University, which alone confers university degrees. To these colleges must be added others opened in recent years, namely Loyola College in Montreal, Sudbury in Ontario, Saint Albert in Alberta and Saint Boniface in Manitoba. Saint Augustine's Seminary in Toronto, opened in 1913, is a faculty of theology. Young men destined for the priesthood prepare by two years of philosophy and four of theology. This preparation begins in a great seminary; that of Montreal has nearly 300 aspirants for the priesthood, that of Quebec over 100. There is besides, one at Halifax; and each religious community of men is endowed with an academy where dogmatic and moral theology, the Holy Scriptures, patrology, canon law, Church history and the pastorate are taught. Those young priests who are most distinguished

for their intelligence are sent by their bishops to Rome to the Canadian College, founded by the Sulpicians in 1888, where they follow courses given by learned professors of the Roman universities and return with the degrees of doctors in philosophy, in divinity or in canon law. Consult Hopkins, 'Canada: an Encyclopedia of the Country,' Vol. V (Toronto 1898). Two important events took place in recent years; one in 1910, the Plenary Council of Quebec, at which all the bishops of Canada assisted, under the presidency of the papal delegate, Monsignor Sbaretii. At this council new laws were enacted and the old laws were confirmed. The other event was the solemn Eucharistic Congress, the XXIst of the series, which proved to be a wonderful success, the whole population of Montreal, Protestants as well as Catholics, joining hands in the celebration of this great event.

French-Canadian Catholics believe that they have been called by Providence to personate on American soil the rôle that France personated in the Old World. They look upon themselves as destined to fill a mission, and that mission the one that France has filled in Europe; to carry high the banner of the Catholic Church, and among races more inclined to positivism, maintain and propagate the instinct of disinterested devotion, and the worship of the ideal. Consult Casgrain, 'Histoire de la Vénérable de l'Incarnation,' t. I. p. 95; Gailly de Taurines, 'La nation Canadienne,' ch. XXV, pp. 280-91; Masson, 'Le Canada français et la Providence' (Quebec 1875); Ragey, P., 'Une nouvelle France' (Paris 1902).

27. THE FRENCH CANADIAN. *Geographical Distribution.*—In 1911, according to the last Dominion census, 2,055,000 inhabitants of Canada were of French origin, being over 28 per cent of the whole population, and showing an increase of 24 per cent since the census of 1901. Of these by far the greater part, 1,605,000, were settled in the province of Quebec, forming 80 per cent of the total population of that province. But considerable numbers were located in some of the other provinces: 202,000 in Ontario, 98,000 in New Brunswick, 51,000 in Nova Scotia, 13,000 in Prince Edward Island, 31,000 in Manitoba, 23,000 in Saskatchewan, 20,000 in Alberta, and 700 in the Yukon and the Northwest Territories. The French population of Canada has doubled every 27 years for the past 200 years. Then, according to the last United States census, there were, in 1910, throughout the Union, over 400,000 Canadian-born French; and the total number of people of French Canadian extraction in the United States, if local statistics are to be credited, would exceed 1,000,000. From the point of view of physical and social geography, the French Canadian element in North America is made up as follows:

(1) The main body, 1,800,000 strong, extends uninterruptedly over Quebec, eastern and northern Ontario and northern New Brunswick. The nucleus of this main body is a compact community of farmers occupying the banks of the Saint Lawrence and the valleys of its

tributaries. On the outskirts of this central group, over the wooded and rocky highlands, north and south of the great river, but more especially throughout the plateaus of northern Quebec, northeastern Ontario and northern New Brunswick, farming is largely supplemented by lumbering, and not infrequently by mining; while along the Gulf and sea-coast of Labrador, the Gaspé Peninsula, Chaleurs Bay and eastern New Brunswick it is more or less superseded by fishing.

(2) Then hardly separated from these, and from one another, we have, off the extreme eastern limit of this central group, the French-speaking communities of fishermen of Nova Scotia and Prince Edward Island; while, as a projection from the opposite extreme western border, in Ontario, we find, along the shores of the Saint Lawrence and the Great Lakes, a string of small settlements of French Canadian rivermen, boatmen and woodsmen, forming an almost continuous chain around that province and connecting, as it were, the two large French groups of Detroit River and Georgian Bay with the still larger one occupying the western bank of the Ottawa. Over one-third, namely, about 680,000 of the total French element composing this main body and its projections are congregated in villages, towns or cities, where they make a living through physical labor, trading, the crafts and the liberal professions.

(3) As distinct outliers from the above main group, we have, in the first place, the many French-speaking communities of urban population, which, in very large, though fluctuating numbers, are spread throughout the manufacturing towns of the North Atlantic States of the Union, principally Massachusetts; in the second place, smaller and sparser groups of French-speaking farmers (at times woodsmen and miners as well), to be found in the Western country, in Manitoba, Alberta and in some States of the North Central division of the Union, especially Michigan, Wisconsin, Minnesota and Illinois; in the third place, still smaller and sparser groups of French Canadian prospectors or miners, spread in the camps and towns of British Columbia, the Yukon and some of the States of the Western division of the Union, principally Montana and California. Lastly, French Canadian families or individuals are to be found in every part of the Union, though in the States of the South Atlantic, South Central and Western divisions they aggregate in most cases a few units or a few hundred only. About 40 per cent of the total French Canadian element in the United States are located in 160 principal cities.

**Social Features.**—The most widespread, fundamental and characteristic type of the French Canadian is the habitant, or farmer, of the province of Quebec (q.v.). From a study of his conditions there may be gathered the clearest idea of the capabilities and limitations of the race as a whole. Three main groupings are distinctive of social life in the French Canadian country: the habitant's household, the range, the parish.

(1) The habitant's household normally consists of two families, that of the senior householder, and that of an associate son and heir; it includes generally sisters and younger brothers of the heir, children of the younger couple, and, in some cases, sisters of the senior

father of family. We have thus a group of some 10 or more persons, closely bound together, not only by ties of kinship and family love, but by co-operative effort, community of interest and habits of mutual dependence, which extend, in a measure, even to those members of the group who have settled outside of the family circle. The habitant's household is primarily a labor organism, a workshop. Agriculture is its mainstay; but it is of a type neither extensive nor intensive, its scope being narrowed down to the task of satisfying directly the household's needs, and limited by the household's internal supply of labor. The farms seldom exceed 100 acres in area, and outside help is resorted to in very exceptional cases only. To avoid this contingency, women and children are called upon to work in the fields, especially in haying and harvesting time. On the other hand, the object being to provide directly, as far as circumstances will permit, for all the requirements of the family, habitant farming is greatly diversified. On almost every farm there are to be found, beside the kitchen-garden and its few fruit trees, small patches of flax, tobacco, potatoes, Indian corn, buckwheat and barley, while larger areas are given to other cereals, hay and pasturage. Similarly, all kinds of stock are kept on each farm, though seldom any in large numbers or of excellent quality. Various home industries, such as the spinning and weaving of both flax and wool, the manufacture of maple syrup and sugar, carpentry, joinery, cooperage, brush-making, leather-working, etc., are an important factor on many farms. Agriculture is seldom the sole means of living of the habitant, since in the newer settlements the mere gathering of natural products, such as fish, game, wild fruits and wood is largely resorted to, while in the older and more densely populated sections by-industries are conspicuous. Then again temporary emigration to and employment in the manufacturing, mining and lumbering centres of Canada and the United States is, in all situations, an occasional means of securing capital to start out in life or of bridging over hard times. The methods of farming of the habitant, his rotation of crops, his processes of retting and breaking flax, dyeing wool, making candles, etc., are traditional and have been in use for centuries in certain provinces of France. However, in recent years, the wave of modern progress has been felt, agricultural machinery has come into fairly general use, co-operative butter and cheese factories have been established, and, especially in the vicinity of railways, improved methods and a more specialized type of farming have been adopted. Through hard work and close economy a capable habitant will succeed, with the help of his family, in building up a homestead of sufficient area to meet the wants of the household. Should his acquisitions of land during his lifetime remain within that limit, then the homestead will be transferred in its entirety to the associate son or heir, who in turn will be charged with providing for the whole family, in the same way as the testator would have done. On the other hand, should the acquisitions of the father of family exceed the area required for the support of an ordinary household, the lots in excess are freely used in helping out other sons who, after contributing to the sustenance and welfare of the pater-

nal household in their early life, undertake to make an independent living through agriculture. Girls receive very little aid from the family estate, as it is considered they will be provided for either through remaining as members of the paternal household, or through marrying into some neighboring family. Likewise, sons who are sent to college and enter the liberal professions or the priesthood receive very little else from their parents. In the management of the family affairs, the influence of the mother is about on a par with that of the father. As a rule she is better educated than her husband, sees to the correspondence and accounts, is consulted in all matters of importance and leads in the family worship. Through working with their parents on the farm the children acquire a variety of aptitudes, but no particular proficiency in any of the arts, nor any strong desire of attaining eminence in the various walks of life, barring possibly priesthood and politics. Education is reserved for the few who take to the liberal professions and the Church. The style of living is plain, and in many respects old-fashioned. Food is in abundance, though lacking in delicacy. The house, usually of wood and whitewashed, is often rather small for the accommodation of its inmates, but as a rule kept clean and tidy. Homespun, still in use in a few families in isolated sections, is fast being replaced by the cheap cotton and woolen goods supplied by the trade. Births are numerous, but owing to defective hygienic conditions, or to overwork on the part of mothers, this advantage is partially offset by the high proportion of deaths among infants. Amusements are simple, pertaining to the daily work, the family circle, Church festivals. Many of the songs and dances are importations or adaptations from Old France. However, here, as throughout the whole range of social phenomena, outside influences are apparent, and features of recent origin are found grafted on old and quaint usages.

(2) The farms are in the shape of long, narrow rectangles, 20 or 30 arpents in length, by 2 or 3 in breadth. The farm buildings are all built at one end of these rectangles, along the public road, which crosses them at right angles, thus giving a close succession of houses and barns. Not infrequently the buildings of two abutting ranges are situated on opposite sides of the same road, making a double row of almost contiguous houses, somewhat like a village street. The ranges, of which there are four or five in parallel line in every parish, connect with one another and with the village by means of "routes" or transverse roads, along which no buildings are erected; so that each range is isolated from the rest and forms a distinct grouping within the parish. This type of settlement, which differs from that of the isolated homestead to be found in some parts of France and throughout the Anglo-Saxon world, and also from the central village type observed in other parts of France and Europe, is a distinctly French Canadian creation, which the habitant takes with him wherever he settles in numbers. The range seems to have been the outcome of the desire on the part of the habitant, while residing on his own farm (which the village settlement would not allow him to do), to secure the benefit of his neighbor's assistance and company in a more effective way than the isolated homestead would permit. What

the habitant cannot accomplish with the help of his family he endeavors to do through the free help of his neighbors. However, while the nearest neighbor, on either side, may be called upon now and then to lend a hand in the ordinary work of the farm, the summoning in numbers of the near-by farmers is resorted to in exceptional cases only, such as the clearing of land, the "lifting" of a barn or the relief of some destitute family. Each range looks after its poor, by means of voluntary contributions, principally in kind. Each range has its cheese or butter factory, its schoolhouse, also its large wooden cross along the highway, in commemoration of some religious revival.

(3) The roads leading from the various ranges all centre toward a village, generally small, comprising a few lodgings, workshops and stores, besides the priest's house and the church. A community wherein the highest aim of the farmer, the basal element, is to cater to all the needs of his household directly through the labor of his own family and the occasional assistance of his neighbors does not leave much scope for the development of other social factors. The ambitions and efforts of the most capable being restrained within that limit, equality and similarity of condition is the rule. Commerce, industry, the liberal professions remain embryonic. In the absence of leaders in agriculture, industry and commerce, learning becomes the standard of distinction. A few wise old farmers, the doctor, the notary, the lawyer, are looked up to; but, on account of the exalted nature of his function, the parish priest is decidedly the dominant factor. Like the family and the range, the parish is primarily an organism for mutual support, both in the physical and moral order. It plays to a certain extent the part of an insurance company, as barns, for instance, destroyed by fire are restored through contributions from all the parishioners in material or labor. On Sundays and feast days the habitant meets at church his coparishioners, who are all relatives or close acquaintances, the doctor, the notary; he listens to the admonitions of the "curé," to the announcements made by the public crier, and receives the intelligence and impressions which will be his mental food for the remainder of the week. To all intents, the parish may be considered as an enlargement of the family with the parish priest as its patriarchal head. Then, the parish is the main organ of local government in the French Canadian country, the school commission and the municipal corporation, of British origin and of comparatively recent introduction, remaining mere adjuncts, only partially developed, of the parish proper. The revenues of the latter often exceed those of the school commission and municipal body put together. Many localities have no town-hall other than the vestry. In practice the curé is much more the maintainer of the peace and the arbitrator of disputes within the parish than are the mayor, the local magistrates and court. His powers extend even to a close supervision of family affairs. The law of the province allows him the 26th bushel of all cereals grown by his parishioners within his territory, and his influence over the church wardens and flock enables him to obtain from close-fisted farmers the expenditure of comparatively large sums of money on church

buildings. His influence is exerted as well over the school commission and municipal council, whose policy and decisions are usually made to conform to his wishes. On the other hand, practically the only check on the curé is the far-off bishop, who visits the parish and inspects the books every third year, and may remove him at will. The school commission and municipal corporation are administered in a spirit of parsimony. School buildings are inadequate, and the teachers, generally girls, receive very little pay and give correspondingly poor results. Illiterates are still in large numbers. As each individual farmer is required to look directly after that part of the public highway which faces his property, and to contribute his share of the labor necessary for the maintenance of the cross-road leading to the village, the municipal council has little to do apart from supervising, in a general way, the repairing of roads or the occasional building or repairing of bridges within the limits of the parish. Similarly, county councils have not acquired in the French country anything like the importance which they have in English sections, and are content with looking after roads, bridges or water courses common to two or more parishes. On the other hand, provincial and Federal politics have taken quite a hold on the habitant; but the interest which he takes in them is more the outcome of his inclination for clannish warfare and oratory, and of his craving for the petty favors of officialism, than the result of a desire on his part to ensure the proper management of public affairs, which he does not always grasp. These are the prey of organized political parties, whose leaders are recruited mainly from the liberal professions and the cities. Church and politics are, in the mind of the habitant, the only avenues open to those desirous of rising in the world. And this accounts for a rather remarkable development of institutions of classical and literary teaching in a community wherein common schools are markedly deficient and technical and business training neglected.

**Evolution.**—On the basis of the classification of societies proposed by F. LePlay and his followers, H. de Tourville and the French school of social science, the French Canadian is a semi-patriarchal or semi-communistic type; that is one in which social organization and life, while swayed by tradition and habits of mutual dependence to a less degree than in the purely patriarchal or communistic types of the Orient, still are not permeated and uplifted by that spirit of private independence and enterprise distinctive of the individualistic or "particularistic" types, as exemplified in the Anglo-Saxon races. His semi-communistic training the French Canadian holds from France. His social ancestors were mainly the Gaul, on the one hand, the Frank on the other. The former, with his clan organization, village life and neglect of agriculture, was a distinctly communistic type. The particularistic Frank broke up, to some extent, the clannish and communistic spirit and institutions of the Gaul, and gave a strong impulse to agricultural pursuits; but his influence, for reasons which it would be too long to set forth here, was not so lasting nor so far-reaching in France as was that of his duplicate, the Saxon, in England. Thus there sprang up an intermediate type presenting many of the qual-

ities and defects of the Celt, with something of the qualities of the Saxon. A farmer, an artisan, a trader, though generally in a small way and still conserving a fondness for nature and primitive, easy-going occupations; a race lacking ambition and ability to rise in the ordinary callings of life, having for its sole leaders the clergy and the military or civil officers of the Crown; and these leaders, though in many cases sprung from the people, isolated from them by class interests and training and unfit to lead adequately in practical pursuits. Under the trying conditions of New France—the dense forest to clear, the rigorous climate to provide against, the lurking Iroquois to evade—the peasant from north central France, single-handed, made rather slow progress at colonization. Agriculture was neglected, while the more attractive, more remunerative, though deceptive, fur trade became the means of sustenance of both the individual and the colonial government, with a consequent rapid but superficial expansion of the colony and constant warring. The French settler, fond of home and of quiet, evolved into the adventurous and hardy type of the *coureur des bois*. Under British rule, and especially in the course of the 19th century, through the restoration of peace and the advent from Great Britain of a class of business men, the fur trade, carried on by large companies, receded toward Hudson Bay and the Far West, vast lumbering operations were carried on, with a consequent impulse to agriculture, extension of settlements, increase in population; a period of unprecedented prosperity for French Canada. Then, in the latter half of the 19th century, the world-wide evolution of commerce and industry set in, with its marvelous applications of steam and electricity, its powerful machinery and means of transportation, the progress of manufacturing centres; and the French Canadians developed a class of factory operatives, together with a vigorous undergrowth of artisans and traders in the large cities. See also the articles in this series: UNDER FRENCH RULE; POPULATION AND RACIAL DISTRIBUTION; CATHOLIC EDUCATION; RELIGIOUS CONDITIONS.

**28. POPULATION; RACIAL DISTRIBUTION AND IMMIGRATION.** In a new country, population grows by additions from without rather than by natural increase, and questions relating to immigration and the foreign element become of primary significance. Especially is this the case in Canada after the experiences of the present century, when in less than 20 years the inflow from abroad amounted to not less than 60 per cent of the original people. A considerable portion of this was "floating" labor whose stay in the country was brief, but even so the situation which the figures reveal is sufficiently arresting. When it is remembered that the stock of 1900 was in its turn largely composed of persons born in other countries, the importance of a careful analysis of the Canadian population from the point of view of origins is further emphasized.

**Population According to Origin.**—The immigration returns do not offer the final avenue to racial origins, yet, as above hinted, they

throw so powerful a light on Canada in the making—on the process whose result it is the purpose of the present article to describe—that comparative statistics of 1900, 1911 and 1914-16 may be quoted as having a bearing on the matter to follow. The accompanying tabular statement (Table I) shows also the extraor-

TABLE I. IMMIGRATION TO CANADA BY NATIONALITIES, FROM 1 JULY 1900 TO 31 MAR. 1916 (FISCAL YEAR).

	1900-1901	1910-1911	1914-1915	1915-1916	Totals 1901-1916

Total immigration	49,149	311,084	144,789	48,537	3,099,348

dinary range from which Canada has drawn population since 1900, whether as settlers intending to adopt the country permanently, or as laborers attracted by the great construction "boom" of 1900-12. The figures of earlier years are not available in similar detail, but doubtless differ mainly in degree. It will be seen that roughly 38 per cent of the recent heavy drafts came from the British Isles, 35 per cent from the United States and 27 per cent from the countries of continental Europe.

As has been said, not all of this influx remained. Indeed the census shows an increase in the number of those resident in Canada, but born outside, of only 887,461 during the first decade of the century (see Table II), whereas the immigrants during the same years were at least double that number. The two sets of figures, however, in the absence of statistics of emigration and of reliable vital statistics cannot be collated with the immigration returns, and Table II is to be regarded merely as a further introductory sidelight on the subject in hand.

**Latest Census Reports.**—For the analysis of the population as it stands to-day from a racial standpoint, recourse must be had to the specific results of the decennial census. The last census for the whole of Canada was taken in June 1911. It contained altogether 41 questions on population, one of which required the racial or tribal origin of each individual. The Canadian census does not take cognizance of "color," as there is only a small admixture of the red, black and yellow races, which it is thought is sufficiently indicated by the returns of origins. Enumerators in taking the census are instructed to trace racial or tribal origin through the father. A person, for example, whose father is English, but whose mother is Scotch, would be ranked as "English." It was pointed out, however, to the enumerators that such terms as "American" or "Canadian" ought not to be applied in a tribal sense. In the case of Indians, the origin is traced through the mother, and the name of their tribe given, as Chippewa, Cree, etc. Persons of mixed white and red blood, usually called "half-breeds," were to be described, in addition to the tribal name, with the name of the white race infused in the blood. Thus "Cree F. B." would denote that the person is a mixture of Cree and French. "Chippewa S.B." that the person was a mixture of Chippewa and Scottish. Children of marriages between white and black or yellow races were to be classed as Negro, Mongolian (Chinese or Japanese) as the case might be. Throughout the census no attempt was made at classification by physical types, such as form of the head, facial features, etc., as this is essentially a matter of expert investigation. A question as to country of birth was added in which distinctive sections are particularized, as for example, between Bohemia and Galicia in Austria-Hungary, England and Scotland in Great Britain, etc., etc. This question was inserted largely as a check on the

TABLE II. POPULATION OF CANADA BY BIRTHPLACE.

BIRTHPLACE	Population born in specified birthplace by—				
	Totals			Per cent population	
	1901	1911	Increase	1901	1911

<sup>1</sup> Includes British of unrecorded birthplace and "born at sea."

<sup>2</sup> Exclusive of natives of British India.

population immediately derived from the United States.

The general results of the census are exhibited in Table III, which has been constructed so as to afford comparisons with 1901, the preceding census year, and thus to reveal recent tendencies as well as present facts. Of the total Canadian population (7,206,643), it will be seen those of British race make up well over one-half, whilst the other pioneer race, the French, contribute considerably more than half the remainder. Together, the British and French races represent 82.6 per cent of the population. Those of German extraction follow with 5.5 per cent. Of the 20 other racial strains that are enumerated, only four—the Austrian, the Scandinavian, the Indian and the Jewish—amount to more than 1 per cent, none of them exceeding 2 per cent.

which has for many years been characteristic in the province of Quebec. (The number of Canadian residents born in France was only 7,944 in 1901, and rose to only 17,619 in 1911). The German proportion has similarly fallen slightly, though a substantial flow of immigrants persisted up to the outbreak of the war. For the very marked percentage increases which are shown in the Austro-Hungarian, Scandinavian and Italian elements we have undoubtedly to thank the great railway- and town-building era of 1900-13, which, financed by British capital, drew so heavily upon these reservoirs of labor. It need occasion no surprise to see a recession in these elements by the time of the next census, for the enumeration of 1911 came when the expansion was at its height and the numbers of these more or less temporary residents were

TABLE III. ORIGINS IN 1911 AND 1901. INCREASE IN THE 10 YEARS AND PROPORTION PER CENT OF POPULATION.

<sup>1</sup> Included under the general term "Austrian."

<sup>2</sup> Included under the general term "Galician."

<sup>3</sup> Included half-breeds in 1901.

<sup>4</sup> Included with Austro-Hungarians, Germans and Russians in 1901, but given separately in this table.

The columns which analyze the trend between 1901 and 1910 are also interesting, especially when read in conjunction with the immigration statistics of Table I. The largest absolute gain during recent years has been in the persons of British origin; it has not sufficed, however, to prevent a falling off in the proportion of British to the whole, which dropped from 57 per cent to 54 per cent in the decade, notwithstanding the heavy immigration from the British Isles shown in Table I. The French stock has similarly declined from 30 to 28 per cent of the whole, but its net accretion of 405,519 (less than half that of the British), has been without any such adventitious help as the latter received, being accounted for almost wholly by the large natural increase

at their maximum. Many, of course, came as agriculturists, and these will count as permanent. The Greek and Balkan races made practically their first appearance in Canada since 1900.

It is interesting to note that among British stocks, the English alone have increased their proportion, advancing from 23.4 to 25.3 per cent of the whole, and gaining 44.5 per cent in actual numbers. The Scotch have gained 24.7 per cent, but this has not prevented them from shrinking from a proportion of 14.9 per cent in 1901 to one of 13.8 per cent in 1911. The Irish on the other hand have risen only 6.2 per cent in numbers and have rather markedly declined in proportional standing, namely, from 18.4 per cent to 14.5 per cent. The Eng-

lish in Canada numbered 1,823,150, the Irish 1,050,384 and the Scotch 997,800, in 1911. The French totaled 2,054,890.

**Distribution of Races by Provinces.**—To describe the distribution of the different races by provinces would be to write the history of the settlement of Canada. Table IV will show the general situation as it exists to-day. The earliest movement to dispossess the native Indian was, of course, that of the French into Acadia and Quebec. It ceased at the Conquest, 1759, when the population of Canada was estimated at 82,000, but the remarkable natural fertility already remarked upon has left the French not only paramount in Quebec, but constituting the second element, and that a considerable one, in New Brunswick, Nova Scotia and Prince Edward Island, the third in Ontario and the fourth in Manitoba. The first marked infusion of British stock, on the other hand, was that of the Loyalists from the thirteen

Dominion also witnessed three special immigrations — the precursors of several of like nature — into the West. These early movements consisted of Mennonites, Icelanders and Russian Jews, the victims, for the most part, of economic or political disadvantage, from which they sought a refuge, and with success, in the New World. A better remembered episode of the kind is the migration of the religious body known as Doukhobors, who came to Canada in the closing years of the 19th century to escape the long and relentless persecution with which they had been followed in Russia. The table will show how all these newer elements have been distributed, and what the racial problem connotes for each of the provinces. How that problem is capable of taking on new and unexpected forms has been demonstrated since the outbreak of the great war, when extensive internments of alien enemies, as well as modifications of the Franchise Act, have been made

<sup>3</sup>Including Finns in 1911.

colonies, 40,000 of whom crossed into Canada during the years immediately following the Treaty of Versailles, 1783. About one-half of these were divided between New Brunswick and Nova Scotia, and the rest between Quebec and Ontario, where, and especially in Ontario, they became the nucleus of a fast-growing population recruited from the British Isles. In Ontario alone by 1841, the population had risen to 455,688, and to-day, as the accompanying statement shows, the British is the predominant race in all but one of the provinces. The predominance, naturally enough, in view of recent history, is less marked in the West, but even Saskatchewan, which may be said to have been created as a community by the immigration of the past quarter of a century, has more than half of its people of British extraction, whilst the next prevailing strain numbers but 14 per cent. The German movement to Canada began to be noticeable about the time of Confederation (1867). The first 10 years of the new

in the national interest. It was already appreciated in the increasing stringency which may be seen in the regulations regarding immigrants during the past few years. On the whole, in the absorption of these diverse and polyglot additions to her population, Canada has proceeded rapidly and with success, and if the result still leaves some unevenness, it will compare not unfavorably with the same in other new countries.

**Racial Concentration.**—Special examples of local racial concentration may be noted in the presence of Jews to the number of 27,948 in Montreal, 18,237 in Toronto and 9,023 in Winnipeg; of Germans to the number of 10,633 in Kitchener, 9,775 in Toronto, 8,912 in Winnipeg, 4,619 in Hamilton and 2,758 in Regina; and of Chinese and Japanese in Vancouver to the number of 3,559 and 2,036, respectively.

**Aboriginal Population.**—The aboriginal population of Canada, in points of numbers, is standing still. The latest census (1916) by

principal tribes is given in Table V. There has been so much admixture by intermarriage at several of the government's Indian agencies that it is impossible to classify the present Indian population completely according to tribes, and the table accounts for only 72,509. There are, however, 106,511 Indians on the official records which differentiate the Canadian Indians according to linguistic stocks. Of these 59,222 are Algonkians, 13,747 Athabaskan, 595 Haida, 12,142 Iroquois, 515 Kutenai, 9,888 Salish, 1,838 Siouan, 2,834 Tsimshian, 3,230 Kwakiutl-Nootka (Wabaskau) and 2,500 nomads of British Columbia unclassified.

TABLE V. CENSUS OF CANADIAN INDIANS, 1916, BY PRINCIPAL TRIBES.

Tribe	Location	Numbers
Abenaki (Algonkin stock)	Quebec	333
Algonquin (Algonkin stock)	Ontario and Quebec	822
Assiniboine (Siouan stock)	Sask. and Alta.	207
Athabaskan tribes (Athabaskan stock)	N. W. T., Alta., British Columbia, Manitoba and Sask.	7,976
Bella Coola (Salish stock)	British Columbia	215
Bella Bella (Wabaskan stock)	British Columbia	311
Blackfoot (Algonkin stock)	Alberta	2,317
Coast Salish (Salish stock)	British Columbia	4,126
Delaware (Algonkin stock)	Ontario	127
Haida (Haida or Skittagatan stock)	British Columbia	595
Hurons (Iroquoian stock)	Quebec and Ontario	519
Interior Salish (Salish stock)	British Columbia	5,480
Iroquois (Iroquoian stock)	Ontario, Quebec and Alberta	11,623
Kutenai	British Columbia	582
Kwakiutl (Wabaskan stock)	British Columbia	1,140
Malécites (Algonkin stock)	Quebec and New Brunswick	898
Micmacs (Algonkin stock)	Quebec, New Brunswick and Nova Scotia	3,590
Montagnais (Algonkin stock)	Quebec	2,071
Nootka (Wabaskan stock)	British Columbia	1,779
Ojibwa or Chippewa (Algonkin stock)	Saskatchewan, Alberta, Ontario and Manitoba	16,315
Plain Cree (Algonkin stock)	Saskatchewan and Alberta	6,816
Pottawatomi (Algonkin stock)	Ontario	178
Sarcee (Athabaskan stock)	Alberta	188
Sioux (Siouan stock)	Manitoba, Saskatchewan	590
Swampy Cree (Algonkin stock)	Manitoba and Saskatchewan	877
Tsimshian (Tsimshian stock)	British Columbia	2,834
Total		<u>72,509</u>

**Negro Population.**—The Negro is not a problem in Canada. All told, he numbers less than 17,000. More than three-fourths are divided between Nova Scotia and the southern counties of Ontario. The latter are descendants mainly of fugitive American slaves, but the former came originally from Jamaica, a band of negro "maroons" having been brought by the British government to construct the citadel of Halifax, whence they scattered over the neighborhood. Windsor, Ontario, has over a thousand negroes and Halifax 800, and these are the largest colonies.

**Oriental Population.**—The problem of the Oriental immigrant calls for special remark. Against the Oriental alone as a race has Canada reared a barrier which is intended to prevent ingress. In the case of the Chinese, a head tax of \$50 was imposed as far back as 1885. In 1901 this was increased to \$100, and in 1904

to \$500. So many, however, have been the opportunities for profitable labor for the Chinaman in Canada that after a couple of years' cessation the movement recommenced, and over 28,000 landed in Canada, paying over half a million dollars in head tax, between 1905 and 1915. In the case of the Japanese, the matter was less easy of adjustment: no such means could be employed against a proud and powerful nation, the ally of the mother country. An arrangement, however, was arrived at by negotiations, and since 1907 the arrivals of Japanese have been voluntarily limited to a few hundred a year. The Hindu immigration presented a scarcely less embarrassing problem, owing to the inter-imperial relations of the two countries. In all cases, the policy of the Dominion was based on the same principle—the desire not to be overstocked by a people of lower standards of living, incapable of assimilation with European races. The employing class upon the whole has favored the freer admission of Orientals, but labor has resolutely set its face against it, and has thus far secured the backing of public opinion.

**Population and Language.**—Race and language go hand in hand. By the British North American Act, 1867, the Dominion has two official languages, English and French. The province of Quebec is likewise bi-lingual. With the growth of the French population in Ontario, an agitation has arisen for the extension of the privileges conferred upon the French tongue in the schools, and the door has been opened upon a persistent and disturbing controversy. No record of the language spoken by the people was taken at the 1911 census, but in 1901 there were 3,709,370 over five years of age able to speak English and 1,514,977 able to speak French. The number of French able to speak both languages has always exceeded that of the English similarly endowed. In 1901 it was 529,552, compared with 126,078 English able to speak French. There were in 1901 1,019,261 unable to speak English, 3,213,654 unable to speak French and 160,814 (chiefly Indians and recent immigrants) unable to speak either of the official languages.

R. H. COATS,  
*Dominion Statistician and Controller of Census.*

**29. IMMIGRATION.** Opportunities for. The Dominion has witnessed within recent years a great increase of immigration, more especially from the British Isles and the United States, but also from the Scandinavian kingdoms, France, Belgium and other countries of Europe. Within the past decade the Dominion has received more than 2,000,000 immigrants, nearly all of a most desirable class, and the large majority devoted to agriculture, ready and able to do their part in developing the practically unlimited wealth of Canada's vast grain-growing area, estimated at 171,000,000 acres, of which about 35,000,000 acres are now under cultivation. During the year 1915, 12,986,400 acres produced wheat, and the entire wheat crop harvested was more than 393,000,000 bushels, almost double the annual importation of wheat for the British Isles.

The cheapness of land, its unparalleled productivity, the certainty of comfort and independence as the reward of industry and thrift, and the security of life and property under a

well-regulated administration, are the chief inducements which have already attracted hundreds of thousands of Britons and Americans to the Canadian West, and which are continuing to bring them.

English-speaking settlers from the British Isles and the United States form the much greater part of the new population. Scandinavians, French, Belgians, Russians, Swiss, Italians and other nationalities are also represented in the arrivals. The Doukhobors, from Russia, have proved an industrious and valuable addition to Canada's population. They are almost exclusively engaged in farming.

The lands offered to settlers by the Canadian government are situated west of Lake Superior, and to the north of Minnesota, North Dakota and Montana, and east of the Rocky Mountains, in the provinces of Manitoba, Saskatchewan and Alberta. The land is for the most part prairie, and can be secured absolutely free from timber and stones, if desired, the soil being the very best alluvial black loam, from one to two feet deep, with a clay subsoil. It is just rolling enough to give it good drainage, and in a great many places there is plenty of timber, and in other places it is underlaid with good coal. The land may be secured by homesteading. The entry fee for a homestead of 160 acres is \$10, there being no further money consideration. The settler, before receiving his patent, must live upon the land three years, a residence of six months in each year being necessary, and he must also do a small amount of cultivation.

An alien that is a person not a British subject, may make application for a free-homestead at once on his arrival in Canada, but he must become naturalized, or give proof of intention to become naturalized, before he can obtain a patent for the land. A residence of five years in British Dominions — the last year Canada — is necessary to acquire naturalization. In the meantime the homesteader may reside on, and exercise every right of, possession, save that he may not mortgage or sell the land until he gets his patent or title.

Though there are tracts of forest in the Canadian Northwest, there are localities where the quantity of building timber and other building material is limited, and the government has made provision for such cases. Should a man settle on a quarter section of land void of timber, he can, by making application to the Dominion lands agent in the locality, obtain a permit to cut on government lands free of charge the following: (1) 3,000 lineal feet of building timber, measuring no more than 12 inches at the butt, or 9,250 feet board measure. (2) 400 roofing poles. (3) 2,000 fencing rails and 500 fence posts, seven feet long, and not exceeding five inches in diameter at the small end. (4) 30 cords of firewood. The settler having all these free of charge has only the expense of cutting and hauling them to his homestead, which cannot cost him a great deal. He is also very likely to have the benefit of cheap coal; there are areas of coal in western Canada of such an extent as to be practically inexhaustible. The principal districts of western Canada are within easy reach of firewood, while the settlers of Alberta and Saskatchewan are particularly favored, especially along the various streams, at which they may get all the coal

they require, very frequently at the cost of handling and hauling it home. If a settler should desire to go into stock raising, and his quarter section of 160 acres should not prove sufficient to furnish pasturage for his stock, he can make application to the land commissioner for a lease of grazing lands at a very low cost.

The public school system is established all through the country, and there are schools in all the organized school districts. There is a ready market for cereals and other produce; the climate is healthful and agreeable.

The aim of the Dominion government is to attract to Canada industrious, intelligent, energetic settlers with the purpose and ability to do their part in building up a nation imperial in its natural resources and in the extent of its magnificent territory: in the carrying out of this policy the government is meeting with eminent success. See CANADA — POPULATION, RACIAL DISTRIBUTION AND IMMIGRATION.

W. D. SCOTT,

*Superintendent of Immigration, Ottawa.*

### 30. MILITARY SYSTEM. Historical.

The Canadian military system has its roots in the principle of universal, compulsory military service. This principle was firmly established in the French colony on the Saint Lawrence; when this colony passed under the British flag and was supplemented by English-speaking colonies to the east and the west the principle was maintained. The general system of defense in use by Great Britain for her North American colonies in the first half of the 19th century provided wholly against attack from the south; at that period there existed an antagonism between the British empire and the United States which a century of peace fortunately has removed. The method adopted was (1) to maintain in the North American colonies (Upper and Lower Canada, New Brunswick, Nova Scotia, etc.) a garrison of the British regular army, which until about 1840 was roughly equal in strength to the regular army of the United States; (2) so to organize the male inhabitants of the colonies as to facilitate their embodiment in emergency in firmly organized corps, under regular conditions and discipline and under the leadership of regular officers; (3) to provide in advance arms, stores and equipment for these native troops. By the militia until 1862 was meant the peace organization of the male inhabitants of the country suited to this scheme. No attempt was made at peace training; the effort made was to impress upon the people's minds the universal obligation of service and to provide for the rapid and orderly raising of service corps. There was an annual muster parade of all men of military age, and all liable to serve were divided into regiments and companies; local officers were appointed, but these officers were for duties of administration rather than of leadership, and if the need of mobilization had occurred their function would have been to select from their formations suitable men to be organized into service corps, which, as already stated, would have been trained and led under the supervision of the regular army. The mainspring of this system was the presence in the country of a comparatively large force of regulars, and when, after the Crimean War, the government of

Great Britain gradually denuded the colonies of regular troops, and at last withdrew these almost altogether from Canada, the old organization fell into decay. Early in the second half of the 19th century the second phase set in with the organization of a number of separate volunteer corps; the citizen soldiers comprising these drilled in their spare time after the manner now familiar on the North American continent, and the volunteers gradually supplanted the old militia. The slight Fenian raids of 1866 and 1870 were repelled mainly by the use of these volunteers, and after confederation in 1867 the whole defense of Canada was committed to a new volunteer militia of this type. The principle of universal compulsory service remained on the statute book, but in practice there was no compulsion and the Dominion kept up a voluntarily enlisted citizen force. In corps enlisted in the cities the regiments trained by evening drills; the corps raised in rural districts went to camp for 12 days in the year. The training was imperfect, and higher organization, stores for mobilization and staff services were neglected. In 1870 the British troops were finally withdrawn from the Dominion, with the exception of the naval stations of Halifax and Esquimalt, and from that year to the period of the South African War the military equipment of the country was slight. A revolt by a few half-breeds and Indians in the Northwest territories in 1885 was put down wholly by the forces of the Dominion, about 5,000 being employed. To the struggle in South Africa the Dominion contributed about 8,000 men; of these 7,000 crossed the sea, while the remainder undertook the garrisoning of Halifax, and so released an equivalent number of the British regular army for active service. All the corps so employed were specially raised for the war. The experience of this war, and the gradual deepening of the diplomatic dangers which led to the great European War, caused Canadian statesmen and soldiers to reorganize the defensive forces of the country. The process was a gradual one; it began about 1902 and was still in progress when the explosion of 1914 occurred.

**The Militia Act.**—The foundation of the new organization is the Militia Act of 1904, and as this constitutes the legal authority by virtue of which the land forces of Canada exist, it may be noticed at some length. During the Great War it has been modified in some respects, partly by statutes and partly by regulations enacted under the authority of the War Measure Act. The command in chief is vested in His Majesty the King, with the governor-general as his representative. The administration of the force is entrusted to the Minister of Militia and Defense; he is a member of the Dominion Cabinet, he must be a member of Parliament and he can be held to account by that body. In the summer of 1916 a parliamentary under-secretary was appointed to assist the Minister in administering the department; early in 1918 this office was discontinued. Following recent British example, the Minister is assisted by a militia council, composed of four military and two civil members. The military members are the chief of the general staff, the adjutant-general, the quartermaster-general and the master-general of the

ordnance. The civil members are the deputy minister and the paymaster-general. Each of these officers presides over a branch of the department, and the business of administering the force is distributed among these branches. The Minister presides over the meetings of the council and acts affecting the administration of the militia technically issue from the Minister in council; in practice the decision lies with the Minister. Outside of the militia council stand two inspectors-general, officers of rank, who report upon the quality of the training, etc., of the troops. The country is divided into 11 military districts, each under a district officer commanding, who is either a colonel or a general officer; in the interests of decentralization considerable powers of administration are entrusted to these officers.

All the male inhabitants of Canada from 18 to 60 years of age are liable to military service. To this general rule there are some exceptions, such as judges, clergymen and professors in colleges. In cases of great emergency a "Levee en Masse" may be ordered, when all male inhabitants capable of bearing arms can be summoned. Those ordinarily liable to service are divided into four classes: (1) Those 18 years of age to 30, unmarried, or widowers without children; (2) 30 years of age to 45, unmarried, or widowers without children; (3) 18 to 45 who are married, or widowers with children; (4) 45 and upwards, but under 60. The principle of substitution is recognized. It is in this order that the Militia Act of 1904 contemplated the summoning of the male population to the colors. When in the stress of the Great European War resort was had to compulsion for overseas the foregoing classification was rearranged, and the principle of substitution disappeared. The Militia Act limited compulsory service in the field to 18 months at most; this limitation disappeared. The militia may be sent on active service "anywhere in Canada and also beyond Canada for the defense thereof." When in time of war the "militia is called out for active service to serve conjointly with His Majesty's regular forces, His Majesty may place in command thereof a senior general officer of his regular army." In the census year of 1911 the number of males in Canada between 18 and 45 was 1,720,000; of these 1,109,000 were native-born, 306,000 were British born and 304,000 were foreign-born.

**Later Organization.**—During the period 1902 to 1914 the professional soldiers of Great Britain once more influenced the military policy of Canada, but this time in a manner consistent with the autonomy attained by the Dominion in the British empire. During the greater portion of this period the sailors and soldiers of the empire were preparing, as far as political policy allowed, for the great war which they foresaw, and which came in 1914. The general policy pursued was for the United Kingdom to prepare its forces to meet the first shock of the conflict, and for the Dominions—Canada, Australia, New Zealand and South Africa—so to organize their citizen forces as to enable them in the event of war rapidly to raise forces which would fit into the general British military system. This implied (1) common establishments; it was understood, for example, that if Canada raised a division for war service, it would be identical as to number

of battalions, proportion of artillery, details of staff, etc., with the divisions of the British army. (2) A considerable amount of staff work, in the shape of mobilization arrangements, plans of organization, etc. (3) The provision of arms, stores, equipment, etc., for a force of the size which Canada might reasonably be expected to raise. Such plans were prepared and carried out to a certain extent in Canada. The foundations of them are to be found in a series of agreements made at the Imperial Conferences of 1907, 1909 and 1911 and set forth in blue-books published in those years; these agreements were concluded between the statesmen of the mother country and the Dominions, assisted by soldiers and sailors representing the several parts of the empire concerned. The details were worked out by a number of staff officers, in part supplied from the British army, in part belonging to the Canadian establishment. The organization of the Canadian forces was stimulated by two visits of inspection paid by distinguished officers, by Sir John French in 1910, and by Sir Ian Hamilton in 1912; their advice proved of great value. The general Canadian organization was based on the theory that the militia was to provide the framework of corps, officers, arms, training establishments, etc., of an army to resist invasion; the first line was to be 125,000 strong and behind was to be a second line of reinforcing units, also 125,000 strong. The country east of Lake Superior was divided into six areas, each of which was to provide a self-contained division of all arms. In the region west of Lake Superior were a considerable number of mounted units and a number of infantry corps, which it was planned ultimately would form a Seventh Division. Provision also was made for a number of mounted brigades. Theoretically this organization faced southward; in point of fact, the real danger apprehended was across the Atlantic.

In this period the organization and numbers of the militia changed rapidly, the general aim being to attain a proper distribution of arms; the force had comprised too large a proportion of infantry, with too small a supply of cavalry and artillery. Several instructional corps, known as the Permanent Force, had existed from about 1880; early in the 20th century this force was considerably increased, partly because the Dominion undertook to garrison the Imperial fortresses of Halifax and Esquimalt, and partly because the militia needed more ample facilities for training. By 1914 the authorized establishment of this Permanent Force was 5,000 and the actual strength was about 3,000. The organizations included: cavalry, 4 squadrons; horse artillery, 2 batteries; garrison artillery, 5 companies; engineers, 3 companies; infantry, 1 battalion; and also army service corps, army medical corps, army veterinary corps, ordnance corps, army pay corps, military staff clerks, etc. The active militia comprised in 1914: cavalry, 130 squadrons; field artillery, 38 batteries; heavy artillery, 5 batteries; siege artillery, 2 batteries; garrison artillery, 13 companies; engineers, 4 field troops, 9 field companies, 9 telegraph detachments, 1 wireless telegraph detachment; infantry, 104 battalions; signal corps, 4 com-

panies and 3 independent sections; army service corps, 18 companies; army medical corps, 21 field ambulances; and sundry auxiliary services. The war establishments of these units would not be far short of 150,000.

These corps were distributed into higher formations in accordance with the plan already outlined: the organization was not complete in 1914, there still being an excess of infantry and deficiency of some of the other arms, notably of artillery. A feature of this period was the provision of special troops for the auxiliary services—army medical corps, army service corps (for supply and transport), ordnance store corps, a corps of guides (for intelligence work), and similar organizations. Citizen soldiers proved particularly adapted to these ancillary services, and often attained much proficiency in them. The number of the active militia trained, which before the South African War had been fewer than 20,000, by 1914 had risen to nearly 60,000. With all this improvement in organization the progress in training was slower. Something was done in substituting practical work for the older close-order drill and ceremonial, and rifle-shooting was encouraged, but the bulk of the militia had to content themselves with 12 days' training in the year.

Training establishments had been increased during these years. The oldest of these is the Royal Military College at Kingston; founded in 1876 in professed imitation of West Point, this institution gives an excellent general education, and in addition fits its graduates to be officers in the regular army. A proportion of its graduates have entered the Imperial forces, others are in the Canadian Permanent Force, while the larger number have entered civil life, but have constituted a reserve of military skill. Schools of artillery, cavalry and infantry long have been conducted at certain centres, and these of late have been multiplied, while instruction has been carried to the militia by detaching instructors from the permanent corps to conduct temporary courses at the headquarters of militia units. Rifle-shooting, for many years a popular pastime, has been stimulated, partly by the establishment at Rockliffe, near Ottawa, of a School of Musketry, modelled upon the British institution at Hythe, partly by the encouragement of rifle clubs, both for military and civilian. Persons enrolling themselves in civilian rifle clubs did so on the condition that "in case of emergency" they should at once become members of the active militia. The government in addition to annual grants supplied a limited number of rifles to each club, with a fair proportion of free ammunition; much energy was shown in providing ranges for these numerous and widely scattered clubs. By 1914 these institutions had increased to 167 military and 433 civilian clubs, and had attained a membership of 52,000. Shooting by members of the militia is actively encouraged. Both the Dominion and provincial governments give monetary grants to the Dominion and provincial rifle associations, the annual meetings of these bodies being well attended, both by militiamen, members of the rifle associations and cadets.

To serve as feeders to the militia, and to disseminate military knowledge and aptitude at

an age when lessons are easily learned, the militia department before 1914 had done its utmost to encourage the cadet movement. Corps were formed in the schools, the provincial governments (in whose hands the control of education is vested under the Canadian constitution) co-operating with the Dominion government. The movement began in 1908; by 1911 there were 492 companies and 19,250 cadets; by 31 March 1916 the numbers had increased to 1,428 companies and 57,000 cadets. Of these units 76 were affiliated or attached to militia organizations; 26,000 cadets were drawn from secondary schools, 25,500 from primary schools and 5,000 were in corps fostered by municipalities or government institutions. In 1912 cadet camps were formed, and in the years before the outbreak of the war these camps were attended by from 12,000 to 20,000 lads; a good deal also was done to teach cadets rifle-shooting.

In regard to the provision of arms the most important step taken was the establishment in 1904 of the Ross rifle factory at Quebec; this institution until the summer of 1916 manufactured the Ross rifle, a type of weapon differing in many respects from the Lee Enfield, the military rifle used elsewhere in the British empire, but of the same calibre and taking the same ammunition. The capacity of this factory before the war was 12,000 rifles a year, and in 1914 there were about 70,000 Ross rifles in the country, some of them of an earlier make which was unsuitable for campaigning. In 1916 the Canadian troops in France were rearmed with the Lee Enfield, and the Ross rifle factory, which had been much enlarged, was changed to the manufacture of that weapon. In 1917 this factory was taken over by the government. A small arsenal exists at Quebec, capable in 1914 of turning out several million rounds annually; it also made a limited quantity of 18-pounder shells. A second arsenal has been established at Lindsay, Ontario; it began to manufacture ammunition in 1917. The government by 1914 had provided about 100 guns, mostly 13- and 18-pounder horse and field quick-firing guns; it also had a few medium guns, 4.7-inch and 60-pounders. The supply of machine guns was scanty. Something was done toward providing mobilization stores, i.e., clothing and other necessary articles which would be required by the new men who would be brought into the regiments when they were increased to their war strength.

**Participation in the Great War.**—Canada unhesitatingly took part in the European War. Mention already has been made of the plans framed by the military authorities; these included confidential plans for the dispatching abroad, in the event of a war in Europe, of an expeditionary force comprising a division (i.e., 12 battalions of infantry, with the necessary complement of artillery and other troops, in all about 18,000 men) and a mounted brigade (about 2,000 mounted rifles). Detailed plans for the enlistment and mobilization of these had been matured; the troops were to be specially enlisted, the militia organization being employed to raise this force. On 1 Aug. 1914 the Canadian government telegraphed to London offering a contingent, and on 6 August the British government replied accepting, and

suggesting that the force sent consist of one division and a "first reinforcement" of 10 per cent; in all, including subsidiary services, some 22,000 of all ranks. Recruiting was so ardent and districts so vied in providing corps, that instead of 12 battalions 17 were raised almost instantaneously; in addition another battalion, the Princess Patricia's Canadian Light Infantry, was raised from former British soldiers residing in Canada. These 18 battalions, with other corps, numbering in all 33,000 all ranks, sailed from Quebec late in September and landed at Plymouth on 15 Oct. 1914. This was a force raised *ad hoc*, and in a sense was outside the active militia, although it was based upon that force. The liability of the militia to serve abroad has been noted earlier; no attempt was made to apply this liability, the course followed being to organize, under the Militia Act, a new force known as the Canadian Expeditionary Force. The term of service is the duration of the war, with a minimum of one year. The active militia supplied nearly all of the officers and many of the men of the first division, and its whole machinery was employed in raising, organizing and outfitting this overseas army. Many, however, of the rank and file had not previously served in the militia, and this fact, coupled with the slight training afforded in any case, made it necessary to give the whole force several months of training before sending it to the Continent. Something was done, especially in the way of musketry, at the great mobilization camp at Valcartier, near Quebec. On landing in England the division was placed under the command of a British general, and it spent the winter upon Salisbury Plain, training amid discouraging conditions of weather—conditions which were shared by scores of divisions of new troops which had been raised in Great Britain. In February 1915 the First Division, as it now was, crossed the Channel, leaving the surplus five battalions in England to serve as feeders. This division was heavily engaged in April at the second battle of Ypres, or Saint Julien as it sometimes is termed, sustaining some 6,000 casualties. Before the First Division was well clear of the Saint Lawrence a Second Division was offered; its organization went on through the winter of 1914-15, the battalions crossing the Atlantic in single ships instead of in one great convoy as with the First Division. The same deliberate training was given to the new troops, and the Second Division was fairly organized by mid-summer of 1915. When it was sent to France the two divisions were united in a Canadian Army Corps. New battalions kept working their way across the Atlantic and through the training camps in England, and by the end of the winter of 1915-16 a Third Division was complete and the Canadian Army Corps had three divisions and upward of 60,000 men. The army corps suffered upward of 10,000 casualties at Hooge in May 1916, the Third Division being the heaviest loser. A Fourth Division was then organized and in the summer of 1916 it joined the Canadian Army Corps in France. The Canadian corps was heavily engaged in the Battle of the Somme in 1916, and at Vimy, Lens and Passchendaele in 1917. Its casualties in 1917 were in excess of 84,000. At

the beginning of the campaign of 1918 the Canadian Army Corps consisted of four divisions, numbering 78,000 all ranks, and about 11,000 "corps troops," principally artillery; altogether the Army Corps comprised some 90,000 troops, this being the standard large formation in the British Army. The general commanding the Army Corps, Sir Arthur Currie, was a Canadian militia officer, who had raised a battalion of the First Division. In addition there was a Canadian Cavalry Brigade serving elsewhere in the British Army, and there were large numbers of railway and forestry troops, as well as many line of communication units; all told, the Canadian troops in France of the various categories mustered approximately 150,000.

To provide for a steady flow of reinforcements to the troops in France, and for the care of wounded and sick, an extensive establishment was maintained in England, over which after the autumn of 1916 a Minister of the Canadian Cabinet presided with the title of Minister of the Overseas Military Forces of Canada. At one time a fifth division was formed, but the need for drafts to keep the other divisions up to establishment was so great that it was broken up. The establishment in England comprised numerous training schools, and the general policy settled upon in 1917 and 1918 was to forward recruits from Canada to the United Kingdom as soon after their embodiment as convenient, so as to receive their training close to the fighting. This was part of a general reorganization, more especially of the infantry. At first the method of recruitment was to authorize the raising of numerous single unrelated battalions, and in all more than 250 such battalions were formed. The four divisions in the field comprised no more than 52 battalions of infantry and pioneers, and these were reinforced whenever depleted; as a necessary consequence on arriving in England four-fifths of the infantry units raised were either converted into depot or reserve battalions, or were broken up to furnish drafts for the battalions in the fighting divisions: a course which entailed considerable hardships upon the senior officers of corps so treated, as the majority of them could not obtain employment in France. In 1917 the raising of new battalions was discontinued and the whole of the Canadian infantry were organized in 12 territorial regiments, each of several battalions. These regiments were: The Western Ontario Regiment; the 1st Central Ontario Regiment; the 2d Central Ontario Regiment; the Eastern Ontario Regiment; the 1st Quebec Regiment; the 2d Quebec Regiment; the Nova Scotia Regiment; the New Brunswick Regiment; the Manitoba Regiment; the British Columbia Regiment; the Saskatchewan Regiment; the Alberta Regiment. Each of these regiments had several fighting battalions in France, one or more reserve battalions in England, and one or more depot battalions in Canada. By this arrangement steadier and more equitable relations were established between the several services of procuring men, training them and employing them in battle. Canada maintained in England and France numerous auxiliary services, such as hospitals, Y. M. C. A. huts, etc. In addition to the forces despatched to Europe, the Dominion contributed to the gar-

risons of Bermuda and the West Indian island of Saint Lucia. Many individual Canadians obtained commissions in the forces of the United Kingdom, the air services in particular attracting several thousand men.

The reorganization just described coincided with a change in the method of recruitment from voluntary enlistment to compulsory service. At the outset recruiting was voluntary and in 1914 and 1915 great eagerness was shown. In all about 375,000 effective recruits were obtained in this manner, or more than 5 per cent of the population. In 1916 the stream of enlistment slackened and in 1917 the government decided to have recourse to compulsion. After some delay due to political difficulties the Military Service Act was passed, and its operations began in October 1917. The general principle was that 100,000 men were to be drafted from the unmarried men of the country between the ages of 20 and 34; liberal provision was made for exemption on grounds of medical unfitness, the dependence of others upon the draftee, indispensability for purposes of food production, war industries, etc. A system of tribunals was set up, the general principle of administration being that the draftees were obtained by the civil power, and by it turned over to the military authorities, who did not themselves come into contact with the civilian population. The military authorities on receiving the recruits so produced outfitted them in depot battalions, gave them preliminary training, and sent them to Great Britain in comparatively small drafts. In 1916, toward the close of voluntary enlistment, replacement troops were sent across the Atlantic at the rate of about 10,000 a month; in the early months of 1918, when the new system was beginning to work well, the rate of reinforcement was about the same. Side by side with compulsory service volunteering persisted and was encouraged; those coming forward voluntarily going principally into the air forces and special services.

A feature of Canadian participation in the war has been the unexpected production of munitions of war. Soon after the outbreak of the war the then Minister of Militia, Major-General, the Hon. Sir Sam Hughes, formed a shell committee, composed mainly of manufacturers, and this body, acting for the British government, placed large orders for munitions, both in Canada and in the United States. In the latter part of 1915 it was remodelled, the new organization being styled the Imperial munitions board. The two bodies were remarkably successful in inducing and encouraging Canadian industries originally designed for peaceful purposes to turn to the making of munitions. Up to the end of January 1918 the orders given to firms in Canada and the United States aggregated rather over a \$1,000,000,000. It may be added that the voluntary giving of the people of Canada to Red Cross, Belgium Relief, the Canadian Patriotic Fund [an organization for caring for soldiers' dependents] so far have been about \$50,000,000.

**Naval Defense.**—Canada took little interest in the question of helping with the naval defense of the empire until March 1909. The excitement which arose in England in that month over the naval rivalry of Germany

deeply impressed Canadian public opinion, and the Canadian House of Commons by a unanimous resolution approved the principle of participation. In the autumn of 1909 representatives of the Canadian government attended the defense conference of the several parts of the empire held in London, and as a result the government of the day put forward in 1910 a project for the establishment of a separate Canadian navy; two old cruisers, the *Niobe* of 11,000 and the *Rainbow* of 3,600 tons, were bought to serve as training ships, and it was proposed to build in Canada four light cruisers of the *Bristol* class and six destroyers. In time of war this force was to be placed under the British Admiralty. A number of officers were borrowed from the Royal Navy, and a few hundred men enrolled, many of these also coming from the British navy. This proposal encountered political resistance on two grounds, one school of thought regarding it as insufficient, and another school disliking any contribution to naval defense. The administration was defeated at the polls in 1911 and retired without having ordered the ships. The administration which succeeded it consulted the Imperial government afresh, and in 1912 proposed to drop the idea of a separate navy and to present to the British navy a gift of three battleships. The opposition resisted this, putting forward an alternative plan for a Canadian navy of 2 battle cruisers, 6 light cruisers and 12 destroyers. The proposal of the government passed the House of Commons, but was rejected by the Senate, in which the opposition commanded a majority. The great war began before any further steps were taken by the government. On the outbreak of hostilities the Canadian naval forces—the two cruisers already mentioned and two submarines hastily purchased from an American shipyard on the Pacific coast, with some hundred seamen—were placed at the disposal of the Admiralty. The Canadian vessels took part in the patrolling of the Atlantic and Pacific oceans for the protection of commerce. The department of the Naval Service administered the movement of ships from Canada to Great Britain.

C. T. HAMILTON,

*Department of Militia and Defense, Ottawa.*

**31. THE ACADIAN REFUGEES.** After the conquest of Acadia in 1710—the first and only fruit of Samuel Vetch's grand design for the conquest of Canada,—the Treaty of Utrecht (see *UTRECHT, PEACE OF*) provided for the free exercise of the Roman Catholic religion by such of the French inhabitants as were willing to remain there, but also stipulated that any who should choose might remove within a year. Nearly all remained; but, under various excuses, in the hope of a return of French power, they postponed taking the oath of allegiance to the British Crown until 1730. In 1745 war broke out again, and in 1749 the founding of Halifax (q.v.) by several thousand British emigrants excited the jealousy of the officials of Canada and priests of Acadia. The people were a simple and densely illiterate peasantry, taught to obey their missionaries in everything. These missionaries were chosen and directed by the bishop of Quebec and the governor of Canada as agents of French policy, and hence a very diffi-

cult position existed, both for the English and for the Acadians. Through the promptings of the fanatical Abbé Louis Joseph Le Loutre (q.v.), and the duplicity of Governor La Jonquière of Canada and the court of France, the Indians were encouraged to murder English settlers and commit other outrages, some of the Acadians even taking part in these crimes. These charges are proved by the citations from French secret documents given in Parkman's 'Montcalm and Wolfe'; and have not been effectively answered. Le Loutre, who was vicar-general of Acadia and missionary to the Micmacs, even paid 100 livres each for English scalps in time of peace; and the money was reimbursed to him by the intendant of Louisburg. He held constant threats of Micmac massacre over the Acadians themselves, compelling them to acts antagonistic to the English, and moving many of them from their farms and possessions to suit his plans. Yet his inhumanities were evidently justified in his own warped heart and intellect as services to his Church and country. The people, as a whole, would have been quite content to live in peace, being very well treated. In 1751, La Jonquière issued a proclamation commanding all Acadians to enroll themselves in the French militia. A claim was put forward that only a small part of the province was 'Acadia,' as ceded to the British under the Treaty of Utrecht, and consequently that all the rest was still under the rule of the French. The latter now conceived the definite design of reconquering the province; but the English, obtaining exact information through the spy Pichon, struck first by capturing Fort Beauséjour, on the neck of the Acadian peninsula, on 16 June 1775. Fort Gaspereau, 12 miles distant, then surrendered, and the French fort at Saint John being burnt and abandoned on the approach of an English force, the whole country was left under British control. This entire plan of re-establishment was due to the forethought of Governor Lawrence, aided with due vigor by Governor Shirley (see *SHIRLEY, WILLIAM*) of Massachusetts.

The chief interest in the Acadians will always, however, be centred in the incidents of the famous dispersion, which were now about to begin. The projected French invasion had aroused the apprehension of the small British population and authorities, an apprehension deepened by the Indian outrages of Le Loutre and the fear of the neighboring stronghold of Louisburg. The whole of the Acadians also persistently refused the oath of allegiance. In this state of affairs, which not only seemed a great danger but appeared to imply a great ingratitude, after the mild treatment and privileges of property and religion so long extended to them, it was determined by Governor Lawrence that the only safety lay in removing the Acadian population and replacing them by New Englanders. That view had been held for some time by Governor Shirley of Massachusetts and others. Lawrence had complained bitterly to the Lords of Trade before the capture of the French forts 'that this lenity has had so little effect, and that they still hold the same conduct, furnishing them [the French] with labor, provisions, and intelligence, and concealing their designs from us.' On the capture of Beauséjour, Lawrence exacted an unqualified oath of allegiance from the Acadians; and in response

two successive deputations came to Halifax, representing together nine-tenths of their entire population. Both absolutely refused to take the simple pledge of fidelity and allegiance to the British sovereign. The governor and council therefore resolved that it was necessary to deport their people, and in order that they should not strengthen the enemy, they were to be distributed among the English colonies. Lawrence now ordered Colonels Moncton and Winslow and Major Hanfield,—at Beauséjour, Basin of Minas and Annapolis, respectively,—to seize the inhabitants, and if necessary to burn their houses. The principal scenes of the expulsion took place under Winslow at Grand Pré and Fort Edward, in the Basin of Minas, just after completion of the harvest at those fair and populous settlements. At Grand Pré all the males over 10 were ordered to the parish church, where Winslow read them the order of removal and detained them as prisoners. They were kept several weeks before deportation, and the year was nearly ended before all were gone. Tragic scenes of lamentation and distress accompanied the leaving, although it was carried out as humanely as possible. The whole number removed from the province is usually stated as a little over 6,000, although Richard and others place the figures much higher. Some took refuge in the forests or fled to the French territories. Lawrence sent the ships deporting them to the different colonies from Massachusetts to Georgia, where they became a charge on the people and their gradual departure was connived at. Many in the South eventually reached the French settlements of Louisiana, where their descendants are still found in certain parishes and were estimated at 40,000 a few years ago. The sorrows of the dispersion were great, and the death rate considerable. It is regrettable that those who reached Canada and the French West Indies suffered perhaps the most terrible miseries of all from neglect and ill-treatment. Most of the refugees at length found their way back to Nova Scotia and were progenitors of the greater part of the present French population. Their woful story was told in an idealized form in the pages of Haliburton, from whom, passing through a medium of feminine sentimentality in the pages of a lady writer, it reached Longfellow and was immortalized in his 'Evangeline.' The unhappy facts were afterward the subject of heated recriminations, especially by French writers such as Abbé Casgrain and Rameau, against the New Englanders, whose leading defenders are Parkman and Hannay. Edouard Richard in his 'Acadia' ascribes all to Lawrence personally. The dispassionate view would seem to lie in fair allowances for the difficult situation and training of the actors on both sides. In this light the Acadian population must be remembered as a densely ignorant people. Without some education, the measure of natural shrewdness they possessed could not be expected to clear up for most of them the moral problems connected with allegiance to the British Crown, and the political problem of the ownership of Acadia as it was represented to them. Most of them were undoubtedly trying to be loyal to France and ready to return the country into its possession, and duplicity did not seem to them improper. This is not only deducible from all the events but plainly set forth in the petition

of 3,500 Miramichi refugees to Governor de Vaudreuil in 1756.

For the Indian atrocities, to which some of them gave support, we cannot hold the people as a whole responsible. In view of these considerations the Acadian people must be regarded as unfortunate and misled, and their condition as a conquered people, torn from their compatriots and coreligionists by the fortune of war, as they hoped only temporarily, must be considered. As in the case of ignorant populations generally, it is chiefly their leaders and advisers—Le Loutre, Jonquière and the bishop of Quebec—who must be held responsible. 'Regarding Le Loutre, although his character of the peculiarly savage and relentless fanatic led him into acts which place him among the class of murderous criminals, his guiding motives appear to have been a distorted patriotism and allegiance to his religion. These are in a different class from the mean duplicities and false quibbles of La Jonquière and the French ministry, who were well aware both of the untruth of their pretensions concerning the extent of Acadia, and of the dangerous position in which they were placing the Acadian people. When we examine the motives of the British side, we have to deal with practically only Lawrence and his council at Halifax. A state of war existed, and in their judgment desperate measures were necessary for the safety of the little British colony. The British settlers were greatly outnumbered and held but a small part of the country. Le Loutre and the French authorities were pursuing a treacherous course of savage murder against them, with Acadian participation. The entire people absolutely refused to take a simple oath of allegiance, although repeatedly and plainly warned of the consequence. In Lawrence's judgment no other course than deportation then seemed safe; and although a harsh measure, like its modern analogue, Reconcentration, it proved effectual in removing all doubt respecting the security of the colony. Harsh and drastic as his measures were, he is entitled to be judged, in part at least, as a military man bound to perform a duty; and his freedom of discretion at a difficult juncture must be respected even if it may have been badly used. On the side of France, two instances of a similar deportation policy are cited in defense—the proposal of Governor de Callières, endorsed by the French King in 1689, to seize the province of New York and deport all the Protestant population (Doc. Hist. N. Y. Vol. I, pp. 285-97); and the actual deportation of the English settlers from the island of Saint Kitts in 1666, to the number of 2,500, an occurrence marked by the striking of a medal by Louis XIV, inscribed "Ang. Ex Insula St. Christoph. Exturbat."

**32. THE QUEBEC ACT.** From the capitulation of Montreal in 1760 down to the ratification of the Treaty of Paris in 1763 Canada was without any form of civil government, the affairs of the colony being administered by the officer in command of the British armies of occupation. But with the conclusion of peace and the definite cession of the colony to the British Crown this tentative arrangement came to an end and in the autumn of 1763 a royal proclamation decreed the establishment of a civil government in the newly-acquired colony, promising that as soon as circumstances would permit representative assemblies would be convened. In the meantime the laws of England were to be in force. In virtue of this arrangement Gen. James Murray (q.v.) was appointed to the governorship of the colony and a council of eight members was nominated to assist him in the work of administration. For the time being, justice continued to be administered by the military courts at Quebec, Three Rivers and Montreal, but in September 1764 a proclamation was issued by the governor-in-council establishing a Court of King's Bench for the trial of all causes, both civil and criminal, agreeably to the laws of England which the royal proclamation of the preceding year had declared to be in force. At the same time a Court of Common Pleas was established for the trial of actions which had arisen before the publication of the proclamation of 1763 and in regard to which the old French law had to be applied.

The immediate result of this change was to inaugurate a régime of utter judicial chaos, for the new judges were completely at a loss to apply the principles of English common law to the causes which came before them, especially where questions of real property were concerned. Accordingly, the governor-in-council during the month of November 1764 issued a further proclamation declaring that "in all actions relative to the tenure of land or the rights of inheritance, the French laws and usages shall be observed as the rule of decision." But in all other civil cases and in all criminal cases the common law of England was to be applied. This change improved matters but slightly for the new English judges were slow to master the intricacies of French law and applied it very imperfectly where they endeavored to make it apply. To the application of the English criminal law the French inhabitants of the province made no great objection, although for the time being many of them failed to take kindly to the institution of trial by jury; but there was a widespread demand for the extension of French law to all civil causes. Complaints were likewise made that the judicial officers of the colony were for the most part ignorant of the French language; that they were often dishonest and that the legal fees charged the inhabitants were exorbitant. For all of these complaints there seems to have been considerable foundation and in fact the law officers of the Crown in England reported a recommendation that the French language should be restored in judicial proceedings and

that the old French law should be extended to all civil cases.

Matters rested as they were until the appointment of Gen. Sir Guy Carleton (q.v.) to the post of governor in 1767. The new governor was not long in grasping the situation and in deciding that the restoration of the whole fabric of French civil law would be advisable. To this end he had the *coutume de Paris* of the old régime carefully re-edited by several colonial jurists of acknowledged ability and the revised text at once became the acknowledged source of law in all cases of land tenure and inheritance. Carleton pressed his proposal on the home authorities and in 1770 went to England to urge its adoption. There he managed to secure the appointment of a commission to examine into the merits of the whole matter and the report of this body, although it was not presented until the closing days of 1772, was on the whole in favor of the governor's recommendation. In the meantime, however, there was a growing demand among the British inhabitants of the colony for the establishment of a representative assembly in accordance with the promise made in the proclamation of 1763. At meetings of the British inhabitants resolutions calling upon the home authorities to take steps in this direction were passed and forwarded to England. But to the adoption of such a step there was grave difficulty, namely, the decision of the question as to whether Roman Catholics would be permitted to sit in the new assembly. The disabilities of Roman Catholics had not been removed in England at this time and it was hardly to be expected that Parliament would extend to Roman Catholics in a colony privileges which it denied them at home. On the other hand, an assembly from which Roman Catholics were excluded would be very far from representative in a colony where nine-tenths or more of the population professed that religion. This difficulty, together with the fact that the position assumed by the representative assemblies in the British colonies on the Atlantic seaboard at this time was not calculated to inspire the home authorities with a favorable regard for popular colonial representation, seems to have determined the ministry in its decision that Canada, for the time being, should not be trusted with an assembly representing the people. On some other points, however, the home authorities evinced a desire to meet the wishes of the colonists.

On 2 May 1774 a bill, popularly known as the Quebec Bill, was introduced into the House of Lords where it passed with little opposition. In the House of Commons the measure was vigorously opposed by a strong minority, but with some amendments was eventually passed, and toward the end of June received the royal assent. By the provisions of the act the boundaries of the province of Quebec were extended to include all ancient Canada, including Labrador, and all the territory lying north of the Ohio and west of the Mississippi. Roman Catholics were released from all penal restrictions; the obligation of the tithe was reimposed in favor of the Church, and all classes, with the exception of the religious orders, were confirmed in the full enjoyment of their proprietary rights. French law was hereafter to be applied in *all* civil cases while the law of Eng-

land was retained for the decision of all criminal causes. Both, however, might be modified by ordinances of the governor and legislative council. Inasmuch as it was "inexpedient to call an Assembly" the act provided for the establishment of a legislative council to consist of not less than 17 nor more than 23 members nominated by the Crown. To this body in conjunction with the governor was given a limited power of internal administration, including the right to levy internal and local taxes. But Parliament expressly reserved to itself the right of external taxation and every ordinance passed by the council was to be transmitted to England where it might be disallowed if the home authorities deemed advisable.

In the New England colonies the passage of the Quebec Act was bitterly resented, partly because of the privileges which it granted a French and Roman Catholic population but more especially because it placed under the almost complete control of the British authorities the vast expanse of territory west of the Alleghanies in the conquest of which the seaboard colonies had borne a heavy share. In Quebec the French inhabitants, while many regretted that provision had not been made for the establishment of a popular assembly open to Roman Catholics, for the most part welcomed the substantial concessions which the act conveyed. There is little doubt that these concessions served in some measure to assure the British authorities of at least their neutrality during the turbulent days of the next few years. The British inhabitants of the province, on the other hand, were naturally disappointed but the course of events during the next half-decade was such as to preclude any important manifestation of their feelings. Under the provisions of the Quebec Act the administration of the province was carried on for the ensuing 17 years.

### 33. THE ASHBURTON TREATY.

The Ashburton Treaty (also called Treaty of Washington), a treaty between the United States and Great Britain, signed 9 Aug. 1842, is chiefly important for its settlement of the northeastern boundary question. The boundary between Massachusetts (subsequently Maine) and British North America had been in dispute since 1783. The treaty of that year (Art. 2) had made the following provision: "And that all disputes which might arise in future on the subject of the boundaries of the said United States may be prevented it is hereby agreed and declared, that the following are and shall be their boundaries, namely, from the northwest angle of Nova Scotia, namely, that angle which is formed by a line drawn due north from the source of the Saint Croix River, to the Highlands; along the said Highlands which divide those rivers that empty themselves into the river Saint Lawrence from those which fall into

the Atlantic Ocean, to the northwesternmost head of the Connecticut River; east, by a line to be drawn along the middle of the river Saint Croix, from its mouth in the Bay of Fundy to its source, and from its source directly north to the aforesaid Highlands which divide the rivers that fall into the Atlantic Ocean from those which fall into the river Saint Lawrence." The article was doubtless drawn in good faith, but owing to the imperfect knowledge of the geography of the territory concerned, its meaning was soon involved in doubt. The identity of the river Saint Croix, the location of the Highlands referred to and the ownership of the Passamaquoddy Islands became matters of dispute. The identity of the Saint Croix was settled by a commission in 1798, appointed under the treaty of 1794. Under the Treaty of Ghent (see GHENT, TREATY OF) (1814) a commission was appointed which settled the Passamaquoddy question by compromise (1817). But the demarcation of the inland boundary seemed long impossible of solution. The American claim located the "northwest angle" at the point where the line due north from the source of the Saint Croix met the Highlands between the rivers flowing into the Saint Lawrence and those flowing into the Atlantic; this established the angle in question "at a place about 144 miles due north from the source of the River Saint Croix, and about 66 miles north of the River Saint John" (United States commissioner, 4 Oct. 1821). The extreme British claim (at any rate after 1814) placed the angle "at or near the mountain or hill called Mars Hill, distant about 40 miles on a due north line from the source of the River Saint Croix, and about 37 miles south of the River Saint John" (note of British commissioner 4 Oct. 1821). In each case the boundary proceeded westward and southward along the Highlands to the head-waters of the Connecticut. Between the two there thus lay a disputed territory of 12,000 square miles. After fruitless negotiations a convention of 27 Sept. 1827 referred the boundary to the arbitration of the King of the Netherlands. His award, however, in 1831 was rejected by the United States.

Meantime the district of Maine had become (1820) a State, and was eager in the defense of its claim to the disputed region. The progress of settlement naturally led to conflict and disturbance on the border line, known as the "Aroostook War." By the year 1840 matters had reached an apparent deadlock in which the adoption of a conventional line seemed the only solution. In addition to the northeastern boundary, various other matters of controversy were outstanding between the two nations. The English claim of a "right of search" for the suppression of the slave trade created a standing difficulty. The destruction of the *Caroline* (q.v.), an American vessel, by a party of Canadians during the revolt of 1837 had led to a demand for redress. The British government had met this claim by asserting that the destruction of the vessel was a legitimate act of war, the *Caroline* having carried supplies for the insurgents. A Captain McLeod, a Canadian, accused of participation in the affair, was arrested and brought to trial in New York; in all probability nothing but his acquittal prevented actual

hostilities. A further complication had arisen in the case of the *Creole*, a slave ship on which the negroes had revolted (1841), and which they had carried to a British port in the West Indies, where they were allowed to go unmolested. There was also in question the boundary of Oregon. To settle these various points at issue, Lord Ashburton (see ASHBURTON, ALEXANDER BARING, LORD) was sent to Washington (April 1842) and in conjunction with Daniel Webster, Secretary of State, arranged the treaty commonly known by his name. Ashburton, formerly Mr. Alexander Baring a prominent financier, and for nearly 20 years a member of the House of Commons, had previously resided in America, where he married a daughter of Senator Bingham. His known desire for a good understanding between Britain and America rendered his relations at Washington most cordial. He was widely entertained, and is said to have "spread a social charm over Washington, and filled everybody with friendly feelings toward England." With Webster his relations were especially amicable, and their negotiations assumed an altogether informal character. (See Schouler, 'History of the United States,' Vol. IV, ch. xvii). To this fact has been partly due the impression ever since prevalent in Canada that the interests of that country were sacrificed to the expansiveness of Lord Ashburton's feelings. Under the terms of the treaty, the northeast boundary was settled thus (Art. I): "It is hereby agreed and declared that the line of boundary shall be as follows: Beginning at the monument at the source of the River Saint Croix, as designated and agreed to by the commissioners under the fifth article of the treaty of 1794 between the governments of Great Britain and the United States; thence north, following the exploring line run and marked by the surveyors of the two governments in the years 1817 and 1818, under the fifth article of the Treaty of Ghent, to its intersection with the River Saint John, and to the middle of the channel thereof; thence up the middle of the main channel of the said River Saint John into the mouth of the River Saint Francis; thence up the middle of the channel of the said River Saint Francis, and of the lakes through which it flows, to the outlet of the Lake Pohenagamook; thence southwesterly in a straight line to a point on the northwest branch of the River Saint John." This locates the main part of the boundary; for details of the further extension of the line, the text of the treaty may be consulted ('Treaties and Conventions,' Washington 1889; 'Annual Register,' 1842). The treaty provided further for the survey and permanent marking of the boundary, which was completed in 1847. Of the disputed territory the United States received about seven-twelfths and Canada five-twelfths. Rouse's Point, on Lake Champlain, was also declared to belong to the United States, the government of that country binding itself to pay to Maine and Massachusetts \$300,000 on account of the relinquished territory. The right to carry timber down the Saint John River was granted to the United States. By article 8 of the treaty, it was agreed that each country should maintain on the coast of Africa a sufficient naval force, carrying not less than 80 guns, for the purpose of enforcing, separately and respectively, the

laws, rights and obligations of each contracting party for the suppression of the slave trade. The treaty passed over the *Caroline* and *Creole* cases (see CREOLE CASE), but declared (Art. 10) that "each party, on requisition from the other, shall deliver up to justice persons charged with murder, assault with intent to murder, piracy, arson, robbery or forgery, upon sufficient proof of their criminality." The question of the Oregon boundary was also omitted.

The boundary award of the treaty met with great dissatisfaction in Canada. It was currently believed, and the belief largely persists, that the interests of Canada had been unduly sacrificed. The Canadian view of the case is presented in Dent's 'Last Forty Years of Canada' (1881), and in more extreme form in Coffin's 'Quirks of Diplomacy' (1874). The supposed sacrifice of Canada by Lord Ashburton has become a commonplace of Canadian political discussion. Later investigation, however, is strongly in favor of the American claim. The whole subject of the boundary has recently been exhaustively treated in an admirable paper by Dr. William Ganong of Smith College ('Proceedings of the Royal Society of Canada,' 2d series, Vol. VII, 1901). Dr. Ganong, though a Canadian, decides that Maine was right and New Brunswick wrong in the northwest angle controversy. He bases his decision on the text of the treaty of 1783, on the maps of the time, on the admissions of Governor Carlton and others and on a petition of the New Brunswick legislature of 1814, virtually admitting the American claim. The Mars Hill boundary line was not advanced, he says, until 1814. In the controversial discussion of the treaty the episode of the "red line" map has played a considerable part (see *North American Review*, April 1843, and Winsor's 'America,' VII, 180). This was a map found in the French archives and supposed to have been given to Vergennes by Franklin in connection with the treaty of 1783. A boundary line favoring the English claim was marked upon it in red ink. A copy of this map was in Webster's possession during the negotiations but was not shown by him to Lord Ashburton. It was shown by him to the Maine commissioners and played some part in securing their assent to the Ashburton Treaty. But it is not proved that the marking of the map was by Franklin, and it is also possible that it was wrongly marked with intent to deceive (see Hinks, 'Boundaries Formerly in Dispute,' 1885). To offset this map, the original of which has disappeared, there is still in the British Museum an English map favoring the American claim.

**34. CLERGY RESERVES.** The. The clergy reserves were lands set apart, by virtue of the Constitutional Act of 1791, for the maintenance of the Protestant clergy in Upper and Lower Canada. The intention of the act was to reproduce in the colony an episcopal establishment similar to that of Great Britain, to whose primate it was to be subordinate. The provincial governors were directed under the act to reserve one-seventh of the land for the support of the Protestant clergy. The re-

served blocks of land were to be distributed among those granted to settlers. In Upper Canada a full seventh of all the land was to be granted. In Lower Canada reserves were to be made only in proportion to new settlement and not in respect of lands already occupied. No reservations were made in the latter province until 1796. Reservations were made each year until 1838 (except in 1813). The total reservations made in Lower Canada amounted to over 930,000 acres: in the upper province to about 2,400,000 acres. The Crown was also empowered to authorize the lieutenant-governor of each province from time to time to erect parsonages, to endow them with a portion of the reserve lands and to present incumbents to them (Constitutional Act, Secs. 38, 39, 40). The operation of the system thus established was not at first felt as a serious grievance. Land being still plentiful, the reservations remained unsold and were leased at extremely low rentals (10 shillings for 200 acres during first seven years). With the progress of settlement however the rentals constantly rose. The question of the clergy reserves became a subject of increasing complaint. The members of the Church of England were in a decided minority, not only in the lower province, but in Upper Canada itself. The question early arose whether the wording of the act—"allotment and appropriation of lands for the support of a Protestant clergy"—could not be construed in favor of the Presbyterian and Dissenting denominations. The matter being referred to the home government, the law officers of the Crown decided (November 1819) that the Scotch Church had a claim for a share of the rentals, but that no other denominations had a claim at all. The irritation thus caused rendered the question one of acute difficulty during the succeeding 30 years, and has been designated by Dr. Bryce, the Canadian historian, the "Thirty Years' Religious War in Upper Canada." The distribution of the population of Upper Canada among the different denominations in 1839 was as follows: Church of England, 79,754; Methodists, 61,088; Presbyterians, 78,383; Roman Catholics, 43,029; Baptists, 12,968; others, 57,572. The claims of the Church of England were stoutly upheld by the Rev. John Strachan, subsequently bishop of Toronto (1839). Egerton Ryerson (see RYERSON, A. E.), a young Methodist minister, strove with equal zeal on behalf of the Methodist Church.

In 1827 the assembly of Upper Canada asked the Crown to devote the reserves to the creation of schools and of churches of all denominations. The same request was repeated in each of the three following years with considerable popular agitation. Meantime the endowment of rectories as provided by the act of 1791 was authorized by instructions from the Crown in 1825. The excited state of public feeling delayed for some years the execution of this project, but in 1836 54 rectories were endowed with 400 acres each. The discontent thus caused helped to precipitate the rebellion of 1837. With the suppression of that movement the question of the clergy reserves still earnestly demanded solution. An act of the legislature of Upper Canada in 1839, proposing to reinvest the reserves in the Crown,

was disallowed by the home government. In the following year the legislature passed an act for the sale of the reserves, one-half of the proceeds to go to the churches of England and Scotland, and the other to be divided among the other religious denominations. This again was abortive, the British judges, on question by the House of Lords, deciding that the provincial legislature had exceeded its authority. The Imperial Parliament now intervened and passed an act (7 Aug. 1840) for the settlement of the question. Part of the reserves had already been sold by authority of a statute of 1827. The proceeds of these sales were to be divided between the churches of England and Scotland, the former receiving two-thirds; the unappropriated lands (1,800,000 acres) were to be sold, and the amount realized to be invested, one-half of the interest being given to the two above churches, in the proportion already mentioned, the other half to be applied by the governor and executive council for public worship and religious instruction. The income thus accruing was divided in the ensuing years among the churches of England and Scotland, the Wesleyan Methodist, Roman Catholic and Synod Presbyterian churches and the United Synod Presbytery. The question was still far from settled. It was claimed that the lands were sold by the Crown at insufficient prices, and Bishop Strachan led an agitation for the sharing up of the lands themselves. The assembly refused to petition the Crown to this effect, but demanded the repeal of the act of 1840. The Imperial Parliament complied by a statute of 1853, which placed the reserves in the control of the provincial Parliament (the two Canadas being now united). The Canadian Parliament elected in 1854 strongly reflected the general public feeling in favor of secularization. A statute to that effect was passed. A lump sum of £188,342 was paid to the Church of England, representing the guarantee of stipends then charged on the reserve fund, called for by the Imperial act. The reserved lands were sold and the proceeds given to the municipal authorities for education and local improvement. Consult Lindsay, 'The Clergy Reserves' (1851); 'Memoir of Bishop Strachan' (1870); Ryerson, 'Story of My Life' (1883).

**35. SEIGNIORIAL TENURE.** The system of Seigniorial Tenure was that system of public and private relations based upon the tenure of land which the French government undertook, during the course of the 17th and 18th centuries, to introduce into its North American colonies, and more especially into the colony of New France, now Canada. The system of feudal—or as in its later stages it came to be called—seigniorial tenure, was deeply rooted in France, and it is easy to understand how its introduction into the colonies appealed to Richelieu as a means of providing estates for many of the landless aristocrats of France. Moreover as feudalism was now so far advanced in decay as to be no longer a menace to the central power, it is easy to see how the system appealed to the Bourbon monarchs as likely to permit, in the colonies, of that cen-

tralization of authority which characterized France at this time.

As regards Canada, the seigniorial system had its origin in 1627 when the French King granted to the Company of New France, more commonly known as the Company of One Hundred Associates, the whole of the French possessions in North America as one immense fief with full power to sub-grant it in seigniories to settlers. During the whole 35 years of its existence, however, this company devoted almost its entire attention to the development of the lucrative fur trade; very few settlers were sent out to the colony, with the result that while over 60 *in extenso* grants of seigniories were made, almost none at all were ever taken possession of by the grantees. But in 1663 the company was compelled to surrender its charter and extensive territorial rights, the Crown taking into its own hands the supervision of colonial affairs and providing New France with a royal government corresponding roughly to that established in the French provinces at home. From this time on settlers came in increasing numbers; power was given the colonial governor and intendant to make grants of seigniories subject to royal ratification, and during the last quarter of the 17th century these were made freely. In no case were grants made to absentees; each applicant for a seigniorial grant had to prove himself a bona-fide colonist. Large numbers of the settlers were sent over at the royal expense and once in the colony, every inducement was given them to remain. Even the detachments of French regular troops sent out to the colony were disbanded there and both officers and men were encouraged, by liberal grants both of land and money, to become permanent residents of New France.

As to the size of the seigniories granted, there was no fixed rule: they varied from small plots containing a few square *arpents* to huge tracts 10 by 12 leagues in area. Much depended on the position occupied by the settler before his immigration to the colony and upon the available means which he had for the development of his grant. But whatever the area of the grants, they almost invariably assumed the same shape,—that of a parallelogram with the shorter end fronting on the river. On receiving his grant the new seignior was under obligation to repair at once to the Château de Saint Louis in Quebec, there to render his fealty and homage to the governor as the representative of the Crown. Within the next 40 days he was required to file with the registrar-general his *aveu et dénombryment*, or statement showing clearly the location, extent and nature of his seignior. A similar statement containing full information regarding the development of the holding was required every time the seignior changed owners. No payment was exacted from the seignior in return for the original grant, but an exaction known as the *quint* became payable on each mutation of ownership by sale, gift or inheritance other than in direct succession. This amounted to one-fifth of the estimated value of the seignior, but of this amount it was the custom of the Crown to give a rebate of one-third. As the seigniories increased in value very slowly this burden was never an onerous one. In making the grants, the authorities usually re-

served the right of taking, from the granted seigniories, such locations as might at any time be found necessary for the construction of fortifications or other public works, such oak and pine timber as might be found suitable for use in the royal shipyards and the right to a share in all mines and mineral deposits found in the seignior.

In France the seignior was under no obligation to sub-grant the lands within his seignior, but by a series of royal edicts,—more notably the Edict of Marly (1711), this obligation was imposed upon the seigniors of New France in the interest of colonial development. From 1711 onwards it was incumbent on all seigniors in Canada to sub-grant portions of the unoccupied lands of their seigniories to any settlers who applied for such grants, on whatever terms were customary in the neighborhood without exacting any bonus or *prix d'entree*. If the seignior refused to do this, power was given the governor and intendant to step in and to make the grant, the seigniorial dues in such case to become payable to the Crown. Furthermore, from time to time various edicts revoked or curtailed the grants made to such seigniors as did not seem to be showing sufficient zeal in having their lands granted to settlers. In this way every seignior was compelled to become, after a fashion, the immigration agent of the colonial authorities, and it was this particular feature which serves most prominently to differentiate the seigniorial system in Canada from its prototype at home.

Grants made by the seigniors to settlers were called grants *en censive*. These likewise varied considerably in size, but almost invariably assumed the same shape as the seignior within which they lay. Over them the seignior retained a variety of rights, some financial, some judicial and some merely ceremonial or honorary in their nature. Among the former was the annual payments known as the *cens et rentes*, the former payable in money, the latter usually in produce. The *cens* was a very small due, amounting usually to a few *sous* per superficial *arpent* and valuable to the seignior mainly as establishing his claim to other and more important rights. The *rentes* was payable annually in grain, cattle or poultry but might be commuted by agreement of the parties into a fixed money payment. Then there was the *lods et ventes*, a mutation fine payable at every change of ownership. This amounted to one-twelfth of the mutation price, and of it the seignior usually remitted one-fourth, although he was under no legal obligation so to do. To guard himself against loss of his proper *lods et ventes* through sales of *en censive* holdings at less than their actual value, the seignior possessed the *droit de retrait* by virtue of which right he might preempt any holding thus sold by payment to the purchaser of the mutation price, within 40 days from the date of the sale. Then there was the *droit de banalité* or the exclusive right of the seignior to erect a grist mill within the limits of his seignior and to compel his *consitaires* to have their grain ground there and not elsewhere on pain of confiscation. The amount of toll receivable for this service was fixed by a royal edict at one-fourteenth of the grain ground. During the greater part of the French régime this incident bore more heavily

upon the seignior than upon his  *censitaires* , for except in the more populous seigniories, the amount of toll received rarely sufficed to pay expenses. At the same time the colonial authorities compelled the seigniors to provide mills in their seigniories on pain of losing the right for all future time. Finally, there was the much-detested  *corvée* , or right of the seigniors to exact from their  *censitaires*  a certain quota of labor on the seigniorial lands without compensation. The amount allowable varied in different seigniories but as a rule the  *censitaires*  were permitted to commute it into a fixed money payment. An ordinance of the superior council in 1716 forbade the exaction of  *corvée*  during seed time and harvest. In addition to the foregoing main rights the seignior ordinarily reserved for himself the privilege of taking from the lands of the  *censitaires*  such wood and stone as might be found necessary in the erection of the seigniorial manor house, mill or church, and in some cases the right of taking wood for fuel. In many cases he likewise reserved the right of claiming a share in all the fish caught by his  *censitaires*  in the waters of the seignior.

Most of the seigniors possessed certain judicial rights. These, however, were not inherent in the ownership of a seignior, but were specifically granted by the Crown. This grant might convey merely the right of  *basse justice*  in which case the seignior was empowered to deal with minor causes in which the amount in dispute did not exceed a few  *sols* . The grant of  *moyenne justice*  gave him a large jurisdiction, while the grant of  *haute justice*  gave full judicial power in all cases except those such as treason and counterfeiting in which the Crown was directly concerned. As a rule all three degrees of judicial power were conferred on the seignior. But in every case an appeal lay to the royal courts of the colony. As the exercise of his judicial powers brought the seignior very little profit the seigniorial courts never became a very important element in the colonial judicial system.

The remaining rights of the seignior were merely honorary and afforded him no financial return. He was entitled to the fealty and homage of his  *censitaires* , to a front pew in the parish church, to certain precedence at the sacraments, to the erection of a Maypole at his door each Mayday and, in general, to the respect and deference of his dependents. A number of seigniors who showed zeal in the development of their holdings received patents of nobility but it must be borne in mind that the possession of a seignior in New France did not of itself give noble rank. Herein Canadian feudalism again differed from its prototype in France. The French seignior was always a noble; the Canadian very rarely.

At the close of the French régime nearly 8,000,000  *arpents*  of land had been granted out to be holden under the seigniorial tenure. The system had become so deeply rooted in the colony that the English authorities, after the conquest, did not venture to take the drastic step of supplanting it in favor of the English system of tenure in free and common socage. The old system was allowed, therefore, to remain intact, but as the colony became more thickly settled many of the seigniorial exactions became burdensome. The  *droit de*

*banalité*  became especially so. Moreover, the new English courts failed utterly to afford the  *censitaires*  that protection against the seigniors which the authorities of the old régime had given. From time to time the legislature of Lower Canada sought to deal with the growing complaint that the operation of the system was retarding the development of the province but found it extremely difficult to devise any plan which would be satisfactory to the tenants and at the same time protect the vested interests of the seigniors. In 1825 an act was passed giving to the parties concerned the right to commute all seigniorial dues into a lump sum by mutual agreement but very few took advantage of the legal permission thus accorded. It was not until 1854 that by the Seigniorial Tenures Abolition Act a general scheme for the compulsory commutation of all seigniorial obligations received the assent of the Canadian legislature. This act provided for the establishment of a special court to determine just what seigniorial claims were justifiable and on a basis of its decisions each seignior was awarded a certain indemnity for the loss of his rights. Part of the amount was paid him from the public treasury; the balance became an annual rent charge on the lands of the tenants, which annual charge, again, might be commuted into a lump sum if the tenant so desired. In any case all lands formerly holden  *en seigneurie*  or  *en censive*  were thereafter to be holden in fee simple. Thus by one stroke of legislation the whole system of territorial law in Lower Canada was revolutionized and the last vestige of Canadian feudalism disappeared.

### 36. HUDSON'S BAY COMPANY, The.\*

This great trading company has been in operation under its present charter for two and one-third centuries. Its charter, which is a very generous one, was given by easy-going Charles II. The company owes its origin to the adventures in the New World of two French Huguenots, Pierre Esprit Radisson and Medard Chouart (afterward Sieur de Groseilliers, or familiarly "Mr. Gooseberry"). It is claimed that in 1662 these daring spirits reached James

\* The charter of this company is given to the "Governor and Company of Adventurers of England trading into Hudson's Bay." From this it has been usual to employ the title "Hudson's Bay Company," using the possessive form of the name of Hudson, the discoverer. The bay itself, as in the case of Hudson River, has its name spelt by the geographers without the apostrophe and s.

Bay, the southern lobe of Hudson Bay. This is entirely improbable, as in that year they are known to have been in Lac des milles Lacs, now northern Minnesota. (See the discussion on this matter in the author's 'Remarkable History of the Hudson's Bay Company'). Persecuted in French Canada, the adventurers fled to New England and thence to England, where they had an audience with the King, and through the influence of Prince Rupert (see RUPERT, PRINCE), the King's cousin, a strong company was afterward formed, being created by royal charter. The first expedition to Hudson Bay was made for the adventurers in the ship *Non-such Ketch*, Capt. Zachariah Gillam, a New England mariner. Arrived at the destination, a fortress was erected on James Bay (lat. 51° 20' N., long., 78° W.), called Charles Fort. On the return of the vessel to England the charter was granted (1670). Prince Rupert was made the first governor, and the vast territory covered by the charter became known as Rupert's Land. He was followed by the King's brother, James, Duke of York, and the third governor was the famous Duke of Marlborough, who has left his family name on Fort Churchill. England's great rival, "La Belle France," immediately began to lay claim to the bay as a part of Canada. Several expeditions were sent out to drive off the English, the most notable being that under Pierre Le Moynes d'Iberville. (See IBERVILLE, PIERRE LE MOYNE D'.) He achieved so great a naval victory that the whole bay fell into French hands, comprising at that time seven forts, of which Charles, Nelson, Moose and Albany were the chief. The territory under dispute was restored to England by the famous Treaty of Ryswick, 1697. Up to the time of the French forays rich dividends had been declared by the partners, that of 1690 being 75 per cent of the original stock, and the King's share was rendered in guineas instead of pounds. The company, which included many distinguished men such as the Duke of Albemarle (General Monk), (see MONK, GEORGE), and Sir George Carteret (see CARTERET, SIR GEORGE) was very influential. Prince Rupert presided at the London meetings, and a sub-committee met regularly to buy and sell, went to Gravesend to see the goods shipped, the men paid, and the like, in the good ships *Prince Rupert*, *Wyuenhoe*, or *Bark Craven*, which sailed around the north of Scotland and thence to Hudson Bay. Every year, about 1 June, for more than 200 years, one ship at least has cleared for its northern port on the bay, latterly generally York Factory. How small the beginnings of trade were may be seen in the inventory of goods sent out in 1672: "Two hundred fowling-pieces, and powder and shot; 200 brass kettles, size from 5 to 16 gallons; 12 gross of knives; 900 or 1,000 hatchets." In October the ship returned with its valuable cargo of furs, which was sold in London, often by auction.

The second period of Hudson's Bay Company history is that involving the local opposition in England to the traders. Between the treaties of Ryswick (1697) and Utrecht (1713), the menaces of the French destroyed the fur trade, but after the latter treaty, from which time the bay has remained continuously English, the affairs of the company improved. This roused the envy of a number of merchants, a

leader among them being an Irish gentleman named Arthur Dobbs. He advocated an expedition to explore the Northwest Passage, raised by subscription a large sum to send out a ship to rival the company, and though his expedition did not accomplish much, yet the Hudson's Bay Company was disturbed, was put on its mettle, and the struggle as recorded in the government bluebook of 1749 became very interesting. A more serious movement, however, began in French Canada. The charter of the company gave it the trade of all the lands and streams within "Hudson's Streights," with one most important limitation, namely, except those "which are not now actually possessed by any of our subjects, or by the subjects of any other Christian prince or state." Long before the Hudson's Bay Company penetrated Rupert's Land, the French ascended the Great Lakes, and 20 or 30 years before the English had reached the Saskatchewan River from Hudson Bay explored the river system of Rupert's Land and came in sight of the Rocky Mountains. This feat was accomplished by Sieur de la Verendrye, who in 1738 caused a fort to be erected on the site of the present city of Winnipeg, and took possession of the country for the King of France. The conquest of Canada by Wolfe put an end to this French occupation, but as later discussions show left it a part of Canada. Soon after the conquest of Canada, however, a critical movement took place in the effort of the Hudson's Bay Company to penetrate the interior from the bay, on whose shores for nearly a century it had lain in slumber. This advance was under the leadership of one of the captains of exploration, Samuel Hearne, a Hudson's Bay Company officer, sometimes called the "Mungo Park of Canada." Hearne discovered the Coppermine River and followed it to its mouth on the Arctic Sea. He, too, first of white men saw Great Slave Lake. But, also, shortly after the transfer of Canada from France to England, Scottish traders from Montreal began to ascend the waterways of Canada, and to pass from Lake Superior on to Lake Winnipeg and the Saskatchewan River, the very centre of Rupert's Land. Alexander Henry (1760), Thomas Curry, James Finlay and the brothers Frobisher, traders from Montreal, led the way and reached the Saskatchewan. Hearne from Hudson Bay heard of the Canadian traders having built a fort at Sturgeon Lake, and two years later (1774) accepted the gage of battle, and built Fort Cumberland alongside of his rivals on the Saskatchewan. The war of the giants had now begun, and for well-nigh 50 years it raged with increasing rancor and bitterness. Out of the movement of the Scottish merchants named, from Montreal, grew the union of traders (1783-84) known as the Northwest Company. Its leading traders were Frobisher, Mackenzie, McLeod, McGillivray, Grant, Cameron and greatest of all Simon McTavish — familiarly called "Le premier," and the founder of the Northwest Company. The magnates of this great company Washington Irving has characterized as the "Lords of the Lakes and Forests." Their trade was enormous and extended to the coast of the Pacific Ocean itself. Toward the end of the century (1795-99) one year's production of furs was 106,000 beavers, 32 martens, 11,800 mink, 17,000 musquash — counting alto-

gether 184,000 skins. At this time the Northwest Company employed, besides officers and partners, 50 higher clerks, 71 interpreters and clerks, 1,200 canoeemen and 35 guides. But the Hudson's Bay Company was not to be beaten. They were able to carry goods from the sea-coast of Hudson Bay to the inland parts of Rupert's Land earlier in the season, even in the Red River districts, than the Nor'-Westers were able to do by the long river and lake route from Montreal. They duplicated all the forts of the Northwest Company. The confusion became worse confounded when the Northwest Company divided (1796) into two rival factions, the rebels forming themselves into the "New Northwest Company" or "Alexander Mackenzie and Company," more familiarly, however, known as the "XY," the name being from the letters of the alphabet following the initials of the old company N.W. The young company was intensely active, and about this time, but only for a short period, the introduction of dangerous amounts of strong drink took place among the Indians. After eight years of unprofitable trade the two sections were reunited as the "Northwest Company."

Early in the 19th century a new problem arose. A Scottish nobleman, the Earl of Selkirk, obtained control of the stock of the Hudson's Bay Company and proceeded to settle up the fertile lands along the Red River, bringing his colonists chiefly from Scotland by way of Hudson Bay. This invasion of the fur-country (1812-15) by farmers the Nor'-Westers strongly resented. They several times drove out, or inveigled away many of the Highland settlers, who were beginning to till the soil within two or three miles of the site of the present city of Winnipeg. Two forts represented the opposing parties—Fort Gibraltar, the Northwest Company fort—Fort Douglas, the Lord Selkirk stronghold. The descendants of the Nor'-Wester French voyageurs, whose mothers were Indian women, were now becoming numerous and went by the name of Metis (Half-breeds) or Bois-Brûlés (Charcoal faces). They were chiefly in the employ of the Montreal Company, while the servants of the Hudson's Bay Company, largely Orkneyemen, were called by their opponents "Les Orcanais." Attacks on the forts were begun by the hostile factions, and in 1816 Governor Semple and 20 of his officers were killed by the Bois-Brûlés, and Fort Douglas was captured. In the next year Lord Selkirk arrived supported by a band of several hundreds of discharged mercenary soldiers who had fought in the War of 1812-15 in eastern Canada. These his lordship had hired and with their aid Fort Douglas was retaken and the colonists re-established in their farms. About the year 1811 John Jacob Astor of New York engaged a number of men who had been in the Northwest Company and with these established Astoria, a trading post, on the Columbia River. This movement took place by way of the Cape Horn route and the rendezvous was in what was known as the Oregon region. The Nor'-Westers taking advantage of the state of war between Great Britain and the United States seized Astoria and employed the greater number of the Astorians in their posts in New Caledonia, as the region of British Columbia was then called. The conflicts of the various companies in different parts of Rupert's Land,

the Mackenzie River district and New Caledonia well-nigh destroyed the fur trade. Now arose a man who was to be the pacificator and leader of all the fur-traders. This was a young Scottish clerk in the Hudson's Bay Company—George Simpson (see SIMPSON, SIR GEORGE). On the union of the worn-out companies in 1821, Simpson was made chief officer and in time he became "Emperor" of the fur company. For 40 years he built up the united company, and spent a portion of his time at Fort Garry, the chief point in Rupert's Land, as it was also the capital of Assiniboia, as the Selkirk colony was legally called. In Assiniboia a community of 12,000 grew up, 5,000 Metis, 5,000 English-speaking or locally called Scotch half-breeds, and some 2,000 whites. Not only in this chief settlement, but from Labrador in the Atlantic Ocean to Vancouver Island on the Pacific did the little despot rule. Great forts were scattered over this wide domain, such as Fort Victoria on the Pacific shore, Fort Simpson in the Mackenzie River district, Fort Chipewyan on Lake Athabasca, Fort Edmonton on the Saskatchewan River, old Fort Cumberland on the same river, Norway House on Lake Winnipeg, York Factory and Fort Churchill on Hudson Bay, Fort William on Lake Superior, Sault Sainte Marie, between Lakes Huron and Superior, the King's post on the lower Saint Lawrence River, and Rigolette in extreme Labrador. From Lachine, his residence, Sir George Simpson dictated law throughout this vast extent of country, and compelled order and industry. The company quoting its charter-rights was from the first repressive in dealing in its territory with traders other than its own. The usual metaphor for describing Rupert's Land was that it was "surrounded by a Chinese wall." After a revolt of the Metis in 1849 this largely ceased to be the case. The company always retained the confidence of the Indians, and with practically no police or military maintained a fair state of law and order. The fertile plains of Rupert's Land were visited by several exploratory expeditions shortly after the middle of the 19th century. Some of these were that of Palliser and Hector, 1857, of H. Y. Hind in the same year and of Milton and Cheadle a few years afterward. A famous parliamentary investigation took place in London in the year of Palliser's expedition. Canada was at this time becoming alive to the importance of the Northwest. Negotiations took place between the British and Canadian governments which culminated in 1868-70 in the virtual decision that Rupert's Land, and the Northern and Western territories which were leased to the Hudson's Bay Company, should become Canadian. Unskilful dealing on the part of the Dominion government with the people of Red River Settlement led, however, to the Riel rebellion, 1869-70. A military expedition of British troops and Canadian volunteers was sent by the old fur traders' route to Red River, but the rebels disappeared before the arrival of the troops. In 1870 the sum of \$1,500,000 was paid by Canada to the Hudson's Bay Company to satisfy its claims, the new province of Manitoba was formed by the Canadian Parliament, and thenceforward the West as far as the Rocky Mountains became a part of Canada. Several years afterward British Columbia came into the Dominion as a province.

The Hudson's Bay Company, though shorn of all political power, still survives, and is vigorous. It still seeks for furs in the far North, and is the largest land company in Canada, owning one-twentieth of every new township, which the government surveys. This serves to give the Hudson's Bay Company a strong interest in building up and developing the newer portions of the country. In addition to this the company has largely devoted itself to conducting large shops in the leading business centres of western Canada. The largest of these is the store in Winnipeg. This with its different departments does an enormous trade not only in Winnipeg, but in supplying by the use of the mails the needs of all parts of the country. Important stores are maintained by the company in Portage la Prairie, Rat Portage, Fort William, Calgary, Vancouver, Edmonton and Prince Albert. The governor of the Hudson's Bay Company till 1914 was the predominating figure, Lord Strathcona, the Canadian commissioner in London. As the writer has elsewhere said, "for the last 15 years the veteran of kindly manner, warm heart, and genial disposition, Lord Strathcona and Mount Royal (q.v.), has occupied this high place. The clerk, junior officer and chief factor of 30 hard years on the inhospitable shores of Hudson Bay and Labrador; the commissioner who, as Donald A. Smith, soothed the Riel rebellion, and for years directed the reorganization of the company's affairs at Fort Garry and the whole Northwest; the daring speculator who took hold with his friends, of the Minnesota and Manitoba Railway, and with Midas touch turned the enterprise to gold; a projector and a builder of the Canadian Pacific Railway; the patron of art and education, and the patriot who sent out at a cost of between \$1,000,000 and \$2,000,000 the Strathcona regiment of horse to the South African War has worthily filled the office of governor of the Hudson's Bay company, and with much success reorganized its administration and directed its affairs." GEORGE BRYCE,

Author of 'History of the Hudson's Bay Company.'

**37. WASHINGTON TREATY, The.** The Treaty of Washington, between the United States and Great Britain, was signed on 8 May 1871, and had reference to the Alabama claims (q.v.), the fisheries question, the lake, river and canal navigation, the bonding privilege and the Vancouver water boundary question. In the years immediately following the Civil War several causes of acute friction existed between the two countries. Of these the principal was the question of indemnity for the depredations committed by the *Alabama* and other Southern cruisers, whose construction in England was claimed by the United States to be a violation of neutrality. The second main cause of contention was the question of the coast fisheries. Under the Reciprocity Treaty of 1854, the fishermen of each nation were admitted to the in-shore coast fisheries of the other. With the expiration of the treaty in 1866 the rights of American fishermen on the Atlantic Coast of Canada were limited to the privileges secured

under the convention of 1818, with a modification of 1845 admitting them to the Bay of Fundy. By this they were excluded from taking fish within three marine miles of any coasts, bays, creeks or harbors of British North America, except in special parts of the Newfoundland and Labrador coast, and off the Magdalen Islands. The proper interpretation of this three-mile limit had been a standing subject of controversy. It was claimed by Great Britain that the terms of the treaty precluded entrance into the bays: by the United States that it merely forbid a nearer approach to the shores of the bay than a distance of three miles. This left in dispute the right to fish in the Bay of Chaleurs and other important places. (See Cushing, 'Treaty of Washington,' ch. v). As a temporary expedient since 1866, the Canadian government had sold licenses to American fishermen for a nominal fee. This scheme had proved abortive, for the raising of the license fee in 1868 had resulted in an almost complete cessation in their use, only 25 being taken out in 1869. The Dominion government, in consequence, by an order in council (8 Jan. 1870) abandoned the system of licenses and equipped cruisers to protect its claims of the coast fisheries. The *Alabama* claims and the fisheries had been for some time a standing subject for negotiations. A treaty of January 1869 (known as the Johnson-Clarendon Treaty) was rejected by the Senate. Negotiations were renewed under President Grant and, at the suggestion of the British government, it was finally decided to appoint a joint high commission to meet at Washington to settle outstanding matters of dispute. The commissioners for the United States were Hamilton Fish, Secretary of State; Gen. Robert Schenck, Judge Nelson of the Supreme Court, Ebenezer Hoar and George H. Williams. The British commissioners were Lord de Grey, Sir Stafford Northcote, Sir Edward Thornton, Prof. Montague Barnard and Sir John Macdonald, Prime Minister of Canada. Their deliberations lasted from 27 Feb. until 6 May 1871. Of the different points in the treaty agreed upon the most important is that in reference to the *Alabama* claims, on account of its bearing upon international law. The matter at issue here was the extent to which Great Britain had been guilty of a breach of neutrality. The *Alabama* had been built in Birkenhead. The purpose of her construction had been a matter of general notoriety. The British government had refused to listen to any representations that fell short of being technical evidence. Even when the American consul at Liverpool furnished the needed proof, the dilatory action of the government permitted the cruiser to depart unmolested. The question was whether, in reference to the *Alabama* and other Confederate cruisers, the government of Great Britain had shown the diligence demanded of a neutral power (see 42d Congress, 2d Sessn. Senate Exec. Doc. 31 November, pp. 146-51). The commission decided that the claims thus arising "shall be referred to a tribunal of arbitration to be composed of five arbiters," one to be named by the President of the United States, one by Her Britannic Majesty, one by the King of Italy, one by the President of the Swiss Confederation and one by the Emperor of Brazil. The questions considered were to be

decided by a majority. Article 6 of the treaty declares: "In deciding the matters submitted to the arbitrators they shall be governed by the following three rules, which are agreed upon by the high contracting parties as rules to be taken as applicable to the case, and by such principles of international law not inconsistent therewith as the arbitrators shall determine to have been applicable to the case: A neutral government is bound: First, to use due diligence to prevent the fitting out, arming or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use. Secondly, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of renewal or augmentation of military supplies or arms, or the recruitment of men. Thirdly, to exercise due diligence in its own ports and waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties." The tribunal thus arranged met at Geneva (December 1871) and in September 1872 rendered its decision "that the British government had failed to use due diligence in the performance of its neutral obligations," and awarded an indemnity of \$15,500,000 to the United States. In regard to the fisheries, the treaty practically re-established the status under the Reciprocity Treaty of 1854, throwing open the inshore fisheries of the Atlantic Coast north of latitude 39° to the fishermen of both nations (Art. XVIII, XIX). It also established reciprocal free trade in fish and fish oil (Art. XXI) and decided that commissioners should be appointed to determine what extra compensation, if any, should be paid by the United States for the privileges thus acquired. A compensation of \$5,500,000 was subsequently awarded by the Halifax Fisheries Commission (1878). The location of the north-western boundary (see NORTHWEST BOUNDARY DISPUTE) which under the treaty of 1846 was declared to follow the 49th parallel "to the middle of the channel which separates the continent from Vancouver's Island and thence southerly through the middle of the said channel and Fuca Straits to the Pacific Ocean," was left (Art. XXXIV) to the decision of the German Emperor. It was further agreed (Art. XXVI) that the navigation of the river Saint Lawrence shall forever remain free and open for the purpose of commerce to the citizens of the United States. The United States in return declared the Yukon, Porcupine and Stikine open to British commerce (Art. XXVI), granting also to British subjects the right of navigating Lake Michigan, the use of the Saint Clair Flats Canal on terms of equality with inhabitants of the United States. The bonding privilege (Art. XXIX) was mutually conceded. The fisheries provisions were not to go into effect until the "laws required to carry them into operation" should be passed by the British and Canadian Parliaments, the legislature of Prince Edward Island and the Congress

of the United States. The entire treaty was to remain in force for 10 years, after which certain articles — the fisheries arrangement, the right of navigating Lake Michigan and the bonding privilege — might be terminated on two years' notice from either party. The fisheries clauses of the treaty were subsequently renounced by the United States, and after due notice expired 1 July 1885. For further details the work of Cushing (mentioned above) may be consulted. The text of the treaty is in 'Treaties and Conventions of the United States' (1889). For the part played by Sir John Macdonald (q.v.) in the negotiations and their relation to Canadian politics, see Pope, 'Memoirs of Sir John A. Macdonald,' Vol. II, ch. xix-xxi.

*McGill University.*

**38. JESUIT ESTATES ACT.** This measure, passed by the legislature of Quebec in 1888, gave rise to an agitation which occupied public attention throughout all parts of Canada during the following year and for a time threatened to bring about a reconstruction of political parties. Under the French régime, which ended in 1763, the Jesuits had owned considerable landed estates at various points in the valley of the Saint Lawrence — particularly at Quebec, Montreal and Laprairie. After the conquest of Canada by the English the religious orders were permitted to retain the property which they held under grant from the French Crown or by other legal title, with the exception of the Jesuits. This order had been banished from France, 1767, and was suppressed generally by the papal brief *Dominus ac Redemptor* (1773). Although General Amherst brought influence to bear upon the government to secure for himself the estates of the Jesuits in Canada, his efforts proved unsuccessful. Despite personal pressure and the papal brief the "black robes" at Montreal and Quebec were not immediately molested by the British authorities who refrained from taking over their property until the death of Father Casot, the last remaining member of the Society. This event occurred in 1800. Once possessed of the Jesuits' estates the Crown had to determine what should be done with them, and after a certain amount of indecision it was decided that their income should be used for the support of education in the province of Lower Canada. In vain the Roman Catholic bishops maintained the legality of the Church's claim to the property. The government stood its ground and appropriated the revenues.

From having been originally assigned to Lower Canada, the Jesuits' estates passed at Confederation (1867) into the hands of the province of Quebec. It was found, however, by the local government that their actual value was impaired by the ecclesiastical claims which stood against them. The bishops did not cease to protest against their retention by the state and the Jesuit order, revived under papal warrant, defended the justice of its own title. Had these lands been situated in a Protestant community the representations of bishops and Jesuits might have carried little weight, inasmuch as they could not be vindicated by an appeal to the courts, but where the mass of the population was Catholic the reiterated claims of

the Church had their effect upon the market. After Confederation the rent of the property decreased until it became almost negligible in comparison with the valuation, and when the government sought to effect a sale no purchaser could be found. In 1887 after the question had been put off by several preceding administrations, Mr. Mercier, a French Nationalist of pronounced views, endeavored to effect a final settlement of it. Whatever the motives which actuated him, to criticize them would be to raise a matter of opinion. He introduced a bill which gave \$400,000 to the Roman Catholic Church as compensation for the property which the Crown had seized in 1800. This sum was, for the moment, to constitute a special deposit which eventually should be distributed by the Pope in return for a relinquishment of all claims to the Jesuits' estates that had been advanced by the bishops or by the Jesuits themselves. As a matter of fact the Pope divided the money between the Jesuits, the bishops and Laval University, but in the meantime this recognition of his right to allot what were considered public funds among members of his own Church drew forth cries of remonstrance from a large number of Protestants. A simultaneous grant of \$60,000 to Protestant schools in Quebec did not allay the feeling of hostility.

It should be observed that two distinct questions were raised by the agitation which proceeded from the Jesuits' Estates Act. The first had its root in the opposition of religious systems; the second was due to Federal character of the Canadian constitution. In 1888, Colonel O'Brien, a Protestant member of the House of Commons, proposed that the Dominion Parliament should disallow the action of the Quebec legislature in appealing to the Pope and setting aside \$400,000 as a subsidy to Roman Catholic institutions. The debate which followed was marked by a series of able and aggressive speeches from all quarters of the House. The chief supporter of Colonel O'Brien's motion was Mr. Dalton McCarthy, while against him were ranged the Premier, Sir John Macdonald, and Mr. Laurier, the leader of the Opposition. On the one side an appeal was made to the alleged political misdeeds of the Jesuits throughout the whole course of their history and to their expulsion from the chief countries of the civilized world. On the other, it was maintained that the Dominion Parliament could not, without extreme danger, disallow provincial legislation and that "the subject-matter of this act was one of provincial concern, only having relation to a fiscal matter entirely within the control of the legislature of Quebec." The vote of 188 to 13 against Colonel O'Brien's motion conveys but a faint idea of the public interest in this debate and in the issues which lay behind it. The fundamental claim of the extreme Protestant party was that recognition of papal authority and the encouragement of the Jesuits were direct blows at British freedom; while the leaders of both parties united to point out the constitutional dangers which would accompany disallowance.

Outside the House of Commons the agitation caused by the Jesuits' Estates Act led to the formation of an "Equal Rights" party which was recruited from the ranks of the more pronounced Protestants. It proved impossible, however, to break down existing political lines

by giving central importance to an anti-Catholic movement. Despite many public meetings and an active campaign in the newspapers, the attack upon the Jesuits' Estates Act has left no lasting trace upon party organization in Canada.

CHARLES W. COLBY,  
*Formerly Professor of History, McGill University.*

**39. AGRICULTURE.** At least half of the population of Canada is directly or indirectly dependent upon agriculture, the chief industry of the Dominion. During the present century agricultural development in Canada has been extremely rapid, and although violent dislocations were caused by the European War there are indications that after the conclusion of peace a new period of rapid agricultural expansion will begin.

**Political Boundaries.**— Extending westward from the Atlantic to the Pacific and northward from the United States boundary into the Arctic circle, Canada, in size, embraces a total area computed at 3,729,665 square miles, of which 125,755 square miles are water. Politically, Canada is divided into nine provinces, in addition to which there are the Northwest and Yukon territories. Each province has control over its own affairs. Agricultural conditions vary with climate and physical characteristics, density of population, accessibility of markets and special aptitudes of the people. In 1912 took place the latest adjustment of the provincial boundaries when by act of the Dominion Parliament portions of the Northwest territories were added to the provinces of Manitoba, Ontario and Quebec. The effect was to extend the province of Manitoba northward to the 60th parallel of north latitude and the southern shores of Hudson Bay, to extend the northern limits of Ontario to Hudson Bay and to throw into the province of Quebec the whole of the huge territory of Ungava and Labrador with the exception of that part of the coast line which belongs to Newfoundland. Manitoba thus received about 113,984,000, Ontario 93,696,000 and Quebec 227,175,000 acres of additional territory. The agricultural possibilities of these new areas are at present unknown.

**Effects of Climate.**— Extending over such a large area and presenting topographical and orographical features of considerable variety, the Dominion of Canada possesses a series of different climates which influence and modify the local agriculture. The Atlantic provinces (Prince Edward Island, Nova Scotia and New Brunswick) have comparatively mild winters with a moist, cool atmosphere. Potatoes and root crops do well, and buckwheat is a special crop. In Quebec and in the eastern and northern parts of Ontario the winters are colder and the summers are warmer than they are at the coast on either seaboard. The ground is usually covered by deep snow during winter, and there are occasionally spells of severe cold in winter and of intense heat in summer, the latter usually tempered however by cool nights of great benefit to vegetation. A special characteristic is the rapidity with which the spring advances and merges into summer, and the rapidity of vegetation when once the winter snows have melted. In the southern parts of Ontario, especially that part of it which is known as the Niagara peninsula, the climate is considerably

milder. Fruit cultivation is therefore a great feature, and tender fruits such as peaches, pears and grapes are grown to perfection. Corn is an important crop grown both for grain and green fodder or silage. The Prairie provinces (Manitoba, Saskatchewan and Alberta) have cold winters, but the air is dry and bracing. Usually, especially in Manitoba and Saskatchewan, an abundant snowfall protects the soil and ensures ample moisture during the early stages of plant growth. In Alberta the winter climate is variable, but milder as a rule than in the other Prairie provinces. Cattle ranching is a feature in certain parts, the animals being able during winter to remain out of doors and find their own food. The Chinook winds, which blow down from the Rocky Mountains, often cause a rapid increase of temperature to the extent sometimes of 60 degrees. In southern Alberta are large semi-arid areas in which irrigation and methods of dry farming are being successfully practised. Finally in British Columbia the climate varies greatly with altitude, latitude and coast proximity. The valleys are warm and suitable for a great variety of crops and for mixed farming. The areas near the coast have mild winters and a long spring, the conditions resembling those of the south of England. The precipitation varies a good deal. It is as much as 100 inches per annum in some parts; in others it is so scanty that agriculture is dependent upon artificial irrigation. This is being resorted to with marked success for fruits and vegetables.

**Economic Factors.**—Since the beginning of the present century agriculture in Canada has been profoundly influenced by immigration and railway construction. The total number of immigrant arrivals in Canada during the 16 years ended 31 March 1916, was 3,099,348, of whom 1,168,292 came from the United Kingdom, 1,095,375 from the United States and 835,681 from all other countries. The largest number of immigrants in a single year was 402,432, who arrived in 1913. Partly dependent upon immigration and partly stimulating it there has been during the same period an extraordinary activity in railway construction. Two additional transcontinental lines, the National Transcontinental, constructed by the Dominion government and the Grand Trunk Pacific Railway, and the Canadian Northern, have been added to the previously existing line of the Canadian Pacific Railway opened in 1886. Altogether, during the first 16 years of the present century 19,773 miles have been added to the railway systems of Canada, the total mileage of which on 30 June 1916 stood at 37,430.

With a total land area of 1,401,316,413 acres, only 109,948,988 acres, or less than 8 per cent, were returned as occupied farm lands at the census of 1911, this area representing an increase since 1901 of 46,526,650 acres. Of the occupied area in 1911, 48,733,823 acres were returned as improved and 61,215,165 acres as unimproved land. The unimproved occupied land consists of 17,477,526 acres of natural forest, 4,174,270 acres of marsh land, etc., and the remainder of 39,563,369 acres of unbroken prairie or other land that is gradually being brought under the plough. Of the improved area of 48,733,823 acres, field crops occupy 35,261,338 acres, orchards and nurseries 403,596

acres, vegetables 206,011 acres, vineyards 9,836 acres and small fruits 17,495 acres. The remaining 12,835,547 acres of improved land consist of pasture, fallow or otherwise uncropped land. In 1911 the total number of occupiers of land was 714,646, an increase of 169,958, or 31 per cent, since the previous census of 1901. About 74 per cent of the holdings in Canada were over 50 acres in extent as compared with 68 per cent in 1901.

**Field Crops.**—During the decade 1900 to 1910 the area under field crops increased from 19,763,740 acres to 30,556,168 acres, a ratio of 54.6 per cent. In 1911 field crops occupied 35,261,338 acres, the increase for the 11 years representing over 78 per cent. During the past five years the total area under field crops has continued to be about 35,000,000 acres; but in 1915, under the stimulus of war, the acreage arose to its highest point, viz., 39,140,460 acres. The recent expansion of area has been chiefly in wheat, oats and flax, and is due to the opening up and settlement of the Prairie provinces—the great feature of Canadian progress since the beginning of the present century. The area under wheat, which was a little over 4,000,000 acres in 1900, increased to over 10,000,000 acres in 1914. Similarly, the acreage under oats has practically doubled, and flaxseed which only occupied 23,000 acres in 1900 occupied over 1,000,000 acres in 1914. During the last 30 years the distribution of the principal crops in Canada has undergone considerable change. In the 19th century the chief wheat-growing province of Canada was Ontario, and in 1890 the wheat acreage of this province was 1,430,532. But with the completion of the Canadian Pacific Railway in 1886 the fertile prairies of the West began to be opened up for wheat growing, and in 1890 the wheat area in Manitoba had grown to 896,622 acres from 51,293 acres in 1880. At the close of the century the wheat area of Manitoba was 1,950,200 acres, as against 1,487,633 acres in Ontario. In the first decade of the 20th century wheat growing in Ontario began to decline, while in the West it progressively increased so that in 1910 wheat in Ontario occupied only 870,354 acres, and in 1914 only 834,000 acres. The territories to the West of Manitoba also progressed; and since 1905, when the provinces of Saskatchewan and Alberta were formed, the three Prairie provinces have become the great wheat-producing area of the Dominion. The following statement showing the area under the principal grain crops in the Prairie provinces, as compared with the rest of Canada for the year 1915, will make this point clear:

CROP	Prairie provinces, acres	Rest of Canada, acres	Total acres
Wheat.....	13,868,000	1,241,400	15,109,400
Barley.....	1,171,000	547,000	1,718,000
Oats.....	6,481,000	5,075,000	11,556,000
Flaxseed.....	458,000	5,000	463,000

In the Prairie provinces, therefore, for the year 1915, wheat occupied 92, barley 68, oats 56 and flaxseed 99 per cent of the total area under these crops in the Dominion.

In most parts of Canada wheat is sown in the spring; but in the southern parts of Ontario and in Alberta, wheat, sown in the fall, ripens earlier and gives usually a

higher yield than the spring sown varieties. With fall sown wheat there is always a proportion,—varying from about 5 to 30 per cent according to the mildness or severity of the season,—of the area that is winter-killed, but reploughed and resown in the spring in Manitoba, Saskatchewan and British Columbia there are also small areas upon which fall sown wheat is grown. Other crops that have a more or less local importance are buckwheat which is grown in the Atlantic provinces, in Ontario and in Quebec, corn, grown chiefly in Ontario and Quebec, and potatoes, which are an important crop in Nova Scotia and New Brunswick, where they occupy a larger area than does wheat.

The following table gives the area and production of all the principal field crops of Canada for the years 1900, 1914 and 1915 with annual averages for the five years 1910-14.

Crops	AREA		
	1914, acres	1915, acres	1910-14, acres
Fall wheat.....	973,000	1,030,600	1,010,000
Spring wheat.....	9,321,000	14,078,800	9,444,000
All wheat.....	10,294,000	15,109,400	10,454,000
Rye.....	111,000	122,000	121,000
Barley.....	1,496,000	1,718,000	1,500,000
Oats.....	10,061,000	11,556,000	9,749,000
Peas.....	206,000	196,000	267,000
Beans.....	44,000	43,000	48,000
Buckwheat.....	354,000	344,000	375,000
Mixed grains.....	463,000	467,000	478,000
Flaxseed.....	1,084,000	463,000	1,224,000
Corn for husking.....	256,000	253,000	290,000
Potatoes.....	476,000	486,000	476,000
Turnips, mangolds, etc.....	175,000	157,000	189,000
Hay and clover.....	7,997,000	7,777,000	8,268,000
Alfalfa.....	90,000	98,000	88,000
Fodder corn.....	317,000	332,000	302,000
Sugar beets.....	12,000	18,000	17,000

Crops	PRODUCTION		
	Bushels	Bushels	Bushels
Fall wheat.....	20,837,000	29,321,000	22,003,000
Spring wheat.....	140,443,000	364,222,000	174,023,000
All wheat.....	161,280,000	393,543,000	196,026,000
Rye.....	2,017,000	2,486,000	2,155,000
Barley.....	36,201,000	54,017,000	41,436,000
Oats.....	313,078,000	464,934,000	343,612,000
Peas.....	3,363,000	3,464,000	4,140,000
Beans.....	797,000	723,000	874,000
Buckwheat.....	8,626,000	7,866,000	8,631,000
Mixed grains.....	16,382,000	17,518,000	15,652,000
Flaxseed.....	7,175,000	6,114,000	13,033,000
Corn for husking.....	13,924,000	14,368,000	16,231,000
Potatoes.....	85,672,000	60,353,000	75,190,000
Turnips, mangolds, etc.....	69,003,000	60,175,000	69,181,000
Hay and clover.....	10,259,000	10,612,000	11,706,000
Alfalfa.....	218,000	261,000	217,000
Fodder corn.....	3,251,000	3,383,000	2,856,000
Sugar beets.....	109,000	141,000	164,000

It should be observed that in the preceding table the years 1914 and 1915 represent opposite extremes as regards production, the year 1914 being one of the poorest grain seasons on record, while in 1915 circumstances combined to produce the most abundant grain crops in the history of Canada. Yields in particular cases are frequently high, occasionally reaching for wheat 60, for barley 50 and for oats 100 bushels per acre; but the average rate in production for wheat in Canada is about 18½ bushels per acre; in 1914 it was only 15½ bushels; in 1915 the average was 26 bushels. The average yield per acre of oats reached 40½ bushels in 1915; over a series of

years the annual average is about 35¼ bushels. Other crop averages in bushels per acre are as follows: Rye 21.3; peas 15.5; beans 18.2; buckwheat 23; flax 10.5; corn 56; potatoes 158; turnips, mangolds, etc. 366; hay and clover average about 1.42, alfalfa 2½, fodder corn 9½ and sugar beets 9½ tons. Among the numerous varieties of grain grown in Canada those most widely sown comprise for winter wheat Dawson's Golden Chaff in Ontario and Turkey Red in Alberta, for spring wheat the Marquis, Red Fife and White Fife, for barley Mensury, Mandscheuri and O. A. C. 21 and for oats American Banner and Siberian.

The average cost of grain production runs from about \$12 to \$14 per acre, the profit depending upon the yield and price which vary with the season and the world's crops. Corn costs more to produce, averaging from \$19 to \$22 per acre, but the value of the crop and the profit are correspondingly higher. The surplus of grain over home requirements is annually exported, and the Canadian grain trade is highly organized. Exports of wheat and flour, principally to the United Kingdom, have increased with the increasing production. In 1914, after the abundant yield of 1913 they were upwards of 142,000,000 bushels, and in 1916 after the record harvest of 1915 they reached the total of 289,794,162 bushels. There is usually a small surplus of barley, oats and other grains for export, and practically the whole of the flaxseed crop goes across the southern border. Hay, compressed mechanically, is also exported both to the United Kingdom and to the United States. The largest export in recent years was 784,864 tons in 1912; but the annual average is between 200,000 and 250,000 tons. Flour milling is an important Canadian industry and in 1915 the value of flour and grist mill products was \$114,483,924 from 1,644 establishments.

Sugar beet for the manufacture of beetroot sugar has been grown in Canada since the beginning of the century. At present two factories, those of the Dominion Sugar Company at Wallaceburg and Kitchener in Ontario, are in operation for the manufacture of sugar from Canadian beetroot. For the season of 1915 the production of sugar beet was 141,000 tons from 18,000 acres, and the production of refined beetroot sugar was 39,515,802 pounds. Tobacco is grown in parts of Quebec and southern Ontario. In 1910 the production was 17,632,342 pounds from 18,928 acres. In 1915 the estimated production was about 9,000,000 pounds, and in 1916 about 5,943,000 pounds. The production of honey in 1910 was 6,089,784 pounds, the number of hives being returned as 100,372.

**Farm Live Stock.**—Canada is well suited to the raising of all descriptions of farm live stock, although sheep in the central and colder parts cannot be kept out of doors during winter in the large flocks that are customary in countries with milder climates. As a general rule, Canadian farm animals are remarkably free from disease, and the more virulent contagious maladies are entirely absent. The accompanying table shows the total number of horses, cattle, sheep and swine in the census years 1901 and 1911, and as estimated annually at the end of June by the Census and Statistics Office for the years 1912 to 1916.

Fine horses, both light and heavy, are bred in all the provinces. Horse ranching is practised largely in southern Alberta and in south-west Saskatchewan under the favorable conditions of comparatively mild winters and light snowfall with abundant wild hay and pasture. There is a good demand for heavy horses, both for agricultural purposes and for the drawing of logs from the lumber camps. The favorite draught horse is the Clydesdale, a medium size being usually preferred for farm work. Next in importance comes the Percheron of which by far the larger number are in Alberta. The French Canadian is the draught horse of the French farmers in Quebec. The English Shire horse is also raised principally in Ontario, and there are small numbers of the Suffolk Punch and of Belgian breeds. Among the light breeds the Standard Bred trotter, used largely in trotting and pacing races, and the Hackney predominate. Thoroughbreds and coach horses are also raised. Animals for cavalry and mounted infantry remounts are produced in all the provinces, and have been especially in demand for the war. In 1911 the number of pure-bred horses was 33,149, an increase of 22,393, or 208 per cent since 1901. Of the total, 19,911 or 60 per cent were Clydesdales. During the five years ended 31 March 1910-14 the average number of horses annually exported, chiefly across the southern border, was about 2,600; but in 1916 the exports rose to 26,818, of which

management of skilled flockmasters. Nearly all the leading British breeds are to be found in Canada, the most numerous being the Shropshire, Oxford Down, Leicester, Cotswold and Southdown breeds. At the census of 1911 there were 53,616 pure bred sheep in Canada. The industry, in spite of earnest efforts to encourage it on the part of the government, has steadily declined. In 1881 the total number of sheep in Canada was 3,048,678; in 1911 the number was 2,175,302, a falling off of 873,376, or 28 per cent. Since the census of 1911 the numbers have continued to decline, and the estimated number on 30 June 1916 was 2,022,941, a further decline, since the census of 1911, of 152,361. The average price of wool has increased materially during the war; the prices in 1916 for washed and unwashed wool being respectively 50 and 37 cents per pound, as compared with 26 and 19 cents in 1914. Swine, unlike sheep, have increased steadily in numbers during the last 30 or 40 years. In 1881 they numbered 1,207,619, and in 1911 3,634,778. Swine raising, especially in the West, is a fluctuating industry, being largely dependent upon cheap feeding grain. When for instance prices rose suddenly on the outbreak of the war, pig feeding on the Prairie provinces became unremunerative, and large numbers were immediately thrown on the market at nominal prices. On 30 June 1916, the estimated number of swine in Canada was 3,474,840. The principal breeds are the Yorkshire, Berkshire,

LIVE STOCK	1901	1911	1912	1913	1914	1915	1916
Horses.....	1,577,493	2,598,958	2,692,357	2,866,008	2,947,738	2,996,099	2,990,635
Milch cows.....	2,408,677	2,395,255	2,604,488	2,740,434	2,673,286	2,666,846	2,603,345
Other cattle.....	3,167,774	3,930,828	3,827,373	3,915,687	3,363,531	3,399,155	3,313,519
All cattle.....	5,576,451	6,526,083	6,431,861	6,656,121	6,036,817	6,066,001	5,916,864
Sheep.....	2,510,239	2,174,300	2,082,381	2,128,531	2,058,045	2,038,662	1,965,101
Swine.....	2,353,828	3,634,778	3,477,310	3,448,326	3,434,261	3,111,900	2,814,672

21,833 went to Great Britain, most of them as military remounts.

Cattle, principally of British origin, are bred in all the provinces, and, as in the case of horses, there are large ranches in Saskatchewan and Alberta. The beef breeds include Shorthorns, Herefords, Aberdeen Angus and Galloways, Shorthorns comprising the great majority. In Ontario cattle raising is a very important industry, the animals being fattened on grass lands during summer and in the stable during winter. Of late years, especially in the western counties of Ontario, fine herds of pure-bred cattle have gradually been established, and their quality has been maintained by large importations from the mother country. As a consequence the trade in pure bred stock with the United States has been considerably developed. Cattle throughout Canada have been reduced in numbers by slaughter for the purpose of meat exports to Great Britain in consequence of the war, but herds are being gradually replenished by the breeding of young stock. Amongst dairy cattle are the Shorthorn, Ayrshire, Jersey, French Canadian and Holstein-Freisian breeds. Many parts of the Dominion are quite favorable for the keeping of sheep and for the production of mutton and wool of the highest quality; but for various reasons this branch of the live stock industry has not been followed so generally as it might have been. In individual cases, however, sheep raising has proved very profitable under the

Chester White and Tamworth; but the Yorkshire largely predominate. In 1911, 56,457 pure bred swine were returned as on Canadian farms. Poultry raising as an adjunct to ordinary farming has made great strides. In 1911 the numbers of all descriptions of poultry were 31,793,261 of the value of \$15,047,009, as compared with 17,922,658 in 1901 of the value of \$5,723,890. The production of eggs in 1911 was 123,071,034 dozen, value \$23,501,173. Turkeys are easily reared in Canada, and are often a valuable source of additional farm revenue.

**Dairying Industry.**—Dairying is practised in all the provinces of Canada, but it is carried on chiefly in Ontario and Quebec. The factory system for the manufacture of cheese and creameries for the making of butter have been largely instrumental in the development of the industry. Cheese factories date from the early sixties, the first cheese factory in Canada having been established on the farm of G. V. de Long at Norwich, Oxford County, Ontario, in the spring of 1864. Much has been done by both the Dominion and provincial governments to improve the methods of cheese making in Canada, as well as to repress fraudulent practices injurious to its reputation. Since 1890 Canadian trade in agricultural products to Great Britain has greatly developed and there has gradually been built up an increasing export trade in Canadian cheddar cheese which in the British markets now enjoys a high reputation for purity and excellence of quality.

Butter made under the creamery system was formerly exported in considerable quantities to Great Britain; but during the past decade,—a period coincident with a marked increase of the population of Canada by immigration—the exportation of butter has been greatly reduced, whilst for the same reason the quantities manufactured and exported of cheese have diminished. The production of milk has increased, but its use has been diverted from the making of cheese to the making of butter, of which comparatively little is available for export after satisfaction of home requirements. Since 5 Aug. 1909, when the Payne-Aldrich tariff took effect, there has been a considerable exportation of fresh cream from Canada into the United States. In the year 1916 the production of cheese in factories amounted to 192,968,597 pounds of the value of \$35,512,622 as compared with 220,833,269 pounds of the value of \$22,221,430 in 1900. The production of creamery butter in 1916 was 82,564,130 pounds of the value of \$26,966,357, as compared with 36,066,739 pounds of the value of \$7,240,972 in 1900, the number of factories and creameries being 3,446 as against 3,576 in 1900. The production of homemade butter in 1910 was 137,110,200 pounds as compared with 105,343,076 pounds in 1900, and in 1910 the production of home-made cheese was 1,371,092 pounds. For 1910 the total production of cheese was 201,275,297 pounds and of butter 201,808,365 pounds. In 1910 condensed milk products were made in 11 factories amounting to 27,831,596 pounds of the value of \$1,814,871. During the five fiscal years ended 31 March 1916 the average annual exports of cheese have been 153,941,732 pounds as compared with 215,137,339 pounds for the first five years of the century. Similarly, for the same periods in the case of butter the exports have averaged 3,413,515 pounds as against 26,930,551 pounds. There is on the other hand a comparatively small importation of varieties of cheese not manufactured in Canada, amounting annually to about 1,500,000 pounds. Dairying in the Prairie provinces has recently made considerable progress, and there is every indication that the dairy products of these provinces will soon be more than sufficient to supply all the western requirements and leave a substantial surplus for export.

**Fruit Growing.**—This is an increasingly important branch of the agricultural industry in Canada. Apples, plums and small fruits are grown successfully all over Canada; but the production of fruits on a large scale is confined practically to three well-defined fruit growing districts, viz., the Annapolis Valley in Nova Scotia, the eastern, southern and western parts of Ontario, especially in the southern part of the Niagara peninsula, and in the valleys of British Columbia. In Nova Scotia apples for export are the chief fruit; but in the Niagara peninsula pears, peaches, grapes and other tender fruits, as well as apples, grow to perfection. In British Columbia great progress in fruit growing has taken place during the present century, and in certain parts of the province, where the rainfall is scanty, irrigation has been resorted to with marked success for the growth of all kinds of fruit. The census returns of 1911 show an increase in the area devoted to orchards of 47,490 acres,

the area having grown from 356,106 acres in 1901 to 403,596 acres in 1911. Grapes are grown for wine making to a small extent in southern Ontario, and the total acreage under vineyards was 9,836 in 1911. The total number of fruit trees in bearing in 1911 was 14,002,145 and of non-bearing fruit trees the number was 8,315,236. The output varies considerably with the season and the prevalence of insect pests, but in 1910 the production of the following fruits was, in bushels, as follows: Apples 10,618,666; peaches 646,826; pears 504,171; plums 508,994; cherries 238,974; other fruits 47,789. Apples are exported principally to the United Kingdom, the quantity ranging during the past five years from 523,658 barrels in 1911 to 1,664,165 barrels in 1912. In 1916 the exports were 577,451 barrels. One barrel holds on the average about three bushels. A certain amount of cider is annually made in the apple growing districts, the exports being upward of 150,000 gallons and occasionally exceeding 200,000 gallons. Maple sugar and maple syrup are made on farms where the maple tree flourishes, chiefly in Quebec and Ontario. In 1910 the total production of maple sugar was 10,488,340 pounds and of maple syrup 1,802,581 gallons.

**Value of Agricultural Production.**—In 1915 the estimated value of the field crops of Canada was \$825,370,000, but this was a year of exceptional abundance. For 1916 the total value was \$886,494,900, owing to the high prices caused by the war. The average annual value of the total agricultural production of Canada may be placed at about \$782,000,000, including field crops \$650,000,000, dairy products \$70,000,000, wool \$2,000,000, poultry and eggs \$25,000,000, and fruits and vegetables \$35,000,000. The total value of horses, cattle, sheep and swine estimated at \$903,686,000 for 1916.

**Agricultural Organization.**—Associated effort for the improvement of agriculture is largely directed and controlled by the state. There is not only a strong and many-sided Department of Agriculture of the Dominion government, but each of the nine provincial governments has also a department of agriculture serving local needs. Since 1911 an important advance has been made by the Dominion Parliament in appropriating large sums annually for the encouragement of agriculture under the Agricultural Instruction Act of 1913. The funds thus available are divided amongst the nine provinces and administered in close co-operation with the provincial departments of agriculture. The amount now annually appropriated under this act is about \$1,000,000. A great deal of the work of the Dominion department is carried on through the experimental farms and stations which are situated in different parts of Canada. A central farm at Ottawa and four branch farms in Nova Scotia, Manitoba, the Northwest territories and British Columbia were originally established in 1886 under the Experimental Farm Stations Act. These five farms continued in operation for 20 years when their usefulness became so apparent that steps began to be taken for their extension; and two new stations were established in Alberta in 1907. Since then development has been rapid; and in 1917 the experimental farms and stations of the Dominion government originally

five in number with a total acreage of 3,472, number 21 with an acreage of 11,148, not counting seven smaller substations at points in British Columbia, Alberta and the Northwest territories. The more strictly scientific work of the farms is organized at the central farm, Ottawa, in 13 divisions, comprising field husbandry, animal husbandry, horticulture, cereals, chemistry, forage plants, botany, poultry, tobacco, economic fibre, illustration stations, apiculture, extension and publicity. Amongst the results of greatest general influence upon Canadian agriculture, due directly to the experimental work of the farms, may be mentioned the practice of early sowing, the adoption of summer fallowing and the distribution of improved varieties of seeds of cereal and other plants, especially in the West. Phenomenal success has indeed attended one branch of the work of the experimental farms by the introduction of the Marquis variety of hard wheat. This wheat, which possesses all the good qualities of the Red Fife with the added advantages of an earlier ripening habit and superior yield, leaped into fame by taking the champion prize for the best hard wheat at the first American Land Show, held in New York from 3-12 Nov. 1911. Since then it has taken many similar prizes, and is now in process of rapid distribution throughout the western grain-growing area in replacement of the Red Fife. The work of the Dominion Department of Agriculture extends over many other important fields, including the seed branch for the analysis of seeds in respect of germination and purity; the dairy and cold storage branch; the fruit branch; the health of animals branch under a veterinary director-general; the live stock branch for improvement of farm live stock; and an entomological branch. All these branches not only administer laws affecting the subjects with which they deal, but also carry on scientific investigation at field and other laboratories. Important work in the improvement of farm seeds is being accomplished by the Canadian Seed Growers' Association, who work in close association with the seed branch of the department. The maintenance of pedigree registers of pure-bred live stock is in charge of a National Record Board which receives special grants, facilities and privileges from the Dominion government. Under the Live Stock Pedigree Act, 1900, the pedigree records of live stock were both unified and nationalized. Each of the breed societies in Canada, while remaining responsible for the local management of its own affairs, is represented upon the National Record Board for the issue of pedigree certificates, which before issue are certified by an officer of the live stock branch of the Department of Agriculture; so that every pedigree certificate has behind it a government guarantee of accuracy, a matter of considerable advantage in connection with international trade. Only the Holstein-Frisian Society of Canada remains outside this scheme. Much is being done to test experimentally the varieties of tobacco best suited to the Canadian climate and the best methods of cultivation, curing, marketing, etc. Canada is an adhering country of the International Institute of Agriculture, and an officer of the Department of Agriculture acts as

Canadian commissioner of the Institute. The publications of the various branches of the department, most of which are issued gratis, are voluminous and diverse; so much so that within recent years a special branch of the department has been organized for their more effective distribution. This branch also issues monthly the *Agricultural Gazette of Canada*.

Of the provincial departments of agriculture, the oldest and most thoroughly organized are those of Ontario and Quebec. Farmers' institutes and clubs, women's institutes, agricultural and live stock associations and fairs are amongst the agencies employed; but probably the agricultural colleges and experiment stations in each province have the greatest influence. Foremost amongst these institutions are the Ontario Agricultural College at Guelph under the provincial department of agriculture and the Macdonald Agricultural College at Sainte Anne de Bellevue in the province of Quebec. The college at Guelph is remarkable for the comprehensive thoroughness with which it covers the whole wide field of agriculture. Its departments comprise field and animal husbandry, dairying, poultry, apiculture, horticulture, pomology, agricultural chemistry, bacteriology, zoology, entomology, botany and physics. The Ontario Agricultural and Experimental Union, which is organized by officers of the college for the conduct of annual co-operative experiments by farmers throughout the province, has been in existence for 38 years, and the average number of annual experimenters is about 4,500. The Macdonald College at Sainte Anne de Bellevue is a newer institution dating from 1907; but is gradually covering much the same ground for English-speaking students of the province of Quebec. Both colleges provide courses for the graduation of students with the degree of B.S.A. (Bachelor of Science in Agriculture) conferred by the universities to which they are respectively affiliated, viz., Toronto for Guelph and McGill for Macdonald. In the other provinces agricultural colleges and experiment stations exist at Truro (Nova Scotia), Oka and Saint Anne de la Pocatière (Quebec); Winnipeg (Manitoba); Saskatoon (Saskatchewan); Edmonton (Alberta) and Point Grey, Vancouver (British Columbia). Agricultural fairs, shows or exhibitions are held all over Canada, usually by the aid of grants from the provincial governments or municipalities. The largest of these exhibitions is held annually in August and September at Toronto by the Industrial Exhibition Association.

**Future Prospects.**—At present the great war in which the British empire is strenuously engaged affects Canadian agriculture by the absence at the front of many of its citizens, which renders more acute the scarcity of farm labor, limits production and increases its cost. These conditions are of temporary duration, and will change on the return of the soldiers and resumption of the immigration that was stopped on the outbreak of the war. It is probable that the immigrants who enter Canada after the war will settle upon agricultural lands instead of flocking to the towns for the development of municipal enterprises by means of borrowed capital, as was largely the case before the war. Conditions in Canada will

make it essential that the actual development of agricultural resources shall in future be the first consideration. To what extent homesteads may be prepared in advance for settlement by returned soldiers and immigrants is engaging attention, and it is possible that the policy of ready-made farms on lines already adopted in Alberta by the Canadian Pacific Railway may be more extensively adopted. Future agricultural production in the West is likely to be largely influenced by the facilities of the Panama Canal, and already the Canadian government have constructed grain elevators at interior western points in anticipation of new grain movements in this direction. A railway from Le Pas in Manitoba to the southern shores of the Hudson Bay is under construction by the Dominion government with the object of providing an additional outlet for western grain through the Hudson Strait. A change in the direction of a more general adoption in the Prairie provinces of the practice of mixed farming is already in progress and will probably be hastened by the poor wheat seasons of 1914 and 1916, which have shown farmers the unwisdom of trusting to a single crop. But, probably, this will not entail any total decrease in the growing of wheat which will continue to be sown on newly-broken areas. Larger grain production is possible in Canada by an increase in the rates of yield per acre. Improved agricultural methods, including the more general adoption of mixed farming, the use of judicious rotations and more care in the selection of seed, will result in a large average yields per acre in the grain-growing provinces, as has already been the case in the older and more thickly settled parts of Ontario. Here there is evidence to show that during the past 35 years the average yields per acre have been increased by  $3\frac{1}{2}$  bushels for fall wheat,  $2\frac{3}{4}$  bushels for spring wheat,  $4\frac{1}{2}$  bushels for barley and  $1\frac{3}{4}$  bushels for oats. Similar future progress in the Prairie provinces will mean a large aggregate addition to the annual output. New lands in nearly all the provinces are available for settlement, and have been made easily accessible by the construction of railways. It is estimated that there are 56,000,000 acres of land more or less immediately available for agricultural settlement in Canada. Of this area about 31,000,000 acres are Crown lands at the disposal of the provincial governments in New Brunswick, Quebec, Ontario and British Columbia and about 25,000,000 acres are free grant surveyed lands at the disposal of the Dominion government in the Prairie provinces and the Railway Belt of British Columbia. The lands available in northern Ontario, through which run the new National Transcontinental and Canadian Northern railways, including an immense area of excellent agricultural soil, the great clay belt alone consisting of 24,500 square miles, or 15,680,000 acres, specially suitable for the growth of wheat.

A., 'An Historical and Descriptive Account of the Dairying Industry of Canada' (Department of Agriculture, Ottawa 1911); Annual Reports of the Ontario Bureau of Industries, the Ontario Agricultural College and Experimental Farm and the Agricultural and Experimental Union, Toronto.

ERNEST H. GODFREY, F.S.S.,

Editor, *Census and Statistics Office, Ottawa.*

**40. FOREST AND LUMBER INDUSTRY.** A great forest stretches across the Dominion of Canada from the Atlantic seaboard to Alaska and the Pacific Ocean, and may be roughly divided into a northern forest and a southern forest. The northern forest may be subdivided into a sparsely wooded portion lying north of a line extending from the Strait of Belle Isle westward to the southern end of James Bay, and thence northward to Lake Athabasca and the Yukon River. South of this line lies a rather densely wooded portion separated from the southern forest by an irregular line running from Anticosti Island north of Lakes Saint John and Abitibi, south of Lake Nipigon, across the southern end of Lake Winnipeg, and northward to the headwaters of the Athabasca and Liard rivers. With the exception of the great plains region of southern Manitoba, southern Saskatchewan and southern Alberta, the southern forest extends as far south as the international boundary. Around the coasts of Nova Scotia and New Brunswick, along the Saint Lawrence River and in the southwestern part of Ontario it is largely cleared off for farming; while in Manitoba, Saskatchewan and Alberta there is a fringe of mixed prairie and woodland lying just south of the heavily wooded portion of the northern forest. In British Columbia is what is usually described as the Cordilleran forest. Along the Pacific Coast and on Vancouver and Queen Charlotte islands this forest has heavy stands of timber; in the southern interior part there is what is known as the "dry belt" forest; between the southern end of Kootenay Lake and Quesnel Lake lies the "wet belt" forest; while all the rest of the province and the southern part of the Yukon territory is occupied by an interior mountain forest with extensive fire-swept and grassland areas.

**Total Forest Area.**—The total land area of the Dominion is 3,603,910 square miles, or 2,306,502,400 acres, but it is not known with any degree of accuracy how much of this vast territory is covered with forest growth. The most reliable information available places it somewhere in the neighborhood of 700,000,000 acres, which is approximately 30 per cent of the total area. The exact areas of the forest containing timber of commercial sizes cannot be known until the Federal and provincial governments complete the surveys now in progress. For the present we may safely assume that Nova Scotia has 5,000,000 acres; New Brunswick 9,000,000; Quebec 100,000,000; Ontario 70,000,000; Manitoba 1,920,000; Saskatchewan 3,584,000; Alberta 5,416,000, and British Columbia 30,000,000 acres—making a total of about

225,000,000 acres or 9½ per cent of the total land area.

**Control of Forest Lands.**—In the provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia the licenses to cut timber on specified tracts, known as "Timber Limits," are issued by the provincial governments; while in the provinces of Manitoba, Saskatchewan and Alberta and in the "railway belt" in British Columbia (a strip of 11,000,000 acres extending 20 miles on each side of the main line of the Canadian Pacific Railway) the Federal government, at Ottawa, controls the lands and issues licenses and permits to cut timber on "timber berths" and forest reserves. These licenses are obtained by public competition and the sum paid for the right to cut timber for a specified time is known as the "bonus price." In addition to the bonus price there is also paid a specified sum per annum per square mile (or per acre) known as the "ground rent," and when the timber is cut the "stumpage dues" are paid at the rate of so much per M (log scale), or per cord. These fees are the source of considerable revenue to the respective governments, which impose certain "regulations" regarding the methods of cutting and removing timber, protection against fire, etc. In no case does the holder of a license or permit acquire a right to the land, which reverts to the Crown as soon as his license expires or is canceled for non-fulfilment of the existing timber regulations.

**Forest Reserves.**—For many years both the Dominion and provincial governments have followed the policy of setting aside forest reserves and national parks for the purpose of providing a permanent supply of timber, of maintaining conditions favorable to a continuous water supply, and of protecting mammals, fish and birds within the boundaries of the reserves and parks. The Dominion forest reserves in Manitoba have an area of 2,941,600 acres; in Saskatchewan 6,748,954 acres; in Alberta 21,643,814 acres, and in the railway belt in British Columbia 3,485,590 acres—making a total of 34,819,958 acres. In British Columbia there are still 27,931,482 acres under provincial control while Ontario has 14,430,720 acres in forest reserves, and Quebec the huge total of 111,400,320 acres. Neither New Brunswick nor Nova Scotia have, as yet, established forest reserves; while all the land in Prince Edward Island has been alienated for farming purposes.

**Federal Forest Service.**—In 1899 the forestry branch of the Department of the Interior was established and at once inaugurated a policy of increasing the number and extent of the forest reserves upon Dominion lands. In 1900 arrangements were made to furnish settlers in Manitoba, Saskatchewan and Alberta with young trees and cuttings for the planting of wind-breaks and shelter belts. The settler entered into an agreement with the forestry branch to set aside a certain portion of his land as a permanent tree plantation, to carefully prepare his ground according to the directions of the tree inspectors, to plant the trees upon their arrival and to cultivate and keep the ground clean until the trees are large enough to take care of themselves. The species planted vary according to the climatic and soil conditions, and the great success of this co-

operative plan is proved by the fact that approximately 95 per cent of the 20,000,000 trees and cuttings sent out to settlers are growing and are a source of great pleasure and comfort to all who have taken care of them. In 1906 the work of surveying and mapping the Dominion forest reserves was begun, and has been carried on ever since. In 1908 the work of collecting forest statistics from reliable sources was begun. In 1911 the work of examining and reporting upon lands thought to be suitable for forest reserves was begun, and has resulted in the creation of new reserves and additions to those already existing. In 1914 forest product laboratories were established at McGill University, Montreal, where exhaustive tests are being carried on to determine the technical properties of Canadian timber and the solution of problems connected with the pulp and paper industry. So rapidly has this most useful branch of the public service grown that in May 1914 it had 159 officers on its payroll, and the expenditure for the year amounted to \$571,798. Since the outbreak of the European War many of these highly trained men have enlisted for over-seas service and the work of the branch is considerably hampered.

**Other Forest Services.**—In 1909 the province of Quebec began the extension of its forest service by employing two technically trained foresters as advisers, and most encouraging progress has been made all along the line of developing a progressive forest policy.

In 1911 the British Columbia department of land and forests established a forest branch which has made remarkable progress in the scientific administration of her forest lands and in making known to the world the extent and variety of her forest resources. Just before the outbreak of war the staff consisted of 170 members (including female clerks and stenographers), but the enlistment of 60 of its most efficient members badly crippled the service.

In 1912 the Canadian Pacific Railway Company established a department of natural resources and charged the forestry branch with the responsibility of administering timber lands owned by the company and the investigation of problems arising out of the use and preservation of timber for railway purposes.

In 1909 the Dominion government established a commission of conservation, which has devoted much time and energy to the protection of timber from fire, the making of forest surveys and the lessening of logging waste.

In 1912 the Dominion Railway Board introduced regulations for the protection of forest properties traversed by the steam roads, and the number of fires has been greatly reduced. In every province of the Dominion fire has done a tremendous amount of damage to standing timber and impoverished the soil for the growth of future wood crops. Now, however, the Federal and provincial authorities have realized the seriousness of the situation and effective steps are being taken to reduce the number of forest fires. Measures are also being taken to reduce the waste incident to logging operations; such as the waste in tree tops, the disposal of logging slash, etc.

**Forestry Education.**—In 1900 the Canadian Forestry Association was organized for the purpose of getting the public to realize the

necessity of conserving the forest resources of the Dominion. Its membership is now 4,350 and it has been largely instrumental in securing advanced legislation in the matter of increasing the forest reserve area, a more careful administration of timber lands and protection from fire.

In 1907 the faculty of forestry was established in the University of Toronto for the purpose of giving young men a thorough technical training along lines required for the scientific management of forest properties, and in 1908 a similar department was established in the University of New Brunswick at Fredericton, N. B. A couple of years later a department of forestry was established in Laval University, Quebec, and plans are now under way for the establishment of a course in forest engineering in the University of British Columbia, Vancouver, B. C. Nearly all the graduates of these schools are employed by the Dominion forestry branch, the British Columbia forestry branch, the Quebec forest service, the New Brunswick forest service, and the forest service of the Canadian Pacific Railway Company.

**Estimate of Standing Timber.**—During the summer of 1909 and 1910 a reconnaissance survey was made of the forest lands of Nova Scotia. For the mainland the estimate is placed at 94,496 acres of virgin and semi-virgin coniferous timber with a stand of 1,133,952,000 board feet; 1,318,964 acres of moderately culled conifers carrying 3,956,892,000 board feet; 3,192,175 acres of severely culled and burned timber estimated at 3,192,175,000 feet, and 1,138,730 acres of green barrens and burns with 341,619,000 board feet. This makes a total of 5,744,365 acres with 8,624,638,000 board feet of coniferous timber. In addition to this there is the island of Cape Breton, which is estimated to have an area of 1,535,000 acres under forest more suitable for pulpwood than for saw timber. For the whole province the coniferous saw timber is approximately 10,000,000,000 feet, and the hardwoods probably amount to 5,000,000,000 feet.

New Brunswick is now engaged in the work of mapping and classifying lands still in possession of the Crown, and in the course of two or three years will have a close estimate of the amount of timber thereon. The present estimate for the whole province (Crown lands and alienated lands) is 12,000,000 acres, carrying 22,000,000,000 feet of saw timber—mostly spruce, pine, tamarack and cedar.

Quebec has at least 265,000,000 acres of nearly pure coniferous forest, 52,000,000 acres of mixed conifers and hardwoods, and 5,000,000 acres of hardwoods, but no reliable figures are available for the amount of standing timber. Most of it is more suitable for pulpwood than for saw timber, although large quantities of the latter are taken out every spring—especially from lands tributary to the rivers flowing into the Saint Lawrence and Ottawa rivers.

Ontario probably has more saw timber than any other province except British Columbia. The northern forests contains something like 180,000,000 acres of spruce, jack pine, balsam fir and tamarack (much of it of little value), and the southern forests about 100,000,000 acres carrying approximately 200,000,000,000 feet of saw timber. In 1917 the Department of Lands and Forests made extensive preparations for the

organization of a thoroughly efficient fire protection service, and introduced stringent regulations regarding the disposal of logging slash, which in times has been a menace to both lumbermen and settlers.

In the case of the "Prairie provinces" there are less than 11,000,000 acres of timberland with a total stand of approximately 42,000,000,000 feet of timber distributed as follows: Manitoba with 1,920,000 acres and 6,850,000,000 board feet; Saskatchewan, 3,584,000 acres and 14,000,000,000 board feet; Alberta, 5,416,000 acres and 21,000,000,000 board feet.

In the Yukon and Northwest territories the timber has practically no commercial value, because of its inaccessibility, smallness and low stumpage per acre.

In British Columbia the forest branch estimates the total stand of commercial timber at somewhere between 350,000,000,000 and 400,000,000,000 feet. Approximately one-third of it is Douglas fir and one-fifth western cedar; the remainder being almost entirely made up of western hemlock, larch, yellow pine, white pine and jack pine. The estimate of timber suitable for pulpwood is placed at 250,000,000 cords.

From the above estimates it will be seen that the total amount of merchantable saw timber is somewhere in the neighborhood of seven hundred billion feet—approximately 28 per cent of the merchantable timber in the United States of America.

**Annual Cut of Timber.**—Nearly all the coniferous timber cut in the eastern and central parts of Canada is floated down the creeks, lakes and rivers to convenient milling points, from which it is shipped by rail or water to market. In the case of hardwoods the usual method of removal is by sleigh-haul, as they are generally used for fuel, distillation, cooperage—only a limited amount being used for furniture and interior finishing. In British Columbia the absence of drivable streams renders the use of logging railways, yarding engines and aerial skidders necessary for the removal of Douglas fir and other large timber.

For the year 1915 the production of sawn lumber was as shown below:

PROVINCE	No. of firms reporting	Cut, in board feet
Quebec	1,578	1,078,787,000
Ontario	656	1,035,341,000
British Columbia	238	669,816,000
New Brunswick	240	633,518,000
Nova Scotia	366	294,475,000
Saskatchewan	13	62,864,000
Manitoba	37	42,357,000
Alberta	13	17,975,000
Prince Edward Island	43	7,543,000
Totals	3,239	3,842,676,000

The value of this cut of lumber was estimated at \$61,919,806, which gives an average price of \$16.11 per M. Although 25 different kinds of wood were sawn; the five leading species being spruce, which made up 40.7 per cent of the total cut; white pine (eastern and western) 22.1 per cent; Douglas fir 11.8 per cent; hemlock (western and eastern) 6.2 per cent, and balsam fir 6.1 per cent. For the remaining 13.1 per cent of the total cut the next five species were red pine, birch (yellow and white), cedar (western and eastern), maple (sugar and red), and larch (western and eastern)—which made up 10 per cent of the total

cut. The remaining 3.1 per cent was made up of western yellow pine, jack pine (eastern and western), basswood, elm, ash, poplar, beech, oak, yellow cypress, hickory, chestnut, cherry, butternut and walnut.

The quantity of lath manufactured was:

PROVINCE	Number of thousand	Percentage of total
Ontario.....	309,022	39.0
New Brunswick.....	288,951	36.4
Nova Scotia.....	59,921	7.5
Quebec.....	55,204	7.0
British Columbia.....	46,345	5.8
Saskatchewan.....	23,611	3.0
Manitoba.....	8,910	1.1
Prince Edward Island.....	1,262	0.2
<b>Totals.....</b>	<b>793,226</b>	<b>100.0</b>

The total value of the 793,226,00 lath sawn was placed at \$2,040,819, which gives an average price of \$2.57 per M. The five leading species of wood used were spruce, white pine, cedar, Douglas fir and hemlock.

The cut of shingles was as follows:

PROVINCE	Number of thousand	Percentage of total
British Columbia.....	1,894,642	61.3
Quebec.....	574,794	18.6
New Brunswick.....	458,987	14.9
Ontario.....	93,497	3.0
Nova Scotia.....	30,733	1.0
Alberta.....	18,740	0.6
Prince Edward Island.....	17,589	0.6
Saskatchewan.....	404	...
Manitoba.....	81	...
<b>Totals.....</b>	<b>3,089,470</b>	<b>100.0</b>

The total production of 3,089,470,000 shingles was valued at \$5,734,852, which gives an average value of \$1.86 per M. Cedar made up 90.5 per cent of the total cut; with spruce, white pine and jack pine next in order.

**Pulpwood, Poles and Ties.**—Since 1908 the consumption of wood for the manufacture of pulp has increased almost threefold, and is certain to increase still more. The annexed table shows the consumption and average price per cord for the year 1915:

	No. of firms reporting	Cords	Average value per cord	
			Value	per cord
Quebec.....	24	697,962	\$4,227,033	\$6.06
Ontario.....	15	480,627	3,806,804	7.92
New Brunswick.....	4	115,842	732,521	5.32
British Columbia.....	2	90,535	550,809	6.08
Nova Scotia.....	5	20,870	99,050	4.75
<b>Totals.....</b>	<b>50</b>	<b>1,405,836</b>	<b>\$9,426,217</b>	<b>\$6.71</b>

These figures show that 49.6 per cent of the pulpwood was used in Quebec, 34.3 per cent in Ontario, 8.2 percent in New Brunswick, 6.4 per cent in British Columbia and 1.5 per cent in Nova Scotia; while the total consumption of 1,405,836 cords is an increase of 14.8 per cent over that for 1914. Spruce made up 71 per cent of the total, balsam fir 21 per cent, hemlock 4 per cent, jack pine 3 per cent and poplar 1 per cent. Of mechanical pulp the amount produced was 743,770 tons, of sulphite 235,474 tons, of sulphate 92,404 tons and of soda pulp 3,150 tons. This makes a total of 1,074,805 tons, which is an increase of 15 per cent over the production of 1914. The manufacture of pulpwood is one of the few industries, not engaged in the production of munitions, which

have not suffered from war conditions. Although labor conditions have been disturbed and the cost of raw materials has increased, the American demand for pulp has increased and the difficulty of obtaining it from Scandinavian sources has increased the over-seas demand.

The total number of telegraph and telephone poles sold in 1915 is reported as 179,248; at an average price of \$2.52 each. Exactly 67.4 per cent of them were of eastern cedar, 11.1 per cent of western cedar, 9.3 per cent of tamarack, 5.6 per cent of spruce, and 2.3 per cent of jack pine—the remaining 4.3 per cent being of fir, hemlock, chestnut and oak.

The total number of cross-ties sold in 1915 is given at 7,592,530, and their average price at 44 cents each. Jack pine made up 32.4 per cent of the total, eastern cedar 25.8 per cent, hemlock 11.1 per cent, tamarack 8.3 per cent, eastern spruce 6.7 per cent, Douglas fir 5.3 per cent and oak 4.3 per cent—the remaining 6.1 per cent being made up of yellow birch, chestnut, maple, elm and western cedar. It is worthy of note that the total number of ties sold in 1914 was 19,403,646, or more than two and a half times that for 1915.

The following figures show the values of the exports of forest products for the year ending 31 March 1916:

DESTINATION	Unmanufactured	Manufactured
United States.....	\$34,573,005	\$9,555,016
Great Britain.....	14,125,537	1,008,821
Other countries.....	2,504,428	934,033
<b>Totals.....</b>	<b>\$51,292,970</b>	<b>\$11,497,870</b>

The manufactured articles consisted mainly of pulpwood, saw logs, ties, posts, poles, piling, firewood, tanbark, square and waney timber, planks, boards and scantling, and the manufactured articles of wood pulp, furniture, barrels, etc.; the value of both amounting to \$62,790,840.

**Total Value of Forest Products.**—The following table is based partly upon actual statistics and partly upon the estimates of the Dominion forestry branch, and shows the estimated value of different classes of forest products for the calendar years 1913 to 1915, inclusive:

KIND OF FOREST PRODUCT	1913	1914	1915
Lumber, lath and shingles.....	\$71,000,000	\$67,500,000	\$69,750,000
Pulpwood.....	15,000,000	15,500,000	15,750,000
Poles.....	1,800,000	700,000	500,000
Ties.....	9,000,000	9,000,000	3,500,000
Round mining timbers.....	600,000	500,000	680,000
Posts and rails.....	10,000,000	9,500,000	9,000,000
Firewood.....	55,000,000	60,500,000	60,650,000
Cooperage.....	1,900,000	1,900,000	1,400,000
Tanbark.....	20,000	22,000	170,000
Miscellaneous products.....	11,000,000	10,000,000	9,500,000
Logs exported.....	900,000	850,000	1,325,000
Square timber exported.....	500,000	400,000	480,000
Miscellaneous exports.....	400,000	300,000	175,000
<b>Totals.....</b>	<b>\$177,120,000</b>	<b>\$176,672,000</b>	<b>\$172,880,000</b>

This table gives a fairly accurate idea of the magnitude and stability of the forest industries of Canada.

A. H. D. Ross,  
Consulting Forest Engineer, Toronto.

**41. THE GRAIN TRADE.** The Canadian grain trade has been subject to legislative control from an early date; but the first enactment after confederation applicable to the whole of Canada was in 1874 when the Dominion Parliament passed the General Inspection Act dealing with a large variety of staple commodities. Under this act the different brands of flour and meal were legally defined, and special provisions were included for the grading of grain. After the establishment of a grain-growing industry in the province of Manitoba, an act of 1885, in further amendment of the General Inspection Act of 1874, considerably extended the grades of grain and introduced for the first time grades descriptive of the hard wheats of Manitoba and the Northwest territories. Subsequently the legislation affecting the warehousing and transportation of grain became merged in the Manitoba Grain Act of 1900 and amending acts. The Inspection Act covered the inspection, grading and weighing of grain up to 1904, when all matters affecting grain were withdrawn from that act and embodied in the Grain Inspection Act, 1904, which on the revision of the statutes in 1906 became Part II of the Inspection and Sale Act.

**The Canada Grain Act.**—Four years ago the Dominion legislation affecting the Canadian grain trade was codified by the Canada Grain Act of 1912, which also included numerous additional provisions of important character. The act provides for the appointment by order in council of a board of three commissioners, known as the Board of Grain Commissioners for Canada, who are charged with the management and control of the grain trade for the whole of Canada in accordance with the terms of the act. The offices of the board are at Fort William where, and at the twin city of Port Arthur, are situated the large terminal elevators from which grain is discharged into the lake steamboats plying eastward. For the purposes of grain shipment Canada is divided into two inspection divisions, the Eastern and Western. The former comprises the portion of Ontario lying east of Port Arthur and Quebec and the Maritime provinces, while the latter comprises the portion of Ontario lying west of and including Port Arthur, the Northwest provinces and territories and British Columbia.

**Grain Elevators.**—These constitute an integral part of the grain trade as controlled by the act, and the development of grain growing in the Northwest made their introduction into Canada a necessity. The first Canadian grain elevators were constructed shortly after the year 1880. Before this date grain grown in Canada was shipped through flat warehouses built by grain dealers at points along the railway line. The grain was bought by the dealers, stored in the warehouse and shipped in car lots for sale in Winnipeg. The warehouse was a simple wooden storehouse, built parallel with the railway track. A passageway across divided the house in two and each end was subdivided into bins. The machinery usually consisted of a scale in the passageway, a trolley for pulling the sacks and a grain cart to handle the grain in bulk. The grain was weighed, piled loose in the bins and drawn in the cart to the railway car. This system has become an-

tiquated, and the flat warehouses, of which there are now only about 24 in Canada, tend annually to disappear.

Dissatisfaction on the part of grain growers with the management of the elevators led to the introduction of what are called "loading platforms." The platform is a wooden structure on a railway siding to which a farmer can drive his team and from which he can shovel the grain into the car. When the grain has been loaded, he can either sell it on the spot as track grain, or consign it to a commission firm in Winnipeg to be sold for his account. By using the platform a farmer can protect himself from the possibility of malpractice on the part of the elevator, and can save the elevator charges amounting to about \$17 per car. On the other hand he has to secure the car, make his own arrangements for selling the grain and load the grain into the car with his own labor. In spite of these disadvantages as compared with the elevators, the loading platforms are popular, and applications for new and larger ones are constantly being made. There are at present about 1,600 of these platforms, and Dr. Magill, when chairman of the Board of Grain Commissioners, in a report on grain inspection in Canada, estimated that the proportion of grain loaded over platforms was about one-third of the whole.

With regard to the elevators themselves it will be understood that the name refers originally to the mechanical devices employed for hoisting grain in order to store it in bulk. The mechanical device most generally employed is on the endless chain and bucket principle. This is applied for lifting the grain perpendicularly, whilst belts called conveyors are also used to convey it horizontally for the purpose of shooting it into different bins. But the term elevator, whilst originally employed to designate the machinery for hoisting, has come to signify also the building used for the storage and handling of grain. It is in this sense that the term is employed for the purpose of this article.

There are now in Canada six different kinds of grain elevators. There are first what are called the "country elevators." These, as defined by the Canada Grain Act, include all elevators and warehouses which receive grain for storage before inspection and which are erected at a railway station or on railway lands. As a general rule the country elevators are owned and operated by commercial companies or by farmers' co-operative companies. When the farmer takes his grain to a country elevator he can either sell the grain to the operator, in which case it is called "street grain," or he can hire a bin in the elevator to keep his grain distinct from all other grain, in which case it is called "special binned grain," or he can store it with other grain of the same grade. If he stores the grain either in a special or general bin, he arranges with the railway company for a car, and the elevator loads the grain into the car to his order. When the grain is loaded he can either sell it on the spot as track grain or send it forward consigned on commission. In 1916 the total number of country elevators and warehouses was 3,014 with an aggregate storage capacity of 94,322,000 bushels.

Next in order come the large terminal ele-

vators, which are situated at Fort William and Port Arthur, the twin cities at the head of Lake Superior, to which the country elevators are tributary, and from which the grain is shipped by the lake steamboats to Montreal, or to the lake ports of Canada and the United States. These elevators are called "terminal" not because they are situated at the railway termini, but because the inspection of western grain ends at them. Of these terminal elevators at Fort William and Port Arthur there are 13 with a total capacity of 40,435,000 bushels.

Other descriptions of elevators include 22 "public elevators" with a capacity of 29,250,000 bushels, 19 "hospitable elevators" with a capacity of 2,560,000 bushels for the cleaning or other treatment of rejected or damaged grains and three milling elevators with a capacity of 1,700,000 bushels used in connection with the manufacture of grain products in the western inspection division. Under powers conferred by the Canada Grain Act, and partly for the purpose of meeting a contemplated western expansion of trade through the opening of the Panama Canal, the Dominion government has erected and is operating four new interior terminal elevators. These are situated at Port Arthur, Saskatoon, Moosejaw and Calgary, and have an aggregate capacity of 9,500,000 bushels. At Vancouver, also, a public or transfer elevator, with a capacity of 1,250,000 bushels, has been erected by the government to facilitate the loading of grain in ocean steamships. Altogether the Dominion government has licensed 3,078 grain elevators and warehouses with an aggregate storage capacity of 180,988,000 bushels. In 1901 the licensed grain elevators in Canada numbered 523 with a total storage capacity of 18,329,352 bushels; so that the difference between these figures and those just quoted for 1916 shows how great has been the development of the trade since the beginning of the 20th century.

**Inspection and Grading.**—Under the Canada Grain Act all Canadian grain shipped in car load lot or cargoes from elevators is subject to government inspection and grading, and the grain is sold both at home and abroad on the inspection certificate entirely by grade and not by sample. As each car arrives at an inspection point it is sampled and graded by qualified samplers and inspectors appointed under the act. When the grain arrives at the terminal elevators it is weighed, cleaned and binned according to grade under the direct supervision of the inspectors, and a warehouse receipt is issued by the elevator operator to the owner of the grain. When the grain leaves the terminal elevator in car or cargo lots it is again weighed and inspected, and it must be graded out as graded in; that is, if it was received into the terminal elevator as "No. 1," grain of equal quality must be shipped out. Thus the identity of the grade of exported grain is carefully preserved through every stage of movement. There are a number of inspection points; but for grain going west the principal inspection point is Calgary. Duluth is the inspection point for bonded grain going through the United States. Winnipeg is the inspection point for all eastward bound grain and Fort William and Port Arthur are the points of in-

spection for grain leaving the terminal elevators.

Under the act Canadian grain is divided into five general classes, viz., "Statutory grade," "Commercial grade," "Rejected," "Condemned," and "No grade." The statutory grade means for each grain the highest grades, as defined in the act. There are four of these grades for western spring wheat, viz., No. 1 Hard and Nos. 1, 2 and 3 Northern. The act prescribes that the first two of these grades shall be "sound and well cleaned, weighing not less than 60 pounds to the bushel and composed of at least 75 per cent for No. 1 Hard and 60 per cent No. 1 Northern of hard Red Fife wheat." No. 2 Northern must be "sound and reasonably clean, of good milling qualities and fit for warehousing, weighing not less than 58 pounds to the bushel and composed of at least 45 per cent of hard Red Fife wheat." No. 3 Northern comprises grain not good enough for No. 2 that is graded No. 3 at the discretion of the inspector. A variety of other "statutory grades" are established under the act for spring wheat, goose wheat, winter wheat, Indian corn, oats, rye, barley, peas, buckwheat and flax, with distinctions for grain grown in the West. In addition to these statutory grades, other grades are established each year under the authority of the act by the Standards Board consisting of experts appointed by the Grain Commissioners to establish "commercial grades" in addition to the statutory grades. These extra commercial grades vary with the season, whilst the statutory grades remain invariable. The effect of these arrangements is that there may be as many as 31 grades of western spring wheat alone, 30 grades of western winter wheat, 30 grades of oats, 15 of barley and 15 of flax. Of the other three classes, i.e., grain not graded, "rejected grain" means all grain that is unsound, musty, dirty, smutty or sprouted or that contains a large admixture of other kinds of grain, seeds or wild oats or that from any other cause is unfit to be classed under any of the recognized grades. "Condemned grain" means all grain that is in a heating condition or is badly binburnt, whatever grade it might otherwise be, and "No grade" means all good grain that has an excessive moisture, being tough, damp or wet, or otherwise unfit for warehousing.

All grain in Canada is sold, unless otherwise contracted for, by certain legal weights per bushel. These were originally fixed by an act of the Dominion Parliament passed in 1879. At the present time the legal weights per bushel for the principal grains are as follows: Wheat 60 pounds, rye 56 pounds, barley 48 pounds, oats 34 pounds, Indian corn 56 pounds.

**Exports of Canadian Grain.**—Although the acreage and production of wheat and oats, the two principal grain crops of Canada, are similar in extent and quantity, it is only the wheat that figures very largely in the export returns. Oats are used mainly for the home feeding of live stock, and the surplus for export is not considerable except after very abundant seasons. The following table shows for each of the five years ended 31 March 1916 the quantity and value of the principal grains exported to the United Kingdom, to the United States and to other remaining countries:

EXPORTS OF GRAIN FROM CANADA FOR THE FIVE FISCAL YEARS ENDED 31 MARCH 1912-16. QUANTITIES.

GRAIN AND YEAR	To United States	To United Kingdom	To other countries	Total

1916	2,926,421	47,511		2,973,932

It will be seen from this table that the bulk of the exports of both wheat and oats goes to the United Kingdom. In the case of wheat the percentage proportions for the last fiscal year were for quantities 85 per cent to the United Kingdom, 5 per cent to the United States and 10 per cent to remaining countries. In Ontario and Quebec, and to a less extent in the Atlantic provinces, there is a large production of all kinds of grain, a considerable proportion of which enters into commerce, but of which very little is available for export from Canada.

It is estimated that of wheat Canada requires annually for home consumption about 96,000,000 bushels, of which 48,000,000 bushels or one-half represents food for the population of eight millions, and 48,000,000 bushels are either used for seed or are grain of inferior qualities kept on the farm for the feeding of live stock. Following the great increase of settlement during the present century the exports of wheat from Canada, especially to the mother country, have been rapidly expanding; and have reached in recent years a total equivalent to about 144,000,000 bushels, or about 67 per cent of the total British imports of wheat and flour. After the season of 1915, when high tide was reached by the most abundant harvest ever reaped in Canada, the Canadian exports of wheat (including flour) for the crop year ended 31 Aug. 1916 were 289,794,162 bushels.

ERNEST H. GODFREY, F.S.S.,

Editor, Census and Statistics Office, Ottawa.

**42. MINERALS.** From a country so vast and of such varied geological structure as Canada one expects a wide range of mineral deposits, and the expectation is not disappointed, for already most of the minerals known to exist elsewhere have been found in the Dominion, and often in important deposits, though only its southern fringe has been explored. However, up to the present, Canada's mineral production must be looked on as at the stage of promise rather than performance, except in a few substances where nature has given her the lead. For example, the world's supply of asbestos comes from the province of Quebec, and more than three-quarters of its supply of nickel is obtained from mines in Ontario, while rich placer mines have produced largely in the Yukon, and Cobalt supplies the needs of the world for that metal and has attained a great place in silver production. Canada is backward in the production of iron and steel, basic factors in the development of a country, and stands relatively low as a producer of coal, though the fact that the only deposits of good coal on tide-water in America, both on the Atlantic and Pacific, are Canadian, is a fact of much importance which has produced great metallurgical industries in Nova Scotia.

Until recently the exploitation of Canadian mineral resources has been largely due to foreigners, especially Americans; but Canadian and British capital are now turning in this direction.

In 1913, the year of greatest output, the total value of the mineral products of Canada was \$145,634,812, about \$18.75 for each inhabitant, as compared with \$24.50 per capita in the United States, where the total reached \$2,445,805,017 in the same year. The area of Canada is about equal to that of the United States and in the parts best explored its mineral resources give promise of equalling in value those of corresponding States of the Union; so that an immense expansion in mining is to be looked for in the next generation.

The mineral production of Canada is very unequally distributed among the provinces, Ontario coming first with nearly 45 per cent of the whole, followed by British Columbia with 21 per cent and Nova Scotia with 13 per cent and the other provinces with smaller percentages. It is interesting to note that Ontario, one

of the oldest and presumably best known of the provinces, has had important mineral discoveries in recent years increasing its output threefold in the last decade. Of the Maritime provinces of eastern Canada only Nova Scotia can be described as a mining region, gold and coal having been produced there for nearly half a century. Quebec is not of great importance except for its asbestos mines. Ontario produces a variety of minerals, nickel, silver and gold being foremost, while British Columbia provides gold, silver, copper, lead, zinc and coal, and the Yukon gold.

Following the usual classification, the minerals of Canada may be taken up under three heads, metals, non-metallic minerals and structural materials.

#### METALS.

Ores of 15 metals have been mined in Canada — antimony, chromium, cobalt, copper, gold, iron, manganese, mercury, molybdenum, nickel, palladium, platinum, silver, tungsten and zinc, and minerals containing a number of other metals have been found, though they have not yet been mined. Only eight of these metals are prominent economically, gold, silver, nickel, copper, lead, cobalt, zinc and iron, and attention will be directed mainly to them.

**Gold.**— The gold areas of Canada are widespread but the production has been very fluctuating the value in recent years varying from \$907,601 (in 1892) to \$27,908,153 (in 1900) and standing at \$15,983,007 in 1915. In 1900 Canada was third in rank as a producer of gold, being surpassed by the United States and Australia only; but has dropped to the fifth place since then, yielding to South Africa and Russia. Three provinces and one territory are gold producers at present. Nova Scotia has carried on quartz mining, on "saddle reefs" like those of the famous Bendigo region in Australia, for more than 50 years, but has seldom exceeded \$500,000 per annum, the value falling to \$137,178 in 1915. Ontario also produces gold from quartz mines, but until recently only in small amounts. Since the opening up of the important Porcupine gold region in 1912 the output has rapidly increased, reaching \$8,386,956 in 1915. The Porcupine district is now the most productive in the Dominion. Before the sudden rise of the Klondike, British Columbia was the greatest gold region of Canada, its history beginning with the times of wild excitement in the sixties, when thousands of miners from California swarmed into the rich placers of the Fraser and Columbia rivers and washed out millions of dollars worth, reaching the climax of \$3,913,563 in 1863. The easily available placers were gradually exhausted, the value falling in 1893 to \$379,535, a little less than the output of Nova Scotia in the same year; but the production of lode gold, especially from the smelting ores of Rossland on the southern edge of the province, once more placed British Columbia in the first rank. In 1908 the yield was \$9,529,880, of which \$3,600,000 came from placer mines, mostly in the Cariboo and Atlin districts in the north, the rest from smelting ores and a few quartz mines in the south; but this has fallen off to \$5,628,982.

The prairies furnished a small amount of placer gold from bars on the Saskatchewan and other rivers for a number of years, but it was

not until the working of the Klondike placers in 1897 that gold mining assumed importance in the north. This region, in lat. 64°, 500 miles below the headwaters of the great Yukon River, was unique as a placer mining country, reminding one of the famous placers of California and Australia, but surpassing them in difficulty of access and of working conditions, as well as in richness. For its length Eldorado Creek, a tributary of Bonanza Creek, was the most productive ever mined, but its gravels are nearly worked out, and the yield of gold, though still great for so small a region as the Klondike, which is about 40 miles square, has fallen since 1900, when it was estimated at \$22,275,000, to \$4,755,721 in 1915. The gold-bearing gravels were perpetually frozen and usually buried under several feet of frozen muck, so that the ground had to be thawed before it could be worked. At first this was done by building fires, but later steam delivered from steel pipes driven into the ground was employed, and it was found, also, that when stripped of moss the warm summer's sun thaws layer after layer, which may then be sluiced off in the ordinary way. All the rich placers have now been worked, but dredges and hydraulic plants are covering the ground again with good results. In 1915 these methods produced the amount mentioned above, but a gradual falling off may be expected in the future.

**Silver.**— For many years Ontario was the chief province for silver, the mine at Silver Islet near Thunder Bay on the north shore of Lake Superior being credited with a total output of \$3,250,000, while several other mines to the west of Thunder Bay were also worked. For a while British Columbia took the lead in the production of silver, beginning in 1892, and culminating in 1897 with an output of over \$3,000,000. In 1897, Ontario produced only 5,000 ounces, worth about \$3,000, but from that date onward there was a yearly increase in her output, until in 1911 it was 30,540,754 ounces, valued at \$16,279,443. British Columbia's production was only 1,887,147 ounces in the same year. Cobalt has been declining in its silver production since 1911, the amount in 1915 being 23,568,147 ounces, while British Columbia's production rose to 3,628,727 ounces.

**Nickel.**— This metal has become of practical value only since 1889 and methods of reducing its ores are still somewhat in the experimental stage. The world's supply comes almost entirely from two regions, the Sudbury district in northern Ontario and the French penal colony of New Caledonia. In early years New Caledonia was somewhat in advance, but in 1903 Sudbury passed it in production and seems likely to hold its position in the future. The mines are all situated round the edge of a basin-shaped sheet of eruptive rock 37 miles long and 15 broad, and among them the Creighton is the greatest nickel mine in the world, supplying more than half of the total output. About half as much copper as nickel is produced in these mines and also small amounts of gold, palladium and platinum, the last metal occurring in the rare arsenide sperrylite, first found in the district. In 1915 matte smelted from the roasted ore contained 34,000 tons of nickel, mostly mined and treated by the Canadian Copper Company, though the Mond Com-

pany of England was of some importance, also. The value of the nickel in the matte was placed at \$10,352,344, while the refined metal was estimated to be worth \$20,423,348. The demand for nickel steel for war purposes has greatly helped the industry.

**Copper.**—Copper has been mined in Newfoundland, Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia, but only the last two provinces are important producers. The copper of Quebec is a by-product of the iron pyrites of the Eastern Townships; and most of the copper from Ontario is, as shown above, produced as an accompaniment of the Sudbury nickel ores, though mines of copper alone are worked on a small scale at Massey in western Ontario, not far from the once well-known Bruce mines, north of Lake Huron, which were prosperous half a century ago but are no longer in operation. British Columbia supplies more than three-fourths of the copper mined in Canada, chiefly from the gold-copper ores of the Rossland region, the large low grade deposits of the boundary districts and of the Pacific Coast of the province, while a small amount comes from the White Horse district of Yukon territory. The total production of copper in the Dominion in 1915 was 51,306 tons, valued at \$17,726,307. The demand for copper for war purposes has greatly increased the production.

**Lead.**—Almost the whole of the lead mined in Canada comes from the silver-lead ores of southern British Columbia, which began to be opened up extensively in 1893 and furnished 31,500 tons in 1900. Since then there have been great fluctuations in the amount mined, which was 22,184 tons in 1915, the production depending largely on the prosperity of the silver mining industry, since the two metals occur together.

**Cobalt.**—The whole of the cobalt produced in Canada, and practically all that is used in the world, comes from the silver mines of Cobalt in northern Ontario, where the metal occurs in arsenides, especially smaltite. Though the metal is better suited for plating than nickel, very little is employed in this way. Its chief use is in the preparation of cobalt blue and in giving a blue color to glass or porcelain. In 1914 there was a production of 871,891 pounds of cobalt, mostly disposed of as the oxide, and the value is estimated at about \$550,000.

**Zinc.**—Zinc ores, chiefly blende, have been mined in Quebec, Ontario and British Columbia, and have been shipped to the United States or to Belgium for treatment, but the recent high price of zinc, due to the European War, has encouraged two companies, one at Welland, Ontario, the other at Trail, B. C., to produce the metal from its ores. In 1915 15,553 tons of ore were reported, mainly from British Columbia, and the value is given as \$636,204.

**Iron.**—In regard to the most important of all metals, iron, Canada is backward, largely from the fact that the ore deposits and the fuel for treating them are generally widely sundered. Nova Scotia, Quebec and Ontario have been producers of iron and steel, the first province having the great advantage of supplies of coking coal on the seaboard, at Sydney in Cape Breton Island and other points, so that two large iron and steel plants are in operation

there. Most of the ore smelted is, however, in a sense foreign, coming from Bell Island, off the coast of Newfoundland. The province of Quebec has for generations smelted a small amount of bog iron ore in charcoal furnaces near Three Rivers, the product being of high grade and used for special purposes, but since 1912 these furnaces have been shut down. Charcoal iron furnaces were operated on a small scale in different parts of Ontario, also, from 50 to 100 years ago, but when railways began to bring in British iron the industry ceased. Within the last few years large furnaces using American fuel and in part American ore have sprung up at Hamilton, Midland and the Sault Sainte Marie.

Deposits containing millions of tons of fair grade ore have been found in Hutton township, Michipicoton and other points in northern Ontario in rocks similar to those of the great iron regions of Michigan and Minnesota, so that iron production is likely to increase in the future. British Columbia also possesses large deposits of iron ore and excellent coking coal, so that an iron industry like that of Nova Scotia may be expected to grow up as the province becomes more populous. The amount of pig iron smelted in Canada in 1915 was 913,719 tons, of which Ontario produced more than half, but of this amount only 158,598 tons came from Canadian ore, the rest coming from American or Newfoundland ore. The amount of steel produced was 1,020,335 tons.

**Platinum and Palladium.**—Among the rarer and more precious metals it is perhaps worth while to mention platinum, which has been obtained from placers in the Similkameen region, B. C., and which occurs also in the form of the arsenide, sperrylite, in the Sudbury nickel ores. A few hundred ounces of the metal have been obtained annually as residues after the separation of the nickel and copper in the Bessemer matte from Sudbury. The way in which palladium occurs in the nickel ore is unknown, but it is obtained in larger amounts than the platinum.

#### NON-METALLIC MINERALS.

Twenty-two non-metallic minerals are reported in the statistics for 1915, and several others occur in lists of former years, but attention may be confined to a few of the more important ones, beginning with the mineral fuels.

**Coal.**—In 1915 the coal mined in the Dominion amounted to 13,209,371 tons, valued at \$31,957,757. Of this Nova Scotia supplied 7,429,888 tons, Alberta 3,320,431, British Columbia 2,089,966, New Brunswick 236,940, Saskatchewan 122,422, and the Yukon territory 9,724. The coal supply of the great manufacturing province of Ontario comes entirely from the United States, and much of that used in Quebec is obtained from the same source; but as a small offset Nova Scotia exports coal to the New England States, and British Columbia to the Western States, the total amount being 1,766,543 tons. The coal of Nova Scotia is bituminous and of Carboniferous Age; most of the coal mined in Alberta and British Columbia is bituminous, also, but of Cretaceous Age. A small amount of coal approaching anthracite is mined in Bow Pass, where seams of Cretaceous coal have been nipped in during moun-

tain building; and a considerable tonnage of lignitic coal and of lignite of poorer quality is mined at numerous points on the prairies. In general the older the deposits and the more they have been disturbed in the rise of the foothills, and especially of the mountains, the better is the quality of the coal.

Excellent coke is made from the coal of Cape Breton Island, Nova Scotia, and of the Crows Nest region of Alberta and British Columbia, and also of Nanaimo on the Pacific Coast, the amount in 1915 being 884,555 tons.

Though Canada is surpassed in the extent of its coal deposits by only two or three countries in the world, their distribution, mainly in the foothills and mountains of the West, leaves the populous central provinces and the largest cities mainly without a native coal supply.

**Petroleum and Natural Gas.**—At present Ontario is practically the only producer of petroleum, which comes from a small area in its southwestern peninsula. Crude oil and its products to the extent of 215,464 barrels valued at \$300,572 are reported in 1915, but the supply is slowly diminishing and before long will be exhausted unless other pools are struck. Petroleum is known from Gaspe in Quebec and from southern Alberta, and great stretches of "tar sands" along the Saskatchewan and Athabasca suggest oil deposits, though productive wells have not been sunk in these regions. See **PETROLEUM INDUSTRY, THE**.

Natural gas has been exploited in Essex and Welland counties of southwestern Ontario. In 1915 the wells of Ontario furnished gas to the value of \$2,202,523. Natural gas is obtained on a large scale in Alberta, especially near Medicine Hat and between it and Calgary, where the production is valued at \$1,037,919; and on a much smaller scale in New Brunswick.

In addition to the mineral fuels just mentioned Canada has large areas of bituminous shale from which oil may be distilled and of peat bog from which fuel may be obtained when the need arises.

#### MINOR ECONOMIC MINERALS.

After the fuels come several less important minerals, asbestos being the chief one, with an output of 113,115 tons in 1915, valued at \$3,491,450. The whole product, which means practically the world's supply, comes from a few mines in serpentine rocks in the Eastern Townships of Quebec. The value of this beautiful silky-fibred mineral depends on the fact that it is an incombustible material which can be spun or woven or felted together into non-conducting sheets. Next in value is pyrites, of which 296,910 tons were mined in the provinces of Quebec and Ontario, having a value of \$1,028,678. Gypsum, the raw material of plaster of paris, was quarried mainly in New Brunswick and Nova Scotia, to the amount of 470,335 tons, valued at \$849,928. Salt prepared from wells in southwestern Ontario reached 119,900 tons in weight and \$600,226 in value. In addition quartz, chromite, white arsenic, magnesite and graphite reached values of over \$100,000, and mica, feldspar, corundum, talc and ochres were produced in smaller amounts. The corundum mined in Ontario is used only as an abrasive; the gem varieties, ruby, sapphire, etc., have, so far, not been found.

#### STRUCTURAL MATERIALS.

Building stone, clay for brick making and marl or limestone and clay for the manufacture of cement are, of course, found in all the provinces; but the greater part of the clay products and most of the cement are manufactured in Ontario and Quebec where the demand for structural materials is greatest. In 1915 5,681,032 tons of Portland cement were made with a value of \$6,977,024; and clay products were valued at \$3,918,200. Statistics of other structural materials of importance are given as follows: Lime, \$1,015,878; sand and gravel, \$2,098,683; sand-lime brick, \$182,651; granite, \$1,634,084; limestone, \$2,504,731; marble and sandstone, \$365,784. The total value of structural materials is given as \$18,712,074.

#### MINERAL PRODUCTION.

The mineral productions of all kinds sum up to a value of \$138,513,750 in 1915, representing an advance of 7.49 per cent over the previous year, but a falling off of \$7,121,062 as compared with that of 1913, the year of greatest prosperity. The falling off in 1914 was due to the general collapse of the world's industries because of the war, and one may confidently expect the usual advance in output when peace is restored and conditions become normal again.

The following table, showing the production at five-year intervals, illustrates the rapidity of the increase since statistics have been kept by the Geological Survey:

1886 (first year of statistics)	\$10,221,255
1888	12,518,894
1893	20,035,082
1898	38,697,021
1903	63,226,510
1908	85,927,802
1913	145,634,812

From this table it will be seen that the mineral industries of Canada increased the value of their output more than eleven-fold in the 25 years between 1888 and 1913, often nearly doubling in the five-year intervals, an almost unexampled advance. That the rate of increase will be as rapid in years to come can scarcely be expected, but so little of the area of Canada has yet been carefully explored that many important discoveries may be looked for as the great northern regions are mapped and opened up.

**Sources of Information.**—Statistical information as to the mineral production of the country as a whole may be found in the annual reports of the Geological Survey of Canada, Department of Mines, compiled by John McLeish, and in the annual volumes of the *Mineral Industry*. The mining departments of the provinces of Nova Scotia, Quebec, Ontario and British Columbia also publish annual reports of much value in which information is given as to their special mining industries. The statistical materials for this paper have been largely drawn from these sources.

A. P. COLEMAN,  
Professor of Geology, University of Toronto.

**43. FISHERIES.** Among the great industries of Canada the fisheries stand fifth in the order of value. The farming industry (mainly grain growing) is estimated to yield \$500,000,000 per annum; the lumber industry \$100,000,000; stock raising \$100,000,000; mining

\$105,000,000, while the fishing industries are estimated to produce, on the whole, \$39,000,000 to \$40,000,000 annually. The latest report of the Marine and Fisheries Department, which gives the value for 1916-17, places it at \$39,208,378, but when account is taken of the amount of fish consumed by wandering tribes of Indians and Eskimo, with their hordes of fish-eating dogs, as well as the amount used as food by isolated settlers, miners, prospectors, lumberers and sportsmen, and, above all, the employees at the Hudson's Bay Company's posts in the remoter parts of northern Canada, the total amount must be greatly in excess of official statistics.

Completely accurate returns are hardly possible, admirable as the Canadian system of gathering statistics is, so admirable that the late Prof. Brown Goode, head of the United States Fish Commission, declared at a fisheries conference in 1883 that ". . . other countries ought to study it with a great deal of care."

The expansion of the Canadian fisheries since 1870 is sufficiently shown by the figures given below:

1870	\$6,577,391	1901	\$25,737,153
1876	11,117,000	1908	25,451,094
1880	14,499,979	1911	29,965,433
1890	17,714,902	1913	33,389,464
1893	20,686,661	1915	31,264,631
1897	22,783,546	1916	35,860,708
1900	21,557,639	1917	39,208,378

**Number of Boats, Fishermen, etc.**—Over 1,300 vessels (valued at \$4,961,343) and 40,105 boats, including 12,828 with gasoline engines (valued at \$4,829,493), are employed, while the fishing gear used, including nets, lines, lobster-traps, etc., is valued at over \$5,690,002. Certain branches of the fisheries have developed in a special degree, such as the salmon canning industry on the Pacific Coast and lobster packing on the Atlantic Coast. The former, embracing about 80 canneries, represents an investment of about \$3,000,000, while the Atlantic lobster canneries, in Quebec and the three Maritime provinces, numbering 700, are valued at about \$660,000. Smokehouses, curing and refrigerating establishments, in operation, are officially recorded at \$4,025,371 in value. In other words, a capital of over \$28,000,000 is employed in the fisheries. In three years (1911-14) the total increased by nearly \$5,000,000.

The total number of persons engaged either in fishing or in handling fishery products in Canada reaches to over 90,000, of whom 70,000 take part in Atlantic fishery enterprises. On the Pacific Coast 10,000 fishermen follow salmon netting, and 8,000 hands find employment as cannery workers, etc. The inland (fresh-water) fisheries engage a considerable number of fishermen, over 4,000 being employed in the Ontario or Great Lake fisheries, while, in Manitoba and the Northwest territories, 3,000 or 4,000 men take part in the fishing operations.

**Seven Fishery Districts.**—Seven territorial divisions may be distinguished in a general survey of the fisheries of the Dominion, viz.:

1. The Atlantic division, from Grand Manan in the south to the coast of Labrador, including the Bay of Fundy (8,000 square miles) and the Gulf of Saint Lawrence (80,000 square miles), and characterized by deep-sea and inshore fisheries for cod, mackerel, haddock, halibut, herring, hake, lobsters, oysters, seals and white whales (*beluga*). Annual value, over \$14,000,000.

2. The estuarine and inland waters of Quebec and the Maritime provinces, including fisheries for salmon (by stake-nets, drift-nets and angling), striped bass, smelt, shad, gaspereau (alewife); and in the lakes, ouananiche or land-locked salmon, lake trout, togue or lunge, etc. Annual value, nearly \$2,000,000.

3. Great Lakes division, including Lakes Ontario, Erie, Huron and Superior, which Canada shares with the United States, the international boundary passing practically through the centre of these vast inland seas, all of which finally empty into the river Saint Lawrence. This complex system of waters, with innumerable subsidiary lakes and rivers, abounds in lake whitefish (*Coregonus*), great lake trout (*Cristivomer namaycush*), lesser whitefish (erroneously called lake herring); sturgeon, pike-perch (doreé or pickerel), black bass, brook trout, maskinongé, pike and numerous carpoïd suckers, and bearded catfish. Annual value, nearly \$3,000,000.

4. Manitoba and northwestern division, including Keewatin, etc., whose wide expanses of fresh water, such as Lake Winnipeg, Great Bear Lake and Great Slave Lake, yield enormous quantities of whitefish, sturgeon, pike-perch, tullibee (a peculiar lesser whitefish), pike, gold-eye (a true fresh-water herring), large river trout and catfish. Value, inclusive of an extensive "caviare" or sturgeon-roe industry, over \$1,000,000.

5. Pacific Interior division, extending from the Okanagan, Kootenay and Arrow waters, in the south, to the Yukon district, in the north, and covering an area of plain, valley and mountain 1,000 miles north and south, by about 500 miles east and west, intersected everywhere by rivers and lakes, and comprising limited fisheries for lake trout, whitefish, land-locked salmon, river trout, grayling and numerous carps or suckers, not identical, for the most part, with eastern species. Annual value probably not exceeding \$500,000.

6. Pacific Coast division, the fisheries of which are little developed, if we except the estuarine and coastal salmon fisheries. The various species of salmon, include the blue-black or sockeye, the spring salmon or quinnat, the coho, dog-salmon, humpback and a true salmon, namely gairdner's salmon or steel-head. Skill, or black cod, oulanchan (candle-fish), anchovy, herring, sardine, smelt and a great variety of other fishes abound which are not utilized to any great extent. Shark, dog-fish, rat-fish and whale fisheries exist; and there are limited oyster fisheries. The halibut fishery is of great importance and yields upward of \$2,000,000 annually. With the shipping facilities provided by the extension of the Grand Trunk Pacific to Prince Rupert, in the vicinity of which port are located the best fishing banks, this fishery will develop greatly in the near future.

7. Hudson Bay and Peri-Arctic division, from Ungava Bay, Labrador, to the Mackenzie River, or rather Herschell Island, Yukon district. Whale, walrus, sea trout, Hearn's salmon (a great spotted trout), the inconnu (resembling a river whitefish), pike, suckers, sturgeon and, possibly, salmon and cod occur in these vast northern waters, of which Hudson Bay alone exceeds the Mediterranean in extent and has

an estimated drainage area of 2,700,000 square miles. The richest whaling grounds in the world are in these remote regions of the Dominion, whose tidal channels, as the late Sir John Schultz declared, "are destined to be the last home of the leviathans which within the memory of living man have been driven from Newfoundland latitudes to the places where their survivors have now sought retreat." Hair-seals of various species and white whales (*Beluga*) abound in these sub-arctic waters, and constitute valuable fisheries; one station, according to Dr. Robert Bell, securing no less than 2,800 of these small whales in one season.

**Marine Fishing Grounds: Area, Kinds of Fish, etc.**—The waters grouped in this seven-fold manner afford a field, hardly to be surpassed, for the development of extensive fisheries. The grounds where fishing can be remuneratively carried on, off the eastern and western sea-board, embrace a total area of no less than 200,000 square miles, the Atlantic shore being over 5,000 miles in length, while the Pacific shore (British Columbia) exceeds 7,000 miles. On this latter coast, Hecate Straits (20,000 square miles) and the straits between Vancouver Island and the mainland, namely, the straits of Georgia and Fuca (15,000 square miles) afford the most remarkable sheltered fishing grounds in the world, being for the most part shielded from the open ocean, and extending inland as placid fiords and deep, salt-water inlets, the total area of these inshore waters being no less than 40,000 square miles in extent. The Canadian fishing banks on the Atlantic Coast are historic. They stretch from Labrador, Anticosti and Gaspé in the north to the West Isles in the southern Passamaquoddy waters, including famous areas like the Bay of Chaleurs, off Quebec province, Northumberland Straits, off Prince Edward Island, and New Brunswick, and Chedabucto Bay, off eastern Nova Scotia. Between the outer edge of the inshore areas and the deep-sea waters of the Atlantic the feeding and breeding grounds occur for cod, haddock, mackerel and other valued edible fishes. "There is probably no part of the world," said Mr. P. L. Simmonds, the well-known fishery authority, "where such extensive fisheries are to be found, as in the Gulf of Saint Lawrence." Among the series of banks mainly resorted to by Canadian fishing boats are (passing from north to south) Great Bank, Green Bank, Bank Saint Peter, Misaine, Canso, Quero, Howe, Roseway, La Have and Western Banks, apart from the great fishing areas in the open Atlantic, such as the Grand Banks, which are not really in Canadian limits and are indeed mainly exploited by fishermen from more distant countries.

**Fresh-water Fisheries.**—If, owing to the superficial extent, and, no less, the coldness and purity of the marine waters of Canada, as well as the abundance of natural food, upon which cod, mackerel, halibut, herring, etc., subsist, the sea fisheries rank amongst the best in the world, it may be said of the fresh-water fisheries that they are hardly inferior in these characteristics. The total area of the fresh waters of the Dominion (lakes and rivers) is estimated at 140,000 square miles. From a fishers' point of view the lake systems of Canada may be arranged under five principal heads, namely:

*Five Lake Systems.*—1. The maritime lakes,

embracing the numerous lakes of Labrador, Quebec and the Atlantic provinces. Certain of these, notably Lake Saint John, Quebec (366 square miles), and the Chamcook Lakes, N. B., are famous for land-locked salmon, so prized for their unique game qualities. Black bass, pickerel or doré, lake trout, red and speckled trout abound in these waters, while Clear Lake, Little Seal, Mistassini and most of the northern lakes swarm with whitefish and sub-arctic varieties of trout.

2. The central lake system, including the Great Lakes (76,562 square miles in total area) and innumerable subsidiary lakes, all utilized for commercial purposes and for sport. The areas and maximum depths of the more important of these lakes are as follows: Superior, 31,200 square miles, 160 fathoms deep; Huron, 23,800 square miles, 145 fathoms deep; Erie, 10,030 square miles, 35 fathoms deep; Ontario, 7,330 square miles, 123 fathoms deep; Lake Nepigon, 1,450 square miles; Lakes Saint Clair and Simcoe, 300 square miles each.

3. The Manitoba and Keewatin system, the principal waters of which are Lake Winnipeg, 9,400 square miles; Lake Winnipegosis, 2,030 square miles; Lake Manitoba, 1,900 square miles; and Lake of the Woods, 1,500 square miles; and in these waters enormous fishing operations are carried on for whitefish, pickerel or doré, sturgeon, pike, etc.

4. The Athabasca and Mackenzie system, extending from Reindeer Lake to Great Bear Lake, the latter lake no less than 11,200 square miles in area, while Great Slave Lake is 10,100 square miles, and others are: Athabasca 4,400 square miles; Reindeer Lake, 4,000 square miles; Woolaston and Doobount lakes, each over 2,000 square miles in extent. These waters have been little fished, excepting by Indians, Hudson's Bay Company employees and the like, but being prolific in whitefish, sturgeon, etc., the development of great commercial fisheries in the near future is assured.

5. The Pacific Interior system from Lakes Labarge and Atlin to Shuswap Lake, and the Kootenay, Arrow and Okanagan lakes near the United States boundary. None of the lakes in this western series are comparable in area to the vast inland seas referred to above; but such waters as Babine Lake (250 or 300 square miles) at the head of the Skeena River, and Stuart Lake and Quesnelle lakes (respectively 100 and 750 square miles in area) at the head of the Fraser River, have an importance wholly disproportionate to their size, owing to the fact that their creeks and tributary streams are the great spawning resorts of various species of Pacific salmon. Whitefish, lake-trout, Pacific trout of various species and grayling occur in these waters.

**Rivers of Canada.**—Fisheries are also conducted upon the rivers, which almost without exception are abundantly supplied with the most esteemed fishes. Apart from a great stream like the river Saint Lawrence, whose drainage area is estimated to be 367,000 square miles, there are rivers, like the Mackenzie (2,400 miles long); the Great Saskatchewan (1,900 miles); the Churchill and Black rivers (each 1,500 miles); the Fraser (750 miles long and draining 100,000 square miles); the Red River (600 miles), and others like the Peace, Nelson, Albany, Great Whale, Skeena (300 miles); Ottawa (600

miles); Saint John (500 miles), Restigouche, Saguenay and Miramichi; all of which are great rivers, presenting for the most part unsurpassed scenic grandeur, and affording notable sport and extensive commercial fishing. It would indeed be difficult to parallel the Fraser River, with its incredible multitudes of salmon, while the Restigouche and other famous angling rivers emptying into the Atlantic Ocean have no peers in the annals of sport. "Canada," as Professor Elwyn said, "is the paradise of the angler."

#### Minor Fisheries, Oysters, Smelts, etc.—

The shores of Prince Edward Island, New Brunswick and parts of Nova Scotia furnish oysters of unequalled flavor and comestible qualities. Owing to over-fishing and inadequate protection the yield has seriously declined from 70,000 or 80,000 barrels per annum to half that quantity, valued at about \$180,000 yearly. On the other hand, such an industry as the smelt fishery, mainly carried on through the ice in December and the early months of the year, has grown from \$117,000 in 1881 to over \$800,000 in value. These dainty fish, formerly used as fertilizing material on farm lands, are now shipped, four or five thousand tons per season, in a frozen condition, mainly to the United States markets. The estuaries of the Miramichi, Restigouche and other New Brunswick rivers are the centres of this remarkable fishery.

The sturgeon fishery has witnessed a great development recently, and has much greater possibilities before it. This fish became commercially valuable in Canada, first on the Saint John River, N. B., in 1880, when 602,500 pounds were shipped to New York. In four years the catch fell to 126,000 pounds, and in 1895 barely 27,000 pounds were secured; but in Lake of the Woods, and on the Great Lakes, and above all, in the illimitable waters of Manitoba, the Northwest and British Columbia, the sturgeon fishery has received a great impetus during the last five or six years. In 1902 the yield of sturgeon was valued at \$173,315, as compared with \$90,000 20 years ago. Canada, in the opinion of some authorities, is now one of the chief producers of "caviare," which formerly brought 10 cents to 15 cents per pound, and now sells in the cleaned, partly prepared condition at 90 cents to \$1 per pound. Catfish and similar species, as well as eels and coarse fish generally, formerly little valued, are now in demand, bringing to the fisherman from \$750,000 to \$1,000,000 per annum.

**Fishing Bounty.**—For the encouragement of the Atlantic deep-sea fisheries a bounty system is carried out, the fund for which (\$4,490,882) was provided by the Halifax Award, 1877. The bounties paid annually to vessel-owners, vessel-fishermen and boat-fishermen amount to about \$160,000.

**Government Hatcheries.**—An important adjunct to the natural reproduction of fish aided by close seasons, size, limits, etc., is the artificial culture of fish. Sixty-four hatcheries are in operation. The output of fry in 1916 amounted to 1,624,924,254 and included Atlantic and Pacific salmon, lake trout, brook trout, whitefish, pickerel, or doré, lobsters, etc. Several of the provincial governments also aid in fish-culture to a limited extent.

**Scientific Stations.**—Three scientific bio-

logical stations are maintained by the government for the study and solution of fishery problems. One is situated at Saint Andrews, N. B., another at Georgian Bay, Lake Huron, and the other at Departure Bay, B. C. The staff at all three institutions consists of professors and specialists from Canadian universities.

#### Bait Freezers and Guano Works, etc.—

In order to meet the needs of deep-sea fishermen, who suffer much from irregular supplies of bait, the Canadian government assists in the building and maintenance of bait-freezers at convenient and suitable ports. The incursions of hordes of destructive dogfish and the injury to the fisheries resulting from the dumping of fish offal in the sea have moved the government to start fish waste reduction works at various localities on the coast. Under government management these works purchase dogfish, cod-heads, etc., and convert them into guano and fish oil.

#### Inspection and Branding of Pickled Fish.

—In June 1914, the Dominion government passed an act to provide for the inspection and branding of pickled fish, such as mackerel, herring, alewives and salmon. The object of the act is to bring into use a strong, well-made barrel of a standard size for marketing such fish in; also to raise the standard of curing and grading the fish, so that the cured article may secure the confidence of dealers and consumers at home and abroad and be traded in with advantage to the producer and dealer alike. A staff of competent inspectors carry out the provisions of the act, and if they find the fish cured and graded in accordance with the act, and packed in barrels that are of the standard size and make, a mark in the form of a crown is branded on the side of each barrel of fish so conforming to the act. The brand shows the grade and kind of fish contained in the barrel. It is expected that the pickled fish trade will be greatly extended and its value enhanced by means of this system of inspection.

**Inspection of Fish Canneries.**—A systematic inspection of all lobster, salmon and other fish canneries is maintained by officers of the Fisheries Department for the purpose of ensuring that the various kinds of fish and shell-fish are canned under proper sanitary conditions, and to prevent the canning of unsound fish.

**Fisheries Protection Vessels.**—A fleet of 45 vessels of various kinds patrols the Atlantic and Pacific coasts and the inland lakes for the protection and regulation of the fisheries.

**Central Administration.**—For the administration of fishery affairs a special government Department of Marine and Fisheries was created at Confederation (1867) under a minister of the Crown. A deputy minister and a large staff of inside and outside officials carry out the administrative duties which fall to the Federal authorities. Statistics of the quantities and kinds of fish landed in all parts of Canada are carefully collected by officials of the department and published first in the form of a monthly bulletin and afterward in the form of an annual detailed report. The Dominion expenditure on fisheries, including fisheries protection, amounts to nearly \$1,500,000 annually.

JOHN J. COWIE,  
Department of Marine and Fisheries, Ottawa.

**44. MANUFACTURES.** The 1911 census of Canada, which affords the latest comprehensive view of Canadian manufacturing, gave the total value of manufactured products in establishments employing five hands and over as \$1,165,975,639, and placed a value on the raw materials consumed in the manufacturing process at about half that amount. A postal census of manufactures for the year 1915 shows an annual production over \$240,000,000 in excess of the total above quoted. Compared with the beginning of the century, the latter figures reveal a growth of nearly three times in the value of products.\* They also effectively reveal the important place which manufacturing has come to occupy within the Canadian economic scheme. Only one other total, that of agriculture, vies with manufactures. From the billion dollars' worth of cereals and animals produced on Canadian farms in 1915 there are, of course, comparatively few deductions to be made an account of raw materials consumed, the allowing for which is one of the vexing problems of statistics of manufactures. It would apparently, however, be safe to say that the manufacturing industry of Canada contributes a new value approaching half a billion dollars annually to the production of the country, a total which places manufacturing an easy second to agriculture in the Canadian industrial organization.

Anything like a detailed description of manufacturing in Canada exceeds the intention of the present article. It may, however, be practicable to run over in a summary way the leading groups into which the industry may be divided. These divisions are necessarily somewhat arbitrary, but perhaps the best initial approach is from the standpoint of the primary extractive industries, whose products it is the function of the manufacturer to turn into the forms required for final use.†

**Food Production.**—First then with regard to manufactures using Canadian farm products as raw materials. The most important industry under this heading is flour and grist milling which had a production valued at \$114,483,924 in 1915, the larger mills being located at points strategic to the grain fields of Ontario and the West. Exports of flour in 1915-16 amounted to \$35,767,044 and of oatmeal to \$471,298. Bread and biscuit-making establishments reported a total product of \$40,772,216.

The butter and cheese factories of Canada yielded a product valued at about half that of the flour mills in 1915, a total which does not include farm-made produce. These are chiefly small establishments owned for the most part by associations of farmers. The majority are in Ontario and Quebec, though the Maritime provinces have a well-developed dairying industry, and rapid progress is being made in the West, where the provincial governments have in some cases operated the plants. Condensed milk factories yielded \$3,725,668 in 1915. Exports of butter, once a very heavy item, have decreased in recent years with the great increase in home consumption. Cheese

exports, however, have steadily increased, reaching a total in 1915-16 of \$26,690,500.

Against the live stock branch of farming may be placed a large meat-packing industry, the total product of which reached \$96,789,731 in 1915. Meat packing has increased very rapidly in Canada during the past few years, and there has also grown up an important wholesale fresh meat trade. The latter was practically non-existent in 1900. Soap making, which is usually subsidiary to meat packing, is not so in Canada; the product reached a value of \$6,445,939 in 1915. Leather making is more directly associated with live stock; the total Canadian product was valued at \$3,654,491 in 1915, most of it, however, from imported hides. The boot and shoe industry, based on the leather trade, had an output of \$34,064,696, the city of Quebec being the main manufacturing point. The harness and saddlery output accounted for \$8,739,278 more, and gloves and mitts for an additional \$1,899,092.

Fruit and vegetable canneries, located chiefly in southern and southwestern Ontario, reported a product of \$3,794,922 in 1915. Jams and jellies added over a million to this total, evaporated fruits and vinegar and pickles another million and a quarter each. Starch production exceeded \$2,600,000.

The Canadian fisheries (which it may be remarked in passing are potentially the most important in the world, both from the standpoint of area of fishing grounds and the abundance, variety and quality of the catch), are also the basis of a large manufacturing industry. The salmon canneries of British Columbia and the lobster canneries of the Maritime provinces are world famous. Altogether the value of preserved fish products in 1915 was about \$15,000,000. There is a large dried fish industry (domestic) in Nova Scotia, which, for two generations, has found its chief market in the West Indies. Factory production in the same district, however, is growing, and is beginning to enter into competition with Gloucester, Mass., and other centres of the cured fish trade. The future of Canada's status in this industry seems assured. See CANADA—FISHERIES (article 43).

The above includes the more important items of "food production," which is one of the stock grouping of manufactures. The chief omissions are the industries whose raw materials are imported into Canada, e.g., sugar. Eight sugar refineries are in operation in Canada, yielding in 1915 a product valued at \$37,752,235. Manufactures of cocoa and chocolate, coffee and spices, baking powder, etc., yield a product of \$10,278,000.

**Wood and Paper.**—The lumbering industry of Canada is one of its most historic and picturesque industries, and the unrivalled forest wealth which forms its background vouches for its continuance. It is also one of the most widely diffused of Canadian industries. Southwestern Nova Scotia is important for its saw-milling, though less so than the interior of New Brunswick tapped by the Saint John and Miramichi rivers. Northern Quebec, the Ottawa Valley, the Georgian Bay district and the territory north and west of Lakes Huron and Superior are the sources of an extensive lumber trade. Northern Saskatchewan and Manitoba have also important timber areas, though

\* The rise in prices accounts for perhaps one-third of this increase.

† The statistics which follow are quoted from the 1915 Postal Census of Manufactures. Where the war has produced somewhat abnormal conditions mention is made of the fact.

dwarfed by the wealth of British Columbia in this respect. The total product which these various sources yielded in sawn lumber, shingles and laths, reached a value of \$68,815,472 in 1915; this, however, was under war conditions, which were perhaps more depressing in the lumber trade than in any other branch of industry. In 1911, the output was almost exactly half again as large. Side by side with this initial working up of the raw material may be placed the manufacture of sashes and doors, blinds, boxes and similar products, the output of which in 1915 was over \$18,370,604. Cooperage added \$1,989,564. A higher grade of manufacture is represented by furniture, the value of which was well over \$9,765,339 in 1915; carriages and wagons with a somewhat higher value; musical instruments and materials with a value of \$4,500,000; and brooms and brushes with a value of \$1,378,828. Cars, car works and car repair shops reported a product of \$39,794,379.

Wood pulp and paper making may be treated in close connection with lumbering. The total output of both in 1915 was \$40,348,000. Paper bags and boxes manufactured in 1915 were valued at \$5,350,667, and stationery at \$3,306,545.

The printing and publishing trade is scarcely to be linked with the paper industry. It may, however, be noted here as well as elsewhere that the output of Canadian printing, book-binding and lithographing establishments in 1915 was valued at over \$33,000,000.

**Mineral Products.**—The manufactures which have mining for basis are very important in Canada. It is usual to group iron and steel production by itself. There are over 20 blast furnaces in Canada with a total daily capacity of, say, 4,500 tons. The value of the pig iron product in 1913, a high year, was \$16,540,000. Steel ingots and castings went over a million in the same year. Total smelter products (in which the above are included) were valued at \$102,000,000 in 1915. Some of the most extensive and distinctive Canadian industries are engaged in iron and steel manufacture, such as the Dominion Iron and Steel Company, the Nova Scotia Steel and Coal Company, the Algoma Steel Company, the Steel Company of Canada, the Canada Car and Foundry Company, etc. Based on the raw materials which these supply is a large and varied industry. Foundry products totalled over \$36,736,000 in value in 1915; electrical apparatus and supplies, \$18,108,241; iron and steel bridges, \$9,611,000; boilers and engines, \$8,546,488; brass castings, \$7,787,302; wire,

\$6,280,000; aluminum, \$4,071,000; plumbers' supplies, \$2,268,800; coke, \$4,416,000. Other great industries that may be regarded as in a way subsidiary to this branch are the automobile industry, the production of which with its accessories totalled over \$28,000,000 in 1915; and the agricultural implement industry with a total product of over \$13,370,000. The latter is perhaps the leading example of a Canadian industry having a market in practically every quarter of the globe.

Cement and cement products were valued at \$11,676,000 in 1915; brick and tile at \$2,931,575; paints and varnishes at \$3,373,746. The cut stone industry had a product of \$2,568,491. The glass product was valued at \$4,718,000, to which mirrors and plate glass added \$1,095,000.

**Textiles, Rubber, Liquors and Tobacco.**—There remain several groups of manufactures whose connection with the primary industries of the country is not so immediate. Among these is the textile industry. Canadian cotton mills had a product of \$20,512,909 in 1915; woolens a product of \$12,889,708; while silk and silk products aggregated \$1,277,044. The clothing industry associated with these raw materials is also very considerable. Men's and women's factory clothing was approximately \$41,000,000 in value; hosiery and knit goods over \$16,096,800; hats, caps and furs \$7,559,000; and carpets \$1,500,000. Dyeing and cleaning establishments valued their total contribution at \$3,986,670. The rubber industry approximated \$14,500,000 in value of product. Liquors and tobacco is a second important group of this kind. Distilled and malted liquors were produced in Canada to the value of \$30,756,000 in 1915, while manufactures of tobacco in all forms aggregated \$28,987,250. Tobacco growing has made rapid strides in Quebec and southwestern Ontario recently, and British Columbia is beginning to introduce the industry.

Summing up by provinces, approximately half of the Canadian manufacturing industry is in Ontario, and well over half of the remainder in Quebec. British Columbia stands third with about one-fifth the output of Quebec, while Nova Scotia and Manitoba follow close behind. Saskatchewan has a very slight manufacturing industry, though larger than Prince Edward Island, which stands lowest.

The accompanying tables, showing the number of establishments, number of employees and value of products in certain of the more important groups of manufactures and in the several provinces, will be of interest for purposes of more detailed reference.

The preceding brief review will serve to show the substantial status that has been achieved by manufacturing in Canada. Two remaining points may be touched upon. Apart from an abundance of raw material, the first requisite in manufacturing is cheap motive power. Canada is well supplied with bituminous coal. The fields of Nova Scotia are extensive, and are cheaply worked, and the product is accessible to Quebec and Montreal by water transportation. Ontario, however, is largely dependent for its coal on Pennsylvania, and in the west a long and difficult haul separates the exceedingly rich deposits of Vancouver Island and the Crow's Nest Pass from the prairie centres. In the other great power factor, however, that on which the future of manufacturing will more and more depend, viz., the "white coal" of water power—there is probably no other country in the world more fortunately endowed than Canada. Practically every large centre from coast to coast has abundance of water power available not only for present needs, but for all requirements within anticipation. Quebec and Montreal tap the resources of the Shawinigan and the Cedar Rapids of the Saint Lawrence; central and eastern Ontario the Trent Valley and the Ottawa; southwestern Ontario has the three great plants at Niagara Falls; Winnipeg the two large plants of the Winnipeg River; Calgary those of the Bow River; while Vancouver has developed the Coquitlam with its 400 feet of head. Altogether there are in Canada exclusive of the Northwest territories, the Yukon

and the northern and eastern portions of Quebec, approximately 17,750,000 horse power available, this amount including in the case of Niagara Falls and other border powers only the development permitted by international treaties, and excluding the possibilities of storage for the enlargement of present capacities. Of this, considerably less than one-tenth has as yet been developed—two-thirds of the development having been carried out only within the past 10 years. The "Hydro Electric Power Commission" of the Ontario government is perhaps the most extensive experiment in government ownership and operation of an important utility in Canada. In 1915 not less than 73 municipalities and 96,744 consumers were obtaining electric power through this body, whose investments in power development in the six preceding years reached a total of approximately \$25,000,000.

The labor factor may be mentioned briefly. A heavy immigration has in recent years maintained the labor supply, and though government encouragement is extended only to agriculturalists and domestic servants, the influx has included considerable numbers of skilled artisans. The census of occupations, 1911, credited 491,342 (98,561 female) "workers" to manufactures, the largest total outside of agriculture. These were further divided as follows: Mechanical 303,471; textiles 20,642; food 45,816; clothing 80,409; other factories 41,000. From the standpoint of organized labor, several of the most powerful unions are among employees of industrial establishments. In the metal

trades, 186 unions with a membership of 11,813 exist; in the boot and shoe and clothing trades, 59 unions with a membership of 4,966; and in the printing and allied trades, 91 unions with a membership of 6,614. These unions are "international," i.e., are part and parcel of the similar movement in the United States, though with a Dominion "Congress," which plays much the same rôle in Canada as the American Federation of Labor in the United States. There is a purely Canadian "Federation of Labor," but its following is small. The technical education of labor has made a substantial beginning in Canada and the country is alive to its importance. Its development was the subject of inquiry by a royal commission of seven members, appointed in 1910, who after two years' investigation brought in a comprehensive scheme for Dominion and provincial co-operation.

**Historical Sketch.**—The Canadian manufacturing industry may be said to have been born of the protective tariff of 1878. There were manufactures, of course, before that date. Iron working had been an industry in Quebec from the days of Frontenac, and the ship-building yards of New Brunswick were famous half a century ago the world over. Prior to Confederation, however, the greater opportunities and more imperative tasks of agriculture forced manufacturing into the background, and such industries as arose were small and catered to local markets. Flour mills and saw mills were the most numerous; tanning also was a flourishing industry. The woolen mills of Ontario in these early days were of considerable relative importance. In 1876, however, it was still possible for a captain of industry to declare that "there isn't a manufacturer of us all who has not come up from five dollars." To this phase the tariff of 1878, which banished the policy of "incidental protection" and aimed to found a well-rounded manufacturing industry, was the end. A notable expansion set in with 1879 and lasted until 1882, after which the general stagnation accompanying the fall of prices told unfavorably. The "national policy" (as the protective scheme of 1878 was styled) may, however, be said to have doubled the extent of the industry within about a decade. It was not until after the end of the century that a like forward movement was repeated. Throughout the nineties, in fact, manufacturing no more than held its own, employing fewer wage-earners and paying out less for labor, though showing a gain in capitalization and value of products. With the opening of the 20th century, however, this was rapidly overcome. Manufacturing within a decade nearly trebled its capitalization; increased the number of its employees by one-half; considerably more than doubled the amounts paid out in salaries and for raw materials, and increased the value of its product from \$481,053,375 to \$1,165,975,639. A strong tendency toward specialization and merger made itself felt after 1907, over 40 combinations having been made in the three years 1908, 1909 and 1910; it passed away, however, rather quickly, not having proved the success that was expected. The general expansion continued during 1911 and 1912, but sank back with 1913, being revived, though in a new direction, by the heavy orders for war materials that came from Europe shortly after the declaration of war in August

1914.\* In the remarkable story of expansion, therefore, which constitutes the history of Canada during the 20th century, and which had its basis in the opening up of the Canadian west to agriculture and the building of railways on an unprecedented scale as feeders of the new territory, manufacturing contributes one of the most important chapters. With the growth of western agriculture the claim of the Canadian manufacturer to special favors under the tariff has been challenged with more insistence than previously. Independently of fiscal policy, however, which has shown no tendency to fundamental change, it may be predicted with assurance that manufacturing will play an important rôle in Canadian development, and that in many lines of products Canada bids fair to become one of the world's growing sources of supply.

R. H. COATS,

*Dominion Statistician and Controller of Census,  
Ottawa.*

**45. WATER POWERS.** Some years ago the late T. C. Keefer, C.M.G., a distinguished Canadian engineer, in a presidential address before the Royal Society, described the water resources of Canada in the following words:

"An examination of any good map of our broad Dominion, reveals, as its most striking feature, an extraordinarily wealthy and remarkably uninterrupted succession of lakes and rivers, suggestive of ample rainfall, the first great requisite in the occupation of any country. Over a length of several thousand miles, between Labrador and Alaska, and over a width of several hundred miles, there is an almost continuous distribution of lakes, lakelets and rivers; the lakes of varied outlines, dimensions and elevations above sea-level, and many possessing facilities for the storage of their flood waters. In many places the outlet from the lake or the connection between a chain of lakes is a narrow cleft in rock where an inexpensive dam will hold back the water supplied by the winter's accumulation of snow."

These words were written shortly after the first successful transmission of high voltage electricity had opened a new era to water power, and they were designed to emphasize the fundamental advantages that Canada possessed under the new régime. Even in the days of the first Canadian settlers, however, when the harnessing of Niagara would have seemed the wildest of dreams, the earliest manufactures were prescribed by water power, and it was not until the late seventies that the water-driven saw mills and flour mills of Ontario ceased to occupy the premier place in the Canadian industrial scheme.

It would be easy, of course, to exaggerate the importance of water power and of Canada's wealth in that particular. Thus, though the Dominion has a water area of 125,755 square miles, as compared with only 52,630 square miles in the United States, many factors must be considered before such figures are taken at their face significance. The development of power is only one of many uses to which the water resources of the country may be put, and these uses include such important ones as navigation, irrigation and domestic and municipal supply. Moreover, water area is not the same as volume of water, and the volume of water is only one factor in water power, the other being hydraulic head, or the vertical distance through which the water falls.

Nevertheless the resources of Canada in

\* Up to 1 June 1917, the Imperial Munitions Board alone had forwarded war materials to the value of \$510,000,000 to the government of the United Kingdom from Canada.

this respect are so great as to make moderate statement difficult. Within the nine provinces of the Dominion, excluding the Northwest territories and the northern and eastern portions of Quebec, it is estimated that 17,746,000 horse power are available. Of this amount,—including in the case of Niagara Falls and other international streams only such development as is permitted by treaty, and taking no account of the increases that would be rendered possible by storage,—fully 8,000,000 horse power are readily available to present markets.

Not more than one-fifth of this latter total and less than 10 per cent of the whole has been developed up to the present. By provinces, the record is as follows:

	Developed horse power
Nova Scotia.....	21,412
New Brunswick.....	13,390
Prince Edward Island.....	500
Quebec.....	520,000
Ontario.....	789,466
Manitoba.....	56,730
Saskatchewan.....	45
Alberta.....	33,305
British Columbia.....	265,345
Yukon.....	12,000
Total.....	1,712,193

Of the above, about 75 per cent goes to the production of electrical energy, and over half the remainder to pulp and paper manufacture.

It is impossible within brief space to describe in any detail the progress that has been made in bringing this great asset into the service of the community. It will be of interest, however, to run over the several districts into which the country may be divided from this standpoint, noting in each the main developments and the promises that the future holds out.

**The Maritime Provinces.**—Coal, timber and fish rather than secondary production are the industries for which the Atlantic provinces are known. The land area is not extensive and it is so cut up by the sea that with one or two exceptions no large river systems exist, while the smaller streams are tidal for considerable distances inland. Offsets, however, are found in the heavy rainfall and in the dispersion of water power sites, most of the seaports, where industrial activity may be expected to increase, having water powers in close proximity. Upon the whole, therefore, the power equipment of these provinces is considered satisfactory for present and future needs, though the latter include the heavy demands represented by the smelting of iron ores on a large scale and a considerable steel industry. Existing developments are mainly of two types: Saw, pulp and paper mills, based on the timber resources of the country; and municipal lighting plants. A few woolen and grist mills driven by water are also found. New Brunswick to date has developed about 13,000 horse power, the largest plant being at Aroostook Falls, where 3,800 horse power is manufactured, for sale chiefly in the State of Maine. Nova Scotia has over 21,000 horse power developed, more than half for the manufacture of pulp and paper; gold mining employs 1,150 horse power in this province. The largest water power in the Maritime provinces and one of the largest sites in Canada is at Grand Falls on the Saint John River, where it is now proposed to instal 80,000 horse

power. The Nepisguit is another New Brunswick stream which offers 10,000 horse power for development. The Mersey River in south-western Nova Scotia has a potentiality of 30,000 horse power, of which only 4,250 is now in use.

**Quebec and Eastern Ontario.**—Coming to Quebec (where 75 per cent of all the power consumed is water power) and eastern Ontario, five groups of water powers—all part of or subsidiary to the Saint Lawrence River—may be distinguished. The first has the city of Quebec for centre. It comprises the Chaudière River to the south, the Montmorency and Saint Anne in the near vicinity (whose combined present development of 19,000 horse power operates the tramways and many of the factories of Quebec) and the Lake Saint John region to the north. On the Saguenay, the outlet of Lake Saint John, it is estimated that a continuous supply of 300,000 horse power can be obtained—a supply that could be doubled by storage—whereas on the rivers flowing into the lake several additional hundreds of thousands of horse power are available. The second group is that of the Saint Maurice, which joins the Saint Lawrence at Three Rivers, and which alone offers a potentiality of 650,000 horse power. Two very large plants are already installed; that of the Shawenegan Water and Power Company at Shawenegan Falls, where 155,000 horse power is produced for local manufactures and for Montreal, Three Rivers and other neighboring cities; and that of the Laurentide Company which controls the fall at Grande Mère, with its 300,000 horse power, 12 miles above Shawenegan, and which manufactures 250 tons of paper daily. At La Tuque, 103 miles from Three Rivers, is a third fall of 70 feet, capable of generating 75,000 horse power, of which only 3,500 is developed. A third group has Montreal, the commercial capital and outpost of Canada, for central market. In it are included the Cedar Rapids of the Saint Lawrence, which have a potentiality of 160,000 horse power, of which 90,000 is developed by one company and 20,000 by a second. Another 13,000 horse power is available for Montreal from the Soulages Canal, still another 13,000 from the Lachine Rapids, whilst Chambly on the Richelieu River contributes 20,000 horse power to this favorably situated metropolis. It is estimated that an additional 240,000 horse power can be developed for Montreal as the demand arises. The fourth group is that of the Ottawa Valley, on the Quebec tributaries of which several hundred thousands of horse power remain to be developed, the Gatineau alone having 225,000 horse power, none of it utilized. Further north and west on the Ontario side the Cobalt mines are supplied by the Northern Light and Power Company, who, in a single year, reduced the consumption of coal in the camp from 63,000 tons to 17,000 tons. On the Ottawa River itself 600,000 horse power would be rendered available by the canalizing of the river. Development, however, is at present confined to the large industries of Ottawa and Hull operating at the Chaudière Falls and consuming about 36,000 horse power. The rapids of the upper Saint Lawrence may be considered a fifth and last group in this area. They have been utilized only to a small extent for local purposes.

**Central and Southwestern Ontario.**—The Trent River system is the main supply of central, and Niagara Falls that of southwestern, Ontario. No event in the history of the subject has so appealed to the imagination as the harnessing of Niagara Falls and the employment of its gigantic energy to turn the factory wheels and light the streets and houses of the scores of towns and cities dotting the thickly populated area between Lakes Huron, Erie and Ontario. Under franchises granted by the province of Ontario 405,000 horse power is to be developed at Niagara Falls, 100,000 by the Canadian Niagara Power Company, 125,000 by the Electrical Development Company and 180,000 by the Ontario Power Company. Between 1905 and 1914, 369,000 of this was placed on the market, chiefly in the districts between Toronto and London. Linked with Niagara is the plant of the Dominion Power and Transmission Company at Decew Falls, where 57,000 horse power is developed by drawing water from the Welland Canal and carrying it over the Niagara escarpment, a development which renders possible the operation of an extensive system of radial and street railways in the Niagara Peninsula and lies at the basis of the rapid industrial development of the city of Hamilton. Another international power is that at Sault Sainte Marie, where the Algoma Steel Company and allied industries have developed 17,000 horse power. Returning to the Trent system, about 75,000 horse power is there rendered available by the construction of the canal; of this 45,000 horse power is already in use, the Electrical Power Company having seven plants and supplying a wide territory. The deforestation of southern Ontario and consequent alteration of the regimen of the rivers has greatly reduced the power potentialities of the province.

**New Ontario.**—The northern and western portions of Ontario are rich in water powers. Of developed works, that of the Canadian Copper Company at Spanish River (10,000 horse power) and that of the Kaministiquia Power Company at Kakabeka Falls near Port Arthur and Fort William (15,500 horse power) are the most important. The Lake Nipigon region and the rivers flowing into James Bay offer perhaps 2,000,000 horse power for future development, only a few thousands being now in use.

**The Prairie Provinces.**—The two chief developments in the prairie sections of Canada are those on the Winnipeg River, which supply Winnipeg with power, and those on the Bow River, acting as feeders to Calgary. The Winnipeg municipal plant and the Winnipeg Electric Railway Company's plant on the former aggregate a turbine capacity of 79,700 horse power, but this is only a fraction of the total capacity of the river. On the Bow River, the three plants now installed at Eau Claire, Horseshoe Falls and Kananaskis Falls, respectively, yield altogether over 32,000 horse power. The above, however, are merely the first beginnings of power development in western Canada. The North and South Saskatchewan have several important power sites, while the Nelson, with one of the principal drainage areas of the continent, has been estimated to offer no less than 2,500,000 horse power, there being 19 power sites on it, each of which would produce from 75,000 to 235,000 horse power. The Churchill, the Athabaska and the Peace are likewise

rivers of great potentialities. For the moment, however, these, like the Nelson, lie beyond reach of a market.

**British Columbia.**—The "sea of mountains" which constitutes the interior, and the heavy precipitation of a mild and equable climate, makes British Columbia a country of numerous lakes, large and rapid rivers and abundant water powers. The latter early attracted attention. The first development was made 18 years ago at Bonnington Falls on the Kootenay, where 23,000 horse power is now available for the important mining and smelting industries of Rossland and Trail. About the same time the British Columbia Electric Railway Company developed the Goldstream plant on Vancouver Island; but this has been completely eclipsed by the later plants of the same company at Lake Buntzen on Burrard Inlet (being the largest in the province with 84,500 horse power), and at Jordan River on Vancouver Island (25,000 horse power). Other large British Columbia plants are those of the Northwestern Canada Power Company at Stave Lake (26,000 horse power) and of the Powell River Company, Limited, at Powell River, the latter a newsprint establishment generating 24,000 horse power. Altogether over 265,000 horse power has been developed, but it is estimated that there are nearly three times that amount available within market distance of Vancouver and Victoria alone.

The foregoing rapid sketch will serve to show the importance both present and to come of the water power resources of the Dominion. Next to their great extent—Canada in this respect standing second only to the United States, and higher than any other country in the world except Norway on a per capita basis—their proximity to leading centres of population will have been apparent. All across the continent the great cities of Canada have at their disposal an enormous supply of the power which is so essential to their future as industrial centres. Another feature which it has been possible to mention only incidentally is the rapidity of the strides with which Canada is now entering upon her inheritance. Of the total horse power at present in use not less than two-thirds have been developed within the past 10 years, whilst a quarter of a century ago it may be said that the present development had not even been begun.

As an evidence of the awakening of public opinion on the importance of water power, reference may be made to the organization of the Hydro-Electric Power Commission of Ontario, whose operations represent the largest effort in Canada in the way of public administration of a national utility. The Commission was created in 1906, largely upon the report of a previous royal commission of inquiry into the possibilities of Niagara power. Public sentiment had become aroused through fear that the only great source of hydraulic power for southwestern Ontario might be exploited in private interests. The Hydro-Electric Commission began by conducting an extensive series of investigations under direct governmental auspices into the power resources of the province. The next step was the vesting of the Commission with powers of administration, under which it at once contracted for supplies of power at Niagara and elsewhere, and consti-

tuted itself a great transmission and supplying agency. Within four years over 1,000 miles of transmission lines and over 1,500 miles of telephone lines had been constructed. In 1915, the Commission was supplying 73 municipalities, and its distribution of power from Niagara alone amounted to 63,500 horse power, the number of consumers reaching nearly to 100,000. The investment by the Commission and its customers to date approximates \$24,500,000. The outlook is that within a few years these totals will be largely exceeded.

For official information regarding water powers in Canada, application may be made to the water powers branch of the Department of the Interior of the Dominion government, which exercises jurisdiction in the provinces of Manitoba, Saskatchewan, Alberta and in the unorganized territories of Canada. For the provinces, the following officers are in control: Nova Scotia: the secretary of the Nova Scotia Water Power Commission, Halifax, N. S.; New Brunswick: The surveyor-general of New Brunswick, Fredericton, N. B.; Quebec: The chief engineer, hydraulic service, Department of Lands and Forests, Quebec, Quebec; Ontario: The Deputy Minister of Lands, Forests and Mines, Toronto, Ontario; also, the secretary of the Hydro-Electric Power Commission of Ontario, Toronto, Ontario; British Columbia: The comptroller of water rights, Victoria, B. C.

R. H. COATS,

*Dominion Statistician and Controller of Census.*

**46. COMMERCE, TARIFFS AND TRANSPORTATION. Early Trade Relations.**—In their earlier condition the various provinces of British North America, now forming the Dominion of Canada, were all alike subject to those general laws which embodied the principles, if not always the practice, of the British colonial system. Owing, however, to variations in location, natural resources and the character of the inhabitants, the commerce and tariffs of the various provinces were more or less adapted to their special conditions.

Before the conquest of Canada the Maritime provinces, under the general name of Nova Scotia, were valued as a market for British goods and as a field for the furnishing of naval supplies, chiefly sailors, fish and timber. Nova Scotia's trade was almost entirely developed in connection with New England and the West Indies. Trade with French Canada was illegal, on both sides, and for the most part unprofitable, except for furs in exchange for British manufactures. It was but natural, therefore, that after the conquest of Canada and the independence of the United States, Nova Scotia should still continue to trade chiefly with the New England States and the West Indies, and only to a limited extent with Canada.

Owing to their extensive coast line and numerous harbors, New Brunswick being also well supplied with river navigation, the question of transportation was long a simple one for the Maritime provinces. For Canada, the Saint Lawrence and its tributaries had always furnished the great highway of the country. But above Montreal the river was greatly obstructed by rapids, hence the trade to the West was first developed along the easier Ottawa route, which passed by way of Lake Nipissing to the

Georgian Bay. There it followed the sheltered northern channel and the Saint Mary River, with a portage at Sault Sainte Marie, up to Lake Superior, and on, by numerous lakes and streams, to the vast Indian country beyond.

The coming of the Loyalists, the first settlers in what is now the province of Ontario, rendered necessary a regular traffic up the Saint Lawrence and along the lower lakes. From Montreal to Prescott and Kingston this traffic was carried on by means of various forms of large flat-bottomed boats, known as bateaux, which were towed up the rapids, later with the aid of horses. These bateaux brought up limited supplies of European imports, chiefly British goods, and took down the furs and, so far as their space would allow, the potash and flour of the Western settlements. The Revolutionary War had led to the building of the first British vessels on the lakes. After the peace, several of these became trading vessels and others were built, the number steadily increasing with the growth of the Canadian and American settlements on either side of the lakes. The presence of lake vessels diverted the greater part of the Indian trade from the northern to the southern route.

At first most of the surplus produce of the Western settlements found a ready local market in supplying the temporary needs of new settlers, and in furnishing provisions for the Indian posts and the British garrisons. With increasing crops, however, there soon arose a necessity for export, especially of such articles as wheat, flour, peas, salt meat and various minor provisions. About the beginning of the 19th century the amount of provisions produced in western Canada was nearly equivalent to the amount purchased by the British government for consumption at the garrisons and posts. In 1801 the total exports of Canada amounted to \$4,800,000. This growing trade required a more extensive and economical means of conveyance than that afforded by the bateaux. A trade in staves and various forms of timber having developed about the same time, and being sent to market in the shape of rafts, these were utilized to convey such provisions as might suffer a little exposure. Large square scows were also built for the purpose of taking provisions to market in bulk.

As regards tariffs and trade regulations in the earlier Colonial period, nothing was left to the provincial authorities; all was regulated by British statutes and administered by Imperial officers. In the matter of taxation, after the American Revolution the British North American colonies had little to complain of, for instead of being taxed to assist Britain the British people were taxed to assist the colonies. In return for her freedom to determine the commercial policy of the colonies and to appoint their officials, Britain had to meet their deficits, besides furnishing the whole of the naval and military services.

The first important change in Colonial commercial relations resulted from the recognition of the independence of the United States in 1783. Pitt and Shelburne had desired to continue practically the same commercial relations with the late colonies after the separation as had existed before it, considering that political independence did not alter the value of a profitable mutual trade. Technically, however, such

a policy would do violence to the whole commercial and colonial system, including the Navigation Acts,—the system of “ships, colonies and commerce,” upon which the whole British empire was supposed to rest—and this could not be permitted.

Canadians were for a long time too completely absorbed in questions connected with the control of their internal affairs to be much concerned with the fiscal policy of the country. Indeed they rather looked upon Britain's control of the fiscal policy as a means of obtaining increasing assistance from the mother country. The earlier tariffs were simple affairs, the revenue being derived chiefly from duties on spirituous liquors and the molasses from which rum was distilled. The sweeping prohibitions of the Navigation Acts simplified matters very much. There was no trouble with foreign European goods, because they were forbidden to be admitted to the colonies even in British ships, except when they had passed through British ports. It was in Britain, therefore, that the tariff dealt with them and qualified them for entrance to the colonies. In the matter of spirits and such things as were dealt with in colonial tariffs, a variety of preferential duties favored the more as against the less direct trade with Britain and the colonies. After the granting of representative legislatures in the colonies (1791 in Canada) they were permitted to impose customs duties on imports, for revenue purposes only. The right of disallowance exercised by the Crown prevented any unfavorable treatment of British goods.

By the Act of 1778 the British Parliament maintained and freely exercised the right to regulate, by tariff or other restrictions, the commerce of the colonies, but explicitly stated that all revenue incidentally obtained, after paying the expenses of its collection, should go to the treasury of the colony in which it was collected. There was thus a double jurisdiction in the matter of tariffs, the Imperial and the colonial. But, so far as the colonial and Imperial tariffs covered the same ground, only the colonial tariff was enforced. The Imperial tariff applied only where its rate of duty exceeded that of the colonial. The colonial tariff looked only to revenue; the Imperial tariff to the regulation of commerce in the interests of Imperial trade.

The first legally recognized trade between the United States and Canada was provided for in the Quebec Ordinances of 1787-88, which permitted the free export of all goods except furs and peltries, and the import of all forms of timber and naval stores, all kinds of grain and other natural products, and settlers' effects. Rum, spirits and manufactured goods were entirely prohibited, but in 1790 pig iron was added to the list of permissible imports. Pitt's commercial treaty with the United States in 1794 greatly promoted trade between the British American provinces and that country. In this he partly realized his earlier idea of permitting a free mutual trade in all ordinary goods between the United States and the British colonies. But, in deference to the Navigation Acts, so far as the trade was conducted by sea, it must be in British ships. A direct trade to the East Indies was also permitted to the United States. Later this led to several important relaxations of the British colonial policy.

The trade relations of the Maritime prov-

inces, as we have seen, were well established before the United States secured its independence, but, while the United States enjoyed great freedom of trade with all countries, the Maritime provinces still remained under the close restrictions of the Navigation Acts and the colonial system. Thus general merchandise, even British and East Indian goods, was cheaper in the United States than in the British American ports. As a natural result there was extensive smuggling along the coasts of Nova Scotia and New Brunswick, and especially among the islands of Passamaquoddy Bay. American vessels supplied the colonists with liquor, tea, tobacco, molasses and other East and West Indian produce, and the chief lines of European and American goods. They received in return furs, fish, lumber, grain, etc., which they carried to their own ports and to the West Indies. Thus the restrictions designed to give Britain a monopoly of the colonial trade and shipping worked to the opposite purpose. Plainly the system had either to be given up or enforced by quite drastic measures. On the death of Pitt the latter policy was adopted, beginning with the Orders in Council, which in turn induced the non-intercourse policy of the United States, and ultimately the War of 1812-15.

While disastrous to the West Indies and most injurious to Great Britain, yet the troubles between Britain and the United States were immensely profitable, for the time being, to the British North American colonies. To ensure the carrying of the West Indian supplies in British ships, American produce was collected in ports of the Maritime provinces and in Canada, where it might be taken by sea in either American or British vessels, by overland transport or by inland navigation. This stimulated the trade and shipping of the Canadian and Maritime provinces and enriched the colonial produce dealers. The ultimate benefit, however, of these and later abnormal conditions was more than doubtful. After the Peace of 1815, Canada suffered a severe reaction, emphasized by an unfortunate land and immigration policy.

The enormous preference in the British market on British North American timber, which had been built up during the Napoleonic wars, was retained and developed because it enriched British shipowners and timber merchants. By the new Corn Law of 1815 a preference was granted to Canadian grain, but it was very uncertain in its operation, since the grain was not admitted at all until the price had risen to quite a high level, in the case of wheat to about \$2.10 a bushel.

The international restrictions necessary to preserve a fair equality for British shipping, under the disadvantages of her colonial system, involved further trouble with the United States. Britain admitted a reciprocal shipping trade between the home country and the United States, and between her colonial possessions and the United States in the inland waters of North America, but denied corresponding reciprocity by sea between the United States and her American colonial possessions. In 1818 the United States retaliated, and direct trade with the West Indies was again suspended. Halifax in Nova Scotia and Saint John in New Brunswick were then made free ports for American vessels bringing certain lines of goods necessary for

the supply of the West Indies. In 1823 American vessels were admitted to the colonial trade generally, for all direct dealings between the United States and the colonies. Once more the trade of the Saint Lawrence languished, and complaints poured in upon the home government.

In 1825 Mr. Huskisson, who had revived the policy of Pitt, sought to promote freer trade in America. But he found it impossible as yet to grant perfect reciprocity in shipping. Differential duties were imposed in favor of British shipping in the trade between the United States and the West Indies. The Americans applied the same differentials on their side, and there resulted another period of non-intercourse, from 1826 to 1831, with corresponding activity and prosperity for the Saint Lawrence route and the British North American ports. By admitting to the colonies provisions from the northern nations of Europe in their own ships, Huskisson managed to prevent the Americans from forcing his hand. They came to terms in 1831 and normal trade was once more resumed. But by this time the Colonial System was badly shattered, and almost the only thing left of the Navigation Acts was the British monopoly of the domestic shipping of the empire. The way was being gradually prepared for the final stroke of colonial economic emancipation.

In 1825 Huskisson weakened the corn laws by greatly increasing the preference on Canadian wheat. Regardless of the local price, Canadian wheat was to be admitted at a uniform duty of five shillings per quarter. For a time the exports of wheat were greatly stimulated, but the benefit was not permanent, and the cry for additional preferences was soon resumed.

The prosperous period of 1826-31, augmented by large expenditures on Canadian public works and an increased emigration, continued for a couple of years after the resumption of normal relations with the United States. But trade depression and political troubles brought Canada to a very low ebb in 1837-38. In 1841 the two Canadian provinces were united, and their political freedom was greatly enlarged and trade revived.

In 1843, after urgent petitions, which more or less coincided with the rising demand in Britain for free food, Canada obtained the ominously liberal concession of access to the British market, at the nominal rate of one shilling per quarter, for all the flour she could grind from her own, or imported American wheat, while the corn laws still stood against the rest of the world. Bad harvests and higher prices in Britain tended to enrich the Canadian merchants and millers, but precipitated the repeal of the corn laws in 1846, and the adoption of a free trade policy generally.

Free trade carried with it important changes for Canadian commerce, tariffs and transportation. The preference on Canadian grain had gone, and the preference on British North American timber soon followed. In 1847 Britain renounced the right to regulate Canadian trade, and in 1849, by the final repeal of the Navigation Acts, she gave up her monopoly of the domestic carrying trade of the empire. The general result was that the colonies were left to face the world on much the same terms as other countries. Though lacking in the experience which breeds prudence, those interests which

had not been specially pampered entered upon their new career with much zest and enterprise, tending sometimes to rashness.

**Canal Building.**—At this stage questions of transportation began to be of vital importance to Canada. After the War of 1812 attention had been directed to the necessity for improving the Saint Lawrence route between Montreal and the lakes. A canal to surmount the Lachine Rapids had long been talked of and even abortively attempted. Finally, in 1821, the work was seriously undertaken by the government of Lower Canada, and completed in 1825. This was the year of the opening of the Erie Canal, which, coming at the beginning of a decade of unusual expansion and prosperity for the lake regions, proved a phenomenal success, commercially and financially. This gave an immense impetus to canal building in Canada and the United States. Canals, instead of building public debts, were to abolish them and support States and provinces without taxation. See CANALS.

In 1824 the Welland Canal was undertaken by a joint stock company with a capital of only \$150,000, mostly subscribed in the United States. After many vicissitudes and appeals for both Imperial and provincial assistance, it was opened for traffic in 1832. The locks were of wood, 100 x 22 feet with 7 feet of water. However, neither the Lachine nor the Welland Canal could be of much more than local importance until the remaining Saint Lawrence rapids were surmounted. This task the Imperial government was prevailed upon to undertake. But, in doing so, it disregarded all commercial considerations and followed a short-sighted but very round-about military idea. The Rideau Canal was the result, extending from Kingston to Ottawa, which was afterward connected with Montreal by improvements of the Ottawa River navigation. The locks as constructed were 134 x 33 feet with 5 feet of water. It was opened in 1832 and cost the Imperial government about \$4,000,000, or between six and seven times the original estimate. Though of necessity carrying considerable traffic, it soon proved that it was not to be a commercial success, since it could not compete with the Erie Canal and did not even supersede the bateaux on the Saint Lawrence. The Upper Canadian legislature determined to complete the Saint Lawrence system and the Cornwall Canal was begun in 1834. But the financial crisis and political troubles of 1837 suspended operations.

The union of the provinces in 1841 brought with it an Imperial guaranteed loan for \$7,500,000, with which to complete the public works already planned and partly undertaken. The Welland Canal was taken over by the government and reconstructed. The new locks were 150 x 45 feet, with 9 feet of water, afterward increased to 10½ feet. These were smaller than the locks of the Cornwall Canal, which were 200 x 45 with 9 feet of water. The latter was opened in 1843. The Beauharnois and Williamsburg canals completed the Saint Lawrence system. They were built on the same scale as the Cornwall Canal, and the last lock was opened in 1847. The completing of these canals necessitated the enlargement of the Lachine on the same scale, which was completed in 1848. Thus, in 1849, after the expenditure

of upward of \$20,000,000, the new Canadian canal system was prepared to accommodate vessels drawing nine feet of water, and Canada expected to realize her eagerly awaited control of the growing traffic of the great basin of the lakes.

But many changes in commerce and transportation had taken place between the opening of the Erie Canal and the opening of the Saint Lawrence system. The British protective and colonial system had been abandoned, and grain from the ports of the United States entered Britain as freely as from those of Canada. Moreover, railways were transforming the carrying trade, making time and continuous service essential features in commerce. While the Canadians were preparing their canals to capture the American carrying trade of the West, the American government was induced, in 1846, to establish the drawback or bonding system. This enabled the American railroads and other transportation companies to make a successful bid for a large share of the western Canadian carrying trade to Atlantic ports. Finally, though after 1849 western produce could be landed at Canadian seaports much more cheaply than at American ports, yet this advantage was lost through higher ocean freights and higher insurance from Canadian ports. The total suspension of shipping for half the year also discounted the natural advantages of the Canadian route, especially in competition with the railroads.

Nothing daunted, the Canadians with their new energy and self-reliance grappled with the changed conditions. On the one hand the government undertook the improvement of the navigation of the Saint Lawrence below Montreal, especially by deepening the channel of the river. The depth of 11½ feet at the time was increased to 18½ by 1860, and has since been increased to 27½ feet as far as Montreal. The navigation of the gulf was also improved.

About 1850 the ocean steamer was rapidly replacing the sailing vessel. The Cunard line of steamers, running to New York and Boston, was subsidized by the British government, doubtless a profitable venture for Britain, but appearing to Canadians as an additional handicap for the Saint Lawrence route. Canada was constrained to subsidize a line of its own,—the Allan — for weekly service, at an annual cost to the country of \$225,000.

The American boom in railroad building, and railroad activity, convinced the Canadians that they must have railroads to supplement their canals. They desired independent winter outlets on the Atlantic, and connection with American markets to which the attention of Canada was now turning. While absorbed in their canals the Canadians had given little practical attention to railroads. Hence, before 1840 only 16 miles of railroad had been built, connecting Montreal with Saint John's on the Champlain route to New York. Much discussion took place and many charters were obtained during the forties, but little of a serious nature was attempted. In 1849 the Canadian government, chiefly under the influence of Mr. (afterward Sir) Francis Hincks, adopted a vigorous railroad policy by undertaking to guarantee 6 per cent interest on a sum not to exceed half the cost of any railroad of not less than 70 miles in length. Among the first lines to be

undertaken was the Saint Lawrence and Atlantic, connecting Montreal with Portland, and opened in 1853. In western Canada the Northern Railway, from Toronto to Collingwood, was the first to be built, being begun in 1850 and opened in 1853. The Great Western Railway, between Niagara and Detroit, was the next to be undertaken, and was opened in 1854. Under the fostering direction of Mr. Hincks, the Grand Trunk Railroad was chartered in 1852, as the great central line of Canada. In 1853 it leased the Saint Lawrence and Atlantic, and when, in 1856, the main line was opened from Toronto to Montreal, the chief commercial districts of Canada were connected with the Atlantic by a Canadian line.

The railroad boom lasted from 1849 to 1857, involving an immense outlay of capital, chiefly British. Both the central government and the municipalities were deeply pledged in support of the numerous lines undertaken. The crisis of 1857 brought the movement to a close, and the pecuniary embarrassments of most of the lines effectively discouraged further railroad enterprises for the next 10 years. In Nova Scotia and New Brunswick large projects were also afoot to connect Halifax and Saint John with the New England States, and also with Canada. But, beyond small sections of these plans, chiefly for local traffic, little was accomplished before Confederation. The general situation is reflected in the following figures. In 1840 there were in the British North American provinces 16 miles of railroad; in 1850, 66 miles; in 1860, 2,065 miles, and in 1870, 2,617 miles.

**Tariffs and Expansion of Trade.**—With regard to tariffs, the central feature of the period between 1850 and Confederation, in 1867, was the Reciprocity Treaty with the United States, signed in 1854 and abrogated in 1866. It established reciprocal free trade between the British North American provinces and the United States, in all natural products. This secured free entry to the United States for practically everything which the British provinces had to sell. (See CANADA — RECIPROCITY WITH THE UNITED STATES). The special attraction for the United States was the freedom of access to the Canadian fisheries (q.v.); though the Americans also enjoyed large local markets for agricultural products in many parts of the eastern provinces. According to the statistics of trade, Canada appeared to have the best of the bargain. But the statistics require interpretation. Much of the Canadian export to the United States was really only a transit trade; either the same goods, or their equivalent, being shipped from Atlantic ports. Again, between 1854 and 1858 the decline in the amount of manufactures imported from the United States was due to the financial crisis of 1857 and the cessation of public works in Canada. Then, during the Civil War the United States was extensively purchasing supplies, and had little to sell. The Canadians themselves have been greatly deceived by the figures of the reciprocity period, and imagined that a like result would flow from the renewal of reciprocal trade.

The other feature of importance in this period was the increase in the Canadian tariff on manufactured goods, in 1858 and 1859. Owing to the large public debt contracted for the building of the canals, the interest on which was not

offset by tolls as expected, and, more immediately, owing to the great obligations incurred in guaranteeing railroad investments, the Canadian government was in great financial straits after 1856 and was therefore forced to seek a larger revenue. Accordingly, in 1858 the tariff on imports was raised the general rate being increased from about 12½ to 15 per cent, and in 1859 it was still further increased to 20 per cent. The British merchants and manufacturers vigorously protested against such an increase of duties on the goods of the mother country, and the manufacturers of the United States considered the increase of duties a breach of faith, inasmuch as they had expected their advantage from reciprocity to come from the sale of manufactured goods. The Canadian government replied that its sole object was to relieve its financial obligations, not to check imports.

The abrogation of the Reciprocity Treaty in 1866 produced a strong effect upon the British North American provinces and undoubtedly precipitated Confederation. The Canadian tariff of 1866 was lowered to a 15 per cent standard, as a concession to the freer trade leanings of the Maritime provinces, and became the first tariff of the Canadian Dominion. Canada retained the general principles of a tariff for revenue until, in common with other countries, she suffered from the world-wide depression of 1875-78. An effort was made to secure the renewal of the Reciprocity Treaty. This failed, however, and a change of government took place on a promise of relief by means of a protective tariff. This new tariff of 1879 raised the general standard of duties from 17½ to 20 per cent. Times revived throughout the world and the relief promised actually came. The tariff, however, did not prevent the country from suffering with all others during the next period of depression, from 1884 to 1886, though the tariff had been raised somewhat in the interval. Nor did the country escape during the next depression, from 1894-96, when another change of government took place after a general election. The Liberal party being more or less pledged to a reduction of duties, found this more difficult to accomplish than to promise. In 1897, however, the tariff was considerably amended in the interest of the consumer, and the happy expedient was devised of offering to the world at large a reduction of 25 per cent on the general tariff, wherever Canada was treated with equal favor. As Britain was practically the only important country fulfilling these universal conditions, the policy which was entered upon as a redemption of the party pledge ended in the preferential treatment of British goods only. This limitation was explicitly recognized in 1900, when the preference on British imports was increased to 33½ per cent. Since, for various reasons, Canadian imports from Britain were declining, relatively at least, this concession did not adversely affect important Canadian industries except in the department of textiles. Accordingly in 1904 this part of the preferential tariff was amended and the duties were raised. At the same time a new principle of maximum and minimum tariffs was outlined for the future.

For a decade and a half after 1897 a steady tide of population and capital set in toward Canada. In a new region such as the virgin plains of western Canada, the new and exten-

sive employment of labor and capital resulted in the most obvious prosperity and radical changes on the face of nature. In planting the wilderness with the homes and busy trade centres of men, a lively market was created for all manner of wares for construction and consumption. Even the wilderness itself soon came to have a highly speculative value, whether in the gross, as prospective farms, or in detail as metropolitan city lots estimated at so much per foot. Thus the investment of one dollar in actual capital called into existence several other dollars of prospective value, and the real and imaginary were exchanged indiscriminately.

Again, the building of modern railroads into unexploited territory is like the letting out of water upon the thirsty earth. Even in the process of construction they irrigate the country with millions of wealth, producing large harvests of profit for contractors and the purveyors of supplies. They afford markets for armies of workmen, and for all manner of machinery, implements and materials of construction and equipment. When completed these agencies of transportation open the wilderness to the home seeker, who, merely as home builder, furnishes them with employment for years, and, as town and city builders, for decades. Soon the speedy returns from agricultural industry furnish the railroads with traffic; alike in the export of bountiful harvests and the import of the implements with which they are to be increased, and the myriad of miscellaneous supplies which the ingenuity of the modern trader brings to the door of the settler with actual or prospective crop returns.

All these features were strikingly realized in Canada between the years 1897 and 1913 and may be illustrated by some typical concrete facts. The immigration from the adjoining agricultural and industrial regions of the United States was very marked during this period. The annual immigration from the United States was but little over 2,000 in 1897 but it rose to 139,000 in 1913. During the same period, the annual immigration from Britain increased from 11,000 in 1897 to 150,000 in 1913. The total annual immigration from all countries increased from 21,000 in 1897 to 402,000 in 1913. The British immigrants as a rule preferred settlement in the towns, while the American settlers preferred the farms, thus indicating the life to which the respective immigrants had been accustomed before coming to Canada.

The natural effect of the modern tendency toward highly specialized production, as applicable to agriculture as to other industries, has enhanced the activities of urban life and reduced proportionately the occupations of rural life. Agricultural machinery and the supplies for the farmers' homes are now chiefly produced in the cities. The rural population of Canada, which amounted to 63 per cent in 1901, fell to 55 per cent in 1911. This decline was marked in all the older parts of the country and even in southern and central Manitoba where the earliest settlements had been made in the West.

The trade of Canada no less than its population testified, not only to the rapidity of the development of the country between 1897 and 1913, but to the fact that this was largely due

to the influx of immense volumes of foreign capital, which came almost entirely in the shape of goods and not in the form of money. Thus the total trade of the country, which had stagnated from 1875 to 1895, having increased barely 12 per cent in those 20 years, rose from \$224,000,000 in 1895 to \$550,000,000 in 1906. In another eight years it had increased to \$1,129,000,000, in 1914. It then fell off some \$9,000,000 during the first year of the war, but, under the stimulus of war expenditure and munition supplies, rose to \$1,447,000,000 in 1916.

Under the influence of the capital investment already referred to, the imports of the country rose much faster during the period of expansion than did the exports. Thus at the beginning of the period of expansion in 1897, the exports of the country exceeded the imports by \$18,000,000 on a total trade of \$257,000,000. But by 1906 the imports had already exceeded the exports to the extent of \$37,000,000, and in 1913 the exports had reached an excess of \$298,000,000. These excesses were completely offset by borrowings abroad, much the greater part being obtained in the London market. With the rapid falling off in 1913-14 in the supply of borrowed capital, with a corresponding reduction in capital expenditure, there was a severe shrinkage in importation and a corresponding liberation for export of much Canadian produce hitherto purchased for use in the country itself. This transition was greatly emphasized during the first year of the war, when British capital was practically entirely cut off for all but military service.

This sharp reversal of the movement of the previous decade immediately revealed itself in the trade statistics of the country. The surplus of imports of \$298,000,000 in 1913 was reduced to \$171,000,000 in 1914, was further reduced to \$26,000,000 in 1915 and in 1916 was converted into a surplus of exports of \$149,000,000. In the trade returns for the last two years, the export and import of bullion has been eliminated as it was abnormally influenced by financial arrangements between Great Britain and the United States with which Canada had no special concern.

Britain and the United States have continued throughout to be the all-important factors in Canadian foreign trade. Thus Britain is the chief market for Canadian exports, while the United States furnishes the chief source of supply for Canadian imports. The Canadian trade with all other countries combined makes but a relatively small showing in comparison with the trade carried on with either of these two countries. In the decade between 1904 and 1914, out of a total of \$2,892,000,000 of exports, Great Britain took \$1,447,000,000 and the United States \$1,157,000,000, leaving only \$287,000,000 as taken by all other countries, including the other sections of the British empire. During the same period Canada imported for home consumption a total of \$4,160,000,000, of which the United States furnished \$2,601,000,000, and Great Britain \$952,000,000, leaving only \$605,000,000 as supplied by all other countries, whether within or without the British empire.

Such being the case, the tariff relations between Canada and her two chief customers, Great Britain and the United States, are of chief interest in this field. Until the outbreak of the European War, however, few changes

were made in the tariffs applicable to these two countries. Treaties had been negotiated with several of the British West Indian Islands on the basis of mutual preference. As already indicated, however, for the past century and more, many attempts have been made to break the natural trade relations originally established between the West Indies and the Atlantic States when they were British colonies. The British island colonies on the Atlantic Coast are loath to invite unfavorable tariff treatment from the United States by granting special favors to Canadian trade. Hence, while some of the smaller islands accepted the Canadian offer, the larger colonies of Newfoundland, Bermuda, Jamaica and British Honduras declined to respond to the Canadian preference extended to them for three years from 1912.

On the other hand, as regards Canadian tariff relations with the United States, the situation for Canada has considerably improved since the opening of the century. On the one hand, Canadian products have been coming ever more fully into world markets; while, on the other, the increasing population and industries of the United States have rendered the Canadian supplies of raw materials and food products a matter of undoubtedly increasing importance. Further, the Canadian market for American raw material such as coal, cotton, corn, etc., and for many important lines of manufactured goods has been steadily increasing. These changing relations naturally affected the traditional attitudes of the respective countries toward the perennial question of reciprocity. The discussion of this question was renewed in 1910, and, after considerable negotiation, centring around the higher and lower schedules of the Payne-Aldrich tariff, there emerged the reciprocity agreement of 1911, which followed fairly closely the previous treaty of 1854. The new treaty was passed by the United States Congress in July 1911, but was successfully blocked by the opposition in the Canadian House of Commons in the expiring days of the parliamentary term of 1911. The general election which necessarily followed largely turned on this issue, and revealed the strength of the growing Canadian sentiment in favor of maintaining not only political but commercial independence. The existing government was defeated in the election of September 1911. In consequence the treaty was not confirmed and the tariff relations between the two countries remained upon the basis of the ordinary tariff legislation of each country.

Such modifications as have been made in the general Canadian tariff since 1911 have been due to special local interests. The changes introduced since the outbreak of the war have been determined almost entirely on revenue grounds and will be dealt with under the section on PUBLIC FINANCE.

Incidentally to the process of granting preferential treatment to Great Britain, Canada has secured complete fiscal independence, being no longer bound by the commercial treaties negotiated between Great Britain and other countries, unless she explicitly agrees to accept the terms of any treaty. Incidentally to the same process of tariff emancipation, Canada found herself involved in a tariff

quarrel with Germany. This lasted for some seven years, from 1903 to 1910, ending in favor of the Canadian contention. During this period most German imports reached Canada as Dutch, Belgian or British goods, and Canadian supplies went to Germany through similar channels.

Of late years Canada has virtually established an independent consular service under the guise of a system of trade commissionerships. They were established at first chiefly with Great Britain and other portions of the British empire, but now extend to several foreign countries with which it is desired to promote direct trade relations. This system is certain to be more fully developed after the war.

**Railways.**—As a condition of Confederation, in the East, the Intercolonial Railway, connecting the Maritime provinces with Canada, was constructed by the government at a cost of upward of \$20,000,000. A corresponding condition of western federation was the construction of a transcontinental line to British Columbia. This was ultimately realized in the Canadian Pacific Railway, begun in 1881 and completed in 1885 at a cost to the country of \$62,000,000 in cash and 25,000,000 acres of land.

The rapid development of Canadian railways since 1900 centres upon the actual and prospective needs of the immense inland areas west of the Great Lakes. The need for additional facilities for main line transportation has been largely incidental to the need for extended systems of branch lines for the settlement and development of so extended an area. A solution of the problem has been largely effected, but unfortunately without any very obvious regard to either economy or efficiency. The combination of transcontinental and local service has been attempted, and, so far as construction is concerned, has been largely realized by three independent and competitive systems, the Canadian Pacific Railway, the Grand Trunk and Grand Trunk Pacific Railway and the Canadian Northern Railway. In various portions of the western provinces other more or less independent but chiefly provincial lines have been partially constructed, largely on the basis of liberal financial assistance by the respective provinces in which they are located. Most of the larger railroad extensions in the East, including the government Transcontinental Railway, have been necessitated by the western developments of the three larger companies. Since 1870 the mileage of the railroads has increased as follows: 1870, 2,617 miles; 1880, 7,174 miles; 1890, 13,151 miles; 1900, 17,657 miles; 1910, 24,731 miles; 1915, 35,582 miles.

The total capitalization of the Canadian railways in 1914 was \$1,808,820,000, nearly evenly divided between stocks and bonds. In addition the Dominion government has subsidized the railway systems to the extent of \$178,834,000 in cash. It also granted to them 31,864,000 acres of land and has guaranteed their bonds to the extent of \$127,965,000. The Dominion government has also expended \$323,596,000 in building or purchasing certain railroad lines of its own, chief of which are the Intercolonial Railway and the Transcontinental, both built entirely by the government. The provincial governments have subsidized the railroads to the extent of \$37,023,000 in cash, and

23,876,000 acres of land, and have guaranteed their bonds to the extent of \$107,500,000. To these subsidies must be added the cash contributions of the municipalities, amounting to \$17,914,000.

The outbreak of the European War naturally disturbed the calculations of the railroads as to their normal prospects, affecting them both as to their capital financing and their traffic earnings. The results, however, have not always been adverse, since in many lines their earnings have been greatly increased, owing to the exceptional Western crop of 1915 and the great transportation needs incident to the war. All of the Canadian railways, and especially the Canadian Pacific Railway, found the year 1915-16 an exceptionally profitable one. The net earnings of the Canadian Pacific Railway system for that year amounted to over \$49,000,000, being more than \$15,000,000 in excess of the net earnings of the previous year. At the same time the Grand Trunk Pacific and the Canadian Northern railroads experienced difficulties in connection with their capital financing, which forced them to come to the government for assistance and which it has not been found possible to resist. At present a commission is investigating the whole railroad problem of the country with a view to some permanent reorganization of the internal transportation system of Canada.

**Canals.**—Confederation also directed attention to the renewed importance of the Saint Lawrence route and the economy of large vessels for the carrying trade. It was determined to enlarge and deepen the canal system. The new movement was once more begun at Cornwall, in 1876. The dimensions of the new locks were 270 x 45 feet with 14 feet of water. The other canals were enlarged or quite new ones constructed on at least the same scale. The Soulanges Canal, the last to be built, has locks of 280 x 45 feet with 15 feet of water. In 1895 a Canadian canal at Sault Sainte Marie was opened with one lock of 900 x 60 feet and with 18 feet of water. There is now, therefore, a continuous waterway with a minimum depth of 14 feet from Lake Superior to the sea.

As usual it was expected that when the new canal system on a 14-foot basis was fully completed, the grain and other traffic from the West would be largely diverted to the Saint Lawrence route. This expectation, however, was but slightly realized, there being many factors to be taken into account, among them the construction of still larger vessels upon the upper lakes and the changed conditions of transatlantic shipping, tending to favor the larger American ports. The forwarding of grain tended to shift from the Saint Lawrence route below Lake Erie to the New York and other transatlantic routes through Buffalo, which, at present, furnishes the chief exit for western Canadian as well as American grain. Still another attempt, therefore, is being made to readjust matters by a further enlargement of the Welland Canal. After elaborate surveys and much discussion, with incidentally a considerable agitation from Montreal and northeastern Ontario for the construction of a new canal route via the Ottawa River and Georgian Bay, it was decided in 1912 to undertake the enlargement of the Welland Canal. This involves widening and deepening the un-

locked section of the canal from Lake Erie to Thorold, and the construction of a new system of seven very large locks from that point to Lake Ontario, serving the purpose of the 25 locks on the existing canal. Ultimately, the new canal will furnish a water way of 30 feet in depth although in the meantime of 25 feet for the unlocked section of it. This will amply accommodate all present vessels from the head of Lake Superior, the Sault Sainte Marie having a minimum depth of only 18 feet 3 inches. The estimated cost of the new canal is \$50,000,000, \$20,000,000 have been voted and \$10,000,000 expended, but further operations are likely to be suspended until the close of the war.

The full benefit of the new Welland Canal for the Saint Lawrence route cannot be realized until the Saint Lawrence River canals from Prescott to Montreal are also enlarged, the present locks on this section ranging from 14 to 18 feet, the majority with the lesser depth.

Meantime, extensive improvements in the harbor accommodation at Saint John, N. B., and the construction of new terminal facilities at Halifax are expected to have an important influence on the transatlantic facilities from Canada, without which the mere improvement of the canals would not be sufficient to influence the present and possibly future trend of Canada's external trade through American ports. See CANADIAN CANALS.

ADAM SHORTT,

*Commissioner of the Dominion Civil Service.*

**47. BANKING SYSTEM.** The first banking establishment in Canada was a private bank founded in Montreal in 1792, under the name of the Canada Banking Company, and evidently intended to be modeled after the English private banks. It opened for business and issued notes, but its life was very short. In 1807-08 an unsuccessful attempt was made to obtain from the legislature of Lower Canada a charter for the Bank of Canada, which would have been a semi-government bank, resembling in many respects the first Bank of the United States, though naturally on a much smaller scale. In 1817 the "Montreal Bank" began business in Montreal as a private partnership, this being the origin of the Bank of Montreal, which was for many years, and still in some respect remains, the most important bank on the continent, while from its "Articles of Association" there has been developed, with steady continuity, the scientific system of banking law which exists in Canada to-day. In the following year two similar associations—the Quebec Bank and the Bank of Canada—were formed, on almost identical lines, and in 1822 all three obtained legislative charters of incorporation, valid for 10 years, which followed the articles of association in almost every important particular. They differed very considerably, however, from the abortive bill of 1808. Framed to give legal recognition to associations of merchants already actively engaged in commercial banking, they were throughout designed to meet ordinary commercial requirements, and although they are perhaps more remarkable for what they omitted than for what they included, most of their provisions were sound. They confined the bank's business to legitimate lines, they prohibited lending upon

the pledge of goods or upon mortgage, or dealing in real estate, and they provided that all notes issued were to be redeemable on demand in specie. Power to open branches was not expressly given, but as it was not denied, its existence was assumed, and the banks did, as a matter of fact, open branches or agencies in both Lower and Upper Canada. The English private banks and the Scottish chartered banks were the joint parents of these Lower Canadian charters, and of the Canadian banking system which has sprung from them. Various changes and additions were made to suit Canadian requirements, while in the phraseology used, as well as in some of the internal regulations, the influence of the chartered banks in the United States may be seen, but it may safely be said that practically everything which has proved of permanent value was derived from English, Scotch or native sources.

In Upper Canada the earliest banking legislation was on political, rather than commercial, lines, and the first charter, that of the Bank of Upper Canada, granted in 1821-22, followed the Lower Canadian bill of 1808 rather than the articles of association of the "Montreal Bank." The plan as first adopted was not sound, and as it had little permanent influence upon later legislation no description of it is necessary. The Imperial authorities, by pressure persistently exerted, succeeded in securing the adoption of two important amendments which are still part of Canadian banking law. In 1832 banks were prohibited from holding, or lending on, their own stock, while in the charter of the Gore Bank, granted in 1835, it was provided that the shareholders should be individually liable for the debts of the bank to an amount equal to their respective holdings of subscribed stock. The prohibition of the lending of money on mortgage, which from the first had been embodied in Lower Canadian charters, was never adopted in Upper Canada, although strongly urged by the Colonial Office.

The Union of the two Canadas took place in 1840, and at its first session in 1841 the legislature of the province of Canada adopted the report of a select committee, favoring a uniform system of banking, and approving a number of important regulations emanating from the Colonial Office, some of which already existed in individual charters. All notes were to be payable on demand in specie, they were not to be issued to an amount exceeding the bank's paid-up capital, and suspension of specie payments for a given number of days (not in any case exceeding 60), either consecutively or at intervals within any one year, was to forfeit the charter. The bank was not to hold its own stock, or to make advances against it, nor was it to lend money on security of lands or houses, or ships, or on pledge of merchandise. These and a few less important regulations were incorporated in every new and renewal bank charter thereafter granted, the double liability clause was made applicable to every bank, and one bank was prohibited from holding stock in another, except such as might be taken for bona fide debts, contracted in the usual course of business. In this act we have the first attempt to deal with banking in a systematic way and to lay down general rules to which all banks must conform.

Only a passing mention need be made of

the free banking law which, avowedly an imitation of the free banking laws of the State of New York, was passed in 1850. By 1854 its failure was evident, the free banks gradually died out or obtained charters, and the act was repealed in 1866. The only vestige of it now to be found is the provision, revived in the Dominion Act of 1880, that notes issued by a bank should be the first charge upon its assets.

Up to 1859 banks had been prohibited from lending money upon the pledge of goods, but in that year an act was passed authorizing a bank to take bills of lading, warehouse receipts, etc., as collateral security for the payment of any bill or note discounted by it, providing the security was taken at the time the bill was negotiated.

Little need be said as to the banking history of the other provinces. The charters in the Maritime Provinces were very similar to those of Lower Canada, Manitoba had no existence as a province before it joined the Confederation, while British Columbia had passed no banking legislation, its only bank having been incorporated under an Imperial charter, which has now been surrendered.

At Confederation, in 1867, all right to legislate regarding banking was vested in the Federal government, but the initial task of framing a comprehensive banking law which should be uniform for the whole Dominion was by no means an easy one. Banking experiences during the previous two or three years had not been altogether happy, very divergent views were held, and even among bankers there was a wide difference of opinion, a difference which to some extent followed geographical lines, the existing system being generally upheld in Ontario, while in Quebec and the Maritime Provinces there was a widespread desire for a change. A system which in its main features would have followed pretty closely the banking practice of the United States was in 1869 proposed to Parliament by Mr. Rose, then Minister of Finance, and was strongly supported by representatives of the Bank of Montreal and the Bank of British North America. But determined opposition developed, and the proposals were withdrawn. A new Finance Minister, Sir Francis Hincks, having taken office, an act was passed in 1870, continuing many existing features and introducing some new ones. But the first really important Bank Act passed after Confederation was that of 1871 (34 Vict. Chap. V), which embodied all the provisions of any charter or general act then in force which it seemed desirable to perpetuate, making them applicable immediately to all new banks, and to all the existing banks as soon as their respective charters expired. A few small banks in the Maritime Provinces continued for several years under their old charters, the last one coming under the operation of the act on 1 March 1892. While each bank retained the necessarily individual features of its own charter—those relating to its name, capital, chief place of business, etc.—and while it still remained necessary for every new bank to obtain a special act of incorporation (which it could do as a matter of course during any session of Parliament, if it conformed to the prescribed conditions), the new act made all other regulations uniform, with some unimportant

exceptions in the case of the Bank of British North America, which was incorporated under an Imperial charter, and La Banque du Peuple, which has since passed out of existence. Except for the express right given to a bank to make advances on the stock of other banks (a most objectionable enactment, repealed in 1879), no new features of special consequence were introduced. It provided that no bank should issue notes of less than \$4 each, and that every bank should hold as nearly as practicable one-half, and never less than one-third, of its cash reserves in Dominion notes (both provisions designed to increase the issue of Dominion notes): but the importance of the act rests on the fact that it firmly established in Canada a banking system based upon Canadian and British principles, a system which, modified and improved from time to time, exists in Canada to-day. Its chief features are: large banks, the branch system, an elastic assets currency, no fixed reserves and the double liability of shareholders. In 1879 the Bank Act was revised, and in 1890 it was revised and re-enacted, while an amending act (63, 64 Vict. Chap. 26) was duly passed in 1900, but only two new provisions require mention. Special powers were given in 1900 under which any bank might sell the whole or any portion of its assets to any other bank, and the Canadian Bankers' Association was formally recognized and given certain definite legal powers and duties. For a long time past it had been an established rule to enact the Bank Act for 10 years only, thus ensuring a periodical discussion of the whole theory and practice of banking, while during the 10-year intervals the banks could enjoy comparative peace. A revision of the act was accordingly due in 1910, but at that time the public mind was much disturbed over two or three recent bank failures, and it was therefore deemed best to postpone discussion and revision. But the act of 1900 would expire on 1 July 1911, so in order to keep the bank charters in force the act was extended from year to year until 1913, when it was decided to deal with the matter.

As a result of public feeling, and of a persistent anti-bank agitation which had been going on in some of the newspapers, the whole banking system was subjected to very close and searching criticism. Many radical changes were proposed, some of them meeting with strong support both in Parliament and in the country. But while some important alterations were embodied in the new act, there was no real departure from the principles of the established system, which may be said to have encountered successfully the hostile criticism to which it was exposed. The new act (3-4 George V, Chap. 9) came into force on 1 July 1913 and will expire on 1 July 1923. Until that date it is the charter of every Canadian bank (except a couple of savings banks in the province of Quebec), and under it every bank has exactly similar rights, privileges and limitations\*; the Bank of Montreal, with paid-up capital and reserve fund of \$32,000,000, and the Weyburn Security Bank, which has a paid-up capital and reserve fund of \$535,320, standing on precisely the same legal footing. The mini-

\* An unimportant exception in the case of the Bank of British North America is noted later on.

imum subscribed capital necessary before a new bank can begin business is \$500,000, of which at least \$250,000 must be actually paid up in cash and deposited with the Minister of Finance. After the bank is in operation the shareholders may, by passing a by-law at a general meeting, and afterward obtaining the approval of the Treasury Board, increase or reduce the capital stock, but it must not be

any part of it without being authorized to do so by the Bank Act or by some other act, nor may he use foreign words equivalent to "banker" or "private banker." There are now very few private bankers in Canada, and their operations are on quite a small scale. The following tables give the principal items in the combined balance sheets of the banks at different dates since Confederation.

## LIABILITIES (000 Omitted).

31 Dec.	No. of banks	No. of branches		To shareholders			To public		
		Canada	Elsewhere	Paid-up capital	Surplus	Average capital per bank	Notes in circulation	Deposits	Total liabilities to public

(a) Five other small banks not reporting.

(b) Eight other small banks not reporting.

(c) Two other small banks not reporting.

(d) Government securities only.

(e) Exact figures not available.

(f) Since this report was made, the number of banks has been reduced to 19; the Bank of British North America, which operated on an Imperial charter, was incorporated by the Bank of Montreal, and the Northern Crown Bank by the Royal Bank of Canada—both in the early part of 1918.

The dividends paid vary from 5 to 14 per cent, the average rate being 10.

reduced below \$250,000. Before a bank may begin business it must obtain from the Treasury Board a certificate that it has complied with all the requirements of the law, this certificate to be obtained within one year of the date of the act of incorporation. The Treasury Board is the financial committee of the Privy Council for Canada, composed of five Cabinet ministers, with the Minister of Finance as chairman. No person or corporation may use the word "bank," or the words "savings bank," "banking company," "banking house," "banking association" or "banking institute," or any word or words of import equivalent thereto in any foreign language, to describe his business or

The chief place of business of most of the banks is at either Montreal or Toronto, only three having their head offices west of Ontario. The right to establish branches is specifically granted, and most of them have numerous branches, several being represented in nearly every Canadian town of any importance. The Bank of Montreal, for instance, has about 174 branches in Canada and 10 elsewhere, the Canadian Bank of Commerce about 374 in Canada and 7 elsewhere, and the Royal Bank of Canada about 366 in Canada and 65 elsewhere. Several have branches or agencies in London and some of the more important cities in the United States, those represented in New

York being among the largest dealers in foreign exchange. Newfoundland is entirely dependent for its banking facilities upon the Canadian banks, which have some 28 branches there, while a large proportion of the whole banking business of the West Indies, including Cuba, Porto Rico, British Guiana, etc., is done by two Canadian banks—the Royal Bank of Canada and the Bank of Nova Scotia,—which have between them about 70 branches in the West Indies and adjoining districts. The foregoing tables show that the 21 banks in existence at the end of 1917 had 3,100 branches, an average of 148 branches per bank. Each bank is administered by directors, not less than five in number, who are elected annually by the shareholders, each share carrying one vote. Directors must each hold paid up stock of from three to five thousand dollars, according to the total amount of the capital stock; the majority of them must be British subjects domiciled in Canada. A general meeting of shareholders must be held annually at which directors must submit a clear and full statement of the affairs of the bank. Statements of assets and liabilities (in a prescribed form) must be sent monthly to the Minister of Finance, by whom they are published in the *Canada Gazette*. Two or three other returns are also required, and the Minister of Finance has power to call for special information from any bank. The banks have long made a practice of having all their branches and departments inspected at least once a year by their own inspectors, but until 1913 no system prevailed either of audit by the shareholders or of examination by the government. In that year, in deference to popular sentiment, provision was made for an audit by a person or persons appointed by the shareholders of each bank in general meeting, such persons being selected each year from a list of persons (not less than 40 in number) chosen by ballot by the general managers of all the banks at a meeting called annually for that purpose, and approved by the Minister of Finance. Every such auditor has a right of access to the books and accounts, cash, securities and documents of the bank, and is entitled to require from the directors and officers such information and explanations as may be necessary for the performance of his duties. The auditor must certify to the correctness of the statement presented to the annual general meeting of shareholders, and of any other statement which the shareholders may by by-law require. Provision is made for special audits at the direction of the Minister of Finance. The practical working out of this audit system is still on trial, but it may be anticipated that at the next revision of the Bank Act the selection of the panel of auditors will be removed from the general managers, the persons against whom the audit is more particularly directed, that more practical opportunity for independent selection will be given to the shareholders, and that a restriction will be placed on the number of banks for which any one person (or members of the same firm) may act as auditor.

In the United States the bank's president is generally its chief executive officer, but in Canada this is not the case. British precedent is followed, and the bank is managed by a general manager, who accepts the fullest responsibility

for the conduct of its business. The Board of Directors deliberate on all important transactions and all applications for large credits which have been approved by the general manager are submitted to them. The branch managers are responsible for the general business of their respective branches, and, as a rule, are allowed to use their own discretion in making advances up to certain amounts, varying according to the importance of the particular branch. Any loans applied for in excess of the limit fixed must be referred to the general management at the head office. By means of the branch system credit is distributed throughout the whole country; money borrowed from depositors in the rich but less progressive portions of Ontario may be lent out again in the newest parts of the Northwest, and interest tends toward a common level. The average rate obtained in western Canada is only about 1 per cent more than in Ontario. The banks being large, and under no restrictions as to the amount which they may lend to any one customer, are able to supply the total needs of any person with whom they are willing to do business. They grant yearly credits, and practically undertake to supply their customers' wants up to the limit fixed at any time during the continuance of the credit. As a corollary to this they almost invariably require that each customer shall borrow from only one bank.

No special percentage of cash reserves is required to be kept—in fact, the banks are not required by law to keep any cash or other reserves—but of whatever cash reserves are kept in Canada at least 40 per cent must be in Dominion notes. Percentages of cash reserves to total liabilities to the public held by all banks on 31 December in certain years were as follows:

(000 Omitted).

31 Dec.	Specie	Dominion notes	Total cash reserves	Total liabilities to public	Percentage cash to liabilities
1900...	\$11,773	\$19,785	\$31,558	\$392,150	8.4
1910...	33,411	76,007	109,418	1,036,075	10.5
1911...	37,464	97,657	135,121	1,174,323	11.5
1912...	33,780	94,584	128,364	1,292,451	9.9
1913...	46,620	111,178	157,798	1,308,757	12.0
1914...	67,070	143,240	210,310	1,314,646	15.9
1915...	74,205	156,698	230,903	1,499,284	15.4
1916...	83,132	156,490	239,622	1,706,948	14.0
1917...	101,712	245,099	346,812	2,081,733	16.6

It must not be forgotten that the banks' cash reserves are only their first line of defense. Their real reserves are in the shape of call loans in New York against stocks and bonds, balances in the hands of their correspondents and securities lodged with their agents in London and elsewhere, against which they are entitled to draw at any moment. New York and London are the final settlement points, and it is there that real strength is most necessary and most effective.

On 31 Dec. 1917 there were 25 clearing-houses in Canada, the oldest being that at Halifax, which was established on 1 July 1886. Montreal followed in January 1889 and Toronto in July 1891. The others, listed in order of

age, are Hamilton, Winnipeg, Saint John, Vancouver, Victoria, Quebec, Ottawa, London, Calgary, Edmonton, Regina, Brandon, Lethbridge, Saskatoon, Brantford, Moose Jaw, New Westminster, Medicine Hat, Peterboro, Fort William, Kitchener and Sherbrooke.

The total clearings in certain years have been: 1900, \$1,584,869,240; 1910, \$6,115,039,241; 1911, \$7,343,729,546; 1912, \$9,147,334,855; 1913, \$9,230,096,680; 1914, \$8,063,814,799; 1915, \$7,276,476,210; 1916, \$10,557,187,917; 1917, \$12,552,821,949.

The right to issue notes intended for circulation (other than notes issued by the Dominion government, see CURRENCY, COINAGE AND LEGAL TENDER) is confined to the chartered banks. The bank may issue and re-issue notes of \$5 and multiples thereof, which must circulate at par in any and every part of Canada and must be redeemed on demand in specie or Dominion notes. In order to ensure this the bank must establish agencies for the redemption and payment of its notes at Toronto, Montreal, Halifax, Saint John, Winnipeg, Victoria, Charlottetown, Regina and Calgary, and at such other places as are, from time to time, designated by the Treasury Board. In addition, the bank must accept its own notes in payment at any of its branches. The notes issued by a bank are a first charge upon all its assets, and they are also especially secured by the Central Gold Reserve and by the "Bank Circulation Redemption Fund," to which all the banks have contributed 5 per cent on their average circulation and which is held by the government for the purpose of redeeming with interest at 5 per cent any notes of a suspended bank which the bank or its liquidator is not ready to redeem within two months after the date of suspension. The result of this is that the other banks readily accept at par the notes of a suspended bank, the notes remaining in their hands earning interest at 5 per cent until they are redeemed. As the banks are obliged to replenish the Redemption Fund gradually if it ever becomes depleted, they are all practically guaranteeing the notes of each. The amount at credit of this fund on 31 Dec. 1917 was \$5,769,631, bearing interest at 3 per cent. No call has yet been made on it. Since 1841 the limit of the bank's authorized note issue had been the amount of its unimpaired paid-up capital, and for many years the banks had found no difficulty in keeping well below this limit. So late as 31 Dec. 1890 the total paid-up capital of all the banks was \$60,000,000, while their note issue was only \$35,000,000. But early in the present century conditions began to change, and by 1907 the increase in capital had so far failed to keep pace with increase in business that on 31 October of that year the total note issue had reached its legal maximum, unless and until some of the banks increased their capital. But as the acute need for the issue of additional notes only existed during four or five months each year, the banks were loath to increase, for this purpose alone, capital which was otherwise sufficient, so in 1908 each bank was authorized to issue "during the season for moving the crops," that is, from 1 October to 31 January, "excess circulation" to the extent of 15 per cent of its combined unimpaired paid-up capital and rest. In 1912 this

period was extended to run from 1 September to the end of February. On this "crop-moving" issue the bank must pay to the government interest at a rate to be fixed by the government, but not exceeding 5 per cent per annum. In 1913 provision was made for "central gold reserves." Trustees are appointed by the Canadian Bankers' Association and by the Minister of Finance, who receive such amounts in current gold coin and Dominion notes, or either, as any bank may desire from time to time to deposit. Against the gold and notes thus actually held for it, any bank may at any time issue notes of an equal amount, in addition to the amount which it may otherwise issue. The "excess circulation" provision was also continued. Although this arrangement makes it easy for the banks to furnish all the currency needed, it may be doubted whether, from the public standpoint, it is altogether wise. The "gold reserve" feature is illogical, inasmuch as assets which already form part of the general security for the total note issue are placed in the hands of trustees, and there used as special security for an additional issue. All that is gained is the physical certainty of their actual and continued existence, and possibly some small increase in total cash reserves. But as the security is ample in any event, this is of little consequence. A serious objection is that the banks are thereby relieved to a considerable extent from the necessity of increasing their capital from time to time as their business increases, and thus the "margin of safety," in the form of capital and double liability, which is the general creditors' insurance against loss, tends constantly to become proportionately less at a more rapid rate than it otherwise would. And in this way, too, any tendency to undue concentration in banking is strengthened.

Very heavy fines are imposed in the case of over-issue, these fines varying from the amount of the excess circulation, if the excess is not over \$1,000, up to \$100,000, if the excess is over \$200,000.

The security behind the total bank issue is shown by the following figures:

Total note issue 31 Dec. 1917 (of this \$24,078,909 held by banks).....	<u>\$192,923,824</u>
Specie held:	
By banks (about 90 per cent gold).....	\$82,032,863
In central gold reserve (gold).....	19,680,000
Dominion notes held by banks.....	245,099,000
(Gold held against notes by government, say \$103,000,000)	
Circulation Redemption Fund.....	5,769,631
Dominion and provincial government securities.....	188,703,175
	<u>\$541,284,669</u>
Other assets.....	1,781,879,114
Total assets.....	<u>\$2,323,163,783</u>
Double liability of shareholders.....	106,807,110
Unpaid stock.....	417,690
	<u>\$2,430,388,583</u>
Total security.....	

The bank's unissued notes cost it nothing, except for paper, printing and transmission, and it is thus enabled to keep at each of its branches a sufficient supply of currency for ordinary requirements, without any loss of interest except on a trifling amount of change-making currency. This has an important bearing upon the cost of establishing and conducting small branches. As the note issue is

a source of profit, each bank pays out within its limit only its own notes and sends in for redemption the notes of other banks which it receives. Daily exchanges are made at every point where two or more banks are represented, each bank sending in to the other all the notes issued by the other bank which it received the previous day. The resulting balances are settled at the smaller places by drafts on the Clearing-House centres. In this way an automatically elastic currency is obtained, and the banks are enabled, up to the extreme limit of their issuing power, to meet the annual demand for currency to "move the crops"—a demand which in an agricultural country like Canada is very urgent—while at the same time the daily redemption provides that the extra supply of notes will be forced out of circulation as soon as the need of them has passed. The elasticity of the note issue is shown by the following table:

TOTAL NOTE ISSUE OF THE CHARTERED BANKS.  
(000 omitted)

YEAR	Lowest point reached		Highest point reached		Percentage of increase
	Amount	Date	Amount	Date	
1900...	\$41,320	January	\$53,198	October	28.75
1910...	73,379	"	95,992	"	30.8
1911...	77,111	"	105,855	"	37.2
1912...	88,065	"	115,473	November	31.1
1913...	94,576	"	119,497	"	26.3
1914...	93,064	April	123,745	October	32.9
1915...	96,288	"	124,154	November	29.9
1916...	111,029	January	148,785	December	34.0
1917...	133,358	"	196,135	November	47.0

In the course of each bank's daily business, it receives notes issued by other banks, which are not sent in for redemption until the following day, at the earliest—sometimes not for two or three days. A certain proportion, therefore, of the total note issue is always in the hands of the banks themselves, and of total notes in circulation on 31 Dec. 1917, of \$192,923,824, the amount thus held was \$24,078,909, or about 12.5 per cent of the total outstanding, leaving \$168,844,917, or about 87.5 per cent actually in the hands of the public.

The Canadian Bankers' Association is by statute charged with the duty of supervising and controlling all details connected with the issue of notes. The merits of the Canadian bank note may be thus summed up: First, it is safe; nothing, but national insolvency could make its ultimate redemption doubtful. Second, it is redeemable on demand in specie or Dominion notes; if suspension of payment occurs, the note bears interest at 5 per cent until it is redeemed, and if not redeemed by the bank within two months, it will be paid out of the Redemption Fund. Third, it passes at par from one end of Canada to the other. Fourth, the amount in circulation always tends to be the exact amount demanded by the industrial activity of the country. The bank is obliged to confine its business within the limits which are almost universally assigned to the banker. Speaking generally, it may not deal in merchandise, or be engaged in any

trade; it may not lend money upon the security of goods, or ships, or lands, and other immovable property, nor may it advance against its own stock, or the stock of any other bank, but it may lend against or take as security bonds of an incorporated company, even though the bonds are secured by mortgage on real estate. It may, however, under certain conditions, lend money to wholesale manufacturers, and to wholesale purchasers, shippers of or dealers in various products, on the security of the goods they manufacture or deal in, and it may lend to any person on the security of a bill of lading or of a warehouse receipt. It may also lend money on the security of standing timber, and may make advances for shipbuilding, taking security on the ship. As additional collateral to a debt already contracted it may take security of almost any kind, except goods or documents representing goods, and it has a first lien on its own stock for any liability due to it by a stockholder. It cannot recover by process of law any interest in excess of 7 per cent, but no penalties for usury now exist.

In addition to carrying on the ordinary business of a commercial bank, the Canadian banks receive money on deposit at interest, the prevailing rate at present being 3 per cent. Probably about 60 per cent of their total deposits would in the United States be deposits in savings banks. No securities are specially set aside against any deposits. Deposits due to the Dominion government are a second charge on all the assets of the bank (the notes being the first), and those to any provincial government are a third charge. One bank may sell out all its assets to another bank, proper provision being made for the assumption of the liabilities of the selling bank. The purchase price may be in stock of the purchasing bank, or in such other form as may be arranged. No agreement to sell, however, may be made unless and until the Minister of Finance, in writing, gives his consent. In at least one recent instance the Minister has, on grounds of public policy, withheld his consent. In the event of a bank suspending payment, it is taken in charge by a curator appointed by the Canadian Bankers' Association, who controls and supervises it until it either resumes payment or goes into liquidation. Suspension for 90 days, consecutively or at intervals within 12 consecutive months, constitutes the bank insolvent. If it becomes insolvent the shareholders are each individually liable for an amount equal to the amount of their respective holdings of subscribed stock in addition to any amount not paid up on such stock. This double liability did not exist in the case of the Bank of British North America (now incorporated in the Bank of Montreal), and its ordinary note issue was therefore confined to 75 per cent of its paid-up capital. Against any portion of the other 25 per cent which it might desire to issue, it had to make a special deposit with the government.

The giving of a fraudulent preference to any creditor, the corrupt acceptance of a gift, commission or other consideration in respect of dealing with the bank's affairs, or the making of false returns, etc., on the part of any director or officer of a bank, is punishable by heavy fines or by terms of imprisonment, or

both. Since Confederation 25 banks working under Federal laws have gone into liquidation, their paid-up capital at the time of suspension aggregating some \$17,000,000, and their total liabilities about \$62,500,000. At least 14 of these paid noteholders and depositors in full, and all those chartered since Confederation paid their noteholders in full. Three, which failed before notes were made a first charge on assets, paid neither in full, but varying percentages to depositors, while one of these was a fraudulent affair, which was only in operation for a few months.

Savings banks under the management of the government are of two kinds: Government savings banks, under the control of the Finance Department, and post office savings banks, which are part of the post office system. The former were in existence in the Maritime Provinces for several years previous to 1867 and were taken over by the Federal government when the provinces entered into Confederation. In British Columbia savings banks controlled by trustees existed before Confederation, and these banks were wound up and "government savings banks" established in their stead. A government savings bank was opened in Winnipeg in 1871 and another in Toronto in 1872. In 1888 there were 50 offices with 57,367 depositors, having \$20,682,025 to their credit, an average of \$360 for each depositor. It has now been recognized that these banks are no longer necessary, and whenever the position of superintendent of any office becomes vacant, the deposits in that office are transferred to the post office savings bank.

By 31 Dec. 1917 the number of offices open had decreased to 14, all of them, except those at Winnipeg and Victoria, being in the Maritime Provinces. The total amount on deposit was \$13,610,069. In 1868 the system of post office savings banks which had proved so successful in Great Britain was introduced into Canada, 81 offices being opened on 1 April in that year. On 31 Dec. 1916, there were 1,269 savings bank offices in Canada with 134,345 depositors and total balances of \$40,478,123. In order to give some support to the theory that both kinds of public savings banks are intended primarily as safe places of deposit for persons of limited means, the net amount which may be received from any person during one year is \$1,000, while the total amount which any depositor may have at his credit is \$3,000. The rate of interest paid in both classes of savings banks was formerly 4 per cent but on 1 Oct. 1899 it was reduced to 3½ per cent and on 1 July 1897 to 3 per cent. Until recently there was, however, no justification for even 3 per cent being paid. Canada in normal times was able to negotiate term loans (against which no reserves need be kept) at a net interest rate of about 2.86. By an act passed in 1903 the Department of Finance is obliged to hold as reserves against savings bank deposits an amount in gold, or in gold and Canada securities guaranteed by the government of the United Kingdom, equal to not less than 10 per cent of the deposits. When to the rate actually paid on these deposits is added cost of reserves and expense of management (from one-fourth to one-half of 1 per

cent per annum), the money held on deposit actually costs the country about 3.75 per cent. This fact was fully recognized by the government, and some years ago they proposed to reduce the rate paid to 2½ per cent, but, for political reasons, the proposal was withdrawn. Having regard to the high rates at which the government at present has to borrow for war purposes, it is a question whether the rate should not be raised to—say—4 per cent.

Amounts held on deposit by the government in certain years were as follows:

YEAR	Government savings bank	Post office savings bank	Total
1870 June.....	\$1,822,570	\$1,588,849	\$3,411,419
1880 ".....	7,107,287	3,945,609	11,052,956

\* Highest point reached.

Apart from the public savings banks, the only savings banks of any importance are the Montreal City and District Savings Bank, of Montreal, and La Caisse d'Economie de Notre Dame de Quebec. The former has a paid-up capital of \$1,000,000, and a reserve fund of \$1,350,000; its deposits are about \$31,000,000, it holds securities of about \$19,000,000, and has loans against securities of over \$8,000,000. The latter has a paid-up capital of \$250,000, and a reserve fund of about \$1,000,000; its deposits are about \$10,000,000, it holds securities of about \$8,000,000 and has loans of about \$3,000,000 against securities. These banks may invest 80 per cent of their deposits in certain approved securities, including the stock of chartered banks, and may make advances against such securities. These are the only classes of investments which they may make. They are specially prohibited from lending on real estate, promissory notes or commercial paper. Unlike the ordinary chartered banks, they have not the right to issue notes for circulation.

At the outbreak of the European War it became necessary to take steps to conserve the financial resources of the country. On 3 Aug. 1914, an Order in Council was passed, giving authority as follows: (1) To the Minister of Finance, to issue Dominion notes to such an amount as might be necessary against such securities as might be deposited by the banks and approved by the Minister; (2) To the banks, to make payment in bank notes, instead of in gold or Dominion notes; (3) To the banks, to issue at any time excess circulation not to exceed 15 per cent of their respective combined unimpaired capitals and rests.

This Order in Council (together with one dated 10 Aug. 1914, suspending the redemption in specie of Dominion notes (see CANADA —

CURRENCY, COINAGE AND LEGAL TENDER), was confirmed by an act (5 George V Chap. 3) dated 22 Aug. 1914, which continued it in force until 15 Sept. 1914, and gave the governor-in-council statutory power "In case of war, invasion, riot or insurrection, real or apprehended, and in case of any real or apprehended financial crisis," to make effective proclamation provisions similar to those contained in the Orders in Council of 3d and 10th of August, the only change being that advances to the Quebec savings banks were also authorized. On 3 Sept. 1914, a proclamation was duly issued, revoking the Orders in Council, and putting into force the provisions of the act. These provisions will doubtless be retained for some time after the end of the war. The effect of them is that the banks can at any time obtain from the government advances (unlimited in amount, so far as the law is concerned) of Dominion notes against approved securities deposited (these securities being deemed to be the security required by the Dominion Note Act to be held against Dominion notes: i.e., gold), that they may make all payments in bank notes including the payments necessary to redeem their own notes, which they are thus by law relieved from redeeming, and they may during the whole year issue excess circulation to the extent of 15 per cent of their combined unimpaired capital and rest, instead of only during the period from the beginning of September to the end of February. The practical effect of these provisions is that no gold and only change-making quantities of Dominion notes are paid out over the counter, so that the obtaining of gold by the public for hoarding, export or any other purpose is absolutely prevented. In order, however, to retain the daily redemption of notes not needed by the public, and to prevent large quantities of notes of one bank being held by other banks, the Clearing-House rules provide that the daily settlements at the chief redemption points shall continue to be made in Dominion notes. The whole arrangement has worked remarkably well; even in the disturbed days at the beginning of the war, when all commercial and industrial interests were in a state of absolute uncertainty, and no one knew how things would go from day to day, there was not the slightest tendency toward a run on the banks, which continued to pay their depositors and to all outward appearance to transact internal business as usual.

F. G. JEMMETT,

*Colonial Bank, London; Formerly Secretary,  
The Canadian Bank of Commerce.*

**48. PUBLIC FINANCE, 1867-1917.** Up to the time that the various provinces, which originally constituted the Dominion of Canada, entered into Confederation, they had depended almost entirely for their provincial revenues upon customs duties upon imports, supplemented by a limited set of excise taxes. Direct taxation upon property and income had been practically entirely reserved for the municipalities, both rural and urban. These municipal revenues, however, had been regularly supplemented from the provincial treasuries by grants

in aid of specific requirements, chief of which were education and transportation, or schools and highways and bridges. The larger public works, such as railways and canals, harbors and roads, were for the most part undertaken by the provincial governments, or by corporations chartered by them and heavily subsidized or aided in other ways, including authorized municipal assistance.

**Source of Revenue.**—Such being the financial conditions of the provinces at the time of Confederation, one of the chief difficulties to be faced was that of persuading the individual provinces to resign almost their only methods of taxation, customs and excise, into the hands of the new Federal government, and thus be left to cast about for other and hitherto but little developed sources of revenue. After much discussion, but under the somewhat stimulating pressure of necessity, a compromise was arrived at. The new Dominion or Federal government was granted sole control of the customs, excise and all other so-called indirect methods of taxation; while the provinces and their subordinate municipal institutions were confined to direct methods of taxation without, however, excluding the Dominion government from these sources also. On the other hand, the Dominion, in view of these sacrifices on the part of the provinces, not only assumed the future costs, management and maintenance of all the larger and expensive public works and public services, but also assumed the previously accumulated funded debts of the provinces. In addition, the Dominion was required to grant to the respective provinces, on a specified basis, certain annual subsidies in cash. These for some time furnished the most important element in their respective provincial revenues. The amounts of these provincial subsidies have been the occasion of much agitation and not infrequent revision ever since. To the provinces were also assigned the various public lands, including the timber and mines on or within them. At the same time, the British North America Act authorized both the provincial and Dominion governments to borrow money on the basis of their respective public credits.

The very strong and long grounded dislike of the Canadian people, both French and English, to direct taxation led not only, as we have seen, to the confinement of this method of taxation to the self-imposed levies on the property owners of the municipalities, but steadily prevented, until quite recently and chiefly under the temporary requirements of the war, the levy of direct property and income taxes for provincial or Dominion purposes. Thus in most cases, up to the outbreak of the present great war, there had remained a sharp distinction between the sources of the revenues of the Dominion, provincial and municipal governments. This separation has been of the greatest value to the people of Canada in simplifying their fiscal problems, and in keeping before them the distinct fields of responsibility for the levying and expending of the various contributions which the citizens are called upon to make in support of the different public administrations under which they live.

As already indicated, the revenues of the Dominion are, for the most part, derived from

customs duties on imports and excise duties on certain lines of manufactured goods, chiefly liquors and tobaccos. Owing to the customary method of presentation and discussion of the annual budgets and public accounts of the Dominion, the very limited source of the chief revenues of the country is apt to be overlooked. The present situation arose from historic conditions and the necessity for remedying certain obvious abuses under former methods of dealing with public accounts. Thus, at one time, the officials connected with the collection of the public revenue, whether levied as taxes or obtained in connection with certain public services, were permitted to retain, chiefly in the shape of fees and expenses, the cost of collection, returning to the government only the balance in its favor. When combined with the prevalent system of political patronage, the abuses connected with this method can be readily understood. In order, therefore, to bring as much as possible of the receipts and payments from the various departments to the attention of Parliament and the country, the ordinary receipts from the different sources, except from loans and trust funds which are otherwise accounted for, were combined in what is known as the consolidated fund. Out of this is paid both the ordinary and miscellaneous charges and expenses of the government, except what is applied in the way of capital expenditure or the redemption of debt, or special subsidies and grants. At the same time, in connection with some of the public service, as for instance the postal service, a very considerable element of the expense connected with it is deducted before the remaining funds are handed over to become part of the consolidated revenue. Thus the total gross revenue of the Post-Office Department amounted to upwards of \$16,750,000 in 1914-15, but charges to the extent of almost \$4,000,000 were deducted therefrom before the remaining amount of nearly \$13,000,000 was handed over as part of the consolidated revenue.

For the fiscal year ending 31 March 1915, the consolidated fund amounted to \$133,073,481 and the expenditures chargeable to it amounted to \$135,523,206, representing a deficit of nearly two and a half millions, to be met from loans or other available resources not constituting part of the consolidated fund. When, however, we come to analyze the sources of revenue making up the \$133,000,000 of the consolidated fund, and the items of expenditure which are charged upon it, we find that a large portion of the fund represents simply the gross income from various government services, such as the postal and government railway services; while the charges upon it include also the working expenses of these same enterprises, so far at least as they have not been already deducted before being brought into the budget, as indicated above in the case of the Post-Office Department. Thus, for instance, the consolidated fund includes receipts from the postal service of slightly over \$13,000,000, but when we turn to the expenditures from the fund, we find that the operating expenses of the postal service amount to almost \$16,000,000. This takes no account of the considerable portion of an expenditure of some two millions on mail subsidies and steamship subventions. Further the

central or administrative staff of this service at Ottawa costs an additional \$800,000, being included in the item of "civil government." If one cares to go further and turn to the detailed expenditures of the Public Works Department, it will be found that of the expenditure for the year of \$7,750,000, a large section is represented by either new post-office buildings, separately, or combination public buildings, the chief sections of which are commonly devoted to the postal service. Thus instead of the Post-Office Department furnishing any real revenue to the government, it represents a very extensive additional charge upon the real revenues of the country. The same is true of the large revenue item of \$12,000,000 from the government railways,—the Intercolonial, Prince Edward Island, Transcontinental and one or two small lines. We find on referring to the operating expenses of these lines that not only is this revenue entirely absorbed but there is left in its place some \$325,000 of a deficit on operating expenses. This does not take into account the share of the Railway Department in the expenditure under civil government of \$188,000 for the staff of the Department of Railways and Canals. Neither does it take into account the interest on the enormous capital expenditure on the government lines and which constitutes so large a part of the interest charge on the public debt, amounting to over \$15,000,000.

It might appear that the sale of Dominion lands, amounting to over \$2,800,000 in 1914, would furnish a very considerable surplus of revenue. But we find that the annual cost of the administration of the Dominion lands amounted to \$3,700,000 in the same year. Another important item in the annual receipts included in the consolidated fund is that of \$2,900,000 of interest on investments. But this, it is found, represents chiefly the interest on the advances to the Grand Trunk Pacific, amounting to over one and a half millions, on Montreal Harbor debentures, the sinking fund, advances to banks, etc. Altogether the interest on investments represents but a small offset on the interest requiring to be paid by the Dominion on the public debt, which, directly or indirectly, was partly incurred for these purposes.

**Income from Taxation.**—One of the tables in the Annual Report on Public Accounts, prepared by the Finance Department, sets forth separately the income from taxation, which is the real income of the country, and the income derived from other sources, largely, as indicated, the gross receipts from certain government services. Up to the outbreak of the European War, there were, as mentioned, only two real sources of revenue: customs and excise duties. The Chinese immigration tax, though listed separately, is really a customs tax on imports with the usual protective object in view. Since 1914, to these two sources of direct revenue the special war taxes, to be referred to, must be added.

Distinguishing taxes proper from the other sources of income, we find that of the total receipts of \$133,073,481, constituting the consolidated fund for the year 1914-15, \$97,715,440 were derived from taxes proper, while \$35,358,041 were derived from the other sources. Of the charges which are almost entirely paid

out of the \$97,000,000 of taxation, the chief are the following:

Interest and management of the national debt.	\$16,188,000
Customs and excise collection.	4,605,000
Subsidies to the provinces.	11,451,000
Sinking funds.	1,645,000
Civil government.	6,157,000
Administration of justice.	1,469,000
Legislation.	2,376,000
Arts, agriculture and statistics.	3,618,000
Immigration.	1,658,000
Militia (apart from the war).	10,000,000
Public works (not charged to capital).	19,349,000
Mail subsidies and steamship subventions.	2,162,000
Ocean and river service.	1,133,000
Lighthouse and coast service.	2,583,000
Trade and commerce.	2,943,000
Indians.	2,400,000

These items account for somewhat over \$89,500,000 of the regular revenue, leaving about \$8,000,000 to meet other minor items of unremunerative expenditure and cover the deficits on the various remunerative government enterprises whose gross revenue furnishes the other \$35,000,000 of income. This \$35,000,000 of revenue partly meets what we have called the working expenses of the departments; the chief of these items are:

Post-office.	\$15,961,000
Public works, collection of revenue.	799,000
Railways and canals.	13,876,000
Dominion lands.	3,701,000
Weights, measures, gas and electric light inspection, etc.	288,000

These items alone amount to \$34,500,000, leaving about \$750,000 for all the other smaller items of this character. As a matter of fact, as already indicated, most of the deficits, representing the surplus of costs over revenue in these branches of the service, have to be met out of the additional \$8,000,000 remaining from the tax revenue as indicated above.

**Special Funds.**—The Dominion government has the use of several trust funds, such as the post-office and savings bank deposits on which a comparatively low interest is paid. It enjoys also the issue of Dominion notes to a specified amount in excess of the specie reserve. The other funds, beyond the consolidated fund, which are available for expenditure within the year are, first, any surplus of revenue from the consolidated fund; second, loans, whether permanent or temporary, raised during the year. Under normal conditions these extra funds are applied to meet any deficit in the consolidated fund, for the redemption of debt, capital expenditure on public works, or subsidies to railroads, and other special grants.

As to what works may be chargeable to capital expenditure or to annual revenue out of the consolidated fund is largely a matter of expediency. In the history of the Dominion since Confederation, the views and the practices of finance ministers and governments have varied very considerably. Thus, items which at one time are regarded as properly charged to consolidated revenue are, at another, charged to capital account. Apparently the most influential element in determining the variations in practice has been the condition of the public purse, and the very natural disinclination of ministers of finance and their colleagues to present budgets showing deficits on the ordinary annual expenditure. The lack of any definite principle in the division between expenditure from consolidated revenue and expenditure on

capital account will be recognized in a survey of the details of the items charged to capital account and annual revenue in the Departments of Public Works and Railways and Canals.

**Changes Resulting from the War.**—We turn now to take a brief survey of the financial changes which have resulted from the voluntary participation of Canada in the present great war. Canada has undertaken to bear the entire cost of placing half a million troops in the field, fully equipped, transporting them to and from Europe, maintaining them on the front with provisions, munitions, ambulance and hospital equipment and all the other expenses incidental to war. In so doing the country has necessarily to face new and hitherto untried problems of finance. The government has followed the British example of meeting as large a share as possible of the expense from increased taxation, and the remainder from loans. Both old and new forms of taxation have been employed in raising additional revenue. In 1914 additional customs duties were levied on a list of articles mostly of foreign production, and more or less in the line of what are now considered necessary luxuries, and therefore likely to increase revenue rather than curtail consumption. Excise duties on liquor and tobacco were also increased. The additional revenue expected from these sources was about \$1,000,000 per month.

In 1915 the customs dues were still further augmented by a general increase of 5 per cent on the British preferential rates and of 7½ per cent on all other rates. This additional tax was applied, with a few specific exceptions, to goods both free and dutiable in the regular tariff. As a result, although the imports of the previously dutiable goods fell off in 1915-16 while the total imports increased only \$32,500,000, yet the customs revenue increased \$24,735,000 over the previous year.

The government issue of Dominion notes, supported by a 25 per cent reserve instead of 100 per cent reserve, was increased from \$30,000,000 to \$50,000,000, thereby securing an additional free loan of \$15,000,000. So large, however, was the volume of notes fully secured by gold that this change reduced the reserve on the total issue merely from 81 to 71.7 per cent.

New features of Federal taxation were first introduced in 1915, and consisted of special taxes of 1 per cent on bank notes, 1 per cent on the interest income of loan and trust companies and the net premium of insurance companies, except life and marine. Telegraph and cable messages were taxed one cent each, and railway and steamship tickets at graduated rates. Other features were a two-cent stamp on bank cheques, bills of exchange, money and postal orders, travelers' cheques, and notes discounted at banks. There was also a levy of one cent extra on letters and post cards. Additional excise stamps of varying amounts were levied on proprietary medicines, perfumery and wines. During the first year the revenue from these special taxes amounted to somewhat over \$3,000,000.

In 1914 the special appropriation for war purposes was \$50,000,000, the following year \$100,000,000, and for 1916-17 \$250,000,000. In this connection two quite new departures in

Federal finance were made. During the summer of 1915, the first Dominion loans to be negotiated in the United States were arranged. The first was for \$25,000,000 and the second for \$20,000,000. These were followed in the spring of 1916 by another loan of \$75,000,000, floated in New York. The other departure was the raising of a domestic loan for \$50,000,000, in the autumn of 1915. This was so successful that over twice that amount was subscribed and \$100,000,000 accepted. In the autumn of 1916, the experiment was repeated for another \$100,000,000 with perfect success. Exchange conditions, owing to the enormous surplus of British imports from America during the earlier period of the war, rendered it undesirable to borrow in Britain for use in America. A mutual arrangement was therefore effected by which the British treasury advanced funds for Canadian war expenditure in Europe and the Canadian government, partly from its own borrowings and partly by credit arrangements with the banks, financed British purchases in Canada, thus naturally relieving the transatlantic exchange situation.

As the Canadian war expenditure increased, additional taxes were imposed. The new taxes of 1916 took the form of a levy on exceptional profits, most of which were naturally due to the production of army supplies. The tax consisted of one-fourth of all profits in excess of 7 per cent from incorporated companies, and in excess of 10 per cent in other cases. Naturally in the administration of such a tax a good deal of discretion had to be allowed to the officials of the Department of Finance.

One of the most interesting questions which arises in connection with the new departures now being made, both as to methods of taxation and sources of loans, is as to whether and how far these experimental ventures may permanently affect the future financial practice and policy of Canada.

**Provincial Finance.**—We may now take a brief survey of the leading features of Canadian provincial finance. As already indicated the provincial subsidies of the Dominion treasury constituted the original basis of provincial revenue. The Dominion having assumed, up to a certain specified amount, the debts of the four original provinces of Ontario, Quebec, Nova Scotia and New Brunswick, found it necessary to make corresponding allowances for the other provinces as they entered Confederation, or were created out of the vast western territories held by the Dominion government, on much the same basis as those territories out of which have been created the Western States of the American Union were held by the Federal government at Washington. In view of the reasons for granting them, these were known as "debt allowances," and interest is paid on them at special rates. The object of the debt allowance was, of course, to enable the new provinces to equip themselves with such provincial public works and buildings as would place them on a fairly equitable footing with the older provinces when they entered Confederation. In the case of the two last provinces to be created, Alberta and Saskatchewan, no definite debt allowances were fixed, but they were granted specific annual subsidies in lieu of the interest upon fixed capital sums.

The details of the frequent agitations for readjustment of the original financial arrangements with the provinces, either at the time of Confederation or on their subsequent entrance or creation, and the actual changes effected from time to time, are quite beyond the scope of this article. Suffice it to say that the grounds on which these relations at present stand, though still subject to demands for revision, are as follows:

1. A fixed grant according to population.
2. A per capita grant of 80 cents per head up to a population of 2,500,000, and at the rate of 60 cents per head above that number.
3. Special grants for buildings, in lieu of public lands.
4. Interest upon debt allowances, or annual grants in lieu thereof.

In raising the remainder of their revenues, the provinces, especially of recent years, have devised many new taxes. As in the case of the Dominion, however, their budgets combine purely revenue taxes and incomes from various forms of provincial service, and these incomes are either wholly or partially offset by the cost of rendering these services. For a considerable time, as already indicated, the taxes on real estate and provincial income were exclusively assigned to the municipalities for the support of their local requirements. Up to 1915 only two provinces had departed from this policy, British Columbia and Prince Edward Island. Both levy a tax upon real estate and income, while British Columbia alone has resorted to that old standby of the American States, the personal property tax.

It is impossible to go into details with reference to the very varied financial arrangements, and classifications of revenue and expenditure, of the different provinces. In their provincial accounts, the combinations of items in some provinces and the separation of them in others render it very difficult to make any detailed comparisons of their budgets. Certain broad facts, however, stand out as indicative at once of those features common to the majority of the nine provinces and those which are peculiar to individual provinces owing to their special historic or physical conditions, though sometimes due also to special lines of policy. Taking the last available returns for all the provinces up to 1914, we find that beyond the Dominion subsidies, the most common sources of provincial revenue are succession duties, taxes on corporations and various special fees. In these all the provinces share. In some cases the returns from certain fees and licenses are set forth separately. Thus licenses for the sale of liquor, for motor vehicles, moving pictures, hunting and fishing, etc., are listed separately in a number of accounts. Six provinces derive revenues from Crown lands, timber and mines, and from interest on investments. Most of them derive a certain revenue from hospitals and public charities which tends to offset the cost of these institutions. Revenues come also from certain public works, and from activities in aid of agriculture. Certain revenues, as regards their relative importance at least, are peculiar to individual provinces. Among these are the tax on fox farms in Prince Edward Island, royalties on coal mines in Nova Scotia and British Columbia and to a lesser degree in Alberta, also on other mines in Ontario, Que-

bec and British Columbia. The income from the Timiskaming and Northern Railway, and the investments of the Hydro-Electric Commission, are characteristic of Ontario. Revenues from provincial telegraph and telephone lines are important in Manitoba, and from Chinese restriction in British Columbia. On the side of expenditure there is more uniformity. All of the provinces have large outlays for interest and sinking funds, the administration of justice, for legislation, the civil service, education, public charities, agriculture and public works. Five of them expend considerable sums on colonization and immigration, several on mines, lands and forests. Ontario spends much on its Hydro-Electric Commission; Manitoba on telegraphs and telephones and British Columbia on its fisheries.

In six of the provinces the Dominion subsidy constitutes the largest item in revenue. In Nova Scotia the first place is taken by mines; in Ontario, lands, forests and mines; while in British Columbia no less than five sources of revenue take precedence of the Dominion subsidy, in the following order, timber royalties and licenses, Chinese restriction, land sales, wild land taxes and registration fees. Of those in which the subsidy takes the first place, the land tax comes second in Prince Edward Island, territorial revenue in New Brunswick, succession duties in Quebec and land title fees in the three Prairie provinces of Manitoba, Saskatchewan and Alberta. In Manitoba, however, the gross revenue from the telegraph and telephone service, and in Alberta the special tax on railway bonds, exceeded these items in 1914, but these do not represent normal revenues available for general purposes.

In the line of expenditure, education ranks first in five provinces, second in two, third in one and fourth in another. Where education is not first, public works in one form or another take precedence. In Manitoba, however, the gross outlay on the telegraph and telephone service exceeded all other items. In British Columbia public works, divided into two branches of (a) railroads, bridges and wharves, and (b) other public works, occupy the first and second places, with the civil service third and education fourth. The following table gives the total revenue and expenditure and the amounts per capita for the different provinces for the fiscal year ending at various periods in 1914:

PROVINCE	Total revenue	Revenue per head	Total expenditure	Expenditure per head
Prince Edward Island	\$525,555	\$5 61	\$445,396	\$4 75
Nova Scotia	1,885,458	3 75	2,098,893	4 18
New Brunswick	1,505,229	4 25	1,493,774	4 22
Quebec	9,000,377	4 25	8,524,368	4 07
Ontario	11,121,382	4 23	11,919,311	4 49
Manitoba	5,512,163	10 28	5,638,658	10 52
Saskatchewan	5,866,220	8 12	5,396,380	7 47
Alberta	4,522,513	9 27	4,409,795	9 04
British Columbia	10,479,259	21 46	15,766,912	32 30

The budgets of the provinces have not been materially affected by the war and yet it has had its influence in various ways. When the war broke out, largely as an expression of their enthusiastic support of the action taken by Great Britain, each of the provinces made typical contributions of supplies for the British army. Ontario and Manitoba contributed flour; Quebec, cheese; New Brunswick, potatoes; Al-

berta and Prince Edward Island, oats; Saskatchewan, horses and British Columbia canned salmon. These contributions amounted to nearly \$2,250,000. Another large factor has been the provincial contributions toward the patriotic fund, to provide supplementary assistance for the wives, children and other dependents of the Canadian soldiers. To meet these and any other miscellaneous outlays connected with the war has already entailed the levying of additional taxation in most of the provinces.

ADAM SHORTT,

Commissioner of the Dominion Civil Service.

**49. CURRENCY, COINAGE AND LEGAL TENDER.** Interesting as it would be to trace the history of the currency and coinage of the various British provinces from the time when grain and furs were the actual currency, down through the card money of de Meulles, the *ordonnances* of Bigot and the Army Bills of 1812 to the present satisfactory system, such a task is quite impossible within the limits set for this article. "Broadly speaking," says Chalmers, "the currency history of Canada consists in the transition from the French *écu* to the silver Spanish dollar, and from the Spanish dollar to the gold dollar of the United States. But this transition has reference exclusively to the standard coin; the characteristic feature of Canadian currency, both in the 17th century and at the present day, is paper." During the French régime a special colonial coinage was struck in France, but until the period when the chartered banks began to provide a stable medium of exchange, we find a large proportion of the currency consisting of the gold and silver coins of various countries, passing current and made legal tender at rates which were changed from time to time in the hope of keeping coin within the country. British, French, Spanish, Portuguese, German, Mexican and American coins were all legal tender, while for the first 50 or 60 years after the British conquest the actual currency of old Canada consisted chiefly of Spanish silver and some British gold, together with paper, more or less doubtful in value, issued by merchants, private bankers and others.

By ordinance of 1777, followed up by acts of the legislatures of Upper and Lower Canada in 1796, the Halifax currency, with the Spanish dollar valued at five shillings, or four to the pound currency, was made the standard of the country, and new rates were established at which different coins should pass current. The British guinea, which appears to have been the gold coin most in use, was worth £1 3s 4d currency. The Halifax currency, it will be observed, was to sterling money in the proportion of 10 to 9, £10 currency being the equivalent of £9 sterling. In Lower Canada, however, accounts were for many years afterward kept in livres and sols, six livres being equal to one Spanish dollar, while in Upper Canada the York (or New York) currency was more or less in use, its basis being the Mexican *real*, known in North America as the York shilling, eight of which went to the dollar. Its use, however, was prohibited after 1 July 1822. With many attempts at change, and with variations in the ratings of different coins from time to time, the Halifax currency, which, it must be remembered, was a money of account only, remained as the legal currency system until 1853,

when, after previous consultation with New Brunswick and Nova Scotia, a decimal system having as its unit a dollar equal in value to the American dollar was introduced and placed on an equal footing with the Halifax currency, and the British sovereign was made full legal tender at \$4.8667. On 1 Jan. 1858, the decimal system was finally adopted as that in which all public accounts should be kept, and since that date Canadian currency has been on a gold monometallic basis, with a unit of value equal to the gold dollar of the United States.

On 1 July 1867, the Dominion of Canada came into being, uniting in one Confederation the provinces of Ontario, Quebec, Nova Scotia and New Brunswick; currency, coinage and legal tender were thereafter under the sole control of the Dominion Parliament.

The first Federal Act dealing with the standard of value and the metallic currency was passed in 1868. It declared that it was desirable that the currency of Canada should be assimilated to the basis agreed on at the monetary conference held in Paris earlier in the year, and also that it should be of the same value as the metallic currency of the United States. It provided, however, for the continued use of the old

It will be observed that although the Canadian currency has a unit of value equivalent to that of the United States, the standard of value is the British sovereign.

Power was taken to make any foreign gold coins legal tender in Canada, and the American gold eagle of the weight and standard of fineness then existing, together with its multiples and halves, was made legal tender, each coin at its face value.

In 1910 the Act now in force (9-10 Edward VII, Chap. 14) was enacted. Its reads in part as follows:

"The denomination of money in the currency of Canada shall be dollars, cents and mills,—the cents being one-hundredth part of a dollar, and the mill one-tenth part of a cent.

The standard for gold coins of the currency of Canada shall be such that of one thousand parts by weight, nine hundred shall be of fine gold and one hundred of alloy; and the standard for silver coins of such currency shall be such that of one thousand parts by weight nine hundred and twenty-five shall be of fine silver and seventy-five of alloy.

Gold, silver and bronze coins, struck by the authority of the Crown for circulation in Canada, of the respective denominations mentioned in the schedule to this act, and of the standard weight and fineness therein set out, shall be equal to and pass current for the respective sums in the currency of Canada following, to wit: for twenty dollars, ten dollars, five dollars, two and one-half dollars, fifty cents, twenty-five cents, ten cents, five cents and one cent."

SCHEDULE

DENOMINATION OF COIN	Standard weight Grains	Least current weight Grains	Standard fineness	Remedy allowance	
				Weight per piece Grains	Millesimal fineness
<b>Gold</b>					
Twenty dollar.....	516	513.42	{ Nine-tenths fine gold, one-tenth alloy; or millesimal fineness, 900	.50	1
Ten dollar.....	258	256.71		.40	1

\* This remedy is on a group of one dollar's worth, ten pieces.

† This remedy is on a group of one dollar's worth, twenty pieces.

‡ This remedy is on a group of eighty pieces weighed against a weight of one pound avoirdupois.

"pound currency" when this was desired. This Act was repealed by the Act of 1871, which established the metallic currency on its present basis throughout the whole of the Dominion except Prince Edward Island (entered Confederation, 1873) and British Columbia (entered Confederation, 1871) extension to these provinces being effected in 1881. In 1886 a consolidating act was passed, providing that:

"The denominations of money in the currency of Canada shall be dollars, cents and mills—the cent being one hundredth part of a dollar, and the mill one-tenth part of a cent.

"The currency of Canada shall be such, that the British sovereign of the weight and fineness now prescribed by the laws of the United Kingdom, shall be equal to and shall pass current for four dollars eighty-six cents and two-thirds of a cent of the currency of Canada, and the half sovereign of proportionate weight and the fineness, for one-half the said sum.

"Any gold coins which Her Majesty causes to be struck for circulation in Canada, of the standard of fineness prescribed by law for the gold coins of the United Kingdom, and bearing the same proportion in weight to that of the British sovereign, which five dollars bear to four dollars eighty-six cents and two-thirds of a cent, shall pass current and be a legal tender in Canada for five dollars; and any multiples of divisions of such coin, which Her Majesty causes to be struck for like purposes, shall pass current and be a legal tender in Canada at rates proportionate to their intrinsic value respectively."

It also provides that the British sovereign and multiples and divisions thereof, and the five, ten and twenty dollar gold coins of the United States shall pass current and be legal tender, and gives the governor in council authority to fix, by proclamation, the rates at which any foreign gold coins shall pass current and be a legal tender.

The actual currency of the country consists almost entirely of paper (see CANADA — BANKING SYSTEM) and this has been found entirely satisfactory. Until recent years there had been no Canadian gold coinage, while the silver and bronze coinage needed had been obtained from England, through the Royal Mint, an arrangement which had always worked very well. Influenced, however, by the large production of gold in the Yukon territory the government took authority, during the session of 1901, with the concurrence of the Imperial government, to establish at Ottawa a branch of the Royal Mint, which came into operation in 1908.

Since that date all Canadian coinage has been minted in Ottawa. In 1912 the Ottawa Mint began the coinage of Canadian five dollar and ten dollar gold pieces, and up to 31 Dec.

1915 \$4,868,420 had been coined and issued. Practically none of this is in the hands of the public, which does not want and will not use gold, except very occasionally for some special purpose, and almost the whole of Canada's gold currency is held by the government or the banks, forming a small part of the country's gold reserves. These reserves are drawn upon or added to in the settlement of international balances, and for this purpose British and American gold is better adapted than is Canadian.

The subsidiary or token coins in use are five, ten, twenty-five and fifty cent pieces, all silver, and one cent, bronze. The total amount of silver coined and put into circulation in Canada (including \$95,000 old coinage of New Brunswick) up to 31 Dec. 1915 is \$19,848,323 and of bronze \$1,212,933. Silver of the face value of \$1,259,750 has been withdrawn for recoinage, and it is estimated that the amount now in circulation is from one-third to one-half of the total coined.

The history of the paper obligations of the Dominion government really begins before Confederation, when in 1866 the legislature of the province of Canada sanctioned an issue of provincial notes to an amount not exceeding \$8,000,000. At Confederation this issue, amounting to \$3,113,700, together with \$605,859.12 issued by Nova Scotia, was assumed by the Dominion, and the "Dominion Notes" system was thus inaugurated. In 1868 provision was made for securing by specie the note issue up to \$5,000,000 and 25 per cent of any excess, the balance up to the limit of \$8,000,000 to be covered by provincial or Dominion debentures. In 1870 the issue limit was raised to \$9,000,000, secured by 20 per cent of specie and 80 per cent of debentures, with authority to increase to any amount, providing the excess above \$9,000,000 was covered by specie. In 1872 it was provided that only 35 per cent of this excess need be so covered, while in 1875 it was enacted that for any issue between \$9,000,000 and \$12,000,000 specie to the extent of 50 per cent must be held, any excess above \$12,000,000 being entirely covered by specie. In 1880 the issue was raised to \$20,000,000 to be covered to the extent of at least 15 per cent by gold, an additional 10 per cent by gold or Dominion securities guaranteed by the Imperial government and the remaining 75 per cent by ordinary Dominion securities. The issue might exceed \$20,000,000 to any extent provided the whole of any excess was covered by gold. In 1903 an issue of \$30,000,000 was authorized, secured as to not less than 15 per cent by gold, and another 10 per cent by gold or guaranteed debentures. Any notes issued in excess of \$30,000,000 were to be secured by gold.

Immediately after the outbreak of war in 1914 the Act (5 George V, Chap. 4) now in force was passed, its main provisions being as follows:

"Dominion notes may be issued and outstanding at any time to any amount, and such notes shall be a legal tender in every part of Canada except at the offices at which they are redeemable".

"Dominion notes shall be of such denominational values as the Governor in Council determines, and shall be in such form, and signed by such persons, two in number, as the Minister directs".

"Dominion notes shall be redeemable in go. on presentation at branch offices established, or at banks with which arrangements are made for the redemption thereof as hereinafter provided".

"The Minister of Finance shall always hold as security for the redemption of Dominion notes up to and including fifty million dollars, issued and outstanding at any one time, an amount equal to not less than twenty-five per centum of the amount of such notes in gold".

"As security for the redemption of Dominion notes issued in excess of fifty million dollars, the Minister shall hold an amount in gold equal to such excess".

"The Governor in Council may establish branch offices of the Department of Finance at Toronto, Montreal, Halifax, Saint John, Winnipeg, Victoria, Charlottetown, Regina and Calgary, for the redemption of Dominion notes, or may make arrangements with a chartered bank at any of the said places for the redemption thereof".

Under the authority of this Act the following notes were outstanding on 31 March 1917:

Provincial notes	\$27,769.25
Fractionals	1,085,481.54
\$1, \$2 and \$4	24,085,893.50
\$5	3,253,092.50
\$50 and \$100	11,750.00
\$500 and \$1,000	6,526,500.00
	<u>\$34,990,486.79</u>
\$500, \$1,000, \$5,000 (for use of banks only)	148,258,500.00
Total	<u>\$183,248,986.79</u>

A very large proportion of the large notes in circulation is held by the chartered banks for reserve purposes, and also as a medium in which to make their daily settlements with each other. A special form of note has therefore been issued, negotiable only between banks, and of no value except to a bank. This materially lessens the risk of loss by robbery when large amounts are being carried from one bank to another, or at any other time. Of the notes in circulation as above \$148,258,500 were the special notes for the banks, while of the total issue of \$183,248,986 the banks held \$160,291,577, leaving only \$22,957,409 in the hands of the public.

To comply with the provisions of the Act, the Minister of Finance should have held on 31 March 1917, as security for the note issue, gold or securities deposited by the banks under 5 Geo. V, Sec. 4, Subsec. 2 (see CANADA — BANKING SYSTEM) as follows:

Up to and including \$50,000,000, 25 per cent.	\$12,500,000
\$50,000,000 to \$183,248,986, dollar for dollar.	133,248,986
Legal requirements	<u>\$145,748,986</u>

Of this total \$113,110,154 was in gold.

Immediately following the outbreak of the European War, redemption in specie of Dominion notes was suspended, the necessary instructions being given by the Minister of Finance on 4 Aug. 1914. These instructions were approved by an order in council dated 10 August and given full legal confirmation by an Act (5 Geo. V, Chap. 3) passed on 22 August. Under the authority of this Act, the redemption in specie of Dominion notes is still (31 Dec. 1917) suspended, and the suspension will doubtless continue until the end of the war.

In recent years the following amounts of Dominion notes (including a petty amount of old provincial notes) were outstanding:

1900	30 June	\$26,134,348
1910	31 March	87,173,342
1911	"	90,033,509
1912	"	113,368,858
1913	"	112,141,106
1914	"	117,834,859
1915	"	157,095,339
1916	"	176,969,293
1917	"	<u>183,248,986</u>

Legal tender in Canada is:

(1) Full legal tender. (a) Any Canadian gold coins struck under the authority of the Currency Act of 1910. (b) The British sovereign, and any divisions or multiples thereof, at \$4.86 $\frac{2}{3}$  to the £. (c) Gold coins of the United States of five, ten and twenty dollars each, at their face value. (d) Notes of the Dominion government, redeemable in specie on presentation (redemption suspended since 4 Aug. 1914).

(2) Limited legal tender. (a) Silver coinage of Canada up to \$10. (b) Bronze coinage of Canada, up to 25 cents.

(3) Potential legal tender. Any foreign gold coin, at rates to be fixed by proclamation.

The Canadian Bank of Commerce.*

**50. THE GRANGER MOVEMENT.** The Granger movement in Canada closely resembles in its economic and social features the movement of the same name in the United States from which it derived its initial inspiration. The Grange was first established in the province of Quebec in 1872 by Eben Thompson, a deputy from the United States. Two years later representatives from several Canadian Granges met at London, Ontario, and organized the Dominion Grange of the Patrons of Husbandry. In the declaration of principles then adopted the motto, "Unity, Liberty and Charity," was heartily endorsed. The objects of the organization were declared to be to develop a higher and better manhood and womanhood among the agricultural class; to enhance the comforts and attractions of their homes; to encourage farmers to buy less and produce more; to diversify their crops; to condense the weight of exports, selling more on hoof and in fleece, and less in the bushel. The society expressed itself as opposed to the credit system, and the mortgage system. It declared itself to be independent of political organizations and disassociated from political parties. At the same time it was "reserved for every patron as his right as a freeman to affiliate with any party that will best carry out his principles." The declaration of principles laid stress upon the importance of the abilities and sphere of women, who were admitted both to membership and to office in the order. The growth of the Grange during the next few years was very rapid. With the Dominion grange as its centre, it was organized in provincial granges, division granges and subordinate granges. In 1876 the secretary reported a total membership of 17,500 patrons, with 33 division and 530 subordinate granges. Of the latter 4 were in Nova Scotia, 7 in New Brunswick, 16 in Quebec and 503 in Ontario. There were also six subordinate granges in Quebec, organized under the National Grange of the United States. In the following year the Grange was incorporated by the Dominion Parliament, and in 1879 its membership reached 31,000. The Grange not only sought to exert an educative influence on the farming population by the distribution of literature, etc., but also set on foot, directly or indirectly, various economic enterprises of a co-operative nature intended to enable the farmers to buy and sell more cheaply by acting in union. Of these the most important was the Grange

Wholesale Supply Company of Toronto, with a branch establishment at Halifax. This was a joint stock company whose capital was supplied by members of the society, and which sold farmers' supplies, seeds and minor machinery to the patrons at greatly reduced prices. The local distribution was effected by the members of the subordinate granges. The company issued for some years a paper devoted to the interests of the patrons under the title of the *Grange Bulletin*. In this were printed extensive price lists of farmers' supplies offered for sale. A similar undertaking was established in the form of the People's Salt Company of Kincardine. The economic enterprises of the Grange have not, however, met with marked success. The demands made upon the initiative of the co-operative purchasers have proved too exacting. After some 10 years of successful existence the enthusiasm which the institution of the Grange had at first aroused began to cool, and many of the subordinate granges died of inanition. In the year 1876, 271 new granges had been reported in Ontario alone; in 1891 only two subordinate granges were organized in Canada, and in 1898 no new organizations were reported. Meantime the constant lapse of those in existence, through the apathy of their previous supporters, greatly reduced the numbers of the active patrons. The total number of granges instituted had reached about 1,000, but at the 29th annual meeting (2 and 3 Feb. 1904) the secretary's statement shows that only 13 division granges and 30 subordinate granges (with a membership of 411) had reported during the last year. The receipts of the treasury of the Dominion grange, which amounted to \$6,900 in 1876, fell to \$134 in 1906. In that year the Grange was amalgamated with the Farmers' Association, a society reformed from the Patrons of Industry, but since 1909 no statistics of membership and no annual reports of this body have been issued. During the whole history of the order there were organized at one time or another 57 division granges, 976 subordinate, 2 provincial (Ontario and Maritime provinces), and one Dominion, making a grand total of 1,036 separate Grange organizations in the Dominion. Many persons had been led to join in the movement from the sanguine hopes of profit to be derived from the co-operative side of the enterprise, and fell away when these were not realized. On the whole, the Grange movement must be regarded as a failure in the direction of its economic enterprises, but its influence for the social and educational advancement of the farming class has undoubtedly been great. During the flourishing period of the movement literary exercises alternated with the conduct of business matters at the local meetings. It has especially been instrumental in promoting various legislative measures in the interests of the farming class. Among these may be mentioned the Provincial Drainage Acts (R. S. O. C. 37, 38), the Dominion statute known as the Butter Act, etc. On the tariff question the opinion of the patrons has been divided; it has been difficult for the Grange to adopt any decided position in the matter without identifying itself with party politics. The Grange was, however, instrumental in securing the repeal of the duty on binder twine. The patrons have constantly sought to foster the

cheese industry and the cattle trade with Great Britain; have succeeded in having agriculture taught in the public schools; and have strongly supported the agricultural college at Guelph. The Grange has also agitated in favor of the inflation of the Dominion paper currency, the reduction of railroad rates and the appointment of a railroad commission. Consult Michell, H., 'The Grange in Canada' (Bulletin, Department of History, Queen's University, Kingston 1914).

STEPHEN LEACOCK,

*Professor of Economics and Political Science,  
McGill University.*

**51. THE LABOR MOVEMENT IN CANADA.** In Canada, as elsewhere, the labor movement has been shaped by political and economic environment. The presence of the French in Quebec has been an important factor. The existence of free land and the large part played by transportation and construction trades in a country of great distances and under rapid development are others.

The history of organized labor in Canada is in the main that of a series of outposts of the larger movements of Great Britain and the United States. The legislative aims of Canadian labor have been derived largely from the United Kingdom, but the working mechanism of trade unionism has come almost entirely, and especially in recent years, from the United States. Few data on the subject prior to Confederation (1867) exist. The newness of the country and the lack of industrial population were against organization. There were "labor circles," so-called, in the province of Quebec as early as 1825. In 1827 a printers' organization in the city of Quebec took cognizance of wages and cared for its sick. A similar union among the printers of York was recorded when that municipality became the city of Toronto in 1834. The larger seaports, being the localities in closest touch with Great Britain, were the first to develop trade unionism. Prior to 1850, however, the movement was negligible. The railway and land "boom" of 1850-54 brought important changes, especially in Ontario, and there were strikes of printers, shoemakers and molders at Toronto in the latter year. The Typographical Union of the United States crossed into Canada in the sixties. But it was not until 1872, and the winning of a celebrated conspiracy trial arising out of a strike of printers at Toronto, and the passing by the Dominion government of "An Act respecting Trade Unions," which repealed the harsh measures previously in effect against associations of employees (an echo of the repeal of the Combination Laws of England), that the labor movement had its real birth in Canada. In that year, which was the apex of a period of great industrial and commercial prosperity, the first general assembly of Canadian labor met at Toronto. It was attended by the representatives of 31 unions, though there were 70 unions in existence by that time in Ontario alone. The organization with some initial successes to its credit in securing legislation in the province of Ontario waned with the depression which followed the panic of 1873, and disappeared entirely three years later. In 1883, under more direct encouragement and support from the unions of the United States, the attempt to

found a central labor body in Canada was repeated, this time with permanent success, and after 1886 "The Trades and Labor Congress of Canada" secured a firm place among Canadian institutions, holding annual meetings and consistently increasing in strength and influence ever since. Since 1900 alone the increase in the membership of the Congress and its adhering bodies has been tenfold.

The constitution and general position within the Canadian labor movement of the Trades and Labor Congress as it exists to-day is of considerable significance and interest. From the outset, as already remarked, the typical local trade union in Canada has been a branch of a large "craft" organization having its headquarters in the United States. Even where the parent body is British, the immediate affiliation has usually been from a continental head office situated in the United States. Canadian trade unionism, accordingly, has reflected rather accurately the conflicts and general fortunes of the unions of the neighboring republic. The Congress is in effect an organization on the federal principle of the Canadian members of the general international labor movement, for the purpose primarily of directing public opinion and influencing legislation in the Parliament of Canada and the legislatures of the several provinces, a function which obviously a foreign organization could not adequately perform. The Congress accordingly has always been closely allied with the federated bodies of the United States, deriving its revenues not only from its own members but by grant from the federal head bodies whose work it carries out in Canadian territory.

This status of the Congress has in large part determined its history. In the great conflict which was waged in the closing decades of the 19th century between the Knights of Labor and the American Federation of Labor for supremacy in the federal field of American trade unionism, the Congress at first held the balance even. Later on, however, with the increasing strength of the Federation, the influence of the Knights of Labor in the Congress declined. Eventually an open rupture occurred, and in 1904 the "Canadian Federation of Labor" was organized of unions cast out of the Congress on the ground of adherence to the principles of the defeated movement. The new organization adopted as its leading policy the fostering of a purely Canadian as opposed to an international trade union movement. Outside of the province of Quebec, however, where the Knights of Labor had attained an exceptionally strong position, no numerous following was obtained. The Federation has at the present time a membership of about 50 unions. There have always been, of course, a limited number of purely local organizations of labor in Canada, and even of central craft associations, outside the international movement. The boot and shoe workers and textile workers of the province of Quebec had at one time considerable organizations. The Canadian Brotherhood of Railway Employees has more recently become prominent, and there are at present at least 10 other Canadian associations of a central character. Of these the best known, both because of its history and its present importance, is the Provincial Workmen's Association of Nova Scotia, a body founded in 1879, origi-

nally of coal miners. After a career of 30 years replete with successes, the Association had established its influence throughout Nova Scotia, when a strike of the Dominion Coal Company's employees threatened to involve the great majority of its members and accordingly to place an undue strain on its resources. The incident is somewhat typical of organizations having a limited field of operations. It caused a section of the membership in the present case to look for help to the United Mine Workers of America, the international body established throughout the continent, which at once threw organizers into the field. After a bitter struggle of several years' duration, a compromise was effected in 1917, by which the two series of local organizations have become merged, but have continued on a Canadian basis. As to the present position of trade unionism in Canada, the following is a brief review:

**Local Unions.**—Beginning with the unit of trade union organization, namely, the local union,—usually the craft union—there were in 1916 some 1,842 bodies of this character in Canada. Of these, 1,626 were branches of international organizations, 189 were branches of purely Canadian organizations, whilst 27 were entirely independent and local. The total trade union membership was estimated at 160,407 in 1916, of which 129,123 was international. This does not represent the highest point reached by the Canadian labor movement; in 1913, there were 2,017 local unions and the total membership was over 175,000. By provinces, Ontario stands first with 753 unions, and Quebec second with 306. British Columbia follows with 202 and Alberta with 147. Manitoba has 130, Saskatchewan 116, Nova Scotia 100, New Brunswick 80 and Prince Edward Island 8. Trade unionism naturally predominates in the larger industrial centres, and 18 Canadian cities contain 828 of the 1,842 local branches, and over 40 per cent of the entire membership. Montreal with 127 unions, Toronto with 111, Winnipeg with 75, Vancouver with 56, Hamilton with 50, Ottawa with 46, Edmonton with 42 and London with 40 are the leading centres of the labor movement. The most highly unionized group of workpeople is the railroad employees, who constitute 30.5 per cent of all Canadian trade unionists. The clothing and boot and shoe trades account for 10.6 per cent of the locals and the metal trades for 9.5 per cent. Building trades and mining and quarrying tie for next place with 9.4 per cent each. The printing trades have 4.5 per cent. These proportions vary from year to year with general economic conditions. In 1914 the building trades made up 18.9 per cent of the total trade union membership, whilst the railway employees were at that time only 24.9 per cent.

With regard to the central international craft organizations, it may be noted that of a total of 143 operating on the North American continent, 91 are represented in Canada. The American Federation of Labor constitutes the federal head of 112 of these; within Canada 84 are in affiliation with the Trades and Labor Congress. Naturally the Canadian representation in the international movement is but a small proportion of the whole. It was estimated in 1916 that the American Federation of Labor embraced a total of 24,360 local branches,

with a membership of 2,529,198. The Trades and Labor Congress of Canada could speak at the same time for 1,138 local branches having a membership of 66,573. Of the 91 organizations above mentioned, 41 have 10 or more branches in Canada. Those having 25 or more branches are as follows:

NAME OF ORGANIZATION	Number of Canadian local units	Reported membership of all units in Canada
Barbers' International Union of America, Journeymen.....	40	1,193
Bricklayers, Masons and Plasterers' International Union of America.....	56	3,755

	44	4,647
Totals.....	1,114	75,300

**Trades and Labor Councils.**—These are the municipal parliaments of labor, of somewhat loose organization, supported by a small per capita assessment. They are most important bodies under the Canadian system. All matters of general as opposed to craft interests are particularly their concern. In 1916 they numbered 46, of which 42 were chartered by the Trades and Labor Congress and 3 by the Canadian Federation of Labor. Nineteen of the trades councils are in Ontario. Perhaps the most historic labor body in Canada is the Toronto Trades and Labor Council. It was the body chiefly instrumental in calling together the first congress of labor in Canada, and it represents to-day over 10,000 members of the rank and file.

**Federal Councils.**—Canada has also its quota of trade federations, i.e., local associations of the unions of similar or allied trades. Thus there are nine allied printing trades councils, six building trades councils, six federal councils of railway employees and four federations of theatrical employees. A considerable number of the craft unions have also what is termed "district councils," which usually comprise all the branches of the same craft organization within the given area. Thus the Provincial Conference Board of Ontario of the Bricklayers, Masons and Plasterers' International Union is made up of 30 local unions scattered throughout the province. Similarly the United Mine Workers of Alberta and British Columbia have a district association. There are altogether 38 district councils of labor unions in Canada. It should be noted that in Canada as

in the United States the large international railway organizations have been chary of entering into definite affiliation with the general labor movement. They are not represented for example in the Trades and Labor Congress. They maintain instead a series of "protective" and "legislative" committees. Certain of the railway organizations have special officers under salary to watch their interests during the sessions of the Dominion Parliament.

**Beneficiary Work.**—The beneficiary work of the Canadian unions is inextricably interwoven with that of the continental movement. It may be remarked that the total expenditures on benefits of the international organizations represented in Canada was \$12,502,128 in 1916, of which the Canadian membership doubtless received its proportional share. In addition, the Canadian unions paid out independently and on a purely local basis the following sums:

Death benefits.....	\$56,646
Unemployed benefits.....	2,121
Strike benefits.....	15,542
Sick benefits.....	146,592
Other benefits.....	27,279

**Labor Legislation.**—The main body of labor legislation in Canada is of provincial origin—the provinces being vested, under the British North America Act, with the protection of civil rights. In the rise and development of the factory system in the older provinces, and of the mining and construction trades there and elsewhere, will be found the conditions which have created most of the Canadian labor laws. Factories and Shops Acts exist in all the provinces, and Mines Acts in those which have an active mining industry. Acts defining the relations of master and servant and protecting the wages of the latter found their way into provincial statutes at an early date. In legislation of this character the model followed has been that of Great Britain. In workmen's compensation legislation, for example, marked diversity has resulted from the different pace with which the provinces have followed British precedent. The Dominion Parliament, however, as responsible for the peace, order and good government of the country, the regulation of trade and immigration and the scope of the criminal law, has also been largely interested in labor problems. A Dominion Department of Labor has existed since 1900, and has been the chief Canadian agency for the settlement of disputes between capital and labor. The evolution of the Dominion policy in intervention in labor disputes, culminating in the Industrial Disputes Investigation Act of 1907—a measure which forbids a strike or lockout in the more important industries prior to investigation by a board of inquiry—constitutes perhaps the most interesting chapter in the subject of Canadian labor legislation. Labor departments in more or less developed form exist in most of the provinces.

R. H. COATS,

*Dominion Statistician and Controller of the Census.*

**CANADA HEMP, INDIAN HEMP, or AMY-ROOT,** a perennial herb *Apocynum cannabinum* of the dogbane family (*Apocynaceæ*), a native of North America (British Columbia, Florida and Lower California) gener-

ally found growing along the banks of streams or in moist ground. It has a strong fibre used by the Indians for twine, nets, woven fabrics, etc. They root deep, the stem and branches are upright and the leaves oblong, lanceolate-oblong and ovate-oblong, acute or obtuse and mucronate at the apex but narrow and rounded at the base. Above they are glabrous and sometimes pubescent beneath and range from two to six feet in length and six inches to three feet in width. The cymes are dense; the pedicels short and bracteolate at the base; and the flowers are from two and one-half to three inches broad. The calyx-segments are nearly as long as the tube of the greenish-white corolla. Consult Britton, 'Illustrated Flora of the Northern United States and Canada' (New York 1897); Gray, 'Manual of Botany' (New York 1889), etc.

**CANADIAN BOUNDARIES.** See BOUNDARIES OF THE UNITED STATES.

**CANADIAN CANALS.** The outstanding feature of water transportation in Canada is the Saint Lawrence system of rivers and lakes stretching from the Strait of Belle Isle to the head of Lake Superior—a distance of 2,340 miles. The shoals of the Saint Lawrence River in Lake Saint Peter between Quebec and Montreal have been dredged to give a waterway with a minimum of 30 feet in depth. Above Montreal the difficulties to navigation begin, and here begin a series of canals which overcome rapids and other obstacles. This work of canalizing the Saint Lawrence was not effectively begun till about 60 years after the British occupation. The canal system then embarked upon has been subsequently improved and enlarged, and in 1875 it was decided to increase their depths to a minimum of 14 feet. There is a difference in level between Lake Superior and tidewater of 600 feet, the total length of the canalization at different points being 73 miles. The following gives a summary of traffic during the past five years: 1911, 38,030,353 tons, of which 20.5 per cent was freight of Canadian origin, and the balance American; 1912, 47,587,245 tons (19.7 Canadian); 1913, 52,053,913 tons (21.3 Canadian); 1914, 37,023,237 tons (25.3 Canadian); 1915, 15,198,803 tons (44.7 Canadian). It will be observed that 1915 shows the extraordinary decrease of 21,824,434 tons, or 58.9 per cent, over the figures of 1914. Of that decrease 91 per cent occurred at Sault Sainte Marie (see p. 477, Sault Sainte Marie Canal). The canals of Canada, like those of the United States, are free of toll or restrictions of any kind, and there is thus absolute reciprocity in the use made of them by the vessels of each nation. The following is a brief summary of the principal canals of Canada:

**Saint Lawrence Canals.**—The Saint Lawrence canals, Lachine, Soulanges, Cornwall and Williamsburg, had a total traffic of 3,409,467 tons in 1915, a decrease of 982,026 tons over the figures of 1914.

**Lachine Canal.**—This canal was built across a portion of the island of Montreal in order to avoid the Lachine Rapids. It was opened in 1824, and has been subsequently enlarged three times. The present canal has five locks 275 feet long, of which two have a depth of 18 feet of water on the sills.

**Soulanges Canal.**—Between Lake Saint Louis and Lake Saint Francis three rapids are passed—the Cascades, the Cedars and the Coteau. In order to avoid these rapids the Beauharnois Canal was built on the south shore of the river and completed in 1845. It was 11½ miles in length, with nine locks. The Soulanges Canal, completed in 1899, and built on the north shore, has now superseded the Beauharnois Canal. Its length is 14 miles, and it has a depth of 15 feet of water available on the sills.

**Cornwall Canal.**—The Cornwall Canal was built to overcome the Long Sault Rapids at the head of Lake Saint Francis. It extends from Cornwall to Dickinson's Landing, and was opened for navigation in 1843.

**Williamsburg Canals.**—These begin with the Farran's Point Canal, five miles above the Cornwall Canal, and are continued by the canals at Rapide Plat and the Galops. They were completed and opened for navigation in 1846-47, and have been recently deepened and enlarged.

**Chambly Canal.**—The Chambly Canal at one time formed an important link in the chain of communication between the Saint Lawrence and the Hudson River via Lake Champlain. A lock at Saint Ours, 14 miles above Sorel, was finished in 1839. The Chambly Canal was opened in 1843, but was improved in 1850, giving a navigable depth of about seven feet of water. The canal is 12 miles long, the connection from Lake Champlain being by the Champlain Canal, built in 1822. The Chambly Canal, owing to the building of railways and the increased draught of vessels, is now of little commercial importance, and is chiefly used by barges carrying lumber from the Ottawa River to New York. In 1915 478,707 tons passed through, an increase of 41,802 tons over the preceding year.

**The Rideau-Ottawa Canal System.**—This system was designed to provide safe water communication between Kingston and the lower Saint Lawrence by way of Ottawa (then called Bytown) and the Ottawa River. In its conception the requirements of commerce were secondary to military considerations. Water communications with Upper Canada had been seriously interrupted during the War of 1812, and the system was intended to form, so to speak, a back-door between the two great rivers. At Sainte Anne, where the Ottawa joins the Saint Lawrence, private interests had constructed a lock in 1816. Twenty-seven miles farther up the Ottawa, the Carillon Canal was built to avoid the Carillon Rapids; the Chute à Blondeau Canal four miles above that, and the Grenville Canal a mile and a half above the Chute à Blondeau Canal. The Ottawa River canals handled 272,370 tons of freight in 1915, a decrease of 62,762 tons in comparison with the preceding year.

The Rideau Canal, formed by canalizing the Rideau and Catarqui rivers, and by making use of the Rideau lakes, was constructed as a military work, and was opened for navigation in 1832. The locks were 134 feet long by 33 feet wide, with five feet depth of water on the sills. In 1915 120,781 tons of freight passed through, a decrease of 30,958 tons from 1914.

**Trent Navigation System.**—A plan has been projected to construct a navigable waterway over 200 miles in length, connecting the

ivers and lakes between the Bay of Quinte and the southeastern shore of Georgian Bay. In 1907 it was decided to proceed with the improvement of the Trent River from the Bay of Quinte to Lake Simcoe, with an eight and one-half-foot navigation to Rice Lake, and a six-foot navigation from that point to Lake Simcoe. Contracts were let to a value of over \$5,000,000. Two great hydraulic lift locks have been constructed in connection with these works, the one at Peterborough being the largest in the world, and is able to lift vessels of a capacity of 800 tons vertically a distance of 65 feet. In 1915 49,904 tons passed through the Trent canals, a decrease of 17,811 tons on the figures of 1914.

**Welland Canal.**—This is the most extensive of the public works of this character undertaken by the Canadian government, and is designed to overcome the 27 miles that separate Lake Erie from Lake Ontario. The difference in level between the two lakes is 326¾ feet. The first canal was opened 27 Nov. 1829, and extended from Port Dalhousie on Lake Ontario to the Welland River, which was utilized as far as its outlet to the Niagara River. Vessels then ascended the Niagara to Lake Erie. In 1833 a diversion was made by extending the canal to Port Colborne on Lake Erie. In 1842 improvements and enlargements were made, and in 1875 a new cutting was begun from Allanburg to Port Dalhousie. In 1912 further enlargements were undertaken, at an estimated cost of \$50,000,000. The present channel will be used from Port Colborne to Thorold, and from there a new cutting will be made to Lake Ontario, entering the lake about three miles east of Port Dalhousie. This canal will be 25 miles in length, and in place of 25 locks will have seven locks, all of which are to be between Thorold and Lake Ontario. Each lift lock will be 800 feet by 80 feet in the clear with 30 feet of water above the sills, and will have a lift of 46½ feet. Provision is to be made to admit of a future 30-foot navigation. It is believed the opening of the new canal will favorably affect wheat freights and will result in the diversion of much traffic from the Buffalo-New York route to the Saint Lawrence. In 1915 3,061,012 tons passed through the Welland Canal, a decrease of 982,026 tons on the figures for 1914.

**Sault Sainte Marie Canal.**—Built to overcome the falls and rapids of Saint Mary River connecting Lake Superior with Lake Huron, it was opened for navigation in 1895. This was not the first canal to be constructed, the Northwest Company having built a small canal at the end of the 18th century. The Sault Sainte Marie Canal has a lock 900 feet long with a width of 60 feet and depth of water on the sills of 18 feet 3 inches at the lowest known water level. In 1897, 4,947,065 tons of freight passed through the Canadian Canal, and by 1913 the tonnage had increased to 42,699,324 tons. These figures had declined in 1914 to 27,599,184 tons; and the following year, 1915, an extraordinary reduction took place, the freight passing through being only 7,750,957 tons—a decrease for the 12 months of 19,848,227 tons. Of the decline of traffic at this gateway, 1,049,241 tons (or 5.1 per cent) attached to Canadian traffic, and 18,798,986 (or 94.9 per cent) to American traffic. The decrease was

largely in the nature of a diversion to the American Canal at Sault Sainte Marie. The cause of this diversion was the availability of a new lock on the American side, having a much larger capacity than the lock on the Canadian side. The practicability of carrying a heavier load through the new American lock drew away nearly all the iron ore trade and a good deal of wheat from the Canadian canal.

**Saint Peter's Canal.**—The Saint Peter's Canal connects Saint Peter's Bay on the Atlantic Ocean with Bras d'Or Lake, a salt-water estuary in Cape Breton Island. It was completed in 1869, was enlarged between 1875 and 1879, and has a lock 200 feet long, 48 feet wide, with 19 feet depth of water. A new entrance from the Atlantic is being made, with enlargement of the lock.

D. S. DOUGLAS.

**CANADIAN COPYRIGHT.** See COPY-RIGHT, CANADIAN.

**CANADIAN EMBROIDERY,** a kind of embroidery formed from small pieces of snake skin, fur, etc., intermingled with flexible pieces of split porcupine quills dyed in various colors.

**CANADIAN GOVERNMENT RAILWAYS.** The following lines were owned and operated by the Dominion government as the government railways in 1917: The Intercolonial Railway (1,562 miles), with which is associated the Prince Edward Island Railway (275 miles), the International Railway of New Brunswick (112 miles), and the Saint John and Quebec Railway (105 miles); and the National Transcontinental Railway, from Moncton, N. B., to Winnipeg (2,009 miles), giving a total of 4,063 miles. In 1917 a measure passed the Dominion Parliament providing for government ownership and operation of the Canadian Northern Railway. The Hudson Bay Railway, now (1918) in course of construction from The Pas, on the Saskatchewan River, to Port Nelson, on Hudson Bay, a distance of 410 miles, is to be operated as a government line. After the Canadian Northern Railway passes into government hands, there will remain only three lines of any importance under private ownership—the Grand Trunk, Canadian Pacific, and Grand Trunk Pacific railways. See separate articles on before-mentioned railways—CANADIAN NORTHERN; CANADIAN PACIFIC; GRAND TRUNK; GRAND TRUNK PACIFIC; INTERCOLONIAL; and NATIONAL TRANSCONTINENTAL.

**CANADIAN NORTHERN RAILWAY.** The Canadian Northern Railway system may be said to have had its origin in the construction in 1896 by Mackenzie and Mann, contractors, of a line of railway between Gladstone and Dauphin, in Manitoba, under the charter of the Lake Manitoba Railway and Canal Company. During the next few years construction was carried on under a variety of company names, but by virtue of an order in council, passed 13 Jan. 1899, the Canadian Northern Railway Company was brought into existence. In that year there were 252.6 miles in operation. In 1901 the lines of the Northern Pacific and Manitoba Railway Company in the province of Manitoba were leased for a very long term of years, and on 1 Jan. 1902, the last spike was driven upon a line connecting Winnipeg and Port Arthur, on Lake Superior, giving the Canadian Northern its own independent outlet

from the wheat fields of the prairies to the cargo carriers of the Great Lakes. Since then the lines have been extended over the Prairie provinces of Manitoba, Saskatchewan and Alberta, to the Pacific at Vancouver and Victoria, and to the principal centres of Ontario and Quebec, while in Nova Scotia, Canadian Northern lines serve the Atlantic shore from Halifax to Yarmouth, and cut across the province to the Bay of Fundy side. To-day the system comprises more than 9,000 miles of line. It connects Atlantic and Pacific ports and serves centres containing 60 per cent of the population and producing 70 per cent of the manufactured products of the provinces of Ontario and Quebec; 97 per cent of the urban population of Manitoba; 97 per cent of that in Saskatchewan, and 90 per cent in Alberta; in British Columbia it opens up the North Thompson Valley to settlement, and serves anew the old places such as Kamloops, Ashcroft, Yale, Hope, New Westminster, Vancouver and Victoria—in all 78 per cent of the urban population of the province. It has contributed measurably to the prosperity of the Dominion through opening up vast areas to settlement, by encouraging immigrants to make the new country their home and by opening up timber and mineral-bearing lands to development. The possibilities for economical operation in the future are exemplified by the fact that this transcontinental line possesses the easiest gradient of any of the great systems on the continent of North America.

Collecting elevators for grain having 26 per cent of the total capacity of western Canada are served by the Canadian Northern Railway; licensed terminal elevators having 47 per cent of the total capacity in Canada are on the Canadian Northern Railway lines. Flour mills having 51 per cent of the total daily capacity of Canada are on the lines of the Canadian Northern Railway. In British Columbia the Canadian Northern Railway proportion is 90 per cent; in Alberta 44 per cent; in Saskatchewan 74 per cent; in Manitoba 81 per cent; in Ontario 34 per cent; in Quebec 90 per cent; in Nova Scotia 15 per cent. Lumber mills producing 30 per cent of the total output in Canada are served by the Canadian Northern Railway, while 32 per cent of the total is marketed by water. In British Columbia the Canadian Northern proportion is 34 per cent; in Alberta, Saskatchewan and Manitoba 70 per cent; in Ontario 33 per cent; in Quebec 28 per cent; in Nova Scotia 28 per cent. Pulp and paper plants having 53 per cent of the capacity of Canada are served by the Canadian Northern Railway lines. In Ontario the Canadian Northern proportion is 60 per cent, in Quebec 64 per cent and in Nova Scotia 50 per cent. The company owns 3,245,987 acres of land, 843,127 of which are prairie land.

Its grain elevator at Port Arthur is the largest consolidated grain elevator plant in the world—capacity 10,000,000 bushels. Its coal docks at Port Arthur, Ontario, have a storage capacity of 660,000 tons, an unloading capacity of 700 tons per hour and an annual capacity of over 1,000,000 tons. The shipping capacity of the Canadian Northern Railway ore docks at Key Harbor, on Georgian Bay, is 8,000 tons of ore daily.

The lines of the system are located as fol-

lows: Nova Scotia, 369.90 miles; Quebec, 626.77 miles; Ontario, 2,219.10 miles; Manitoba, 1,989.10 miles; Saskatchewan, 2,178.10 miles; Alberta, 1,181.21 miles; British Columbia, 516.40 miles; State of Minnesota, 215.42 miles; a total of 9,296 miles.

During the fiscal year ended 30 June 1916, the Canadian Northern Railway system carried 9,384,056 passengers, and 13,353,381 tons of freight. The gross earnings for that period were \$35,476,275.06, the expenses \$26,102,744.52, and the net earnings \$9,373,530.54. There has been expended upon the construction of the system \$433,918,288.18, and upon equipment \$60,844,201.16, a total of \$494,762,489.34. The head office is located at Toronto. In 1917 a measure passed the Dominion Parliament providing for government ownership and operation of the Canadian Northern systems.

**CANADIAN PACIFIC RAILWAY, The.** A Canadian railway running across the continent from Saint John, N. B., on the Atlantic, to Vancouver, B. C., on the Pacific, with lines owned or leased, running from Montreal to Quebec, Ottawa, Toronto, London and Windsor, on the Detroit River, and branch lines throughout the provinces of Ontario and Quebec; with other branch lines to various points in New Brunswick; with a network of lines throughout the Canadian West and British Columbia, including the Souris branch, the Manitoba South Western, the Manitoba & North Western, the Great North West Central, the Crow's Nest Pass and Columbia & Kootenay lines, the Calgary & Edmonton, the Columbia & Western and many others; making a total mileage of 12,917 covered by the traffic returns of 30 June 1915. Other lines worked by the railway at that date aggregated 383 miles, and there were under construction 60 miles, while the mileage of the Minneapolis, Saint Paul & Sault Sainte Marie Railway and the Duluth, South Shore & Atlantic Railway (lines controlled by the Canadian Pacific) was 4,103 and 626 miles, respectively; a grand total of 18,090 miles of road built, acquired, leased or controlled since the company was chartered early in 1881. Construction of the main line was commenced in June 1881 and completed on 7 Nov. 1885.

By the terms of the government contract with a company whose directorate included George Stephen (now Lord Mount Stephen), Donald A. Smith (afterward Lord Strathcona and Mount Royal), Richard B. Angus, and others, it was agreed to build a railway from Callander, in northern Ontario; to the Pacific, for a consideration of \$25,000,000 in money and 25,000,000 acres of selected land, together with various privileges as to right of way, etc.

The original share capital of the company was \$5,000,000, increased in 1882 to \$25,000,000, and then to \$100,000,000, of which \$35,000,000 was canceled in 1885. Various financial changes and difficulties occurred during construction, and it became necessary to secure government loans of \$30,000,000 in 1884, and \$5,000,000 in 1885; these loans were repaid in full and the efforts of the promoters and management of the railway were eventually crowned with success.

By owning and operating all of the adjuncts of the railway service—telegraphs, express, sleeping cars, dining cars, grain elevators, as well as hotels at the leading points, steam-

ship lines on the lakes and on the Pacific and Atlantic oceans, the Canadian Pacific adopted special methods of management which have worked out to the material advantage of the company.

According to its statement of 30 June 1911, the cost of the railway and equipment was \$503,584,724 and of its various steamship lines \$24,208,595. It then held in Manitoba, Western provinces and in British Columbia 8,214,186 acres of land. Its capital stock was \$200,000,000, receiving dividends at the rate of 10 per cent per annum; its 4 per cent preference stock, \$80,681,921; its 4 per cent consolidated debenture stock, \$176,284,882; its bonded debt, \$6,399,180; 6 per cent note certificates, \$52,000,000.

The company issued \$25,000,000 5 per cent land grant bonds in 1881, which have been paid off. In 1888 a further issue of \$15,000,000 3½ per cent land bonds was made, and of these \$3,500,000 had been provided for at 30 June 1904 by payment of that amount to the government out of the proceeds of land sales in terms of the mortgage, leaving \$11,500,000 outstanding. These were afterward paid off.

The following table illustrates the diversified nature of its traffic during the three years, each ending June 30:

DESCRIPTION OF FREIGHT CARRIED	Year ended June 30th		
	1902	1911	1915
Flour, barrels . . . . .	4,921,993	8,469,744	8,538,600
Grain, bushels . . . . .	52,719,706	111,169,982	126,909,828
Live stock, head . . . . .	963,742	1,567,665	2,833,726
Lumber, feet . . . . .	1,033,569,377	2,441,007,107	2,180,735,600
Firewood, cords . . . . .	204,963	298,345	254,428
Manufactured articles, tons . . . . .	2,288,234	5,759,344	6,024,590
All other articles, tons . . . . .	2,571,136	8,971,037	7,423,163
<i>Freight traffic</i>			
Number of tons carried . . . . .	8,769,934	22,536,214	21,490,596
Of tons carried 1 mile . . . . .	3,247,922,167	8,062,102,013	7,940,151,342
Earnings per ton per mile . . . . .	\$0 75	\$0 81	\$0 76
<i>Passenger traffic</i>			
Number of passengers carried . . . . .		12,080,150	13,202,603
Number of passengers carried 1 mile . . . . .		1,457,332,932	1,164,488,630
Earnings per passenger per mile . . . . .		\$1 93	\$2 06

The gross earnings of the system for the year ending 30 June 1915 were \$98,865,209, and the working expenses \$65,290,582, with net earnings of \$33,574,627.

Lord Mount Stephen, the first president of the company, resigned from that office in 1888 and was succeeded by Sir William C. Van Horne, who retired in 1899, when Lord Shaughnessy, K.C.V.O., the present president and chairman of the company, became his successor. The general offices of the company are at Montreal, Canada.

**CANADIAN RIVER**, a river that rises in the northeast part of New Mexico, and runs generally eastward through Texas and Oklahoma to the Arkansas. Its length is about 900 miles, but it is rather shallow and not important for navigation. Its largest tributary is the

Rio Nutria, or North Fork of the Canadian, which runs parallel to the main stream for about 600 miles.

**CANADIAN SERIES**, the lower of the three series into which the rocks of the Ordovician system are divided by American geologists. It comprises the Chazy and Calciferous stages, principally limestones. See **ORDOVICIAN**.

**CANAIGRE**, kǎn-yí'-grā, a species of dock (*Rumex hymenosepalus*) indigenous to the arid region of southern California, Arizona, New Mexico, northern Mexico and western Texas. It is a perennial herb with tuberous roots from which a reddish or green stem rises to a height of about two feet and bears rather large leaves resembling those of other docks. The tubers, which resemble those of the dahlia, have long been used locally as a source of tannin, and attempts have been made to grow them upon a commercial scale for this purpose.

**CANAJOHARIE**, kǎn'a-jō-hǎ're, N. Y., an Indian word, meaning, "The pot that washes itself." A village on the south bank of the Mohawk River in Montgomery County, 55 miles west of Albany, in the most picturesque part of the Mohawk Valley. Canajoharie was first settled about 1740 by the Dutch and Germans. It was the home of Brant, chief of the Six Nations, and place of departure from the Mohawk to the southern interior. The Erie Canal, the New York Central and West Shore railroads pass through the village. The village has two banks, a library, six churches and a school of high standing; two weekly local newspapers and one hay-trade publication; flour mills, limestone quarries, paper and cloth bag manufactory and meat and fruit packing-houses. It is equipped with electric light and power, sewers and an abundant water supply. It is governed by a board of trustees and a council of five members, elected annually. Pop. (1916) 2,500.

**CANAL DOVER**, Ohio, city of Tuscarawas County, 70 miles south of Cleveland, situated on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and Baltimore and Ohio railroads. There are deposits of coal, iron and building stone in the vicinity. The city owns and operates its waterworks and electric lighting plant. The chief industries are in iron and steel, and the manufacture of racing-sulkies, baby-carriages, roofing, etc. Pop. (1910) 6,621.

**CANAL DU MIDI**, or **CANAL DU LANGUEDOC**, a canal in the south of France, connecting the Mediterranean Sea and the Atlantic Ocean. See **CANALS — HISTORICAL**.

**CANAL RING**. See **TILDEN, SAMUEL J.**

**CANAL ZONE BOUNDARY**. See **BOUNDARIES OF THE UNITED STATES**.

**CANALE**, kǎ-nā'lě, Nicolo, Venetian admiral, who flourished in the second half of 15th century. In 1469 he was commander of the Venetian fleet at Negropont (the ancient Chalcis), and succeeded in seizing the Turkish town of Enos. The cruelties perpetrated upon the inoffensive inhabitants created great indignation at Constantinople, and Mohammed II, with a view of resenting the outrages, besieged Negropont with a force of 120,000 men, and

after a violent contest expelled the Venetians. Canale, to whom this defeat was attributed, was sentenced to death by the Council of Ten, but at the instance of Pope Paul II and of other influential persons, his punishment was commuted to exile for life.

**CANALEJAS**, kǎ-na-lǎ'hǎs, Don José, Spanish statesman: b. 1854; d. 12 Nov. 1912. The son of humble parents, he was originally trained for the law, but took to politics at an early age. Working his way up the political ladder he held several portfolios, including those of Finance and Justice, and was for a time President of the Chamber. In February 1910 he was called by King Alfonso to succeed Señor Moret, the Premier, whose administration had lasted only four months. Moret had bitterly attacked the Maura ministry on the campaign in Morocco and their strong action in suppressing the Barcelona riots. Maura was compelled to resign and Moret, a Liberal, assumed office, but was soon forced to resign owing to dissensions in his party. Canalejas was called to the helm and formed his Cabinet in one day, distributing the portfolios among the Democrats, of which party he was the leader. On 15 June 1910 he disclosed his policy in the King's speech, which, whilst containing expressions of filial consideration for the Pope, clearly indicated that the government intended to take action against "unauthorized" religious orders and congregations. Canalejas speedily found himself in conflict with the Vatican when he canceled the prohibition, which was then in force, of the use of "any emblem, attribute, or lettering" on the exterior walls of Protestant places of worship. A number of prominent Carlists seized the occasion to send a testimony of their regard to Don Jaime of Bourbon, son of the late pretender, Don Carlos. Don Jaime, however, wisely repudiated any intention of disturbing the peace of Spain. The financial policy of Canalejas also ran counter to vested interests. Among his proposals was a tax on sums bequeathed for masses for the souls of the dead. A grave political crisis shook his administration early in 1911, when the question of the execution of Ferrer was revived. The responsibility for that sentence, however, did not rest upon Canalejas, for he was not in office when Ferrer was shot. In a speech he stated that he would have been in favor of a reprieve—as a matter of policy—which offended the military authorities. The War Minister sided with the army, but the King and the Cortes supported the Premier. Barcelona was said to be the home of 10,000 anarchists. In September 1911 these malcontents broke out in fierce riots, which spread with alarming rapidity. Canalejas was equal to the occasion. He proclaimed martial law throughout the country, seized the ring-leaders and broke up the menace in a few days. A democrat in sentiment, his sense of justice was strong, if severe. He resigned twice because the king had reprieved criminals condemned to death for atrocious murders. The king wished to bestow a title upon him, but the honor was refused by Canalejas, who said he preferred to remain associated with the proletariat from whom he was sprung. While looking in the window of a bookstore he was shot and killed by an anarchist.

**CANALETTO**, or **CANALE**, name applied to two Venetian painters: (1) ANTONIO, b. 18 Oct. 1697; d. 20 Aug. 1768, first followed his father's profession as scene-painter, but having studied in Rome, where he employed his time depicting ancient ruins in studied light and shade effects. He was the first to employ the camera obscura practically. He returned home and devoted his work to views of the palaces and scenes of Venice, which he painted with fine perspective, a clear and firm touch and an excellent mastery of color. He has been given both favorable and unfavorable criticism, the latter for the mechanical nature of his art. The National Gallery, London, has five pictures by him, among them 'View on the Grand Canal, Venice' and the 'Regatta on the Grand Canal.' (2) BERNARDO BELLOTTO (q.v.) nephew of the former, also a landscape painter, who imitated his uncle and master. He lived in Dresden where he was a member of the Academy of Painters.

**CANALS.** Canals are waterways, wholly or partially artificial, used for conveying water or for providing navigation. Those used for irrigation, drainage and water-power development are of the first class and, being closely related to the subjects of their purpose, are not considered here.

Navigation canals have been designated according to the size or kind of boats that can navigate them, as boat, barge or ship canals; according to the nature of the channel, whether purely artificial or in natural streams, they have been known as artificial canals or canalized rivers; and according to geographical location they have been called isthmian canals, peninsular canals, canals around falls or rapids, artificial seaport canals or canals connecting waterway systems. Also there are sea-level canals—built at sea level—and tidal canals, which are sea-level canals subject to tidal flow.

The term ship canal is commonly applied to those canals intended for ocean-going vessels, but the other terms—boat and barge—are not so generally used, probably because they fail to convey any definite idea as to size. However, the term thousand-ton barge canal, which was used to designate one particular canal, gives a fairly close idea of the boats that can be accommodated. As no standard of size has ever been or is likely to be established, the size of a canal is truly defined only by stating the maximum dimensions of the boats that can be accommodated. These are usually given in terms of draft, beam and length, but sometimes the form of bow and stern must also be considered.

Until a few years ago the great majority of canals were of small size, and before the advent of the lock, unless a canal could be built at one level, the boats used were limited to a size which could be transferred from one level to another by some mechanical device. After locks came into use, France, in the 17th century, undertook considerable canal construction. England followed next, but did little until the latter half of the 18th century. Early in the 19th century the beginning of canal construction was witnessed in America. This was all prior to the coming of railroads and at a time when canals furnished the only cheap means of transportation. The sizes of the canals up to

this time seem, in the light of present dimensions, but very small. During the latter part of the 19th century several of the European countries began enlarging and improving their more important canals, making some radical changes in size and in manner of construction and operation. These changes were worked out by careful study, made in accordance with modern scientific methods rather than by the rule-of-thumb procedure of former years. American waterway improvement along modern lines did not become very active until the beginning of the present—20th—century, but now various Federal projects, also the Panama Canal and New York State Barge Canal have caused a reawakening of canal construction in America.

The artificial channel, which among engineers is now known as a land-line, was the prevailing type of construction for many years, even where the route was parallel and in close proximity to a natural stream, as was often the case. To control a river sufficiently for navigation by small boats was often considered impracticable and the cost, prohibitive. The liability of damage to canal structures by floods and the damage to adjacent territory resulting from backwater caused by canal structures at flood time argued against the use of the natural channels. Later, when larger canals were built and methods for the control of rivers were improved, it became more economical to utilize the natural channels, where available.

Isthmian and peninsular canals, so called from the neck of land crossed, provide shorter and safer routes between certain ports. Canals around falls or rapids connect navigable portions of a river above and below the fall. There are several of these on the Saint Lawrence River. Artificial seaport canals extend from the coast inland and are designed to permit sea-going vessels to reach inland ports. Canals connecting waterway systems enable boats to pass from one system to another, thereby increasing the utility of both systems, and often also they possess other features of much importance.

Of canal structures, the most important probably is the lock, a device to raise or lower boats from one level to another. A lock, placed at the meeting of two canal levels, is simply a chamber or basin which has a gate or set of gates at each end and side walls extending from a little above the water-surface of the higher level to the bottom of the lower level. When a boat enters a lock the closed gates at the other end maintain the difference in elevation between the two levels. After the gates are closed behind the boat, water is admitted to or drawn from the lock chamber, so as to raise the boat to the upper level or lower it to the lower level. Then the gates ahead of the boat are opened and it passes to the new level, the point of difference in elevation between the two levels having been transferred to the gates through which the boat entered the lock.

Various kinds of lock-gates have been employed, the most common being the mitre-gate. This consists of two leaves swinging on vertical axes from the side walls and meeting at an angle in the centre with the apex toward the upper level. Wood was the material formerly used for mitre-gate construction, but now steel

is generally used. Improvement in gate design has made possible locks of more than 40 feet lift, whereas 10 or 12 feet was the usual maximum. The tumble-gate, sometimes used at the upper end of the chamber, is mounted on a horizontal axis at the bottom and is raised or lowered mechanically. Lift-gates, which can be raised high enough to clear the boats, and rolling-gates, which roll back into a recess formed outside the lock at right angles to the side wall, have also been used.

On the smaller locks, when mitre-gates were used, the water in the lock chamber was controlled by means of wickets or valves in the gates, but where the other kinds of gates are used and in all large locks, culverts are employed. These are built in the side walls or under the floor of the lock chamber, and in the larger locks usually extend just beyond the gates at both ends of the lock, connecting with the pools above and below the lock. They have several openings to the lock chamber, in order that the lock may be filled or emptied in a reasonable time with the least disturbance to the craft in the lock. The flow in these culverts is usually controlled by means of lift-gates or valves, located near each end. The Stoney gate, which operates on a nest of rollers, is being used largely on the New York State Barge Canal. There are a few instances of locks in which the culvert has been formed near each end into a siphon that has its neck above the highest water in the upper pool. A closed tank built in the masonry, which is filled from the upper pool and has an outlet to the lower pool and air pipe connection with the neck, primes the siphon, the water flowing from the tank tending to create a vacuum, which is filled by air from the neck.

The quantity of water required for one complete lockage is equal to the volume of the lock chamber between the elevations of the two pools. However, when the lockages alternate up and down, this quantity of water will serve to lock a boat each way. Where conditions permit, a saving of water is sometimes effected by the construction of a side pool. When the lock is to be emptied, some of the water is drawn into the side pool and retained above the level of the lower pool, thereby being available for filling the lower portion of the lock chamber at the next lockage. Evidently the quantity of water thus saved must be somewhat less than half the quantity required for one lockage.

There are a few examples of another type of lock—a structure consisting of a tank into which the boats pass and which is raised or lowered by power. Gates are provided at each end of the tank and also in the canal adjacent to the tank. Sometimes two tanks are operated side by side on a kind of balance. Since the weight of a tank and its contents is nearly constant, very little power is required and that mostly to overcome friction. With this type no water is consumed for lockage and but a small amount for power. On account of certain structural difficulties, however, very few locks of this variety have been built.

Inclined planes have been used occasionally in small canals in place of locks, the boats being hauled out of the water and up or down the incline in a saddle. Obviously these are not suited to large boats on account of the

difficulty of safely supporting the boat and also because of the great amount of power required.

Of the other structures used in canals the movable dams deserve special mention, because of the part they play in the utilization of natural streams for canal purposes. These structures are designed to fulfil all the functions of a fixed dam, when it is desired to maintain the pools for navigation, and at other times, when a fixed dam would cause excessive floods, to be capable of being removed from the channel area either by being lowered to the river bed or by being raised above the flood level. Many kinds have been devised and used, the bear trap, of which there are several varieties, the Chanoine wicket, the Boulé gate, the Taintor gate, the rolling drum and the Poirée needle dam being best known. Boulé gates are often used in connection with a sort of bridge superstructure, forming what is commonly called a bridge dam. Many types of automatic crests and also of controlled flashboards have been devised for special cases, to serve partially the same purpose as the movable dam, but their use is less general.

In the operation of the larger canal structures mechanical power has almost entirely superseded hand-operation. The great advances made in the development of electrical equipment render electric power particularly suitable for canal service. Also by its use the best means of lighting for night operation can be obtained. Where water power is available at a lock, a hydro-electric plant may be installed. In some cases, where power may be needed at times when water power is not available, as at movable dams, the electric generators are driven by gasoline engines. Electric power has the advantage of ease in distribution to points where it is needed and also flexibility in the amount employed. In addition, the modern equipment for lock operation is damaged very little by flood water. The equipment is often quite extensive, as on the Panama locks at Gatun, where all the operations are indicated on a board or diagram, which automatically shows the position of all the moving parts of the locks at all times.

Any project for canal construction must necessarily be considered from three standpoints—the commercial, the engineering and the financial. From these standpoints there must be considered not only the subjects that have already been discussed, such matters as terminals, power-supply and types of locks, dams and a host of lesser structures, but also the more general problems that arise in canal-building, and which remain for discussion.

These problems are so many and so interdependent that they do not readily lend themselves to brief classification. However, under three main heads—(1) dimensions, (2) route and (3) water-supply—the most important can be considered.

1. Several elements enter into a determination of the dimensions for a canal. In general a large boat can carry freight cheaper than a small boat, but unless the traffic is sufficient and of the proper kind to keep the large boat working to capacity, a canal of large size is not economical. A canal often terminates at a large lake or river or at the ocean. The question then arises as to whether it is advisable to make the waterway to fit the boats which

navigate these adjacent channels or to use smaller boats and transfer the cargoes. The nature of the territory traversed is also a determining factor. If natural waterways are available, then a larger channel may be desirable, since it can be made without excessive cost and will permit greater speeds. The necessity of bridges has a bearing on the subject. If they must be fixed bridges, the minimum clearance tends to limit the boat dimensions and through them the channel dimensions.

Until recent times the question of speed has not had much bearing on canal dimensions. On the old and small canals the permissible speed did not exceed three and a half or four miles an hour, this limit being necessary because of injury to the banks by wave action. Since larger channels and canalized rivers have come into use, higher speeds are obtainable. Just how high speeds will eventually be attained is hard to say. The economical speed probably has not yet been worked out; at least it is not generally recognized. Doubtless higher speeds are attempted than are warranted economically. In a restricted channel, such as most canals must necessarily have, the power required for a speed in excess of about five miles per hour increases much more rapidly than does the resulting speed attained. The necessity for a considerable amount of water under the keel has not been appreciated by canal boatmen of the old order. They have usually crowded the channel dimensions beyond a reasonable limit by the boats they have used, not realizing that they were defeating their own ends by increased cost for traction. On some of the recently improved canals the allowable speeds change with the locality. For example, on the New York Barge Canal they range from 4 to 10 miles. From this discussion it appears that, if a given speed must be attained on a canal, then the channel dimensions must be planned accordingly.

Closely allied to the question of speed is that of power. In the primitive canals man furnished the motor power, pushing the boats by poles, rowing them or drawing them by ropes from the banks. Then came the use of animals on a towpath. This was the common method until the modern era of improvement. Sometimes locomotives have replaced the animals. Steam propulsion has been in use to a limited extent on various canals for many years. Experiments in electric propulsion have been numerous, but no very successful system has yet been developed. A cable or a chain along the bottom of the canal has been used in some places, especially in Europe. These are either gripped or wound over a drum on the boat. According to modern methods canal boats are self-propelled or move in fleets of one power boat and one or more consorts. The newer canals are not provided with towpaths.

2. The early canals followed the natural contours of the ground much closer than do modern canals. Because of difficulties connected with stream canalization, preference was usually given to the building of independent channels, which often were close to but slightly above the streams. As previously stated, modern practice favors river canalization. After certain general features of location have been determined by commercial and broad topographical considerations, the detailed location

of a canal is distinctively a technical problem, in which questions of engineering expediency and relative costs play the chief part. The desiderata sought in canal location are shortness of route, minimum of curvature, least number of locks, all possible elimination of intermediate summit levels, minimum of excavation and embankment, avoidance of a channel above surrounding country, greatest ease of excavation consistent with stability, suitable foundations for structures, accessibility to water-supply, least interference with adjoining private, municipal and industrial interests, utilization of natural water courses, etc. This subject of location, like that of dimensions, is complicated. Only by careful surveys and comparative plans and estimates can the questions be solved.

3. The supplying of water is one of the most important problems connected with canals. In the old canals, which were generally small and ran beside natural streams, the water requirements could be readily met by damming the stream and leading a short feeder to the canal. Under more difficult conditions, lakes or artificial reservoirs and sometimes long feeders have to be resorted to. It is almost essential that the supply be such that it can reach the canal by gravity flow, since in a canal of any magnitude the question of pumping is seldom to be considered.

Water has to be supplied to canals for three main purposes, namely, to fill the canal prism and to replenish loss in the levels between locks; to furnish water sufficient for lockages and for unavoidable leakage at locks; and to furnish power for operating the machinery at locks and other structures, and for electric lighting along certain portions of the canal, particularly at the locks.

An independent water-supply for filling the canal prism is required only in land-lines and then only at the opening of navigation or after water has been drawn out of the levels for repairs or other purposes. In river-lines the natural flow of the stream will, of course, fill the canal prism. The losses in land-lines include seepage through embankments, waste over spillways, evaporation from water-surfaces and transpiration through aquatic plants. For river-lines there is less waste through seepage and none over spillways.

The amount of water required for a lock varies not only with the height of the lift, but also with the volume of traffic. The same quantity of water is used in lockage, whether the boats are large or small and whether the lockage is up or down. Therefore the efficiency, or economy, of the lifting operation is increased with the larger boats. For a given amount of traffic the water-supply varies according as the boats are large or small and according to the manner in which they pass the lock—whether singly or in groups and whether lockages in the same direction are made in sequence or alternate with lockages in the opposite direction. A canal is essentially an inland transportation line in which the grades are overcome by water-power. That the power is applied directly from water to boat does not alter the case. All things considered, the canal lock is a fairly efficient water-driven machine. In addition, the lock has the advantage of simplicity, quick operation and avoidance of strain on the boat.

The critical points of supplying water to canals are usually the summit levels. Although lower levels may require more water, it is generally more readily obtainable for such portions, especially under the modern method of stream utilization. Proceeding downward in either direction from a summit, the water-supply required at any lock is equal to the sum of the losses from the source of supply down to the lock, plus the water required at the lock, minus the natural inflow, if any, between the source of supply and the lock. From this it appears that the water-supply required may vary greatly from point to point. In providing water for a summit level of a canal it is necessary, therefore, to obtain a supply adequate for the points of greatest demand on both sides of the summit.

Thus it will be seen that the problem of estimating the water-supply required by a canal, like the problems already discussed, is also complicated. Many items can be determined only approximately. It is necessary to allow a liberal excess, or reserve supply, as a factor of safety.

**Historical.**—The earliest artificial water channels were for irrigation and drainage; not to reclaim swamp land, other soil being too plentiful, but to regulate the overflow of rivers. These date from an immemorial past, certainly 3500 B.C. in Babylonia and Egypt, more probably 7000 at least. Very early also the larger ones must have been used for boat navigation, to transport agricultural and building materials; these combined drains and canals still exist in England, called "navigations," and the workers on them "navigators," and have given to the language the word "navvy" for construction laborers. At what period the first ones were dug primarily for navigation, and incidentally for irrigation, cannot be told. There is a tradition that the Suez Canal was dug under the old kingdom of Egypt before 2000 B.C.; it was certainly opened or reopened for small boats by Necho, about 600 B.C. About this time also Nebuchadrezzar of Babylon opened the Royal Canal between the Tigris and Euphrates, but Mesopotamia had been well canalized before. These two countries, indeed, invited canals, with their flat surface and long levels, and easy digging in sand or clay. It is probable that China also had canals before the Christian era, but evidence is wanting. The first canals were of course on one level; but with the light boats and great engineering skill of the ancients the step was not long by damming the water at different levels and hauling the boat over. The first system, not yet disused, was to pull the boat up an inclined plane and let it down by gravity; and this remained the only available method till modern times. Under Alexander and his successors in Egypt and the Seleucid empire canals were much used: an important one was from Alexandria to the Nile, whose mouths were shut off by sandbars. Marius had one constructed 102 B.C. from the lower Rhone to the Mediterranean. Under Claudius there was one from the Tiber to the sea; and in Great Britain there are two which date from the Roman time, the Foss Dyke and the Caer Dyke, in Lincolnshire, of 40 and 11 miles respectively. In the 4th century Lombardy was canalized,—a very favorable spot from its great plain and many rivers; and near the end of the 5th cen-

tury Odoacer carried one from the Adriatic to Mentone above Ravenna. The downfall of Roman civilization stopped their development for a while; but under Charlemagne a fresh extension began, that monarch building canals to connect the Danube both with the Rhine and the Black Sea. In the Netherland bogs the system is that of nature itself, and began very early; here the canal is not so much an artificial channel as a remnant of the original sea, around which the land is built. In Britain as early as 1121 Henry I deepened and made navigable the old Foss Dyke. The Grand Canal of China, about 1,000 miles long, a large part of it made up of canalized rivers, was completed in 1289. That country has many other great systems connecting its internal waterways.

But obviously the boats transferable by such machinery must be small and lightly loaded; and the modern canal system, with long, heavy boats and large cargoes, was first made possible by the invention of the lock. This doubtless developed out of putting dams close together with gates in them; but neither inventor nor even country of first use is certain. It has been claimed for two brothers, engineers at Viterbo in Italy, in 1481; also for Leonardo da Vinci, the universal genius; and again for Holland a century earlier. The one certain fact is, that in the latter part of the 15th century they were in use in both countries, and spread rapidly through Europe. The first country to undertake on a large and systematic scale the connection of its leading systems by canals was France, in the 17th century. The Brière Canal, connecting the Seine and Loire, was begun in 1605 under Henry IV, and completed 1642 under Louis XIII. The Orléans Canal, uniting the same basins by the Loing, was completed 1675, under Louis XIV. The greatest of all, the Languedoc Canal, to connect the Bay of Biscay with the Mediterranean, was finished 1681. It is 148 miles long, 6½ feet deep, with a summit level of 600 feet; has about 119 locks and 50 aqueducts, and floats barges of 100 tons. France in 1879 passed a law making all its canals uniform at 6½ feet deep, with locks 126½ feet long by 17 wide. England was much later in taking up the system on a large scale, but when it did so, carried out a remarkable one, with great feats of engineering. The fathers of it were Francis, Duke of Bridgewater and his famous engineer, James Brindley; and the beginning was the charter for the Bridgewater Canal in 1759. The names of Watt, Telford, Nimmo, Rennie and other noted engineers are associated with it. The last inland canal in Great Britain was built in 1834. Among the leading ones are the Grand Junction, 128 miles; Leeds & Liverpool, 128; Trent & Mersey, 93; Kennet & Avon, 57. The great Irish canals are the Grand Canal, from Dublin to Ballinasloe, 164 miles, uniting the Irish Sea to the Shannon; and the Royal Canal nearly parallel to it for the same traffic, from Dublin to Torinansburg, west of Longford. The great canals of Scotland are the Caledonian and the Forth & Clyde, described under SHIP CANALS. Early in the 18th century Peter the Great constructed a great system of canals and canalized rivers, 1,434 miles long, to connect Saint Petersburg with the Caspian. The Danish Canal, 100 miles long, from the North Sea to the Baltic, was finished in 1785. The Gotha Canal, 280

miles long, connecting Stockholm with Gothenburg across Sweden, was planned 1716, but opened the first part 1810, the whole 1832. In 1836-46 Louis of Bavaria revived Charlemagne's old plan, connecting the Main (and so the Rhine) with the Danube, by a canal 108 miles long, 650 feet above the Main, and 270 feet above the Danube.

**United States Boat Canals.**—The first canal in this country was built in 1793, around the falls of the Connecticut River at South Hadley Falls, Mass.; the engineer was Benjamin Prescott of Northampton, afterward superintendent of the Springfield armory. The lift was not by locks, but by inclined planes, the boats being run into a movable caisson, filled with water and hauled up by cables operated by water power; locks were introduced later. In 1796 a canal was completed around Turner's Falls farther north in the same river, at Montague. "The Proprietors of the Locks and Canals on Merrimack River" were incorporated 1792, and opened their canal around the falls at Lowell to the mouth of the Concord, one and a half miles long and with four locks, in 1797; it was for the lumbering business, rafts, masts, etc. But the first general canal for passengers and merchandise opened in the United States was the Middlesex, a rival to the last, incorporated 1793, and completed 1804 at a cost of \$700,000; it ran to Charlestown, 31 miles, was 24 feet wide and 4 feet deep, and fed by the Concord. A packet boat, the *Governor Sullivan*, plied regularly between Boston and Lowell, taking nearly a day. The first boat voyage to Concord, N. H., was made in 1814, and a steamer began passages in 1819. The canal was disused 1851. But much broader projects had been set on foot about the time of these local ventures; and several of the greatest afterward carried out, as well as some which have been chimeras rather from political developments than from any inherent impracticability, were broached even before the Revolution. Washington was deeply interested in canal schemes all through his life, and favored canals to connect all the great American water systems. The Potomac and Ohio, the James and Ohio, and the Mohawk Valley and Great Lakes connections, were all examined by him. The last named he looked over during the Revolution. In 1792 the Western Inland Lock Navigation Company was formed, and by 1797 had finished six miles of canals around the rapids at Little Falls, making a navigable way for 15-ton barges to Lake Ontario. Pennsylvania built several small canals in the two decades from 1790 to 1810, but they had little success. In 1784 Maryland and Virginia jointly granted a charter for a canal from Georgetown on the Potomac to the Alleghanies, under which up to 1822, when it was abandoned, some three-quarters of a million dollars were spent in excavations, dams and locks.

**Chesapeake and Ohio.**—The fortunes of this system have shown how difficult it is to forecast business developments. As designed by Washington, it was to connect the Chesapeake and ocean navigation, by way of the Potomac, with that of the Ohio, by portages and highroads from its terminus, Cumberland, at the foot of the Alleghanies; as a fact, its use has been mainly from the accidental fact that Cumberland is near the Pennsylvania coal fields. The fortunes of the first company have been described.

In 1823 commissioners appointed by Maryland and Virginia reported in favor of a new route in place of attempting to complete the old one; in 1824 the national system of internal improvements was inaugurated by act of 30 April, and a board of engineers in October 1826 reported on a canal from Georgetown to Pittsburgh. As the cost was over \$22,000,000, it was considered prohibitory then; and in 1829 the "eastern division" to Cumberland was authorized, by national, State, municipal and private stock subscriptions. But the work had been inaugurated on 4 July 1828 by President J. Q. Adams, who struck the first spade; and it was fully opened in 1850. It is 184 miles long and 6 feet deep, 60 feet wide from Georgetown to Harper's Ferry, and 70 on an average from thence to Cumberland. It is fed from the Potomac by seven dams. The aqueduct at Georgetown over the Potomac was a very considerable engineering feat for its time; it rests on 12 masonry piers constructed by coffer-dams on rock 28 to 40 feet below the surface. At Paw Paw Bend, 27 miles east of Cumberland, the canal saves six miles by a cut-off and tunnel through the mountain, 3,118 feet long. The summit level is 613¾ feet above tidewater; the rise is accomplished by 74 locks from 6 to 10 feet lift. The whole work had cost over \$9,500,000 when opened, and its total capitalized outlay had been over \$15,000,000 when the bondholders foreclosed in 1890.

**Erie Canal.**—The best known of the New York State canals is the Erie Canal, which joins the Hudson River and Lake Erie. The original Erie Canal was the great pioneer work of engineering in America, standing as the model for canal-building for a half century. The work of opening navigation to the interior which was undertaken by the Western Inland Lock Navigation Company in 1792 did not accomplish all that was needed and early in the 19th century agitation began for something more adequate. In 1808 the legislature ordered a survey of the route between the Hudson and the Lakes for the purpose of securing information to set before President Jefferson, who a short time before had recommended that Congress appropriate surplus moneys for building canals and highways. In 1810 the legislature appointed a commission, Gouverneur Morris and De Witt Clinton being two of the members. In 1811 Robert Fulton and Robert R. Livingston were added. This commission made reports from year to year and in 1816 was ordered to make complete surveys and estimates. On 15 April 1817 construction of the Erie and Champlain canals was authorized and on 4 July 1817 the first ground was broken at Rome. On 26 Oct. 1825 the canal was formally opened from Albany to Buffalo, 363 miles. Its success was so marked that it gave rise to a veritable mania for canal-building throughout the country. There can be no doubt that it was the greatest single factor in bringing to the State and the city of New York their remarkable development and prosperity during the first half of the 19th century, giving the latter the initial impetus which has made it the chief metropolis of the Western world. The channel was 28 feet wide at bottom, 40 feet of water-surface and 4 feet deep. It had 84 locks, 90 feet long between gates and 15 feet wide, with a total lift of 689 feet. It cost \$7,143,790.

The first enlargement, begun in 1836, was not finished till 1862. It shortened the canal to 350½ miles; gave a channel of 70 feet wide at water-line, 52½ or 56 feet at bottom, according to side slopes, and 7 feet deep; made 72 locks, each 110 feet long between gates and 18 feet wide, having a total lift of 654.8 feet; and cost \$31,834,041. At the close of 1882, when all tolls were abolished, gross revenues to the amount of \$121,461,871 had been collected on the Erie Canal; the cost of construction, improvements and maintenance had been \$78,862,154, leaving a balance of \$42,599,717 to its credit. The preceding decade was a period of adverse public sentiment toward the State canals and several of the lateral branches were abandoned. In 1884 there began a series of lock-lengthenings which continued for about 10 years and marked the beginning of renewed interest in canals which has endured until the present time, finding expression in two enlargements. The first of these, 1896 to 1898, which was the second enlargement of the canal, attempted a ~~deepening to~~ nine feet, but because of exhaustion of funds it was never completed. The third enlargement, authorized in 1903, is an improvement in more things than size; it is a rebuilding along modern lines. It was originally planned for barges of 1,000 tons, but before work was begun the size was increased to accommodate boats of two or three times that capacity. The Erie Canal has had a remarkable history. It occupies a strategic position; it connects the Lakes and the Atlantic along the only feasible canal route in the United States. It has played an important part in industrial development and regulation of commerce between the great interior and the coast, and it promises to continue exercising a mighty influence. See **BARGE CANAL**.

**Hennepin Canal.**—This is one of the few boat canals which have been dug in the United States since 1850. It was begun June 1892 and completed in 1908, at a cost of \$75,000,000. It affords a short route from the upper Mississippi to Lake Michigan, extending from the Illinois River at Great Bend, about two miles from Hennepin, Ill., to Rock Island, Ill. Its entire length is 77 miles, but of this distance 27 miles are along the slack waters of the Rock River. The canal proper and its summit level feeders are 7 feet in depth and 80 feet wide. There are 37 locks, each 35 by 70 feet in size and with lifts ranging from 3 to 10 feet in height.

**Illinois & Michigan Canal.**—This route connects the Mississippi system with the Great Lakes, and, by the Welland Canal, with the Saint Lawrence. Its inevitability was plain by reason of the extensive use of the Chicago portage (from the Chicago River to the headwaters of the Kankakee, an affluent of the Illinois) by the Indians and trappers, it being only half a mile for boats, the shortest important portage on the continent. Chicago was one of the best trodden sites in America before white men came here. As early as 1822 Congress granted a right of way for such a canal, and in 1827 and 1854 made further grants. For some reason it hung fire for many years, though a host of surveys and estimates were made by the State and the nation. Work was prosecuted on it 1836-41, then suspended till 1845, and the canal was finally opened in April 1848. It had then cost \$6,170,226. The western

terminus is La Salle, at the head of steamer navigation on the Illinois River; its eastern is on the south branch of the Chicago, about five miles from its mouth in the city. The entire length is 96 miles, and the rise from La Salle to Lake Michigan is 145 feet, surmounted by 17 locks, 110 by 18; the capacity of boats is 150 tons. The original intention was to make a straight cut from Lake Michigan to the Des Plaines River, the chief branch which with the Kankakee forms the Illinois; but to save expense it was decided to use the Chicago River instead. Thence it runs to Summit on the Des Plaines 8 miles; then 42 miles to the junction with the Kankakee; thence through the Illinois Valley to La Salle. It has five navigable feeders, the Calumet, Des Plaines, Du Page, Kankakee and Fox; and five large storage basins. The summit level at Bridgeport required pumping for supply; and two steam engines, delivering 15,000 cubic feet of water per minute, were used till 1870. These were also used for many years to help draw off the sewage of Chicago, which empties for miles into the river. By supplying the canal from the river, the lake water was drawn in to fill the vacancy, and so kept the river comparatively sweet. But the system was expensive, and the canal was deepened for some years, ending 1870, to carry the sewage by its own flow to the Des Plaines, reversing the current of the river. It proved insufficient, and in 1892 the Chicago Drainage Canal (q.v.) was begun, which was finished in 1900. It is 40 miles long to Joliet, 22 feet minimum depth, and 162 to 290 feet wide at top. A scheme has been mooted for years to convert this into a huge ship canal to enable ocean-going steamers to ascend from New Orleans to Chicago, and so through the Great Lakes and to the Saint Lawrence; but it depends on the co-operation of the national government. Consult Putnam, J. W., 'The Illinois and Michigan Canal' (Chicago 1918).

**James River & Kanawha Canal.**—This is a line partly existent and partly on paper, but interesting as probably the oldest North American canal scheme. The idea is accredited to Governor Spotswood in 1716, when he explored the Blue Ridge; but the first active part was taken, as in all these early ventures, by Washington, who saw from his backwoods days the necessity of joining the eastern seaboard to the trans-Alleghanian territory by lines of communication. He personally explored the James River route in 1784, and induced the Virginia legislature on 5 Jan. 1785 to pass an act for improving the navigation of the James. Under this the James River Company was organized, 25 Jan. 1785, with Washington as president. No work was done, and in 1835 another company of the same name took up its task, beginning the construction of the section from Richmond to Lynchburg in 1836, and completing it near the end of 1841. The second division, from Lynchburg to Buchanan on the upper James, was begun before this was opened, and completed in 1851. In 1853 an extension of 47 miles to Covington on Jackson River was begun, but the war interrupted it, and it has never been resumed. In 1874 the cost of completing it to the Kanawha, including an improvement of the navigation of that river, was estimated at \$60,000,000.

**The Ohio Falls Canal.**—This is a short canal, but from its location a very important one; it makes continuous navigation in one of the chief waterways of the continent. The first canal was built 1825-30, and called the Louisville & Portland. It was 17-10 miles long, 64 feet wide, had 8½ feet lift, and three locks, one at the head and two at the foot. An enlargement was begun in 1861, but interrupted by the war; in 1868 the national government included it in its river and harbor appropriation, and it was opened February 1873, having cost about \$4,000,000. It runs west from in front of Louisville, Ky., to Portland; is a little over 11,000 feet long and 86½ feet wide, with a minimum depth of 6 feet assured by a dam at the falls. The water in the river varies from 6 to nearly 43 feet, and earthen parapets on the sides of the canal rise to 44 feet, based on stone walls, themselves built on the limestone rock through which the canal is cut. The upper lock has been raised, the lower two left as they were, but a branch with two locks has been added. At the head are flood-gates 46 feet 11 in. high. The upper entrance is 400 feet wide.

Among others existent or of past importance are the canal between the Chesapeake and Delaware bays, across the Delaware isthmus, built 1824-29, 13½ miles long, and supplied by pumps for 10 miles of it. An enlargement has been projected. This system has recently been acquired by the Federal government. (See SHIP CANALS). The Morris Canal, 101 miles long, built in 1830, connects the Hudson at Jersey City with the Delaware at Phillipsburg, N. J.; it is owned by the Lehigh Valley Railroad. The Delaware & Raritan, 43 miles long, built 1831-34, connects those rivers, and therefore New York and Philadelphia. The Delaware & Hudson, completed 1820, was once the great coal freight route between New York and the Pennsylvania mines; its company transformed itself into the railroad company of the same name, and has abandoned the canal. The Schuylkill Coal & Navigation Company's canal is 108 miles long. The Ohio & Erie Canal from Portsmouth, Ohio, to Cleveland, and the Wabash from Toledo, Ohio, to Evansville, Ind., were once of importance in building up these sections.

The initiative taken by New York in the construction of the great barge canal seems to have had the effect of causing a new era of canal building. Several projects have been begun and several of these have almost been completed, among these latter being the Lake Washington Canal, which connects Lake Washington, near Seattle, Wash., with Puget Sound by means of a canal nearly two miles in length, a 17-foot lock being required to lift the vessels from the waters of the Sound to the lake. The Dalles-Celilo Canal is another enterprise practically completed, which opens up the Columbia River to light draught vessels as far up stream as Priest Rapids, on the main river above Pasco, and to Lewiston, on Snake River, in Idaho. It is 8½ miles in length and climbs to a height of 82 feet above low water, the cost of building having been \$5,000,000. During 1915 the Illinois legislature appropriated \$5,000,000 for a 65-mile canal, 8 feet in depth, from Joliet to Utica, the canal to start from the end of the Chicago Sanitary District Canal. The Pennsylvania legislature,

too, has authorized an issue of bonds for the construction of a canal from Pittsburgh to Lake Erie. According to the plans already roughly drafted this canal will put Pittsburgh into water communication with 27 States.

Senior Assistant Engineer, Department of State  
Engineers, New York.

**CANANDAIGUA**, N. Y., city and the county-seat of Ontario County, 29 miles southeast of Rochester, at the northern end of Canandaigua Lake, and on the New York C. and H. R. and Northern C. railroads. It is situated, on high ground, with a commanding view of the lake amid attractive scenery, Canandaigua is a popular holiday resort. The fishing and boating accommodations are excellent. The chief manufactures are those of ale, pressed brick and anti-rust tin and enameled ware. The power-house and shops of the Rochester and Eastern Interurban Electric Railway are located here. The public institutions include the Thompson Memorial Hospital, the Ontario Orphan Asylum (private), a private sanatorium, an association library, two banks and churches of six denominations. It is also the seat of Canandaigua Academy, a public high school, and of the Granger Place School for Girls, a private secondary school. The government is administered by a mayor and a board of aldermen. Municipal waterworks, a sewage system, public playground and swimming schools are modern developments. Canandaigua was settled by New Englanders in 1789, became a village in 1815 and received a city charter in 1913. The name was originally Canandarqua, an Indian word thought by some to signify "the chosen spot," by others "the site of a former settlement." Pop. 7,217.

**CANANDAIGUA LAKE**, N. Y., a body of water lying chiefly within the limits of Ontario County. It is 668 feet above the sea and 437 feet above Lake Ontario, and has an extreme length of 15 miles and an average width of one mile. Its outlet is the Clyde, a tributary of Seneca River.

**CANANI**, kã-nã'nẽ, Giovanni Battista, Italian anatomist: b. 1515; d. 1579. He discovered certain of the hand muscles, and was the first to observe the use of the valves in the veins.

**CANAR**, kã-nãr', Ecuador, a small province situated among the Andes, between the provinces of Chimborazo and Azuay; capital, Azogues. It has the Eastern Cordillera of the Andes on the eastern border, and is watered by the tributaries of Paute River. Numerous Inca remains are found there. Pop. 64,000.

**CANARD**, kã-nãrd', or kã-nãr', a false report; a silly rumor. The origin of this use of the term is not known. It is the French word meaning "duck," and is thought by some to be derived from the old phrase, *Vendeur de canard à moitié*, one who half-sells a duck or cheats in such a transaction; hence a liar, a guller, etc. According to an account of wide currency in different versions, the usage arose from a story

of cannibalism among a flock of ducks that ate one of their number each day until they were reduced to a single survivor, who, it was argued, had eaten all his companions. The story became common in Paris, and afterward, when any marvelous recital was heard, the listener would shrug his shoulders and exclaim, *C'est un canard!* ("That's a canard, or duck!").

**CANARIES.** See CANARY ISLANDS.

**CANARIUM**, a genus of plants of the order *Burseraceæ*. There are about 90 species, inhabiting tropical Asia and Africa. The gum of *C. commune*, known as Elemi, has the same properties as balsam of copaiva. The nuts are eaten in the Moluccas and Java, but are apt to bring on diarrhœa. An oil is expressed from them, used at table when fresh and burned in lamps when stale.

**CANARY**, a small domesticated finch (*Carduelis canaria*), closely allied to the goldfinch (q.v.), and found throughout the Canary Islands, Cape Verde and Madeira. Domestication, besides having modified the size and colors of this bird, has developed its power of song. It was introduced into Europe as a cage-bird early in the 16th century, and is now familiar in all parts of the world. Canaries in their wild state are about five inches long, and, like other finches, live mainly upon seeds, seldom eating insects. They build nests of moss and feathers in bushes and trees, often near dwellings; and their pale-blue eggs number four or five. Canaries are bought, bred and sold in large numbers in England, Scotland, Belgium and in the Hartz Mountains, where their breeding forms an important household industry. The varieties are named, to a great extent, from the localities in which they are bred. Among birds valued for their beauty rather than for their power of song are: the British crested Norwich canary, the Manchester canary, which is noted for its abnormal size, it sometimes reaching a length of eight inches. The Scotch Fancy is a slender bird with long neck, its body, trunk and tail, when in certain positions, curving into almost a half circle. The gold- and silver-spangled canaries are considered the handsomest. Their ground color is dull, spotted with gold or silver markings. The Belgian or humpback canaries are also bred for their beauty of plumage, and are remarkable by reason of the peculiar appearance they present by their broad shoulders, short neck and small head. Canaries bred for their power of song, and selling for from \$1 to \$75, are those of the Hartz Mountains, which vary in color from a clear yellow to a bright green. The most valuable of all varieties is the South Andreasberg bird, bred solely for their power of song. Single birds are frequently utilized for the instruction of young birds, and are known as "campaninis." Other varieties are the cinnamon canaries and the cayennes, the brilliant red and scarlet of the latter being due to judicious feeding with red pepper. Canaries are also crossed by fanciers, with other finches; the resulting hybrids are called "mules," and are usually from the mating of hen canaries with other cock birds, great difficulty being experienced in keeping female goldfinches, linnets, etc., on the eggs in captivity.

Canaries are easily cared for, the only essentials being cleanliness, food and water. The

principal danger to the bird is a cold draught. The best food consists of canary-grass seed, hemp-seed and a certain amount of greens. Acids are to be avoided, but sugar is beneficial in small quantities. Lime is essential to its welfare and is most easily obtained in cuttle-fish bone. If their nails grow so long as to be troublesome to the bird, they should be occasionally cut with a very sharp scissors, thus running no chance of injuring the foot. Attention must also be given to the perches. These should be no thicker than a thin lead pencil, so that the birds' toes may meet around them. Consult Wallace, 'The Canary Book' (London 1893); Belts, 'The Pleasurable Art of Breeding Pet Canaries' (London 1897); Blakston, Swaisland and Miener, 'The Book of Canaries and Cage Birds' (London); Holden, 'Canaries and Cage-Birds' (New York 1883); Robson, 'Canaries, Hybrids and British Birds in Cage and Aviary' (London 1912). Consult also the weekly, *Cage-Birds* (London).

**CANARY-CREEPER**, or **CANARY-BIRD FLOWER**, an annual climbing plant (*Tropæolum peregrinum*), of the nasturtium family, a native of Colombia, cultivated for its showy yellow flowers.

**CANARY-GRASS.** See CANARY-SEED.

**CANARY ISLANDS**, or **CANARIES**, a cluster of islands in the Atlantic, politically forming a province and military district of Spain, but geographically considered as belonging to Africa, the most easterly being about 150 miles from Cape Nun. They are 13 in number, 7 of which are of considerable size, namely, Palma, Hierro, Gomera, Teneriffe, Grand Canary (Gran Canaria), Fuerteventura and Lanzarote. The other six are little more than mere rocks. The population numbers about 526,400, the area being about 3,216 square miles. Lanzarote and Fuerteventura lie in the northeast of the group. Hierro is the farthest southwest. Through Hierro the first meridian used to be drawn. All are rugged and mountainous, frequently presenting deep ravines and precipitous cliffs to the sea, though having also fertile valleys and verdant slopes. The principal peaks are those of Teneriffe, 12,182 feet, and La Cruz, in Palma, 7,730 feet. Fuerteventura and Lanzarote, which are nearest the African coast, are less elevated than the others, and have more strongly marked African characteristics. Evidence of volcanic action is almost everywhere present, and volcanic disturbances have taken place on some of the islands in quite modern times. The flora of the central and western islands generally resembles that of the Mediterranean region, the trees and shrubs including the oak, chestnut, pine, cedar, laurel, heather, etc.; but there are (particularly on the eastern islands) plants that belong to the African region, such as the dragon-tree and euphorbias. Among the fauna may be mentioned the canary, the red partridge, and several kinds of lizards; there are no snakes. Goats and camels are the chief domestic animals. The islands are deficient in moisture and severe droughts sometimes occur; tornadoes also are not infrequent. The climate is hot on the low grounds, temperate higher up, and generally healthy. The soil where suited for cultivation readily produces all kinds of grain, fruits and vegetables in abundance, three and even four crops being raised yearly; some

of the islands furnish good wine, especially Teneriffe and Palma. The Canaries constitute a valuable possession of Spain and they serve as a winter resort for invalids from colder regions. This has led to the erection of hotels specially intended for visitors, to the making or improvements of roads and to the providing of attractions of various kinds, including golf-courses, lawn-tennis grounds, etc. There are several places of worship for English-speaking visitors. The exports at present consist chiefly of bananas, tomatoes, onions and potatoes, shipped in great quantities to London and Liverpool, cochineal, sugar, wine, etc. The imports chiefly consist of textiles and other manufactured goods, cereals, coals, etc. Peaches, oranges, lemons, figs and other fruits are cultivated. Teneriffe and Grand Canary are the two chief islands. Santa Cruz, the capital of the islands, is a port on the northeast coast of the former, and on the western coast of the same island is Orotava, a favorite resort of foreign visitors. Las Palmas, on the northeast coast of Grand Canary, is a more important place, with its new harbor, Puerto de la Luz, between three and four miles distant, protected by a breakwater. The city is rapidly extending, its streets have been improved and lighted by electricity. In 1917 it had about 43,000 inhabitants. Numerous steamers engaged in the trade between Europe and Africa call here, and also at Santa Cruz. Wireless telegraphic stations, one of 860 miles range, carry out the service with Spain and another of 250 miles range the service with ship and shore traffic.

**Historical Outlines.**—The half-fabulous "Fortunate Isles," as the Canary Islands were called in the classical ages, were undoubtedly known to the Semitic merchant-adventurers from the south-southeast Mediterranean coasts (including the Carthaginians) long before the Roman conquests extended to Spain. But it is possible that, as Mr. Royale Tyler suggests, the Carthaginians may have kept the secret of their whereabouts for fear that others might share with them such advantages as the astute traders of those days were anxious to keep to themselves. Contact with the outside world appears to have been interrupted for centuries. Finally, the Arabs "discovered" the Canaries in the 13th century; the Portuguese and Majorcans visited them in the 14th; and in the early years of the 15th a Norman adventurer, Jean de Béthencourt, established himself at Fuerteventura and founded his capital in a village that still exists under the name of Betancuria (more correctly, Bethencuria), on the western side of that island. The King of Castile was his protector, and toward the end of the 15th century Ferdinand and Isabella took possession of the islands. At that time the Canaries were inhabited by people of different races, some of whom were Semites, as we have said; but the bulk of the population was formed by a people called the Guanches who had been in possession of the islands for ages. The blood of the Guanches still flows in the veins of many of the inhabitants; and even to-day, in Gomera and Teneriffe especially, the old race appears to have maintained itself almost without admixture.

**CANARY-SEED**, the seed of a plant (*Phalaris canariensis*), belonging to the order

of *Graminacea*, cultivated for its seed, which is used principally as food for birds. In its early growth it is scarcely distinguishable from oats or wheat. With good cultivation it attains a height of three or four feet, and terminates in egg-shaped heads or ears, each containing upward of 100 seeds. The straw is of little value, either as fodder or litter, but the ears, especially when mixed with other kinds of chaff, are good food for horses. It requires a deep adhesive soil, and its produce per acre is about the same in quantity as wheat. It is a native of the Canary Islands, but is successfully cultivated elsewhere.

**CANARY WINE**, a wine that comes from the Canary Islands, chiefly from the island of Teneriffe. It is not unlike Madeira, but the name is properly applied only to the Bidogne wine.

**CANARY-WOOD**, the light orange-colored wood of *Phæbe indica* and *P. canariensis*, trees of the laurel family of the Azores and Madeira, so called because it was brought originally from the Canaries. It is also called Madeira mahogany.

**CANASTER**, or **KANASTER**, originally the rush-basket in which South American tobacco was packed and exported, and hence applied to a kind of tobacco consisting of the leaves coarsely broken for smoking.

**CANASTOTA**, N. Y., village in Madison County, on the Erie Canal, and on the New York Central, the West Shore and the Lehigh Valley railroads, 21 miles east of Syracuse. It is the centre of an agricultural district and manufactures agricultural implements, gasoline engines, boats, canned goods, cut glass, etc. It has two banks, public library, churches, high school, hospital and two grammar schools. Canastota was settled about 1806 and was first incorporated in 1835. The government is administered by a president, elected annually, and a board of trustees. Seneca turnpike, built in 1790 and now a State road, runs along the southern boundary of Canastota. Pop. (1910) 3,247.

**CANBERRA**, the new Federal capital of the Commonwealth of Australia, situated in lat. 35° 15' S. and long. 149° 15' E. on a plateau about 2,000 feet above sea-level in the Yass Canberra district, New South Wales, 70 miles distant from the eastern coast line of Australia. The constitution of 1900 provided for a new capital, and after nearly 10 years' search and deliberation the present site was chosen. The territory is 900 square miles in area, and includes a spot of two square miles at Jervis Bay for the construction of a port and a naval college. In 1911 the Australian government offered \$15,000 in three prizes, for the best plans submitted, the competition being open to all architects of the world. A serious difference of opinion between the Minister for Home Affairs and British architects caused all the best of the latter to withdraw from the competition. On 23 May 1912 it was announced that the first prize, \$8,750, had been awarded to an American architect, Mr. Walter Burley Griffin of Chicago. The second prize (\$3,750) went to M. Eliel Saarinen, of Helsingfors, Finland, and the third to Alfred Agache, of Paris. From these three plans the work of designing the

future city was begun. The population contemplated for the capital was fixed at 25,000, and a period of eight years in four stages was estimated for the completion of the preliminary works, at a cost of \$10,000,000. According to Mr. Griffin's plan the city will be divided by three large sheets of water, with parks and boulevards; a capitol of 600 feet frontage and 200 feet depth; accommodation for all the great departments of state; courts of justice, mint, art gallery, museum, churches, a university, post-office, hospital, stadium, gas-works, etc. A large reproduction of the winning design appeared in the *London Times* of 24 May 1913.

**CANBY, Edward Richard Sprigg**, American army officer: b. Kentucky 1817; d. 11 April 1873. He was graduated at West Point in 1839; served in the Mexican War, 1846-48; commanded the United States troops in New York during the draft riots of 1863; succeeded General Banks in the command of the army in Louisiana, 1864; became brigadier-general, United States army, and major-general of volunteers, 1866. After the war special duties were assigned to him, and in 1869 he took command of the department of the Columbia. He was treacherously shot by an Indian chief, while negotiating for the removal of the Modocs from northern California, in the "Lava Beds."

**CANBY, William Marriott**, American botanist: b. Philadelphia, Pa., 1831; d. 1904. He was educated privately, and though a business man, devoted much time to the study of botany. He gathered a fine herbarium of over 30,000 species of plants, which is now owned by the New York College of Pharmacy. A smaller collection was brought together for the Delaware Society of Natural History. He was one of the botanists attached to the Northern Pacific Transcontinental Survey.

**CANCALE**, kãn'cal', France, fishing port of Ille-et-Vilaine department, on the Bay of Mont Saint-Michel, 10 miles east of Saint-Malo. Oyster culture and shipbuilding are busy industries, and it is a popular seaside resort. Pop. 8,000.

**CAN-CAN**, a dance, something of the nature of a quadrille, but accompanied by violent leaps and indecorous contortions of the body originated by the demimonde of Paris, and resembling the old Bacchic dances. The earlier and usual meaning of the word in French is noise, racket, scandal and is derived, oddly enough, from the Latin conjunction *quamquam*, "although,"—a great squabble having arisen in the French mediæval law schools as to the pronunciation of this word.

**CANCELLARIA**, a genus of Gastropods belonging to the family *cancellariidæ*, in which the shell is turbinate, scabrous and generally reticulated, the spire and aperture nearly equal and the body ventricose. Tate in 1875 estimated the known recent species at 71, and the fossil ones, at 60, the latter from the Upper Chalk till now.

**CANCELLATION**, a method of abbreviating certain arithmetical and algebraic operations. When the product of several numbers is to be divided by another such product, any factors common to both products may be left out, or "canceled." If divisor and dividend do not appear *in extenso* as products, the process

of cancellation may yet be applied if common factors exist and can be detected. The work is substantially the same as that of reducing fractions to their lowest terms.

**CANCER, Luis**, early Spanish-American missionary: b. Barbastro, near Saragossa; d. Florida 1549. After missionary labors in Dominica and Haiti, he was very successful with the antagonized Indians of the mainland and supported their cause in an ecclesiastical assembly at Mexico in 1546. He was killed by Florida Indians 26 June 1549.

**CANCER. Nature of Cancer.**—A tumor is a growth of abnormal size and situation, composed of cells of the body. Some tumors are not dangerous to life, because they do not increase after they attain a certain size; others, and these are *cancers*, have no limit to their growth, and destroy life by extending into healthy tissue or by interfering with digestion or some other important vital function. While a cancer is a particular sort of tumor, there are also many varieties of cancer; and these varieties are classified according to the tissue from which the growth originates. If the cancer begin in the skin or epidermis, it is called an *epithelioma*; if it begin in a gland, it is called a *carcinoma*; if it begin in muscle, fibrous tissue, tendon or bone, it is called a *sarcoma*. These kinds of cancer grow progressively and are fatal if not promptly removed.

Sarcoma of arm

In the beginning a cancer is composed of a few microscopic cells, much smaller than the point of a pin. Depending upon the type, it may grow in a few months to the size of a grapefruit, or may require years to reach the size of a pea. When it first begins to grow there are no symptoms—no pain and no bleeding; but later, when the cancer presses on the nerves, pain results. Bleeding begins only when the cancer ulcerates. Any other symptoms to which a cancer may give rise are due solely to its interference with some normal function of the body. A cancer looks like a lump of tissue. It has no roots, as is popularly believed, but it may grow out through the vessels of the body to distant parts.

Cancer is not a new disease but one which has been recognized since earliest times. It is mentioned by the Egyptians in the Papyrus Ebers, and by the Hindus in their medical writings, both of which probably date back to about 2000 B.C.

**Occurrence of Cancer.**—While cancer occurs not only in man but in all warm-blooded animals, it is not equally frequent at all ages.

Certain types of cancer may be found in a newborn infant, in other words, are congenital; but these are very rare. The usual rule is that cancer begins to appear at the age of 35, and increases rapidly in frequency until the age of 65—a little earlier in women, a little later in men. After 75, the rate of occurrence of cancer decreases very rapidly, until it practically disappears at 90. The same frequency distribution according to age is seen also in mice, rats, dogs, cats, etc.; that is, the disease appears only in older animals, but is less often seen in the very old.

**Sex Variations.**—Sex has some influence on the rate of occurrence of cancer; for example, between the ages of 35 and 45, men show the disease less often, practically only one-third as often as women; between the ages of 55 and 65 the frequency in men is about 65 per cent of that in women of corresponding age; while in old age, men have more cancer than women. This is due to the fact that in women a great many cancers occur in the breast and in the womb at about the beginning of the change of life, that is, from 45 to 50 years of age. On the other hand, cancers of the lip and tongue attack men only, practically; and these, with cancer of the skin, appear late in life. Similar variations in the occurrence of cancer are noted also in the different organs of the body; for example, the more frequent site for cancer is either the stomach or the liver. Thus, while in 1913, in the United States, 30,205 people died of cancer of the stomach or of the liver, only 2,633 died of cancer of the skin, and 3,007 of cancer of the tongue and mouth.

**Race Variations.**—The differences noted in the occurrence of cancer in organs are also noted in the occurrence of cancer in different races; for example, the negro race is attacked by cancer much less frequently than the white race, and cancer seems to be more frequent in people of the northern European states than it does in those living in the tropics or in South America, although the population of South America is much the same as that of Spain. There is, also, a difference in the organ distribution in different countries. In England and Wales, out of 100,000 women, 18.6 individuals will have cancer of the breast, while in

the death rate per 100,000 from cancer was 67 in clergymen and 265 in chimney sweeps. The irritation resulting from the soot may explain this difference.

**Increase of Cancer.**—There is a widespread opinion that cancer is increasing rapidly in frequency of occurrence. This question has been subjected to elaborate statistical analysis by Hoffman in a volume on 'The Mortality of Cancer Throughout the World.' Hoffman comes to the conclusion that there is a gradual increase in the number of cases of cancer occurring in most of the countries of the world, but that this increase tends to reach a certain maximum and not to pass that point. This maximum has already been reached in Switzerland, where the cancer death rate is now 124 per 100,000, while in the United States it is only 74 per 100,000. There are, however, many authorities who consider that this increase in cancer is due not to an absolute increase in the number of persons with cancer, but to an increase in reported cases; in other words, that improvements in diagnosis and in our understanding of the nature of the disease and the increased accuracy of statistics have resulted in an increase in the number of cases of cancer which are reported. The matter cannot be considered as finally settled, however; and only greatly improved statistical reports from different countries can throw any light upon the problem.

**Heredity.**—The question of heredity in cancer has long occupied the attention both of statisticians and of workers with experimental cancers in animals. While there is no doubt that an individual family may show a large number of cases of cancer for one or two generations, this is by no means a proof that the disease itself is hereditary. It is not even a proof that a liability to the disease is hereditary. If we realize that out of every 100,000 people living in the United States, 80 will die from cancer, it is easy to see that, as age increases and the frequency of cancer becomes greater (so that between the ages of 45 and 65 one woman in 6 and one man in 12 will die from the disease) the occurrence of several cases in a family, especially if it be long lived, is not astonishing. It is evident that if cancer occur so frequently, some families are bound to have a larger number of cases than others, merely by chance. This point is illustrated in the "cancer villages" which will be discussed in the next paragraph. The problem of heredity in cancer has interested the life insurance companies, also, because if cancer be hereditary, it is very important that no one in whose family cancer has occurred shall be accepted by the companies. But a careful analysis of a large number of persons insured shows that the liability of death from cancer is no greater because that disease has occurred in one's family than it is if no cancer death has been recorded; so that the insurance companies do not regard a history of cancer in the ancestry as any evidence that cancer will occur in the descendants.

It has been shown, however, by breeding mice of cancerous ancestry, that is, by selecting both father and mother from a highly cancerous strain, that the amount of cancer occurring in the descendants after many generations of such selected breeding, is apt to be about twice as much as occurs in the stock in which

Epithelioma of ear

Japan, only 1.8 women out of 100,000 will suffer from the disease. The occurrence of cancer of the skin in the negro race in the State of Maryland is only half that in the white population.

**Occupation** also plays a still but little understood rôle; thus in England from 1890 to 1892,

no special selection was made. Such a concentration of cancer heredity in man is quite impossible, as the stock would die out long before the 8 or 10 cancerous generations could be produced.

**Contagion in Cancer.**—It is a popular superstition that cancer is contagious, and that it is very dangerous to nurse a person with an ulcerating cancer; but there is not the slightest foundation for this belief. There is no recorded evidence of a case in which cancer has been transferred from one person to another or in which a surgeon has contracted the disease during an operation on a cancerous patient. If cancer were a germ disease, it would probably be very easily transmitted in this way; but there is no evidence that a germ has anything to do with the development of the tumor; and the only way in which the disease can be transferred is by direct grafting of a piece of the growth from a cancer patient to a healthy person. It is very difficult even to graft a cancer from one mouse to another. Often hundreds of animals are inoculated in order that one or two cancers may be grown. Animals bearing cancer and healthy animals have been kept together in large numbers for long periods, and not the slightest evidence of any transfer has been shown.

It has been popularly supposed that cancer is very abundant in certain districts or villages or houses, and that this fact pointed to the contagiousness of the disease; but when the population of these districts is studied, it is usually found that all the young people have gone to the neighboring large towns or cities, leaving only those whose age is such that they are especially liable to cancer. Consequently, the number of cases seems very large and the percentage is increased for that particular locality; but if the cancer incidence is considered in conjunction with the age of the population, it will be found that no greater number of cases has occurred, for example, between the ages of 45 and 50, than has occurred in the general population elsewhere in the country within the same age limits. It follows that "cancer villages" do not exist, although old-age villages do.

Human cancer is not derived from animal cancer, for it has been shown that it is impossible to transplant, even with the greatest care, a tumor from a mouse to a rat or a tumor from a rat to a mouse; in other words, cancer of one animal will not grow in any other animal except it be one of the same species; that is, no animal cancer can be transplanted to a human being and remain alive and grow.

The theory of the origin of cancer from the so-called cancers of vegetables, which are really not cancers but only inflammations, seems too foolish to have any wide credence; but occasionally the newspapers take up some such wild story and people are led to believe that there may be something in it. It is, however, not true.

**Cause of Cancer.**—The cause of cancer is not known, though there are two popular superstitions regarding it. One is, that cancer may be produced by a blow; and the other, that cancer is due to a germ. To uphold either of these there is not the slightest evidence. A large number of cases in which it was claimed that a blow had caused the growth of the cancer have been investigated, and it has been

found that the disease existed before the blow was received. And when we compare the large numbers of people who in their lifetime have received blows in various portions of their bodies, with the small numbers relatively who have developed cancers, it is evident that there can be no relationship between the blow and the beginning of the tumor. It is true that a blow may stimulate a cancer which is already existing, but usually on investigation of such cases it will be found that the growth had reached a considerable size before the injury occurred. The same thing is true of the growth of cancer in a broken bone; the presence of the tumor in the bone makes it liable to break, and often the fracture is the first evidence of the tumor. But the fracture did not cause the tumor, even though it may appear to have grown after the break occurred or was not discovered until after the injury.

The reasons for believing that bacteria have nothing to do with cancer are based upon experimental work on animals. If a cancer is transplanted from one animal to another of the same species, it will grow and ultimately kill the second animal; some cancers are so very virulent that they will, when properly transplanted, grow in every mouse in which they are implanted and cause the ultimate death of the host. But if some of this cancer tissue is crushed or frozen so that all the cells present are broken up, it will not produce a tumor when grafted on to another animal. Now we know that bacteria will live in liquid air which is about 400° F. below freezing, and that they are not killed merely by being crushed; and for these very good reasons we believe that cancer is not produced by bacteria.

While we do not know the cause of cancer, we do know the conditions under which it is liable to arise, and these are any chronic inflammation or ulceration of the skin or of any organ of the body. If, for instance, the skin is burned, and the burn remains for a long time, there is always risk that a cancer may develop in the site. The burns due to X-rays are very chronic; and cancers frequently develop in them. Cancers frequently follow irritation of the lip, tongue or cheek, by smoking or by a rough tooth or an ill-fitting plate.

This relationship between chronic irritation and cancer is well shown by the fact that women of the white race very rarely suffer from cancer of the cheek, while in Ceylon and the Philippine Islands where women chew a highly irritating substance known as the betel-nut, and keep the chewed mass in the cheek over night, they very frequently have cancer arising on the inside of the mouth. Chronic ulcer of the stomach in persons over 40 is another condition which has the same relationship to cancer, for it has been shown that most of the cases of cancer of the stomach arise in one of these ulcers. Chronic ulceration or irritation of the intestine, also, is a cause of the beginning of cancer; and cancers of the womb often result from tears or injuries following childbirth.

Cancer of the breast occasionally begins in lumps which are the seat of chronic inflammation, so that it is well in case a woman has a lump in the breast to have it carefully examined by a physician every six months or so in order to be sure that a cancer is not beginning.

Chronic irritation, therefore, is the only cause for cancer which we know of, and yet it is curious that not everyone who has chronic irritation develops cancer. There is some peculiar personal quality in the tissue which is necessary before a cancer will develop. An example of this is the fact that leg ulcers which are so very common among old people almost never give rise to cancer, although ulcer of the stomach so frequently does. There is, therefore, something besides the ulceration and the chronic irritation which makes the cancer start.

**Cure of Cancer.**—The only generally successful cure for cancer is its removal as early as possible by surgical means. The use of the knife is preferred to caustics or cautery because it permits of a cleaner cut and more rapid healing. Of course, the knife is the only possibility for deep internal cancers involving the stomach or intestines; but occasionally cancers of the skin are treated by caustic with fair results. It is, however, better to have the cancer cut out clean, as the scar is then much less marked and the healing is more rapid. It is, also a satisfaction for the patient to know that all the cancer is out of the body, instead of having it burned out by some slow caustic. A certain number of cancers of the face, and especially small early cancers in other sites, can occasionally be cured by either radium or X-ray, but as yet we have no published statistics to show what proportion of cases can be permanently cured by either of these agents; the number of cures reported after some 10 years of use of both these is exceedingly small, and the results are not nearly so good as those which follow surgical removal of the entire tumor. For it must be remembered that cancer is not a blood disease and that when it begins it is no larger than a pin-point, so that if we could make a diagnosis and cut it out in time, every cancer would be curable. The difficulty is to make a diagnosis and as the symptoms of cancer are obscure and often are entirely absent, it is impossible for a physician to learn of the beginning of the disease in time to cut it all out. With every improvement in diagnosis of cancer, the possibility of curing the disease is increased.

FRANCIS CARTER WOOD, M.D.,  
*Director of Cancer Research, Columbia University.*

**CANCER**, in astronomy, fourth sign in the zodiac (q.v.) marked thus ♋. The sun enters this sign on or about the 21st of June. He is at his greatest northern declination on entering the sign, and the point which he reaches is called the summer solstice, because he appears for the moment to stop in his progress northward and then to turn south again. The sun is then 23½° north of the equator, and a small circle of the sphere parallel to the equator at 23½° distant from it is called the Tropic of Cancer. The sun leaves this sign about the 22d of July. The constellation Cancer is no longer in the

sign of Cancer. At present it occupies the place of the sign Leo. The constellation Cancer contains within it the cluster of Praesepe or the Manger. This lies between two stars of the fourth magnitude, the Aselli or Asses, whose disappearance, according to the ancients, presaged rain. The arrangement of the stars is in the triple or quadruple system ζ Cancri. Two close stars of the fifth and sixth magnitudes which revolve about each other during 60 years; and a third part which has a retrograde motion of longer period, which is still unknown and variable, form the constellation. It is probable that the third component is a satellite of a larger body, and that the other two stars also revolve about this larger unknown.

**CANCER-ROOT**, or **BEECH-DROPS**, a branched parasitic plant (*Leptamnum virginianum*), of the family *Orobanchaceæ*, with brownish scaly leaves, indigenous in eastern North America, growing almost exclusively on the roots of the beech tree. The whole plant is powerfully astringent, and the root of a brownish color, spongy and of a very nauseous bitter taste. It was once popularly believed to be a cure for cancer. Other plants of the same family are also called cancer-root.

**CANCERIN**, kân-krên', Georg, COUNT, Russian general, statesman and financier: b. Hanau, Prussia, 8 Dec. 1774; d. Saint Petersburg, 22 Sept. 1845. He studied at Giessen and Marburg. In 1812 he was commissary-general of the Russian forces, and in 1814 accompanied Tsar Alexander I to Paris; was Minister of Finance from 1823 to 1844; and wrote on military and economic subjects, his most noted works being 'Military Economy in Peace and War'; 'The Economy of Human Societies' (1845).

**CANCERUM ORIS**, or **NOMA**, gangrene of the cheek, due to bacterial infection and mostly occurring in sickly children, especially those with scarlet fever or measles. The immediate cause is infection from a fusiform bacillus and the spirillum of Vincent, associated with other pus-producing microorganisms. It begins as a red spot on the cheek or at the angle of the mouth, spreads rapidly, and soon eats away the whole cheek, even the bone. There is fever, and death usually results in 75 to 80 per cent of the cases. As soon as the disease is recognized it should be freely cauterized and the parts kept bathed in antiseptic solutions.

**CANDACE**, kân'da-sê, a name apparently common to the warrior queens of Ethiopia (Upper Nubia), between the Nile and the Atbara, in the later period of the kingdom of Merôe. The most distinguished of them invaded Egypt 27 B.C., was defeated by the Romans and obliged to sue for peace, which she obtained with a remission of the tribute imposed on her by Petronius. One of her successors is mentioned in Acts viii, 27; her high treasurer was baptized by Philip the Deacon on the road to Gaza.

**CANDAHAR**. See **KANDAHAR**.

**CANDAULES**, kân-dô'lêz, king of Lydia, who lost his throne and life through his besotted admiration of the beauty of the person of his Queen in 718 B.C. See **GYGES**.

**CANDEE**, Helen Churchill, American writer: b. New York 1868. She was educated at various private schools in New Haven and

Norwalk, Conn. Has published 'An Oklahoma Romance' (1902); 'Styles and Periods in Furniture and Decoration' (1908); 'The Tapestry Book' (1912); 'Jacobean Furniture' (1916). Is also a specialist and lecturer on fine antiques, tapestries and decorations.

**CANDEILLE**, kăn'dī'e, Amélie Julie, French actress, singer and composer: b. Paris, 31 July 1767; d. there, 4 Feb. 1834. At a very early age she began to take leading parts in classical opera. Later she abandoned opera and made her appearance at the Comédie Française in 1785, in 'Andromaque,' 'Bajazet' and 'Tancredi.' In 1790, she composed both libretto and music of 'Catherine ou la belle fermière,' a very popular operetta in three acts, in which she took the leading part and accompanied herself on the harp and on the piano. She also made several tours through the Continent, wrote novels and several other operettas.

**CANDEISH**. See KHANDESH.

**CANDELABRUM**, a word originally signifying candlestick, but usually denoting a support for a lamp or lamps among the Romans. The candelabra were of considerable size and often intended to stand upon the ground. They were made of wood, bronze, silver or marble, and were often elaborately and beautifully adorned. Sometimes they had shafts in the shape of columns, which could be shortened or drawn out; sometimes the luxuriant acanthus formed a part of them; sometimes they represented trunks of trees entwined with ivy and flowers, and terminated by vases or bell-flowers, at the top, for the reception of the lamps; and not infrequently the lamps were supported by figures. In ancient times Tarentum and Ægina were famous for their elegant candelabra, and Corinth also manufactured them. The Etruscan candelabra of bronze were celebrated. Examples may be found in the plates of the 'Museo Gregoriano' or in the works of Overbeck, 'Pompeii in seinen Gebäuden, Alterthümern und Kunstwerken' (4th ed., Leipzig 1884), and Mankelsy, 'Pompeii: Its Life and Art' (New York 1902).

**CANDIA**. See CRETE.

**CANDIA**, or **MEGALOKASTRON**, Crete, a fortified seaport and capital of the island, situated on the north coast, 65 miles east of Canea; lat. 35° 20' N. and long. 25° 9' E. Its harbor admits only vessels of small draught. The governor and the Greek archbishop reside here. Soap is manufactured and exported. The fortifications of the city date from the time of the Venetian occupation, and in 1669, after a prolonged siege, it submitted to the Turks. These fortifications have been much demolished by frequent earthquakes. Pop. estimated at 20,000.

**CANDIDA**. George Bernard Shaw's play 'Candida' belongs to that early group of the author's plays that followed hard upon the close of his novel-writing period. Written in 1894 for Richard Mansfield, who had that year produced 'Arms and the Man,' it had its first production on any stage in 1897 when the Independent Theatre Company offered it in Aberdeen and on tour, with Janet Achurch in the title rôle and Charles Charrington in the part of the Rev. James Mavor Morell. It was

printed the following year as the second play in the volume of "pleasant" plays in the 'Plays Pleasant and Unpleasant' series. The theme of love, marriage and the artist had been treated by Shaw in his novel, 'Love Among the Artists.' It is returned to as a minor theme in 'The Doctor's Dilemma.' In 'Candida' it is handled in a spirit of combined disillusion and reverence that raises the play to first rank as a work of art and as a psychological document. Into the contented household of the Rev. James Mavor Morell and his wife, Candida, comes the poet, Eugene Marchbanks. The action that follows is not so much a development of the triangle theme, as the testing of the marriage compact of Morell and Candida before the acute perceptions of the poet. Marchbanks' temporary error in thinking he is in love with Candida but raises her to a greater clarity of insight; happily too it gives the masterful Morell a quarter of an hour of keen self-distrust. But there is no real struggle between Morell and Marchbanks. Each man has what he most desires and most needs. In Marchbanks, who all through is too much "aware" to be really in love, the author is revealing the lonely soul of the poet, as in Candida and Morell he is uncovering the secret places in the marriage bond. "One of the noblest, if not the noblest, of modern plays," Chesterton calls 'Candida.' This nobility appertains not only to the theme, but as well to the manner in which the play is written. In its freedom from "gallant, wicked and poetic attitudes," in its lofty idealism as well as in its searching of human weaknesses it is a work of genius. Unlike the greater number of Shaw's plays 'Candida' is a true theatre-piece. Against all the dramatic anarchy of his discursive plays it is Shaw's indubitable warrant as a great dramatist. The stage history of the play has been distinguished. Finally produced by Mansfield in 1903, it was the same year given notable productions in Dresden and by Arnold Daly in New York. The following year it was a part of the Court Theatre repertory of the Vedrenne Barker management in London. It was given in French in Brussels in 1907 and in Paris in 1908. In recent years it has occupied a leading place in the repertoires of "new" theatres. Consult Henderson, Archibald, 'George Bernard Shaw: his Life and Works' (London 1911); Chesterton, G. K., 'George Bernard Shaw' (ib. 1909); Burton, Richard, 'George Bernard Shaw: the Man and the Mask' (New York 1916); Hamon, Augustin, 'Le Molière du XX<sup>e</sup> siècle: Bernard Shaw' (Paris 1913); 'The Technique of Bernard Shaw's Plays,' translated by F. Maurice (London 1912).

THOMAS H. DICKINSON.

**CANDIDATE**, an applicant for an office, from the Latin *candidatus*, "white-robed," because, among the Romans, a man who solicited a public office appeared in a white garment—*toga candida*—and wore this during his candidature, which lasted for two years. In the first year the candidates delivered speeches to the people, or had them delivered by others. After this year they requested the magistrate to enter their names on the list of candidates for the office sought for. Before this was done the previous life of the candidate was subjected to a scrutiny in the Senate, after the prætor or

consul had received his name. If the Senate accepted him he was permitted to offer himself on the day of election as a candidate. The formula by which permission was granted was "*Rationem habebo, renuntiabo*"; if he was not accepted he received the answer, "*Rationem non habebo; non renuntiabo*." The tribunes often opposed a candidate who had been accepted by the Senate. The morals of the aspirants, in the purer ages of the republic, were always severely examined. In the later period of the republic, nobody could obtain an office if he was not present and if he had not offered himself on three market days. On these days the candidates tried to insinuate themselves into the favor of the people. They went from house to house (*ambitio*, whence the word ambition), shook hands with everybody whom they met (*prensatio*), addressed each one by his name, for which purpose they generally had a nomenclator with them, who whispered the names of those whom they met into their ear. Cicero, therefore, calls the candidates *natio officiosissima*. They placed themselves on market days in elevated places in order to be seen. On the day of election they did the same. Favorites of the people accompanied them (*deductoes*); some of their suite (*divisores*) distributed money among the people, which, though prohibited, was done publicly. *Interpretes* were employed to bargain with the people, and the money was deposited in the hands of *sequestres*. Sometimes a number of candidates united into parties (*coitiones*), in order to defeat the endeavors of the others. At last the grounds on which each candidate rested his claims to the office were read, and the "tribes" delivered their votes. The successful candidate then sacrificed to the gods in the capitol. To oppose a candidate was called *ei refragari*; to support him, *suffragari*, or *suffragatoris esse*. In the early Church newly-baptized Christians were called candidates, on account of the white robes worn by them for a certain period after celebrating the rite. The word "candidate" is also used by Protestants to designate a theologian who, having finished his studies at a university, is waiting for an appointment in the Church. At present it means, in English-speaking countries, an applicant for any office whatever. (See CONVENTION, POLITICAL; CORRUPT PRACTICES ACT). Consult the treatise known as 'Quinti Ciceronis de Petitione Consulatus ad Marcum Tullium Fratrem' (printed with Cicero's letters); Greenidge, 'Roman Public Life' (London 1901).

**CANDIDE, OR OPTIMISM** ('Candide, ou l'Optimisme'), kán'déd, oo lóp'te'més'm', is one of the most characteristic works of Voltaire. It is the longest and the best known of the 'Philosophic Tales' ('Contes Philosophiques'), in which he let his incomparably nimble intelligence play over all questions of human interest,—politics, religion, morals. The story of the remarkable adventures of Candide and his tutor, Pangloss, in search of his beloved cousin, Cunégonde, is merely the thread on which are strung the flashing gems of his wit, his satire and his irony. In substance it is a pitiless attack on the easy optimism of "Whatever is, is right." Earlier Voltaire had shown decided leanings toward such a view. He had translated Pope's 'Essay on Man,' and in an-

other philosophic tale, 'Zadig,' in 1747, he had, though with some mental reservations, apparently "justified the ways of Providence to man." But his optimism, such as it was, was shattered by the Lisbon earthquake, and in Candide, in 1752, he disposed the wanderings of his personages so that they are witnesses not only of its horrors but of a thousand others. The endless panorama of human sufferings and meanness is unrolled before us,—plague, pestilence and famine, war, lust, greed, injustice, cruelty, disease. Pangloss, academic champion of optimism, long maintains in the face of each new disaster, that, after all, this is the best of all possible worlds. But even he is finally reduced to silence. Cunégonde, when found, is a mere wreck, diseased in body and soured in temper. Candide buys a little plot of ground and installs himself and his companions in a modest cottage. Life is a sorry snarl. Philosophy is powerless to untangle it. "To work without philosophizing is the only way of making life tolerable," is Candide's conclusion. And to every attempt of the incorrigible Pangloss to discuss "cause and effect" and other high problems he opposes the famous final word of experience and common sense; "*Il faut cultiver notre jardin*"—"We must attend to our hoeing."

ARTHUR G. CANFIELD.

**CANDLE**, a solid cylindrical rod composed of beeswax, tallow, paraffine or some other fatty substance, with a wick running longitudinally through its centre, designed for slow combustion with illumination. The wick is generally composed of a few threads of cotton yarn lightly twisted or plaited; but formerly, in home-made candles, dried rushes (*Juncus effusus*) were employed for this purpose. The process of making rushlights is described at length by the Rev. Gilbert White in his well-known 'History of Selborne.'

Candles are mentioned in several places in the Bible, but no direct evidence is given as to their form or of what they were made. There seems to be a distinction, however, between candles and lamps,—the latter specifically calling for oil, while the candle is spoken of as being lighted and placed on a candlestick.

Considerable modern improvements have been made in the manufacture of candles. One of the most important of these consists in not employing the whole of the fatty or oily substances, but in decomposing them, and then using only the stearin or stearic acid of the former, and the palmitine of the latter class of substances. The animal fats are combinations of glycerine and fatty acids, principally stearic and palmitic, both solids, and oleic acid, which is liquid. If the latter be in excess, the fat will be a liquid and constitute an oil; if, on the contrary, the solid acids predominate, we shall have a more or less concrete fat, such as the tallow of the ruminants and lard of the hog. Stearic acid now constitutes the principal raw material for the manufacture of candles. The chief chemical agents employed to obtain the stearin are caustic lime, which, setting free the glycerine, produces stearate, margarate and oleate of lime, in the form of a solid soap; and dilute sulphuric acid by which this solid soap, after being reduced to powder, is effectually freed of its lime. By means of a subsequent bleaching process cakes of a perfectly white

color, free from impurities, and fit for the manufacture of candles, are obtained.

Candles are commonly made by dipping, molding or rolling. The former is the older method, and consists in arranging in a frame a number of wicks of the proper length and thickness, and dipping them a number of times successively in a tank of melted tallow or other fatty composition, with intervals for the incipient forms to cool and harden. These dippings are repeated until the candles have assumed the requisite thickness and weight.

Molded candles, as their name implies, are formed in molds. These are generally made of pewter, or an alloy of 20 parts of tin and 10 of lead, though glass has also been introduced. They are hollow cylinders of the length of the candle, and open at both ends, but provided at the upper end with a conical cap, in which there is a hole for the wick. A number of these molds are inserted in a wooden frame or trough with their heads downward; the wick is then drawn in through the top hole by means of a wire, and kept stretched and in the centre by a peculiar arrangement. The molds thus prepared are filled by running melted tallow of the proper temperature from a boiler into the trough. The candles remain in the molds for about 24 hours, but, as they improve by keeping, generally remain in the storehouse for a few months before they are exposed for sale.

The rolling of candles is confined principally to those made of wax. Although the bleaching of wax was described by Pliny, the use of this material for the manufacture of candles dates back only to the beginning of the 4th century. From its tenacity, and the contraction which it undergoes in cooling, wax cannot be formed into candles by melting it and then running it into molds. Instead, wicks, properly cut and twisted, are suspended by a ring over a basin of liquid wax, which is poured on the tops of the wicks, and, gradually adhering, covers them. Or the wicks may be immersed, as in the case of tallow "dips." When a sufficient thickness is obtained, the candles, while hot, are placed on a smooth table kept constantly wet, and rolled upon it by means of a flat piece of wood. In this way they assume a perfectly cylindrical form. Machines have been constructed, however, for the manufacture of such products. The large wax candles used in Roman Catholic churches are merely plates of wax bent round a wick and then rolled.

For preparing wax tapers, the wick is wound around a drum and is then made to pass into the melted wax under a hook placed at the bottom of the kettle. The wick, coated with wax, traverses a draw-plate which gives it the desired diameter, and then winds around a second drum. A little tallow, resin and turpentine is often added to the wax in order to give it greater ductility.

Wax matches, also, which are generally of paraffine, are made with the draw-plate. They are afterward cut to the proper length and tipped with a paste of inflammable material. The use of wax for candles, by reason of their cost, was never very widely diffused, and of course at the present day is likely to diminish greatly. See WAX.

Hollow candles are provided with three apertures extending throughout their entire length. They offer the advantage of not gutter-

ing when burning. They are manufactured by means of a special machine, the molds of which contain three solid rods, which are withdrawn before the solidification of the mass.

At the beginning of the 18th century, spermaceti, a product of the cachalot, or sperm whale, came largely into use for the manufacture of candles. The competition of other materials and the decline of the whale fisheries limit its use at the present day.

Cetin, a form of spermaceti, is too brittle and lamellar in texture to use alone in candle-making. These defects are corrected by the addition of about 3 per cent of wax.

Paraffine candles came into general use about 1850. When crude petroleum is distilled the products obtained consist of light oils employed for illuminating purposes, and heavy oils used as lubricants. These latter, upon cooling, yield a solid substance of waxy consistence and deep color, called paraffine. This material, when purified, gives a white, odorless combustible substance, which is made into candles which give a brilliant but slightly smoky flame. Objections to their use are that at the moment of extinction they emit a disagreeable odor, and that they are too fusible and apt to become distorted in a warm atmosphere. For these reasons paraffine is generally mixed with stearic acid. The use of paraffine candles is most common in Great Britain. See PARAFFINE.

Ozokerit, or *cérésine*, which is also used in the manufacture of candles, resembles paraffine in appearance. It is obtained by purifying a sort of natural mineral wax, the principal deposit of which is found in Galicia. It is not much used except in Germany and Austria. Since *cérésine* candles melt at a higher temperature than paraffine, they undergo no deformation when used.

Palm-oil is obtained from the west coast of Africa, especially the neighborhood of Lagos. The palm which yields it is the *Elias guineensis*, which produces a golden-yellow fruit of the size and shape of a pigeon's egg. By detaching its pulp from the kernel, bruising it into a paste, and then agitating it in boiling water, the oil is separated, and, rising to the surface, concretes as the water cools. About two-thirds of it in weight consists of a peculiar, white, solid fat, called palmitine; the remainder is chiefly olein.

The manufacture of candle-wicks is fully as important as the treatment of the combustible fats, and candle-makers have studied the principles of combustion with a view to discovering methods of producing the clearest light with the minimum of smoke, odor and trouble in snuffing.

A flame is the result of the combustion of a gas. In a burning candle the fatty or other substances are melted and carried by the wick into the interior of the flame, where they are continuously converted into gas. We may compare the combustion of a candle to a microscopic gasworks, and, just as the gas-burner gives more or less light according as the pressure is varied, or the tip is more or less foul, or the proportion of air that reaches the gas is greater or less, just so a candle will give a different light according to the draft of air, the size and nature of the wick. Too large a wick would absorb the melted material too rapidly, the flame would be unduly increased,

and the feeding of it would be effected under unfavorable conditions. Too small a wick would produce the opposite effect; around the periphery of the candle there would form a rim, which, no longer receiving a sufficient quantity of heat, would remain in a solid state; the cavity that serves as a reservoir for the liquefied material would become too full; and the candle would gutter. So the section of the candle, the size of the wick and the draft of air in the flame must be apportioned in such a way that there shall always be an equilibrium between the quantity of material melted and that decomposed by the flame. The purity of the air, too, must be taken into account, for, just as a man needs pure air in order to live in health, so a candle has need of the same in order to burn well. During an evening party it may be observed that the brilliancy of the candles diminishes in measure as the air becomes impoverished in oxygen and enriched with carbonic acid.

The wick must be placed in the centre of the candle, or else it will remain too long, produce smoke, and darken the flame. If the end remains exactly in the centre the air will not reach it, and the wick will carbonize and form a "thief" or "waster," which, falling into the cavity at the top of the candle, will make the latter gutter, and end by obstructing the wick. It then becomes necessary to snuff it. In order to do away with this inconvenience, Gay-Lussac and Chevreul, in 1825, recommended the use of flat or cylindrical wicks of an uneven texture, having the property of curving over. In the same year Cambacérès proposed the use of hollow plaited wicks, which, in measure as the candle burned, had the property of curving toward the white part of the flame. But ashes nevertheless formed, and, obstructing the wick, affected the light. In the month of June 1826 De Milly finally succeeded in solving the problem by impregnating the wick with boric acid. This latter, uniting with the ashes of the wick, gives rise to a fusible body, which is rejected in the form of a drop or bead toward the extremity of the wick. In Austria, wicks are impregnated with phosphate of ammonia, which gives analogous results. Balley has proposed a solution of sal-ammoniac of 2° or 3° Baumé. Consult Calderwood, 'Manufacture of Candles' (London 1891); Lamborn, 'Modern Soaps, Candles and Glycerine' (ib. 1906); Lewkowitzsch, 'Chemical Technology and Analyses of Oils, Fats and Waxes' (Vol. II, London and New York 1909).

**CANDLE, Electric.** See **ELECTRIC LIGHTING.**

**CANDLE-FISH, OOLAKAN,** oo'la-kän, **OULACHON,** -kön, or **EULACHON,** ü'la-kön, a sea-fish (*Thaleichthys pacificus*), of the salmon family, frequenting the northwestern shores of America, of about the size of the smelt, to which it is allied. It is a greenish olive on the back, with a white belly, spotted with yellow. It is converted by the Indians into a candle simply by passing the pith of a rush or a strip of the bark of the cypress-tree through it as a wick, when its extreme oiliness keeps the wick blazing. Oulachon oil, a substitute for cod-liver oil, is obtained from it. This fish is a favorite article of food in British Columbia. The name is also applied to a fish in San Fran-

cisco (*anoploma fimbria*), or Pacific coalfish. Consult Swan, in 'Proceedings of the United States National Museum' (Vol. III, Washington 1881).

**CANDLE-FLY, or LANTERN-FLY,** a hemipterous insect of the group *Homoptera*, family *Fulgoridæ*. The large Chinese candle-fly (*Fulgora candelaria*) is remarkable for its greatly prolonged head, which was formerly believed to be luminous. Compare **LANTERN-FLY.**

**CANDLE-NUT,** the nut of *Aleurites moluccana*, the candleberry-tree, a native of Malaysia, belonging to the family *Euphorbiaceæ*. It is about the size of a walnut, and yields an oil used for food for lamps, and in the manufacture of varnish, while the oily kernels are also strung together and lighted as torches.

**CANDLEBERRY, BAYBERRY, CANDLEBERRY MYRTLE, TALLOW-TREE, or WAX MYRTLE,** a shrub (*Cerothamnus cerifera*) common in eastern North America, where candles are made from the waxy substance collected from a decoction of the fruit. It grows abundantly in sandy soil, and seems to thrive particularly well in the neighborhood of the sea, nor does it ever seem to be found far inland. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water, where the fatty or waxy substance floats on the top and is skimmed off. When congealed this substance is of a dirty-green color, somewhat intermediate in its nature between wax and tallow. After being again melted and refined it assumes a transparent green hue. Mixed with a proportion of tallow it forms candles, which burn better and slower than common tallow ones, and do not run so much in hot weather. They have also very little smoke and emit a rather agreeable odor. Soap and sealing-wax are also made of this substance. The plant has been cultivated in France and Germany, where it grows in the open air. Another plant belonging to the same family is the sweet-gale (*Myrica gale*), which grows abundantly in bogs and marshes in Europe. It is a small shrub with leaves somewhat like the myrtle or willow, of a fragrant odor and bitter taste, and yielding an essential oil by distillation. It was formerly used in the north of Europe instead of hops, and in some places it is still so used. The catkins or cones boiled in water throw up a scum resembling beeswax, which, collected in sufficient quantities, would make candles. The plant is used to tan calf-skins. Gathered in the autumn, it dyes wool yellow, and is thus used both in Sweden and in Wales. The dried leaves are used to scent linen.

**CANDLEMAS,** an ecclesiastical festival instituted by Pope Gelasius I in 492, in commemoration of the presentation of Christ in the temple, and of the purification of the Virgin Mary. It is celebrated on 2 February, and has its name from the fact that in the Roman Catholic Church candles are blessed and carried in procession, in allusion to the words of Simeon, spoken of the infant Christ, "a light to lighten the Gentiles." See **PURIFICATION.**

**CANDLER, Warren Akin,** American clergyman: b. Carroll County, Ga., 23 Aug. 1857. He was graduated from Emory College, Ox-

ford, Ga., in 1875, being licensed to preach and entering the North Georgia Conference of the Methodist Episcopal Church in that year. He was in the pastorate until July 1886, when he became editor of the *Nashville Christian Advocate* (the organ of the M. E. Church South), serving in that capacity until 1888. In the latter year he became president of Emory College, but resigned in 1898 when he became a bishop of the M. E. Church South. He has written 'History of Sunday Schools' (1880); 'Georgia's Educational Work' (1893); 'Christus Auctor' (1899); 'High Living and High Lives' (1901); 'Great Revivals and the Great Republic' (1904); 'Dangerous Donations and Degrading Doles' (1909); 'Wesley and His Work' (1912); 'Practical Studies in the Fourth Gospel' (1913).

**CANDLISH, Robert Smith**, Scottish clergyman: b. Edinburgh, 23 March 1806; d. Edinburgh, 19 Oct. 1873. He was educated at Glasgow University; in 1828 was licensed as a preacher, and in 1834 was transferred from Bonhill to Saint George's, Edinburgh. In 1839 he threw himself into the conflict with the civil courts in the matter of the congregational right of election and independent church jurisdiction in matters spiritual, and soon became, next to Chalmers, the most prominent leader of the "non-intrusion" party and of the movement that culminated in the Disruption of 1843, and the formation of the Free Church of Scotland. From the death of Chalmers till his own death, Candlish was the ruling spirit in the Free Church. In 1862 he was made principal of the New College (the theological college of the Free Church), Edinburgh, and was one of the founders of the Evangelical Alliance. He was the author of 'Contributions Toward the Exposition of the Book of Genesis' (1842); 'Reason and Revelation' (1859); 'The Fatherhood of God'; 'The Two Great Commandments' (1860), etc. Consult 'Life,' by Wilson and Rainy (1888).

**CANDOLLE, kân-dôl, Alphonse Louis Pierre Pyramus de**, Swiss botanist: b. Paris, 28 Oct. 1806; d. 4 April 1893. He was son of Augustin de Candolle (q.v.). He was professor of botany and director of the Botanical Garden at Geneva, published numerous works on botanical subjects, and continued his father's 'Introduction to a Natural System of the Vegetable Kingdom.' In 1714, he succeeded Agassiz in the Academy of Sciences at Paris.

**CANDOLLE, Augustin Pyramus de**, Swiss botanist: b. Geneva, 4 Feb. 1778; d. there, 9 Sept. 1841. He studied at Paris, where he made his reputation by his 'History of Succulent Plants,' and 'Essay on the Medicinal Properties of Plants.' In 1808 he took the chair of botany at Montpellier, where he replaced the artificial method of Linnæus by the natural method of Jussieu, and published the remarkable 'Elementary Theory of Botany.' After the Restoration of 1815, he returned to Geneva, where he devoted the rest of his life to his great work, 'Introduction to a Natural System of the Vegetable Kingdom,' the continuation of which he entrusted to his son, together with an herbarium of 70,000 species of plants.

**CANDON, kân-dôn'**, Philippines, a town of the province of Ilocos Sur, situated in the northwestern part of the island of Luzon, very near the coast. It manufactures cotton. Pop. about 15,797.

**CANDY**. See CONFECTIONERY.

**CANDY, or KANDY**, a measure of weight in the East Indies. In Madras the candy is equal to 493.7 pounds, in Bombay it is 560 pounds and in Ceylon it is equal to 500 pounds. It is divided into from 20 to 22 maunds. In Bombay there is a unit of capacity called the candy, equal to 8.2 Imperial bushels, and elsewhere a dry-measure candy is found varying from 15 to 30 bushels.

**CANDY CEYLON**. See KANDY.

**CANDYLARTHRA**, a group of primitive animals, ancestral to the ungulate type and especially the perissodactyls, remains of which are found fossil in Cretaceous rocks, and on into the Eocene, where they disappear. They were animals of moderate size, imperfectly plantigrade, with five toes on all feet, teeth adapted to both animal and vegetable diet, and small, smooth brains. The best-known example is *Phenacodus*, found in the lower Eocene formation of the Rocky Mountain region. It had the form of a small tapir, but had a long tail. Their nearest modern representatives of the condylarths, structurally, are the African conies (*Hyrax*).

**CANDYTUFT**, a genus of plants (*Iberis*), of the natural order *Crucifera*, flowering in dense corymbs, and distinguished by an emarginate pouch with keeled and winged valves. Some species are shrubs; some, herbaceous perennials and some, annuals. It is indigenous to the countries bordering on the Mediterranean, and several species, as *Iberis umbellata*, *Iberis odorata* and others, are cultivated in gardens.

**CANE, kân, or KEN**, a river in Bundelcund (q.v.), British India, a tributary of the Jumna River. It follows a northeast course and is about 250 miles long.

**CANE-BRAKE**, a term applied to the extensive growths of *Arundinaria macrosperma*, the most gigantic of United States grasses, which occur in the southern portions of the United States, often covering vast extents of country. The plant's stalks are much used for fishing-rods. Cane-brakes are indicative of rich land, as they are only to be found in perfection in the most inexhaustible soils, where, having obtained a foothold, by their more rapid growth they usurp the place of the timber. In the southern portions of the United States the plant often reaches the height of 15 to 25 feet, with a base one to one and a half inches diameter. It grows as straight as an arrow from the root, tapering off finally in a beautiful, thread-like, feathery top. The leaves commence at about two-thirds of the height of the plant, and seem to be attached directly to the stalk, as the branches on which they grow, save the very top ones, are not perceptible to ordinary observation. To the hunter, progress through a cane-brake is one of the most toilsome journeys that can be undertaken. Each step is disputed by the dense vegetation, which rises before the intruder like a wall. In places the cane is sometimes pressed down and inter-

laced, and then it becomes quite impenetrable. Under the most favorable circumstances the knife has to be freely used. Cane-brakes are often many miles in extent, always lessening in density as they reach high ground. They are favorite haunts for all kinds of game, which seek their solitudes either for protection or for the leaves for food. The deer are particularly fond of the young green leaves, and upon them often become exceedingly fat. Cane-stalks being hollow, having no pith, and being divided inside every few inches into sections, are very combustible when dried in the sun; and the air confined within the hollow sections, warming by the external heat, explodes with very considerable force, so that a cane-brake on fire gives the idea of a continued roar of distant musketry.

**CANE SUGAR.** See SUGAR AND SUGAR-MAKING.

**CANEA**, kā-nē'a (Greek KHANIA), Crete, the chief commercial town of the island, situated on the northwest coast, with a good harbor. It occupies the site of the ancient Cydonia, but the present town is due to the Venetians, from whom it was wrested by the Turks, after a two years' siege in 1669. Canea is the principal mart for exporting the productions of the island. Pop. about 20,000. See CRETE.

**CANELLA**, a genus of plants belonging to the family *Canellaceae*. They are ornamental shrubs or trees. *C. alba*, the wild cinnamon, is a common West Indian aromatic evergreen tree, growing to a height of from 10 to 50 feet, with a straight stem branched only at the top. It is covered with a whitish bark, by which it is easily distinguished at a distance from other trees; the leaves are placed upon short leaf-stalks and are alternate. They are oblong, obtuse, entire, of a dark, shining green hue, and thick like those of the laurel. The flowers are small, of a violet color, and grow in clusters at the tops of the branches on branched stalks. The fruit is an oblong berry containing four kidney-shaped seeds of equal size. The tree is very aromatic, and when in blossom perfumes the whole neighborhood. The berries, when ripe, are greedily eaten by the wild pigeons of Jamaica, and impart a peculiar flavor to their flesh. The canella of commerce is the bark of the tree freed from its outward covering and dried in the shade. It is brought to Europe in long quills, which are about three-fourths of an inch in diameter, somewhat thicker than cinnamon, and both externally and internally of a whitish or light-brown hue, with a tinge of yellow. This bark is moderately warm to the taste, and aromatic and bitterish. Its smell is agreeable, and resembles that of cloves. In distillation with water it yields an essential oil of a dark-yellowish color, and of a thick tenacious consistence, with difficulty separable from the aqueous fluid. The remaining decoction, when evaporated, leaves a very bitter extract composed of resinous and gummy matter imperfectly mixed. It has been supposed to possess a considerable share of active medicinal powers, and was formerly employed as a cure in scurvy. Now it is merely esteemed as a pleasing and aromatic bitter, and as a useful adjunct in correcting more active though nauseous medicines. The powder is given along with aloes as a stimulating purgative.

**CANEPHORUS**, a term applied to one of the bearers of the baskets containing the implements of sacrifice in the processions of the Dionysia, Panathenæa and other ancient Grecian festivals. It was an office of honor, much coveted by the virgins of antiquity. The term is often applied to architectural figures bearing baskets on their heads, and is sometimes improperly confounded with caryatides.

**CANES VENATICI**, kā'nēz vē-nāt'isi ("the hunting dogs"), one of the northern constellations added by Hevelius in 1690, between Boötes and Ursa Major. Coming in after the time of Bayer, it has none of his assigned letters; but Baily, in the "B. A. C." in 1845, assigned the letters  $\alpha$  and  $\beta$  to the two brightest stars, and they will probably stand, though they have not been universally accepted by astronomers. The former of the two stars is a well-known double. On the maps, the two dogs, Asterion and Chara, are represented as held in leash by Boötes, and pursuing Ursa Major and the celestial pole, but this change in the figure of Boötes has of course been made since the introduction of Canes Venatici into the celestial train. The constellation is surrounded by Ursa Major, Boötes and Coma Berenices. The great whirlpool nebula of this train was discovered by Lord Rosse in 1845, and a fine globular cluster of stars of the 11th magnitude and fainter, notable for the large (nearly one-seventh) proportion of variables among them. Its principal star, to which Halley gave the name Cor Caroli, is a double star with components of the third and sixth magnitudes.

**CANETE**, kān-yā'tā, Manuel, Spanish author: b. Seville, 6 Aug. 1822; d. 4 Nov. 1891. He was educated in Cadiz. For a long time he was an official in the ministry of the interior, and was later chamberlain to King Alfonso XII. His lyric poems, published under the title, 'Poesías,' are highly esteemed, and his dramas, also successful, include 'Un Rebato en Granada'; 'El Duque de Alba'; 'La Flor de Besalu'; and 'La Esperanza de la Patria' (with Tammayo). He is best known, however, as a dramatic critic and a writer on the history of the Spanish stage. His writings in the field of criticism had much influence in the reform of the stage and were not unconnected with his advancement to important posts in the commissions of Historic and Artistic Monuments and the Inspection of Museums. Among his other works are 'Farsas y Elogos de Lucas Fernandez' (1867); 'La Tragedia Llamada Josefina' (1870); 'Escritores Españoles é Hispano-Americanos' (1884); and 'Teatro Español del Siglo XVI' (1885).

**CANEY**, kā'nē, Kan., city, Montgomery County, on the Missouri Pacific and on the Atchison, Topeka and Santa Fe railroads, 144 miles southwest of Topeka. It has smelting plants, municipal operated waterworks, and manufactures of glass, oil, flour and bricks. Pop. (1910) 3,597.

**CANFIELD**, James Hulme, American educator: b. Delaware, Ohio, 18 March 1847; d. New York city, 29 March 1909. He was graduated from Williams College in 1868; admitted to the Michigan bar, 1872, and practised law at Saint Joseph, Mich., 1872-77. He was professor of history in the State University of Kansas, 1877-91; chancellor of the University

of Nebraska, 1891-95; president of the Ohio State University, 1895-99, when he was appointed librarian of Columbia University, New York. He was secretary of the National Education Association for five years, and its president for one. Oxford conferred on him the degree of Litt.D. in 1902. He published 'Taxation: Plain Talk for Plain People' (1883); 'The College Student and His Problems' (1902); 'A Short History of Kansas' (1885); 'Local Government in Kansas' (1887).

**CANG, CANGUE, or KIA**, the wooden collar or portable pillory, weighing from 50 to 60 pounds, and fitting closely round the neck, imposed upon criminals in China, who are then paraded through the streets and exposed in the public thoroughfare. It renders the wearer unable to feed or otherwise care for himself. On the cang is inscribed the nature of the crime and duration of punishment.

**CANGA ARGÜELLES**, kán'ga är-gwél'yēs, José, Spanish statesman: b. Asturias 1770; d. 1843. In 1812 he was a member of the Cortes from Valencia, and rapidly rose to the leadership of the Constitutional party; hence on the accession of Ferdinand VII he was banished. Recalled in 1816, he became Minister of Finance in 1820, when the constitution was restored. Through the abolition of certain direct taxes, he caused financial disorder, and was forced to resign in 1821; was a member of the Cortes in 1822, but fled to England at the time of the revolution of 1823. Returning in 1829, he again was elected to the Cortes, where he remained true to his liberal principles. He wrote 'Memoria sobre el Crédito Público' (1820); 'Elementos de la Ciencia de Hacienda' (1825); 'Diccionario de Hacienda' (1827, and 2d ed, 1833-34); 'Observaciones sobre la Guerra de la Peninsula' (1833-36); and poems, translations in verse from the Greek, etc.

**CANGAS DE ONIS**, Spain, town, Oviedo province, on the Sella River, 35 miles east of Oviedo. It has busy stock raising and coal mining industries, and is noted for historic incidents. Here the first Spanish Kings resided after the Moorish invasion and here in the 8th century King Pelayo started the Spanish Conquest. The famous cave of Covadonga where he hid is eight miles distant. There are Roman ruins of bridges, etc., and the 19th century church of the Assumption is a replica of the mediæval church which it replaced. Pop. 9,100.

**CANGAS DE TINEO**, Spain, town of Oviedo province, 37 miles southwest of Oviedo on the Rio Narcea, here spanned by an historic bridge. Situated in a well-watered mountainous and wild region, stock raising, farming and coal mining are active industries and cloth, leather, pottery, liquors, flour and linen are manufactured. Pop. 24,000.

**CANIAPUSCAW**, kán-i-áp'ús-ka, a river in Labrador, outlet of a lake of the same name, flowing northwest into Ungava Bay, Hudson Strait; length, 400 miles.

**CANICATTI**, ká-nē-kát'tē, Sicily, a city in the province of Girgenti on the Naro, situated in a grain and fruit region. Here are also sulphur mines. The inhabitants are mostly engaged in agriculture. Pop. (1911) 31,204.

**CANIDÆ**, the dog tribe, comprising wolves, foxes, jackals, dogs and the like, a family of

carnivores, intermediate in structure and phylogeny between bears, hyenas and weasels. Their legs are long; the claws non-retractile, and in all except the lycaon there are five toes in front and four behind. The dentitions usually consist of three incisors, a great canine (a tooth which takes its name from its prominence in the dog, and is the seizing and tearing instrument); four small premolars, and two molars on each side of each jaw; but in the lower jaw there are three molars. All these teeth have the carnivorous characteristic of sharp-cutting crowns rather than broad, grinding surfaces, such as characterize the molar teeth of vegetable-eaters. Dogs are mainly diurnal and live in open uplands rather than in forests, where they obtain their prey by chasing it down; they occupy dens and burrows, and possess keen senses and great intelligence. See **DOGS**. For the fossil history of the family, see **CARNIVORA**.

**CANIDIA**, a Neapolitan woman (real name probably Gratidia), whom Horace loved, and who deserted him. Horace, in an epode and the Satires, gives her name to a sorceress.

**CANIGOU**, ká-nē-goo', one of the peaks of the Pyrenees in France. It is in the department Pyrénées-Orientales, 24 miles from Perpignan; height, 9,137 feet.

**CANINA**, ká-nē'ná, Luigi, Italian archaeologist and architect: b. Casale, Piedmont, 23 Oct. 1795; d. Florence, 17 Oct. 1856. He was for some time professor of architecture at Turin, and afterward lived in Rome, where he published works of great value on the antiquities of Rome, Veii, Etruria and Tusculum, among them 'L'Architettura antica descritta e dimostrata coi monumenti' (1839-46).

**CANINDE**, ká-nē'n'dá, a river of Brazil, flowing into the Paranahiba; length, 200 miles.

**CANIS MAJOR** ("the greater dog"), a constellation of the southern hemisphere, remarkable as containing Sirius, the brightest star in the heavens, by means of which the constellation may be located on a continuation of the line through the belt of Orion.

**CANIS MINOR** ("the lesser dog"), a constellation in the northern hemisphere, immediately above Canis Major, the chief star in which is Procyon, lying between Sirius and Pollux. Procyon has a satellite of a star of the 13th magnitude, and the pair revolve about each other about every 40 years.

**CANISIUS**, ká-nish'i-üs, Petrus (Lat. trans. of Dutch name, De Hond), Dutch theologian: b. Nimeguen, 8 May 1524; d. Freiburg, Switzerland, 21 Dec. 1597. He was the first man in Germany who entered the order of the Jesuits, of which he became a very active member. In 1549 he was made professor of theology, rector and vice-chancellor of the university at Ingolstadt, and in 1551 court preacher at Vienna. He afterward reformed the University of Vienna, according to the views of the order. His catechism, which has passed through more than 400 editions, is yet in use. He persuaded Ferdinand I to adopt stringent measures against the Protestants, and founded the colleges at Prague, Augsburg, Dillingen and Freiburg in Switzerland. He was beatified 20 Nov. 1864. For his life, consult Reiss (Freiburg 1865); Drews, P. (Hale 1892); Mehler, J. B.

(Berlin 1897); Michel, L. (Lille 1898); Kross, A., 'Canisius in Oesterreich' (Vienna 1898); Braunsberger, O. (editor), 'Epistolæ et Acta' (8 vols., Freiburg 1896 et seq.).

**CANISIUS COLLEGE**, an educational institution in Buffalo, N. Y.; organized in 1870 under the auspices of the Roman Catholic Church; reported in 1917: Professors and instructors, 25; students, 530; volumes in the library, 45,000; value of property (including endowment) about \$385,000.

**CANITIES**. Graying of the hair. See HAIR.

**CANITZ**, cä'-nits, Friedrich Rudolf Ludwig, German poet and diplomat: b. Berlin, 27 Nov. 1654; d. there, 16 Aug. 1699. He studied law at Leyden and Leipzig, and was made state counsellor in 1697 under Frederick I of Prussia; in 1698 he was given the rank of baron. His poems were first published anonymously after his death (1700) under the title 'Nebenstunde unterschiedener Gedichte'; the second edition with the name of the author appeared in 1719. They had influence on style in opposition to the mannerisms of Lohenstein and other writers of the time. Those most popular with his contemporaries are the satires, elegies and odes, imitating Boileau; and also an elegy on the death of his first wife, Dorothea von Arnim. Consult König, 'Des Freiherrn von Canitz Gedichte' (Leipzig 1727); Varnhagen von Ense, 'Biographische Denkmale' (Vol. IV, Berlin 1824-45); and Lutz, 'Canitz und sein Verhältnis zu dem französischen Klassicismus' (Munich 1887).

**CANKER**, a disease of plants. See APPLE.

**CANKERWORM**, a caterpillar of a geometid moth of the genus *Anisopteryx*, destructive to fruit-trees, especially apples. See APPLE.

**CANLASSI**, kân-läs'sê, Guido, Italian painter: b. Sant Archangelo 1601; d. Vienna 1681. He studied under Guido Reni at Bologna, and lived at Venice as court painter under the Emperor Leopold I, and later at Vienna. He is to some extent an imitator of Guido Reni, but is especially distinguished for his use of color. His chief works, mostly biblical or mythological subjects, are in Vienna, Munich and Dresden.

**CANNA**, one of the Hebrides, 12 miles southwest of Skye, and 3 miles northwest of Rum. It is 4½ miles long, 1 mile broad and 4¼ square miles in area. The surface, nowhere higher than 800 feet, consists of trap. A hill here of basalt, called Compass Hill, reverses the magnetic needle.

**CANNA**, a genus of plants, some species of which have fine flowers, and some, from their black, hard, heavy seeds, are called Indian shot. There are about 50 species in tropical America and Asia, with ornamental leaves, creeping rootstock, and panicles of red or yellow flowers. *C. indica* is the best-known species, and the roots of *C. edulis* yield starch. The plants are very popular in cultivation, especially the hybrids between various species and the improved varieties obtained by selective breeding. A very large number of named horticultural varieties has been produced in recent years.

**CANNABIS INDICA**. See HEMP, INDIAN.

**CANNÆ**, kân'ê, Italy, an ancient town in Apulia, on the river Aufidus. Its site was between the modern Canosa and Bartletta, and was famous for the battle in which the Romans were defeated by Hannibal (216 B.C.). The Roman army under the consuls Æmilius Paulus and Terentius Varro consisted of 87,000 men, while that of the enemy amounted only to 50,000, among whom were 10,000 horse. The battle was brought on by Varro against the better judgment of his colleague. The Romans left their strong position at Canusium on the banks of the Aufidus, and the whole army crossed the river. Varro drew up his troops on the plain, with his right wing protected by the river. At the same time Hannibal forded the Aufidus and led his small army to the attack. The battle was long, and the Romans fell in great numbers, among them the consul, Æmilius Paulus, and both the proconsuls Servilius and Atilius. Hannibal's Numidian horse destroyed those who fled from the field. The victor made 13,000 prisoners. The Romans lost, according to their own lowest statements, 45,000 men; according to the highest, 70,000. Hannibal collected the gold rings of the knights who had fallen and sent some pecks thereof to Carthage.

**CANNAN**, Edwin, English economist: b. 1861. A student at Balliol, Oxford, he was engaged as lecturer at the London School of Economics (1897) and became professor of political economy in the University of London (1907). He is widely known in advanced circles as author of 'Elementary Political Economy' (1888, 3d ed., 1903); 'History of the Theories of Production and Distribution' (1893, 2d ed., 1903); 'History of Social Rates in England' (1896, 2d ed., 1912); 'The Economic Outlook' (1912); 'Wealth' (1914). He also edited Adam Smith's 'Lectures on Justice, Police, Revenue and Arms' (1896), and the same author's 'Inquiry into the Nature and Causes of the Wealth of Nations' (2 vols., 1904).

**CANNEL COAL**. See COAL.

**CANNELTON**, Ind., city and county-seat of Perry County, 150 miles south of Indianapolis, on the Southern Railroad, and on the Ohio River. It has cotton mills, flour mills, foundry and machine shops, potteries, brick yards and sewer-pipe manufactories. Coal and sandstone are mined in the neighborhood and gas and oil are also found. The city owns the electric-lighting plant and the waterworks. Pop. 2,136.

**CANNES**, kân, France, a seaport and health resort on the shore of the Mediterranean at the west end of the Riviera, 22 miles southwest of Nice, in the department of Alpes-Maritimes. It is beautifully situated in a rich fruit district. It is famed for its mild and equable climate, with an average winter temperature of 50°, and an average of about 70 days on which rain falls in the year. Since its discovery as a health resort by Lord Brougham in 1831 it has become celebrated as a wintering station. There are many hotels and fine villas, charming public walks, etc. Perfumes and soap are made here and anchovies, oils and fruit are among the articles exported. It is a place of great antiquity, and twice suffered destruction at the hands of the Moors. On the island of Sainte Marguerite opposite, the Man with the Iron Mask was imprisoned from 1686-98. Near

Cannes, 1 March 1815, Napoleon landed on his escape from Elba. Pop. (1911) 29,656.

**CANNIBALISM**, the act or practice of eating human flesh by mankind. In his accidental discovery of the West Indies Columbus heard of, if he did not himself see, the Carib Islands, the inhabitants of which were spoken of as Caribales, or, owing to the customary dialectical interchange of *l*, *n* and *r*, Canibales. These Canibales or Caribales were reported to be man-eaters. This terrible association of Canibales with the practice of eating human flesh naturally enough led straightway to the transfer of the name of the people to their horrid custom. The Greek word, anthropophagy (*ἀνθρωποφάγος*), coming down from pre-Christian times, indicates that the practice, though unknown to Columbus, was ancient and well enough known to be in the literature of the older peoples. The story of Polyphemus devouring human flesh as told in the 'Odyssey' and other legends of semi-divine man-eaters is evidence enough that the ancient authors knew, by hearsay at least, of this practice. It is a well-established fact that all races of men have at some time, in a greater or less degree, been guilty of the practice of eating human flesh for one purpose or another. It is very generally believed, and with a good show of reason, that there never has been a time, since man first appeared, down to and including our own, when the world has been free from cannibalism. It is nearer being free from it now than it has been perhaps in all past time. To-day it exists among isolated South American tribes; in West Equatorial and Central Africa; in the Malay Archipelago, some of the South Sea Islands (mainly in Melanesia) and in parts of Australia. Excluding Australia cannibalism may be said to be confined to a belt of land extending to a little more than 10 degrees north and south of the equator.

How far back the practice goes it is not possible to tell. So far as is known there is nothing to warrant the belief that the ancestors of the human species or the first of the human species ate one another. There is little if any evidence to indicate that down to as late a period as the close of the Old Stone Age the several races of men which had successively inhabited Euro-Asia and northern Africa practised cannibalism. Cannibalism is not universally characteristic of the savage state. A few charred and broken and scraped human bones from the cave-dwelling period are substantially all that has been found which can by any stretch of the imagination be supposed to hint at this practice. Tylor goes as far as the facts seem to warrant when he says that this evidence may "perhaps be taken to show that prehistoric savages were in this respect like those of modern times neither free from cannibalism nor universally practising it." Cannibalism originates in and is carried on from widely different motives, ranging all the way from eating human flesh as a regular part of daily subsistence to the eating of it for purely magical or ritualistic reasons. It is not possible to draw a dividing line between the several kinds because all or nearly all forms are more or less interrelated. This may arise from the fact that usually the practice does not begin in a single motive.

**As a Means of Subsistence.**—The most repulsive and degrading form of cannibalism is that of eating human flesh as a part, the main part, of the regular diet. The negro tribes along the Guinea Coast southwards into the Kongo and for some distance eastward eat human flesh as food. It is treated just as other races treat animal flesh. Raids are made to capture prisoners and they are herded and kept till wanted. Sometimes they are fattened just as other races fatten animals for the slaughter. Under great stress of hunger occasioned by shipwrecks, sieges and famines civilized persons have been driven to the eating of human flesh. The siege of Samaria about the middle of the 8th century B.C. (II Kings vi, 24ff.); the siege of Paris in 1590; and the famine in Algiers in 1868 furnish instances of this. What civilized people are driven to do by the pressure of hunger it is not surprising that the savage should do with even greater readiness under similar circumstances. Many savage races have resorted to cannibalism only in times of famine. The Mungerra tribe in Queensland in times of severe famine "kill and eat some of their female children." The natives of Tierra del Fuego, when starving in winter, "throttle and devour the oldest woman of the party. When asked why they did not kill and eat the dogs, they reply 'Dogs catch otters.'"

**As a Manifestation of Affection.**—Incredible as it may seem cannibalism in some instances seems to be prompted by affection. The Binderwurs of Central India killed and ate the sick and aged, "thinking this an act of kindness and acceptable to the goddess Kali." The aborigines of southwest Victoria practise eating human flesh in a solemn service of mourning for the dead, particularly for those killed by accident. "The Tangara carry their dead about with them, and whenever they feel sorry for their death, they eat some of the flesh till nothing remains but the bones." Among still other peoples parents partake of the flesh of their dead children "as a token of grief and affection for the deceased." The practice of eating flesh for the purpose of honoring dead kinsmen is of a similar character. Herodotus, writing of the Massagetæ, a Scythian people living in the northeast of the Caspian, relates that when a man has attained a great age among these people it is the custom for his kinsmen to sacrifice him, boil his flesh with the flesh of cattle and eat it. This is accounted an exceedingly happy ending. Lyden describes a cannibalistic custom which has the appearance of a very pious ceremony. The aged and infirm invite their descendants to eat them. The victim ascends a tree around which the others assemble singing a funeral dirge: "The season is come, the fruit is ripe, and it must descend." He then descends, and is put to death and eaten in a solemn banquet.

**As a Ritualistic Practice.**—Cannibalism as a religious institution is one of the most widespread and persistent forms of the practice and it ranges all the way from almost a passable refinement to the most revolting orgies. The religious purpose is not always the same. In some instances it is due to a desire, as among some Australian tribes, who make a practice of eating their totems, to become identified with the totem or god. In other cases the desire is simply to establish a close bond of friendship

between the flesh-eating god and themselves. The peoples who offer human sacrifices to the god eat of these sacrifices, believing that by so doing they directly and surely become possessed of the divine virtues supposed to proceed from such sacrifices. With the Khonds it was the custom for a girl representing the goddess Tari to be sacrificed and torn limb from limb by the worshippers eager to obtain a piece of the deified victim. Cannibalism as a purely religious exercise among people possessing a high degree of culture is best and most notoriously illustrated by the Mexican custom of offering human sacrifices to the god Huitzilopochtli. "The victims were enemies or slaves and were offered before the images of the gods. The priest cut open the breast with an obsidian knife, tore out the heart and offered it to the gods; then he sprinkled his assistant and the offerers with the blood. After this a cannibal feast on the body took place, priest and offerers partaking." Early writers say these cannibalistic sacrifices reached yearly into the thousands. To obtain rain from the rain-god Quiateot, children and adults were sacrificed to him and his images were sprinkled with their blood.

**As Magic and Medicine.**—One of the most varied forms of cannibalism is that originating in the belief that by eating human flesh or certain parts of the human body very important advantages would be gained. Dead relatives in some instances are eaten in the belief that the soul of the deceased will thus pass into the eater, and he thereby become possessed of all the desirable qualities of the dead man. In other instances the body of an enemy was eaten because that was the way to destroy the soul and thus put an end to further menace. Landor reports that in Tibet the dead is eaten partly by the Lamas and in part by the relatives, it being believed that the spirit whose flesh has been eaten will always remain friendly. The Botocudos ate an enemy to render themselves invulnerable against the arrows of the hostile tribe. Among some peoples at the founding of a new town a human victim was slain and the heart and liver eaten by all present so that they might not die within the year. In I Kings xvi, 34, is reflected a survival of a similar custom. The idea that the eating of human flesh endows the eater with distinctly magical or supernatural powers is frequently met with in the savage world. In East Central Africa it is quite generally believed that the uncanny powers supposed to be possessed by witches and wizards are obtained by the feeding of the latter upon human corpses. From this comes, naturally enough, the belief that whoever feeds on human flesh will have the power of witches and wizards.

Not infrequently cannibalism has arisen from an almost uncontrollable passion for revenge, and a savage belief that eating an enemy is the surest way of bringing about his lasting disgrace. The ferocious natives of New Caledonia do not consider that revenge is complete until they have devoured the slain. The cannibal practices in Samoa seem to have had hatred and revenge as the motive. "I will roast thee" was the greatest insult that could be offered a Samoan. For a long time after the practice was abandoned, captives, in token of submission, would offer burning wood and say

"Kill and cook us when it seems good to thee." The Tupis of South America ate their dead enemies, and the children were brought home captive and cared for till the age of 14 when they were slain and eaten. Instances have been met with where the criminal enemies within the tribe are slain and eaten. Where this is the custom it is usually the chief alone who has the privilege of eating the offending tribesmen. In some cases it is not easy to distinguish between this custom and that of mere gluttonous cannibalism. The chief goes so far as to cause a tumult to be raised. As a punishment the offender is slain and the chief invites guests to share in the meal of human flesh. So powerful an incitement to cannibalism is this passion for revenge that quite civilized peoples have been guilty of it.

**Other Motives.**—There are several other motives leading to cannibalism more or less distinct from those mentioned. Among some peoples the flesh of a fallen enemy was eaten after the fight by both contending parties as a token of entering into a binding covenant of peace. At the coronation of a king in the Sandwich Islands it was the custom for the new king to swallow the left eye of a human victim that he might thus receive an accession of strength. Among the Indian tribes of the Northwest of America cannibalism took the form of initiation into certain secret societies—a sort of ritualism. At the beginning of the initiation into the cannibal society the person is supposed to become possessed of the cannibal spirit, and so of a violent desire to eat human flesh. In olden times, when the cannibal was in a state of ecstasy, slaves were killed for him and he devoured them raw. Cannibal practices are of almost infinite variety, and perhaps all, except where human flesh is eaten simply as food, have their root in a superstitious view of life and the world. Naturally the practice has been disappearing before the progressive enlightenment of the world, and even the tribes who are still guilty of eating human flesh as food are increasingly ashamed of it, very often carrying on the practice in closely guarded secrecy.

The bibliography of the subject covers a multitude of publications. Articles on anthropology and ethnology in journals devoted to such subjects will yield much information; also the narratives of travel and adventure by well-known explorers of early and later times. A few might be mentioned simply as suggestions: Weeks, 'Among Congo Cannibals'; Frazer, J. K., 'Totemism and Exogamy'; Stanley, H. M., 'In Darkest Africa'; Landor, W. S., 'In the Forbidden Land'; Rannie, 'My Adventures Among South Sea Cannibals'; Dennys, 'Folklore of China.'

**CANNIFF, William**, Canadian physician: b. Thurlow, near Belleville, Ontario, 1830; d. 1910. He was educated at Victoria College, Cobourg, and studied medicine in Toronto, New York and London, England, where he took the degree of M.R.C.S. He served in the Crimean War, 1856; returned to Canada, became professor of pathology in Victoria College; visited the Washington hospitals during the Civil War, and finally settled in the practice of his profession at Toronto. He was one of the originators of the "Canada First" movement. He was the author of 'The Medical Profession in Upper

Canada, 1783-1850' (1894); 'The Settlement of Upper Canada' (1872).

**CANNING, Charles John (EARL)**, English statesman, son of George Canning (q.v.): b. near London, 14 Dec. 1812; d. London, 17 June 1862. He was educated at Eton and Oxford. He entered Parliament in 1836 as member for Warwick, and in the following year succeeded to the peerage, on his mother's death, as Viscount Canning. In 1841 he was appointed under-secretary for foreign affairs in Peel's government, and in 1846 commissioner of woods and forests. In the Aberdeen ministry of 1853, and under Palmerston in 1855, he held the Postmaster-Generalship, and in 1856 went out to India as governor-general. Throughout the mutiny he showed a fine coolness and clear-headedness, and though his carefully pondered decisions were sometimes lacking in promptness, yet his admirable moderation and the implicit trust he imposed in able military subordinates did much to re-establish the British empire in India. In 1858, when the government of India was transferred from the East India Company to the Crown, Canning became the first viceroy; and in the succeeding year he was raised to the rank of earl. From that time till his retirement in March 1862, the arduous task of undoing the mischief wrought by the mutiny devolved upon him, and his great success was a witness to his ability. Consult Cunningham, 'Earl Canning' (1891); Hare, A. J. C., 'The Story of Two Noble Lives' (1893).

**CANNING, George**, English orator and statesman; b. London, 11 April 1770; d. Chiswick, 8 Aug. 1827. His father offended his family by marrying a lady of beauty and accomplishments, but without fortune, and died in 1771, leaving her destitute. She however lived to see the success of her son, from whom she ever received the tenderest marks of filial love. Canning, who had inherited a small estate in Ireland, was educated at Eton. In 1787 he was entered at Oxford. His vacations were passed with Sheridan, by whom he was introduced to Burke, Fox and other distinguished Whigs. But although Sheridan had already announced him in Parliament as the future ornament of his party, Canning entered into terms with Pitt, by whom he was brought into Parliament in 1793. During the first session he remained silent. In 1796 he was under-secretary for foreign affairs. In 1797 he projected, with some friends, the *Anti-Jacobin*, of which Gifford was appointed editor. Canning contributed many poetical and other articles to this periodical, the happiest of his efforts in this direction being the 'Needy Knife-grinder.' In 1798 he supported Wilberforce's motion for the abolition of the slave-trade. In 1800 Canning increased his fortune and influence by a marriage with Joanna, daughter of General Scott, a lady of ample fortune. The administration being dissolved in 1801, Canning became a member of the opposition until the restoration of Pitt in 1804. In 1807 he was appointed Secretary of State for Foreign Affairs in the Portland administration. A political misunderstanding with Lord Castlereagh led to a duel between that minister and Canning, in which the latter was slightly wounded. This dispute occasioned the dissolution of the ministry. In 1810 he opposed

the reference of the Roman Catholic claims to the committee of the whole House, on the ground that no security or engagement had been offered by the Roman Catholics. Some of his most brilliant speeches were on this subject. The adoption of the measure being a matter of policy, the state of opinion, the condition of affairs, and the securities with which it should be accompanied, were with him elements of the question. He proposed securities in 1813, which, with the bill, were rejected. He supported in 1812 and 1813 the same motion which he had opposed in 1810. To Canning was principally owing the first blow which shook the throne of Napoleon: the British policy in Spain was directed and animated by him. In 1812 he was elected member for Liverpool, from which he was also returned in 1814, 1818, 1820. In 1814 he was appointed Ambassador Extraordinary to Portugal, and remained abroad about two years. In 1819 he declared his decided hostility to parliamentary reform in whatever shape. On the occasion of the proceedings relative to Queen Caroline, the discarded wife of George IV, he declared that "toward the object of that investigation he felt an unaltered regard and affection"; and soon after resigned the presidency of the board of control and went abroad. Having been nominated governor-general of India, he was on the point of embarking when the death of the Marquis of Londonderry called him to the Cabinet as Secretary for Foreign Affairs, 16 Sept. 1822. One of his earliest acts in this situation was to check the French influence in Spain, the French having sent an army into that country to put down the revolutionary party. By way of withdrawing the Spanish-American colonies from French influence he decided to recognize their independence; thus, as he afterward phrased it, "calling the New World into existence to redress the balance of the Old." He continued to support the propositions in favor of the Roman Catholics, and in 1825 communicated to foreign ministers the determination of the government to appoint *chargés d'affaires* to Colombia, Mexico and Buenos Aires. In consequence of the attempts made by Spain to assist the malcontents of Portugal, it was immediately determined by the ministry to support the regency in that country, and troops were sent to Lisbon in January 1827. On 12 April 1827 his appointment as Prime Minister was announced. His administration was terminated by his death, but not until it had been crowned by the Treaty of London (6 July), for the settlement of the affairs of Greece. As an orator Canning was showy and graceful, with a brilliant wit and caustic satire, though neither formed on a very masculine taste. During his career the leading domestic subjects on which the British Parliament was called upon to legislate were the following: the liberty of the press, the emancipation of the Roman Catholics, the test and corporation acts, the corn-laws and reform in Parliament. Those of a foreign nature were, among others, the various overtures of peace between Britain and France, the settlement of Europe on the overthrow of Napoleon, the treatment of Italy by the Austrians, the Spanish revolution and recognition of the South American republics. On all these questions, with one or two exceptions, he supported the high Tory side. The chief exceptions were

the emancipation of the Roman Catholics and the recognition of the South American republics. He was also desirous of reforming the corn-laws. His speeches, edited by Thierry, were published in six volumes in 1830. Consult Stapleton, 'Political Life of Canning' (1831); Stapleton, 'Canning and His Times' (1835); Temperley's 'Life of Canning' (1905); Bagot, 'George Canning and His Friends' (1909); Marriott, 'George Canning and His Times' (1905); Lord Dalling, 'Historical Characters' (1867).

**CANNING, STR Samuel**, English civil engineer: b. Wiltshire 1823; d. 24 Sept. 1908. He is best known in connection with the laying of the Atlantic cables, and those in the Mediterranean and North seas. He was knighted in 1866.

**CANNING, Stratford** (1st VISCOUNT STRATFORD DE REDCLIFFE), English diplomatist, cousin of George Canning (q.v.): b. London, 4 Nov. 1786; d. 14 Aug. 1880. His father, Stratford Canning, who had been disinherited owing to an imprudent marriage, and had gone into business as a merchant, died a few months after his son's birth, and in consequence young Stratford and his mother removed to Wanstead. He went to Eton, and in 1805 he was elected to a scholarship at King's College, Cambridge. Before graduating he was in 1807 appointed by his cousin, George Canning, then Foreign Secretary, to be his précis writer, and in the latter part of that year was sent as second secretary with a mission to Denmark. In the following year he accompanied as first secretary an important mission to Constantinople, which resulted in the conclusion of a treaty of peace with the Porte on 5 Jan. 1809. In the summer of 1810 his chief, Sir Robert Adair, was transferred to Vienna, and Canning temporarily succeeded him as Ambassador at Constantinople. Before the arrival of Adair's successor, Canning made his reputation as a diplomatist by the masterly way in which he conducted the difficult negotiations which led to the signing of the Treaty of Bucharest on 28 May 1812. This treaty put an end for the time to the war between Russia and Turkey, and thus left Russia free to resist the advance of Napoleon. Moreover, it firmly secured English predominance at Constantinople, and was in this respect the first notable triumph in the traditional British policy on the Eastern Question. In 1812 Canning returned to London, and after declining in 1813 the offer of the chief secretaryship to Lord Aberdeen's Vienna mission, accepted in the following year the post of Envoy Extraordinary and Minister Plenipotentiary in Switzerland. He held this post till 1818, and was completely successful in his endeavors to free Switzerland from French domination and to erect it into a neutral federal republic. Shortly after his return he was appointed Ambassador to the United States and he arrived at Washington in the autumn of 1820. He was again in London in 1823. The diplomatic agreement arrived at in 1824 was, however, thrown out by the United States Senate. After a brief but important mission to the Russian capital he was again sent to Constantinople in October 1825 as Ambassador. In the following year he succeeded in again patching up a peace between Russia and Turkey, and

thus prepared the way for a joint representation by England, France and Russia on behalf of insurgent Greece. Negotiations were, however, abruptly broken off by the Sultan's indignation on learning of the battle of Navarino, and Canning was later in the same year engaged, along with the representatives of France and Russia, in drawing up proposals for establishing a Greek kingdom. These were ultimately forced on the acceptance of Turkey in a more stringent form as part of the peace treaty which ended the Russo-Turkish War of 1828-29. In 1829 he resigned his position and returned to England, where he was created G.C.B. He entered Parliament as member for Old Sarum, but he ultimately secured election for King's Lynn. In 1830 he drew up the British case in the Saint Croix-Saint Lawrence boundary dispute with the United States for submission to the King of the Netherlands. After acting as special envoy to the Porte in 1831-32, and to Portugal in 1832-33, he was in 1841 appointed for the third time Ambassador at Constantinople. For a considerable period he was mainly engaged in assisting and encouraging the Sultan, Abd-el-Mejid, in his policy of reform, but after a visit to England in 1852, during which he was raised to the peerage, his efforts had to be directed to thwarting Russian designs. His diplomatic triumph over Prince Mentchikoff caused the Tsar in a moment of irritation to precipitate the Crimean War. He resigned in 1858, and the remainder of his career was passed mainly in retirement. In addition to a few volumes of poetry, he published works entitled 'Why am I a Christian?' (1873), and 'The Greatest of Miracles' (1876). A selection of his articles on Eastern affairs was published in 1881 under the title of 'The Eastern Question.' See 'Life' by Stanley Lane-Poole (1888).

**CANNING AND PRESERVING INDUSTRY.** The hermetical sealing of food, generally termed "canning," has long since passed the experimental stage and is now one of the leading industries of the country. The inventive genius of man has from the earliest times turned toward some method of preventing articles of food from deteriorating, and toward some way of preserving food so that it will be palatable at some future time. "Desiccation" or drying was probably the first method used, but the food thus preserved lost its natural flavor and became tough in texture. Prior to 1750 this method of drying, and that of using salt and sugar, were the only methods in use for preserving food. From 1809-10 a Frenchman, Nicholas Appert (b. 1750; d. 1841), evolved a plan for hermetically sealing foods for use at sea, and his process was purchased by the French government, which gave it to manufacturing firms in France and England for use in producing canned goods. Appert described his invention as an inexpensive and simple method of preserving various sorts of animal and vegetable food in perfect condition for an indefinite period. He gave the world one of the principles involved in the art of canning, and since his time there have been several new principles discovered equally as important as his sterilizing process, which did not take in the prevention of souring prior to sterilization. There have also been other im-

provements in machinery especially adapted to the principles involved, whereby cost has been enormously reduced, so that food preserved in tins is within reach of all classes of consumers. He was later awarded a prize of 12,000 francs by Napoleon, but spent most of this money for further experiment and died when over 90 years of age, after having seen his process thoroughly tested and put into operation.

In 1810 the English government granted a patent to Peter Durand for the preservation of fruits, vegetables and fish in hermetically sealed cans, made of tin, glass or other fit material. He made no claims to the discovery of the process, and it was stated at the time that he received his information in regard to it from a "foreigner residing abroad." The methods, despite the secrecy in their use, gradually became known, and in the course of time came to America. It is believed that a man by the name of Ezra Daggett was the first to put the practice of canning goods into actual use in this country, in the years from 1815 to 1818. He with his son-in-law, Thomas Kensett, began to manufacture hermetically sealed goods, on a large scale in the year 1819, and the principal foods thus packed were salmon, lobsters and oysters. A patent was granted them in 1825 on the use of the tin can, or "case" as it was then called, and they immediately started the use of this process in their factory. Glass jars were then very little in use, because of their costliness, bulk and inability to withstand the extremes of temperature.

In 1820 William Underwood and Charles Mitchel combined, in Boston, for the purpose of manufacturing foods in hermetically sealed cans. The principal business engaged in during the early days of the combination was the preparation of pickles, jams, jellies, sauces and mustard; but they also put up quinces, cranberries, currants, etc. About the same time, Allen Taylor and M. Fallagher, who had learned their trade in Ireland, came to this country and were for some time employed in New York. They with Kensett did much to put the industry on a permanent basis. In 1839 William Underwood began to substitute tin for glass, though it was a number of years before the jar and bottle gave way entirely to the "tin can." The methods of can-making were for many years very slow and primitive. A tinker who could turn out 60 cans a day was a master workman, for every can was made by hand. The body for each had to be measured, marked and cut out from the plate by hand shears, and, to make the seam or lap secure and air-tight, it was thought necessary to pile on the solder until a ridge an eighth of an inch thick was built up from end to end. It was also a slow and difficult operation to make the covers and bottoms. Each one had first to be drawn on the tin with compasses and then cut out with the shears, and finally, with a mallet, the edges struck up or bent, over an upright piece of iron called "a heading stake." The tops and bottoms, like the seams, were soldered on with a heavy beading of metal, and enough solder was used on one can to make a dozen of to-day's manufacture.

So was born the tin can that now is scattered in every direction, along the paths of travel and progress; but, strange enough, this growing infant had, in its younger days,

another name, one which more became its infantile and clumsy form — "The Tin Canister."

In all the correspondence for the next 10 or 15 years, cans or canned goods never seem to be mentioned. They were always spoken of as hermetically sealed goods in canisters or tin cases. In the salesbook or "Waste," as it was then called, canisters were abbreviated thus, "Cans," and probably by such abbreviations, tin packages for food came ultimately to be known as cans.

The stamp-can was invented in 1847 by Allen Taylor and was a decided improvement over any previously made. Two years later, 1849, Henry Evans, Jr., of New Jersey, brought forth the "pendulum" press for making can tops, and so the improvement in the manufacture of cans has gone on till now we have the key-opened can, the invention of a Mr. Zimmerman. While the manufacture of cans has become a distinct industry and not now generally connected with the canning industry, nearly 10 per cent of those now in use are made by the canning establishments. These cans are made from sheets of tinned steel, 14x20 inches in size and weighing about one pound. The objection to tin cans as containing poisonous acid or injurious substances has caused the methods of manufacture to be carefully scrutinized, so that now all cans are subjected to an acid preparation for removing dirt, grease, etc., and then coated with pure tin by the acid process or palm-oil process, the latter of which is considered the safer.

In the methods of cooking there have been many improvements, the slowness and low temperature of 212° F. allowable in the Appert process being gradually raised by the use of chloride of calcium, till now a temperature of 250° F. is possible, although this process is more expensive, as the cans become discolored and have to be cleaned before they can be put on the market. The "closed-kettle" process of cooking goods by means of superheating water with steam was invented by A. K. Shriver of Baltimore, and about the same time, the invention of the patent-process kettle, securing similar results by the use of dry steam, was brought out by John Fisher of the same city. One of the modern systems for sterilization is the Continuous Calcium Process System, patented by the Sprague Canning Machinery Company of Chicago. Another is the Continuous Process System in oil, used by the packers of canned meats. Another is the Polk Agitating System, patented by Ralph Polk, of Greenwood, Ind. By this system the time of sterilization is materially shortened.

The canning industry, although established in the United States as early as 1825, did not become of much importance until the middle of the century, but from 1850 came to the front by leaps and bounds. In 1889 the products of the industry were valued at \$46,600,000; in 1899 at \$99,335,000; in 1904 at \$130,466,000; in 1909 at \$162,000,000; and in 1914 at \$235,000,000. This last tremendous increase appears to be partly fictitious, owing to the fact that more foods are now reported by the census under the heading of "canning." For instance, condensed evaporated milk totaled \$58,747,000 in 1914, or nearly one-sixth the entire production.

Many unaccountable losses were met with, when in certain years the canned goods would

not all keep. Numerous theories were experimented with, in vain efforts to learn the cause of these mysterious deteriorations.

In some cases it seemed certain that spoiling was caused by freezing. Some salmon had been stored in a warehouse, which, during the winter, had not been constantly heated. Many cans of this lot spoiled; so the freezing theory was accepted and held good, until some other cans from the same packing spoiled, which could not possibly have frozen. To explain this new phase of the situation, another theory had to be concocted.

In searching for the probable origin of these mysterious losses, the real cause was not suspected. The exclusion of air was thought to be one of the most important factors in keeping the goods, and, until recently, this opinion has prevailed.

The researches in bacteriology in 1895-99 at the Massachusetts Institute of Technology brought out the fact that in some cases the spoilage of canned goods was due to imperfect sterilization through lack of sufficient heat to destroy all bacteria. This, however, accounted for only a small per cent of the spoilage cases. There are several other causes which have been brought out by the research work of Edward W. Duckwall, M.S., in the Sprague Cannery Laboratory, an institution which was founded in August 1903 by Mr. Daniel G. Trench of Chicago. (The name of this laboratory has since been changed to the National Cannery Laboratory). It was discovered that a large per cent of what is known as "sour" corn and peas was due, not to insufficient sterilization, but to souring which had been accomplished by bacteria in the raw product prior to the sterilizing process. It was also discovered that some of the spoilage was due to the evolution of carbonic acid gas from the seeds of certain fruits and vegetables. The germ life of the seeds was not destroyed by the heat, and carbonic acid was liberated when the seeds sprouted in the cans. Gradually all obstacles are being overcome; new processes have been invented, the purity of the canned article has been proved by expert chemists and the manufacture has become general in every part of the United States where fruits or vegetables are grown or where the supply of fish and oysters is nearby.

The installation of labor-saving machinery, the remarkable growth in the number of firms, the decline in the market value of the goods, made necessary uniform grades and rates of sale throughout the country. In October 1872 the first organization of canned goods packers met in Philadelphia, but this was only short-lived, and it was not until February 1883 that a permanent exchange was established. The "Canned Goods Exchange" of Baltimore was at that time organized, with the intention of having sales on the floor daily, but after a thorough trial they abandoned that plan and adopted grades for goods, and rules and terms governing transactions. These exchanges began rapidly to come into existence. In 1885, the "Western Canned Goods Packers' Association" was formed, composed of those doing business in the Mississippi Valley. In the same year the New York State packers organized, and two years later those of New Jersey and Virginia. In May 1889 the National Association was

formed at Indianapolis, followed by the "Peninsula Packers' Association" of Delaware, formed in 1894, and the "Atlantic States Canned Goods Packers' Association" of Baltimore, organized in the fall of the same year.

The localization in the canning industry is principally due to climatic conditions. California has forged ahead and monopolized one-fourth of the industry, New York producing over 10 per cent and Maryland  $7\frac{1}{2}$  per cent. in 1914. Thus we have Illinois, Maine, Iowa, New York, Ohio and Maryland as the principal corn-packing States; Maryland, New Jersey, Delaware, Indiana, Virginia and California as the tomato-canning States; while Wisconsin, New York, Illinois and Ohio produce the largest amount of canned milk; Maine is the principal packer of sardines, while Washington and Oregon monopolize the salmon canneries. Peaches are principally canned in California, Maryland, Michigan and Georgia; New York, Michigan, Maryland, California and Maine put up the major portion of the apples packed, though the industry is carried on to some extent in Washington and Oregon. Pears are packed mainly in California, New York and Maryland, while pineapples are almost wholly packed in Baltimore, Md. Beans are canned mainly in Indiana, New York, Maryland and Illinois; peas in Wisconsin and New York; prunes and raisins are dried almost wholly in California; nearly all the salt fish is packed in Massachusetts.

For general purposes of comparison, the canning and preserving industry may be divided on the lines of the United States census statistics into four distinct classes: Fruits and vegetables; fish, both canned smoked and dried; oysters and clams; and pickles, preserves, jellies and sauces; and under these headings the industry may be more comprehensively discussed. The canning and preserving of fruits and vegetables gives employment to over 50,000 persons; that of fish to 9,000; and that of oysters, etc., to over 2,000.

**Fruits and Vegetables.**—Fruits were the first foods to be successfully canned, as the low temperature used in the early methods was more easily applied to this class of goods because less heat is required to preserve them than all others. Glass bottles were filled up to the neck, loosely corked, and then placed in tepid water, the temperature of which was gradually raised from 170° to 190° F., remaining there for a period varying from 30 to 60 minutes according to the article being preserved. In 1823 Pierre Antoine Angilbert made an improvement on this method by placing the fruit in a tin can containing water, then placing on the cover in which there was an aperture to allow for gas escape. It was then placed in water and heat applied; after boiling a sufficient length of time, the aperture was closed by a drop of solder.

Not much is known of this branch of the canning industry between the years 1820-45, and it probably was not very extensive, and it is certain that tomatoes and corn were not put up to any great extent during those years. It appears from a narrative presented by William Lyman Underwood that his grandfather, William, began to use the Appert process about 1820, and exported preserved goods to Manila in 1821. In 1830 he packed pie fruit in bottles,

and in 1830 imported tomato seed. His son, William J., has a label used in 1845 on "hermetically sealed tomatoes," and which contains the following: "This is prepared by straining the skins and seeds from the tomatoes, evaporating the particles by slow heat. The bottles contain the substance of about two dozen tomatoes, and it will keep good any length of time." The style of the label is in marked contrast to those now in use. In 1847 Harrison W. Crosby, when he was steward of Lafayette College, at Easton, Pa., first used tin cans to seal tomatoes hermetically, and in 1893 the canning of corn was begun by two firms, one in Baltimore, Md., and one in Portland, Me. The establishment in Portland gained little headway until 1852, in which year Isaac Winslow, who was in charge, applied for a patent on his process, but which was not granted him until 8 April 1862. His method was substantially the same as the Appert process, with the exception that the first cooking was done away with by the introduction of "cookers," which are steam retorts used to cook the corn before placing it in the can. Prior to 1846 numerous canneries were in operation in New York, Boston, Baltimore, Portland and Eastport, Me., and in Newark, N. J., and it was in the latter place that the fruits and vegetables were prepared for Kane's Arctic Expedition.

In 1860 factories began to spring up in all the great fruit and vegetable raising sections of the country. The Middle West loomed up as a manufacturing centre. Thomas Duckwall erected the first canning factory in Claremont County near Cincinnati, and Albert Fisher followed at Cincinnati. A few years later a cannery was started at Circleville, Ohio, and at Indianapolis, Ind. From that time up until 1880 factories sprang up all over the Middle States like mushrooms.

California then began to be heard of, and rapidly came to the front as a producer of canned fruits, now being in the lead in the preserving and canning of small fruits, such as the plum, pear, peach and cherry, and such vegetables as asparagus, tomatoes and peas. The dried fruit industry, in which prunes and raisins lead, and which has reached its fullest development in California now exceeds in volume the production of canned fruit.

The canning of fruits and vegetables has grown more rapidly in the last 30 years than any other branch of the industry, due to the greater territory in which it may be carried on and to the unlimited cultivation of these articles. The canned vegetable branch of the industry yielded products of \$29,000,000 in 1899, \$53,000,000 in 1909, and \$84,000,000 in 1914. The dried fruit production of 1909 was \$22,000,000, and about \$35,000,000 in 1914.

The tomato has proved the most popular of canned vegetables, and the manufacture in 1909 was valued at \$18,747,000, rising to \$25,532,000 in 1914. Corn and peas represented a value of about \$15,000,000 each, and beans \$16,500,000. Of fruits, peaches now lead, apples having fallen into fifth place. Of dried fruits, raisins and prunes are far in the lead. In 1915 leading canneries contracted for the largest acreage recorded to that date—190,106 for sweet corn, 140,000 for tomatoes and 102,000 for peas, this last figure being a reduction from the 1914 acreage, contracted for, of 126,000.

**Fish.**—All the known processes are used in the preservation of fish, which of all foods is the most rapid to putrefy. Smoking and drying are the older methods, and they are still in use. The Hollanders put up fish in cans long before the Soddington and Appert methods were known. About 1845, sardine canning was successfully established on the coast of France. Prior to 1843 the canning of fish in the United States was little known, but in that year lobster and mackerel canneries were successfully established at Eastport, Me., and the business grew rapidly till 1860, when the supply of lobsters decreased and the prejudice against the canneries resulted in the enactment of strict laws restricting the time of operation of canneries and the canning of short lobsters, so that in 1895 the last factory so engaged suspended, and in 1900 there were no lobsters canned. Mr. Underwood established the first lobster-packing factory in this country at Harpswell, Me., in 1848, and in 1853 started a factory for packing salmon at Bathurst, N. B., at one time the only source of supply. Quantities of this fish were sent to California prior to salmon being taken from the Columbia River. He died in 1864, and was succeeded by the firm of William Underwood Company, of which his grandson, H. O. Underwood, is president. Prior to 1864 salmon-canning was carried on to a small extent, but after that year the industry grew rapidly; factories were established on the Pacific Coast at Washington, Cal., on the Sacramento River, and in 1866 on the Columbia River. Perhaps the most striking illustration of the growth of this business is in that almost universally used article, canned salmon. In 1864 the firm of Hapgood, Hume & Company, consisting of William Hume, G. W. Hume and A. S. Hapgood, canned a few cases of salmon on the Sacramento River, where William Hume had been a hunter and fisherman for several years. William Hume carried the samples around to introduce them, using a basket for that purpose, from which the salmon were sold. In 1866 the business was transferred to Eagle Cliff, Wash., on the Columbia River, where William Hume had been prospecting the year before, and there (in 1866) the first Columbia River Royal Chinook salmon were packed, thus introducing to the trade what is unquestionably the finest food-fish known. That year they packed about 4,000 cases of 48 1-pound cans each, or 192,000 cans. Most of this was shipped to Australia, selling at about \$4 in gold (which was at a heavy premium at that time), and a small amount was shipped to New York, around Cape Horn, bringing \$5 per dozen there at wholesale. In 1883 there were in Alaska 5 canneries, which in six years increased to 37 with an output of 714,196 cases.

Next in importance comes the sardine canning of Maine, which did not come to a point of success until 1875, and this branch of the business outranked all others. The process of putting up fish is extensive and complicated, and since the beginning of the industry many changes have been made, more especially in the time allowed for cooking, softening the bones of the fish, and in filling, capping, labeling and boxing the same. Up to 1880 the business done in this line was very small, but gradually grew after that, and the establish-

ments at Eastport, Robinson, Lubec, Jonesport, East Lamoine and Camden, all in Maine, are now thriving.

Besides the fishes named, smelt, sturgeon, menhaden, halibut, Spanish mackerel, eels and herring are put up in large quantities. The canning of fish is generally divided into five classes: (1) Those plain boiled or steamed, which include salmon, mackerel, halibut, lobsters, etc.; (2) those preserved in oil, of which sardines constitute the major portion; (3) those preserved with vinegar, sauces, spices, etc., among which are herring, eels and sturgeon; (4) those cooked with vegetables, namely, fish chowder, clam chowder and codfish balls; (5) those preserved by any other process, such as smoking and salting, and which are put into cans for convenience. Smoking and salting of fish is principally confined to the Eastern States lying along the Atlantic Coast, although the industry is carried on to some extent in the Pacific States.

In 1855 one-pound lobsters sold at \$2.75 and salmon at \$4 a dozen. No one believed him when William J. Underwood made a prediction that the prices of salmon and lobsters would cross each other during his generation, the lobster tending upward and the salmon dropping down, a situation which has come about even earlier than he anticipated.

The canned fish production of 1909 was \$14,500,000; smoked fish \$3,000,000, and salt fish \$7,000,000. In 1914 the total canned fish production rose to \$19,000,000; smoked fish fell off to \$2,760,000 and salt fish increased to over \$8,000,000.

**Oysters and Clams.**—The oyster is a lamellibranch or bivalve mollusk of the genus *Ostræa*, the most important in commercial value to be found in American waters being *Ostræa virginiana*, which are generally found attached to some solid substance in the brackish waters at the mouth of rivers or in the shallow waters along the seacoast, the depths of the water in which they lie varying from 15 to 180 feet, according to temperature. The principal and most productive beds in which they were found in the early history of the industry were in Chesapeake Bay, Cape Cod and Long Island Sound, but the constant fishing up to 1860 soon depleted these, and the supply in the public beds along the coast of Connecticut, New York, New Jersey and Delaware would have been exhausted long ago but for the systematic breeding and cultivation of this succulent bivalve. Maryland, Louisiana, California, Mississippi and South Carolina are now the chief sources of supply.

The canning of oysters has grown simultaneously with the canning of fish, and the two were generally carried on, in the early days of the industry, under the same roof. Thomas Kensett was probably the pioneer of oyster canning, and commenced operations in Baltimore as early as 1820, later being followed by others, but it was not until 1850 that the industry was put on a permanent basis. Originally, the oysters were opened by hand, but Louis McMurray, of Baltimore, introduced, in 1858, a new method, that of scalding the oysters before removing the shells, and this method made the removal of the oyster from the shell much easier. Two years later steaming took the place of McMurray's method, and

this process consisted of placing the oysters in baskets having a capacity of three pecks or more, and then putting these baskets into a box through which steam was passed. In 1862 Henry Evans introduced the method of "shucking," his process being as follows: The oysters were placed in cars of iron framework, six to eight feet long, which held about 20 bushels of unshucked oysters; the cars were then run on a track from the wharf to an air-tight and steam-tight box; after steaming for about 15 minutes, the cars were run into the shucking shed and opened; after shucking they were washed in cold water, packed in air-tight cans, hermetically sealed and weighed; the cars were then run on a track to a steamer and treated to a sufficient degree to kill all germs of fermentation, and then cooled off in a vat of cold water. The total cost of handling a bushel of oysters by this method was estimated at 29 cents. In canning the variety of oysters found in the Gulf of Mexico, the following process was introduced in 1880 by William T. J. Mayburg: "To 10 gallons of pure water add one-half gallon of good commercial vinegar and one-tenth gill of a saturated aqueous solution of salicylic acid, to which mixture sufficient common salt is added to impart the requisite salty flavor to the oyster. The mixture is boiled a few minutes and poured over the oysters in the cans, which are at once sealed and placed in a steam bath, the temperature of which is 202° F. This temperature is gradually raised to 240°, and maintained at that degree for about 40 minutes. The cans are then vented, resealed and steamed as before for about 30 minutes, after which they are ready to be labeled and packed."

It seems rather extraordinary, but in 1850 oysters were packed in Boston, which found a ready sale in direct competition with Baltimore goods, and for a number of years there was considerable rivalry between the two markets. The oysters were brought from the coasts of New Brunswick and Prince Edward Island, and were said to have a finer flavor and to keep much better than those from the warmer waters of the South. They were packed in one- and two-pound canisters, and large sales were made in Saint Louis at \$4 and \$7.50 per dozen. The canned oyster production of 1909 was valued at \$2,443,000, and clams at \$402,000. In 1914 the figures increased to \$2,677,000, and \$670,000.

**Pickles, Preserves, Jellies and Sauces.**—This important branch of the industry is of more recent development. It can hardly be called canning because most of it is put up in glass. The methods of cooking and preserving are very similar. The trade consists mainly of branded goods whose sale is created and maintained largely by advertising. The brands are put up attractively, trade marks are used to protect them, and notwithstanding criticisms of pure food agitators, they have moved steadily forward in popular favor. The goods packed in glass are more liable to contact with the air, and therefore the manufacturers have depended more on artificial preservatives, of which benzoate of soda is the most common. The difficulties of making the goods keep and of avoiding harmful preservatives seems to have been met successfully, as shown by the vast sale. In 1909 the total for

pickles, preserves, jellies and sauces was \$48,500,000, and in 1914 the estimated figure was \$66,000,000 worth.

**Canning Tools and Processes.**—In 1876, at the Centennial Exposition in Philadelphia, the Ferracute Machine Company, of Bridgeton, N. J., displayed a collection of tools for making cans and canners' goods, and immediately thereafter secured large sales. To Oberlin Smith, president of the concern, and also for a time president of the American Society of Mechanical Engineers, must be given a great deal of the credit for supplying canneries with simple and inexpensive machinery. A line of presses was marketed for stamping out the tops and parts of cans of all sizes; gasoline firepots were made for heating the capping steels and tinning-coppers, or tools for closing the cans. These fire-pots were provided with air-pumps for driving air into the gasoline tanks and thus forcing out the oil, which was vaporized by the heat and burned as a gas under the pot. These pots for heating the soldering tools are designed to stand on the capping-tables where the tops of the cans are soldered. Among special machines made for the canner are hulling machines with a capacity of 1,000 bushels of peas in 10 hours, and rotary separators that grade the peas into sizes at about two-thirds this speed. There are also pea-sieves for sorting peas in small quantities, and pea-blanchers for scalding and blanching peas. There are corn-cutters on the market with a capacity of 4,000 ears an hour, and corn-silking machines for removing the silk and refuse from the corn. Many automatic can-filling machines will handle 1,200 cans an hour. There is a great variety of machines for handling the different fruits and vegetables, as well as numerous parers, graters, corers and seeders.

In canning fruit, steam-boilers are necessary to supply the various tanks and kettles, which are used in washing and scalding. Baskets of heavy galvanized wire are used for handling tomatoes and various fruits when dipping into the scalding kettles. For steam-cooking a common method is to fill a large wire tray with filled cans which have been capped but not wholly closed, a vent being left for the escape of air and steam. Immediately after cooking, while yet hot, this vent is sealed with a drop of solder, so that the destructive germ has no chance to enter. Salmon is cooked and sealed afterward in the same manner.

**Statistics.**—California is now the leading State in the canning and preserving industry. Her production increased 120 per cent in the decade ending in 1909, in which latter year over \$33,000,000 worth of goods, mostly canned fruits, were placed to her credit, this being 20 per cent of the country's total. New York was the second State, with \$19,000,000 production, and Maryland has fallen to third place with \$14,700,000. Washington advanced from 13th to fourth rank with a production of \$9,600,000, a gain of 88 per cent; Pennsylvania continued the normal output of \$9,500,000; Indiana developed wonderfully, showing \$8,758,000, a gain of 158 per cent. The other States of large production are Maine, Illinois, Massachusetts, Michigan, Wisconsin, Ohio and New Jersey. Of these, Wisconsin is making the most rapid progress, showing an advance

of 253 per cent in the census period. There is really only one State that shows a considerable falling off in canning, Mississippi, where the fish and oyster industry has decayed.

The average number of people employed in canning and preserving in the United States is 72,000, but this is a very variable figure, because canning is largely a seasonal business. Only 20,000 people find employment in January, while the demand from July to October runs from 100,000 to 155,000, September being the busiest month. Nearly one-half of the employees are women and children, but the proportion of men increases, and the disposition to employ children diminishes.

A total of \$119,000,000 capital is invested in the industry; the earnings are nominally \$235,000,000, but subtracting the cost of the materials, the real income being the value added by manufacture, gives about \$85,000,000 as the real measure of the industry annually.

CHARLES H. COCHRANE,

Author 'Modern Industrial Progress.'

**CANNIZZARO**, kân-nê-tsä'rô Stanislaio, Italian chemist: b. Palermo, 16 July 1826; d. 1910. He studied medicine at Palermo, and chemistry at Pisa. In 1848 he was a member of the Sicilian Parliament and had part in the revolution in Sicily. In 1852 he became professor of chemistry in Alessandria; in 1857 in Genoa; in 1860 in Palermo; and in 1870 in Rome. He emphasized by clear definition the difference between atomic and molecular weights, and was one of the most influential in establishing Avogadro's law as a maxim of chemical science. He also discovered benzyl-alcohol and cyanamide. He wrote 'Sunto di un Corso di Filisofia Chémica, e Nota Sulle Condensazioni di Vapore' (1880); 'Relazione Sulle Analisi di alcune Acque potabili' (1882); and 'Abriss eines Lehrganges der theoretischen Chemie,' which appeared in Ostwald's 'Klassiker der exakten Wissenschaften.'

**CANNOCK**, England, an urban district and parish in West Staffordshire, eight miles north-northwest of Walsall, in the district known as Cannock Chase, which is rich in coal and ironstone. Manufactures of boilers, edge-tools, bricks and tiles are carried on, and there are numerous collieries. Pop. (1911) 28,586.

**CANNON**, Annie Jump, American astronomer: b. Dover, Del., 11 Dec. 1863. A student at Wellesley College, she was engaged in 1897 as staff assistant in Harvard College observatory and in 1911 became curator of astronomical photographs. During her photographic work she discovered three new stars, one spectroscopic binary and 150 variable stars, and completed a voluminous bibliography of variable stars with 45,000 references. She also wrote 'Second Catalogue of Variable Stars' (1907); 'Maxima and Minima of Variable Stars of Long Period' (1909); and 'William Paton Fleming' (1911).

**CANNON**, Frank Jenne, American politician, son of George Q. Cannon (q.v.): b. Salt Lake City, Utah, 25 Jan. 1859. He was graduated from the University of Utah in 1878, and in the same year engaged in the printing business, acquiring interests also in western mining enterprises. He was a delegate to the Republican National Convention in 1892 and 1896, and a delegate to Congress from the Territory of

Utah in 1895. In 1896, against the wishes of the Mormon leaders, he became candidate for and was elected to the United States Senate, serving until 1899. As a result of political differences, he separated himself from the Mormon Church and, joining the Democratic party in 1900, was State chairman from 1902 to 1904. He became managing editor of the *Rocky Mountain News* and contributed articles on political subjects to magazines. He has published 'Under the Prophet in Utah,' with Harvey J. O'Higgins (1911), and 'Brigham Young and the Mormon Empire' (1913). Both works are exposés of conditions in Utah under the Mormon domination.

**CANNON, George Quale**, American politician: b. Liverpool, England, 11 Jan. 1827; d. Monterey, Cal., 12 April 1901. He went with his parents to Nauvoo, Ill., in 1844, and was one of the earliest settlers in Salt Lake City. He was a member of the legislative council of Utah in 1865-66 and 1869-72, and was a delegate to Congress from 1872 to 1881, where he was seated only after a long fight against him on the ground that he was a polygamist. At a Constitutional Convention at Salt Lake City in 1872 he was chosen to present the constitution and memorial to Congress for the admission of the Territory into the Union as a State. He translated the 'Book of Mormon' into the Hawaiian language. He held various positions of importance in the Church, including that of first councillor after 1880, and wrote a number of pamphlets in support of Mormonism, and a biography of Joseph Smith (1888). His son, Frank J. Cannon, was elected one of the first two United States senators from Utah in 1896.

**CANNON, Henry White**, American bank president: b. Delhi, N. Y., 27 Sept. 1850. He was educated at Delaware Academy in his native town and engaged in banking. He was comptroller of the currency, 1884-85, and was a member of the International Monetary Conference at Brussels in 1892. He is a director of several important railroads and of the Manhattan Trust Company, and was president of the Chase National Bank in New York, 1886-1904. He is vice-president and director of the United States Guarantee Company, and of the Brooklyn Union Gas Company.

**CANNON, James Graham**, American financier: b. Delhi, N. Y., 1858. A brother of Henry White Cannon (q.v.), besides being director in several banks and influential corporations, he was for some time president and director of the Fourth National Bank of New York. He is author of the standard work 'Clearing Houses; Their History, Methods and Administration' (New York 1908), and of an address 'Clearing Houses and Currency' (1913).

**CANNON, Joseph Gurney**, American politician: b. Guilford, N. C., 7 May 1836. Admitted to the Illinois bar, he was State's attorney of Vermillion County, 1861-68. He was a member of Congress from 1873 to 1891, and again, 1893-1903. He was 20 years on the Committee on Appropriations, and its chairman in the 55th and 56th Congresses. He was speaker of the House of Representatives in the 59th and many succeeding Congresses. His autocratic power was greatly limited by

the House resolution of 19 March 1910, enlarging the Committee on Rules and taking its appointment from the speaker and giving it to the House. In 1911 Champ Clark, Democrat, succeeded him as speaker, and in 1912, he failed of re-election as representative but was elected from the 18th Illinois District to the 64th Congress (1915-17). He was a leader of the reactionary branch of the Republican party, to whose methods the downfall of the party in 1912 was generally attributed.

**CANNON, William Austin**, American botanist: b. Washington, Mich., 23 Sept. 1870. He studied at the University of Michigan and at Columbia University and from 1903-05 was resident investigator at the Desert Laboratory. He became staff member in 1905, and 1911-12, was acting director of the department of botanical research of the Carnegie Institution. He is author of 'Studies in Plant Hybrids' (1903); 'Studies in Heredity as Illustrated by the Trichomes of Species and Hybrids of Juglans, Enothera, Papaver and Solanum' (1909); 'Root Habits of Desert Plants' (1911); 'Botanical Features of the Algerian Sahara' (1913).

**CANNON.** See **ORDNANCE.**

**CANNON-BALL TREE**, a large tree (*Couroupita guianensis*) of the family *Lecythidaceae*, a native of Guiana, with a hard, woody, globular fruit six or eight inches in diameter—whence the popular name of the tree. It has large white or rose-colored flowers growing in clusters on the stem and branches. The pulp of the fruit is pleasant to eat when fresh.

**CANNSTADT, kân'stat, CANNSTATT**, or **KANSTATT**, Germany, town in Würtemberg, in a beautiful and fertile district on the Neckar, two miles northeast of Stuttgart with which it was incorporated in 1905. Its antiquity is proved by the Roman remains found. It has celebrated and much-frequented mineral springs. The Neckar is here crossed by three bridges. The newer portion of the town is well built, with handsome streets and pleasant recreation grounds. Overlooking the Neckar, near by, is the castle of Wilhelma. Of late years Cannstadt has entered to a considerable extent into industrial pursuits, and has railway shops, and flourishing manufactures of machinery, cooking utensils, woolen goods, furniture, electrical supplies, etc. It suffered much during the Thirty Years' War and through the repeated invasions of the French. It was the scene of the victory of the French under Moreau over the Austrians under Archduke Charles, 21 July 1796. Pop. 26,497. Consult Beck, 'Cannstatt and the New Neckar Bridge' (Cannstatt 1893).

**CANO, kâ'nô, Alonzo**, Spanish painter, sculptor and architect: b. Granada, 19 March 1601; d. 5 Oct. 1667. When quite young he went to Seville, where he studied both painting and architecture, and at Madrid in 1637 he became intimate with Velasquez who helped him in many ways, among others by introducing him at court where he became a court painter in 1639. He was forced to leave Madrid in 1644 because he was suspected of having murdered his wife; and he went to Valencia. He returned to Madrid and was there subjected

to the rack. But his innocence being proved he went to Granada where he spent the rest of his life and where he was made a canon, and chief architect of the cathedral, to which he devoted much of his attention, carving statues and painting pictures for it. He became so distinguished in each of these arts that his countrymen called him the Michelangelo of Spain, although the title is due more to his versatility than to any resemblance in points of genius to the great Florentine. His 'Conception of the Virgin,' in the church of San Diego, at Granada, is considered his masterpiece. His works in sculpture and architecture are numerous. Among the best of these works are his series of pictures 'The Seven Joys of the Virgin,' his busts of Adam and Eve and his various statuettes of the Virgin. In carefulness of design and in the execution of his work Cano ranks high; but in the mastery of coloring he is inferior to the really great artists of his day. His contemporaries ranked him with Velasquez, but time has not sustained this verdict.

**CANO, Juan Sebastian del**, Spanish navigator: b. Guetaria, about 1460; d. on the Pacific, 4 Aug. 1526. He was one of the first to circumnavigate the globe (1522), as captain of one of Magellan's fleet, which he afterward commanded. In 1525 he was placed second in command of a similar expedition and became its commander by the death of Loaisa.

**CANO, Melchior**, Spanish theologian: b. Tarancon 1523; d. Toledo, 30 Sept. 1560. He was a member of the Dominican order and an opponent of the Jesuits. He was professor of theology at the universities of Alcantara and Salamanca, and was made bishop of the Canaries, but did not live in his see. He wrote 'De Locis Theologicis' ('On the Source of Theological Knowledge' 1563) and many other theological works. He was sent as the representative of the Crown to the Council of Trent in 1551 to maintain the court theological traditions. His complete works were published at Padua in 1720.

**CANOE, ka-noo'**, a light boat designed for propulsion with a paddle or paddles. The term is very commonly used to designate the small vessels used by uncivilized people living near the water. The name is of West Indian origin, the Carib word being *canóoa*. Canoes are built in divers forms and of various materials. The primitive canoes were light frames of wood over which skins or barks of trees were stretched. The most common form was the hollowed tree-trunk; the excavation, before the advent of adequate cutting-tools, being accomplished by means of fire. This form is of wide distribution, being found in Africa, South and Central America, China and the islands of the south Pacific and Indian oceans. In the form known as a "dugout" it is common in the United States. Among the island races of the Pacific the stability of the canoe is largely increased by the adoption of an outrigger, which, of varying forms, prevents capsizing on the one side by its weight and leverage, and on the other by its buoyancy. Many of these islanders sew planks together to form their canoes, making the joints water-tight by means of gums, etc. Others use

double canoes united by a strong platform. Such a vessel is capable of carrying a number of persons and a considerable lading. In South America, where large trees are abundant, very large canoes are constructed. The same is true of Africa, where the war-canoes of the native kings carry very large crews. They are often fantastically carved and ornamented.

As stated above, the propelling force of the canoe is usually the paddle, but sails are often used, particularly on sea-going craft.

The Esquimaux canoe is known as a *kayak*. This consists of a light wooden or bone frame covered with seal-skins sewed together with sinews. The skin covering extends across the top, forming a water-tight deck with but one opening amidships to admit the boatman. A hoop is fitted to this opening, and after the boatman has entered he fastens himself in by means of an apron so that the whole boat is water-tight, and he becomes, as it were, part of the craft. So intimate is this union, and so skilful are the Esquimaux in the management of their kayaks, that the boatman can with a twist of his paddle capsize the craft and turn completely around under water, coming up again on the opposite side to that he went over. The paddle is about 10 feet long and double-bladed. The *oomiak*, or women's boat, is also made of seal-skins sewed over a framework; but it is of large, even clumsy build, and but for its propulsion by paddles might be classed as a boat rather than as a canoe. It is designed as a transport for women, children and household goods rather than for the chase, for which the *kayak* is principally used.

The Aleuts build large skin boats, somewhat resembling the Esquimaux *oomiak*, which are propelled by paddles. Such a boat is known as a *bidarkee*. Other tribes of the west coast build large canoes of wood, the war-vessels being, like those of Africa, curiously decorated.

A peculiar form of canoe is found in the Kootenai district and on the Columbia River. While most canoes are constructed with the bow and stern either perpendicular or with a flaring overhang, these Kootenai craft are shaped, both at bow and stern, like the ram of a warship. In other words, the greatest length is along the bottom. These canoes are generally about 15 feet long and are constructed with a light framework of cedar covered with spruce or white-pine bark. This bark is cut off in one piece in the spring, when the sap is running, and is turned inside out, bringing the smooth side in contact with the water. The canoes are sewed with rawhide or tendons, and cracks and knot-holes are stopped with resin. Two squaws will make a canoe in four or five days; the chief difficulty being to get the bark off whole and to turn it wrong side out successfully.

The North American Indians have brought the canoe to its highest state of perfection. With the most frail material, birch bark, they construct a craft so light that it may be carried by one man, and yet so strong and buoyant that it will carry a very considerable load. A framework of light but tough wood is covered with sheets of birch bark, which are sewed together, the seams being waterproofed with resinous gums. They are propelled by means of a single-bladed paddle, which is dipped on one side only (a slight twist correcting the

tendency to swerve from a straight line), or alternately on either side. The use of the birch-bark canoe by the Indians of the United States is rapidly becoming a thing of the past; but the art of building them has been preserved by their construction as pleasure-craft.

A form of canoe of recent invention is used solely for pleasure. About 1865 John MacGregor, impelled by a love of adventure, sought recreation on the rivers and fjords of Europe as well as on the waters of Egypt and Palestine. He developed his model from the Esquimaux kayak, and evolved a clinker-built craft of cedar, about 14 feet long and 2 feet in beam, depth 10 inches to 16 inches, entirely decked over with the exception of a "well" in which the canoeist sits. This is propelled by means of a double-bladed paddle, but a short mast enables the carrying of a sail. In a canoe of this type, which he named the *Rob Roy*, MacGregor cruised on the Danube, the Jordan, the Nile, the Seine and on Norwegian fjords. From this early model other forms have been evolved, notably the *Nautilus* and *Shadow* types. Water-tight compartments ensure permanent buoyancy. Centre-boards counteract leeway when under sail on a wind. The interior space is so arranged as to provide a sleeping-place for the cruiser.

There are many canoe clubs in the United States, England and Canada, and the canoe may be seen on all the coastwise and inland waters of those countries, as well as on the continent of Europe. Consult MacGregor, 'A Thousand Miles in the Rob Roy Canoe' (1866); 'The Rob Roy on the Baltic'; Powell, W. B., 'Canoe Traveling' (1871); Alden, W. L., 'Canoe and the Flying Proa' (New York 1878); Hayward, T. D., 'Camping out with the British Canoe Association'; Vaux, C. B., 'Canoe Handling' (New York 1888); Stephens, 'Canoe and Boat Building' (New York 1881); 'Canoes and Canoeing,' 'Spalding's Athletic Library' (New York, annually).

**CANON**, ká'nôn, Johann, Austrian painter: b. Vienna, 13 March 1829; d. there, 12 Sept. 1885. He studied with Rahl, but imitated the old masters more closely. He entered the Austrian army and in 1848-55 was lieutenant of cuirassiers, but even while in the army had given much attention to painting and finally devoted his whole time to it. His name first became known through his picture 'The Fishermayden,' exhibited in 1858. His work includes genre pictures, historical paintings, and portraits; the latter are thought to resemble Rubens or Van Dyck in style. Among his other paintings are 'Cromwell Beside the Corpse of Charles I'; 'The African Lion Hunt'; 'Flamingo Hunt'; and the 'Fish Market.' His decorative paintings are in Vienna, Karlsruhe and New York. There is a monument dedicated to him at Vienna. Consult his obituary in 'Zeitschrift für bildende Kunst' (1886).

**CAÑON**. See CANYON; GRAND CANYON.

**CANON** (Greek, a rule, measure or standard). 1. *In the arts*.—When art has succeeded in producing beautiful forms the question arises, with what proportions beauty of form is united. Artists of genius first started this question, and imitators, inferior to them in talents, scrupulously followed their results, and naturally ex-

alted some existing work into a model for every performance. Among the Greeks the celebrated statuary Polycletus (452-412 B.C.) first instituted such inquiries; and as he generally represented youthful, pleasing figures, it is probable that he fixed the standard of beauty in the youthful form. The canon (the model statue) of Polycletus was accordingly a statue which was made principally for the purpose of showing the beautiful proportions of the human form in a youth just ripening into manhood. No copy of it is known to exist; the artist probably gave his model of proportion a quiet, simple attitude, without any strong distinguishing marks. His successors imitated it without deviation. Polycletus was not the only Greek artist who pursued such investigations respecting the proportions of form. Among the moderns, Dürer and Leonardo da Vinci have devoted themselves to similar inquiries.

2. *In Scriptural literature*, a term employed to designate the collection of books containing the rule or standard of primitive Christianity; that is, the canonical books of the Holy Scriptures. The canon of the books of the Old Testament, as contained in the Hebrew Bible, receives in this form equal respect among all Christians, because Christ and the apostles have expressly appealed to them, and in this way pronounced them writings inspired by God. There are certain books, however, belonging in subject to the Old Testament, but whose canonical character the Jews did not acknowledge, and which Protestants class together under the head of Apocrypha, and reject from the canon. For these there is only a Greek, and not a Hebrew, text. The Western Church accepted them as canonical in the African council, about the end of the 4th century; but the opinions of the clergy respecting them remained for a long time divided. Saint Jerome denied their canonicity, and many theologians coincided with him. The Roman Catholic Church finally declared them canonical in the Council of Trent. (See АПОКРИФНА). Respecting the number of books belonging to the canon of the New Testament, the opinions of Christians were much divided till the 6th century. As early as the 2d century the separation was made into the Evangelicon (the four Evangelists) and the Apostolion (the Acts and Epistles of the Apostles). The five historical books, the Epistles of Paul, the First Epistle of Peter, and the First Epistle of John were universally acknowledged to be genuine in the 3d century; hence Eusebius, in his 'Ecclesiastical History,' written about 325 A.D., calls them *Homologomena* (universally received). The other five Catholic epistles (Second of Peter, Second and Third of John, Jude and James) he calls *Antilegomena* (doubtful, not universally received). At that time the Epistle to the Hebrews was considered genuine by most persons, and the Apocalypse by many. These books were received in the second half of the 4th century in the Egyptian Church (where Athanasius first used the term canonical), and in the Western Church. In the Eastern Church, properly so called (the dioceses of the patriarchs of Constantinople, Antioch and Jerusalem), only the Catholic epistles were of canonical authority at that time; the Apocalypse not till the 6th century. The canon of the New Testament has since remained unaltered, and the Protestant churches hold it in common with

the Greek and Catholic churches. The results of critical examinations of the genuineness and canonical character of the single books of the Bible, even when they were unfavorable to the books, have produced no alteration in the established canon. The reasons of the ancient fathers of the Church for or against the canonical character of the biblical books were merely historical and traditional, and built on philological criticism; they are still the most tenable and rational; the philosophical grounds are more subject to be affected by extraneous influences. For bibliography see **BIBLE**.

3. *In ecclesiastical use*, a rule or law of doctrine or discipline as established by ecclesiastical authority. The term is further applied to various matters of church organization and ceremony; also to books containing the rules of religious orders, etc., and to a list or catalogue of acknowledged and canonized saints in the Roman Catholic Church.

Another distinctive ecclesiastical use of the term is that which designates a dignitary possessing a prebend, or revenue allotted for the performance of divine service in a cathedral or collegiate church. Canons were originally priests who lived in community, appointed to assist the bishop in his duties, and supported by the revenues of the bishopric. Secular canons are those who, in progress of time, have left off the custom prevalent in monasteries of living a community life, and have the privilege of enjoying the returns of their respective benefices. The obligations of the canons are contained under three heads: (1) The duty of residing in the place where the church they belong to is situated; (2) assisting at the canonical offices which are celebrated in the church; and (3) attending the meeting of the chapter at the appointed times. They cannot be absent from their benefices for a longer period than three months, and are obliged to sing or recite their office in choir. In their collective capacity they are called a chapter, and form the council of the bishop. In each chapter there are dignitaries. The name was originally applied to all the clergy, but was afterward confined to those who were connected with the cathedral church, or to specially privileged churches.

4. *In music*, with the ancient Greeks, the term canon signified what now is called monochord. At present it signifies a composition in which the several voices begin at fixed intervals, one after the other, and in which each successive voice sings the strain of the preceding one. In Italian, therefore, it is called *fuga di conseguenza*; in Latin, *canon perpetuus*, or continuous fugue; in German, *Kreisfuge* (circulating fugue). Sometimes each voice begins with the same, sometimes with different notes. The phrase or passage for imitation is called the theme or subject, the imitation, the reply. Canons may be finite or infinite. The former end, like any other compositions, with a cadence, while the infinite canon is so contrived that the theme is begun again before the parts which follow are concluded. A canon may consist of two, three, four or more voices. Canons differ from ordinary fugues; for, in the latter, it is sufficient that the subject be occasionally repeated and imitated according to the laws of counterpoint; but, in the former, it is essential that the subject be strictly repeated by all the succeeding parts; which repetition may be made

in the unison or octave, the fourth, or the fifth, or any other interval of the scale. There are several other canons, as canon polymorphus, canon per diminutionem and canon per augmentationem. Sometimes, also, a musical passage of a composition in which one voice repeats for a short time another is called, improperly, a canon. Consult Ouseley's 'Treatise on Counterpoint, Canon, and Fugue' (1869).

5. *In printing*, canon is the name given to a large type which is so called from the early use of it for printing the canon of the mass and the Church service-books.

**CAÑON CITY**, Colo., a city and county-seat of Fremont County, situated on the Arkansas River, near the mouth of the Grand Cañon, and on the Denver and Rio Grande, and the Atchison, Topeka and Santa Fé railroads. It is a well-known health resort, over 5,000 feet above the sea-level, with an excellent climate and hot and cold mineral springs. It is the seat of the State penitentiary and Odd Fellows' sanatorium and home, an academy for young women, and has a Carnegie library, two hospitals, seven public parks and a hot-water natatorium. The city has abundant water power, with an excellent gravity system; the soil is fertile, and in the vicinity are rich deposits of iron, coal, silver, copper, marble, limestone and petroleum. Fruit growing is an important industry, and there are canning and brick and tile factories, a large smelter and a reduction mill. Pop. (1910) 5,162.

See **FINCH, TOWHEE, WREN**.

**CANON LAW.** Canon law is so named because it consists of rules or canons, which are established to guide the faithful to eternal happiness. In a strict sense, canon law comprises only those laws which emanate from an ecclesiastical authority that has supreme and universal jurisdiction. In a wide sense, it takes in also those laws enacted for the good of the faithful by anyone having ecclesiastical authority. The sources or fountains from which canon law has originated are sacred Scripture; divine tradition; laws made by the Apostles; teachings of the Fathers; decrees of the sovereign pontiffs; ecumenical councils; certain congregations of cardinals under orders of the Pope; custom, which, however, could in no case be contrary to divine law, common sense, good manners, public order or the spirit and the rights of the Church. The Old Testament contains three sorts of precepts, moral, ceremonial, judicial. The moral code remains in full force under canon law; the ceremonial and judicial laws have lapsed. The New Testament is the chief source of ecclesiastical law. It contains also dogmas of faith, but with these canon law does not deal except indirectly. By tradition is meant a doctrine not written by its first author, but conveyed by word of mouth. Usually it is subsequently put into writing. Traditions, considered in their source, are divine or human. Divine are those which have God for their author, and which the Apostles received either directly from Christ or by the suggestion of the Holy Ghost. Human traditions are termed apostolic if they originate with the Apostles, or ecclesiastical if they come from the successors of the Apostles, called bishops of the Church. Divine traditions bind all the faithful; human

only those of the localities and times to which they are applicable. Some of the enactments attributed to the Apostles are the Apostles' Creed; abstinence from things sacrificed to idols and from blood and from things strangled, part of which prohibition has lapsed; the substitution of Sunday for the Sabbath of the Jews; the institution of certain feast days; the fast of Lent. The sentences of the Fathers, approved by the Church and made into universal laws by councils or the Roman pontiffs, are part of canon law. These sayings were not inserted in the collection of canons before the 6th century, John Scholasticus being the first to do this in the East in that century, and Regino first in the West in the beginning of the 10th century. To the student it is evident that the constitutions or decrees of the Roman pontiffs constitute the chief source of canon law; in fact, the entire canon law in the strict sense of the term is based upon the legislative authority of the Pope. To understand this it is necessary to recall that in the Catholic doctrine all authority in the Church comes from above, not only in the office of priesthood, but also in the matter of jurisdiction or power of ruling. Catholic writers hold that the primacy or headship in the Church was established by Christ in Peter before the priesthood was conferred on him and the other Apostles, the purpose of the Saviour being to effect unity in his organization. The Church thus organized is a spiritual monarchy; elective it is true, but not an aristocracy or democracy. Other religious organizations hold quite the opposite doctrine and would make their unity a coalition of equal parts. This point of primacy of the Roman pontiff is also the line of separation between the canon law of the West and that of the separated Greek and the Russian churches, the review of which is given later in this article. Ecumenical councils, whose decrees are a source of canon law, are those meetings of the bishops of the Church throughout the world, which are held under the presidency of the Pope or his legates, and whose acts are by him confirmed. There are 20 councils recognized as ecumenic; the first being that of Nicæa in 325; the latest that of the Vatican in 1870.

During the first three centuries, the Church was administered according to the Scriptures only and the rules laid down by the Apostles and bishops, as occasion required. Thus Clement, the disciple and successor of Peter, mentions the rule given by the Apostles concerning the succession of bishops, and Ignatius the Martyr, in his epistles, exhorts his followers diligently and tenaciously to observe the traditions of the Apostles. Thus, too, in the controversy concerning the celebration of Easter, the contestants on each side alleged the apostolic tradition. But councils were held at Ancyra and Neo-Cesaræa in 314, at Nicæa in 325, at Antioch in 322, at Sardica in 347, at Gangra from 362 to 370, at Laodicea between 337 and 381, at Constantinople in 381, at Ephesus in 431, and in the council of Chalcedon in 451 a collection of canons made up from these previous councils was read and partly authorized for the entire Church. With the exception of those of Sardica, which are in Latin, the canons of all these early councils were formulated in Greek. The name of the compiler of this first collection is unknown and few of these early canons have

reached our times, only their tenor being known through subsequent use in the Western Church, especially in Spain. After the emperors assumed the Christian religion, ecclesiastical legislation became important, and the laws of the Church were therefore in the year 438 inserted in his collection by the Emperor Theodosius II. Valentinian III afterward adopted this collection for the West. About this time—the latter half of the 5th century—a compilation was made of the so-called apostolic canons and constitutions together with decrees of some of the councils. Originally there were 50 canons called apostolic, but their number was afterward increased to 85, some of which are certainly spurious. In the East these were received as having the stamp of authority, but not so in the West, where their origin was doubted. However, Dionysius adopted the smaller collection of 50, considering them useful for discipline, and thereby without determining their origin procured for them in Rome the stamp of authority. John Scholasticus made a collection of canons for the Greek Church in 564, to which he added 68 canons taken from Saint Basil. He divided the work into 50 titles. To this he later added the laws of the empire which had relation to the laws of the Church, and the new compilation became known as *Nomo-canon*. The Emperor Justinian II in 692 assembled a council in his palace at Constantinople, called the Trullan council from the room in which it was held, and 102 canons were enacted. When the acts and canons of this council were submitted to Pope Sergius at Rome for approval he refused even though the Emperor ordered his armor-bearer to bring the Pope to Constantinople. The Trullan compilation consisted of the so-called canons of the Apostles, those of the 10 councils previously mentioned, the canons of the synod of Carthage, the decrees of a synod in 394 at Constantinople under Nectarius, the canonical decisions of the 12 eastern patriarchs and of some bishops from the 3d to the 5th centuries, the canon of a council held at Carthage under Cyprian in 256, to all of which were added the 102 canons drawn up by the Trullan council itself. Afterward 22 canons of the second council of Nicæa held in 787 were added. On this foundation the Church law of the East was based up to the middle of the 9th century. By the Trullan synod, priests were allowed to marry, which up to that time was against the canon law of both the Eastern and the Western Church. The Trullan synod also sanctioned the canons of the Apostles, one of which teaches the doctrine of the re-baptisers, which had been previously repudiated by Pope Gelasius. Herein is noticed the first real divergence between Eastern and Western canon law. Photius, who was intruded into the see of Constantinople, called a council against the patriarch Ignatius in 861, and 17 canons made by this council were added to the codex of the Greek Church. He also formulated a new collection, in which the second part, called the *Nomo-canon*, remained unchanged. The Emperor Leo the Philosopher, who deposed Photius, rescinded his collection of laws, but nevertheless the seeds of the separation of the Greek Church from that of Rome had been implanted by the work, although a complete schism took place only later in 1054 under Michael Cerularius. From time to time new

ecclesiastical constitutions issued from the emperors, as from Leo Philosophus in 911, from Constantine Porphyrogenitus in 961, from Alexius Comnenus in 1118, from Isaac Alexius in 1185-90. The resolutions of synods summoned by the patriarchs of Constantinople, epistles of renowned bishops and their decisions, formed another addition to the canon law of the Eastern Church. The first commentary on the Greek codex was undertaken by Theodore Prodromos in the 8th century. The second, containing the text with a commentary, is the *Nomo-canon* of Doropater. The monk John Zonares composed a comprehensive verbal interpretation in 1120, using the collection of Photius as a basis. Fifty years later, Theodore Balsamon made a commentary with a view to practical questions, comparing the canons with the civil law and insisting that Justinian's maxims only applied when conformable to the *Basilica*. He added many matters not found in the collection of Photius. Epitomes of canon law were composed at a comparatively early period, the author of the first of which appears to have been Stephen of Ephesus in the 5th century. There is a synopsis by Aristenus augmented by Alexius Aristenus in 1160, and another by Arsenius, a monk of Mount Athos, in 1255. Constantine Harmenopoulos in 1350 composed an epitome of the spiritual law in six parts, using, with some omissions, the collection of Photius as altered by Zonares. In order to reduce canon law to a more practical form than it appeared in the collection of Photius and at the same time present a more comprehensive work than these epitomes, Matthæus Blastares drew up his *syntagma* in 1335, divided into chapters of different lengths and arranged according to the principal word of these rubrics, the numbers of the chapters commencing anew under each letter. Each chapter begins with the ecclesiastical law, followed by the civil law applicable to it, without, however, mentioning the source of the latter. This work came into very general use among the clergy. The collection of Photius and the *syntagma* of Blastares continued still in use under the Turkish rule and were alike termed *Nomo-canon* and, metaphorically, the 'Rudder.' The collection and interpretation of Zonares also obtained canonical authority. From these materials many extracts were translated into modern Greek up to the 18th century, and several textbooks composed for the use of the clergy, some of which were printed in Venice. Lastly a comprehensive collection was published in 1800 at the instance of the patriarch and synod. It contains the old Greek text of all the authentic canons of councils since Photius and Zonares, to which are added interpretations of the authentic commentators in modern Greek, especially those of Zonares and Balsamon. In the interpretation, the canons of those fathers are taken into account which had not been confirmed by any general synod, but had obtained a canonical authority. Nothing was inserted from the municipal law works which did not agree with the canons. Several appendices were added, including formulas for ecclesiastical business, and upon these and similar collections is founded the present law of the Greek separate church. The Russian followed the Greek Church in adopting compilations of Church law up to the end of the 15th century.

In 1550 certain regulations respecting the jurisdiction of bishops were introduced. Some canonical epistles and rules drawn up at councils are used in addition to the Greek codex, and manuals adapted to the country have been compiled therefrom. Peter the Great in 1721 changed the chief executive authority in the Church from a patriarch into the Holy Synod, by decrees of which the Church to-day is ruled. By an arrangement lately made with the Roman pontiff the bishops and priests under Roman jurisdiction are ruled by the canon law of Rome, subject to the civil laws of the Russian empire, and to prevent complications, Russia, besides a resident minister and two secretaries, has at the Vatican a representative agent for ecclesiastical affairs.

In the Western or Latin Church the canons of Nicaea and Sardica were the only code publicly received up to the end of the 5th century. About this time the Spanish translation of the Greek code was turned into barbarous Latin, and became known as the *Prisca*. The decretals of the Roman pontiffs were added to the canons of the Greek code, as found in the *Prisca*, but it seems that Dionysius the Little, about the year 500, was the first to formulate a collection of the councils and the decretals. He had previously made a collection of the concilia for Stephen, the bishop of Dalmatia. The deacon Theodosius later made a new collection founded on the old Spanish and the Dionysian. A third collection termed the *Avellanian*, valuable for the historical documents it contains, appeared in the latter half of the 6th century. These, however, were superseded by a second edition of Dionysius, made probably in 731 under Pope Gregory II. In this edition some decrees overlooked previously were added, together with an appendix consisting of the statutes of the Roman pontiffs from Linus downwards, those up to Sericibus, however, being given only in an historical form as no longer actually in existence. The German conquerors of Italy in 476 did not, although Arian, interfere with the laws by which the Church was governed, but when Justinian reconquered Italy he introduced his *Novellæ* in the Julian translation in place of the codex of Theodosius II, and this order of things was later upheld by the Lombard kings in their edicts. In Africa the deacon Fulgentius Farrandus made the first collection in 547, termed *Breviatio*. This was an excerpt in 232 numbers of nearly all the Greek canons, including the Nicæan, to which was added the African concilia under Gratus in 348-49, under Genethlius in 390, and that of Carthage in 419 with its 33 canons, together with 304 taken from synods as well as an extract from the canons framed at Hippo in 393. The second African work was the *Concordia* of Bishop Cresconius in 690, founded upon the Dionysian, but arranged in 300 titles instead of in chronological order. This work was incorporated with the Dionysian and appeared under the name *Breviarium*. But the Arabs now put a sudden stop to all further development of canon law in this quarter. As early as the 5th century, as noted above, there was in Spain a translation of the Greek canons; in the 6th century Martin of Braga made a collection of canons, but in the 7th century Isadore of Seville held two councils, half church, half civil, the canons of which may be said almost

to have formed the basis of the constitutional law of Spain in both Church and State down to the 15th century. The collection of canons known as *Collectio Isadoriana* or *Hispana* was divided into two parts; the first containing the classified series of Greek, African, Frankist and Spanish canons, and the second the decretals from Pope Damasus in 366 to Gregory the Great in 604. In the 5th century an extensive but confused collection of councils and decretals was compiled in Gaul under Gelasius. It was founded upon the old Spanish version and some peculiar version of the canons of Nicæa and the Prisca. Out of it sprung several other collections; the first in the middle of the 6th century, containing the councils of Nicæa, and of Sardica, some Frankist concilia and papal decretals; the second of the same date containing Greek, African and Gallic canons, and papal decretals in a confused order; the third in the 7th century, containing 103 numbers, many decretals, Frankist, Roman and Italian concilia. A fourth and a fifth collection of the same century contained chiefly Frankist and Spanish conciliar decrees. After Charlemagne in 774 on his first visit to Rome had received from Pope Hadrian a copy of the Dionysian collection with some additions, he had it sanctioned in a synod at Aix-la-Chapelle as the *codex canonum* for the Frankist empire. In addition to these principal works many of the bishops composed capitularies for their own dioceses, as Boniface of Mayence, Theodulph of Orleans, Hincmar of Rheims. The '*Hispana*' circulated among the Franks in a more or less corrupt form. One edition, which appeared between the years of 829 and 857, has caused great controversy, and is known as '*Collectio Pseudo-Isadoriana*,' or False Decretals. The author called himself Isadore Mercator, and the name led many to believe the work that of Isadore of Seville. The best evidence shows that Levites Benedict of Mainz was the compiler, but no purpose for the forgeries in the work has been conclusively shown. After the preface and some minor apocryphal documents, the first part contains 50 of the apostolic canons taken from '*Hispana*' and 60 supposed decretals of the Popes from Clement in 92 to Melchisedes in 314, arranged chronologically. The second part consists chiefly of canons taken from the '*Hispana*.' In the third part, founded also on the '*Hispana*,' the compiler has interpolated 35 decretals. A supplement contains some brief regulations regarding processes against bishops, said to be by Capitula Angilramni, a bishop of Metz. The collection was regarded as genuine by all canonists and theologians for 700 years from the 9th to the 15th century. Cardinal Nicholas of Cusa in the 15th century first expressed doubts of the genuineness of some of its contents. In the following century religious bitterness overshadowed scholarly inquiry, but it is now admitted by Protestant writers that the compilation was produced, not in the interest of the Pope but of the Frankist bishops in order to protect themselves against oppression by temporal rulers on the one hand and Church councils on the other. For this reason such insistence is found in the collection on the right of appeal to the Pope in every major cause of a bishop and also that the Pope's permission is necessary to the holding of a provincial synod. The sources from which

the compiler chiefly borrowed his materials were the Bible, the Fathers, genuine canons and decretals, Roman law, the works of Rufinus and Cassiodorus on Church history and the lives of the Popes in '*Liber Pontificalis*.' Of the supposed decretals a large number are authentic although antedated and ascribed to earlier Popes to give them the value of antiquity, while others embody the traditional contents of actual but lost decretals. The influence of the pseudo Isadorian collection has been much exaggerated, for it wrought no material change either in the faith or the discipline of the Church, since it merely put into enactments the prevailing ideas and doctrines of that period on Church government. Had it introduced a violent change the innovation would have caused a speedy inquiry into the genuineness of the work. However, it cannot be doubted that a written text often in controversy is a more forcible argument than traditional law, and hence the false decretals naturally exerted some influence.

To meet the necessity of rendering canon law more accessible from the 10th to the 12th century at least 36 compilations were made, only the authors, titles and dates of which seem necessary for this article. The first was a manuscript under 12 heads, divided into 354 chapters, abstracted from Cresconius. The second was extracted from Dionysius and the pseudo-Isadore collection. The third is very voluminous, and taken from Hadrian's codex with numerous additions. The fourth, by an unknown author, contains portions of concilia, decretals and extracts from the Fathers. The fifth, made by Regino, abbot of Prum, between 906 and 915, is founded on three Frankist collections, the Fathers and the West Gothic Breviary. The sixth is a Leipzig codex; the seventh a Darmstadt codex. The eighth is attributed to Rotger, bishop of Treves in 922. The ninth is a Viennese manuscript. The 10th is also a manuscript of five books, composed in Italy in the middle of the 10th century, and is founded upon the Irish collection in 65 titles, on fragments of the Fathers, lives of the saints, decretals, Julian's '*Novellæ*,' with capitularies of the emperors added up to Henry I. The 11th was addressed by Abbo, abbot of Fleury, to King Hugo and his son Robert, and consists of a treatise of 52 chapters on the Church and clergy. The 12th was composed by Burchard, bishop of Worms, in 1012-23, and contains the canons of the Apostles, the transmarine, German, Gallic and Spanish councils, papal decrees and other passages. The 13th is a manuscript in 12 books made in Germany or France. The 14th is a Terraconian manuscript belonging to the 11th century. The 15th is an introduction to discipline. The 16th is a collection taken chiefly from Halitgar, Rasbanu, Manurus and Burchard. The 17th is a rich collection in manuscript by Anselm, bishop of Lucca in 1086. The 18th is 74 titles taken from the above work, and the 19th and 20th appear about the end of the 11th century, both taken from the works of Anselm and Burchard. The 21st is a work in 13 books. The 22d is the capitularies of Cardinal Atto in 1081 and excerpts from decretals. Cardinal Deusdedit composed the 23d in four books at the end of the 11th century, from Dionysius, the Greek canons, the

old Italian and Spanish-Saxon and Roman records. The 24th is by Bourgo, bishop of Satrim in 1089, and is in 10 books. The 25th is in two books and belongs to the 11th or the 12th century. The first chapter is inscribed from the Primate of the Roman Church and is published with the Dionysian collection. The 26th is the decree attributed to Ivo, bishop of Chartres, and the 27th is the Pannormia in eight parts by the same author in 1090. The 28th is a large manuscript collection; first of decretals, second of councils, third of fathers, then Roman and Frankish legal collections. The 29th was made under Pascal II in 1102-18 in seven books. The 30th is attributed to Hildebert, bishop of Tours, in 1134, and may be the same as the 10 books attributed to Ivo. The 31st is a manuscript in 15 books called the collection of Saragossa. The 32d is wholly extracted from the above. The 33d is taken from Burchard and Ivo. The 34th is a penitential book in nine titles belonging to the 12th century. The 35th belongs to the middle of the 12th century and is taken chiefly from Anselm of Lucca and the collection dedicated to Anselmus. Gregory, a Spanish priest, is the author. Lastly, Algerius of Liège in the beginning of the 12th century compiled a work on 'Justice and Mercy,' which contains a treatise on Church discipline in three parts, taken from Anselm and Burchard for the most part. Gratian, a Benedictine monk, composed at Bologna in the middle of the 12th century a scientific and practical work on the canon law with references and proofs. The first part treated of ecclesiastical administration, the second contained 26 legal positions, with their answers, the third part concerned the liturgy of the Church. The whole work is founded on previous collections and contains many mistakes. It was never approved by the Church though it obtained great authority and superseded all other collections. Other collections are by Cardinal Laborans in 1182, that of Bernard of Pavia in 1190, that by Gilbert, an Englishman, in 1203. The universities of Bologna and Paris at an early period began to exercise great influence on canon law and their opinion in controverted questions was considered decisive, and was termed the authority of the schools. Gratian's collection was made the basis of lectures in Bologna and teachers of the canons were called *magistri* and *doctores decretorum*. Their teachings were soon gathered together in books of commentaries. Soon after the collection by Gratian, the Extravagantes, or decrees not yet collected, were gathered together, there being between the years 1179 and 1227 14 different compilations, only five of which received the stamp of authority. Pope Gregory IX ordered a code to be published in which the entire body of law was to be properly arranged. What was useless was to be cut out, what was ambiguous was to be corrected. Raymond of Pennafort was entrusted with this task, which he finished in the year 1233, and the collection was sent to the universities of Bologna and Paris with instructions that it was to be the sole authority. The whole work is divided into five books. The first treats of ecclesiastical judicature and of prelates; the second of civil suits; the third of civil causes before the episcopal forum; the fourth of betrothals and

marriage; the fifth of judicial proceedings in criminal matters and of punishments. To these five books was added by Pope Boniface VIII, in 1298, a sixth book of decretals. This was followed in 1334 by the Clementinæ or collection of decretals by Pope Clement V. The Extravagantes of John XXII in 1334 and the Extravagantes Communes (73 decretals from Boniface VIII to Sixtus V) were gathered by authority and made part of the code or 'Corpus Juris Canonici.' Commentaries on the 'Corpus' were made by the doctors, and systematic works for the use of courts were published. In the 15th century legal literature seems confined to these efforts. But in the 16th century Pope Paul IV confined to a congregation of cardinals, with canonists as consultors, the work of revising and correcting the 'Corpus Juris.' Gregory XIII approved the work of the committee and an authentic edition was published in 1580, in which the glosses are retained, and on which all subsequent editions have been based. The corrections made by the commission are marked "*cor. Rom.*" in the text. Two appendices were added, one the Institutiones Lancelotti, the other Septimus Decretalium, which contained the Extravagantes of Sixtus V in 1590. Neither is of public authority, but both are very useful and recognized by scholastic approval. Since then the Bullarium Benedicti XIV, which contains the constitutions of that Pope, has been made of public authority. There is also a collection of papal bulls, called Bullarium Magnum Romanum, made up in 14 volumes, which was published in 1744 and continued in 1840; but it is very imperfect and only a private collection. Anyone who desires to know canon law must learn the 'Corpus Juris,' even though to-day many parts have been changed by the councils of Trent and the Vatican and by new papal decrees. In the 'Corpus' itself the different portions stand as *lex prior* and *lex posterior*, so that in cases of contradiction the latest is preferred. With certain modifications the 'Corpus' still has the force of law in matters relating to ecclesiastical judicature, to divine worship, to doctrine and discipline. It is the code still followed in the schools and used in Church courts, not only as the source of argument but also as the method of procedure in many cases. The 'Jus Novissimum' in canon law consists of laws published from the time the 'Corpus Juris' was closed, that is, since the Extravagantes were inserted down to the present day, and includes the decrees of the councils of Trent and the Vatican. Except the Bullarium of Benedict XIV, mentioned above, no authentic collection has been made of the various constitutions and laws made by the Roman pontiffs since the close of the 'Corpus.' Still every genuine decretal is part of the canon law. The same may be said of the decisions of certain congregations of cardinals which have the force of law, especially that of the council which authoritatively interprets the decrees of the Council of Trent. So evident was the need of a revision of canon law that at the ecumenic Vatican Council, held in 1870, proposals were made by a number of bishops to have a committee appointed, consisting of the most eminent canonists, to revise the 'Corpus Juris' or rather

prepare a new one, omitting whatever owing to changed times was no longer applicable. Nothing was done before the adjournment of that council, but Pope Pius X by a *motu proprio* in the year 1904 appointed a special committee of cardinals, with a number of consultors, and a canonist from each nation, to revise thoroughly not only the 'Corpus Juris' but all the canon law of the Church, that general for the world and that special to the various nations. He himself was president of the committee to which he assigned the following cardinals: Seraphin Vanutelli, Agliardi, Vincent Vanutelli, Satolli, Rampolla, Gotti, Ferrata, Cassetta, Mathieu, Gennari, Cavicchioni, Merry del Val, Steinhuber, Segna, Vives y Tuto and Cavagnis. Archbishop (later Cardinal) Gasparri was appointed secretary. The plans of the various titles have been confided to canonists in every country. The general plan of the Code includes (after the preliminary section) four main divisions: persons, things (with subdivisions for the sacraments, sacred places and objects, etc.), trials, crimes and penalties. The articles are numbered consecutively. The work is now completed and embodies several modifications and reforms in the ancient law. This code is now the only authorized canon law of the Latin Church.

It will have been noticed that canon law is not traceable to any original code, but is a development founded on the general moral rules laid down in the Scriptures and especially in the New Testament. Neither is the Roman civil law traceable to any code, but is a gathering of principles suggested by good reasoning for promoting the civil interests of its subjects. Compared to the Jewish law, the principle upon which Roman jurisprudence was founded was very different—the former treats principally of criminal matters and is most severe in its penalties; the latter on the contrary treats all questions as civil, and prefers restitution to punishment. When the Roman emperors had been converted to Christianity, in promoting its progress by special constitutions which then became part of the canon law, they necessarily gave to canon law much of the spirit of their civil law. Thus it happens that in the canon, as in the Roman civil law, there was little severity in criminal matters, and many cases which other peoples than the Romans treated as criminal were cognizable by a civil tribunal and an indemnification was effected by damages. Generally no crime was punished capitally, especially where no force or violence was employed. This spirit of leniency is manifest throughout canon law to the present day. During and after the 4th century wherever Roman power conquered the nations and wherever Christian missionaries converted the pagans canon law was introduced through the influence of the Pope and the Emperor. It permeated and modified the laws of the peoples of northern Europe, as well as those of England to a certain extent. With it necessarily came the principles of Roman civil law. The rules for the application of canon law were as follows: (1) In cases not contained in the civil law, or the rule for which was obscure, open to doubtful interpretation, or not expressly determined, if expressly and clearly resolved by the canon law,

this latter formed the basis of the decision; and on the contrary, if the case was not provided for, or ambiguously resolved by canon law, when it was expressly met or its solution more clearly indicated by the civil law, this latter was to be preferred. (2) In cases of conflict, the civil law formed the rule for courts of civil, and the canon in those of ecclesiastical, jurisdiction. Thus, when a matter of canon law cognizance arose in the civil courts the decision was given according to the rules of the canon law; and vice-versa, when a question of civil cognizance occurred before an ecclesiastical tribunal. (3) Within the Imperial states the civil law formed the basis, and the canon law in the papal states. (4) In matters of a feudal nature the civil was preferred to the canon law. (5) In forensic causes the canon is not presumed to differ from the civil law. When the Western empire passed under the rule of a barbarian race the Roman and the canon law were not only preserved, but to a great extent they influenced the legislation of the conquerors. Alaric, Attila, Ricimir did not disturb the outward form of Roman government. In the collection of West Gothic laws, gathered in 672 A.D., there are evident traces of the part which the Roman clergy took in the compilation. The Burgundian laws also show literal excerpts from the Roman law. Roman law is found also in the Bavarian code composed in the 7th century, as well as in the capitularies of the Franks, which commence in the year 560 and are introduced by a literal transcript of a novel of Valentinian. It is noteworthy that the German tribes did not force their laws upon their subjects in those portions of their conquests where the Roman law was acknowledged. It was natural, too, that the Churches, as juridical persons, should follow the Roman law, not only on account of its connection with religion and the great degree of favor it manifested toward the Church, but also of the accuracy of its provisions in this respect. Like the law of the Teutonic tribes, that of England is an accumulation of individual laws. While Britain was conquered by Julius Cæsar in 54 B.C., still it was only at the end of the 1st century of the Christian era that Roman manners, arts, architecture, language and laws were introduced. The Roman law superseded the customary laws of the island and remained in force until the year 455, when Britain became derelict because of the removal of the seat of empire to Constantinople and the impossibility of the emperors defending it against the Picts and Scots. Christianity was introduced into Britain under the Roman dominion and was preached in Scotland and Ireland before the year 430. Roman literature, arts and law, however, received a sudden check by the Saxons, who, when they invaded Britain, imposed their law upon the conquered people. The Danes subsequently did the same. Still we are informed by the Venerable Bede that Ethelbert, king of Kent, in 613, with the assistance of his wise men, made certain decrees and gave judgments between his subjects in conformity with the principles of Roman and canon law, at least so far as regarded sacrilege, bishops, and the like. Indeed, it is not surprising that the Saxons and Danes, whose codes contained a great admixture of Roman

law, should have carried the same principles with them into their new settlement in England. Traces of a Roman original may be seen in the laws of Ina, king of the West Saxons, Offa, king of the East Angles, and in the laws published by Canute which were translated into Latin. Thus it happened that, when Edward the Confessor compiled a code out of the materials then at hand, much of the Roman and canon law was inserted and thus became the basis of much of the common law of England and the United States. During the dominion of the Saxons and Danes, those Britons who had fled to Wales were governed by their own princes. Howel Dha, in 940, is said to have assembled his bishops and the more literate among the laity for the purpose of revising the law which was translated into Latin at his command. In the 85th article he approves the Roman rule of two witnesses being sufficient in cases where no specific number is stated, and for holding the testimony of one to be insufficient, except of a woman in cases of rape, of a lord between two tenants, an abbot between two monks, a father between two of his children, a priest in a matter attested in his presence, and a thief turning king's evidence in the place of execution. Most of the Roman laws of this age seem to have been taken from the Theodosian code. Although the foot of the Roman soldier never trod on the bosom of Ireland, nor did a Roman general have a chance to introduce the Roman law, still the principles of canon law were enforced throughout Ireland and Scotland by Saint Patrick in his canons. One of them, translated by the Anglican Bishop Usher, reads: "Wherever any cause that is very difficult and unknown to all the judges of the Scottish nation shall arise, it is rightly to be referred to the see of the archbishop of the Irish (that is, of Saint Patrick) and to the examination of the prelate thereof. But if there, by him and his wise men, a cause of this nature cannot easily be made up, we have decreed it shall be sent to the see apostolic, that is, to the chair of the Apostle Peter, which hath authority of the city of Rome."

In 680, at the command of Ethelred, Egfrid, king of Northumberland, Aldwulf, king of the East Angles, and Lothar, king of Kent, Theodore, at that time archbishop of Canterbury, summoned a synod at Hatfield, in which the canons of the five general councils of Nicaea, Constantinople, Ephesus, Chalcedon, the second of Constantinople, were enforced, together with the concilia drawn up under Pope Martin at Rome in 648. He also collected in his capitularies the most important points of Church discipline. Later he wrote his 'Book of Penances.' In the latter half of the 8th century, Egbert of York made an extensive collection of canon law from the sources then existing. He also wrote the book 'De Remedii Peccatorum.' In the 8th century a collection was made in Ireland in which the Dionysian collection and Roman, Gallic and Irish councils are used. King Henry I, in 1100, endeavored to repudiate a number of Church laws and ordered that Peter's Pence was to be paid to the King instead of the Pope. Henry II entered into a controversy over the enforcement of canon law with Thomas à Becket. In 1215, by the Magna Charta, King John confirmed to the prelates

and barons of his kingdom the freedom of election of the clergy, and this acted as a general acknowledgment of ecclesiastical rights and liberties. In 1230, Otho, the legate of Pope Gregory IX, held a national synod, and in 1268 Othobon, the legate of Pope Clement IV, held a second, both of which, as Blackstone says, had a great effect on the ecclesiastical jurisprudence of England. Under King Henry III, Boniface, archbishop of Canterbury, enacted several canons which seemed against the existing laws of the realm, and under Stephen an ecclesiastical and a secular party were formed, the latter adhering to the common law as tenaciously as the clergy and nobility did to the canon and civil law. In the Parliament of Merton, however, the adherents of the canon and civil law were defeated on the proposition to make *legitimatio per subsequens matrimonium* legal also in England as it was under canon and civil law. Under Richard II, more than 100 years later, the feud still existed. Anglo-canon law was further augmented by the decrees of provincial councils held under the archbishops of Canterbury, from Stephen Langton to Henry Chicheley, which were glossed by William Lindwood, and later enforced also by the archbishops of York. The king meantime had also enacted many statutes on the relations between secular and ecclesiastical jurisdiction. A statute of Henry VIII rendered void all canons which were contrary to the law of the realm or hurtful to the royal prerogatives, and provided a commission to revise them. Edward VI renewed the commission, but the code was not confirmed before his death. Mary repealed all these acts, but Elizabeth revived the first act of Henry VIII. In 1603 some canons were made in the convocation of the province of Canterbury and confirmed by the king but not by Parliament. It is held that, therefore, these bind the clergy in Church matters, but not the laity, except in so far as not repugnant to the laws of the realm. By acts of Parliament (26 Henry VII, 1; 35 Henry VIII, 3; 1 Elizabeth 1) the king was declared the supreme head of the Church, and it became treason (1 Ed. VI, 12; 5 Eliz., 1) to doubt it or to defend the supremacy of the Pope as head of the Church. These acts and subsequent ones reversed canon law in England, Ireland and Scotland. Speaking of the courts of the archbishops and bishops of the English Church to-day, Blackstone says: "An appeal lies from all these courts to the sovereign in the last resort, which proves that the jurisdiction exercised in them is derived from the crown of England. . . . It appears beyond a doubt that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and *leges sub graviore lege*. They are by no means with us a distinct, independent species of law, but are inferior branches of the customary or unwritten laws of England." In Scotland many of the provisions of canon law became the law of the land. During the 16th and 17th centuries canon law was taught in the Scottish universities, and from very early times many of the youths of Scotland attended the schools of the Continent, whence not a few returned as doctors *in utroque jure*, that is, canon and civil law. The canons of provincial councils, held yearly, and at whose meetings representatives of the king were

present, constituted a national canon law which was recognized by the Pope and by Parliament and enforced in the courts of law. Even to this day, though the ecclesiastical system of the country is Presbyterian, the old canon law still prevails to a certain extent. "So deep hath this canon law been rooted," says Lord Stair in his 'Institutes of the Law of Scotland,' "that even where the Pope's authority is rejected yet consideration must be had to these laws, not only as those by which the Church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws which, because of their weighty matter and their once being received may more fitly be retained than rejected." In two old acts of the Scotch Parliament, made in 1540 and 1551, the canon and Roman law are mentioned as the common law of the country, the clause used being "the common law, baith canon, civil and statutes of the realme." Since the restoration of the Catholic hierarchy in England in 1850, and in Scotland in 1878, the churches under Roman jurisdiction have held various councils and enacted laws to fit the changed conditions. These laws, having been examined by the committee of cardinals in Rome appointed for such purpose, have become, as it were, a national canon law for the Catholics of those countries. In a similar way the Catholics of newly established nations, owing to various reasons, are ruled by a modified canon law which gives the bishops and superiors a very extensive authority. Such is the case at present in Canada, Australia and the United States. These modifications pertain chiefly to the election of bishops, the appointment and removal of parish clergy, the tenure and administration of Church property. The second and third plenary councils of Baltimore contain special modifications for the United States. For Mexico, West Indies and South America a council was held in Rome of the bishops of those countries, and its decrees were published in 1901. Other national modifications of canon law in the course of time have been introduced by concordats made by the Pope with the rulers of Christian nations by which he grants them certain concessions. As a nation Spain enjoys the greatest concessions. The councils held in Gaul in the 4th and following centuries show the beginning of a national canon law for France. The fourth canon of the Council of Arles, convoked by King Clovis in 511, prohibited certain laymen and teachers from receiving holy orders without the king's consent. The Council of Orleans, in 549, shows that at that time the king's consent was necessary for the election of bishops. Many points regarding a special liturgy, the administration of the sacraments, the matter and forms of ecclesiastical trials are to be found in these same early councils. The laws of Dagobert, in 620, show special protection given the Church but also lay the foundation for future subjection; for councils could not be held without consent of the king, and bishops were elected not infrequently at the dictation of royalty. But the capitularies of Charlemagne and his successors, collected in 825 by the abbot Ansegiso, were very favorable to the Church. Under the third dynasty, especially because of the feudal law, bishops, abbots and chapters exercised almost complete civil authority over

the people in their charge; but the oath of fealty was imposed on the prelates as vassals of the king. On the other hand, the kings took upon themselves the defense and guardianship of the Church, and on the pretext that at the death of the prelate they were the guardians of the vacant see, they performed many acts of ecclesiastical jurisdiction, among which was the administration of the temporalities of the vacant church. This was not done, however, without the assent of the sovereign pontiffs. Herein is found the origin of *ius Regaliæ* which later caused such trouble. In the year 1268 a pragmatic sanction was issued by Saint Louis which gave liberty of election of bishops and ordered that the general canon law should be observed throughout France. However, the genuineness of this law has been seriously questioned. Under Philip the Fair the seeds of absolute independence of the secular from the spiritual authority were sown; and about the same time serious contests arose between clerical and lay judges concerning their jurisdiction. On appeal to the king the clergy won; but the jurisdiction of the Church was gradually lessened, and at this time the appeal "as from abuse" was introduced, that is, a clergyman might appeal to the king from an abuse of the power exercised by a bishop. This was diametrically opposed to general canon law. The great schism of the West brought out the question whether the Pope or an ecumenical council were superior, and the controversy became especially bitter in France. Charles VII selected certain passages from the Conciliabule of Basel, and in 1438 issued a pragmatic sanction in which the superiority of the council over the Pope was declared, and elections both to episcopal sees and in monasteries were to be held after the ancient law of France. Louis XI suppressed this decree, but it was revived after his death until finally condemned by the Fifth Lateran Council, and changed by the concordat made between Leo X and Francis I. In this concordat many of the dispositions of the pragmatic were preserved; but the concordat differed from the pragmatic in this: that in place of the election of bishops and prelates in case of vacancy the king was given the right to present to the sovereign pontiff, within six months, a doctor or licentiate in theology who should be at least 27 years of age and otherwise competent. The pontiff would grant institution. The Parliament, after a long contest, agreed to the execution of this concordat. Herein is seen the beginning of the system of government nomination of bishops, concerning which, in 1903-04, the Pope and the French government were at variance. In the 16th century the government long opposed the publication of the decrees of the council of Trent, but finally, without mentioning the source, the chief decrees, word for word, were published in 1579 by royal order. In 1681 the Gallican clergy, at the instance of the government, met in extraordinary convention and adopted a declaration favoring the extension of the *Regalia* to all France. This was repudiated by Pope Innocent XI. The next year the Gallican clergy adopted four propositions in which they attacked the Holy See in administering temporal matters, and declared that the judgment of the Pope on a matter of faith was not irreformable except when the consent of the Church had been added.

The king ordered the observance of this declaration, but it was condemned by Alexander VIII. Later, King Louis XIV wrote the Pope that he had ordered that the decree should not be observed. Nevertheless, the *Regalia* was observed up to 1789 throughout all France, and the government continued taking the revenues of all vacant bishoprics and appointing to benefices during the interregnum. In an edict of 1695 a code of ecclesiastical law as observed in France was enacted, and in it was the appeal "as from an abuse," that is, from the ecclesiastical to the civil authorities. The national convention in 1790 passed a civil constitution for the clergy by which dioceses and parishes were suppressed and the Church made subject to the state. In 1801 Napoleon, as First Consul, and Pope Pius VII made a concordat in which the Catholic Church was acknowledged as the state Church, and by which new limits were assigned to dioceses and parishes, and by which especially the right of nominating bishops was given to the ruler of France. To the nominees the Pope would grant institution. Various other regulations were made, and the French government took upon itself the support of the bishops and parish priests in place of restoring the immense Church properties which had been confiscated. During the year 1904 a great agitation occurred for the suppression of this concordat because of controversies over some bishops held delinquent and suspended by the Pope. The concordat was suppressed in 1906. With the abrogation of the concordat the state no longer supports the clergy, nor can it nominate to bishoprics. There is complete separation of Church and State in France since the passage of the law abrogating the concordat of 1801. During the 19th century the liturgical worship of the Church in France was made conformable to that of Rome, and other matters of discipline were brought under general canon law.

Undoubtedly canon law has exerted a wide and lasting influence on the nations of Europe and America. It made them Christian states and directly or indirectly modified their constitutions. State legislative assemblies based their proceedings on the methods of Church councils. The law of nations is simply the application to nations of the principles of Christian law taught to individuals. The ancient Romans as well as barbarous tribes considered all foreigners enemies; the Church taught the brotherhood of all men. The Pope, as the common father of all Christians, acted as arbitrator in the disputes between nations, and so noteworthy became the Roman Rota, to which the Pope referred international disputes, that at times much of its work was deciding important questions for rulers of nations. The system of Church administration served as a model for that of states, and the clergy, especially in the earlier and Middle Ages, being the educated class and following canon law, naturally introduced many of its rules into everyday life. The elevated condition of woman is due to the canon law prescriptions regarding marriage, which the Church enforced on all nations converted to Christianity. Questions relating to widows and orphans were within the jurisdiction of canon law and Church courts. The incorporation of Church bodies, from which other corporations took their origin, had its foundation in the law

of Justinian and was imported into England with the civil and canon law. As in the Roman law, the charter of the sovereign is always expressed, or at least implied. From England the idea of corporation and corporation sole came into American law. The writ of *habeas corpus* had its origin in the Roman law "*interdictum de libero homine exhibendo*." Inheritance by will and the rule for the descent of real property came from Roman law, while trial by jury, with challenges of the jurymen, was determined in the Roman *Lex Servilia* and *Lex Cornelia*. While in England "Christianity is part of the law of the land," in the United States this "is true only in a qualified sense" (33 Barb. 548), and owing only to "the fact that it is a Christian country and that its constitution and laws are made by a Christian people" (23 Ohio St. 211). Nevertheless "the decision of ecclesiastical courts or officers having, by the rules or laws of the bodies to which they belong, jurisdiction of such questions, or the right to decide them, will be held conclusive in all courts of civil administration, and no question involved in such decisions will be revised or reviewed in the civil courts, except those pertaining to the jurisdiction of such courts or officers to determine such questions according to the laws or usage of the bodies which they represent." (Quoted with approval in 98 Penn. 213). "Civil courts will not review the action of ecclesiastical tribunals except where rights of property are involved" (2 Iowa 567; 23 Ill. 456). Justice Strong, in 'Relations of Civil Law to Church Policy,' concludes: "I think it may be safely asserted, as a general proposition, that whenever questions of discipline, of faith, of church rule, of membership, or of office have been decided by the Church in its own modes of decision, civil law tribunals accept the decisions as final and apply them as made." See also LAW; CATHOLIC CHURCH, ROMAN.

**CANON OF THE MASS**, that part of the mass following the sanctus. The rule of the Roman Catholic Church for celebrating the Eucharist is contained in this canon.

**CANON OF SCRIPTURE**. See BIBLE.

**CANONESS**. At the close of the 8th century the title of canoness was given to a class of women who took the vows of chastity and obedience, but not that of poverty, and were not cloistered, though they had a common table and dormitory, and were bound to the recitation of the breviary, as were nuns. They derived their name from their being enrolled in the canon or official list of the Church. Their occupations were chiefly education of girls, transcription and embellishment of Church office-books and embroidery of vestments. The advantages of such institutions as asylums in a rough age were soon visible, and they multiplied in consequence, but as in many houses the religious motive had little to do with entrance, a distinction was drawn ere long between canonesses regular and secular. The secular canonesses were for the most part members of princely or noble families, practised much state and luxury and retained none of the rule save

the common dormitory and the recitation of the Hours in choir. In Germany, several abbesses of canonesses were princesses of the empire, kept up feudal state and furnished contingents to the Imperial army from their vassals; and at the Reformation some chapters adopted the new opinions, and subsist to the present day as Protestant foundations, enjoying the revenues, and admitting to membership only ladies of noble birth or daughters of distinguished members of the military and civil service, whose sole obligation is celibacy during membership. The institute never spread beyond the limits of the empire, and the non-German houses were chiefly in Hainault, Flanders and Lorraine.

**CANONGATE**, The, the principal street in the Old Town of Edinburgh. It is upward of one mile in length, rising gradually with a regular and steep incline from a small plain at the east end of the town, on which stands the palace of Holyrood, and terminating at the castle. The appearance of this street, the scene of many interesting historical incidents, is rendered remarkable by the loftiness and antique aspect of the houses with which it is lined, most of them ranging from five to seven stories in front, and often more behind. At different points it is known by other names, High street, Lawnmarket, etc.

**CANONICAL BOOKS**, the books of Scripture belonging to the canon. See **BIBLE**; **CANON**.

**CANONICAL HOURS**, certain times of the day set apart by ecclesiastical law in the Roman Catholic Church to the offices of prayer and devotion, namely, matins with lauds, prime, tierce, sext, nones, even-song or vespers and compline. These hours of prayer originated early in the Church's history, being mentioned by Clement of Alexandria, Tertullian, Jerome and others. The day was divided into seven parts and the observance of the canonical hours was as follows: prime, tierce, sext and nones at the first, third, sixth and ninth hours of the day, counting from six in the morning; vespers at the eleventh hour, compline at midnight and matins shortly after midnight. These times are no longer strictly adhered to. In England the canonical hours are from eight to twelve in the forenoon, before or after which the marriage service cannot be legally performed in any parish church. See **BREVIARY** and consult Bingham, 'Origines Ecclesiastici'; Proctor, 'On Common Prayer.'

**CANONICALS**, the prescribed dress or vestments worn by the clergy of the Roman Catholic, Protestant Episcopal and other churches when officiating at religious services. The wearing of vestments is of ancient origin. In all the pagan religions the priests wear symbolic garments, and in the Jewish system the priestly robes were very elaborate and significant. The modern Jewish system retains these ecclesiastical vestments and the ministers of many Protestant denominations wear such attire. See **CHASUBLE**; **COSTUME**, **ECCLESIASTICAL**; **STOLE**; **VESTMENTS**.

**CANONICUS**, Indian chief: b. about 1565; d. 4 June 1647. When the Pilgrims landed, he and his nephew Miantonomo (q.v.) were associate sachems of the fierce Narragan-

setts, mustering some 3,000 warriors. In the winter of 1621-22 he sent to the little colony, with about 50 fighting men, a bundle of arrows bound with a snakeskin, either as a preliminary of war or a demand of gifts to avert it. They returned the skin stuffed with powder and ball, and the frightened savages did not dare keep it. A lasting treaty was negotiated, and it was owing to the influence of Canonicus that the tribe never made war against the English, even many years after his death, till "King Philip's War" of 1675. In 1636, Roger Williams and his company sought refuge from the Massachusetts authorities among the Narragansetts. They were kindly received, and to them was granted the peninsula where Providence stands. In 1637 the Pequots of Connecticut were attempting to form a general Indian league to exterminate the English settlements, and the Massachusetts government sent an embassy to prevent the Narragansetts from joining it. Canonicus received them with great Indian pomp in his wigwam of poles and mats, surrounded by his "mugwumps" and leading warriors, gave them a feast with boiled chestnuts and huckleberry Indian pudding for dessert; and probably more from kind regard for Williams than through the embassy's persuasions, kept the peace, and even furnished a couple of hundred warriors to help the English. These allies, however, played the usual ambiguous Indian part, ready to massacre the beaten side. In 1644 the Gorton (q.v.) party succeeded in persuading the chiefs that it was under the protection of irresistible powers in England; and on 9 April Canonicus, his son Mixan and his nephew Pessacus, brother and successor of Miantonomo, signed two astonishing documents, of whose purport it is very unlikely that they had been correctly informed. One of them ceded the land and people of the Narragansetts to his Majesty of Great Britain, placing the Indians themselves under his protection, and appointing Gorton and three others their attorneys to carry the instrument to him. The other, addressed to the Massachusetts authorities, was the refusal of their invitation to visit Boston. It also menaced the authorities on account of Miantonomo's death and threatened to revenge it on Uncas. Finally, however, a truce was signed, and three years later Canonicus died.

**CANONIZATION**, a rite in the Roman Catholic Church by which a deceased person is inscribed in the catalogue of the saints and by which it is publicly, solemnly and canonically declared that such person is to be honored as a saint by all the faithful.

The desire to honor the dead is an instinct of human nature. The state picks out its great ones for civil honors; the Church holds up to the veneration of its members those who by the sanctity of their lives and their love of God and their fellow-men merit imitation.

The state honors its heroes on account of intellectual ability, oratorical gifts, courage or patriotism; the Church demands purity of life and eminent virtue in her spiritual heroes. As a proof of that virtue she requires miracles wrought by or through their intercession. The virtues, which must be heroic, and the miracles, are proved by a process most minute and searching.

During the early centuries the deeds of the martyrs were recorded by Christian notaries. For this purpose Pope Clement divided the city of Rome into seven quarters with a special notary for each quarter. The letters of Saints Cyprian, Jerome, Augustine and Epiphanius tell us of the efforts of the bishops to collect the deeds of the martyrs and to have them venerated.

In the early times individual bishops sifted the testimony regarding those brought to their notice as worthy of veneration and declared for or against it. But this gave rise to inconveniences and the necessity of a central authority for judging in such cases was made manifest.

As early as the 4th century the case of Saint Vigilus, bishop of Trent, who was martyred A.D. 399, was brought to Rome to secure the consent of the Pope for his veneration as a saint.

Gradually the procedure in these matters was elaborated and in 1587 the Congregation of Rites was charged with the duty of investigating the causes of Beatification and Canonization.

Beatification precedes Canonization, and is a decree which permits the honoring of a servant of God by public worship in a certain place. It differs therefore from Canonization in that the latter not only concedes but *declares* that veneration be paid by the universal Church to the canonized one whilst Beatification *permits* only in a certain place the honoring of the beatified.

The process by which Beatification is reached is a lengthy one. "The fierce light which beats upon a throne" is nothing to the minute and protracted inquiry which turns upon the everyday life of the person submitted to it.

Thirteen or fourteen steps may be distinguished in the process of Beatification. The bishop of the diocese first inquires as to the reputation of the person proposed for virtue and miraculous powers. Then the question of "non-cultus" is examined; namely whether any veneration was paid to the servant of God or whether any thing was done contrary to the decrees of Urban VIII which prescribes the form of Beatification and Canonization.

As a third step the minutes of these two inquiries are sent to Rome. The process is then opened before the Congregation of Rites. See CONGREGATIONS, ROMAN.

The Promoter Fidei (called in popular language the "devil's advocate") is appointed. His duty is to raise objections against the process and person. All the works printed or in manuscript, if the person were an author, are then examined. If a favorable report is made, then begins what is called the Apostolic Process. A commission is given to the Congregation of Rites to investigate the notoriety, reality and nature of the virtues and miracles ascribed to the one to be beatified.

Three bishops are appointed to deal with the case systematically. Their findings are sent to the Congregation of Rites and examined and arguments are heard pro and contra.

A new delegation makes another and more searching inquiry, if the result of the last examination is favorable. The process is again returned to the Congregation of Rites to be again examined. In three successive meetings, at the last of which the Pope is present, the virtues and miracles of the subject for beatification are again discussed.

Having sought to know the will of God by prayer the Pope confides his judgment to the secretary of the Congregation.

In a new general assembly the question is considered whether the Beatification may proceed without further delay. In the event of an affirmative decision the Pope appoints a day for the ceremony, and orders a brief to be prepared setting forth the Apostolic sentence.

The Beatification takes place in Saint Peter's with ceremonies appropriate to the occasion. Proof of at least two miracles is necessary in the case of Beatification, and before proceeding to Canonization it must be proved that at least two more miracles were wrought through the intercession of the "Blessed" person.

So strict is the examination of these miracles, that according to an Italian proverb, "It is next to a miracle to get a miracle proved in Rome." To prove the truth of miracles worked after Beatification, the same formality and rigorous conditions are required as are necessary in the case of miracles before Beatification.

The three congregations or assemblies which were required before Beatification are again convoked and after mature deliberation if everything is favorable to the Cause, declare for it. A decree is drawn up by the direction of the Pope expressing that decision. Canonization then takes place in Saint Peter's.

Most solemn ceremonies mark the event and never does the venerable Basilica with its thousands of worshippers look so grand and inspiring as when the Pope declares and ordains that the servant of God in question shall be inscribed in the register of the Saints ("Canon Sanctorum") and that his (or her) memory shall be celebrated on a given day in every church.

Consult the celebrated treatise of Pope Benedict XIV, 'De Servorum Dei Beatificatione et Beatorum Canonizatione' (1734-38), the standard work on the subject; a portion of it has been translated under the title 'Heroic Virtue' (3 vols., 1856); also Addis and Arnold, 'The Catholic Dictionary' (1893); Aichner, 'Compendium Juris Ecclesiastici' (1900); Baart, 'The Roman Court'; Bargilliat, 'Prælectiones Juris Canonici,' Vol. 1, pp. 344-45 (1903); Bouix, 'Tractatus de curia Romana,' 180 p. 183 (1880); Ferraris, 'Bibliotheca Canonica'; Fornari, 'Codex pro Postulatoribus'; Gardellini, 'Decreta authentica S. C. Congregationis Rituum'; Reiffenstül, 'Jus Canonicum Universum'; Schmalzgrüber, 'Jus Ecclesiasticum Universum'; 'Catholic Encyclopedia' (New York 1912). Consult also 'Catalogus ac Status Causarum Beatificationis' (Rome 1901).

**CANONS, Book of,** a system of canons or rules prepared for the Church of Scotland by its bishops, in accordance with the direction of Charles I. It was published in 1636, having undergone revision at the hands of Archbishop Laud. It limited greatly the power of the Church courts inasmuch as their findings were now subject to ratification by the bishops, and also asserted the king's supremacy in spiritual matters. Its promulgation was felt to be arbitrary, and the strongest objections were made against it.

**CANONS OF THE CHURCH OF ENGLAND**, the "constitutions and canons ecclesiastical" drawn up in convocation in 1604 by the synod in London. These canons, still in force as revised, number 141, and were designed to confirm the established system of the Church of England, particularly through the test oath, aimed at the Puritan party, in which the clergy were sworn to subscribe willingly to the supremacy of the sovereign, to the Articles and to the Prayer-book. Consult Walcott, 'The Constitutions and Canons Ecclesiastical of the Church of England' (Oxford and London 1874).

**CANONS OF HIPPOLYTUS**, The, a book divided into 38 canons, believed to have been written by Hippolytus, archbishop of Rome, about the middle of the 3d century. It contains instructions in regard to the selection and ordination of Christian ministers, conversion and baptism of the heathen, rules for the celebration of the Eucharist, for fasting, etc. The book originally was made from a Coptic version of the Greek but has been handed down only in Arabic. It first attracted attention in the 17th century, was published in 1870 by Haneberg, who added a Latin translation, and was revised by Achelis in 1891. A German translation was made by Reidel in 1900 from new manuscript, which showed that the book had been previously thrown into disorder by the displacement of two pages, and which also removed other difficulties upon which the theory of interpolation was based. There has been much controversy about the authorship of the book and as to whether the canons were the original form from which the Egyptian Church Order was derived, but all documents, as well as the general style of writing, point to Hippolytus as the author.

**CANONSBURG**, Pa., borough of Washington County, on the Pittsburgh, Cincinnati, Chicago and Saint Louis Railroad, 18 miles southwest of Pittsburgh. Named after Col. John Canon, who plotted the town in 1789. It was the active centre in 1794 of the Whisky Insurrection. In 1802 it received a borough charter. It is situated in a rich coal region and has manufactures of sheet iron, structural steel, tin plate, stove pipes, pottery, etc. The original building of Rev. Dr. John McMillan's Latin School, founded in 1780, the Pennsylvania Training School, the buildings of Jefferson College founded in 1802, now part of Washington and Jefferson College (p.v.), are situated here. Pop. with South Canonsburg annexed 5,588.

**CANOPIC VASES**, or **CANOPI**, certain large-bellied vessels found in tombs of Egypt, containing the embalmed viscera of bodies that had been converted into mummies. Four of these were placed in a tomb, each appropriated to a particular deity, and surmounted by the effigy of the head of such deity, as of a man, an ape, a jackal or a hawk. It is to those with the human head that the term canopi has been more particularly applied. They were frequently made of basalt, and decorated with figures in relief or paintings; or of costly white alabaster, with spiral flutings; or they were formed from black burned clay. The name is derived from the town Canopus.

**CANOPPI**, *kā-nō'pē*, **Antonio**, Italian scene-painter: b. 1773; d. Saint Petersburg 1832. He received his first education from his father, who was employed as civil engineer by the Duke of Modena, and after occupying himself for some time with fresco-painting, was subsequently employed as scene-painter in Venice and Mantua. Compelled to resort to flight at the time of the French invasion, he first betook himself to Vienna and afterward to Moscow, where he was engaged in the decoration of many places, which, however, were burnt in the great fire of 1812. From that time until his death he was engaged as scene-painter of the Imperial theatre of Saint Petersburg. His most admired efforts in that branch of art were his architectural scenes for Mozart's 'Magic Flute,' and for 'Semiramis.'

**CANOPUS**. (1) In Egyptian mythology, a water-god, represented on vessels of a spherical shape. These vessels were used by the ancient Egyptians to keep the water of the Nile in good drinking condition. The worship of Canopus was superseded under the first Ptolemy by that of Serapis—a Greek inscription in honor of Serapis at Canopus having been discovered by Mr. Hamilton amid the ruins of Alexandria. (2) In ancient geography, one of the most remarkable towns of lower Egypt, near the most western mouth of the Nile, about 14 miles east of Alexandria. The name of the town is variously ascribed to the divinity of the same name and to Canopus, or Canobus, the helmsman of Menelaus, who died in Egypt of the bite of a serpent, after his return from Troy, and who was buried on the site of the town. It became important after the foundation of Alexandria, as a summer resort of doubtful reputation. It was an important port, and although the channel is now filled up, there are still ruins of the old city on the shore at Aboukir. It was the seat of a temple at Serapis (successfully excavated in 1893), whose oracle was celebrated, especially among the sick seeking for restoration to health.

**CANOPUS**, or **CANOBUS**, the brightest star except Sirius of the first magnitude, belonging to the southern constellation Argo, and invisible in the north or middle parts of the United States, on account of its nearness to the South Pole. It is one of the few brilliant stars for which no sensible parallax has been found. The name, according to Plutarch, was derived from Canopus, the pilot of Menelaus.

**CANOPY**, in general, any suspended covering that serves as a protection or shelter, as an awning, the tester of a bed, or the like; especially, an ornamental covering of cloth suspended on posts over a throne or the seat of a high dignitary, or any covering of cloth so disposed. In architecture, it is the decorative hood or cover supported or suspended over an altar, throne, chair of state, pulpit and the like; also the ornamented projecting head of a niche or tabernacle. Early English canopies are generally simple with a trefoiled or cinquefoiled heads. The triangular arrangement over an early English and decorated doorway is often called a canopy.

**CANOSA**, *kā-nōs'sā*, **DI PUGLIA**, Italy, city in the province of Bari delle Puglie, 14 miles to the southwest of Barletta on the Adriatic.

The cathedral of San Sabino, with pavement several feet below the surface of the street, was built about 1101. In an adjacent court is the tomb of Bohemond I; it has bronze doors by Ruggieri of Amalfi. There is a ruined castle, built by Charles I of Naples. It was the ancient Canusium, and various relics of Roman times, including an amphitheatre, have been found. Between Barletta and Canosa was the ancient Cannæ (q.v.), where in 216 B.C. Hannibal defeated the Romans. Tombs cut in rock on a hill have been found in the neighborhood, and in 1813 a beautiful burial-chamber was opened, which contained the corpse of a warrior in armor. A copper lamp and a number of beautiful vases were also found here. The paintings upon the vases were the most important part of this discovery. They refer to the Greek-Italian mysteries. The town was founded by the Greeks, and till the Second Punic War was an important commercial centre. Pop. about 26,000.

**CANOSSA**, small village in northern Italy, 12 miles southwest of Reggio. On a rock near by are the ruins of Canossa castle, which was destroyed by the inhabitants of Reggio in 1255. In the 11th century the castle belonged to Countess Matilda of Tuscany, with whom Pope Gregory was staying in 1077 when the German Emperor Henry IV came to render submission after his excommunication by the Pope. The monarch was compelled to stand barefooted in the courtyard for three days and nights before the pontiff would receive him. Bismarck in 1871 used the historic phrase, "We are not going to Canossa," in a speech directed against the clerical party. Hence, "going to Canossa" signifies submitting to humiliation.

**CANOT**, *kā-nō'*, Theodore, Italian adventurer and slave trader: b. Florence 1807; d. 1850. His father was a French officer. He visited Boston, sailed to various parts of the world, was shipwrecked near Ostend, and again on the coast of Cuba, where he fell into the hands of a gang of pirates, one of whom claimed to be his uncle, befriended him for some time, and finally sent him to an Italian grocer at Regla, near Havana, who was secretly concerned in the African slave trade. Canot made his first voyage to Africa in 1826, landing at the slave station of Bangalang, on the Rio Pongo, Senegambia. After quelling a mutiny on board and helping to stow away 108 slaves under 15 years of age, the young adventurer entered the service of the owner of the station. He visited various parts of the neighboring country, collecting by aid of the African princes a stock of slaves for his newly-established depot at Kambia near Bangalang, which in May 1828 was destroyed by fire. He afterward purchased a vessel at Sierra Leone, in which with a cargo of slaves wrested from a trader in the Rio Numez, he sailed to Cuba. Three more expeditions soon followed; in the first he lost 300 slaves by smallpox; in the last he was taken by the French and condemned to 10 years' confinement in the prison of Brest, in France, but after a year's duration was pardoned by Louis Philippe. He returned to Africa, and was the pioneer of the slave traffic at New Sestros. After a pleasure trip to England he returned to New Sestros and in 1840 shipped to Cuba 749 slaves. He now resolved to abandon his

illicit course, and obtaining from an African chief a valuable grant of land at Cape Mount, established there in 1841 a trading and farming settlement under the name of New Florence, which in March 1847 was destroyed by the British, who suspected it to be a slave station. Canot subsequently removed to South America, then to Baltimore, Md., and finally received from Napoleon III an office in one of the French colonies in Oceanica. Consult Mayer, 'Captain Canot, or Twenty Years of an African Slaver' (1854).

**CANOVA**, *kā-nō'vā*, Antonio, Italian sculptor: b. Possagno, Treviso, 1 Nov. 1757; d. Venice, 13 Oct. 1822. He was the founder of a new school of Italian sculpture in which softness and delicacy of expression predominate. Canova came of a family of stone-cutters and makers of small statuary. At a very early age he was taught by his grandfather to draw, design and copy the statuary in his workshop. He very early showed talent and great interest in the traditional trade of his family; and in this he was encouraged by his grandfather, who acted as his guardian, for his parents had died while he was still an infant. Before his tenth year Canova had begun to imitate the work of his elders; and two small shrines executed by him at this period are still in existence. From this time on he worked continuously in the shop of his grandfather, who had some knowledge of painting, drawing and architecture, a strong love for his profession and a desire to see his grandson distinguish himself in it. At the age of 13 the boy had already acquired a local reputation which attracted the attention of Giovanni Falieri, senator and member of an old patrician family, and a man of great influence in the community, who introduced him to Torretti, a local sculptor. Canova worked with and studied under the latter for two years and went with him to Venice, where Torretti died a few months later. The boy continued with Ferrari, a nephew of Torretti, who made marble house decorations. While here Canova made for his patron Falieri two statues 'Orpheus' and 'Eurydice,' in which the latter saw evidence of great talent, and gave him an order for more. The next three years were, for Canova, a period of study, attendance at the art and other classes in the school and of investigation in anatomy and working from natural objects; at the end of which time he presented to his patron work much superior to anything he had previously done, among them 'Dædalus and Icarus,' the best known of his works of this period. As his reputation grew he turned his eyes toward Rome, then the centre of Italian art, as it is to-day. Falieri came to his aid and secured for him a pension of 300 ducats (\$290) a year for three years from the Venetian Senate to enable him to continue his studies. In 1779, at the age of 22, he went to Rome with a letter of introduction to the Venetian ambassador, who became his friend and patron. There Canova applied himself to study and work with enthusiasm; and under the influence of the city, its ancient monuments, its traditions and the enthusiasm inspired by Winkelmann and other students and reformers of art, the young Venetian developed rapidly and soon acquired, in the Imperial city, a reputation superior even

to that he had left behind him in Venice. 'Theseus Sitting upon the Slain Minotaur' was the first large work by Canova in Rome (1783). In 1783 he undertook the execution of the tomb of Pope Clement XIV, in the church Degli Apostoli. He retained the usual style of composition, and only improved on the depraved taste of the school of Bernini. He next executed the group of 'Cupid and Psyche,' in which he first displayed his own peculiar style, of which loveliness is a striking characteristic. The figures are exceedingly delicate and graceful. He was employed on a second public monument, the tomb of Pope Clement XIII, in Saint Peter's, which was finished in 1792. It is distinguished for its colossal size and simple style. Meanwhile the fame of the artist continually increased. He established in the palace of the Venetian Ambassador a school for the benefit of young Venetians. His next works were a winged Cupid, standing; another group of 'Cupid and Psyche'; a group of 'Venus and Adonis' for the Marchese Verio, in Naples; the tomb of the Venetian Admiral Emo, for the republic of Venice. This latter is a combination of bas-reliefs with figures in full relief. In a very lovely 'Psyche,' standing, half-dressed, with a butterfly in her left hand, which she holds by the wings with her right, and contemplates with a calm, smiling mien and a 'Repentant Magdalene,' natural size, he has carried the expression of blending and softness to the highest degree. His 'Hebe' is a delightful figure. In an easy and animated attitude the smiling goddess of youth hovers over a cloud, pouring nectar with her right hand into a bowl which she holds in her left. Both vessels, as well as the coronet of Hebe and the edges of her garment, are gilt. Canova is fond of a variety of material, and often endeavors to give to his statues the effect of pictures. He displayed his talent for the tragical in the raging 'Hercules Hurling Lichas into the Sea.' The group is colossal, and Hercules is somewhat larger than the Farnesian; but it makes a disagreeable impression, for the genius of Canova was not adapted to such subjects. His representation of the two pugilists, 'Kreugas and Demoxenos,' is much more successful. A standing group of 'Cupid and Psyche' was the triumph of his art. Psyche here appears again holding the butterfly. In 1796 and 1797 Canova finished the model of the celebrated tomb of the Archduchess Christina of Austria, wife of Duke Albert of Saxe-Teschen, which in 1805 was placed in the church of the Augustines at Vienna. In 1803 he made the colossal statue of the King of Naples, one of his finest works, which is 15 palms high, and executed in marble. During the revolution of 1798 and 1799 Canova accompanied Prince Rezzonico on a journey through Germany. On his return he remained for some time in the Venetian territory, and painted for the church of his native village an altar-piece, in which are represented the dead Christ, the Marys, Nicodemus and Joseph, and, on high, God the Father. He afterward executed, in Rome, his 'Perseus with the Head of Medusa,' which, when the Apollo of Belvedere was carried to France, occupied its place and pedestal. This statue increased the fame of Canova more than any of his preceding works. But Perseus is only an imitation of the Apollo. The separate parts are of exquisite

beauty in form as well as in masterly, delicate finishing. In 1802 he was invited by Bonaparte to Paris to make the model of his colossal statue. In the beginning of 1803 the model of the Emperor's bust, and afterward that of his statue, was to be seen in the workshop of the artist. There is not a more successful work of the kind than this bust: the figure of the statue is not so good. Among the later works of the artist are a Washington, of colossal size, in a sitting attitude; the tombs of the Cardinal of York and of Pius VII; an imitation of the Medicean Venus; a 'Venus Rising from the Bath'; the colossal group of 'Theseus killing the Minotaur,' far surpassing his earlier works in the heroic style; the tomb of Alfieri, for the Countess of Stolberg, in Florence, and erected in that place (the 'Weeping Italia,' a colossal statue in marble, is particularly admired); the 'Graces Rising from the Bath'; the monument of the Marchioness of Saint Croce; a 'Venus'; a 'Dancing Girl,' with almost transparent garments; a colossal 'Hector'; a 'Paris'; a 'Muse,' larger than natural size; a model of a colossal 'Ajax'; and the model of a sitting statue, in rich robes, of the Archduchess Maria Louisa of Austria. After the second fall of Napoleon, in 1815, Canova was commissioned by the Pope to demand the restoration of the works of art carried from Rome. He went from Paris to London, and returned to Rome in 1816, where Pius VII inscribed his name in the golden book of the capitol, declared him "to have deserved well of the city of Rome," and made him Marquis of Ischia, with a pension of 3,000 scudi.

As a man Canova was active, open, mild, obliging and kind toward everybody. His opinion of himself was very modest, notwithstanding his fame. He assisted promising young artists, and established prizes for the encouragement of the arts. When the Pope conferred upon him the title of Marquis of Ischia, with a pension, he dedicated the latter to the support and encouragement of poor and deserving artists. Canova was also an agreeable painter, but, strangely enough, more of a colorist than a correct designer. Engraved copies of all his works have appeared in Italy and at Paris. Consult Missirini, Melchior, 'Vita di Canova' (1824); Cicognara, 'History of Modern Sculpture' (Venice 1825); Quatremère de Quincy, 'Canova et ses ouvrages' (Paris 1834); Tripaldo, 'Biographia degli Italiani Illustri'; Anzelmi, 'Opere Scelte di Antonio Canova' (Naples 1842); Meyer, A. G., 'Canova' (1898); Borzelli, Angelo, 'La Relazione del Canova con Napoli' (1901); Malamani, 'Canova' (Milan 1911).

**CANOVAI**, kã-nõ-vã'ë, Stanislaò, Italian ecclesiastic and historian: b. Florence, 27 March 1740; d. Parma, 17 Nov. 1811. Having taken holy orders, he officiated afterward as professor of mathematics at Parma. In 1788, as a member of the academy of antiquities, he contended for the prize which was offered for an essay on Amerigo Vespucci. He opposed the common opinion that Columbus was the first discoverer of the New World, claiming that Vespucci one year before him had touched upon the northern part of the continent and had landed in Brazil. His paper gained the prize, but produced much discussion. He was

also the author of several books on mathematics and history.

**CANOVAS DEL CASTILLO**, kã'nô-vãs dël kãs-têl'yô, Antonio, Spanish statesman and man of letters: b. Malaga, 8 Feb. 1828; d. Santa Aqueda, 8 Aug. 1897. He was editor of the Conservative journal, *Patria*, and in 1854 entered the public service as member of the Cortes; thereafter he held various posts in the government. At his death he had been for two years Prime Minister, and had held the same position three times previously. He is author of 'Literary Studies' (1868); 'History of the Austrian Dominion in Spain' (1869); 'Problems of the Time' (2 vols., 1884); 'Studies on the Reign of Philip IV' (3 vols., 1888-90). He was editor-in-chief of a 'General History of Spain,' consisting of monographs by sundry writers (1890-97). He was assassinated at the baths of Santa Aqueda. Consult Pons y Humbert, 'Canovas del Castillo' (1901).

**CANROBERT**, kãn-rô-bâr, François Cer-tain, marshal of France: b. Saint Céré in Lot, 27 June 1809; d. Paris, 28 Jan. 1895. He was educated in the military academy of Saint Cyr, and in 1828 entered the army. He had seen nearly 20 years' brilliant service in Algeria, and had actively supported the future emperor at the *coup d'état* of 1851, when he received the rank of a general of division in 1853. As such he commanded the first division of the French army under Marshal St. Arnaud, sent to the Crimea in 1854; and at the battle of the Alma was wounded in the breast and hand by the splinter of a shell. On St. Arnaud's death, nine days later, Canrobert assumed the chief command of the French army and was sent to Sweden and Denmark on diplomatic missions. According to the historian, Kinglake, he deliberately retarded the progress of operations, let slip many opportunities and hampered the English — his object being to forward Napoleon's design of coming out to head a final and victorious campaign. In the war in Italy against the Austrians (1859) Canrobert had the command of the third division of the French army, and at the battles of Magenta and Solferino his *corps d'armée* was engaged. In the Franco-German War of 1870 he was shut up in Metz with Bazaine, and became a prisoner in Germany. He was an ardent Imperialist till the death of the Prince Imperial (1879). In 1876 he became a member of the Senate and was returned in 1879 and 1885. Consult Martin, 'Le Maréchal Canrobert' (Paris 1895).

**CANSO**, Gut or Strait of, a narrow strait or channel, about 17 miles long and 2½ miles in width, separating Nova Scotia from Cape Breton Island, leading from the Atlantic Ocean into Northumberland Strait. It is navigable by the largest ships, and its scenery is very beautiful.

**CANSTADT**, kãn'stât, the name given, from Cannstatt or Canstadt, Germany, to the dolicho-cephalic or long-headed man of the Quaternary Age, whose existence was inferred from a piece of skull found near there in 1700, by Duke Eberhard Ludwig. Consult Mortillet, 'Le préhistorique' (Paris 1900).

**CANSTEIN**, kãn'stîn, Karl Hildebrand von, German philanthropist: b. Lindenbergh 1667; d. 1719. He studied at Frankfurt-on-the-

Oder, traveled much in Europe, went in 1688 to Berlin, where he was appointed page of the Elector of Brandenburg, and served as a volunteer in the Netherlands. A dangerous sickness obliged him to leave the military service. He went to Halle, where he became familiarly acquainted with Spener and Francke, and became eager to spread a knowledge of religion among the common people. He was especially anxious that the poor should have Bibles at as low rate as possible, and thus originated the famous institution called the Canstein Bible Institution, which after the death of Canstein in 1719 became associated with the institutions founded by Francke, and still continues its benevolent operations. He wrote a 'Harmony of the Four Evangelists' and a 'Life of Spener.' Consult Francke, 'Memoria Cansteiniana' (Halle 1722) and Bertram, 'Geschichte der cansteinischen Bibelanstalt' (Halle 1863).

**CANT-TIMBERS**, in ship-building, those timbers which are situated at the ends of a ship. They derive their name from being *canted*, or raised obliquely from the keel, in contra-distinction from those the planes of which are perpendicular to it.

**CANTABILE**, kãn-tã'bi-lã, in music, a term applied to movements intended to be performed in a graceful, elegant and melodious style.

**CANTABRI**, the rudest and most savage of all the Iberian tribes who inhabited the greater part of what is now La Montana and the northwest part of the province Burgos. They defied Roman arms for a long time, and though the campaign against them began in about 150 B.C., they were not subdued until Augustus and Agrippa had carried out a series of campaigns against them. They were included in a part of the province of Hispania Tarraconensis, with some measure of self-government. But some time elapsed before they became romanized. In ancient history *Contabri* is used to denote all of the inhabitants of the northern mountains of Spain.

**CANTABRIA**, the name applied to a district of Spain on the south coast of the Bay of Biscay, the home of the Cantabri (q.v.).

**CANTABRIAN MOUNTAINS**, the general name of the various mountain ranges extending for a distance of over 300 miles from the western Pyrenees along the north coast of Spain to Cape Finisterre. They attain in some parts a height of about 9,000 feet, and are rich in minerals, especially copper, lead, iron and gold. Large forests of oak, chestnuts and other trees are also found on their slopes. On the western coast they are very steep and form a bold seacoast, but on the southern and eastern slopes, they are less rugged and descend gradually to the Castilian plateau. Local names are given to different portions of the ridge.

**CANTACUZENUS**, kãn-tã-koo-zã'noos, John, Byzantine emperor and historian: b. about 1292; d. about 1380. While minister of Andronicus III he negotiated a favorable peace with the Genoese in 1336, and repelled the encroachments of the Turks in 1337. On the death of Andronicus in 1341 Cantacuzenus became regent during the minority of the young emperor, John Palæologus. He defeated the

CANTERBURY CATHEDRAL

Bulgarians and Turks, assumed the diadem and entered Constantinople, victorious over his rivals, in 1346. In 1347 he became joint emperor with John Palæologus, but really usurped the royal authority. He used his power with moderation, and endeavored to heal the wounds which five years of civil war had inflicted on the state; but religious disputes, civil dissensions and foreign enemies soon disturbed his government; and the jealousy of Palæologus, the rebellion of his own son, war, plague, the frightful disorders which prevailed in the empire, and his own loss of popular favor, induced him to renounce the crown. He retired to a monastery (1355), where he employed himself in literary labors. He is considered one of the greatest among the successors of Constantine. His 'Four Books of Byzantine History' were printed in 1645, and belong to the collection of the Byzantine historians. His other works, principally theological, are partly printed in the collections of Byzantine historians and partly in manuscript. Consult Pears, 'Destruction of the Greek Empire' (London 1903); Val-Paricot, 'Cantacuzème, homme d'état et historien' (1845).

**CANTAGALLO**, kân-tâ-gäl'lo, Brazil, town, Rio de Janeiro state, 100 miles by rail northeast of Rio de Janeiro. The chief industry is coffee growing; sugar cane and fruits are also cultivated and cattle and swine raised. The former gold placer mines have been exhausted. Pop. 26,000.

**CANTAL**, kân' täl', France, a central department; area, 2,215 square miles; capital, Aurillac. It is named from its highest mountain, the Plomb du Cantal, Mons Celtorum of the ancients, which rises to the height of 6,094 feet. The department is one of the poorest and least productive districts of France. The climate is rather severe near the mountains, and agriculture is in a backward state. The principal crops are rye, buckwheat, potatoes and chestnuts and some hemp and flax. Of wheat and oats the product is insufficient for the consumption. In the declivities of the mountains there is excellent pasturage; cattle, sheep, horses and mules are raised in large numbers; and on the refuse of the dairies numerous pigs are fed. The fat cattle from this department are much esteemed, and are sent to all parts of the country. Large quantities of cheese are made, and sold principally in the south of France under the name of Auvergne cheeses. There are deposits of coal and marble. Hot mineral springs are abundant, those of Chaudes-Aigues being the most frequented. Cantal is divided into four arrondissements, containing 23 cantons and 267 communes. Pop. 223,361.

**CANTALOUPE**, a small round variety of muskmelon, globular, ribbed, of pale-green or yellow color and of delicate flavor; first grown in Europe at Cantalupo, in Italy. See MUSK-MELON.

**CANTANI**, kân-tä'në, Arnaldo, Italian physician: b. Hainsbach, Bohemia, 15 Feb. 1837; d. Naples, 30 April 1893. He was educated at Prague, and was physician in the general hospital there. In 1864 he became professor of pharmacology and toxicology at Pavia; in 1867 he was director of the clinical institute at Milan, and in 1868 of that at Naples. In 1889 he became a senator of Italy. He investigated

chiefly malaria, typhus and tuberculosis; and was influential in introducing the methods of German medicine into Italy. He wrote 'Manuale di materia medica e terapeutica' (1865); 'Manuale di farmacologia clinica' (1885-90).

**CANTARINI**, kân-tä-rë'në, Simone, also known as IL PESARESE, Italian painter: b. Pesaro 1612; d. Verona 1648. He studied under Guido Reni at Bologna, where he afterward painted a large number of pictures, all much in the style, but without the grace and delicacy, of his master's work. His 37 etchings more closely resemble those of Guido. Throughout his life Cantarini's intolerable arrogance made him numerous enemies; and after a quarrel with his chief patron, the Duke of Mantua, he died in Verona. Among his best-known paintings are an 'Assumption'; 'A Holy Family'; and 'Joseph and Potiphar's Wife.'

**CANTATA**, kân-tä'tä, literally, "sung music" to distinguish it from "sonata" or "sounded music." A musical term applied to an elaborate vocal composition, with different movements, arias, recitatives, with piano accompaniment. Orchestral accompaniments are also found, and in character the cantata may be anything from a short oratorio to a slight opera not intended for dramatic representation. In early times the cantata was sung by a single vocalist to the accompaniment of one instrument, in which form it was called cantata da camera to distinguish it from the church cantata which had a religious text.

**CANTEEN**, in the United States, a soldier's metallic water flask, containing two to three pints, and covered with a woven fabric. In England the canteen is combination pan, dish and plate, for use at mess by the army. (2) The departments of the British garrison store, usually divided into a dry canteen and wet canteen, the former being for general groceries and provisions, and the latter for liquid refreshment, excluding spirituous liquors.

Previous to 1901, beer and wine were sold at canteens in the United States army, though spirits were prohibited. In that year an anti-canteen law went into effect, as the result of temperance agitation. Strong efforts were made in 1910 and 1911 to repeal the anti-canteen law, but they were unsuccessful. The canteen was succeeded by the "post exchange" (q.v.). The name, "canteen," is sometimes given at present (1918) to the stores and restaurants for soldiers established at the front by such institutions as the Y. M. C. A. (q.v.).

**CANTERBURY**, England, cathedral city, a parliamentary and a municipal borough, and a county borough under the Local Government Act of 1888. It is situated in the eastern division of the county of Kent, 55 miles distant by road from London and 62 by rail. It stands on the banks of the river Stour, is 14 miles from Margate and 16 from Dover. It is connected with Whitstable by means of a branch line of railway about seven miles in length. The town is on the lower London tertiaryaries.

**Industries.**—The district is chiefly agricultural. Canterbury was formerly noted for its silks, velvet and brocade manufacture. Breweries, linens and worsteds, leather, bricks and lime are the main industries. It is the centre of important corn and hop markets. Ex-

cepting the supply of electric light, there are no great municipal undertakings, not only the gas and waterworks but also the swimming baths being managed privately.

**Churches, Buildings, Educational Institutions, etc.**—There are 14 parish churches and various chapels. In addition to the churches, of which the most historic is Saint Martin's, built originally by the Romans, Canterbury contains a number of interesting buildings, the principal of which are "The Guildhall" (built 1439, rebuilt 1697), Market House, Saint Augustine's College, Chaucer's Inn, the 'Chequers of the Hope' (1477), and the Crown Inn, erected by Prior Chillenden in the 15th century. The only remaining city gate is the West Gate, rebuilt by Archbishop Sudbury, 1380, and now used as a Museum of Arms and Armory. Saint John's Hospital, East-bridge Hospital and Saint Nicholas Hospital at Harbledown are picturesque survivals of ancient charitable foundations.

The public library was established in 1858. The museum, which has been in existence since 1825, is, together with the public library, housed in the Beane Institute. This institute was partially paid for out of a legacy of £10,000, left to the city by the late Dr. Beane, a native of the city, who amassed a large fortune in Australia. The Cathedral library, which was founded in 1660, contains about 13,000 volumes, and the library at Saint Augustine's College has about 18,000 volumes. An art gallery was presented to the town in 1882 by Mr. T. Sidney Cooper, the famous artist, who was born in the city. Attached to the cathedral is a school founded by Henry VIII, and until recently a bluecoat school founded by Queen Elizabeth, now merged into a scheme called the Simon Langton schools. Saint Augustine's Monastery has been restored and enlarged and is now used as a Church Missionary College.

Canterbury Castle, one of the largest in England, was of Norman construction, but all that now remains of it is the keep.

**The Cathedral.**—The most remarkable object in the city is the cathedral, which is one of the finest ecclesiastical structures in England. No part of the original building remains. The cathedral is built on the site of a Roman church, which was renamed Christ Church by Saint Augustine when he was elected archbishop of Canterbury. The church was destroyed by fire the year after the Norman Conquest, 1067, but rebuilding was commenced three years afterward and was completed in 1130. This was again destroyed by fire four years afterward. It contains the tomb of Edward the Black Prince, 1376, also that of Henry IV and his Queen in the Trinity Chapel; the stone chair in which the archbishops are enthroned; and some beautiful 13th-century stained glass. The principal historical event connected with the cathedral is the murder of Thomas à Becket, which took place in 1170. The archbishop of Canterbury is Primate of all England and metropolitan for all the dioceses south of the Trent. See CATHEDRAL and CHURCH.

**Government.**—Canterbury sends a member to the House of Commons and is governed by a mayor, aldermen and councillors. Several charters have been granted to the city from

time to time, the first by Henry II and the last by Charles II, who granted a charter of incorporation in 1686. The first mayor was elected in the year 1448.

**History.**—Canterbury is supposed to have been a place of importance before the Roman invasion, the Roman name *Durovernum* showing apparently the British prefix *Dur*, water, although antiquaries differ in the interpretation of the remainder of the compound. Druidical remains have been found here, together with the British weapons termed celts. Its importance during the Roman occupation is proved by the discovery of a great variety of remains and it is interesting to note that bricks of Roman manufacture have been found in certain portions of the remaining walls. It derives its present name from the Saxon *Cant-wara-byrig*, the Kentishmen's city. During the residence of Ethelbert, king of Kent, the memorable arrival of Saint Augustine took place in 597—an event rapidly followed by the conversion of this King and his people to Christianity and the foundation of the archiepiscopal see of Canterbury. In the 8th and the three following centuries, the city was from time to time dreadfully ravaged by the Danes, and on one occasion, in 1011, nearly the whole of the inhabitants, including women, children and the archbishop himself, were barbarously massacred, and the cathedral burned to its bared walls. It was gradually reconstructed and at the Conquest its buildings exceeded in extent those of London. The ecclesiastical importance of the place, in particular, advanced with great rapidity, and was consummated by the murder of Thomas à Becket, whose canonization by the Pope rendered Canterbury the resort of pilgrims from every part of Europe. Not only were the priory and see enriched by the offering of the wealthy devotees, but the prosperity of the town itself was greatly advanced by the money spent in it by so many strangers. Erasmus describes the church, and especially the chapel in which Becket was interred, as glittering with the gold and jewels offered up by the princes, nobles and wealthy pilgrims to his shrine. Henry VIII appropriated all its revenues on the dissolution of the priory in 1539, when he ordered the bones of Becket to be burned to ashes. Several of the English monarchs have made a temporary residence at Canterbury, which was also occupied by Oliver Cromwell in the civil war, whose troopers made a stable of the cathedral. Pop. (1911) 24,626.

**CANTERBURY**, New Zealand, a provincial district occupying the centre of South Island; capital, Christchurch. Its area is 14,040 square miles. The interior is mountainous, and covered with dense forests. The famous Canterbury Plain, of 2,500,000 acres, slopes

Photograph by J. Horace McFarland Co.

**CANTERBURY BELLS (CAMPANULA)**

gradually down over a descent of 40 miles toward the sea. A rich loamy tract, admirably adapted for agriculture and cattle grazing, extends along the east coast, while the interior is a true pastoral country, well watered by numerous streams, and covered with a perpetual herbage of various grasses. A vast coal-field seems to underlie the whole country, and coal is worked in the districts of Timaru and Malvern. Good fire-clays, quartz, sand for glassmaking, marble, limestone, etc., are also found. The productions include wool, grain, frozen meat, skins and hides, butter, cheese and some silk. Pop. including Maoris, 173,185.

**CANTERBURY-BELL**, a name given to species of *Campanula* (q.v.), especially *C. medium*.

**CANTERBURY TALES**, *The*. 'The Book of the Tales of Canterbury' has a permanent claim on the attention of reading men. It represents the most mature and the most variously brilliant achievement of the man whom the world will always regard, and in many respects rightly, as the father of English poetry. In its structure it is, though uncompleted, the happiest scheme of the many that have been devised for presenting a series of stories in a manner at once natural, dramatic and the reverse of monotonous. In its setting it introduces us to an acquaintance on terms of intimacy with the society, high and low, of merry England's 14th century, an age of color, of contrasts and of essential liveliness. In its contents it offers an inviting approach, for most men probably the readiest, to the literature of the late Middle Ages, a realm of gold for all its dross, whose literary coin still bore, after its own peculiar fashion, some stamp of the antique Roman world and is still current in the world of beauty to-day.

'The Canterbury Tales,' as we know it, is a collection of 24 stories, two of them unfinished and two, for dramatic reasons, interrupted and not continued. These stories are bound together in a scheme, only partly realized, by means of the words of the host, Harry Bailey, toast-master of the occasion; by the talk of the pilgrims—the tellers of the tales—among themselves; and by occasional narrative and descriptive touches on the part of Chaucer, himself a pilgrim and reporter of the whole. Though some of the stories were composed earlier, the writing of many of them and the work of weaving them all into a garland seem to have been the chief literary activity of the last 15 years of the poet's life. For death found him with the work still unfinished.

The plan which the poet proposes at the beginning is characteristically ambitious; characteristically, again, it underwent modifications and adjustments as the work proceeded; this fact, together with the further rearrangements introduced by different copyists, makes it impossible always to speak with certainty of Chaucer's final intention. But enough of the structure emerges to give to the collection as a whole vastly more significance than any one story, or all of them arranged in a manner not so original, could possibly possess. It is perfectly possible for a continental critic, steeped in the literatures of the Romance tongues, to assert that he finds little in the 'Tales' that is

new to him. He might be understood, if he preferred, as most English readers would not, Boccaccio's version of the story of Palamon and Arcite to that which Chaucer puts in the mouth of the Knight. He might assure us with some truth that the story of the patient Griselda is a translation and nothing more of Petrarch's Latin version of the 'Decameron' story. And so he might go through the list, conceding, however, perhaps more readily than the English reader, the originality of Chaucer's adaptation of the *fabliau* type in the 'Miller's Tale,' 'The Reeve's Tale' and the like, being more capable of appreciating these things in the Chaucerian spirit than the English reader, who is troubled, as Chaucer's audience plainly was not, by the indecorous character of the material upon which such splendid narrative artistry is lavished.

But to proceed thus is to refuse the poet credit for much that he has tried to do. He has not assembled his company of nine and twenty—perhaps there were a couple of priests besides—merely to treat us to a portrait gallery. High and low, every one, be it noted, succeeded in the life he had chosen, Knight, Squire, Monk, Prioress, on the one hand, Yeoman, Cook and Plowman on the other; rascals like the Friar, the Pardoner, the Summoner; professional men and tradesmen, and the never-forgotten Wife of Bath, all step before us, it is true, in the general prologue. Under the clear, encouraging eye of Chaucer they declare themselves for the folk they are, so that Dryden could see "their humors, their features and their very dress, as distinctly as if [he] had suppd with them at the Tabard at Southwark." If Chaucer had stopped here, if he had given us nothing beyond his prologue, he would still have written something more brilliant, more sympathetic than anything that can be found in mediæval literature before him, but nothing essentially different from, let us say, the 'États du monde' of many a French satirist. But Chaucer, fortunately, does not stop there. Having got his characters, he set out to order his material in terms of drama. Tale was to be adjusted nicely to teller; character was to play upon character; little personal hostilities, class prejudices, different individual reactions upon some general theme of discussion were to bring the successive stories naturally and dramatically into being, as the pilgrims took their leisurely way along the well-known road to the shrine of the martyred saint. There was to be a constant flow of narrative, washing pleasantly upon the alternate shores of fiction, grave or gay, and of the real life of his own time. This plan, as has been said, is imperfectly carried through. To have conceived it at all, however, and even in part to have given to it poetic expression is to have made a distinct and permanent contribution to the literature of the world.

The reader to-day, making his way through this "God's plenty" of stories, serious and trivial, dignified and the reverse, will find his pleasure in tracing out some of the threads of Chaucer's interests, which make up a strand capable of giving, in spite of imperfections, unity and significance to the whole. He will start easily with the 'Knight's Tale,' noting its nice adaptation to its grave, gentle, its thoroughly chivalrous teller, and he may, if he like, pass

from this sort of serious, quasi-historical romance to romance of Oriental character in the multiplied wonders of the 'Squire's Tale,' to Arthurian matter in the 'Wife of Bath's Tale,' and to Chaucer's gentle and searching ridicule of degenerate romance in his own 'Tale of Sir Thopas.' But if he is wiser he will read the tales in their setting, interrupting with the drunken Miller the Host's well-laid plans and sharing with the Reeve his resulting indignation, noting in the stories of both the robustness of the characters and the richness of the social background. A like situation he will observe in the tales of the Friar and Summoner. With the 'Physician's Tale'—and the experience will doubtless be repeated in the case of the tales of the Man of Law, the Shipman and the Manciple—he will miss the sense of delicate and inevitable adjustment; temporary assignments, stop-gaps, perhaps some of them were. But the 'Pardoner's Tale' is one of the most effectively told of all, and his prologue an amazing and subtle piece of psychologizing. With it he will be interested to compare that other essay in the "literature of exposure," the tale of the Canon's Yeoman. 'The Monk's Tale' and the 'Parson's Tale' do not spring of sheer necessity from the situation, but they are excellent in character, and because informing and edifying, more delightful to contemporary readers than can nowadays be easily appreciated. And to the 'Monk's Tale' the humor of the Nun's Priest, set off with all the arts of a skillful preacher on a holiday, affords a perfect foil, just as Chaucer's ponderous 'Melibœus' contrasts with the gaiety, imperfectly grasped by the host, of his own 'Sir Thopas.' No more delicate adjustment is to be found between tale and teller than in the 'Prioress's Tale,' a story current all over Europe, but here enhanced in value by the artistic uses to which it is put.

Very much on Chaucer's mind, apparently, was the problem of what to do with a certain coarse, forth-putting type of woman whose determination to carry things in her own high-handed way was sure to make trouble for whatever member of the inferior sex she chanced to mate with. Harry Bailey has such a wife, and he has already confided some of his woes on this score to the pilgrims, when the president of this sect of "arch-wives," the very embodiment of all their awful power, steps forward in the person of the Wife of Bath, and in good scholastic style, with full illustration from her own experiences, states her case. Such a subject will not down, and it is the clerk who makes the story of Griselda serve the end of a savage, though delicately administered, satire upon the extravagant positions advanced by the Wife of Bath. At once the Merchant cuts in with a hint of his own miseries in marriage and a story which makes clear his own theory of the bitter disillusion in store for those who trust their wives. It is possible that the 'Squire's Tale,' which treats of love, something quite apart from marriage, according to the mediæval view, might when finished have been brought into closer relation with what goes before. It is certain that it prompts the Franklin to tell his story presenting a husband, a wife, a clerk and a squire in such an amiable light, developing at the same time a theory of mutual forbearance and trust in marriage which is the finest flower of "gentillesse." One can,

if one wishes, push on further and tag the 'Second Nun's Tale' as presenting the ecclesiastical view of marriage as something inferior to celibacy.

But it would probably be wrong to do so or to insist that Chaucer, throughout the tales discussed, felt himself constrained to a rigid, doctrinaire discussion of marriage as a problem. He is concerned with the expression of human character in conduct, with the relations of man to his fellow men and women, and to God. Being of the Middle Ages he exhibits some of the conventions of the Middle Ages; the talk of his pilgrims unashamedly informs, it frankly edifies, it indulges in class satire and sex satire, it inevitably finds itself revolving around traditional questions—how do rogues thrive in the world? how shall we make terms with fortune? how is man to succeed in civilizing woman? what is the nature of true gentility? It is impossible for Chaucer to look thoughtfully on human conduct without proceeding in this way to raise these questions. Human conduct, again, for him, as for his time, falls naturally into the elastic and all-embracing category of the seven deadly sins. But this does not mean that Chaucer is writing a tract on marriage or a book of exemplary anecdotes to illustrate the seven deadly sins. It is unlike him to attempt anything so rigidly schematic; certainly whatever his intention he achieved nothing of the sort; it was not for nothing that Dryden called him "a perpetual fountain of good sense." It is this good sense of his which has led him to pierce through the conventions in which he inevitably worked to the plane of our common humanity on which all who love good literature can affectionately meet with him.

Consult Skeat, 'Complete Works of Geoffrey Chaucer' (7 vols., Oxford 1894), and 'Student's Chaucer' (complete text in one volume, Oxford 1894); Hammond, Eleanor P., 'Chaucer: A Bibliographical Manual' (New York 1908); Kittredge, G. L., 'Chaucer and His Poetry' (Cambridge 1915); Legouis, E., 'Chaucer' (trans. by Lailevoix, London 1913); Tatlock and Mackaye, 'The Modern Reader's Chaucer' (New York 1914); Wells, John E., 'A Manual of Writings in Middle English' (New Haven 1916).

Assistant Professor of English, Columbia University.

**CANTHARELLUS.** See FUNGI, EDIBLE.

**CANTHARIDES**, or SPANISH FLIES, the blister-beetle (q.v.), when prepared for medical use. Their value is due to the presence of a chemical principle, called canthariden, which constitutes from ½ to 1 per cent of cantharides, with the formula  $C_{10}H_{16}O_4$ . On hydrolysis, this is converted into cantharidic acid,  $C_{10}H_{14}O_4$ . Cantharadin is obtained by treating the pulverized insects with a solvent, such as alcohol, ether or chloroform (not water), the last being preferable. The solution is evaporated, and the residue is purified from a green oil which adheres to it obstinately, by digesting with bisulphide of carbon or by redissolving in alcohol. Purification is further affected by animal charcoal and the cantharidin crystallized from hot alcohol or chloroform.

Cantharides is used externally for its

counter-irritant action. It must be used with discretion especially in cases of older persons, children or paralysis. It must not be used in renal disease, owing to the risks attendant on absorption. It is administered internally in cases of impotence. Its criminal employment is usually intended to heighten sexual desire, and has frequently led to death. It produces severe gastro-intestinal irritation, and has toxic qualities, the patient usually dying from arrest of the renal functions. The antidote is the administering of bland fluids, such as milk, soda-water and plain water, to dilute the poison in the blood.

A number of insects other than cantharides possess the vesicant property, such as the Chinese beetle (*Mylabris cichorii*) which is especially rich in cantharidin, yielding about twice as much as the cantharides. Our native blister-beetles, when powdered, nearly resemble *Mylabris* in color, and are used as adulterants to cantharides.

**CANTHOPLASTY** (Gr. *kanthos*, "the angle of the eye" and *plastikos*, "formative"), the operation of slitting up the outer canthus or corner of the eye, so as to enlarge the opening between the lids, an operation proposed by Ammon when the eyelids are not sufficiently cleft, or when the eyelids produce tension on the eyeball, as in inflammatory processes.

**CANTICLE OF THE SUN**, The (II *Cantico del Sole*), known also as the *Praises of the Creatures*, is the only work in Italian that we possess of Saint Francis of Assisi. Giulio Bertoni calls it "the most brilliant gem of the Italian religious poetry of the 13th century." Renan goes even so far as to term it "the finest piece of religious poetry since the Gospels." Written in the Umbrian dialect of the Saint's native region, its assonanced prose and occasional rhymes constitute in its primitive form one of the oldest monuments of mediæval Italian. It was improvised at San Damiano in the fall of 1225 at a moment of great spiritual exaltation during a reaction from a period of severe illness and mental stress. Tradition claims the last two stanzas as subsequent additions, the final one having been composed by Saint Francis just prior to his death, 3 Oct. 1226. Consult 'Mirror of Perfection' Chap. CI, CXIX, CXX, CXXIII.

In this canticle Saint Francis lays bare his own simple, naïve soul, his wonderful love of inanimate nature, his artless faith and innate mystic love. He raises to the Creator a pæan of praise for the light of the sun, the moon and stars, the air and clouds, rain and fire, for mother earth, for those who forgive and endure in peace, and finally for the bodily death "from which no living man can flee." In the loftiness of its inspiration the 'Canticle of the Sun' must be compared to Psalm 148 of David. Like the famous 'Fioretti' of Saint Francis, a work of later date, the 'Canticle of the Sun' has touched the souls of men and has preserved in Italian hearts the popular tradition of their great Saint. It became in his last days the favorite song of Saint Francis, and must be regarded as the message of the Saint himself in all his joyousness, his hopefulness, his broad sympathy toward all things, his feeling for universal brotherhood. We must not look for great literary merit in this canticle. Francis was not a man of learning,

nor in those primitive times was the art of verse in the vernacular sufficiently developed to be compared with the perfected compositions of the following century. Yet in his religious poetry Saint Francis is of the lineage of Jacopone da Todi, his Franciscan successor, who in turn is the precursor of Dante (consult 'Paradiso,' canto XI). For a critical study of the writings of Saint Francis consult Robinson, Paschal, 'The Writings of Saint Francis of Assisi' (Philadelphia 1906). For the Italian original text consult Sabatier, Paul, 'Speculum perfectionis' (Paris 1898). For an English translation consult Cuthbert, 'Life of Saint Francis of Assisi' (1914).

ALFRED G. PANARONI.

**CANTICLES.** One of the canonical books of the Old Testament. The name is derived from the Latin *canticula*, plural of *canticulum*, "a little song." In the Vulgate it is called *canticum canticorum*, "song of songs." This is a literal translation of the Hebrew title which is generally understood to mean "the best song." It may, however, signify "the best songs," if the first word is taken in a collective sense, as it probably should be in the superscription "Songs of the Ascents" in the Pilgrim Psalter (Pss. cxx-cxxxii). The Alexandrian MS of the Greek version has the plural; the Old Latin apparently rendered the title *canticula canticulorum*; and the Targum paraphrases it "songs and hymns which Solomon uttered." This is likely to be the original meaning. When the name of Solomon was added, it may have been the intention to characterize the collection as the choicest of the 1,005 songs ascribed to this monarch in 1 Kings v, 12. The conception of the work as a unit naturally led to understanding the title in the former sense. At the time when the canon was reduced as a result of the critical inquiry caused by the idea that holy books possessed a sanctity rendering it improper to touch profane things without a ceremonial washing after they had been handled, the question of canonicity arose; but it was settled at the Council of Jamnia (c. 90 A.D.) in favor of the book, probably through the weight of the traditional authorship and the allegorical interpretation R. Akiba seems to have adopted. Whenever in earlier times the allegorical exegesis was rejected, there was a tendency to question again the canonicity. To-day the literal sense is generally accepted, and most modern interpreters either look upon the love expressed in the poems as typical of spiritual devotion or seek for no ulterior significance, feeling with the historian Niebuhr that "something would be missing in the Bible, if there were not in it some expression of the profoundest and strongest of human emotions."

There is no intimation of anything but the obvious meaning in the oldest Greek version, and the book is not mentioned by Philo or in the New Testament. But R. Akiba affirmed that the whole world was not worth the day when it was given to Israel, since all Scriptures were holy but this the holiest of all ('Yadaim' iii, 5), and declared that "whoever sings from the Song of Songs in the wine-houses and makes it a (profane) song shall have no share in the world to come" ('Tosephta Sanhedrin' xii). He no doubt saw in the book a description of the love of God and Israel, and this

continued to be the interpretation in the synagogue. Hippolytus (c. 200 A.D.) applied it to the relation of Christ and the Church. In spite of his suggestion that the literary form is that of an epithalamium, Origen rejected the literal sense as inadmissible, and explained that according to the moral or tropological sense the love of the soul for the heavenly bridegroom was represented, and according to the mystic sense the union of Christ and the Church. The mediæval church also saw the love of Christ and the Virgin Mary depicted in the book. Bernard of Clairvaux wrote 86 sermons on it. A fine type of mystical interpretation is found in Teresa de Cepeda's commentary on the first chapter. Nicolaus de Lyra saw in the poem a prophetic adumbration of the course of ecclesiastical history, and Cocceius discovered in it the history of the Church down to the synod of Dort in 1618 A.D., just as the author of the Aramaic Targum had found in it the history of Israel down to 586 B.C. In the same way ingenious exegetes have discerned veiled descriptions of the political courting of the 10 tribes by Hezekiah, or of Samaria by Tirhaka. A different method was suggested by Honorius of Autun (died 1140), who held that the literal sense might be accepted, if a typical significance were attached to it, and this view has been adopted by Vatable, Bossuet, Lowth and many Catholic and Protestant scholars in recent times. The type may then be thought of either as having already been in the mind of the author or only subsequently recognized. From the former standpoint a comparison has been made, e.g., by Harper with the poems of Hafiz, Jami and Jeyadeva, where a double meaning seems to be intended, while the recognition of an original literal sense, having no mystical meaning, afterward legitimately receiving an additional typical significance, is characteristic, e.g., of Gigot's interpretation.

Theodore of Mopsuestia (d. 429) refused to recognize any other than the literal sense. For this he was condemned by the council of Constantinople in 553. Some of the Anabaptists seem to have taken the same view. Sébastien Chateillon recognized the secular character of the poem, and for this offense he was driven out of Geneva through the influence of Calvin. Luis de Leon (d. 1591) made a Latin translation of it for a sister in a convent without suggesting any mystical sense, and was incarcerated by the Inquisition for five years as a punishment. Jean le Clerc maintained that only earthly love was depicted in the songs; and J. D. Michaelis, regarding the work as in part obscene, was unwilling to give it a place in his translation of the Bible. The growing conviction that the poet, or poets, had no other purpose than to depict the love of man and woman has not strengthened this feeling as regards the book; on the contrary there has been during the last century a decidedly higher estimate of its moral worth as well as a greater admiration of its literary charm.

On two important points there is as yet no consensus of opinion. Is *Canticles* a drama or a mere collection of lyrics? And is the love described that of husband and wife, a bridegroom and a bride, a betrothed couple, or only that of man and woman. Caspar Sanctius, in 1616, affirmed that *Canticles* was a sacred drama; Cornelius a Lapide (d. in 1637)

divided it into five acts; Laurentius Petrus, a Danish pastor, arranged it in dramatic form, translated it metrically and set music to it in 1640; Huet, in 1670, declared it to be a drama; Hermann von der Hardt (before 1706), an anonymous Breslau pastor in 1720, G. Wachter in 1722, and Nicholas Nonnen in 1725 presented various attempts to indicate a plot. A shepherd lover as a rival of Solomon was introduced by J. F. Jacobi in 1771. While Franz Delitzsch gave the most perfect expression to the type of dramatic construction which made Solomon and Sulamith the real lovers, it was largely through Ewald that the idea of a heroine, faithful to her absent shepherd in the face of the blandishment of the infatuated despot, became widely popular. It furnished an ethical motive, presented a moral struggle and suggested the ultimate triumph of virtue. Duhm in 1902 and Driver in 1910 still adhere to this view. The chief difficulties that have been raised against it are that the ancient Hebrews possessed no theatre; *Canticles* has no plot, on which two interpreters can agree; Solomon's character and conduct are unintelligible; Sulamith's speeches, ostensibly answering his, in reality addressed to her absent friend, place her in an absurd situation and a morally dubious light; the tone of the King's words, those assigned to the shepherd, and those placed on her own lips is very much the same; and the necessity for putting her to sleep on the stage, to dream through entire scenes, is not less embarrassing because these scenes are so short that they can scarcely have occupied more than a minute or two.

Already Bossuet and Lowth suggested that *Canticles* may have been written for a royal wedding, and divided it in sections for the seven days of the festival. Renan (1860) threw out the idea that it may be the libretto of a simple play performed at some rural wedding, where the singers took the parts of Solomon's guards, ladies of Jerusalem and others. He was influenced by Charles Schefer who had seen such performances in Egypt and in Syria. In 1873 J. G. Wetzstein described, in an article on the "Syrian Threshing Table" a wedding at El Hamma, near Damascus. On the morning after the wedding night the husband and wife played king and queen, sitting upon the threshing table as a throne, dancing and listening to songs in their praise. At a Jewish wedding in Tunis similar ceremonies were observed by Saint Haon in 1882; though there was no sword-dance by the bride. Especially through Budde the view has gained much currency that *Canticles* is a collection of songs brought together by an old wedding poet from his lore. This scholar insists that throughout the collection wedded love is described. All pictures of natural scenery are covered allusions to the complete satisfaction of the sexual instincts in wedlock. The purpose is to commend matrimony. Against this view it has been urged that it is difficult to see wedded love in scenes which describe the husband, according to the theory, as knocking at his wife's window and being refused admittance because she is not dressed, or the wife as expressing a wish that he were her brother so that she might kiss him without being reproved.

According to Luis de Leon (1569), René Rapin (1659), Charles Cotin (1662), Richard Simon (1678), Jean le Clerc (1685), Claude

Genest (1707), J. T. Lessing (1777), J. G. Herder (1778), E. Reuss (1879), W. W. Baudissin (1901), L. Gautier (1906), Paul Haupt (1907), N. Schmidt (1911) and H. Gressmann (1913), *Canticles* is an anthology of love-songs, idyls, eclogues or madrigals. Reuss has especially called attention to the poet's peculiar manner of making the woman with whom he is in love the speaker by preference. There is an unmistakable similarity of this diwan to the "Anthologia Palatina." Greek influence seems certain; it is not impossible that the poet had heard some idyl of Theocritus; and his sense of beauty in nature reminds of Meleager. Nevertheless, it may not be safe to go as far as to the reign of Aretas IV (c. 85-63 B.C.), while it would seem necessary to assume a date later than the 3d century B.C. The language, with its Aramaisms, neo-Hebraic turns, and Persian and Greek loanwords appears to be as late as the 2d century B.C. But if the author lived in the East-Jordan country this appearance may to some extent be due to dialectical differences. There is no hint that he was a married man, or a wedding poet. He did not sing to teach the value of a social institution, but to voice, in the most delicate and beautiful terms he could master, the joy with which the glories of spring and the impulses of love filled his heart. The mention of Solomon by way of comparison naturally led to the idea that he, who had so much experience with love, was the author, and Solomon's reputation for wisdom led to the search for a hidden meaning. This meaning made it appropriate to read the book at the Passover when the intimate relation between Yahwe and Israel was celebrated. There does not seem, therefore, to be any occasion on this account to suspect, as Erbt and Sellin do, that originally these songs were composed in honor of a sun-god and a moon-goddess whose nuptials were celebrated at the feast of the vernal equinox.

**CANTIUM**, cän'ti-üm, England, an ancient territory in South Britain, whence the English word Kent is derived, supposed to have been the first district which received a colony from the Continent. See KENT.

**CANTO FIGURATO**, fë-gü-rä'tō, a term applied by the old Christian ecclesiastics to the chant in its more florid forms, or in which more than one note was sung to a syllable.

**CANTON**, John, English electrician: b. Stroud, 31 July 1718; d. 22 March 1772. He settled as a schoolmaster in London, and was elected a fellow of the Royal Society in 1749. He invented an electroscope and an electrometer; originated experiments in induction; was the first to make powerful artificial magnets; and in 1762 demonstrated the compressibility of water. He and Franklin discovered almost simultaneously that some clouds were charged with positive and others with negative electricity.

**CANTON**, William, English writer: b. Isle of Chusan, China, 27 Oct. 1845. He was educated in France for the Roman Catholic priesthood, but decided upon a secular career and was for many years on the staff of the *Glasgow Herald*. He is author of 'A Lost Epic and Other Poems' (1887); 'The Invisible Playmate,' a strikingly original piece of work (1894); 'W. V., Her Book, and Various Verses' (1896); 'The Invisible Playmate, and W. V., Her Book' (with final chapter) (1897); 'A Child's Book of Saints,' republished in the United States as 'W. V.'s Golden Legend' (1898); 'Children's Sayings' (1900); 'A Child's Book of Warriors' (1912); 'Saint Elizabeth of Hungary' (1912); 'The Bible and the Anglo-Saxon People' (1914).

**CANTON**, China (more correctly *Quangchow-foo*), a large and important city on the Pearl River, at a distance of 80 miles from the sea. It is situated in the province of Quangtung (of which name Canton is a corruption), and consists of the city proper and of many suburbs, and its total population is estimated at from 1,250,000 to 1,800,000 with 500 foreign residents. The city proper is enclosed by walls, forming a circuit of six miles, and is divided into two parts by a partition wall running east and west; the portion north of this wall, which is much the larger, being called the old, that on the south of it the new city. The walls mainly of brick, rise to the height of 25 feet, with a thickness of about 20 feet. There are 12 gates, all of which are shut at night. The streets are long and straight and in general paved with flat stones, but they are very narrow, the average breadth not exceeding eight feet. The

houses of the poorer classes are mere mud hovels; those of the shopkeeping class are commonly of two stories, the lower of which serves as the shop. The streets are to a great extent lined with these shops, in which are to be found the productions of all parts of the globe. Neat and gaudily painted signs and names give a gay appearance to the narrow streets; in most cases there are no windows in front, but the whole is thrown open by day and closed at night. Temples and other religious edifices are very numerous, but few of them are in any way remarkable. There are two lofty pagodas, forming a notable feature in any general view of the city. One of these, 170 feet high, is about 1,300 years old, the other, 160 feet high, about 1,000. Among the chief temples, which are far from attractive buildings, may be mentioned those of the Ocean Banner, of the Five Hundred Gods, of Longevity and of the Five Genii. Among other buildings may be mentioned the residences of the governor-general, the commander-in-chief, the treasurer, the prefect, etc. There are four large prisons, one of them capable of holding 1,000 prisoners. In the European quarter are churches, schools and other buildings in the European style. Wheeled carriages are not in use in Canton; goods are transported on bamboo poles laid across the shoulders of men, while people who can afford it have themselves carried about in sedan-chairs. The river opposite the city for the space of four or five miles presents a most interesting scene. The prodigious number of boats with which it is crowded is the first thing that strikes the eye. A large number of these—as many, it is said, as 40,000, containing a population of 200,000—are fixed residences, and most of them moored stem and stern in rows. The inhabitants are called tankia or boat-people, and form a class with many customs peculiar to themselves. Millions are born and live and die in these floating dwellings without ever having put foot on dry land; while their ancestors for generations were all amphibious like themselves. The family boats are of various sizes, the better sort being from 60 to 80 feet long, and about 15 feet wide. A superstructure of considerable height, and covered with an arched roof, occupies nearly the whole of the interior of the boat. This structure is divided within into several apartments, devoted to different domestic purposes, all of them being kept very clean. The smaller boats of this description are not above 25 feet long, and contain only one room. By far the handsomest boats are the hwa-ting or flower-boats, which are graceful in form and have their raised cabins and awnings fancifully carved and painted. These are let to pleasure-parties for excursions on the river. The foreign mercantile houses and the American, British and French consulates have as their special quarter an area in the suburbs in the southwest of the city, with water on two sides of it. The river banks are faced with a granite wall; handsome hong or factories have been built, and much money has been spent on improvements. The manufactures and other industries of Canton are varied and important, embracing silk, cotton, porcelain, glass, paper, sugar, lacquered ware, ivory carving, metal goods, etc. Its foreign trade has been known for three centuries throughout the world, and it was the chief foreign emporium in China until 1850,

when Shanghai began to surpass it. Since then the opening of other ports and various other causes have interfered with its prosperity, but it still carries on a large traffic, its exports and imports together amounting in 1912 to about \$50,000,000, and its total trade to upwards of \$70,000,000. Business transactions between natives and foreigners are transacted in a jargon known as "pidgin-English." Since the establishment of the colony of Hongkong there has sprung up quite a flotilla of river steamers, which ply daily between Canton, Hongkong and Macao, and convey the greater part of the produce and merchandise for native and foreign consumption. These steamers equal the best river boats of Europe, and carry large numbers of passengers. The climate of Canton is healthy; in July and August the thermometer may rise to 100° F. in the shade, and during winter it is at times below freezing-point. Canton was first visited by English vessels in 1634. From 1689 to 1834 the East India Company had a monopoly of the English trade. In 1839 war was declared by Great Britain against China, and Canton would have been occupied had it not been ransomed by the Chinese. In the war of 1856 the foreign factories were pillaged and destroyed, and about a year after this Canton was taken by an English force. From this time to 1861 it was jointly occupied by an English and French garrison. Since then it has been open to foreign trade. Of revolutionary movements that have affected the political life of China Canton has been the centre.

**CANTON**, Conn., town, Hartford County, on Farmington River and on the Central New England Railroad, 15 miles northwest of Hartford. The manufacture of edged tools and the bottling of plain and carbonated waters are thriving industries. The town includes the village districts of Canton, Canton Centre, North Canton and Collinsville. Pop. 2,732.

**CANTON**, Ill., city of Fulton County, situated on the Chicago, B. & Q. and the Toledo, P. & W. railroads, 28 miles west of Peoria. It is the trade centre of the fertile agricultural and coal-mining region; and has numerous industrial interests, including a large manufactory of agricultural implements, cigar factories and several lesser plants. The United States census of manufactures for 1914 reported 34 industrial establishments of factory grade, employing 1,113 persons, of whom 920 were wage earners, receiving \$829,000 annually in wages. The capital invested aggregated \$9,733,000, and the year's production was valued at \$2,577,000: of this, \$1,451,000 was added by manufacture. It has a public library, a high school and municipal waterworks. Canton was settled in 1832, first incorporated in 1849 and is governed under a charter of 1892, providing for a mayor, elected every two years, and a city council. Pop. 12,000.

**CANTON**, Mass., town in Norfolk County, about 15 miles southwest of Boston, on the New York, New Haven and Hartford Railroad. It includes several villages. The town contains a public library, the Massachusetts Hospital School and has manufactories of felt goods, cotton padded goods, blacking, woolens, rubber goods, patent and enameled leathers, electrical supplies, fire hose, etc. Canton was settled about 1690 and was separated from Stoughton

in 1797 and incorporated. The waterworks are the property of the town, the government of which is carried on by town meetings. Pop. 4,797. Consult Huntoon, 'History of the Town of Canton' (Cambridge 1893).

**CANTON, N. Y.**, village and county-seat of Saint Lawrence County, on Grass River, and the Rome, W. & O. Railroad, 59 miles northeast of Watertown. It is the seat of Saint Lawrence University, a State school of agriculture, a government weather bureau, and has large flour and lumber interests, boat building industries, a national bank, a public library, county almshouse, several churches and an assessed property valuation of over \$3,000,000. Canton was settled in 1803 and incorporated in 1846. Pop. 3,000.

**CANTON, Ohio**, city, county-seat of Stark County, on the Nimishillen Creek, and on the Pennsylvania, Wheeling & Lake Erie, Baltimore and Ohio railroads, 60 miles southeast of Cleveland. Interurban electric railroads connect all cities and towns within a radius of 50 miles. The commercial centre of the second richest agricultural county of Ohio, also ranking among the six richest of the nation, Canton has an extensive grain trade, and manufactures of brick, sheet steel and iron, watches, enamel ware, roller bearings, safes, bridges, toys, knives, etc. The total manufacturing output is valued at \$52,000,000 annually. Neighboring deposits of coal, limestone and pottery clay are also extensively worked. An immense plant supplies electric light and power, natural gas is piped at a domestic rate of 30 cents; an artesian water supply is maintained and operated by the municipality, and a fire department with a modern motor-equipped apparatus. Bank clearings in 1915 amounted to \$95,873,208, an increase of \$16,000,000 over 1914; bank deposits totaled \$27,000,000, resources over \$30,000,000. Canton was the home of President McKinley and one of the city's features is the stately National memorial erected in 1907 on Monument Hill in West Lawn Cemetery, where the President and his wife are buried. Of granite, with a bronze statue of the President and with two sarcophagi containing the bodies, the monument stands in beautiful grounds covering 26 acres; from the lowest step it reaches a height of 163 feet 6 inches and 78 feet 9 inches in diameter. The memorial to the American soldiers of the Spanish-American War is also noteworthy. The city's principal buildings include the Federal building, city hall, city auditorium, county administration building, public library, high and other schools, several theatres, numerous handsome churches which cost \$250,000, membership 1,500. Nimisilla park and Meyer's Lake park are attractive outing resorts. Canton was settled about 1805, was incorporated as a village in 1822 and received a city charter in 1854. It is administered by a mayor and nine aldermen, elected under a law of 1902.

**CANTON, S. D.**, city, capital of Lincoln County, on the Chicago, M. & Saint P. Railroad, and on the Sioux River, 20 miles from Sioux Falls, is the seat of Augustana College and of the government asylum for insane Indians. The city owns its waterworks and has a Carnegie library, a handsome courthouse, churches, public schools and important manu-

factures of concrete, engines and agricultural implements. The commission form of government exists since 1909. Pop. (1910) 2,103.

**CANTON**, a small division of territory, constituting a distinct state or government, as in Switzerland, where each of the 22 states is so designated. In France judicial districts comprising a number of communes, but constituting in the case of very large cities only a part of such commune, are called cantons.

**CANTONI, kân-tōnē, Carlo**, Italian philosopher: b. Gropello 1840; d. 1906. He studied law and philosophy at Turin, and philosophy at Berlin and Göttingen (under Lotze). He was professor at the lyceum at Turin, and in Milan; since 1878 he has been professor of philosophy at the University of Pavia. In his philosophical theory he agrees in general with Kant, except his theory of phenomenon and noumenon. He wrote 'G. Battista Visco, studii virtutis e comparazione' (1867); 'Corso elementare di filosofia' (1870); 'Giuseppe Ferrari' (1878); 'Emanuele Kant' (1879-84).

**CANTONMENT**, the district in which troops are quartered when they are not collected into a camp, but detached and distributed over the neighboring towns and villages. The object of sending troops into cantonments is to be able to concentrate them as quickly as possible on one spot, when circumstances do not admit of a camp being formed, or do not render it advisable to form one. In India the permanent military stations erected in the neighborhood of the principal cities are so called. The larger types contain barracks for European cavalry, infantry and artillery, houses for officers, huts for native troops, gymnasiums, storehouses, parade grounds and administrative buildings.

**CANTOR, Georg**, Russo-German mathematician: b. Saint Petersburg 1845. After 1879 when he became professor of mathematics at the University of Halle, he originated the theory of assemblages or systems of numbers which may contain—as does the universe—a finite or an infinite number of numbers, or an infinity of such infinities; this last class he termed transfinite numbers and made a classification of the systems, relating the potency or degree of infinitude of each. His learned contributions appear chiefly in the *Mathematische Annalen*.

**CANTOR, Moritz**, German mathematician: b. Mannheim 1849. From 1853 he was professor of mathematics and privat-docent in the University of Heidelberg and became widely known by the standard 'Geschichte der Mathematik'—History of Mathematics, which brings the subject down to the year 1799 (4 vols., Leipzig 1880-1909).

**CANTU, kân'too, Cesare**, Italian historian, poet and philosopher: b. Brivio, 7 Dec. 1804; d. 11 March 1895. He was educated at Sondrio in the Valtellina, where he taught *belles-lettres* at a youthful age, resided afterward in Como, and next at Milan until 1848. One of his earliest works, entitled 'Ragionamenti sulla Storia Lombarda nel Secolo XVII' ('Lectures on the History of Lombardy in the 17th Century') appeared in a second edition in 1842-44, and contained liberal ideas that brought upon the author the animadversion of the Aus-

trian government, which condemned him to a year's imprisonment. During his confinement he composed a historical romance, entitled 'Margherita Pusterla' (1845), which became very popular. His great work, on which his reputation will chiefly rest, 'Storia Universale' ('Universal History') appeared first in 1837, at Turin. It has been since revised and reprinted at Palermo and Naples, and translated into German. A French translation by Aroux and Leopardi was published in Paris in 1843. Cantu became director of the archives of Lombardy in 1874. Other works are 'Storia degli Italiani' (1854); 'The Last One Hundred Years' (1864); 'The Italian Heretics' (1866-68), and monographs on various men of letters. Consult Bertolini, 'Cesare Cantu e le sue opere' (1895). See MARGHERITA PUSTERLA.

**CANTUS FIRMUS**, an ancient chant of the Roman Catholic Church. These chants were adopted as standing melodies, and until counterpoint was discovered, were unaccompanied, or only harmonized with octaves.

**CANUCK**, a term sometimes used in the United States to denote a Canadian.

**CANUTE IV**, Saint, King of Denmark 1080-86. He suppressed the ancient heathen customs of his people, and thus aroused opposition; in 1085 he started on an expedition against William the Conqueror, but was murdered by rebels in his own army in 1086. He was canonized in 1100 and in the Middle Ages was considered the patron saint of Denmark.

**CANUTE**, *kä-noot'*, **THE GREAT**, **Knud**, or **Knut**, the second king of Denmark of that name, and first Danish king of England: b. in the former country, about 995; d. Shaftesbury, England, 1035. He was the son of Sweyn, King of Denmark, and accompanied his father in his victorious campaigns in England. Sweyn, having proclaimed himself king of England, died in 1014, before his power was established, and appointed Canute his successor there. The latter was immediately driven out by Ethelred, the representative of the Saxon line, and fled with 60 ships to the court of his brother, Harold, king of Denmark. Harold enabled him to collect a large fleet in the north to prosecute his cause in England. He invaded that country anew in 1015. He fought many battles with Edmund Ironside, who had succeeded his father, Ethelred, in 1016, and was finally victorious at the battle of Ashington. After this battle, Edmund and Canute agreed upon a division of the kingdom. To Canute were assigned Mercia and Northumbria, while the Saxon Prince reserved West and East Anglia. By the death of his brother Harold, he obtained the crown of Denmark (1016). In the same year, and but one month after the ratification of the treaty of partition, Edmund died, and Canute became sole king of England without further resistance. He refrained from murdering the children of his late rival, and sent them to his half-brother, Olave, king of Sweden. He put away his wife, Alfgive, the daughter of the Earl of Northampton, and espoused Emma, the widow of Ethelred, the Saxon monarch (1017), on the condition that their children should succeed to the throne of England. He made the greatest exertions to gain the affections of his English subjects, to whom his Danish origin was no recommendation. He

accordingly disbanded his Danish army, retaining only a body-guard. He endeavored to blend the two races as far as possible and to induce them to live in harmony with each other. He erected churches, and made donations to abbeys and monasteries on the scenes of former conflicts and massacres. In a witenagemote at Winchester, he compiled a code of laws which is still extant. In this code he denounced those who kept up the practice of pagan rites and superstitions, and forbade the sending of Christian slaves out of the country for sale. Although Canute generally resided in England, he made frequent visits to Denmark. He carried with him on these occasions an English fleet, English missionaries and English artisans. He promoted three Englishmen to the newly-erected bishoprics of Scania, Zealand and Fionia. In 1025 he was attacked by the King of Sweden and defeated; but in the night, Earl Godwin, at the head of the English contingent, surprised the Swedish camp and dispersed the enemy. His absence from Denmark, and the bestowal of so many dignities in Denmark upon his English subjects, made him unpopular in that kingdom. To appease this discontent, he left behind in Denmark his son, Hardicanute, then aged 10 years, under the guardianship of his brother-in-law, Ulf (1026). In this year he made a pilgrimage to Rome. He was well received there by the Pope, John, and by the Emperor, Conrad II, who gave up to the Danish King all the country north of the river Eider. From the Pope he obtained privileges for the English school established in Rome, and an abatement of the sums demanded from his archbishops for the pallium; and from the various princes, relief for all English and Danish pilgrims and merchants from all illegal tolls and detentions which they had endured on their route to Rome. He returned from Rome to Denmark. In 1028 he made an expedition into Norway, expelled Olave and restored Haco who swore allegiance to him. In 1029 he returned to England, and his Danish subjects proclaimed Hardicanute king of Denmark. Canute immediately returned to Denmark, put down the revolt and executed the traitor, Ulf. In 1030 Canute was acknowledged king of Norway, and laid claims to the crown of Sweden. On returning again to England, he allowed his son Hardicanute to share with him the Danish crown. His reign is very important in the constitutional history of Denmark. Canute issued the first national coinage of Denmark, and published the first written code of Danish law wherein the custom of private vengeance was prohibited. He raised the clergy in their corporate capacity to a separate estate of the realm, and instituted the Thinglith or royal guard of 3,000 men. The members of this body were all men of good family and rich enough to equip themselves at their own expense. From them sprang the Danish order of nobility; they were tried only by their peers and formed with the king the highest court of justice. Canute's last campaign was against Duncan, king of Scotland, respecting the possession of Cumberland, but before the armies could engage the two kings were reconciled, and ancient stipulations concerning the tenure of Cumberland were renewed (1033). Canute was buried at Winchester. By Emma he had two children, namely, Hardicanute or Canute the Hardy and

a daughter, Gunhilda, married to Henry, the son of Conrad II, of Germany, Emperor. By Alfgeve he left two sons, Sweyn and Harold. To Sweyn was given the crown of Norway; Hardicanute retained that of Denmark, and Harold, surnamed Harefoot, took possession of that of England. Canute is most popularly known, not by his extended rule and legislative enactments, but by the familiar story of the monarch, the courtiers and the disobedient sea. Consult Larson, 'Canute the Great' (New York and London 1912); Freeman, 'The Norman Conquest' (Vol. I, Oxford 1870); Green, 'The Conquest of England' (London 1883).

**CANVAS**, a textile fabric made of the fibres of hemp; or any strong, firm cloth, whether of hemp or flax. It is chiefly used for tents, and for the sails of sailing vessels, for which its strength makes it well adapted. Canvas for sails is made from 18 to 24 inches wide, and numbered 0 to 8, No. 0 being the thickest. A bolt is 39 to 40 yards long, and weighs 25 to 48 pounds. Varieties of it are also used as the ground of tapestry work and of oil paintings. A finer description is used for many common domestic purposes, as for towels, table-cloths, etc. The canvas used by artists is commonly of linen, varying in size and thickness, stretched on a frame or "stretcher," and made tight by "keys" or wedges inserted in the four inside corners. There are several sizes of canvas which are generally used and are kept stretched.

**CANVAS-BACK**, a widely distributed fresh-water duck (*Aythya vallisneria*), much sought as a table luxury, as its flesh is considered superior to that of all other ducks. It is about 22 inches in length and its reddish-chestnut head and neck are much shaded with dusky hues; the lower neck, breast and forepart of the back, with the rump and tail-coverts, are black; and the back and sides gray, covered with fine lines and dots, so that the plumage resembles canvas. By reason of its similarity, this duck is frequently confounded with the red-head (q.v.). "The canvas-back is larger, its head darker, and its bill a deep black, while that of the red-head is deep blue, or a slatish color. The shape of the bill of the canvas-back is wedged and long; of the red-head moderately long and concave. . . . They are very tenacious of life, their bump of stubbornness being fully developed, and they will dive long distances, and prefer death by any other means than human agency. When one is crippled it will usually look around for an instant, to see where the danger lies, then down it goes, and if rushes or cover are near, it is good-bye to that duck,—it will not be seen again. When one is crippled it should be shot again, and at once." The food of the canvas-back consists chiefly of the roots of wild celery (*Zostera vallisneria*), which resembles the cultivated celery in appearance. It grows densely in the shallow parts of the Chesapeake Bay and Susquehanna River about the Great Lakes and in the Mississippi Valley. Few canvas-backs are found east of the Hudson and Delaware rivers. It is almost safe to say that where the plant grows in abundance, the canvas-back is almost sure likewise to be found; consequently the peculiarly delicate flavor of its flesh, and the market value of this duck, increase with the amount of celery it consumes, as otherwise it is

hardly distinguishable from the red-head in flavor. The canvas-back breeds north of Dakota, building its nest on the ground, in a marsh, and laying from 6 to 10 greenish-buff eggs. Consult Elliot, 'Wild Fowl of North America'; Job, 'Among the Wild Fowl.'

**CANYON**, kán'-yón, a valley that is notably deep in proportion to its width. The average idea as to the depth of canyons is much exaggerated, however. Most canyons are much wider than they are deep. The Grand Canyon of the Colorado is as much as 10 miles wide at many points, and averages only about a mile deep, and yet it is one of the most stupendous chasms in the world. In rare cases gorges are deeper than they are wide, but this is the exception. Since the work of a river is not only to cut a valley but to carve away the entire surrounding region, it is evident that canyons represent a youthful stage in river erosion, before there has been time to widen the valley. See GRAND CANYON OF COLORADO.

**CANYON DE CHELLY** (Shay), Ariz., a canyon in the Navajo Indian Reservation in the northeastern corner of the State, famous for its picturesque walls and monuments of red sandstone. Two branch canyons, del Muerto and Monument, are similar. The walls are from 800 to 1,200 feet high and while mostly vertical, present many erosion forms. The canyons have been cut by creeks rising in Chuska Mountains on or near the Arizona-New Mexico State line. The rock is a light red massive, crossbedded sandstone locally developed between Shinarump conglomerate above and Moenkopi formation below, possibly of Permian age. Some notable cliff dwellings remain in the canyon walls. These wonderful canyons can be easily visited by leaving the Santa Fé Railroad at Gallup, taking automobile 70 miles to Chinlee and there obtaining horses for a 35-mile round trip. The canyon was discovered by Doniphan's expedition in 1847 and Simpson who visited the place in 1850 obtained the name from Sr. Vigil, secretary of the province of New Spain. It is believed to be a Spanish version of the Navajo term, *Tse-yi*, meaning "in the canyon."

**CANYON DIABLO**, a noted canyon crossed by Santa Fé Railroad in eastern Arizona. It is 225 feet deep, with steep, step-like walls of the limestone which constitutes the adjoining platform. It was cut by a small stream, tributary to the Little Colorado River, which is not far north.

**CANZONE**, kán-tso'ná, a particular variety of lyric poetry of Provençal origin. It is found in the Italian poetry of the 13th century. At first it was quite irregular, but was confined by Petrarch to more fixed and regular forms. Hence it is called canzone Petrarchesca; it is also called canzone Toscana, because it originated in Tuscany. It is divided into several stanzas, in which the nature and disposition of the verses, which are of 11 and 7 syllables, and the place of the rhymes, are uniform. The canzone-strophe consists of two parts, the opening one being distinguished by Dante as the *fronte*, the closing one as the *sirma*, and these parts are connected by rhyme, it being usual to make the rhyme of the last line of the *fronte* identical with that of the first line of the *sirma*. In

other respects, the canzone has great liberty. The canzone usually concludes with a stanza which is shorter than the others, and is called *ripresa*, *congedo*, *comiato*, signifying dismissal or taking leave. There are different kinds of canzoni, and different names are given to the different parts. The canzone *Anacreontica* is divided into small stanzas, consisting of short verses, with a regular disposition of the rhymes through all the stanzas. Not only light, pleasing songs of love, gaiety and mirth, but poems on solemn and lofty subjects, and of an elevated dithyrambic strain, are included under this name. The latter subjects, however, are better adapted to the canzone *Pindarica*, which was first introduced in the 16th century by Luigi Alamanni, and owes its perfection chiefly to Chiabrera. It is distinguished from that of Petrarch by a bolder flight, loftier ideas, greater freedom in the choice and disposition of the verses, and by the form of the stanzas, which is borrowed from the Greek chorus. The Pindaric canzoni are divided into *strophe*, *antistrophe* and *epode*, and are called *canzoni alla Greca*. Those divisions are sometimes called *ballata*, *contraballata* and *stanza*: or *volta*, *rivolta* and *stanza*; the Greek names are the most common. There is also the canzone *a'ballo*, an old Italian poem, originally intended to be sung at a dance (*ballo*). It is called also *ballata*. It is not employed by the Italian poets later than the 16th century. In England, the canzone was introduced at the end of the 16th century by William Drummond of Hawthornden, who has left some fine examples. In Germany, the poets of the Romantic period imitated it, especially A. W. von Schlegel.

**CANZONET**, *kān-tsō-nēt'*, **CANZONETTA**, in Italian poetry a canzone (q.v.) consisting of short verses, much in use with the poets of the 15th century. Rinuccini, and after him Chiabrera, have used it in modern times, and given it more grace. Canzonets are generally expressive of tender feelings. In music, canzonet signifies a song, shorter and less elaborate than the aria of the oratorio or opera.

**CAONABO**, *kā-o-nābō'*, Indian chief of Hispaniola (Haiti) at the time of its discovery by Columbus: d. 1496. The latter built a fort which he called *La Navidad*, and in which he left, when sailing for Spain early in 1493, a garrison of 40 men. Returning before the end of the year, he found that Caonabó had burned the fort and killed the garrison. According to the account of a friendly native, the Spaniards had drawn this fate upon themselves by their evil conduct. In 1494 the Indians in great numbers attacked the Spaniards, having been provoked by the misconduct of one of the lieutenants of Columbus, Pedro Margarite. Columbus overthrew them, first at Magdalena, and later (1495) on the plains of the Vega Real—where, tradition has it, 100,000 hostiles were assembled. Caonabó meanwhile threatened the garrison of Saint Thomas. Alonzo de Ojeda was sent by Columbus to cajole Caonabó into coming to a conference. Ojeda went alone among the hostiles. As presents he took gyves and manacles of shining metal; treacherously persuaded the Prince to show himself to his subjects wearing these novel ornaments, and

even, while thus adorned, to ride Ojeda's horse; then, mounting also, he dashed through the crowd of savages and carried his victim into the presence of Columbus. He was sent to Spain for trial and died en route.

**CAOUTCHOUC**, *koo'chook*, an elastic, gum-like substance, obtained from the juice of certain tropical trees and shrubs, and commonly known as *India-rubber* or "*rubber*." The best caoutchouc comes from the *Pará* region, in Brazil; but supplies are also obtained from Central America and the West Indies, from Africa and from tropical Asia, especially from Ceylon and Malaya. The details of collecting the juice and preparing it for market vary somewhat according to the locality, and with the nature of the trees or shrubs from which the juice is obtained. In the Amazon region, when the source is a tree, incisions are made in the bark each morning, and the milky sap that exudes is collected in little tin or clay cups that are secured to the tree for the purpose. At the end of about 10 hours these are emptied into larger collecting vessels, and on the morning of the following day new incisions are made in each tree, some eight inches below the first ones. This process is continued until incisions have been made in the bark from a height of about six feet down to the ground. The poorest quality of sap is obtained from the highest wounds, and the best from the lowest ones. To evaporate the juice, a fire is first built of materials that yield dense volumes of smoke. A workman then dips a wooden paddle into the collected sap, after which he holds it in the smoke until the sap solidifies and acquires a slight tinge of yellow. He then dips the paddle into the sap supply again, repeats the smoking process, and so proceeds until the paddle is covered with a layer of the dried gum that is perhaps an inch and a half thick. He then slits this layer, removes it from the paddle, hangs it up to dry, and starts a fresh evaporation.

Pure caoutchouc from *Pará* is light-colored below the surface, but superficially it is dark-brown from oxidation. It has a specific gravity of about 0.92, and consists chiefly of carbon and hydrogen in the proportion of about 87 per cent of carbon to 13 of hydrogen. Small quantities of oxygen are always present, however, as the best of the *Pará* product contains as much as one-half of 1 per cent of a sort of resin that contains oxygen, and is undoubtedly produced by the oxidation of the gum. In fact, it is known that caoutchouc will oxidize slowly in damp air, even after it is vulcanized, and particularly when exposed to the action of light. Caoutchouc consists, apparently, of two different kinds of gum, one of which is fibrous, while the other is viscous, though the two are chemically identical. It is slightly soluble in ether, turpentine, chloroform, petroleum, naphtha, benzene, and carbon disulphide, the viscous portion being more soluble than the fibrous part. At 250° F. caoutchouc begins to melt, and becomes permanently transformed into a sticky substance which retains its peculiar consistency almost indefinitely. At 400° F. the transformation is more complete, and the black, adhesive mass that results makes an excellent lute for sealing glass bottles and jars if it is thoroughly incorporated with 50 per cent of its own weight

of dry slaked lime. By careful destructive distillation caoutchouc is resolved into a number of hydrocarbon oils that are of interest to the chemist.

As early as 1615 the Spaniards used the crude gum "for waxing their cloaks, which were made of canvas, so as to make them resist water." But it was not until about 200 years later that caoutchouc began to attract general attention in such ways. At first it was applied to cloth by the aid of heat; but improved methods followed the discovery of solvents for the gum, and the invention, by an Englishman named Thomas Hancock (about 1820), of the "masticator," a machine by which the caoutchouc is thoroughly worked over and brought to a uniform consistency. But the greatest step in the development of the rubber industry was the discovery of the process of vulcanization,—a discovery that appears to have been made independently and at about the same time (1843) by Charles Goodyear, of New Haven, Conn., and Thomas Hancock, to whom reference has previously been made. The credit of priority belongs to Goodyear, but Hancock did a great deal to make the discovery a commercial success. Unvulcanized caoutchouc is softened by heat, and is made hard and inelastic by cold; but upon being vulcanized the gum becomes comparatively insensible to ordinary extremes of temperature, and also has its elasticity materially increased. The process of vulcanization depends upon the fact that the crude rubber will absorb sulphur, and combine with it at a temperature that is easily attainable without injury to the product. The details of the vulcanization differ somewhat, according to the nature of the article that is being manufactured. If sheet rubber is submerged for a few moments in melted sulphur at a temperature of 250° F., it absorbs about one-tenth of its weight of that element; but although its color changes somewhat, it is otherwise apparently unaltered. Upon exposure for a somewhat longer time to a temperature of 285° F., however, true combination of the sulphur and caoutchouc ensues, and the gum is said to become "vulcanized." It is not necessary that the sulphur should be actually melted in order that the sheet rubber may absorb it, for sheets that are laid in powdered sulphur that is heated nearly to its melting-point will absorb the proper amount for good vulcanization in the course of a few hours. Vulcanization of rubber sheets can even be brought about without the action of heat, by dipping the sheets for a few seconds in a solution of chloride of sulphur in carbon disulphide. It is more common, however, to knead the requisite amount of sulphur directly into the caoutchouc by mechanical means. The article to be manufactured is then brought into shape by the action of pressure and moderate heat (or in any other manner), and the final operation consists in heating it to the vulcanizing temperature by the aid of a steam bath. Chemically considered, the process of vulcanization appears to consist in the substitution of one or more sulphur atoms for a portion of the hydrogen of the hydrocarbons of which the caoutchouc is composed. For many years chemists have been interested in synthetic rubber to take the place of natural caoutchouc, but the artificial product has not yet come into extensive use. See INDIA RUBBER; RUBBER MANUFACTURE.

**CAP**, the cover of the end or head of anything. Caps were not worn by the Romans for many ages. When either the rain or sun was troublesome the lappet of the gown was thrown over the head; and hence all the ancient statues appear bareheaded, excepting sometimes for a wreath or the like. The same usage prevailed among the Greeks, to whom, at least during the Heroic Age, caps were unknown. The sort of caps or covers of the head in use among the Romans on divers occasions were the *pitra*, *pileus*, *cucullus*, *galerus* and *palliotum*, which are often confounded by ancient as well as modern writers. The general use of caps and hats is referred to in the year 1449. The first seen in Europe were used at the entry of Charles VII into Rouen. From that time they began to take the place of *chaperons* or hoods. When the cap was of velvet they called it *mortier*; when of wool simply *bonnet*. None but kings, princes and knights were allowed to use the *mortier*. The cap was the head-dress of the clergy and graduates. Pasquin says that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off, as an encumbrance, left the round cap an easy, commodious cover for the head; which cap, being afterward assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman called Patrouillet. He adds, that the giving of the cap to the students in the university was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors, in imitation of the ancient Romans, who gave a *pileus* to their slaves in the ceremony of making them free: whence the proverb *vocare servos ad pileum*: hence, also, on medals, the cap is the symbol of Liberty, who is represented holding a cap in the right hand by the point.

*Cap of Maintenance*, one of the ornaments of state carried before the sovereigns of England on the occasion of their coronation. It is also applied to an ornament borne before the mayors of certain cities on state occasions, and to a device in heraldry.

In ship-building a cap is a square piece of timber having two holes cut through it,—one square, to fit on the squared or tenon head of the lower mast; the other round, to take the heel of the upper mast. Also a similar contrivance affixed to the end of the bowsprit, through a round hole in which the jib-boom is rigged; and a covering of metal or tarred canvas to protect the end of a rope from fraying.

In mining a mass of unproductive rock overlying valuable ore. In coal mining, the bluish halo of ignited gas which appears above and around the flame of a safety-lamp when a dangerous amount of fire-damp is present. In physical geography a similar mass, as of ice overlying the surface of a country; as, the ice-cap of Greenland. The word is also used in carpentry, in book-binding, in machinery and in ornithology to denote coverings for protection. The term as used in military parlance is percussion cap, a small copper cup containing fulminating powder, used in a percussion lock to explode gunpowder.

**CAPANEUS**, one of seven legendary heroes who warred against Thebes, killed by Jupiter.

**CAP-À-PIE**, kăp'a-pē' (O. Fr. *de cap à pie*; Mod. Fr. *de pied en cap*), a term signifying from head to foot, and used with reference to a complete suit of armor covering the body of a knight at all points; as, "He was armed cap-à-pie for the encounter."

**CAPE ANN**, Mass., the southeast point of the town of Gloucester, Mass., 31 miles from Boston, the northern limit of Massachusetts Bay; in lat. 42° 38' N., and long. 70° 34' W. The whole of the rocky peninsula forming this part of Gloucester is also called Cape Ann, including the village of Squam in its northeastern part. This peninsula is a headland of syenite, which forms low hills, over the surface of which the rock is very generally exposed to view. It projects about 10 miles into the Atlantic Ocean. Valuable quarries of syenite for building purposes are worked most conveniently for shipment. The place is much exposed to the prevalent northeast storms; but it offers a small, well-sheltered harbor among the rocks, where coasting vessels often take refuge. There are on the shores of this harbor two fixed lights about 165 feet above mean high water, and visible for 19 nautical miles; there is also a 10-inch steam fog whistle. The south and east shores have many attractive summer resorts.

**CAPE ANN SETTLEMENT**, the first within the limits of the Massachusetts Bay territory. In 1622, the New England Company, to push the settlement of its grant and give it some value, divided the land in severalty among its members. The region about Cape Ann fell to Edmund, Lord Sheffield, who sold a patent for it in 1624 to Robert Cushman and Edward Winslow of the Plymouth colony. They found some English hunters and fishers who had been there since the year before; these acknowledged the rights of the Plymouth people, and the two parties planted and fished amicably; but shortly after a London vessel which had taken up the quarrel of the firebrand, Rev. John Lyford, seized the Plymouth men's fishing stage. Miles Standish came up from Plymouth to settle the trouble by force, but against his wish the settlement compromised the matter by the crew agreeing to build them another stage. In 1624 Winslow's company sold the site of Gloucester to the "Dorchester Adventurers," an unincorporated English joint-stock company recently formed. These had anticipated the bargain by sending out a band of settlers the fall before, with live stock, implements, etc., and they made Thomas Gardner overseer. The attempt was unsuccessful, and in 1625 the Dorchester company engaged Roger Conant, then at Nantasket with Lyford, to be governor, Lyford to be minister. But the next year the "Adventurers" dissolved, and most of the settlers went home; the few remaining ones, however, removed to "Nahumkeike" (Naumkeag), where they founded Salem.

**CAPE ARAGO**, or **GREGORY**, a cape on the western coast of Oregon, on the south of Coos Bay in Coos County. Its lighthouse, which is on a small island, is at lat. 43° 20' 38" N., and long. 124° 22' 11" W., and shows a white, flashing light 84 feet above sea-level.

**CAPE OF POINT BARROW**. See **BARROW**, **CAPE OF POINT**.

**CAPE BLANCO**, Africa. See **BLANCO**, **CAPE**.

**CAPE BLANCO**, Ore., a cape forming the most western point of the State, situated in lat. 42° 50' N., and long. 124° 37' W. It has a lighthouse with a white fixed light 256 feet above sea-level.

**CAPE BOEO**, bō-ā'ō, or **LILIBEO**, the ancient *Lilybaeum Promontorium*, a cape, on the western coast of Sicily, one mile from Marsala. It is the point of Sicily nearest to ancient Carthage, and at an early period became an important naval station. The naval victory of the Romans over the Carthaginians, which put an end to the first Punic War, was gained near this point.

**CAPE BOJADOR**, bōj-ā-dōr'. See **BOJADOR**, **CAPE**.

**CAPE BON**, or **RAS ADDER**, a headland of Tunis, on the Mediterranean, forming the northernmost point of Africa, in lat. 37° 6' N. and long. 11° 3' E., and a few miles north of the town of Kalibia.

**CAPE BRETON**, bret'ūn, Canada, an island of the Dominion of Canada, separated from Nova Scotia, to which province it belongs, by the narrow gut or strait of Canso; area 3,120 square miles; length about 110 miles. It is of very irregular shape, the Bras d'Or, an almost landlocked arm of the sea (with most picturesque scenery), penetrating its interior in various directions, and dividing it into two peninsulas connected by an isthmus, across which a canal has been cut. The surface is rather rugged, and only small portions are suited for agriculture; but it possesses much timber. The chief towns are Sydney and Arichat.

The mineral deposits are very rich; iron and copper ore is abundant, and over 400 square miles is underlaid with seam upon seam of valuable bituminous coal. The Dominion Steel Corporation had in 1912 over 10,000 men on its pay roll in and about the mines in Cape Breton discovered by John Cabot in 1497, and originally part of the French possession of Acadia; it was captured by the New Englanders in 1745, retroceded under the Treaty of Aix-la-Chapelle in 1748 and became a British possession under the Treaty of Paris in 1763. It was governed as a separate province from 1784 to 1820. It is divided into four counties, Richmond, Inverness, Victoria and Cape Breton.

**CAPE CANAVERAL**, a cape on the eastern coast of Florida, in lat. 28° 27' N. and long. 80° 33' W. There are dangerous shoals at this point, and navigation is protected by a revolving light 137 feet above sea-level and a coast signal station.

**CAPE CANSO**, the eastern extremity of Nova Scotia, at the southern entrance of Chedabucto Bay, in lat. 45° 19.5' N. and long. 60° 55' W.

**CAPE CARTHAGE**, a headland on the northeast coast of Tunis, jutting out into the Mediterranean. Traces of the ancient city of Carthage are found on it to the north of the Tunis lagoon.

**CAPE CATOCHE**, kă-tō'chā, a headland at the northeastern extremity of the peninsula of Yucatan, Central America, in lat. 21° 34' N.

and long. 86° 57' W. It is the northeast extremity of the Mexican state of Yucatan. It was here that the Spaniards first landed on the Mexican coast in 1517.

**CAPE CHARLES**, a cape at the northern entrance of Chesapeake Bay, forming the southern extremity of Northampton County, Va., in lat. 37° 7' N. and long. 75° 53' W. Northeast of it, on Smith's Island, is a first-order lighthouse with a revolving white light, signaling 45" every minute and is 180 feet above mean high water.

**CAPE CITY**. See **CAPE MAY**, N. J.

**CAPE CLEAR**, a headland forming the southernmost extremity of Ireland, in lat. 51° 26' N. and long. 9° 29' W. It is on an island of 1,506 acres, with a lighthouse on an abrupt cliff 455 feet high. Fastnet Rock, with a light 148 feet above high water, is distant three and one-half miles to the southwest. These are generally the first points of land seen by transatlantic voyagers eastward bound.

**CAPE COAST CASTLE**, a town and fort of western Africa on the Gulf of Guinea, in the British colony of the Gold Coast, in lat. 5° 5' N. and long. 1° 13' W. The place lies in a chasm, and is defended by the great castle near the water's edge, and by three small forts on the hills behind, one of which serves as a lighthouse and signal station. With the exception of a few houses for Europeans, the town consists of straggling lines of mud huts, with clusters of palm-trees and an occasional tamarind attached. It is a principal mart for native trade. It is connected by telegraph with Accra (the capital) and by road with Prahsue. The climate is unhealthy; mean temperature, 78°. The principal exports are gold-dust, ivory and palm-oil. Cape Coast Castle was ceded by the Dutch to the English in 1665, and from 1672 was possessed by several British African companies till 1843, when it was taken over by the British government. Pop., mainly Fantis (1911) 11,364.

**CAPE COD**, a cape and peninsula on the coast of Massachusetts, on the south side of Massachusetts Bay, forming the county of Barnstable; lat. of the cape, 42° 3' N., long. 70° 15' W. The peninsula is 65 miles in length and from 1 to 20 in breadth, and is in the form of a man's arm, bent inward both at the elbow and the wrist. Though mostly sandy and barren, it is nevertheless populous; and the inhabitants derive their subsistence chiefly from the sea. The best harbor on the peninsula is at Provincetown. There is a lighthouse known as the Highland Light, on the northeast shore, and one at Race Point almost directly west of the former. The navigation around the cape is peculiarly baffling and hazardous, and the saving to commerce and human life resulting from the short-cut waterway will undoubtedly be very great. A proposition to cut a canal from Buzzard's Bay to Barnstable Bay dates from the early part of the 17th century, but nothing was actually done until 1878, when a charter was granted by the legislature of Massachusetts, a company was formed and work begun. A new charter was granted in 1906, the canal was begun in 1909 and completed in 1914. The Old Colony division of the New York, New Haven & Hartford Railroad extends through the peninsula. The cape was discovered 15 May

1602 by Bartholomew Gosnold, who gave it its name from having taken a great quantity of codfish near it. In 1620 the Pilgrims of the *Mayflower* made a temporary landing at the site now occupied by Provincetown.

**CAPE COLONNA**. See **SUNIUM**.

**CAPE COMORIN**, kōm'ō'rin, the most southern extremity of the peninsula of Deccan, British India, in lat. 8° 5' N. and long. 77° 37' E., forming a circular, low, sandy point, which is not discernible above the distance of 12 to 16 miles from the deck of a large ship. Eighteen miles north from the cape is a bold summit called Comorin Peak, the southern termination of the western Ghats, which has, from a distance, been often taken for the cape itself. Within a short distance of the cape lies a rocky islet, high above water; and about three miles from this islet are a fort and a village, a few fishermen's houses, a church and some ancient temples, being the remains of the once famous town of Cape Comorin.

**CAPE DIAMOND**, Canada, the extremity of an abrupt promontory in the province of Quebec at the junction of the Saint Charles and Saint Lawrence rivers. On the promontory stands the citadel of Quebec, and on the west and nearly on a level with the ramparts lie the Plains of Abraham. It rises precipitously over 300 feet from the river level. Here was gained in 1755 the memorable victory by the English under Wolfe, over the French under Montcalm.

**CAPE DISAPPOINTMENT**, or **CAPE HANCOCK**, Wash., a cape at the north side of the mouth of the Columbia River, forming the southwest point of the State of Washington, in lat. 46° 16' N. and long. 124° 3' W. There is a lighthouse at this point with a flashing light 233 feet above sea-level.

**CAPE DUCATO**, doo-kā'tō, the southern extremity of Santa Maura, one of the Ionian islands. It is identical with the ancient promontory of Leucadia, commonly called the Lover's Leap, or Sappho's Leap. The famous Greek poetess, according to an ancient tradition, threw herself from the top of this promontory. It lies in lat. 38° 34' N. and long. 20° 32' E. The strong currents which sweep around the cape and the frequent fierce gales render it a dread to mariners.

**CAPE ELIZABETH**, Me., a headland projecting into Casco Bay, between Portland harbor and the Atlantic Ocean, in lat. 43° 33' N. and long. 70° 11' W. The coast is rocky, made up of ledges of talcose slate, traversed by dikes of trap. There are two lighthouses on the outer point, which stand 300 yards apart, the lights being 140 feet above the sea.

**CAPE DE ESPICHEL** (probably the ancient *Barbarium Promontorium*), a cape on the western coast of Portugal, 121 miles southwest of Lisbon. It rises abruptly from the sea, and is crowned by a small chapel and a lighthouse.

**CAPE FAREWELL**, the southern extremity of Greenland, at the eastern entrance to Davis Strait. A strong current sets around this cape, and continues north along the eastern coast of the strait. On account of the ice and the current the cape is seldom visited.

**CAPE FARO**, fä'rō, the northeast extremity of the island of Sicily, known to the ancients as *Pelorus*. It is at the narrowest part of the strait of Messina, opposite the rock of Scylla on the coast of Italy.

**CAPE FEAR**, the south point of Smith's Island, near the mouth of Cape Fear River, N. C., in lat. 33° 35' N. and long. 77° 57' W. About one mile from the shore stands Bald Head lighthouse. Navigation of the surrounding waters is attended by many dangers.

**CAPE FEAR RIVER**, a river of North Carolina; navigable for steamboats for 150 miles from its mouth to Fayetteville. Its length, including one of the head branches, is about 300 miles. Formed by the junction of the Deep South and Cape Fear rivers, its course is generally southeast till it reaches the Atlantic Ocean. This is the largest and most important river which lies wholly within the State. Rice growing is an important industry along its lower region.

**CAPE FINISTERRE**, fīn-is-tār', (Lat. *finis terræ*, land's end), the westernmost point of Spain, in the province of Corunna, extending southwest into the Atlantic, in lat. 42° 54' N. and long. 9° 21' W. Several naval battles were fought off this cape, of which the most important were the victories of the English over the French, 3 May 1747 and 22 July 1805.

**CAPE FLATTERY**, the most westerly point of the State of Washington and of the United States, excluding Alaska, at the entrance to the Strait of Juan de Fuca, in lat. 48° 23' N. and long. 124° 44' W. On the island of Tatoosh, opposite the cape, there is a lighthouse 155 feet above sea-level.

**CAPE FLORIDA**, the southern extremity of Biscayne Key off the southeast coast of Florida, in Dade County, at the north entrance to Biscayne Bay, in lat. 25° 39' N. and long. 80° 9' W. There is a lighthouse on the shoals opposite this point. It has a fixed red beacon light.

**CAPE FOULWEATHER**, a cape projecting into the Pacific Ocean from the coast of Oregon, in lat. 44° 50' N. and long. 124° 5' W.

**CAPE FOX**, or **LALANDE'S DOG**, a peculiar canine animal (*Otocyon lalandi*), differing from other dogs principally in the possession of an additional molar in each jaw. Other characters in the structure of the jaw and dentition suggest that *Otocyon* is a persistent creodont-like form which has developed from a primitive arctoid stock in a direction curiously parallel to that of the true dogs. No other mammal outside the marsupial order ever has four molar teeth in both jaws, and this may indicate a still more remote marsupial ancestry. This wild dog is generally found in open country, dwelling among small bushes in pairs, exceedingly shy, and not gathering into packs. It is rather smaller than a fox and resembles a fennec in having enormous ears and a thick bushy tail. In general color it is brownish or iron gray, mottled with yellow and with the limbs nearly black.

**CAPE FRIO**, frē'ō (Port. *Cabo Frio*, "cold cape"), a promontory on the coast of Brazil, in the state of Rio de Janeiro. It forms the terminus of a range of mountains running parallel

to the coast, and consists of a huge oval mass of granite. There is a lighthouse at this point.

**CAPE FROWARD**, the southern extremity of the continent of South America, lying northwest of Cape Horn in lat. 53° 53' S. and long. 71° 18' W. It is a bold promontory of dark slaty rock.

**CAPE GASPÉ**. See GASPÉ.

**CAPE DE GATA**, gā'ta, a promontory of Spain, on the coast of Granada, 150 miles east of Gibraltar, 24 miles in circuit and 13 miles broad. It was formerly a resort of Moorish pirates.

**CAPE GIRARDEAU**, jē-rār-dō', Mo., a city of Cape Girardeau County, on the Mississippi River and on the Cape Girardeau and Northern Railroad and the Frisco Lines, 150 miles southeast of Saint Louis. It is a well-cultivated region and has a large commerce, by river and railroad, in lumber, flour, limestone and mineral paints. There are also manufactories of Portland cement, shoes, bentwood, bricks, tobacco, washtubs, veneer, threshing machines, beer, etc. The United States census of manufactures for 1914 recorded 42 industrial establishments of factory grade, employing 1,397 persons, of whom 1,259 were wage earners, receiving annually \$607,000 in wages. The capital invested aggregated \$3,074,000, and the year's production was valued at \$3,888,000; of this \$1,532,000 was the value added by manufacture. The notable institutions include Saint Vincent's College and Academy, the Southeast Missouri State Normal School, Saint Francis Hospital and the Loretto Convent. The government is administered by a mayor, elected biennially, and a city council. Pop. 10,033.

**CAPE OF GOOD HOPE**, a province in the Union of South Africa, formerly Cape Colony, is situated at the southern extremity of Africa, washed on the west, south and east by the ocean, and having on the north and northeast the German territory of Great Namaqualand, the British territory of Bechuanaland, Orange Free State province, Basutoland and the province of Natal. A considerable portion of the boundary on the north is formed by the Orange River. The colony extends about 450 miles from north to south, and 600 from east to west; the coast line is about 1,300 miles. The area is 276,000 square miles. The principal indentations of the coast are Saint Helena, Saldanha, Table, False, Walker, Mossel, Plettenberg, Saint Francis and Algoa bays.

In the interior almost every variety of soil and surface is found, but a great part of the colony is arid and uninviting in appearance. Several ranges of mountains, running nearly parallel to the southern coast, divide the country into successive terraces, rising as they recede into the interior, between which lie belts of fertile land, or vast treeless and barren-looking plains. One of these, called the Great Karoo, is 300 miles long and 100 broad, and presents a desolate appearance, having a dry and often baked soil, with small shrubby plants scattered over it. Yet these plains make valuable sheep-walks, the flocks thriving exceedingly well upon the scanty vegetation; and the soil, where water can be obtained by collecting the rain, is generally very fertile. Large reser-

voirs have been constructed in many places, and permanent homesteads established where formerly flocks could only be maintained for a month or six weeks at a time. The principal and farthest inland mountain terrace averages 6,000 or 7,000 feet in height, and commencing in Namaqualand, runs eastward under the names of Roggeveld, Nieuwveld, Sneeuwbergen, Stormbergen, etc., to the northeast frontier. The culminating point is the Compass Berg, over 8,000 feet high. The Table Mountain at Cape Town is a stupendous mass of naked rock, rising almost perpendicularly, about 3,585 feet in height. The colony is deficient in rivers, though in this respect the eastern half is more favored than the western. The Orange River is the largest in this part of Africa, but is of little or no use for navigation. Others are the Elephants or Olifants River, flowing into the Atlantic; the Gauritz, Gamtoos, Great Fish, Sunday and Great Kei, emptying themselves into the sea on the south and southeast.

The most valuable mineral product is diamonds; copper ore is largely exported, coal is mined, and iron ore, gold, amethysts, agates, etc., are found. The bulk of the diamonds that come into the markets of the world in the rough state are now obtained from Cape Colony. The great mining centre is Kimberley, in the far north of the colony, about 10 miles from the Vaal River, and near the frontier of the Orange River Colony. So far as is known, the first of the South African diamonds was casually picked up in 1867, and soon after several others were found, including a fine large stone known as the "Star of South Africa." By the early part of 1870 so many diamonds had been found that a rush of people to the diamond district began to take place, and the banks of the Vaal were soon covered with thousands of diggers. At first the precious stones were found on or near the surface, but subsequently it was discovered that they were to be found deeper down, and latterly they have been obtained many hundreds of feet below the surface, great open excavations having been made at the localities where they are plentiful. The richest mine has been the Kimberley mine, situated in the centre of the town of the same name, which sprang up around it. For the first hundred feet in depth the diamonds were found embedded in a soft, friable, yellowish earth; below that the soil changed to a slaty-blue color, and was of a firmer consistency, and the diggers then thought that the bottom of the mine had been reached. It was soon discovered, however, that the blue ground yielded as many diamonds as the yellow, if not more, and this productivity has still continued. Another famous mine is the De Beers mine. Both these mines have yielded a remarkable number of large stones, but a great many of the diamonds have been "off-color," that is, yellow, spotted or otherwise defective in water or lustre. One of the finest yet found in South Africa is the "Porter Rhodes," a beautiful stone weighing 150 carats, and valued at \$300,000. One much larger, a yellow stone, weighing 302 carats, was found in 1884, and a still larger, weighing 428½ carats, was found in the De Beers mine in 1888. The largest in the world, weighing 971 carats, but with a large flaw, was found in the Orange Free State in 1893. Although mining operations have been

carried on at great expense, owing to the depths to which the workings have been sunk (some 600 feet or more), the profits of the companies which latterly have owned the mines have been enormous. The rough work has been done almost entirely by the native Africans, of whom 10,000 or 11,000 have been in employment in the mines at one time. Very stringent regulations have had to be enforced to prevent theft of the precious stones, and also illicit dealing in stones unlawfully acquired.

The climate is very healthy and generally pleasant, though in summer the heat is great in some parts. The mean temperature for the year at Cape Town is about 62°. The climate of the dry and elevated inland districts is considered remarkably suitable for persons of consumptive tendency, and many have been attracted to the colony on this account.

Except along the coast line, especially the southeast coast district, where there are extensive forests, timber is scarce. There are upward of a hundred different kinds of woods, however; many of them extensively employed for such purposes as house-building, wagon-making and furniture- and cabinet-work. With irrigation, trees can be grown anywhere. The aloe and the myrtle attain a great size.

The quadrupeds of the province comprise the African elephant, still found in the forests of the south coast region; the buffalo, equally restricted in locality; the leopard, jackal, hyena, numerous antelopes, baboon, aardvark, etc. Lions, at one time numerous, are not now to be met with in the colony, nor is the giraffe. The birds include vultures, eagles and other *Raptors* (the most remarkable of which is the serpent-eater), pelicans, flamingoes, and most important of all, the ostrich, now bred as a domestic animal for the sake of its feathers, those plucked from an adult bird in a season being sometimes worth from \$50 to \$90. Other native animals are large snakes, the venomous cobra di capello and scorpion. Along the coast whales and seals abound, and salt- and fresh-water fish are plentiful.

The province is better adapted for pasturage than for agriculture, but wheat, maize and other cereals can be grown almost everywhere, the only drawback to their cultivation being the want of moisture in certain localities and in certain seasons. In some years a surplus of grain is left for exportation; in others grain has to be imported. All kinds of European vegetables and pot-herbs, and all the fruits of temperate climates, such as apples, pears, plums, peaches, melons, apricots, walnuts, almonds, oranges, limes, etc., thrive excellently, and fruits, dried and preserved, are exported. The vine is cultivated and some excellent wines (notably those of Constantia) are made. The colony is said to be particularly well suited for grape-culture, and the vines produce heavier crops than are known almost anywhere else. Viticulture, it is believed, is yet only in its infancy, though there are 67,000,000 vine-stocks. The colonial government had up to the end of 1911 alienated 140,000,000 acres.

Sheep-raising is the most important industry, and wool the chief export (although surpassed in value by diamonds). The amount of this article exported to the United Kingdom in 1913 was 92,813,330 pounds. Most attention is now devoted to the breeding of pure merinoes,

the consequence being a great improvement in the wool. Goats are also bred, both the native and the Angora, and the export of goats' wool or hair to Great Britain was valued at \$4,600,000 (1913). Cattle-breeding is carried on to some extent, especially along the coasts and in the eastern and northern districts.

There are no manufactures of any importance, and consequently the imports consist largely of manufactured goods, chiefly from Great Britain. The exports to the United Kingdom (1913) totaled \$47,000,000, and the imports (British and foreign) to nearly \$60,000,000. The export of diamonds in the same year was over \$60,000,000. This industry suffered great disorganization during the European War. The other exports of importance besides wool, are ostrich feathers, copper ore, skins and hides. There are 3,813 miles of railway in operation. Lighthouses have been built round the coast and harbor works constructed.

The coinage is that of Great Britain, as are also the weights and measures, except that for land, the *morgen* = 2.116 acres is employed.

On 31 May 1910 the colony, under the name of the province of the Cape of Good Hope, was merged in the Union of South Africa (q.v.).

The European population consists in part of English, Scottish and Irish settlers and their descendants, but the majority is of Dutch origin (see *BOERS*), with a considerable number of German origin. The colored people are chiefly Hottentots, Kaffirs, Bechuanas, Basutos, Griquas, Malays and a mixed race, the offspring of black women and white fathers. The laborers are chiefly Hottentots and Kaffirs. The prejudices and ill feeling once subsisting between the different nationalities of which the population is made up are now fast disappearing. Education is advancing, though it is not compulsory. The returns show a steady increase in the numbers of children of all classes receiving instruction. For the higher education there are seven colleges, besides a university (at Cape Town) incorporated in 1873. The colleges have each a staff of instructors in classics, mathematics, science, etc., but the university is merely an examining and degree-conferring institution. The religious bodies in the colony with the greatest number of adherents are the Dutch Reformed Church, the Church of England, the Methodist Independents and Presbyterians, in the order here given. There is no Established Church.

The chief towns of the colony ranking after Cape Town are Port Elizabeth and Kimberley (qq.v.).

The Cape of Good Hope was discovered by Bartholomew Diaz in 1486, and rounded by Vasco da Gama in 1497, but was first colonized by the Dutch under Van Riebeeck in 1652. Reducing the Hottentot inhabitants to slavery, or driving them beyond the mountains, they extended the Cape settlement over a pretty large area. But the colony was under the rule of the Dutch East India Company, and owing to their restrictive regulations, made very slow progress. It was captured by the British in 1795, restored at the Peace of Amiens (1802), and again taken in 1806, Sir David Baird being sent at the head of an expedition to take possession of it, and so prevent it from falling into the hands of the French. From this time

it has remained in the possession of the British, to whom it was formally assigned in 1815, along with Dutch Guiana, Holland receiving in return £6,000,000. It now began to advance in prosperity, but the progress of the colony was greatly retarded by the Kaffir wars of 1834, 1846 and 1851-53. Subsequently the area of the colony was greatly enlarged by the successive annexations. The most important of these annexations were: British Kaffraria (1866); Griqualand West (1876); Kaffraria proper, or the Transkeian districts (Transkei proper, Griqualand East and Tembuland), including nearly the whole of the region between the Kei and the Natal border (1875-80); Pondoland (1894), and part of Bechuanaland (1915). Pop. (1911) 2,564,965, of which 582,377 were Europeans. See *SOUTH AFRICA, UNION OF*.

**CAPE DE GRISNEZ**, grē-ná', a headland of France in the department of Pas-de-Calais, the nearest point of the French coast to Great Britain. It has a revolving light 195 feet high.

**CAPE GUARDAFUI**, gwār-dā-foo-ē', or **GARDAFUI**, a cape on the east coast of Africa in Italian Somaliland, situated in lat. 11° 50' N. and long. 51° 16' E. at the entrance to the Gulf of Aden.

**CAPE DE LA HAGUE**, hāg (written also, but less correctly, La Hogue), a headland of Normandy, France, opposite the island of Alderney, 20 miles northwest of Cherbourg, and forming the northwestern extremity of the peninsula of Cotentin, in the English Channel. It is often confounded with Fort La Hogue or La Hougue, on the opposite side of Cotentin. Near this latter promontory the united English and Dutch fleets defeated the French, 19-24 May 1692.

**CAPE HAITIEN**, ā-ē-tē'ān, or **CAPE HAYTIEN**, Haiti, a town on the north coast of the island. It was formerly known as Cap Français, Le Cap or Guarico, the latter being the native name. It has an excellent harbor. The town is well laid out and has the appearance of the older European towns. Before the earthquake in 1842 it was known as "Little Paris," but as most of the white settlers did not rebuild, the town has not recovered since. During the French occupation, Cape Haitien was the capital of the island. It was bombarded by the English in 1865. The commerce is very important, and the chief exports are coffee, logwood, cacao, hides and honey. In 1913 the exports from Cape Haitien amounted to \$1,254,407; in 1915 they amounted to only \$352,418, the shrinkage being due to the hampering of commercial activity by the war in Europe; the imports in the same years amounted to \$1,194,453 and \$560,881 respectively. Pop. about 30,000.

**CAPE HATTERAS**, the easternmost point of North Carolina, a sandy insular spit, or narrow beach, separated from the mainland by the broad bay called Pamlico Sound. South of the capes of the Delaware, no land stretches so far out into the Atlantic as Cape Hatteras. The Gulf Stream, in its eastern and western vibrations, often flows within 20 miles of the cape, crowding toward the shore coasting vessels bound south. The difference of temperature between the hot airs of the Gulf and the breezes along shore and from the land engender

frequent commotions in the atmosphere at this place; and no point on the coast is more noted for its frequent and dangerous storms. A lighthouse is kept a little over a mile north of the outermost point. Also about three-quarters of a mile south a fixed white beacon light is placed about 35 feet above sea-level.

**CAPE HENLOPEN**, a cape on the eastern coast of Delaware at the south side of the entrance of Delaware Bay, in lat.  $38^{\circ} 47' N.$ , and long.  $75^{\circ} 5' W.$  It is 13 miles south of Cape May, on the opposing New Jersey shore. The Cape Henlopen light, 126 feet above sea-level, is a fixed white light.

**CAPE HENRY**, a cape on the coast of Virginia at the southern entrance of Chesapeake Bay in lat.  $36^{\circ} 56' N.$  and long.  $76^{\circ} 1' W.$ , opposite Cape Charles. It has a fixed white light with fixed red sector between south-southeast and southwest by west 157 feet above the level of the sea. Cape Henry has also a life-saving station.

**CAPE HORN**, the southern extremity of an island of the same name, forming the most southerly point of South America. It is a precipitous headland, 500 to 600 feet high, and running far into the sea. Sailing vessels often encounter dangerous tempests in passing round the Horn; steamers generally pass through the Straits of Magellan. The cape was first doubled in 1616 by the navigator Schouten, a native of Hoorn, Holland, whence its name. It is situated in lat.  $55^{\circ} 59' S.$  and long.  $67^{\circ} 16' W.$  The climate is perennially Antarctic.

**CAPE HUNTING-DOG**, a wild dog of Africa (*Lycaon pictus*), which is placed in a separate genus because it differs from all other dogs in having only four toes on each limb, in lacking one pair of molars in the upper jaw and in certain other features. It resembles a hyæna in form, and is yellowish-gray, with irregular, black markings. It hunts in packs and is one of the enemies most dreaded by all the African antelopes. Since the decrease of this, its natural game, it has played havoc with domestic cattle and sheep, and is killed off by the settlers wherever found. It is fast becoming rare. Consult Ingersoll, 'The Mammals' (New York 1906).

**CAPE ISLAND CITY**. See **CAPE MAY**, N. J.

**CAPE JUBY**, Africa, a barren, sandy projection into the Atlantic Ocean, 67 miles due east from the island of Fuerteventura of the Canary group. It is part of the section of the western Sahara which extends along the Atlantic Coast between the Mogador district and Rio de Oro. Water is very scarce on the cape, but is obtained in the ravines by sinking wells. The interior supports great numbers of sheep and produces large crops of wheat, barley and corn. The ocean fisheries at this point are abundant, and most of the catch is marketed in the Canary Islands. There is a monthly steamship service between Cape Juby and Santa Cruz de Teneriffe. A wireless station was erected on the cape in 1916; thus establishing communication with the large station on Teneriffe, and through this, with the Spanish mainland.

**CAPE LINGUETTA**, lin-gwét'ta, a headland of Janina, Greece, 2,290 feet high. It

forms the termination of the Chimara, or Acroceraunian Mountains and bounds the east entrance into the Adriatic at the Strait of Otranto.

**CAPE LOOKOUT**, a cape situated on an island off the southeast coast of North Carolina, in lat.  $34^{\circ} 37' N.$  and long.  $76^{\circ} 31' W.$  There is a lighthouse with fixed white light at a height of 156 feet above the sea. It is 63 miles southwest of Cape Hatteras and 12 miles southeast of Beaufort.

**CAPE LOPATKA**, the southern extremity of Kamchatka. At the northern part of the headland is a mountain, bearing the same name, whence the land gradually slopes and narrows until it terminates in a low and barren tongue.

**CAPE LOPEZ**, lô'pâth, the southern extremity of the Bight of Biafra, on the west coast of Africa. It is situated in lat.  $0^{\circ} 36' S.$  and long.  $8^{\circ} 44' E.$

**CAPE MATAPAN**, mâ-ta-pân', a promontory of Greece, forming the southern extremity of the Peloponnesus, in lat.  $36^{\circ} 23' N.$  and long.  $22^{\circ} 29' E.$  The name *Tænarum*, or *Promontorium Tænarium*, was applied by the Greeks to the headland, and to the small peninsula north of it, connected with the great Taygetic Peninsula by a narrow isthmus. It was sacred to Neptune, whose temple stood nearby.

**CAPE MAY**, N. J., a city and watering place in the southern part of Cape May County, having good railroad and water communication. It has a fine beach and is very popular as a seaside resort, providing accommodations in hotels and boarding-houses for guests 10 times exceeding in number the permanent inhabitants. The industries include fishing, canning, oyster raising, gold beating and sand washing. Its harbor has an area of 500 acres and an average depth of 35 feet. It is the only port of refuge south of Sandy Hook on the New Jersey coast and is the scene of many important yachting events. The government is administered by a mayor, elected for three years, and a city council. The place is sometimes called Cape City or Cape Island City. Pop. 3,000.

**CAPE MAY COURT HOUSE**, N. J. town and county-seat of Cape May County, 70 miles south of Philadelphia, and 11 miles north of Cape City, or Cape May, on the Atlantic City, and Pennsylvania railroads. Glass blowing, fishing and agriculture are among its chief industries. It contains two churches and a penitentiary. Pop. 1,300.

**CAPE MAY POINT**, the southern extremity of New Jersey, at the northern entrance to Delaware Bay, situated in Cape May County, in lat.  $38^{\circ} 56' N.$  and long.  $74^{\circ} 57' W.$  It has a revolving light about 160 feet above sea-level.

**CAPE MENDOCINO**, mên-dô-sé'no, the westernmost point of the coast of California, projecting into the Pacific Ocean in lat.  $40^{\circ} 26' N.$  and long.  $124^{\circ} 25' W.$  It has a very high lighthouse, 422 feet above sea-level, with a flashing light.

**CAPE NEDDOCK**, Me., a promontory 35 miles southwest of Portland, with a lighthouse on Goat Island near it, containing a fixed light, 33 feet above the sea.

**CAPE NOME**, nōm, a cape on the south coast of the peninsular projection of Alaska which separates Kotzebue Sound on the north from Bering Sea on the south. In the vicinity of the cape is a remarkably rich gold mining region. The Nome district as settled centres about the lower course of the Snake River, an exceedingly tortuous stream in its tundra course, which emerges from a badly degraded line of limestone, slaty and schistose mountain spurs, generally not over 700 to 1,200 feet elevation, but backed by loftier granitic heights, and discharges into the sea at a position 13 miles west of Cape Nome proper.

The first discovery of gold was made in September 1898, but it was not until July 1899 that the beach gold was discovered. In the middle of October following, Nome City had 5,000 inhabitants all living in tents on the hitherto barren shore. For a time it appeared as if this region would rival in richness the famous Klondike district, but this anticipation has not been realized.

**CAPE NORTH**, the northeast point of Cape Breton, east of Saint Lawrence Bay, projecting into the Gulf of Saint Lawrence.

**CAPE NORTH**, northernmost promontory of Europe. See **NORTH CAPE**.

**CAPE NUN**, noon, a headland on the west coast of Morocco, extending into the sea at the southwestern extremity of the Atlas range, in lat. 28° 45' N. and long. 11° 5' W.

**CAPE ORTEGAL**, ōr-tā-gāl', a rugged promontory forming the northern extremity of Spain, extending into the Bay of Biscay, in lat. 43° 45' N. and long. 7° 56' W. The coast at this point is barren and rugged.

**CAPE PALMAS**, a cape on the western coast of Africa, situated in the southern part of Liberia, in lat. 4° 22' N. and long. 7° 44' W. In 1834 the Maryland colony of free colored emigrants settled on this point.

**CAPE PETREL**, or **CAPE PIGEON**, a large petrel (*Daption capensis*), about the size of a pigeon, exceedingly numerous about the Cape of Good Hope, and widely distributed throughout the Southern Ocean. Consult Milne-Edwards, A., in 'Annales des sciences naturelles' for 1882.

**CAPE PILLAR**, a high mass of rocks terminating in two tower-shaped cliffs on the northwest coast of Desolation Island, at the southwest entrance from the Pacific Ocean into the Straits of Magellan.

**CAPE POGE**, a cape on the coast of Massachusetts, in lat. 41° 25' N. and long. 70° 26' W. It is the extreme northeast point of the Martha's Vineyard Island group. It has a lighthouse with a flashing white and red, every third flash red, light, with five seconds interval.

**CAPE PRINCE OF WALES**, a promontory on Bering Sea, the most northwest point of North America. It terminates in a peaked mountain, presenting a bold face to the sea, and is a dangerous point on account of a shoal which stretches to the northeast. It lies opposite East Cape on the coast of Siberia. Bering Strait between the two is the narrowest water between America and Asia.

**CAPE RACE**, a promontory at the southeastern extremity of Newfoundland, in lat. 46°

39' N. and 53° 4' W. The fogs of this part of the coast make navigation hazardous. The British government maintains a light here.

**CAPE RIVER**, or **RIO DE SEGOVIA**, known also as Coco or Wanks, a river of Nicaragua, Central America, which after a generally northeast course of nearly 300 miles enters the Caribbean Sea at Cape Gracias á Dios. It is navigable for a considerable distance from the sea, but the upper part of its course is obstructed by cataracts and shallows. It forms part of the boundary between Honduras and Nicaragua.

**CAPE ROMAIN**, a low and barren point of land, with a lighthouse, 37 miles northeast of Charleston, S. C.

**CAPE SABLE**, the name of two capes in North America: (1) The southernmost point of the mainland of the United States at the extremity of Florida, in lat. 25° 8' N. and long. 81° 9' W. (2) A point at the southwest extremity of Nova Scotia, in lat. 43° 23' N., and long. 65° 37' W.

**CAPE SAINT ROQUE**, rō'lā, **SAN ROQUE**, or **SÃO ROQUE**, a cape on the east coast of Brazil, in lat. 5° 29' S. and long. 35° 14' W.

**CAPE SAINT VINCENT**, a headland at the southwestern extremity of Portugal, in lat. 37° 3' N. and long. 8° 58' W. Off this cape, 14 Feb. 1797, an English naval force, consisting of 15 ships of the line, under Admiral Jervis, defeated a superior Spanish fleet. This point was known to the ancients as *Promontorium Sacrum*.

**CAPE SAN ANTONIO**, sän än-tō'nē-ō, the name of two capes: (1) A high, barren and precipitous headland, on the coast of Valencia, Spain, opposite the island of Iviza. On its summit are a convent, a watch tower and several windmills. (2) A lofty and nearly perpendicular promontory, at the mouth of the Rio de la Plata, in the province of Buenos Aires, Argentina.

**CAPE SAN BLAS**, sän blā, a low point of land, about two miles long, on the south coast of western Florida, in Calhoun County, 123 miles east-southeast of Pensacola. It lies between San Blas Bay and Saint Joseph's Bay. It has a revolving light 98 feet above sea-level.

**CAPE SAN LUCAS**, loo'kās, the southern extremity of the peninsula of Lower California, Mexico, in lat. 22° 44' N. and long. 109° 54' W.

**CAPE SPARTIVENTO**, the ancient *Herculis Promontorium*, a promontory of southeastern Italy, forming the southeastern extremity of Calabria, in lat. 37° 57' N. and long. 16° 5' E.

**CAPE OF STORMS**. See **CAPE OF GOOD HOPE**.

**CAPE TINDARO**, tin-dā'rō, a headland of Sicily, near Falcone, extending into the Gulf of Patti. The remains of the ancient Tyndaris are in its neighborhood.

**CAPE TOWN**, Africa, capital of the province of the Cape of Good Hope in the Union of South Africa and the seat of the legislature under the Union, is situated in the midst of striking scenery, rather more than 30 miles from the Cape of Good Hope, at the head of

Table Bay, which opens into the Atlantic on the northwest, and at the foot of Table Mountain. It was founded by Johann van Riebeck in 1652, on behalf of the Dutch East India Company. It is regularly laid out and has some good streets, with well-built business premises and other buildings, and is furnished with most of the institutions and conveniences of a European town (including tramways). The electric lighting and water supply are in the hands of the corporation. The finest edifice is that which accommodates the legislature, a handsome structure of modern erection; another good edifice is that containing the public library (40,000 volumes) and museum built in the Roman-Corinthian style. The Standard Bank of South Africa occupies handsome premises. Other buildings are the government house, the courts and government offices, the town house, the gallery of fine arts, the railway station, the post-office, the exchange, etc. The best ecclesiastical building is the Roman Catholic cathedral; there is also an English Episcopal cathedral and Dutch, Presbyterian, Lutheran, Independent and Methodist churches. There is a well-equipped college, the South African College, which trains students for the degrees of the Cape University, which is merely an examining body. There are beautiful botanic or government gardens in the town, occupying 14 acres and forming a fine promenade. The Cape Observatory is a celebrated institution supported by Imperial funds. The port has been provided with an extensive breakwater inside of which ships can safely ride at anchor protected from the northwest gales; and there are two docks 16 acres in area, an outer harbor of 62 acres, a large graving dock, etc. The net tonnage cleared in 1912 was 3,979,527 tons. The population is very mixed, a large number consisting of colored people of negro or other African descent. In 1913 a number of contiguous municipalities were incorporated within the boundaries of Cape Town, the population of which was then composed of 81,600 Europeans and 73,623 colored persons and the valuation nearly \$110,000,000.

**CAPE TRAFALGAR**, tráf-ál-gär, or tráf-äl'gar, a headland on the coast of Cadiz, Spain. It is memorable for the naval battle fought near it, 21 Oct. 1805, between the English under Nelson and the combined fleets of France and Spain. The English gained a complete victory, though with the loss of their commander. It was known to the Romans as *Promontorium Junonis*.

**CAPE VERDE**, the most westerly headland of Africa, in Senegal, jutting out into the Atlantic Ocean, between the rivers Gambia and Senegal, in lat. 14° 43' N. and long. 17° 34' W. It was discovered by the Portuguese navigator, Fernandez, in 1445, and is said to have derived its name from a group of gigantic baobab trees adorning its summit and forming a green patch on the white coast.

**CAPE VERDE ISLANDS**, a group of islands west of Africa, in the Atlantic Ocean, so called from Cape Verde, opposite to which they are situated, 320 miles west of Cape Verde, and between lat. 15° and 18° N. and between long. 22° and 25° W. They belong to Portugal. As to their number, some reckon 10, others 14

or more, by giving the name of islands to masses which are only rocks. The 10 principal islands are São Thiago, Fogo, Brava, Maio, Boavista, São Nicolão, Santo Antão, São Vicente, Santa Luzia and Sal. The total area of the group is 1,516 square miles. They are, in general, mountainous. The island of Fogo, one of the group, consists of one single mountain, a volcano, sometimes active, about 10,000 feet above the level of the sea. Some of the islands are very bare; in others the lower hills are covered with a beautiful verdure, as well as the valleys between; but there is little water, except what is found in ponds and wells. Long droughts have occurred, sometimes causing great loss of life. The climate is hot and unhealthy in most of the islands. The soil is, for the most part, not very fertile; nevertheless some parts produce sugar, coffee, rice, tobacco, maize, etc., with bananas, lemons, oranges, citrons, grapes and other fruits. European domestic animals abound and thrive well. Marine turtles are plentiful. The ports of the archipelago were visited in 1913 by 1,696 merchant vessels of 6,136,784 tons, besides coasting trade. In 1914 the imports were valued at \$2,306,610; the exports in the same year were valued at \$332,739. The total population amounted to 143,929 in 1912, of whom 4,799 were white, the rest being chiefly negroes. The chief town is Praia on São Thiago (Santiago), and Porto Grande on São Vicente is a coaling station for steamers. Salt is an export of importance. Coffee, hides and physic-nuts are also exported. There is a resident governor at Praia. Consult Ellis, 'West African Islands' (London 1885); Fea, 'Delle Isole del Capo Verde' (Rome 1899); Lima, 'Rapport sur les îles du Cap Vert' (in 'Recueil consulaire,' Vol. CX, Brussels 1900).

**CAPE WRATH**, a pyramidal promontory of unrivaled wildness and grandeur, forming the northwest extremity of Scotland and running out into the Atlantic; in lat. 58° 38' N. and long. 4° 58' 5" W. It presents deep fissures and tall pinnacles. From it a reef of rocks, perforated with arches and caverns, juts out into the sea. Off the cape is Stag Rock, a pillar 200 feet high. Cape Wrath is 525 feet high, and there is a lighthouse near it, 400 feet above the sea, visible 25 miles off.

**CAPEFIGUE**, káp-fég, Baptiste Honoré Raymond, French historian and journalist: b. Marseilles 1802; d. Paris, 23 Dec. 1872. He entered the field of journalism and contributed to various publications under the signature "Un homme d'état." He was appointed to a post in the Foreign Office, holding it until 1848. He thus had access to various documents unknown or closed to others. He was a prolific writer, producing about 100 volumes of history, many being biographies of famous women. They were hastily written, are uncritical and tinged with the Bourbon sympathies of the author. His most important contributions to historical science are the 'History of Philip Augustus' (4 vols., 1829); 'History of the Restoration and of the Causes that Led to the Fall of the Elder Branch of the House of Bourbon' (1831-33); 'Histoire de la réforme, de la ligue, et du règne de Henri IV' (8 vols., 1834-35).

**CAPEL**, Arthur, Lord, English soldier: b. about 1610; d. 9 March 1649. He was son of

Sir Henry Capel; was raised to the peerage as Lord Capel, of Hadham, by Charles I in 1641. He sat for Hertford in both the Short Parliament and the Long Parliament, and took sides with the popular party under Pym in demanding redress of various grievances. He strongly opposed revolution, however, and during the revolutionary war he fought bravely as one of the royalist generals in the west in the engagements at Bristol, Exeter and Taunton. Having been at length forced to surrender at Colchester to General Fairfax, he was imprisoned and, after some vicissitudes, executed. His 'Daily Observations or Meditations' was published posthumously with a memoir.

**CAPEL, Arthur, VISCOUNT MALDEN** and **EARL OF ESSEX**, English statesman, son of the preceding: b. January 1631; d. July 1683. He fought for the King in the civil war and on the accession of Charles II was appointed lord-lieutenant of Hertfordshire. In 1661 he was created Viscount Malden and Earl of Essex and appointed Ambassador to Denmark in 1670. He served as lord-lieutenant of Ireland, 1672-77, and was for a few months in 1679 head of the treasury commission. He opposed the court party and supported the Exclusion Bill. Arrested for his connection with the Monmouth conspiracy (1682) he was sent to the Tower, and is supposed to have committed suicide there.

**CAPEL, Thomas John, MONSIGNOR**, English Roman Catholic ecclesiastic: b. London, 28 Oct. 1836; d. Sacramento, Cal., 24 Oct. 1911. He was ordained to the priesthood in 1860. He conducted a mission for English-speaking Catholics at Pau 1868-73, and was given the title of Monsignor by Pope Pius IX. He afterward devoted himself to education, establishing a Roman Catholic public school at Kensington in 1873 and achieved celebrity as a preacher and proselytizer. He came to the United States in 1883, and after a lecture tour settled to private life in California. He is the author of 'The Holy Catholic Church'; 'Confession'; 'The Name Catholic'; 'The Pope the Head of the Church.' He is the original Monsignor Catesby in Disraeli's 'Lothair.'

**CAPEL, or CAPLE**, a term used by miners to indicate the wall of a lode, especially in a tin or copper mine. It is generally of quartz, black tourmalin and hornblende. The capels sometimes contain sufficient metallic particles to make it worth while to work them. In these cases they may be considered as forming part of the lode. The word "cab" is an equivalent used by Cornish miners. In the United States, "casing" is nearly synonymous.

**CAPELINE, or CAPELLINE**, a small piece of armor, consisting of a skull cap of iron, worn in the Middle Ages by light armed men such as archers.

**CAPELL, Edward**, English Shakespearean scholar: b. Throston, Suffolk, 1713; d. London, 24 Feb. 1781. He was educated at Cambridge; he was deputy inspector of plays after 1737 and devoted his life to the study of Shakespeare. He transcribed this author's plays 10 times. He collated the quartos and the first two folios with greater care than any previous editor. He published 'Prolusions or Select Pieces of Ancient Poetry' (1760); 'Mr. Wil-

liam Shakespeare, His Comedies, Histories, and Tragedies' (10 vols., 1768); 'Notes and Various Readings of Shakespeare' (1783); and 'The School of Shakespeare.'

**CAPELLA, Martianus Mineus Felix**, Latin writer probably of the 5th century: b. probably in Carthage, Africa. His extant work, 'Satiricon,' consists of nine books, the first two under the title, 'De Nuptiis Philologiae et Mercurii,' being an introductory allegory, while the others treat of grammar, logic, metaphysics, geometry, arithmetic, astronomy and music. It is a sort of encyclopædia and was much esteemed in the Middle Ages. His statement of the heliocentric system of astronomy in the eighth book may possibly have given hints to Copernicus, who quotes him occasionally. The best edition is that of Eysenhardt (Leipzig 1886). Consult Teuffel, 'Geschichte der römischen Litteratur' (6th ed., Leipzig 1911).

**CAPELLA**, a star situated in the constellation Auriga, on the "Charioteers" left shoulder. It is of remarkable brilliancy, only four stars exceeding it in that respect. Its color is nearly that of solar light. It is one of Secchi's solar stars, whose spectra closely resemble that of the sun, being ruled with dark lines due to metallic vapors. Its parallax, determined by Elkin, is 0".08, corresponding to a distance nearly 26,000,000 times the distance from the earth to the sun. Its light takes about 40 years to reach us. It is often called Capra. In mythology Capella was Amalthea's goat, which suckled Jupiter.

**CAPELLINI, kä-pël-lë'në, Giovanni**, Italian geologist and palæontologist: b. Spain, 13 Aug. 1833. He studied at Pisa and traveled widely. In 1860 he became professor at Genoa, and later at Bologna. He has emphasized the importance of prehistoric discoveries which related archæology to palæontology and defended the Darwinian theory. He was influential in calling the International Congress of Anthropology and Prehistoric Archæology in 1865. He founded in Bologna a geological museum. His publications include 'Delfini fossili del Bolognese' (1864); 'Relazione d'un viaggio scientifico nell' America settentrionale' (1867); and 'Armi e utensili di pietra del Bolognese' (1870).

**CAPELLO, kä-pël'lö, Bianca**, Italian adventuress: b. Venice 1542; d. in the Castle Paggio di Capano, 11 Oct. 1587. In 1563 she eloped with a banker's clerk named Pietro Buonaventuri, who put himself under the protection of Francesco de Medici at Florence. The latter made Bianca his mistress and her husband his steward, but had him put to death in 1570, and after the death of his wife, Joanna of Austria, married Bianca in 1578. She and Francesco are supposed to have been poisoned by his brother and successor, Cardinal Fernando.

**CAPEN, Elmer Hewitt**, American clergyman educator: b. Stoughton, Mass., 5 April 1838; d. Medford, Mass., 22 March 1905. He was graduated at Tufts College in 1860, and was elected to the Massachusetts legislature while still an undergraduate, 1859. After studying at the Harvard Law School, he was admitted to the bar in 1863 and practised at

Stoughton for a short time; began the study of theology, was ordained pastor of the Independent Christian Church of Gloucester in 1865, held pastorates at Saint Paul, Minn., and Providence, R. I., 1865-75, when he was elected president of Tufts College, a position he held till his death. His administration was most successful in every way, and under him the institution grew to be one of the most progressive of American colleges. His collected addresses appeared, entitled 'Occasional Addresses' (1902). Consult Tombo, A., 'In Memoriam E. H. Capen' (New York 1905).

**CAPEN, Nahum**, American historical writer: b. Canton, Mass., 1 April 1804; d. 4 Jan. 1886. In 1825 he began business in Boston as a publisher, with the firm of Marsh, Capen and Lyon. He was among the first to agitate the matter of an international copyright, his memorial to Congress on the subject being one of the first presented to that body; a letter of his, printed by the Senate, led to the organization of the census bureau at Washington and as postmaster of Boston in 1857-61, he established the custom of collecting letters from street boxes. He contributed to the press many articles on history and political economy. He edited a translation of the 'Works of Dr. Gall' (6 vols.); the 'Annals of Phrenology' (2 vols.); 'The Writings of Hon. Levi Woodbury, LL.D.' and 'The Massachusetts State Records' from 1847 to 1851 (5 vols.). He published 'The Republic of the United States' (1848); 'Reminiscence of John G. Spurzheim and George Combe' and a 'Review of the Science of Phrenology' (1881). He left an unfinished 'History of Democracy' (Vol. I, 1874).

**CAPENA PORTA.** See **CAMPUS SCCLERATUS.**

**CAPER-BUSH**, a shrub of the genus *Capparis* of the family *Capparidaceæ*. The genus includes about 150 species of trees and shrubs, distributed throughout the warmer regions of the earth. Capers are pickles made by preserving the flower buds of *C. spinosa*, a straggling, spiny shrub of the Mediterranean region.

**CAPERCALZIE**, kăp-ër-kă'li, **CAPERCAILLIE**, or **CAILZIE**, kă'li, a readily domesticated, polygamous grouse (*Tetrao urogallus*), about the size of a turkey, widely distributed throughout the pine-covered mountains of Europe. Formerly it inhabited Ireland and Scotland, where it was known as "blackcock," but it was entirely extirpated toward the end of the 18th century. It has since, however, in small numbers, been restored to Scotland by stock imported from Scandinavia. The ground color of the cock is muddy black, spotted with gray and brown; quill feathers dark brown; tail feathers nearly black; a glossy dark green chest; whitish bill and a small patch of naked skin above the eye, which is scarlet. The feet are feathered to the toes. The hen and young are dark brown, covered with freckles of a lighter shade; neck and chest yellowish chestnut, and the feathers of the under part usually edged with white. It feeds chiefly upon berries, seeds, insects and the young shoots of the pine and other trees, which give its flesh a delicate turpentine flavor. They are hunted with the aid of dogs, which "tree" them, when they are

easily shot. In the early spring, at the approach of the breeding season, the cocks meet at an accustomed place to give the hens the benefit of their annual "dances," at which assemblies the hens seem to choose their mates by the amount of plumage, color, daring and extraordinary gestures which each displays. On such occasions the cock is oblivious to all else save the winning of his mate, and may easily be approached and killed. The female bird builds her nest on the ground among the pines, generally laying from 6 to 12 eggs, few of which reach maturity, owing to the carelessness of the mother. They are spotted red or yellowish brown, and are over two inches long. The bird is readily domesticated if it has the range of a space containing a few pine trees. Consult Lloyd, 'Game Birds of Sweden and Norway' (London 1867); Morris, 'British Game Birds' (ib. 1891); Darwin, 'Descent of Man' (2d ed., ib. 1874); Millais, 'The Natural History of British Game Birds' (London 1909).

**CAPERN, Edward**, English minor poet: b. Tiverton, Devonshire, 21 Jan. 1819; d. 1894. He was long in the mail service in his native county, and was often styled "The Postman Poet." The poet Landor, attracted by the verse of Capern, procured him a pension from the civil list. His published works include 'Poems by the Biddeford Rural Postman' (1856); 'Ballads and Songs'; 'Wayside Warbles'; 'Sun-gleams and Shadow Pearls.' His verse is mainly descriptive of Devon life and character and a number of his lyrics were set to music by the poet himself.

**CAPERNAUM**, a city of ancient Palestine, on the west or northwest side of the Sea of Tiberias. This place is famous in Christian history, because Jesus often visited it during the time of his ministry, and in its vicinity he delivered the Sermon on the Mount. Nothing of the city now remains.

**CAPERS, Ellison**, American Protestant Episcopal bishop: b. Charleston, S. C., 14 Oct. 1837; d. Columbia, S. C., 22 April 1908. He was graduated at the South Carolina Military Academy 1857, and was a professor there 1858-60. He entered the Confederate army, was successively major, lieutenant-colonel and brigadier-general, and received several severe wounds. He was secretary of State of South Carolina in 1867-68, then entered the Protestant Episcopal ministry, and was rector of Christ Church, Greenville, S. C., for 20 years, and at Columbia, S. C., for six years where he remained until his elevation to the episcopate. He was secretary and treasurer of the diocesan board of missions 1879-93 and deputy to the general conventions of 1880, 1883, 1886. In 1893 he was consecrated seventh bishop of South Carolina, succeeding Bishop Howe.

**CAPERS, William**, American Methodist Episcopal bishop: b. South Carolina 1790; d. 1855. He was educated at South Carolina College, became an itinerant preacher and ministered to the Indians in Georgia from 1821 to 1824. He was presiding elder in Charleston for four years and for a short time was editor of the *Wesleyan Journal*, later merged in the *New York Christian Advocate*. In 1837 he founded and edited the *Southern Christian Advocate*. He also did missionary work among

the negroes. In 1846 at the first general conference of the Methodist Episcopal Church he was chosen bishop. Consult his autobiography, with memoir by Wightman (Nashville 1858).

**CAPERS**, the unopened flower-buds of a low shrub (*Capparis spinosa*), which grows from the crevices of rocks and walls and among rubbish in the southern parts of France, in Italy and the Levant. The stems of the Caper-bush are trailing and two or three feet long. In the south of France the caper-bush is very common. It grows wild upon the walls of Rome, Siena and Florence, and, when trained against a wall, flourishes even in the neighborhood of Paris. It was introduced into Great Britain as an exotic as early as 1596. Modern horticulturists are of opinion that with care it might be raised in the open air in England, but this has never been accomplished to any practical extent. It is cultivated on a large scale between Marseilles and Toulon and in many parts of Italy. In northern United States it is propagated by cuttings in greenhouses, but is grown from seed in the Southern States. In the early part of summer it begins to flower, and the flowers continue successively to appear until the commencement of winter. The buds are picked every morning before the petals are expanded; and as they are gathered they are put into vinegar and salt. When a sufficient quantity is collected they are distributed, according to their size, into different vessels, again put into vinegar, and then packed up for sale and exportation. The smallest capers are the dearest, simply from the reason that they are more troublesome to gather. This pickle is much used in sauce for boiled mutton. To persons unaccustomed to it the taste of capers is unpleasantly sharp and bitter, but after a little while the palate becomes reconciled to it. The flower-buds of the marsh-marigold (*Calitho palustris*) and the seeds of nasturtiums are frequently pickled and eaten as a substitute for capers. The bark of the root of the caper cut into slices and dried in small rolls or quills is sometimes used in medicine as a diuretic and in cases of obstruction of the liver. The caper-tree (*Capparis Jamaicensis*) is found in tropical America.

**CAPERTON**, Allen Taylor, American Confederate statesman: b. near Union, Monroe County, Va. (now West Virginia), 21 Nov. 1810; d. Washington, D. C., 26 July 1876. After attending school in Huntsville, Ala., and entering the University of Virginia, he went to Yale, where he was graduated in 1832, and studied law at Staunton, Va. He was a director of the James River and Kanawha Canal, and served in both houses of the Virginia legislature, his last term in the senate being in 1859-60. He was a member of the Constitutional Convention of 1861, and opposed secession until the beginning of hostilities. He was elected to the Confederate States Senate in 1863, and served till the fall of the Confederacy in the spring of 1865. He was chosen to represent West Virginia in the United States Senate for the full term beginning 4 March 1875, and was a member of the committees on claims, railroads and the revision of the laws. After the close of the war Caperton took an active part in bringing the coal, timber and grazing lands of West Virginia to the notice of distant capitalists.

**CAPERTON**, William Banks, American naval officer: b. Spring Hill, Tenn., 30 June 1855. He was graduated at the United States Naval Academy in 1875. Through the various grades of the service he rose to the rank of lieutenant in 1889. He has had over 23 years of sea service and about 19 years of shore and other duty. He has seen service in every sea, and has shown that he is one of the great men of the United States navy. He was an officer on board the *Marietta* when she accompanied the *Oregon* in her famous race from the Pacific to the Atlantic to take part in the fight with Admiral Cervera's fleet in the Spanish War. Previous to that he was one of the young American naval officers who were sent to Paris to the Exposition there in 1878. He was at one time assigned to duty with the coast and geodetic survey and served as an officer aboard the *Vesuvius*. He was in command of the naval station at Newport, R. I., and supervisor of the second naval district 1913-14. He was named rear-admiral in 1913 and was assigned to the command of the cruiser squadron of the Atlantic fleet in 1915. In 1914-15 he was in the Caribbean trying to bring peace to the war-torn republics of Hayti and San Domingo. When it was time to fight he showed that he was a fighter, and he has been equally proficient in diplomacy. He brought the most turbulent of the revolutionary leaders at least to make believe they liked peace. In July 1916 he was promoted to admiral "for valuable and satisfactory service in Hayti and San Domingo and his efficient record as a high executive officer." On 29 July 1916 he took command of the Pacific fleet, succeeding Admiral Winslow.

**CAPES**, Bernard, English novelist. His works include 'The Lake of Wine' (1898); 'The Adventures of the Comte de la Muette' (1898); 'Our Lady of Darkness'; 'At a Winter's Fire' (1899); 'From Door to Door' (1900); 'Joan Brotherhood' (1900); 'Love Like a Gipsy' (1901); 'A Castle in Spain' (1903); 'A Jay of Italy' (1905); 'A Rogue's Tragedy' (1906); 'The House of Many Voices' (1911); 'The Story of Fifine' (1914); 'The Fabulists' (1915).

**CAPET**, kâ-pâ, or kâp'â, the name of the French race of kings, which has given 118 sovereigns to Europe, namely, 36 kings of France, 22 kings of Portugal, 11 of Naples and Sicily, 5 of Spain, 3 of Hungary, 3 emperors of Constantinople, 3 kings of Navarre, 17 dukes of Burgundy, 12 dukes of Brittany, 2 dukes of Lorraine and 4 dukes of Parma. The history of this royal race is, at the same time, the history of the rise and progress of the French monarchy. The fate of one of the most interesting countries and nations in Europe is connected with the name of Capet. After having been deprived of four thrones, and again restored to them, this family stood forth as the first and most ancient support of the European principle of political legitimacy, that divine right, which in this house commenced with treason. Its origin is remarkable. Pepin the Short, the father of Charlemagne and mayor of the palace under the Merovingian dynasty, had displaced that royal house and usurped the throne of the ancient kings of the Franks. After a space of 235 years his own descendants, the Carolingian monarchs, experienced a sim-

ilar fate. Under the last Carolingians, destitute alike of energy and wisdom, Hugh the Great, Duke of France (by which was then understood the Isle of France), Orleans and Burgundy, exercised a power as unlimited as that of the mayor of the palace under the Merovingians. On the death of Louis V, without children, in 987 his uncle, Charles, Duke of Lower Lorraine, laid claim to the throne, which the Franks had sworn to preserve to the family of Charlemagne. The French nobility, disgusted at the German leanings of the Carolingians, whose domains and influence lay in the eastern provinces, preferred that a member of their own class, whose possessions were situated in the centre of the country, and whose power was so great as to outrival that of the old dynasty, should rule over them, and accordingly chose as their king Hugh, son of Hugh the Great, Duke of France and Count of Paris, and had the support of the Church in their favor. The valiant Charles of Lorraine was surprised in Laon by the treachery of a bishop and made prisoner. He died soon afterward in prison, and his son, Otho, Duke of Lower Lorraine, died in 1006. Both his younger brothers died childless in Germany. Thus the race of Capet was left in possession of the throne of France. According to some historians, Hugh Capet was descended from a Saxon family. He married a German princess, Adelaide, daughter of King Henry I of Germany (Duke of Saxony). Hugh was crowned at Rheims, and swore to preserve to the nation, and particularly to the powerful feudal nobility and clergy, all their existing privileges. Hugh and the succeeding monarchs, till Louis VII, took the precaution to have their successors invested with the royal title during their own lifetime. Thus Hugh had his son, Robert, crowned and anointed as his colleague as early as 1 Jan. 988. He abolished by law the partition of the hereditary estates among the sons of the kings and forbade the alienation of the family domains. The daughters of the kings were endowed from that time with money, and the appanage which was given to the princes of the blood returned to the Crown in default of male heirs. Both these principles were more fully confirmed by later laws. Thus Hugh Capet, by uniting his hereditary duchy, consisting of Paris, Isle of France and Burgundy, inalienably with the Crown, may be regarded as the founder of the French monarchy. What he had begun was completed by his successors, particularly in the times of the Crusades, and by the establishment of standing armies. On the failure of the direct line at the death of Charles IV (1328) the French throne was kept in the family by the accession of the indirect line of Valois, and in 1589 by that of Bourbon. Capet being thus regarded as the family name of the kings of France, Louis XVI was arraigned before the National Convention under the name of Louis Capet.

**CAPGRAVE** John, English historian: b. Lynn, Norfolk, 1393; d. there 1464. The most of his life was passed in the Augustinian friary of his native place. He was provincial of the order of Austin Friars in England, and was one of the most learned men of his day. He wrote in Latin numerous commentaries, sermons and lives of the saints. His most important work was his 'Chronicle of England,' in

English, extending from the creation to the year 1417. Other works were a 'Liber de Illustribus Henricis' and a 'Life of Saint Katherine.' Many of his works are lost, others have never yet been printed. His 'Chronicle' and his 'Liber de Illustribus Henricis' have been edited by F. C. Hingeston and printed in the Rolls series (London 1858).

**CAPHTOR**, the country in which the Philistines originated mentioned in Deut. ii, 23; Jer. xlvii, 4, and Amos ix, 7. Until recently the location of Caphtor was not certain; it had been variously identified with Cappadocia, Cyprus, Crete and Cilicia. It is now practically certain that it was Crete on account of the frequent connection of the Philistines with the Cherethites (or Cretans). Consult Hall, 'Kef-tin and the Peoples of the Sea' (in *Annual of the British School*, Vol. VIII, pp. 157ff. and cf. Vol. X, p. 154, Vol. XIV, p. 254); Müller, W. M., in 'Mitteilungen der vorderasiatischen Gesellschaft' (1900), and Meyer, Ed., 'Geschichte des Altertums, (I, 2, pp. 798ff.; 3d ed., 1913).

**CAPIAS**, káp'è-ās ("that you take"), a writ or process in a civil action whereby the sheriff is ordered to arrest the body of the defendant. The writ so framed as to call for the arrest of the defendant before judgment, in order to compel him to answer a suit, is called a *capias ad respondendum*; if after the judgment, to compel him to satisfy the judgment, it is called a *capias ad satisfaciendum*, commonly abbreviated *ca. sa*. In case of injuries without force, the civil law, and originally the common law, did not authorize the arrest of the defendant before judgment, that is, the arrest to answer; and upon feudal principles, says Sir William Blackstone (3 Com. 281), "the person of a feudatory was not liable to be attached for injuries merely civil, lest thereby the lord should be deprived of his services." The first writ of *capias ad respondendum* was given by act of Parliament in 1267, 52 Hen. III, c. 23, § 1, which provided that "if bailiffs, which ought to make account to their lords, do withdraw themselves, and have no lands nor tenements whereby they may be restrained, they shall be attached by their bodies, so that the sheriff shall cause them to come to make their account." This act applied to a particular description of receivers, and supposed them not only to be debtors, but also to have in their own hands the evidence of the amount of the debt, the production of which was one object of the process. The statute of 13 Edw. I, c. 11, passed in 1285, 18 years after the former, extends this process to "all manner of receivers bound to yield account," and provides "if they be found in arrearages upon this account, their bodies shall be arrested, and, by the testimony of the auditors, shall be sent into the next jail, and be imprisoned in irons under safe custody, and remain in prison at their own cost until they have satisfied their master (the creditor) fully of their arrearages." It would appear that the practice of arresting on mesne process, that is before judgment, to answer in civil suits, grew out of these statutes; for the subsequent statutes of 25 Edw. III, c. 17 (1350), providing that "such process shall be made in writ of debt, detinue of chattels and taking of beasts, by writ of *capias*, as is used in writ of account"; and of 21 Hen. VII, c. 9 (1503); evidently have

reference to an arrest to answer. Formerly, a writ upon which a suit was commenced was either a *capias*, distress or summons; either the person of the defendant was seized, and (unless he was bailed) imprisoned until the trial, or his goods and lands were seized as a guarantee of his appearance to answer; and more often, in modern times, to obtain a lien to secure satisfaction of the judgment; or he was only summoned, that is, merely had notice that a suit had been commenced before such a court, by such a plaintiff, and was to be heard at such a time. The commencement of an action by summons is now the usual course of procedure; recent legislation, and especially the practical abolition of imprisonment for debt, having greatly restricted the use of writs of *capias* of any kind. By the Debtors' Act, 1869 (32 and 33 Vict. c. 62), the writ of *capias ad satisfaciendum* is abolished, except in cases in which the defendant can pay, but will not. The same act provides that when a plaintiff has good cause of action against a defendant to the amount of £50 or upward, and the defendant is about to quit England, and the absence of the defendant from England will materially prejudice the plaintiff in the prosecution of his action, a judge may order the defendant to be arrested unless or until security be found. A supplementary or second writ, issued when an ordinary *capias* has been placed in the hands of the sheriff and has been returned with the endorsement that the defendant could not be found, is called a *testatum capias*. See ARREST; ATTACHMENT; EXECUTION.

**CAPILLARIES**, the extremely minute blood vessels that make the connection between the arteries and the veins. They are extremely abundant, being present in practically all parts of the body and in enormous numbers. It is by means of the capillaries that most of the interchange of nutrition takes place in the various tissues of the body. The arteries bring the fresh oxygenated blood to the parts, to which it is distributed by the rich network of capillaries, through the walls of which the waste products pass and are carried on by the blood pressure into the veins, to be eliminated by some one of the large excretory organs, the liver, etc., or carried to the lungs to be thus modified or cast off. The arrangement, width and capacity of the capillaries varies in every tissue of the human body. In general they are arranged as a close network about the parts to which they are distributed, and in width they vary from one two-thousandths to one two-hundredths of an inch in diameter. They are largest in the marrow of bone and smallest in the brain. In muscular tissue they are generally parallel one to another, but in numerous cases, as around fat cells, they are arranged spherically and in the intestines they form loops. See ARTERIES; BLOOD, CIRCULATION OF.

**CAPILLARITY**. The subject of capillarity takes its name from the circumstance that it was first studied in connection with the rise of liquids in tubes having a bore so fine as to be comparable in diameter with a hair (*capillus*). When one end of such a tube is immersed in water, the water rises in the tube above the general level of the surface outside it, in a way which is not in accord with the general law of hydrostatics, that a liquid will stand at

the same level in two communicating vessels. Many other instances can be found in which liquid surfaces, especially in the neighborhood of solid bodies, assume shapes and positions which are equally at variance with the laws of hydrostatics. All such cases are now treated as belonging to the general subject of capillarity. Examples of capillary actions are the soaking up of water by a sponge; the penetration of varnish into wood; the rising of oil in a lamp wick; the clinging of ink to a properly nibbed pen; the running off of the ink from pen to paper; the soaking up of the superfluous ink in blotting paper; the falling of drops of uniform size from the lip of a bottle or from a medicine dropper; the rounding of drops of melted lead into pellets of shot as they fall in a shot-tower.

When we consider such examples as these, it becomes clear that they are to be explained as the result of forces acting between the parts of the liquid, or between the liquid and the solid with which it is in contact. These forces are often called the forces of cohesion and adhesion. Very little is known about them. The one thing definitely known is that they are very great when the parts of the body or bodies between which they are exerted are so near together that they are said to be in contact, and fall off rapidly in magnitude as the parts are separated, so as to become inappreciable when the distance between the parts becomes discernible. It is customary to think of these forces as exerted between the molecules of matter, and so to call them molecular forces. The very small distance within which the action of a molecule on its neighbors is appreciable is called the range of molecular action.

By reflection upon the effects of such molecular forces acting in a liquid, Young (1804) was led to assume that a tension exists in a thin layer of molecules at the surface of a liquid, comparable in general to the tension in a stretched membrane. The magnitude of this surface tension depends upon the nature of the liquid, or, more exactly, upon the nature of the two media, of whatever sort they may be, separated by the surface. It is independent of the shape of the surface, provided that its radii of curvature are always great in comparison with the range of molecular action or the thickness of the surface layer. Young added to this hypothesis the observation that the angle of contact between a liquid surface and a solid is always the same for the same pair of substances. The angle of contact is generally measured, at the line of contact, between the external normals to the solid and the liquid surfaces. In the case of mercury and glass, which Young particularly observed, this angle is obtuse, and seemed to him to be about  $135^\circ$ . In the case of water and glass it is acute, and so small as to seem evanescent, or equal to zero. Young assumed that the like is true for all contacts of liquids with solids which are wetted by them.

Young's two principles are clearly not proved to be consequences of the more fundamental hypothesis of molecular force; but, accepted as generalizations from observation, they may be used to explain all the forms of liquid surfaces. For example, let us consider the rise of water in a glass tube. The water wets the inner wall of the tube, and so meets it everywhere in the circle of contact at an angle equal to zero. Owing to this, the surface of the water in the tube will

be concave upward. In a tube of very small bore, it will be approximately hemispherical. The tension strives to straighten out the surface, and since the contact condition prevents its doing this, it lifts a column of water up the tube, to a point such that the weight of the uplifted column is sustained by the upward force due to the tension, while at the same time the curvature of the surface is consistent with the contact condition.

When the column is stationary, the tension in the surface can be considered as acting vertically upward at all points in the circle of contact of the surface with the wall of the tube. Representing by  $T$  the tension in the surface, or the force acting in the surface across a line of unit length, and by  $r$  the radius of the tube, we have the expression  $2\pi rT$  for the upward force acting on the column. Representing by  $\rho$  the density of water, by  $g$  the acceleration of gravity, and by  $h$  the height of the column above the general level of the water surface outside the tube, we have the expression  $\rho g \pi r^2 h$  for the weight of the column. Setting the two forces equal, we obtain  $2T = \rho g r h$ , and conclude that the height of the column is inversely as the radius of the tube. This law was made known by the experiments of Jurin (1718), and is generally known as Jurin's law.

By a slight extension of Young's conception of surface tension, we may deduce from it the constancy of the contact angle. We need only to suppose that a tension exists, in any surface separating two substances, which has a particular value for each pair of substances. Consider then three fluids in contact along a line. It is evident that the line of contact will be at rest when the angles made with each other, at that line, by the three surfaces in which the fluids meet in pairs, are such that the tensions in the three surfaces are in equilibrium. These angles are therefore obtained by constructing the triangle of forces, with the three tensions as sides, and they are constant, for the three substances.

We may consider more particularly the special case in which one of the three substances is a solid. Suppose, for convenience in statement, that the three substances are a liquid, air and a solid. Represent by  $T_{12}$ ,  $T_{13}$  and  $T_{23}$  the tensions in the surfaces separating the liquid from air, the liquid from the solid, and air from the solid, respectively. Denote the angle of contact of the liquid-air surface with the solid by  $\phi$ . The line of contact will be at rest when the sum of all the tensions or components of tension in the plane of the solid is equal to zero, or when

$$T_{12} \cos \phi + T_{13} - T_{23} = 0.$$

The angle of contact is therefore given by

$$\cos \phi = \frac{T_{23} - T_{13}}{T_{12}},$$

and is constant. It is acute or obtuse, according as  $T_{23}$  is greater or less than  $T_{13}$ . In the case of mercury and glass,  $T_{13}$  is the greater, and  $\phi$  is obtuse. In the case of most liquids and glass, the tension corresponding to  $T_{23}$  is the greater, and  $\phi$  is acute. When  $T_{23}$  equals or exceeds  $T_{13} + T_{12}$ , the angle  $\phi$  becomes evanescent.

Almost contemporaneously with Young, Laplace (1805) formally applied the hypothesis of molecular forces to the study of the forms of liquid surfaces. He considered the pressure at

the end of a liquid filament, beginning in the surface and drawn normal to it, and terminating in the interior of the liquid. He proved that it may be expressed by the sum of two pressures. One of these, called the molecular pressure, is very great, and is constant at all points of the liquid that are not in the surface layer. This pressure is eliminated from all equations of equilibrium of liquids, and plays no part in determining the forms of liquid surfaces. The other pressure depends upon the shape of the liquid surface, and is given by the formula

$$\left( \frac{H}{2} \frac{1}{R} + \frac{1}{R'} \right),$$

in which  $H$  is a constant, and  $R$  and  $R'$  the two principal radii of curvature of the surface. This pressure, at any point under the surface layer, is in equilibrium with the hydrostatic pressure at that point. Under a flat surface, and therefore under the level surface of a large expanse of liquid, the radii of curvature are infinite and this pressure vanishes. If  $h$  is the height of a point in the curved surface above the general level, we then have for

$$\text{equilibrium the condition } \frac{H}{2} \left( \frac{1}{R} + \frac{1}{R'} \right) = \rho g h.$$

This relation may be deduced from Young's hypothesis of surface tension, and it is found that Laplace's constant  $H$  is equal to  $2T$ . As an example of the use of this equation, consider again the rise of water in a tube. The surface in the tube, if its bore is small enough, may be considered a hemisphere, and therefore  $R = R' = r$ , the radius of the tube. Accordingly we have  $H = \rho g r h$ , as we obtained before by Young's method.

Laplace's theory did not suffice to demonstrate the constancy of the contact-angle, and Laplace was forced to assume it as a fact of observation.

A more profound and successful application of the hypothesis of molecular forces to the problem of capillarity was made by Gauss (1829). He showed, by means of the principle of virtual work, that a system of substances in contact possesses a certain amount of potential energy arising from the molecular forces. For each pair of substances the energy is proportional to the extent of surface separating them, and the factor of proportion is a characteristic constant for the two substances. This constant is called the surface energy. The existence of such a surface energy may readily be deduced from the hypothesis of molecular forces. Consider, for example, a mass of liquid surrounded by another liquid of the same specific gravity. If its surface is enlarged, it can only be by the movement of some of its parts out of its interior into the surface layer, and it is evident that, as they move out through the layer, work is done against the molecular forces, which will be proportional, generally, to the area by which the surface is increased. The liquid acquires potential energy equal to the work done in increasing its surface. As the potential energy of a system in equilibrium is always a minimum, the condition of equilibrium of such a mass of liquid is, therefore, that the area of its surface shall be a minimum. If the liquid is entirely free, its surface will be spherical. If it is subject to conditions, so that portions of the surface are limited by certain fixed boundary lines, it may be proved that the forms of the various

portions of the surface, which will make the surface energy a minimum, are such that the sum of the reciprocals of the principal radii of curvature is the same for all parts of all the surfaces. We are thus led to the same rule for the form of a liquid surface as that reached by Laplace.

It may be shown that the constants denoting the surface energy and the surface tension are the same. To do this, consider a film of liquid bounded by the sides of a rectangle, one of which can be moved so as to increase or diminish the area of the film. Since both faces of the film act alike, we need consider only one of them. The force applied by the tension  $T$  in the film to the movable side, the length of which is represented by  $s$ , is  $Ts$ ; and if the movable side moves in toward the opposite side through the distance  $r$ , the work done by the surface tension is  $Tsr$ . This is, therefore, the measure of the change in the energy of the film, and since  $\delta r$  is the change of area,  $T$  equals the energy per unit of area, or the surface energy.

The method of Gauss furnishes a proof that the contact-angle should be constant. If we consider that the potential energy of the system is a minimum, when the surface tensions which arise from the surface energies are in equilibrium, this may be proved in the way already indicated; or a direct proof may be given.

The argument by which these conclusions have been reached fails if we take into consideration the heat that must be introduced into the surface film to keep it at constant temperature during its enlargement. When this heat is taken into account it appears that the surface energy differs from the surface tension by a quantity equal to the product of the absolute temperature, and the rate at which the surface tension changes with the temperature. In all known cases the surface tension decreases as the temperature rises and the surface energy is greater than the surface tension. The surface tension, while not equal exactly to the total surface energy, is equal to the so-called free energy of the surface. Since equilibrium depends on the free energy having a minimum value, the test of equilibrium based on the condition that the area of the liquid surface shall be a minimum, consistent with the boundary conditions, is not impaired by this modified statement.

A very interesting set of verifications of the theories of capillarity was devised by Plateau. In order to be able to examine a liquid taking shape under its surface tension only, he prepared a mixture of alcohol and water having the same density as olive oil, in which the oil could be suspended. A mass of oil, freely floating in this mixture, assumed a spherical form. This form is manifestly that which would be produced by a tension acting uniformly in all parts of the surface; it is also that for which

the internal pressure represented by 
$$\frac{H}{2} \left( \frac{1}{R} + \frac{1}{R'} \right)$$

is the same everywhere; and also that for which the surface, and consequently the potential energy, is a minimum. When the oil was suspended in a wire frame, it assumed various forms, depending on the shape of the frame and the quantity of oil, which were always such that the internal pressure, determined by Laplace's equation, was the same everywhere.

A similar set of verifications was afforded by the use of films of soapy water. Such films are so thin and light that their weight hardly distorts them at all, and the positions they assume are due almost solely to the surface tension. Such a film, blown into a bubble, is spherical. When formed on a wire frame lying in a plane, the film is a plane. When the frame is twisted out of the plane, the surface of the film is the least that can be constructed with the edges of the frame as a boundary. It is one of the so-called minimal or ruled surfaces. Various films of this sort were examined by Plateau, and found to fulfil the geometrical conditions of the minimal surface.

Observers have ordinarily tested the theory by determining, from Laplace's equation, the various forms and dimensions of liquid surfaces, subject to various boundary conditions, and comparing the actual forms obtained by experiment with those deduced from the theory. For example, rough observations show that for any one liquid that wets glass, the heights to which it rises in various capillary tubes are inversely as the radii of the tubes, as the elementary theory declares they should be. More refined observations show that this statement is not strictly accurate, and a more complete theory leads to certain corrections of the statement, to which the better observations conform. In a similar way, the rise of a liquid between parallel plates, the forms of large drops of mercury on a horizontal plate, or of large bubbles of air in a liquid under a horizontal plate, the force needed to lift a horizontal plate from the surface of a liquid which wets it, the maximum pressure exerted in a small bubble as it is enlarging in a liquid at the end of a tube, have all been used as means of testing the theory. Generally the observations are used in the appropriate formula to obtain a value for the surface tension  $T$ , or for the constant

$$\sigma^2 = \frac{2T}{\rho g}$$
 (Called Poisson's constant) and the verification of the theory is found in the fact that the values of these quantities obtained by different methods are in good agreement with one another.

The determination of the surface tension is complicated by the fact that many of the formulæ containing it involve the contact-angle also. In such cases the contact-angle may be determined by an independent observation, as was done by Young in the case of mercury in contact with glass; but in most cases the liquids examined wet, or seem to wet, the solid walls, and it is then assumed that the contact-angle is evanescent or zero. The results obtained on this assumption may be compared with those obtained by methods in which the contact-angle is not involved, to test the validity of the assumption, and if it is found in error, to determine the magnitude of the contact-angle.

It is of interest to consider some examples of the constants of capillarity. The units commonly employed are not those of the absolute c. g. s. system. It has been found more convenient to use the millimetre as the unit of length, and the weight of a milligram as the unit of force. Poisson's constant  $\sigma^2$ , being always determined, as in the example given of the rise of a liquid in a tube, by the product of two lengths, is a number of square millimetres. The surface tension  $T$ , or the force which acts

across a unit of length in the surface, is expressed in milligram weights per millimetre. In these units Poisson's constant for mercury is about 6.75, and the surface tension 45.7. For water at 20° C. we may take  $\sigma=15.0$  and  $T=7.5$ ; for chloroform at 23° C.,  $\sigma=3.7$ ,  $T=2.73$ ; for refined petroleum at 22° C.,  $\sigma=6.75$ ,  $T=2.64$ . These numbers are simply cited as examples of the magnitude of the two constants in typical cases. Their exact determination is beset with such difficulties that it is doubtful whether any results have been obtained which can be accepted as definitive.

The constant contact-angle of mercury with glass is about 135°, or a little larger. Most liquids wet glass, and their contact-angles are assumed to be 0°. Evidence has been adduced to show that in some cases, with water or petroleum, for example, the contact-angle with glass is not 0°, but has a finite, though not a large, value. This question is not yet definitely settled.

The principal difficulty in determining the constants of capillarity with accuracy lies in the effect of impurities on the surface tension. This is especially felt with the liquids which have high surface tension, like mercury or water. The least trace of oil or grease will spread out over a water surface in a thin film, and alter its surface tension very considerably. It is very difficult to get the vessels clean, which are used in the experiments, and much more difficult to keep them clean, so that the constants obtained for any liquid are always open to a certain degree of suspicion. Impurities dissolved in the liquid affect the surface tension also, though not to so great a degree as those which spread over its surface.

The surface tensions, of all liquids which have been tested, become less as the temperature rises. It has been shown to be a consequence of the principles of thermo-dynamics that, provided the specific heat of the liquid is independent of the extent of its surface, the amount by which the surface tension changes is proportional to the change in the absolute temperature. Most of the older measurements of the temperature coefficients do not confirm this conclusion, but the observations of Knipp on water and of Feustel on various organic liquids are in agreement with it.

The magnitudes of the constants of capillarity manifestly depend on the magnitudes of the forces between molecules and on the range of molecular action. The theory of van der Waals leads to an estimate of the molecular pressure within a liquid, the values obtained for it ranging from 1,430 atmospheres in the case of ether to 10,700 atmospheres in the case of water. The same theory indicates that the range of molecular action is proportional to the linear dimensions of the molecule, and is of about the same magnitude as the radius of the molecule. By the help of a modified form of this theory, Eötvös came to the conclusion that the rate of variation with the temperature of the product of the surface tension and the two-thirds power of the molecular volume should be constant, and the same for all liquids, within a certain temperature range, if their molecules are single, and not double or compound. Observation shows that this law holds true for many liquids, and in cases in which it fails, there are often other reasons to support the

conclusion that the molecules of the liquid are compound.

Before closing, we may consider a few examples of the effects produced by surface tension.

When waves are set up on the surface of water, they are transmitted across the surface at a rate which depends on the hydrostatic pressure and on the surface tension. The surface tension is practically the only agent in transmitting the waves when they are very short. Such waves may be set up by the use of a vibrating tuning fork, and the measurement of their lengths furnishes a means for the determination of the value of the surface tension. The ripples set up on the smooth surface of a pond by a breath of air, or which proceed in front of a slowly moving boat, are largely due to surface tension.

When a glass tumbler is partly filled with water, the surface tension draws the water up the sides. As more water is carefully poured in, the line of contact rises until it reaches the edge of the glass. It often happens that the line of contact is checked at the edge, so that the water does not run out over the top of the glass. In this case the glass can be filled above the level of its edge, and the water will stand in it under a surface that is convex upward, the surface tension in which keeps the water from running out.

The surface tension in the convex surface of the mercury in the tube of a barometer produces a pressure downward, which has to be estimated and allowed for when accurate observations are to be made.

A fine needle that has been slightly oiled or greased if laid gently down on the surface of water will float there. It lies in a concave trough formed in the water surface. The water cannot wet the needle, because of its coating of oil, and so the needle is supported by the uplift due to the surface tension acting in the concave surface in which the needle rests. In a way generally similar, the insects which run over the surface of water are supported in little hollows in the water surface. Their feet are not wetted by the water.

When two light bodies, floating on the surface of a liquid, are moved toward each other until the curved parts of the liquid surface near them intersect, they seem to exert forces on each other. If they are both wetted by the liquid, or are both not wetted by it, they move together and adhere to each other. If one of them is wetted by the liquid and the other not, they move apart. If water is run in between two parallel sheets of plate glass, they are drawn closely together and adhere very strongly to each other. These actions are ascribed to differences in the pressures on opposite sides of the bodies. In case the bodies are wetted by the liquid, the pressure in the region between them, in the elevated portion of the liquid under its concave surface, is less than the pressure on their outer sides and they are pushed together. This action takes place even in a vacuum, in which case the pressure under the concave surface is a negative pressure or tension. In case the bodies are not wetted by the liquid the liquid is depressed between them, and the pressure inward on their outer sides is greater than that acting outward, and they are pushed together. A curious effect, pre-

dicted by Laplace from the theory of capillarity, and verified by experiment, is exhibited by two bodies, one of which is wetted by the liquid and the other not. These bodies, as the distance between them is diminished, at first appear to repel each other, but as the distance is reduced the repulsion changes to an attraction and the bodies come together.

If a small lump of camphor is dropped on clean water, it begins to move about over the surface in an irregular way, and continues to do so, generally for some time. These motions are explained by noticing that one part of the lump of camphor dissolves more freely than the rest, and so, near it, the surface tension of the water surface is lowered below that near the other parts of the lump. The camphor is accordingly drawn toward that part of the surface in which the tension is greatest.

If a thread of water is at rest in a horizontal capillary tube, and one of its two end surfaces is touched by a wire that has been dipped in turpentine or benzine, the tension at that end will be diminished, and the greater tension of the other end will draw the water along the tube. This effect is taken advantage of in cleaning off grease spots from cloth. The surface tension of benzine is very low, and when benzine is applied in a gradually narrowing ring around the spot of grease, the grease is drawn in toward the centre of the ring, and if the cloth is laid on a piece of blotting paper, the grease will be taken up by it. This action is promoted if a hot iron is applied to the other side of the cloth, for the heat lessens the tension in the ends of the pores nearest the iron, and the greater tension at the other ends draws the grease into the blotting paper. Consult Boys, 'Soap Bubbles, and How to Blow Them' (New York 1900; new ed., London 1912); Lord Rayleigh, 'Collected Scientific Papers' (1901).

WILLIAM FRANCIS MAGIE,

*Professor of Physics, Princeton University.*

**CAPILLARY ATTRACTION.** See CAPILLARITY.

**CAPILUPI**, *kā-pī'-loo-pī*, **Camillo**, Italian poet: b. Mantua 1504; d. 1548. He was the author of a work issued in 1572 entitled 'The Stratagem of Charles IX against the Huguenots,' in which the massacre of Saint Bartholomew was justified, and which made the action appear premeditated. Cardinal Lorraine, who at the time was attending the Pope in Rome, endeavored to suppress the book from motives of policy.

**CAPISTRANO**, *kā-pē-strā'nō*, **Giovanni di**, or **CAPISTRANUS**, **Johannes**, **Saint**, Italian monk: b. Capistrano, a small Neapolitan town of the Abruzzi, 24 June 1386; d. Illock, Slavonia, 23 Oct. 1456. He at first studied law, but in his 30th year, impelled by a vision, entered the Franciscan order, and was soon distinguished by the austerity of his manners, and a great zeal against the numerous heretical sects in Italy. The Popes Martin V, Eugene IV and Felix V, often employed him as legate and inquisitor in suppressing the sect of the Fraticelli, which had spread widely over Naples and the Papal States. In 1444 he became vicar-general of the strict order of Franciscans called Observants, and in 1450 proceeded as legate to Germany with a view to suppress the Hussites,

and rouse the Germans to a crusade against the Turks. Although he was successful in his opposition to the Hussites in Moravia, he was expelled from Bohemia by George Podiebrad. His fanaticism often led him into many acts of cruelty, one of the worst being the racking and burning of 40 Jews in Breslau, on the charge of profaning the Host. His harangues in favor of a crusade against the Turks failing to make much impression on the German princes he resolved to try their effect on the populace, and easily persuaded great numbers to join him in marching against the Turks, who were advancing under Mohammed II, and had closely invested Belgrade, the key of Hungary, with an army of 150,000 men. At the instigation of Capistranus, John Corvinus Hunnyades furnished a force of 60,000, destroyed the Turkish fleet on the Danube, and threw into Belgrade succors both of men and provisions. On this expedition Capistranus in person commanded the left wing of the party, forced his way into Belgrade, repulsed a general assault by the Turks, and on 6 Aug. 1456, in conjunction with Hunnyades, signally defeated the whole Turkish host. His exertions, and the pestilential atmosphere caused by the dead bodies lying unburied around Belgrade, laid him on a sick-bed, and he died in the same year in the Franciscan monastery at Illock. He was beatified in 1690 and canonized in 1724 by Benedict XIII. He was the author of 'Speculum Conscientiæ.' Consult Jacob, 'Johannes von Capistrano' (2 vols., Breslau 1903-06).

**CAPISUCCHI**, *kā-pe-sook'kē*, or **CAPIZUCCA**, **Biago**, or **Biasio**, **MARQUIS OF MONTERIO**, Italian general: b. Rome about the middle of the 16th century; d. Florence 1613. He was in the service of Spain in the Low Countries, under the Duke of Parma, in 1584, afterward becoming lieutenant-general and commander of the army of Ferdinand I de Medici, Duke of Tuscany. He fought the French Protestants in the reign of Charles IX, and distinguished himself at Clain, near Poitiers, in 1569.

**CAPISUCCHI**, **Paolo**, Italian ecclesiastic: b. Rome 1479 d. there 1539. Having become bishop of Neocastro he was summoned to Rome by Clement VII, who referred to him the question of a divorce between Henry VIII of England and Queen Catherine. In this matter Capisucchi made a report against Henry in 1534.

**CAPITAL.** Capital as a factor in the modern economic system is wealth, other than land, which is used by its owner to secure an income rather than for direct enjoyment. Land as a natural agent is usually treated in a class by itself, and is distinguished from products of human industry and enterprise. These products are subdivided, according to the uses to which they are put, into producers' goods and consumers' goods. Producers' goods include all tools, machines, buildings and appliances which are used in production, while consumers' goods include only such goods as are used for direct enjoyment. Capital includes all producers' goods, and some consumers' goods. It includes all producers' goods since they are not used for direct consumption or enjoyment, but rather for the purpose of securing other goods. The term capital, however, is usually made to include, in addition to producers' goods, such consumers' goods also as are used by their

owners for the purpose of securing an income. A pleasure automobile which is let for hire is a consumer's goods from the standpoint of society, but it is capital to its owner, since he gets no consumer's enjoyment from it. He keeps it for the income which it brings him. A dwelling-house is likewise a consumer's goods, but if it is rented, it is capital to its owner. Some writers have accordingly spoken of two kinds of capital, first, social or productive capital, and second, private or acquisitive capital. Social or productive capital is synonymous with producers' goods, while private or acquisitive capital includes such consumers' goods as are let, rented or hired by their owners to other people.

Capital is sometimes thought of not as a class of goods but as a fund of value. There are two reasons which lead to this way of thinking. In the first place, however capital may have originated historically, the characteristic method through which one comes into possession of it nowadays is that of purchase and the means of purchasing is money. Whatever the form of capital which one ultimately possesses, it is almost certain to be in the form of money at one time or another. It is, of course, a mistake to say that capital is money. A work-horse is a form of capital, but capital is not work-horses, neither is capital money, though money is a form of capital. Money may be used as a tool or a means of accomplishing more than could be accomplished without it. After one comes into the possession of money, he then has the power of exchanging it for consumers' goods or for sources of income as he may choose. If he decides to purchase sources of income, he is said to invest his capital. As a matter of fact, he is merely exchanging one form of capital for another. This habit of speaking as though one had invested capital when one had merely invested money, has led naturally to the idea that capital is money.

Another reason is found in the fact that capital, like all wealth, is measured in terms of money, and its quantity so expressed. There is no good way of saying how much capital one possesses except by stating it in terms of money. If any business man were to state how much capital he used in his business, he would be reduced to the necessity of saying so many dollars or so many dollars' worth. However, he is not likely to labor under the delusion that capital is money. If he were to state in what his capital consists, he would not, unless he were a money lender pure and simple, say that it consisted of money. He would give an inventory of his productive property, or of the property which he used in his business.

Others who reject the idea that capital is money still hold to the idea that it is a fund of value. The distinction is made between capital and capital goods, capital being the fund of value and capital goods being the goods in which that fund is embodied. No great harm can come from this use of words so long as they are properly understood, but they are not strictly accurate and may lead to confusion. The value of the goods is not capital, the goods are capital. Value is the important quality which they all possess in common, and, therefore, it is the only quality in terms of which their quantity can be stated. Money is the

commodity used in measuring that quantity. See VALUE.

The function of productive capital is to aid in production. Except in the case of money, its value is not an aid in production, it is only a symptom of the aid which it is anticipated that it will render in production. In this respect the value of a piece of land resembles the value of a piece of capital. It is not its value which makes the land productive; it is its productivity or its usefulness in production which gives it its value. Similarly it is the productivity of any piece of capital, or its usefulness in production, which gives it its value. In the case of that special kind of capital known as money, and in this case alone, its productivity, or its ability to aid in production, depends upon its value or its purchasing power. In all the other cases, it is the various tools, machines, buildings and other bits of equipment which perform the function of aiding in production. They derive their value from the fact that they perform that function. It is not the value which performs the function.

Capital is the combined result of labor performed in the making of the things which constitute it, and of the waiting which is necessary to the performance of work long in advance of the maturing of a consumable product. The labor and the waiting may both be performed by the same person, or by different persons. They are performed by the same person when a man, say a farmer, makes his own plow, and then waits during the lifetime of the plow for the benefits in the form of income or the products of the plow. They are performed by different men when the farmer buys the plow from a blacksmith, paying him cash. The blacksmith performed the labor of making it, but does not have to wait for its benefits, since he is already paid for his work. The farmer does the waiting, having surrendered present cash long before he receives the benefits in the form of larger crops year after year, from its possession. At the present time, in our highly complicated industrial system, with its increase of specialization, the working and the waiting are generally performed by different persons. Even the case of the plow made by a blacksmith and sold to a farmer, while a real case, is exceedingly simple as compared with the average process of capitalistic accumulation. A modern plow factory is using machinery and equipment, that is, capital, which was made in other factories, and these, in turn, are using other capital made in still other factories, and so on back to the mines, and there machinery is used which also can be traced back to other factories and other mines. But in all this complex system, those who labor will generally be paid wages as they go along, while others will do the investing, which means that they must spend considerable money in advance and get it back with an increase over a period of years. Thus the two functions of the laborer and the capitalist, or of labor and capital as they are sometimes called, are pretty sharply separated.

Capital has existed, of course, as long as tools and equipment have existed, but this separation of the two functions has become general only since the rise of machine production. Before that time, the function of the capitalist was not important enough to create

THEBES, EGYPT

an opportunity for many men. Not enough capital was needed in the more primitive forms of industry which preceded the present to enable any large number of men to live on its earnings. It is this fact which is probably meant when it is erroneously stated that capital in the modern sense came into existence with the rise of the factory system. Capital in the modern sense does not differ, except in its greater quantity and in the greater opportunity it gives to the capitalist, from capital in any other sense. See INCOME; NATIONAL WEALTH.

THOMAS N. CARVER,

*Professor of Political Economy, Harvard University.*

**CAPITAL**, in architecture, the uppermost member of a column, that is to say, a separate piece of stone set upon the shaft and supporting an epistyle or the abutment of an arch—in short the mass of the building which is imposed upon the column.

A column must always have a shaft and a capital; without these features it would be a post, perhaps a pillar or a pier, but would have no architectural character. The capital, moreover, has generally received the most elaborate decorative treatment of the whole composition. Thus in Egypt while the shaft might be cylindrical or conical, the capital would spread out immediately in curves either concave or convex, and would be carved and painted. It is even practicable to divide Egyptian columns into four orders by their capitals, which spread in different ways, and are ornamented by different sculpture more or less imitative of nature. The idea of the spread given to the capital is, of course, that in this way the superstructure is taken more easily, as it is always and of necessity much larger horizontally than the column itself.

The stone uprights left in rock-cut temples in India and called ordinarily pillars, because of their varied forms—octagonal, square and the like—are still divided into shaft and capital, though the forms of these are entirely remote from Egyptian or later European examples. Thus, some capitals consist of a mere enrichment of the uppermost band of the shaft and a superincumbent block very elaborately carved. In some cases this upper block gives off corbels and consoles which help to carry the roof by their greater spread.

The capitals which have excited the most interest among European students of art are those of the three Greek orders and of the five Renaissance orders which were deduced from the first three. The capital of the Grecian Doric is a reversal cone rounded off at top and carrying a square plinth or die; this plain *echinus* was richly painted in bright colors. The capital of the Ionic order is a curious device consisting of scrolls or volutes, two on each of the two opposite sides, so that this capital, almost alone, has not the same appearance from every point of view. The capital of the Corinthian order is a circular bell, surrounded by acanthus leaves and having at each corner a couple of projecting scrolls not unlike those of the Ionic order but small. This Corinthian order received many modifications in ancient Roman practice, and one of these was erected by the Renaissance men into a

separate order, the so-called Composite. From the Grecian Doric the Roman Doric took shape, and this was used by the Renaissance men, while a still simpler order was made from it and called the Tuscan. The capitals of these two orders are very thin and low in vertical measurement, and consist of moldings running round the continuation of the shaft, and either plain or slightly carved into the simplest of the egg and dart moldings or the like.

In mediæval architecture, both Romanesque and Gothic, the capitals are almost infinitely varied. The strong tendency of the time toward elaborate carving made this block of stone, from 5 to 20 feet above the aisles and in a prominent place, a most tempting vehicle for sculpture, and the abandonment of the classical orders left every artist free to design his own system of leafage, animal forms and the like. In this way mediæval capitals are often of extraordinary beauty; but no attempt has been made to classify them except as they form part of a style. See COLUMN.

RUSSELL STURGIS.

**CAPITAL** (Das Kapital), a noted work by Karl Marx, published in 1867; English translation edited by Fred Engels, 1887; a book of the first importance, by the founder of international socialism. The conservative aspect of Marx's teaching is in the fact that he honestly seeks to understand what, apart from any man's opinion or theory, the historical development actually is; and that he does not think out and urge his own ideal program of social reform, but strives to understand and to make understood what must inevitably take place.

**CAPITAL PUNISHMENT** (Latin *caput*, "the head"; hence *capitalis*, "pertaining to or affecting the head"; hence "affecting the life"), the punishment of death. The questions most commonly discussed by philosophers and jurists under this head are: (1) As to the right of governments to inflict the punishment of death; (2) as to the expediency of such punishment; (3) as to the crimes to which, if any, it may be most properly confined and limited; (4) as to the manner in which it should be inflicted.

1. As to the right of inflicting the punishment of death. This has been doubted by some distinguished persons and the doubt is often the accompaniment of a highly cultivated mind, inclined to the indulgence of a romantic sensibility, and believing in human perfectibility. One of the first men of prominence to advocate the abolition of capital punishment was Robespierre, the French revolutionist, who not only wrote many pamphlets against it, but resigned his position as criminal judge of Arras, to avoid pronouncing a death sentence. The right of society to punish offenses against its safety and good order will scarcely be doubted by any considerate person. In a state of nature individuals have a right to guard themselves from injury, and to repel all aggressions by a force or precaution adequate to the object. This results from the right of self-preservation. If a person attempts to take away my life, I have, doubtless, a right to protect myself against the attempt by all reasonable means. If I cannot secure myself but by taking the life of the assailant, I have a right to take it. It would otherwise follow that I must submit to a wrong, and lose my life rather than

PIERS WITH CAPITALS

PIERS WITH CAPITALS

preserve it by the means adequate to maintain it. It cannot, then, be denied, that in a state of nature men may repel force by force, and may even justly take away life, if necessary, to preserve their own. When men enter society, the right to protect themselves from injury and to redress wrongs is transferred generally from the individuals to the community. We say that it is generally so, because it must be obvious that in many cases the natural right of self-defense must remain. If a robber attacks one on the highway, or attempts to murder him, it is clear that he has a right to repel the assault, and to take the life of the assailant if necessary for his safety, since society in such a case could not afford him any adequate and prompt protection. The necessity of instant relief, and of instant application of force, justifies the act, and is recognized in all civilized communities. When the right of society is once admitted to punish for offenses, it seems difficult to assign any limits to the exercise of that right, short of what the exigencies of society require. If a state has a right to protect itself and its citizens in the enjoyment of its privileges and its peace, it must have a right to apply means adequate to this object. The object of human punishments is, or may be, threefold: (1) To reform the offender (2) to deter others from offending; and (3) to secure the safety of the community, by depriving the offender of the power of doing mischief. The first consideration has only lately entered into human legislation, because of the inadequacy of our means to produce great moral results by the infliction of punishment. The two latter considerations enter largely into the theory and practice of legislation. Who is to be the judge in such cases? what is the adequate punishment for any offense? Certainly punishments ought not to be inflicted which are utterly disproportionate to the offense, and beyond the exigencies of society. No government has a right to punish cruelly and wantonly and from mere revenge; but still, the discretion must be vested somewhere, to say what shall be the degree of punishment to be assigned to a particular offense. That discretion must be, from its nature, justly a part of the legislative power, and to be exercised according to the actual state of society. It may,—nay, it must,—be differently exercised in different ages and in different countries; for the same punishment which in one age or country may be sufficient to suppress an offense, or render it comparatively harmless, may, in another age or country, wholly fail of the effect. If mild punishments fail of effect, more severe ones must be resorted to if the offense be of a nature which affects society in its vital principles, or safety, or interests. The very frequency of a crime must often furnish a very strong ground for severe punishment, not only as it furnishes proof that the present punishment is insufficient to deter men from committing it, but from the increased necessity of protecting society against dangerous crimes. But it is often said that life is the gift of God, and therefore it cannot justly be taken away, either by the party himself or another. If he cannot take it away, he cannot confer that power on others. But the fallacy of this argument is obvious. Life is no more the gift of God than other personal endowments or rights. A man has, by the gift of

God, a right to personal liberty and locomotion, as well as to life; to eat and drink and breathe at large, as well as to exist, yet no one doubts that, by way of punishment, he may be confined in a solitary cell; that he may be perpetually imprisoned or deprived of free air, or compelled to live on bread and water. In short, no one doubts that he may be restrained in the exercise of any privileges or natural rights short of taking his life. Yet the reasoning, if worth anything, extends to all these cases in an equal degree. If, by his crimes, a man may justly forfeit his personal rights, why not his life? But we have seen that it is not true, even in a state of nature, that a man's life may not be taken away by another if the necessity of the case requires it. Why, then, may not society do the same if its own safety requires it? Is the safety of one person more important than the safety of the whole community? Then, again as to a man's inability to confer on others a right which he does not himself possess. Suppose it is so; the consequence which is deduced from this does not, in fact, arise. Blackstone, indeed, seems to deduce the right of society to punish capital offenses in certain cases (that is, in cases of *mala prohibita* and not *mala in se*) from the consent of the offenders. The Marquis Beccaria, on the other hand, denies that any such consent can confer the right, and therefore objects to its existence. But the notion of consent is, in nearly all cases, a mere theory, having no foundation in fact. If a foreigner comes into a country and commits a crime at his first entrance, it is a very forced construction to say that he consents to be bound by its laws. If a pirate commits piracy, it is absurd to say that he consents to the right of all nations to punish him for it. The true and rational ground on which the right rests is not the consent of the offender, but the right of every society to protect its own peace, interests, property and institutions, and the utter want of any right in other persons to disturb or destroy or subtract them. The right flows, not from consent, but from the legitimate institution of society. If men have a right to form a society for mutual benefit and security they have a right to punish other persons who would overthrow it. There are many cases where a state authorizes life to be taken away, the lawfulness of which is not doubted. No reasonable man doubts the right of a nation, in a just war, especially of self-defense, to repel force by force and to take away the lives of its enemies. And the right is not confined to repelling present force, but it extends to precautionary measures which are necessary for the ultimate safety of the nation. In such a war a nation may justly insist upon the sacrifice of the lives of its own citizens, however innocent, for the purpose of ensuring its own safety. Accordingly we find that all nations enroll militia and employ troops for war, and require them to hazard their lives for the preservation of the state. In these cases life is freely sacrificed by the nation; and the laws enacted for such purposes are deemed just exercises of power. If so, why may not life be taken away by way of punishment if the safety of society requires it? If a nation may authorize, in war, the destruction of thousands, why may it not authorize the destruction of a single life, if self-preservation requires it?

The mistake, however, is in supposing that life cannot be taken away without the consent of the party. If the foregoing reasoning be correct, such consent is neither supposed nor necessary. In truth, the supposition of an original compact between all the persons who are subject to the regulations of a society, by their own free consent, as the necessary and proper basis on which all the rights of such society depend, is at best a gratuitous supposition, and it sometimes leads to very incorrect results. It may be added that the Scriptures most clearly recognize and justify the infliction of capital punishments in certain cases.

2. As to the expediency of capital punishment. This opens a wide field for discussion. Some able men who do not doubt the right do still deny the expediency of inflicting it. It may be admitted that a wise legislature ought to be slow in affixing such a punishment to any but very enormous and dangerous crimes. The frequency of a crime is not of itself a sufficient reason for resorting to such a punishment. It should be a crime of great atrocity and danger to society, and one which cannot otherwise be effectually guarded against. In affixing punishments to any offense, we should consider what are the objects and ends of punishment. It is clear that capital punishment can have no effect in reforming the offender himself. It may have, and ordinarily does have, the effect of deterring others from committing a like offense; but still, human experience shows that even this punishment, when inflicted for small offenses, which are easily perpetrated, and to which there is great temptation, does not always operate as an effectual terror. Men are sometimes hardened by the frequent spectacles of capital punishments and grow indifferent to them. Familiarity deprives them of their horror. The bloodiest codes are not those which have most effectually suppressed offenses. Besides, public opinion has great weight in producing the acquittal or condemnation of offenders. If a punishment be grossly disproportionate to the offense, if it shock human feelings, there arises, insensibly, a sympathy for the victim and a desire to screen him from punishment; so that, as far as certainty of punishment operates to deter from crimes, the object of the legislature is often thus defeated. It may be added that a reasonable doubt may fairly be entertained whether any society can lawfully exercise the power of punishing beyond what the just exigencies of that society require. On the other hand, a total abolition of capital punishments would, in some cases at least, expose society to the risk of deep and vital injuries. A man who has committed murder deliberately has proved himself unfit for society and regardless of all the duties which belong to it. The safety of society is most effectually guarded by cutting him off from the power of doing further mischief. If his life be not taken away, the only other means left are confinement for life or transportation and exile for life. Neither of these is a perfect security against the commission of other crimes, and may not always be within the power of a nation without great inconvenience and great expense to itself. It is true that the latter punishments leave open the chance of reform to the offender, which is indeed but too often a mere delusion; but, on the other

hand, they greatly diminish the influence of another salutary principle, the deterring of others from committing like crimes. It seems to us therefore that it is difficult to maintain the proposition that capital punishments are at all times and under all considerations inexpedient. It may rather be affirmed that in some cases they are absolutely indispensable to the safety and good order of society. Some states have, however, entirely abolished capital punishment, as is the case in Holland, Rumania, Portugal, a certain number of the Swiss cantons, and some States of the American Union, including Michigan, Wisconsin, Maine, Rhode Island and Kansas. It was entirely abolished in Switzerland in 1874, but a few years after, owing to the increase of murders, it was again made permissible. It was also for a time done away with in Austria and in one or two of the States of this country, while in Russia it was abolished in 1750, only to be revived for political offenses when the Revolutionary agitators became numerous. It was again abolished in 1917 by the Revolutionary government.

3. As to the crimes to which capital punishments may most properly be limited. From what has been already said it is plain that this must depend upon the particular circumstances of every age and nation; and much must be left to the exercise of a sound discretion on the part of the legislature. As a general rule humanity forbids such punishments to be applied to any but crimes of very great enormity and danger to individuals or the state. If any crimes can be effectually suppressed by moderate means, these ought certainly to be first resorted to. The experience, however, of most nations, if we may judge from the nature and extent of their criminal legislation, seems to disprove the opinion so often indulged by philanthropists that capital punishments are wholly unnecessary. The codes of most civilized nations used to abound with capital punishments. That of Great Britain long continued to be very sanguinary. Blackstone, in his 'Commentaries,' admits that in his time not less than 160 crimes were, by the English law, punishable with death. Forgery was one of these up to the reign of William IV. The only crimes for which capital punishment may now be inflicted, according to the law of England, are high treason and murder. The law in Scotland is substantially the same, a sentence of capital punishment now being competent only in cases of treason, murder and attempts to murder in certain cases. By United States statutes nine crimes are so punishable, including treason, murder, arson, rape, piracy and robbery of the mail. In several States of the Union still fewer crimes are generally punishable with death. Beyond treason, murder, arson, piracy, highway robbery, burglary, rape and some other offenses of great enormity and of a kindred character, it is extremely questionable whether there can be necessity or expediency in applying so great a severity. Beccaria, with his characteristic humanity and sagacity, has strongly urged that the certainty of punishment is more important to deter from crimes than the severity of it.

4. As to the manner of inflicting the punishment of death. This has been different in different countries, and in different stages of civilization in the same countries. Barbarous nations are generally inclined to severe and

vindictive punishments; and, where they punish with death, to aggravate it by prolonging the sufferings of the victim with ingenious devices in cruelty. And even in civilized countries, in cases of a political nature or of very great atrocity, the punishment has been sometimes inflicted with many horrible accompaniments. Tearing the criminal to pieces, piercing his breast with a pointed pole; pinching to death with red-hot pincers; starving to death; breaking his limbs upon the wheel; pressing to death in a slow and lingering manner; burning at the stake; crucifixion; sawing to pieces; quartering alive; exposure to wild beasts; and other savage punishments, have been sometimes resorted to for the purposes of vengeance, public example or public terror. Compared with these the infliction of death by drowning, strangling, poisoning, bleeding, beheading, shooting or hanging is a moderate punishment. In modern times public opinion is strongly disposed to discountenance the punishment of death by any but simple means; and the infliction of torture is almost universally reprobated. Even in governments where it is still countenanced by the laws it is rarely resorted to; and the sentence is remitted, by the policy of the government, beyond the simple infliction of death. In Prussia, where atrocious criminals were required by the penal code to be broken upon the wheel, the King latterly used always to issue an order to the executioner to strangle the criminal (which was done by a small cord not easily seen) before his limbs were broken. So in the same country, where robbery attended with destruction of life was punished by burning alive, the faggots were so arranged as to form a kind of cell in which the criminal was suffocated by the fumes of sulphur, or other means, before the flame could reach him. Not only is torture now abolished by civilized nations, but even the infliction of capital punishment in public has been given up by most of them. In England, in high treason, the criminal is sentenced to be drawn to the gallows, to be hanged by the neck until he be dead, to have his head cut off, and his body divided into four parts, and these to be at the disposal of the Crown. But, generally, all the punishment is remitted by the Crown, except the hanging and beheading, and these too may be altogether remitted according to circumstances. In other cases the punishment is now simply by hanging, or, in the military and naval service, by shooting. In France formerly the punishment of death was often inflicted by breaking the criminal on the wheel. The usual punishment now is beheading by the guillotine. In 1853 a kind of guillotine (*Fallschwert*) was introduced into the kingdom of Saxony, and it has since been adopted as the means of execution in several other German states. In Austria the general mode of punishment is by hanging. In Prussia hanging is rarely inflicted; but the usual punishment is beheading with a heavy axe, the criminal's head being first tied to a block. In one or two German states execution by the sword still exists. It should be remarked, however, that in Germany hanging has always been deemed the most infamous sort of punishment; and the sentence has often been commuted for beheading by the sword as a milder or less dishonorable mode of punishment. In the United States of America hanging is the almost universal mode of capital punish-

ment, though electrocution has been adopted in New York and Massachusetts, and several other States. The Constitution of the United States contains a provision against "cruel and unusual punishments." In China decapitation by the sword is the usual form: murderers are cut to pieces; robbers not. In Russia the punishment of death was until 1917 frequently inflicted by the knout. In Turkey strangling and sewing the criminal up in a bag, and throwing him into the sea, are common modes of punishment. In the Roman code many severe and cruel punishments were prescribed. During the favored times of the republic many of these were abolished or mitigated. But again, under the emperors, they were revived with full severity. In the ancient Grecian states the modes of punishment were also severe and often cruel. The ancient Greek mode of capital punishment by taking poison at such hour as the condemned party should choose, seems never to have been in use among any Christian people.

Whether execution ought to be public or private has been a question much discussed, and one upon which a great diversity of opinion exists among intelligent statesmen. On the one hand, it is said that public spectacles of this sort have a tendency to brutalize and harden the people, or to make them indifferent to the punishment; and the courage and firmness with which the criminal often meets death have a tendency to awaken feelings of sympathy, and even of admiration, and to take away much of the horror of the offense as well as of the punishment. On the other hand it is said that the great influence of punishment in deterring others from the like offense cannot be obtained in any other way. It is the only means to bring home to the mass of the people a salutary dread and warning; and it is a public admonition of the certainty of punishment following upon crime. It is also added that all punishments ought to be subjected to the public scrutiny, so that it may be known that all the law requires, and no more, has been done. Since 1868 the law of the United Kingdom has required all executions to take place privately within the prison walls, and this system seems to have given general satisfaction. The same method is also practised in various other countries. In 1870 a similar measure was proposed in the French Assembly, but the war prevented it being passed and it is not yet law.

In England, the court before which the trial is held declares the sentence and directs the execution of it. In the courts of the United States there is a like authority; but in the laws of many of the States there is a provision that the execution shall not take place except by a warrant from the governor, or other executive authority. In cases of murder and other atrocious crimes the punishment in England is usually inflicted at a very short interval after the sentence. In America there is usually allowed a very considerable interval, varying from one month to six months. In Great Britain appeal is allowed, on a point of law, and on a question of fact, if the judge certifies the case as fit for appeal, or the Court of Criminal Appeal grants leave to appeal. On conviction the judge can reserve a question of law, but not of fact, for the Court of Criminal Appeal, which can reverse or affirm the judgment. The only other method of securing a revision of a

sentence is by the Royal Prerogative, exercised on the advice of the Home Secretary. In the United States there is considerable latitude of appeal. In France there may be a review in the Court of Cassation. In Germany there is, in criminal as in civil cases, a right of appeal; hence, in that country, few innocent persons have suffered capitally since the 16th century. Capital punishment cannot be inflicted, by the general humanity of the laws of modern nations, upon persons who are insane or who are pregnant, until the latter are delivered and the former become sane. It is said that Frederick the Great required all judgments of his courts condemning persons to death to be written on blue paper; thus he was constantly reminded of them as they lay on his table among other papers, from which they were readily distinguished. He usually took a long time to consider such cases, and thus set an excellent example to sovereigns of their duty. Consult Curtis, N. M., 'Capital Crimes' (New York 1894); Actes du 8me Congrès pénitentiaire international (1910).

**CAPITALS** (*majuscula*), the large letters used in writing and printing, most commonly as the initial letters of certain words, or of all words in certain positions, and distinguished from the small letters (*minuscula*). As among the ancient Greeks and Romans, so also in the early part of the Middle Ages, all books were written without any distinction in the kind of letters used; but gradually the practice became common of beginning a book, subsequently, also, the chief divisions and sections of a book, with a large capital letter, usually illuminated and otherwise richly ornamented. In legal or state documents of the 13th century capital letters are found dispersed over the text as the initial letters of proper names, and of the names of the Deity, and in the next century the same usage was followed in ordinary manuscripts. The practice with regard to the use of capitals varies in different countries. Sentences and proper names begin almost universally with capitals, but there are several other cases in which the usage is not so general. In English there cannot be said to be any invariable rule regulating their use. The first personal pronoun is always written and printed with a capital letter, and it is common also to begin titles and the names of well-known public bodies, societies, institutions, etc., with capitals. Formerly, it was a frequent practice to begin all substantives in English with a capital, which is still the rule in German. The Germans also begin all titles and pronouns of address with capitals, but not the first personal pronoun. One point in which the English practice differs from that of Germany, France, Italy and other continental countries, is in beginning adjectives derived from proper names, such as Spanish, Italian, etc., like proper names themselves, with capitals, such adjectives being printed in other countries entirely with small letters. See ALPHABET; WRITING, and consult Pron, 'Manuel de paléographie latine' (3d ed., Paris 1910); Thompson, E. M., 'Greek and Latin Palæography' (Oxford 1912).

**CAPITANIS**, kăp-ĭ-tă'nēs. See ARMATOLES.

**CAPITATION** is applied to anything that concerns a number of persons individually.

Thus a capitation tax is a tax imposed upon all the members of a state, each of whom has to pay his share, and is distinguished from taxes upon merchandise, etc. A capitation-grant is a grant given to a number of persons, a certain amount being allowed for every individual among the number. Class capitation taxes, when differentiated according to fortune, become income taxes. In France of pre-revolutionary days graduated capitation taxes were levied and were intended to reach all classes. The privileged classes, however, succeeded by various means in evading either wholly or in part these taxes and the unequal burden thus thrown on the great unprivileged class was one of the fundamental causes of the Revolution.

**CAPITO**, cā'pē-tō, or **KOPFEL**, Wolfgang Fabricius, Alsatian reformer: b. Hagenau 1478; d. Strassburg, November 1541. Entering the Benedictine order, he became professor of theology at Basel, where he showed in his lectures a tendency to shake off the trammels of the scholastic writers. In 1523 he was made provost of Saint Thomas, Strassburg. He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He then entered zealously into its work, shared with Bucer the composition of the *Confessio Tetrapolitana*, and took part in the Synod of Bern in 1532. His earnest work for Christian unity caused him to be viewed with suspicion by the narrower-minded among the Reformers. Consult Baum, 'Capito und Bucer' (Elberfeld 1860).

**CAPITOL**, now *Campidoglio*, the citadel of ancient Rome, standing on the Capitoline Hill, the smallest of the seven hills of Rome, anciently called the Saturnine and the Tarpeian Rock. It was planned and said to have been begun by Tarquinius Priscus, but not completed till after the expulsion of the kings. At the time of the civil commotions under Sulla it was burned down, and rebuilt by the Senate. It again suffered the same fate twice, and was restored by Vespasian and Domitian. The latter caused it to be built with great splendor, and instituted there the Capitoline games. Dionysius says the temple, with the exterior pillars, was 200 feet long and 185 broad. The whole building consisted of three temples, which were dedicated to Jupiter, Juno and Minerva, and separated from one another by walls. In the wide portico triumphal banquets were given to the people. The statue of Jupiter, in the capitol, represented him sitting on a throne of ivory and gold, and consisted in the earliest times of clay painted red. Under Trajan, it was formed of gold. The roof of the temple was made of bronze; it was gilded by Quintus Catulus. The doors were of the same metal. Splendor and expense were lavished upon the whole edifice. On the pediment stood a chariot, drawn by four horses, at first of clay, and afterward of gilded brass. The temple itself contained an immense quantity of the most magnificent presents. The most important papers were preserved in it. The Capitoline Hill consists of three parts, namely, the northern summit, now occupied by the church of Santa Maria in Araceli; the southern summit, crowned by the Palazzo Caffarelli, usually oc-

cupied by the German ambassador; and the depression between these, in which is now the Piazza del Campidoglio. The above church, which is approached from the northwest by a lofty flight of steps, is of great antiquity. In 1888 the Franciscan monastery which was connected with it was replaced by a large monument of Victor Emmanuel II. The Piazza del Campidoglio was designed by Michelangelo. In its centre is a fine equestrian bronze statue of Marcus Aurelius. On the southeast side there is the Palazzo del Senatore, with a fine flight of steps erected by Michelangelo. The Palace of the Conservatori occupies the southwest side of the square, and contains valuable collections in art and antiquities. Directly opposite is the Capitoline Museum, founded by Innocent X. The southern summit of the hill is now called Monte Caprino, and on it, beside the Palazzo Caffarelli already mentioned, stands a hospital and a German archaeological institute. (See *ROME*). Consult Platner, 'Topography and Monuments of Ancient Rome,' pp. 291-308, New York 1911. Besides the edifice in Washington where Congress assembles, the state-houses in States of the Union are officially called capitols. Of these the most noteworthy are those at Albany, Hartford, Providence, Austin, Jefferson City and Saint Paul.

**CAPITOL AT WASHINGTON, The.** After the national capital had been located on the Potomac in 1789, Washington and Maj. P. C. L'Enfant selected sites for the public buildings. On the first map (1791), the "Congress House" is situated as now, on a low hill commanding the best view in Washington, with 12 broad streets radiating from it, so that it closes the vista of every main avenue. On the decision of a board of three commissioners, with Washington and Jefferson, the plans of the capitol and the President's house were given out in 1792 to public competition, for a prize of \$500 or a medal of that value, at the winner's option. For the President's house James Hoban's plans were accepted at once, and he was made superintendent of its erection. For the capitol none were satisfactory, but the three foremost competitors were given another trial, and one, Stephen Hallet, a French artist living in Philadelphia, was employed at a salary and indemnity to revise his plans under the commissioners' criticism. But later in the year Dr. William Thornton of Tortola Island, W. I., submitted plans whose "grandeur, simplicity, beauty and convenience" forced the committee to accept them. They were too grand for the commissioners' ideas of national needs or resources at the time, however, and specified too costly materials. Thornton wished marble and mahogany and the best of construction, and under a bitter assault from several of his rejected competitors, headed by Hallet, whom the commissioners had joined with Thornton in a revising board, he was forced to reduce its scale and material greatly. Their suggested modifications of his general plan were, however, disapproved. These plans were for what is now the central portion of the capitol.

Work was begun about 1 August. The corner-stone was laid 18 September in the southeast corner of the old north wing, now the Supreme Court section, with imposing ceremonies, Masonic rites and procession, and a barbecue. Hoban was made superintendent,

and Hallet his assistant; but Hoban gave his whole time to the White House, as the President's house came to be called, and Hallet was the real manager. He proceeded to change Thornton's plans and specifications at will, was repeatedly censured for it and at last ordered to stop it. He resigned, but refused to give up the drawings; the commissioners at last secured them and discharged him, 15 Nov. 1794. Thornton, now one of the commissioners of the District of Columbia, was asked by Washington to obliterate Hallet's changes as injurious, and did so. Hoban now acted as superintendent until George Hadfield, an English architect, was engaged to succeed Hallet, on Jonathan Trumbull's recommendation of him as a modest man and good artist. He outdid Hallet; spent his whole energy in fighting Thornton and Hoban (who always worked in harmony), and after repeated resignations and reconsiderations, was discharged for practical incompetence 10 May 1798. Hoban again took charge. On 17 Nov. 1800 the second session of the sixth Congress met in the north wing of the building. Much of this early construction was of wood or poor material. This was on account of haste, the local interests being very urgent for the coming of the government to that seat. A few years later more durable material was substituted. The commissionership was abolished May 1802, and Thornton and Hoban ceased direct superintendence, though often called in consultation. At this time the north wing was complete, the foundation of the central rotunda and dome in place and the basement story of the south wing partly done. These are still as Thornton planned them.

On 6 March 1803 Jefferson appointed Benjamin H. Latrobe (q.v.) "surveyor of public buildings." He at once began, like the others, to besiege the President with the bitterest assaults on Thornton's designs, and when the former declined to interfere, appealed to Congress. Thornton, however, now in charge of the patent office, though he defended himself with energy, made no further attempt to prevent the alteration of his plans, and Latrobe made many serious changes, some of them since judged harmful to beauty and utility. Thus, the Representatives' hall was changed from a graceful ellipse to a square with semi-circular ends; a bad echo gave trouble for many years, caused by the changes. The number and size of entrances to the rotunda were curtailed, the splendid open staircases, cut down and placed in obscurity, were difficult for strangers to find; and the grand semi-circular western portico was abolished. The principal entrance was also changed from the west front, facing the White House, to the eastern side. Latrobe was constantly in hot water with both Jefferson and Congress, and published a pamphlet against them in 1806; but till 1811 had pretty much his own way. When the War of 1812 broke out, the capitol consisted of the north and south wings, connected by a corridor of rough boards over the central foundations. On 24 Aug. 1814 the British burnt it as far as possible, piling the furniture and platforms in the rooms with rocket stuff and igniting them; the interior was dreadfully damaged, but the outside walls remained, also the inside brickwork and some stone. A strong movement arose for removing the capital elsewhere; but the same considerations prevailed against it as

later. In fear of such a result, however, the local interests formed the "Capitol Hotel Company," and erected a building for government occupancy till the repairs on the capitol were finished. It was occupied, 1815-19, and was afterward known as the "Old Capitol," and used in the Civil War as a military prison. In the reconstruction the House wing was entirely altered.

Near the end of 1817 Latrobe became embroiled with a new commissioner of the Federal building, Samuel Lane, and resigned. In his place was appointed Charles Bulfinch (q.v.), from 1 Jan. 1818; he remained supervising architect for the next decade. In the winter of 1819-20 Congress took its seat in the new hall. The centre was pushed forward to completion, and on 10 Dec. 1824, the entire interior was finished. In 1825 a public competition was held for the figures on the pediment of the eastern portico. From 1826 on, Bulfinch was employed on special detail, and the landscape gardening and work on the grounds, which were of his designing. The capitol was set in a park of 22½ acres, encircled by an iron railing somewhat taller than a man, affixed in the sandstone coping of a low wall. There were four carriage and five pedestrian entrances. On 2 March 1828 the position of architect of the capitol was abolished; but Bulfinch remained in employment till the end of June 1829, when Jackson dismissed him. He designed and planned the modern form of the then west extremity of the building, the Senate galleries and the terraces on the east; and made the dome higher than in Thornton's plan. Among others who should have great credit for the beauty of the capitol are Peter Lenox, clerk of works under Latrobe; George Blagden, superintendent of stone-cutters; and Giovanni Andrei, an Italian, superintendent of carvers. That so beautiful and harmonious a structure should have emerged from the contentions of so many different minds is due partly to the really great ability of the three chief architects, Thornton, Latrobe and Bulfinch, and partly to the determination of successive Presidents that the changes should harmonize with the original design. Latrobe's material external alterations of Thornton's plan have been mentioned; Bulfinch designed the western central portico as it now stands.

From 1829 to 1836 there was no architect of the capitol. On 6 June 1836, Jackson appointed as Federal architect Robert Mills (q.v.), who had studied under Latrobe; and he held the place till 1851. Thomas U. Walter (q.v.) then took the post, having drawn the plans for the two modern wings that extended the original capitol, which the government needs had outgrown, into the modern one. The corner-stone of the extension was laid by President Fillmore, 4 July 1851; the new Representatives' hall was occupied in 1857; the Senate hall in 1859. The great lengthening of the dimensions required a correspondent heightening of the dome; and Mr. Walter designed a new one, which was constructed during the Civil War, and completed at the close of 1863, the statue of Freedom being then lifted into place. Mr. Walter, however, had foreseen a future need of still further extension, and had drawn plans for it while the other work was going on. Congress in the spring of 1903 authorized their execution, at an expenditure of \$2,500,000 and three years'

time, under the supervision of the Federal architect, Mr. Woods. As now completed the capitol cost over \$16,000,000. It covers an area of about four acres standing amid beautiful park grounds of nearly 50 acres, adorned with fountains and classic statuary. The building is 750 feet long, from 121 to 140 feet deep and rises to a total height of 285½ feet from the base of the capitol to the top of the final figure of Freedom, 19½ feet high, on the dome. Massive cast bronze doors, depicting events famous in the nation's history, grace the three main entrances on the east front—to the Rotunda, the Senate and the House. In the Rotunda under the dome are many priceless historical paintings, and in Statuary Hall is an assemblage of portrait statues, gifts from various states. The Supreme Court occupies a room in the Central building; the Senate chamber is in the north wing, the House of Representatives in the south.

**CAPITOLINE GAMES**, games held in ancient Rome in celebration of the deliverance of the city from the Gauls, and in honor of Jupiter Capitolinus, to whom the Romans ascribe the salvation of the capitol in the hour of danger. They were instituted 387 B.C., on motion of Camillus, after the departure of the Gauls. They were in charge of the guild of the Capitolini, whose members were chosen from those who lived on the capitol. In later times it appears they were discontinued. In 86 A.D., Domitian instituted Capitoline games, which were held every four years down to a late period of the empire.

**CAPITOLINUS, Julius**, Roman historian, who lived at the beginning of the 3d century, and wrote the lives of the emperors—Antoninus Pius, M. Aurelius, L. Verus, Pertinax, Albinus, Macinus, the Maximini, the Gordiani, Balbinus and Pupienus. He is one of the writers of the 'Historia Augusta,' in the editions of which his works are to be found.

**CAPITULARY**, (Lat. *capitula*, "chapters"), a writing divided into heads or chapters, especially a law or regal enactment so divided into heads. Laws known by this designation were promulgated by Childebert, Clothaire, Carloman and Pepin, kings of France; but no sovereign seems to have put forth so many of them as the Emperor Charlemagne, who appears to have wished to effect, in a certain degree, a uniformity of law throughout his extensive dominions. With this view it is supposed he added to the existing codes of feudal laws many other laws, divided or arranged under small chapters or heads, sometimes to explain, sometimes to amend, and sometimes to reconcile or remove the differences between them. These were generally promulgated in public assemblies composed of the sovereign and the chief men of the nation, both ecclesiastical and secular. They regulated equally the spiritual and temporal administration of the kingdom; and the execution of them was entrusted to the bishops, the courts and the *missi regii*, officers so called because they were sent by the French kings of the first and second race to dispense law and justice in the provinces. Many copies of these capitularies were made, one of which was generally preserved in the royal archives. The authority of the capitularies was very extensive. It prevailed in every kingdom under the do-

minion of the Franks, and was submitted to in many parts of Italy and Germany. The earliest collection of the capitularies is that of Ansgise, abbot of Fontenelle. It was adopted by Louis the Debonnaire and Charles the Bald, and was publicly approved of in many councils of France and Germany. But as Ansgise had omitted many capitularies in his collection, Benedict, the Levite or deacon of the church of Mentz, added three books to them (before 858). Each of the collections was considered to be authentic, and of course was appealed to as law. Subsequent additions have been made to them. The best editions of them are those of Baluze, *Capitularia Regum Francorum* (2 vols., Paris 1677), Walter, *Corpus Juris Germanici Antiqui* (3 vols., Berlin 1824), and of Pertz in the *Monumenta Germaniæ Historica* (2d div., Vols. I and II, Hanover 1835-37). The best of all is Boretius, *Mon. Germ. Hist. Legum Sectio II* (Vols. I and II, Hanover 1883-97). The capitularies remained in force in Italy longer than in Germany, and in France longer than in Italy. The incursions of the Normans, the intestine confusion and weakness of the government under the successors of Charlemagne, and above all the publication of the epitome of canon law termed the *Decretum* of Gratian, about the year 1150, which totally superseded them in all religious concerns, put an end to their authority in France.

**CAPITULATION** ("a writing drawn up in heads"), in military language, the act of surrendering to an enemy upon stipulated terms, in opposition to a surrender at discretion. The word is also used to designate the instrument containing the terms. The proposition to enter into such a compact may originate either with the commander of the successful or of the defeated party. Based on the terms proposed by either, the conditions are agreed upon, being modified by the relative strength of the belligerents. Consult Article XXXV of the Second Peace Conference at The Hague (1907).

In the 15th century capitulations, as they were called, were presented by the ecclesiastical establishments in Germany to their newly-chosen abbots and bishops, who were obliged to swear to observe them as laws and conditions for their future rule. The ecclesiastical electors obtained, after the fall of the Hohenstaufen family, certain advantageous promises from the new emperors, which were called capitulations. When Charles V was proposed as emperor, and it was apprehended, on account of his foreign education, that he would disregard the German constitution, he was obliged to make oath that he would not reside without the German empire, nor appoint foreigners to office in the empire, etc. This was called his "election capitulation." Such a *Wahlcapitulation* was afterward presented to every new emperor as a fundamental law of the empire. In this way the authority of the German emperors was constantly more and more diminished, so that at last it became merely nominal, since the electors, at the choice of every new emperor, made some new infringement on the imperial privileges. The *Wahlcapitulationen* were acknowledged bargains, certainly unique in history.

**CAPITULATIONS, Turkish**, the decrees governing the privileges and powers of Europeans resident on Turkish soil, so called ap-

parently for the reason that they were divided into articles or chapters. After 1453 such privileges were frequently granted by the sultans; they were personal grants, however, and valid only for the life of the grantor. Hence they were renewed, often with modifications, by each new sultan. So we find many capitulations made with France, England and other states. The earliest of the capitulations, to which reference is often made for precedent, dates from 1535 and was granted to Francis I of France. It was more specific and formal than any preceding grant of the kind and remained in force for over 350 years. By it the French were permitted to travel and to trade according to their own customs and usages; it granted them freedom from all imposts except customs duties, also liberty in matters of religion, inviolability of domicile and the extra-territorial jurisdiction of consuls. Even if they committed a crime, they were to be arrested by an Ottoman official only in the presence of a consular or diplomatic officer of their own country. Ottoman officers, if asked by a consular or diplomatic officer to aid in the arrest of a French subject, were compelled to perform such service. The French had the full right of making wills. If they died intestate in Turkey, their own consul must take possession of their estate and liquidate or administer it for their heirs. Soon after this grant to France other nations of the Occident sought similar privileges. In 1583 Queen Elizabeth after four years of effort succeeded in establishing relations of this nature with the Sultan. This capitulation was afterward many times renewed. The Netherlands received a capitulation in 1609, and Austria in 1615.

In 1673 a new power was granted to France, namely, the exclusive right of protecting under her flag the subjects of sovereigns who had received no capitulations. This gave France prestige in Europe by placing several powers under obligation to her. But in 1675 England succeeded in gaining a right to the protection of other nations jointly with France, so that some states had the option of English or French protection. Austria in 1718 got permission for Genoa and Leghorn to use her flag.

No concession made in the capitulations to foreign powers led to greater abuses than this grant of the right to protect the citizens of sovereigns or states without capitulations. The French and English sold to native Greeks and Armenians the privilege of protection by a document which exempted them from paying duties on goods imported. Many of these became rich through this advantage, and were permitted to make a transfer of their privilege for a consideration. Ambassadors became rich through the traffic; one of the French ministers, it is stated in an official report, received more than 400,000 francs from this source, and the English Ambassador is said to have received from £2,000 to £3,000 as his share. Russia and Austria abused this right of protection for political ends. Rivals in seeking influence in Moldavia and Wallachia in 1780-82, their consuls competed with each other in granting patents of protection to the natives. By 1800 Austria had by this process more than 200,000 subjects in Moldavia and 60,000 in Wallachia. These latter were later given to Russia. In 1806 in order to embarrass Russia Napoleon

put an end to the abuse and Turkey succeeded in persuading most of the foreign powers to follow his example. But this did not prevent many of the great Powers, through their consuls, taking large numbers of Turkish rajahs under their protection under one pretext or another. Many of these formed lawless crowds claiming exemption from police supervision. Many were men of wealth whose acts led to frequent diplomatic difficulties. We need not wonder, then, that in 1869 the Sultan issued an *irade* forbidding the naturalization of his subjects under a foreign government unless they had previously obtained his consent. All treaties since 1800 between Turkey and European powers are based on the capitulations, notably that of 1740. Down to the 19th century foreigners could not hold real property except under borrowed names. Since 1867 they have been allowed to hold it. After 1868 the inviolability of the domicile of a foreigner was limited to residences within nine hours' journey of a consular post. Questions of real property were determined by an Ottoman court. Religious freedom was confirmed in all treaties.

Turkey made repeated efforts to annul the capitulations. She attempted to do so at the Paris Congress of 1856, and again in 1862. But the Powers were unwilling to accede to her request. Germany renounced the capitulations in 1891, but under the most favored nation clause in her treaties she still enjoys the same privileges as formerly. All the Powers except the United States had been gradually yielding on the point of extraterritorial jurisdiction, though the consul of one accused of crime attended the trial, and if there was a denial of justice imminent, the case was made one for diplomatic intervention. America's insistence often led to a miscarriage of justice because the Ottoman government refused to furnish witnesses, and permitted the culprit to escape. Another fruitful source of trouble was in respect to Armenians, who take out naturalization papers in America and return home as American citizens. The Sultan has not recognized such naturalization since 1869, unless it has been made with his consent. England has sidestepped this difficulty by stating on the passports of Turkish subjects naturalized in Great Britain that such passports are not valid on the return of the bearer to Turkey.

The Young Turks after their advent to power repeatedly denounced the capitulations and on 11 Nov. 1914 the Ottoman government announced their abolishment. However, until the Western Powers are satisfied that the judicial system in Turkey has undergone reform sufficient to ensure an impartial administration of justice, it is not likely that the Porte will be permitted to ignore these agreements altogether. See EXTRATERRITORIALITY and consult Moore, John Bassett, 'Digest of International Law' (1906); Angell, J. B., 'Turkish Capitulations' (in *American Historical Review*, Vol. VI, 1901); McLaughlin, A. C., and Hart, A. B., 'Cyclopedia of American Government' (Vol. I, New York 1914).

**CAPIZ**, kâ pèth', Philippines, capital of the province of Capiz, situated in the northern part of the island of Panay, four miles from the mouth of the Panay or Capiz River. The river is navigable to the city, and there is also an

excellent roadstead at its mouth. There is a large local trade, particularly in rice, and connection by steamer with Manila. Capiz is also a telegraph and military station. Highroads connect the town with Iloilo and Miagao. Pop. 18,525.

**CAPLIN**, or **CAPELIN**, a small savory smelt (*Mallothus villosus*), found in large numbers on the Arctic Coast as far south as Cape Cod. The inhabitants of Newfoundland and Labrador catch it in large quantities at certain seasons, and many are dried and exported to Great Britain. The eggs are deposited in very great numbers in the sand along the Arctic shores, are then washed ashore by the waves, where they hatch, the fry being washed back into the sea. Adults are also washed ashore in great numbers and perish. In Greenland fossil caplin have been uncovered, enclosed in clay nodules of recent shales.

**CAPMANY Y DE MONTPALAU**, kâp-mâ-nê é mönt-pa-lâu', Antonio de, Spanish critic and historian: b. Barcelona, 24 Nov. 1742; d. Cadiz, 14 Nov. 1813. He served in the wars with Portugal in 1762, left the army in 1770 and joined Olavide in his scheme for colonizing and cultivating the Sierra Morena. This enterprise terminated disastrously, and Capmany removed to Madrid, where he was chosen secretary of the Royal Historical Academy of Spain in 1790, and filled several offices in the gift of the government. He traveled in Italy, Germany, France and England. When the French entered Madrid in 1808 he fled to Seville, arriving there destitute and in rags. He was chosen a member of the Cortes of Cadiz, in which capacity he made himself conspicuous by his patriotism and active opposition to the new rulers. His works, which enjoy a high reputation in Spain, are numerous; among them are 'Memorias históricas sobre la marina, comercio y artes de la antigua ciudad de Barcelona' (4 vols., 1779-92); 'Cuestiones críticas sobre varios puntos de historia, economica, politica y militar' (1807); 'Teator historico-critico de la elocuencia española' (5 vols., 1786-94); 'Diccionario Frances-Español' (1805); 'Código de las costumbres marítimas de Barcelona' (2 vols., 1791). Of these, the 'Memorias,' the 'Cuestiones' and the 'Código' contain valuable details on the commerce, industry and maritime laws of the Middle Ages. He is equally famed for his philological works, the chief of which are 'Discursos analíticos sobre la formación y perfección de las lenguas, y sobre la castellana en particular' (1776) and 'Filosofía de la elocuencia' (1776; London 1812; Gerona 1826). The purity of his language led the Real Academia Española to include his name in the 'Catálogo de Autoridades del Idioma.' Consult Sempere y Guarinos, 'Ensayo de una biblioteca española' (6 vols., Madrid 1785-89).

**CAPNOMANCY**, divination by smoke, one of the modes of divination resorted to by the ancients. They used to burn vervain or some other sacred plant, and observe the form and direction which the smoke took in escaping, and from these circumstances they drew their auguries. Sometimes the smoke of sacrifices was observed instead of that of vervain. When this smoke was thin and transparent and ascended in a straight column, it was considered a good omen; if, on the contrary, it was thick

and opaque, the omen was bad. Another method of acquiring a knowledge of the future by capnomancy was to throw the seeds of jasmine or poppy on burning coals, and to observe the smoke which rose from them.

**CAPO D'ISTRIA**, Austria (the ancient *ÆGIDA*, later *JUSTINOPOLIS*), seaport on the Gulf of Trieste, nine miles south of Trieste, in the crownland of Istria. It is connected with the mainland by a causeway rather more than half a mile long. It is defended by an old fort now going to decay. It contains a cathedral, a lofty edifice, faced in the Venetian style with marble, and containing some fine paintings, sculptures and arabesques. It is the seat of a bishop, and has six monasteries and two nunneries, a gymnasium, several hospitals and a penitentiary. There are manufactories of soap, candles, leather and sea-salt; and there is also a considerable trade in wines, oil and fish. After the 10th century Capo d'Istria belonged, alternately, to the Venetians and Genoese, till finally, in 1478, it succeeded in making itself independent of the latter with the aid of the former. Capo d'Istria now became the capital of Istria, and along with it came into the possession of Austria in 1815. Pop. 11,765 (largely Italian).

**CAPO D'ISTRAS**, *kā-pō-dēs'-trē-ās*, or **CAPO D'ISTRIA**, *Ioannes Antonios*, COUNT, Greek statesman: b. Corfu, 11 Feb. 1776; d. Nauplia, 9 Oct. 1831. His family had been settled in Corfu since 1373, but originally came from the Illyrian town of Capo d'Istria. He devoted himself to political life, and in 1809, after holding a high place in the Ionian Islands, entered the diplomatic service of Russia. Here his policy tended to the separation of Greece from Turkey. In 1828 he entered on a seven years' presidency of Greece; but whether from his attachment to Russian interests, or from the jealousy and impatience of restraint of the chiefs, he speedily became extremely unpopular. Several of these unruly chiefs belonging to the islands and to the province of Maina at last, in the spring of 1831, rose in open rebellion against him, demanding a convocation of the National Assembly, the establishment of the liberty of the press, and the release of certain state prisoners, especially of Petros Mauromichalis, one of their own number whom D'Istria had arrested and imprisoned. The President obtained the aid of Russia, but before the insurrection could be quelled he was assassinated in a church at Nauplia, by Constantine and George Mauromichalis, the brother and nephew of Petros Mauromichalis. Consult Phillips, 'The War of Greek Independence' (1897).

**CAPONIÈRE**, *kā-pō-nyār*, or **CAPONNIÈRE**, in fortification, a place covered against the fire of the enemy on the sides, sometimes also above, and serving for the connection of two works or for maintaining an important point. In particular: (1) A passage secured by two parapets, in the form of glacis, which leads through the dry ditch from one work to another; for instance, from the chief wall to the ravelin. If danger is to be apprehended only from one side, and consequently only one parapet is made, it is called a *demi-caponnière*; if it is covered above with hurdles or with wood, it is called a *coffer*: but this word is often used indifferently for *caponnière*. (2) Small block-houses so located as to fire along a

dead angle. Coehorn laid out similar but less useful works below the glacis, and Scharnhorst proposed them, under the name of *field-caponnières*, for the salient angles of field fortification. *Caponnières* are also known as *tambours* in many recent works on field fortifications. See **FORTIFICATION**; **TAMBOUR**.

**CAPOTE**, *kā-pō'tā*, **Domingo Mendez**, Cuban statesman: b. Cardenas 1863. He was graduated at the University of Havana and became one of the best-known lawyers in Cuba. Subsequently he was a professor in the University of Havana for many years. In December 1895 he joined the insurgents under Gen. Maximo Gomez; became a brigadier-general, and was appointed civil governor of Matanzas and of Las Villas. In November 1897 he was elected Vice-President of the Cuban republic. When the Cuban Constitutional Convention appointed a commission of five members to confer with President McKinley and Secretary Root concerning the future relations of the United States and Cuba, he became its leader. The conference was held in Washington, D. C., in April 1901.

**CAPOUL**, *kā-pool*, **Joseph Amédée Victor**, French tenor singer: b. Toulouse, 27 Feb. 1839. He was educated at Paris, and sang there in the *Opéra Comique*, 1861-72, where he was very popular, especially in his rôle as Gaston de Meillagré in Auber's 'Premier jour de bonheur.' He has also sung in New York, London, Vienna, Saint Petersburg and other cities, being everywhere very successful. In 1892 he accepted the position of professor of operatic singing at the National Conservatory in New York. In 1898 he took up his residence in Paris, being in great demand as a singing teacher. In 1900 he became stage director at the Grand Opéra.

**CAPPADOCIA**, *kāp-pā-dō'shī-ā*, in antiquity, one of the most important provinces in Asia, once a famous kingdom; in its widest extent bounded west by Lycaonia, south by Cilicia and Syria, east by Armenia and north by the Pontus Euxinus. In the period of the Persian government Cappadocia comprehended all the country between the Halys and Euphrates. By the former river it was separated from Phrygia and Paphlagonia; by the latter, from Armenia: therefore the region afterward called Pontus was comprehended in this territory. The Persians divided it, according to Strabo, into two satrapies, which bore the name of Cappadocia Magna, afterward Cappadocia Proper, and Cappadocia Minor, afterward Pontus. This division, however, was not always strictly observed. The Persian satraps governed, at a later time, under the title of kings, and sometimes made themselves independent. At the time of the famous retreat of the 10,000 Greeks, both the Cappadocias seem to have been under the rule of Mithridates I, who had participated in the conspiracy of Cyrus the Younger, but retained his government and became, after the defeat of Cyrus, again dependent upon the kings of Persia. Alexander the Great received tribute from Ariarathes, but the latter's son did not recognize Alexander's successors. It changed sides frequently during the civil struggles of Cæsar and Pompey, Octavian and Antony and became a Roman prov-

ince in 17 A.D. Cappadocia Magna was a good grazing country, and also well adapted for the cultivation of grain, especially wheat; but wood was scarce. Mazaca, afterward Cæsarea, now Kaisariyeh, was the residence of the kings of Cappadocia. The name of Leukosyri (White Syrians) is said by Strabo to have been applied to the Cappadocians, as if to distinguish them from the dark Syrians who dwelt on the east of Mount Amanus. The ancient population is at present represented by a few mountain tribes called Taktadji. Some anthropologists connect them with the Hittites. However, there is considerable difference of opinion in regard to their ethnic origin. Consult Chantre, 'Recherches anthropologiques dans l'Asie occidentale' (Lyons 1895); Grothe, 'Meine Vorderasiens Expeditionen' (Leipzig 1911); Von Luschan and Petersen's 'Reisen in Lykien' (Vienna 1889); Von Luschan, 'Tachtadschy' (in *Archiv für Anthropologie* 1901).

**CAPPONI**, káp-pō'nē, Gino, MARCHESE, Italian scholar and historian: b. Florence, 14 Sept. 1792; d. there, 3 Feb. 1876. He traveled widely and devoted himself almost entirely to his studies in spite of the fact that he became blind early in life. Returning to Italy he founded at Florence the *Antologia Italiana*, which was suppressed in 1832, when he at once founded the *Archivio Istorico Italiano*. For a short time in 1848 he was at the head of the Tuscan government, attacks by the Radicals causing his temporary retirement to private life. In 1859 he was a member of the Constitutional Convention of Tuscany; he was also made a senator of Italy; and in 1862 was at the head of the Historical Commission for Tuscany, Umbria and the Marches. He wrote 'Storia della repubblica di Firenze' (1875), a standard work; and had a part in the preparation of a lexicon by the Accademia della Crusca, and in the editing of texts of Dante's 'Divine Comedy' (Florence 1837). Consult Tabarini, 'Gino Capponi' (Florence 1879), and Von Reumont, 'Gino Capponi ein Zeit-und Lebensbild' (Gotha 1880).

**CAPPS**, Edward, American philologist: b. 21 Dec. 1866. He was graduated from Illinois College, 1887; took his doctor's degree at Yale, 1891; and was tutor in Latin at the latter place, 1890-92. He was successively associate professor and professor of Greek in the University of Chicago from 1892 to 1907. In the latter year he became professor of classics at Princeton University. Besides a number of philological papers, he has written 'From Homer to Theocritus' (1902); 'Four Plays of Menander' (1910); and sundry other articles in classical philology.

**CAPPS**, Washington Lee, American naval constructor: b. Portsmouth, Va., 31 Jan. 1864. A graduate of the United States Naval Academy in 1884 he rose by grades to the position of naval constructor in 1895. After service at the Union Iron Works 1896-98, and at Washington 1899-1901, in 1903 he was appointed chief constructor of the navy with the rank of rear-admiral. Reappointed four years later, he retired in 1910. President Wilson appointed him commissioner to represent the United States at the International Maritime Conference in 1913.

**CAPRARA**, kā-prā'ra, Giambattista, CARDINAL, Italian ecclesiastic: b. Bologna, Italy, 29 May 1733; d. Paris, 21 June 1810. He studied theology, became vice-legate of Ravenna in 1758 under Benedict XIV, and in 1785 was sent by Pius VI, as nuncio to Vienna, to remonstrate with the Emperor Joseph on his conduct in relation to Church matters. His remonstrance proved ineffectual, but in 1792 he was appointed a cardinal, shortly afterward a member of the state council, and in 1800 bishop of Jesi. In 1801 he went to Paris as legate of Pius VII, and conducted the negotiations with Napoleon with so much success that the first concordat was speedily concluded. Shortly after he was appointed archbishop of Milan, and in 1805 he crowned Napoleon king of Italy, placing on his head the iron crown of Lombardy. The cardinal left his fortune to the hospital in Milan.

**CAPRERA**, kā-prā'ra, a small island to the northeast of Sardinia, and separated from it by a narrow strait. It is six miles long from north to south, and two miles broad. It is fertile, and produces both corn and good pasture and is connected with the island of Maddalana by a causeway and drawbridge. It is well known as the ordinary residence of Garibaldi, who after 1854 possessed a dwelling-house on the island, along with a piece of ground which he farmed until his death there 2 June 1882.

**CAPRI**, kā-prē, Italy, an island in the beautiful Gulf of Naples, which contributes not a little to the charms of this favorite scene of nature. Capri, five miles long and three broad, lies at the entrance of the gulf, and consists of two mountains of limestone, remarkable for their picturesque shape, and a well-cultivated valley. The inhabitants amounting to about 5,000, are occupied in the production of oil and wine, in fishing and in catching quails, which come in immense numbers from Africa to the shores of Italy. Every spot on the island which can be made productive is cultivated. In fact, agriculture all around Naples is in the highest state of perfection. The town of Capri is the seat of a bishop. A high rock separates Capri from the little town of Anacapri, which is reached by 522 steps cut in the rock in 1876. The highest point on the island is Mount Solaro, which rises 1,920 feet above the sea. Capri has a delightful climate and pure air, and is visited annually by over 30,000 tourists. It is a favorite summer resort for the Neapolitans, being distant but 20 miles southwest of their city. The supply of drinking water is far from satisfactory. With the Romans Capri was called Capræ. Augustus obtained it from the Neapolitans in exchange for Ischia, and made it a place of agreeable retreat, but never made use of it. Tiberius spent here the last seven years of his life in degrading voluptuousness and infamous cruelty. The ruins of his palaces are still extant, and other ruins are scattered over the island. The island of Capri is notable for several remarkable caverns or grottoes in its steep, rocky coast. By far the most remarkable of these is unquestionably the celebrated Grotta azzurra (Blue Grotto), which was discovered by a singular accident in the summer of 1832, an Englishman while bathing having observed

the opening in the rocks which forms the entrance to the grotto, and swum into it. It gets its name from the fact that, while the sun is shining outside, all the objects within the cavern—rocks, water and sand—are tinged with a beautiful blue color, very soft and agreeable to the eye. The cavern is elliptical in form, measuring about 1,200 or 1,300 feet in circumference; its height is about 41 feet with water 48 feet deep, and its roof and sides bristle with stalactites. The blue color within the grotto is supposed to be caused by the refraction of the rays of light in passing through the water before entering the cave. The blue rays, with those next to them, the violet and the indigo, being the most refrangible, are the only rays that are admitted, the others—red, orange, etc., being dispersed in the water. In another part of the coast there is another grotto which exhibits phenomena precisely similar, except that the objects in this one are clothed with a green instead of a blue color. It is hence called the Grotta verde (Green Grotto). The English captured the island in 1806 and fortified it, but lost it to the French two years later. They recovered it in 1813 and restored it to King Ferdinand IV of Sicily. Consult Allers, 'Capri' (Munich 1894); Furchheim, 'Bibliographia dell' isola di Capri' (Naples 1899); Gregorovius, 'Die Insel Capri' (Leipzig 1897); Weichardt, 'Das Schloss des Tiberius und andere Römerbauten auf Capri' (Leipzig 1900).

**CAPRIC ACID.** See DECOIC ACID.

**CAPRICCIO**, kă-prĕ'chō (*Caprice*), is the name applied to a musical composition, in which the composer follows the bent of his humor, the aim being to produce piquant and striking effects. The *capriccio* may be used with propriety in pieces for exercise, in which the strangest and most difficult figures may be introduced, if they are not at variance with the nature of the instrument or of the voice. A shorter piece of the same nature is often called *capricciotto*.

**CAPRICORNUS** (Lat. *caper*, "a goat," and *cornu*, "a horn"), "the goat," one (the 10th) of the 12 signs of the Zodiac, between Sagittarius and Aquarius; also the corresponding zodiacal constellation, one of Ptolemy's original 48 and designated by the sign ♄, representing the horns of a goat. One of its brightest stars, Alpha, is a wide double, easily separated by the naked eye by anyone with good eyesight. Capricornus is surrounded by Aquila, Aquarius, Piscis Austrinus, Microscopium and Sagittarius. The star was celebrated among the ancients, who regarded it as of good omen, and as marking the southern tropic or winter solstice, whence it was known as "the Southern Gate of the Sun."

**CAPRIFICATION**, the fertilization of the flowers of the Smyrna fig with pollen derived from the wild fig, or caprifig. From time immemorial it has been the custom of Orientals to break off the fruits of the caprifig, bring them to the edible-fig trees and tie them to the limbs. From the caprifigs thus brought in there issues a minute insect, which, covered with pollen, crawls into the flower receptacles of the edible fig, fertilizes them, and thus produces a crop of seeds and brings about the sub-

sequent ripening of the fruit. It has been shown that the varieties of the wild fig or caprifig are the only ones which contain male organs, while the varieties of the Smyrna fig are exclusively female. In the caprifig there are said to exist in Mediterranean regions three crops of fruit,—the spring crop, a summer crop and a third, which remains upon the trees through the winter. The fig-insect (*Blastophaga grossorum*) over-winters in the third crop, oviposits in the spring crop, develops a generation within it, each individual living in the swelling of a gall-flower (a modified and unfertile female flower), and, issuing from it covered with pollen, enters the young flower receptacles of the young Smyrna fig, which are at that time of the proper size, and makes an attempt to oviposit in the true female flowers, fertilizing them at the same time by means of the pollen adhering to their bodies. The life history of the insect from that time on is not well understood, but the *Blastophaga* has been known to occur again in the over-wintering crop of figs. The effect of caprification on the young Smyrna figs becomes readily visible within a few days; before the *Blastophaga* enters the fig the latter is transverse and strongly ribbed, while a few days after fertilization the fig swells up and becomes rounded and sleek. The male *Blastophaga* is always wingless. It has no ocelli, and its compound eyes are greatly reduced in size. The fact that the male rarely leaves the fig in which it is hatched might almost be inferred from these facts of winglessness and partial blindness. When this wingless male issues from the seed-like gall in which it is contained, it seeks a female gall in the interior of the same fig, gnaws a small hole through its cortex, inserts its extremely long, almost telescopic, abdominal extremity through the hole, and fertilizes the female. The female subsequently, with her powerful jaws, gnaws the top of the gall off and emerges, crawling around the interior of the fig, and eventually forcing her way through the ostium, almost immediately seeking for young figs, which she enters, and should the fig entered prove to be a caprifig, lays her eggs at the base of as many flowers as she can find, and then dies. Should the fig entered, however, be a Smyrna fig, either through the fact of the caprifig from which she issued having been hung in the branches of a Smyrna-fig tree, or from the fact that she has flown to an adjoining Smyrna-fig tree, she walks around among the female flowers seeking for a proper place to oviposit. It is this futile, wandering search, when her body is covered with pollen from the caprifigs, that produces the extensive and almost perfect fertilization of the entire number of female flowers. The young larva is a delicate little maggot curved upon itself and showing no visible segmentation. In the full-grown larva the segments are more apparent, and with the growth of the larva the gall at the base of the male florets becomes hard, and greatly resembles a seed, turning light brown in color. The male and the female pupa each occupies a greater portion of the interior of the gall. Consult 'The Fig' (United States Department of Agriculture, Washington 1901).

Although figs are raised in California and

the Southern States they have long been inferior to the Smyrna fig, the standard kind of commerce, which owes its peculiar flavor to the number of ripe seeds which it contains. These seeds are obtained only by the process described above, and the United States Department of Agriculture devoted much attention to caprification, with a view to the development of the American fig industry. The fig insects were introduced in California in 1899 and have greatly benefited the fig industry. It is now possible to produce Smyrna figs of the fine quality. About 250 tons were produced in 1915. See FIG.

**CAPRIMULGIDÆ**, káp-rī-mŭl'jī-dē, the goat-suckers, better nightjars (so called from a superstition regarding their habits), a family of birds of puzzling affinities, but nearest to the swifts (*Cypselidæ*), with which, and the humming-birds, they are often considered to constitute an order, *Macrochires*. The family is characterized by a small bill, enormous gape, fringed with elongated, stiff bristles, elongated tail of 10 soft rectrices, long pointed wings, very small feet with the middle claw pectinate, and very lax plumage. Two subfamilies, the *Caprimulginae* or true goatsuckers, and the *Nyctibinae* of tropical America, are recognized, to which the oil-birds (*Steatornis*), and *Podargus* and its allies, are sometimes added as two more. The family is nearly cosmopolitan, and comprises 12 or 15 genera and perhaps 100 species, all birds of more or less crepuscular habits, which catch insects on the wing like swallows. The "night-hawk" and "whip-poor-will" are the common species of the eastern United States.

**CAPRIVI**, ká-pré'vë, Georg Leo, GRAF VON, sometimes called CAPRIVI DE CAPRARA DE MONTECUCULI, German soldier and statesman; second Chancellor of the German Empire: b. Charlottenburg, 24 Feb. 1831; d. Skyren, 6 Feb. 1899. He studied in Berlin; entered the army in 1849; fought in the campaigns of 1864 and 1866; and was appointed major and a member of the general staff of the First Army Corps. In the Franco-German War of 1870 he was chief of staff to the 10th Army Corps, served with distinction at Metz and Orléans and in the Loire campaigns. In 1882 he became commander of the 30th Infantry Division at Metz and in 1883-88 he was at the head of the Admiralty. This appointment was made by Bismarck and caused great dissatisfaction among the officers of the navy. Caprivi, however, soon mastered the details of the department, and the successful reorganization of the navy upon its present basis is in great part due to his capable and energetic direction. In 1888 he became commander of his old army corps. Hence he was removed, on the fall of Bismarck, in 1890, to become Imperial Chancellor and Prussian Prime Minister. His principal measures were the army bills of 1892 and 1893, and the commercial treaty with Russia in 1894, in which year he retired. He was made a count in 1891. His position as Bismarck's successor was one of peculiar difficulty and trial, but he showed himself an able and faithful administrator. Like Bismarck he was a man of giant stature, of great mental power and with an incredible capacity for work. Con-

sult 'Die Reden des Grafen von Caprivi . . . 1883-93' (Berlin 1894).

**CAPROIC ACID**. See HEXOIC ACID.

**CAPRON**, Allen Kissam, American military officer (son of Allyn Capron, q.v.): b. Brooklyn, N. Y., 24 June 1871; d. Las Guasimas, Cuba, 24 June 1898. He enlisted as a private (1890), and rose to a second lieutenantcy (1893), joining the "Rough Riders" on the outbreak of the war with Spain. He was made a captain for bravery, and was the first American army officer who fell in that war.

**CAPRON**, Allyn, American soldier: b. Tampa, Fla., 27 Aug. 1846; d. Fort Myer, Va., 18 Sept. 1898. He was graduated at West Point, 1867, and entered the 1st Artillery, receiving his captaincy 4 Dec. 1888. During the Sioux campaign of 1890 he made a brilliant record at the battles of Wounded Knee and Drexel Mission. During the war with Spain, 1898, he opened the fight at El Caney, Cuba, and shattered the first flagstaff in Santiago. During this campaign he was taken ill with typhoid fever, and succumbed to its attack. He was a fine mathematician, and a recognized authority on artillery and tactics. His father, Erastus Allyn Capron, was killed at Churubusco, in the Mexican War, 20 Aug. 1847.

**CAPRYLIC ACID**, or **HEXOIC ACID** ( $C_6H_{12}O_2$ ), an acid found in butter and coconut oil. It is obtained from the latter by saponification with caustic potash and distillation with dilute sulphuric acid. It is a fermentation product of butyric acid. It has an oily appearance and an unpleasant odor resembling sweat.

**CAPSICIN**, a name given to two apparently different substances. One described by Braconnot, obtained from chilli pepper, is an acrid oil or oleoresin, of a reddish-brown color, the vapor of which excites sneezing and coughing. It is probably a mixture of different bodies. The other is a resinoid substance obtained from cayenne pepper; it is brown with a golden tint, has the consistency of tar, an aromatic smell and pungent taste, and is used in America as a powerful stimulant in influenza, fever, indigestion and other disorders, and externally as a rubefacient. Quite recently a volatile alkaloid, also called capsin, has been obtained from chilli pepper, by first removing the acrid resin, then making the fluid alkaline, and extracting with petroleum spirit. On evaporating, a substance is produced with an odor like that of conia. It is distinguished from conia and nicotine by a variety of reactions.

**CAPSICUM**, a genus of plants of the order *Solanaceæ*, consisting of annual or biennial plants, bearing membranous pods containing several seeds, noted for their hot, pungent qualities. *C. annum*, a native of South America, furnishes the fruits known as chillies. These, as well as the fruits of *C. frutescens* and other species, are used to form cayenne pepper. For this purpose the ripe fruits are dried in the sun or in an oven, and then ground to powder, which is mixed with a large quantity of wheat flour. The mixed powder is then turned into cakes with leaven; these are baked till they become as hard as biscuit, and are then ground and sifted. Cayenne pepper is largely adulterated with red lead and other substances. *C. fructus* is the dried ripe fruit of *C. fastigiatum*.

*tum*, imported from Zanzibar. It is a small, oblong, scarlet, membranous pod, divided internally into two or three cells containing numerous flat, white, reniform seeds. It has no odor; its taste is hot and acrid. *C. baccatum*, or bird pepper, is a perennial in tropical latitudes. *C. grossum* has a large, long, ovate fruit, known as bell pepper, and is used either ripe or unripe, except for cayenne pepper, when the dried ripe fruit is employed. Capsicum fruits are used medicinally, in powder or as a tincture, externally, or as a gargle in cases of malignant sore throat, and internally as a stimulant in cases of impaired digestion.

By reason of the resin-like body, capscin, which is contained in the fruits of these plants, they possess very active irritant properties. The pure crystals of capscin are extremely virulent, and readily cause severe poisoning; but the ground fruit is less active, and is of service in medicine, both for external and internal medication.

Externally, capsicum is used as an irritant to cause redness of the skin or to blister, thus affecting related visceral areas within the body. It is thus employed in bronchitis, in early stages of pneumonia, in pleurisies, and in joint and nerve affections. Internally, capsicum is used to stimulate the appetite and to increase the amounts of gastric and intestinal juices. It is particularly serviceable in the gastritis of alcoholism. All capsicum should be excluded from the diet of patients with disease of the kidneys or acute disease of the genito-urinary system. See PEPPER.

**CAPSTAN** (Fr. *cabestan*, probably from a derivative of Lat. *capistrum*, a halter, from *capere*, to hold), an apparatus largely used on ships for moving heavy weights and by various methods for the application of power. Constructed on the mechanical principle of the wheel and axle, its axis, unlike that of the windlass, is vertical. The capstan may be operated either by steam power or by means of a lever set in its socket and worked by horses or pushed by hand, the last method usually requiring several men. When used elsewhere than on shipboard, the capstan generally has some specific name. Thus, when employed for raising coal from pits it is commonly called a gin; if worked by horses, it is known as a whim-gin. Capstans were formerly made of wood, but are now almost universally of iron. The upright barrel of a capstan is constructed around a spindle. The barrel is sometimes smooth, and sometimes for increase of friction has, running up and down its surface, ribs or ridges called whelps. In the capstan-head or drum-head, surmounting the barrel are holes for the levers or capstan-bars used to revolve the barrel. Being smaller at its centre than at the top or bottom end, the barrel has a curve from above and below, whereby a rope wound by working the capstan slips toward the concave part so formed. By this device a length of rope may be compactly and securely wound and kept in place for repeated use. On the circumference of a pawl-head at the bottom of the barrel are pivoted pawls which catch a pawl-rim or ratchet-ring fastened to the platform or floor on which the capstan is fixed. There are various other devices for increasing friction, the prevention of slipping and reverse operation of the mechanism.

**CAPSULE**, in botany, a dry fruit containing several seeds, sometimes a large number, and opening of itself by means of valves or pores when it comes to maturity. According as it contains one, two, three or more cells, the capsule is called unilocular, bilocular, trilocular, etc., and when it has many cells it is called multilocular.

In anatomy a capsule is a mass of fibrous, connective tissue cells surrounding or supporting an organ, either as a bag, as is the case in the kidneys; or as a framework, as in the liver. The capsule is usually an integral portion of the structure of an organ.

In bacteriology, the term is applied to the thin envelope which surrounds certain microorganisms.

In pharmacy gelatin capsules are widely used for purposes of rendering medicines tasteless.

**CAPTAIN**. This is one of those many words derived from the Latin of the Middle Ages, and now to be found in all the different idioms of Europe. Captain comes from the Latin *capitaneus*, from *caput*, head, and signified, first, a governor of a province, who in the first half of the Middle Ages was generally a military man. Thus the word captain soon came to be used chiefly to denote a high, or rather the highest, military officer. In the latter part of the Middle Ages, when armies were not yet so regularly divided and subdivided as at the present time, captains were the commanders of those small bodies of which the armies consisted. These were generally collected by their commander, who entered with his company into the service where most pay or most booty could be obtained. The practice of waging war by troops collected in this manner prevailed to the greatest extent in Italy, where the continual quarrels of the numerous small states afforded ample employment to the unsettled and the dissolute. These companies play an important part in the history of the Middle Ages, particularly that of the two centuries preceding the Reformation, and had a very important influence on the manners and morals of the south of Europe.

**CAPTAIN**, in most modern armies, is the commander of a company of foot, a battery of artillery, or a squadron of horse, or a staff-officer of equivalent rank. In England companies and batteries are often commanded by majors. In the United States cavalry a captain commands a troop, and a major a squadron of four troops. In the United States army the captain nominates the non-commissioned officers of his company who are appointed by the colonel of the regiment; and from the sergeants he selects the first sergeant, mess-sergeant and supply-sergeant.

**CAPTAIN**, in the navy, an officer commanding a ship of war or a staff officer of equivalent rank. The naval captain is next in rank above the commander, and in the United States ranks with a colonel in the army.

**CAPTAIN-GENERAL**, the commander-in-chief of an army or of all the military forces of a country. In France it was an ancient title which conferred an almost unlimited power on the person who possessed it in the district where he commanded. But it never corresponded to that of generalissimo except in the case of the Duke of Savoy, in 1635, in the

time of Louis XIII. The title is not in use at present, nor would it agree with the existing organization of the administration. In Spain the rank of a captain-general corresponds with that of a marshal of France, the captain-general having command of an army or army corps. The title was also given to the head of a province in the Spanish colonies in South America, which were divided into vice-royalties and captain-generalships (*capitanías-generales*); thus Chile used to be a captain-generalship. The captains-general were not placed under the viceroys, but accountable only to the king through the council of the Indies. The captain-general of Venezuela, for instance, had no connection with the viceroy of New Granada. They decided, in the last instance, on all legislative, judicial and military affairs, and presided in the *real audiencia*. The time during which these governors remained in power was limited to a few years, probably in order to prevent them from becoming too powerful. The consequence was, that the colonies were oppressed the more to enrich the governors, for rich every one was when he left his office.

**CAPTAIN** of a merchant ship, he who has the direction of a ship, her crew, lading, etc. In small vessels he is more ordinarily called *master*, which indeed is the correct title.

**CAPTION**, *in law*, signifies the heading or that part of a legal instrument such as an indictment or commission, which states when, where and by what authority it is executed. In Scotch law it signifies a warrant of imprisonment issued against a party to enforce an obligation, being now confined to a warrant served upon a party who has illegally retained papers in a lawsuit that had been borrowed by him, and intended to compel the return of the papers. The word is not now used with any other signification in Great Britain; it is never employed to denote the heading of, for instance, a newspaper article.

**CAPTIVI**, *căp-tě'-vě* ('The Captives'), a comedy of Plautus, declared by Lessing to be the finest piece that had ever been put upon the stage. Such an estimate, even from so great a literary critic, savors rather of enthusiasm than of judgment. But the play has unusual merits. The plot, while simple, is very closely woven; the deception and its disastrous discovery, upon which the action turns, are handled to a certain extent in the spirit of tragedy; and the portrayal of character is so sympathetic that the interest of the audience is aroused almost equally for the deceivers and for the deceived. Plautus himself, both in the prologue and in the epilogue, dwells upon the elevation of tone which distinguishes this play from the usual run, and expresses his regret that playwrights find few comedies, such as this, through which good men may be made better. This conception of the function of comedy is very rare indeed in Plautus, whose chief concern was to make his plays amusing but not necessarily edifying. In 'The Captives' the moral lesson is the more impressively taught because the hero has known only the life and outlook of a slave ever since he was stolen from home in early childhood. But this slave has the soul of a gentleman, and no scene in the play is greater than that in which,

after the discovery of his real status, he fearlessly defends his loyalty to the master, now happily beyond reach, for whose sake he has imperilled his own life. There is a vivacious translation in the 'Loeb Classical Library' by Paul Nixon, 'Plautus, Volume I' (New York 1916). Consult also the excellent chapters on Plautus in Sellar, W. Y., 'Roman Poets of the Republic' (3d ed., reissued, Oxford 1908) and Duff, J. W., 'A Literary History of Rome' (2d ed., London 1910).

NELSON G. MCCREA.

**CAPUA**, *kă'poo-ă*, Italy, city in the province of Caserta, 18 miles north of Naples, on the Volturno, which is crossed by a handsome bridge. The district is very fertile, but somewhat unhealthy. It is the seat of an archbishopric, and was the principal fortress that covered the approach to Naples from the north. It was in consequence of great importance to the former kingdom of Naples. It has two magnificent gates, three principal streets, two handsome squares and three public fountains. The town is dirty and badly built. The principal public buildings are the cathedral with a cupola supported by 18 columns, entirely modernized; the church of the Annunciation; the governor's palace, the town-hall, a museum with many ancient works of art, etc. The ancient city was situated two and a half miles southeast from the modern town, which was built from its ruins on the site of the ancient Casilinum by the Lombards in the 9th century. The site is now occupied by a considerable town called Santa-Maria-di-Capoa-Vetere. The ancient Capua, one of the finest and most agreeable cities of Italy, was of such extent as to be compared to Rome and Carthage. Hannibal wintered at ancient Capua after the battle of Cannæ, and thus not only lost time, but also is commonly said to have rendered his army unfit to follow up the advantage he had gained. It was a favorite place of resort of the Romans, on account of its agreeable situation and its healthy climate; and many existing ruins attest its ancient splendor. In 456 A.D. it was devastated by the Vandals under Genserich, and in 840 the Saracens completely destroyed it. The Torre Mignana inside, and the Capella de' Morti outside, the town, commemorate the bloody attack on Capua in 1501 by Cæsar Borgia. Not far from the city is the field where the soldiers of Garibaldi and of Piedmont defeated King Francis II of Naples, 1 Oct. 1860. Pop. 13,319.

**CAPUANA**, *kă-poo-ă'nă*, Luigi, Italian poet, novelist and critic; b. Mineo, Sicily, 27 May 1839. Having devoted himself to journalism, he settled in Florence in 1864, where he wrote dramatic criticisms; from 1868 until 1877 he lived in his native town, then in Milan, again as a journalist. In 1902 he became professor at Catania. With Verga he stands at the head of the Sicilian group of "realists" who, with their vivid portrayal of Italian regional life, represent one of the most virile branches of Italian fiction. His best-known work is 'Giacinta' (1879), a naturalistic novel. Besides this he has published several volumes of short stories, among them: 'Profiles of Women' (1881); 'Homo' (1883); and two collections of charming fairy tales: 'Once upon a Time' (1882) and 'Fairy Land' (1883). A curious

specimen of rhythmical prose is his 'Semi-Rhythms' (1888), in praise of worldly joy and beauty.

**CAPUCHIN**, kăp-û-shên or kap-û-chên, the name of several animals in which the growth of the hair or feathers upon the head forms a sort of hood suggesting that of a Capuchin friar. Certain monkeys are so called, especially the South American sapajous of the genus *Cebus* and one or more of the macaques (q.v.). A breed of domestic pigeons is also so called.

**CAPUCHINS**, an order of mendicant friars in the Roman Catholic Church founded in 1528 in virtue of a bull of Clement VII. Its founder, Matteo di Bassi, was a member of the rigorist section of the Observantine Franciscans, who sought to restore the rule of perfect poverty and humility, and to be of aid to parish priests in the cure of souls. The Capuchin friars obtained their name from the capuerce, cowl or hood which they wore. They were vowed to live according to the rule of Saint Francis in hermitages and to labor for the conversion of notorious sinners. Their churches were to be bare of ornament. Soon after their foundation they did heroic service in ministering to those stricken by the plague which at that time ravaged all Italy. The third vicar-general of the order, Bernardino Ochino, brought the Capuchins into discredit by his notorious leanings toward Protestantism, and the fraternity was interdicted from preaching by Paul III, and would have been suppressed had not Cardinal Sanseverino, archbishop of Naples, interceded for them. Paul also forbade them to establish any convents beyond the Alps, but his successor, Gregory XIII, revoked that decree. Again, Gregory XIV in 1591 withdrew from them the faculty of ministering in the confessional; but it was restored to them 10 years later by Clement VIII. Finally, in 1619 the fraternity was restored to good standing, and was even erected into an order administratively independent of the general of the Franciscans, and their vicar-general assumed the style of minister-general. Ever since, the Capuchins have been recognized as eminently useful servants of the Church. The order conducts missions in all quarters of the globe, and has the reputation of being very successful in winning converts. In 1775, the order had 64 provinces, with 31,000 members, the largest number reached in their history. In Austria, they are most numerous, but there are also 22 scattered missions. Two provinces exist in the United States,—one centres at Detroit, Mich., and one at Pittsburgh, Pa. There is also a missionary district in California. An order of Capuchin nuns was established at Naples in 1538.

**CAPULETS AND MONTAGUES**, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, according to tradition of Verona, chiefly memorable from their connection with the legend on which Shakespeare has founded his tragedy of 'Romeo and Juliet.' Consult Daniel, 'Originals and Analogues of Romeo and Juliet' (in 'New Shakespeare Society Publications,' London 1875); Furness, H. H., 'Romeo and Juliet' (New Variorum edition, Philadelphia 1871; last revision 1903).

**CAPUS**, kă-pū' (Vincent Marie), Alfred, French litterateur: b. 25 Nov. 1858. He was educated at Aix-en-Provence and at the Lycée Condorcet, Paris. He was intended for the engineering profession and to this end received a technical training. His tastes, however, turned him to literature; he entered the journalistic field as member of the staff of the *Figaro*. He soon became known as a masterful critic and satirist. He published 'Qui perd gagne' in 1890; 'Faux départ' (1891); 'Monsieur veut rire' (1893); 'Années d'aventures' (1895). These novels, while very successful, have been overshadowed by his dramas, in which his genius is best revealed, and which in 1914 led to his selection as a member of the French Academy. The plays are 'Brignol et sa fille' (1895); 'L'Innocent,' with Alphonse Alais (1896); 'Rosine' (1897); 'Mariage bourgeois' (1898); 'Les maris de Léontine' (1900); 'La veine' (1901); 'La petite fonctionnaire' (1901); 'Les deux écoles' (1902); 'La châtelaine' (1902); 'L'Adversaire,' with Emmanuel Arène (1903); 'Notre jeunesse' (1904); 'Monsieur Piégois' (1905); 'L'Attentat,' with Descaves (1906); 'Hélène Ardouin' (1913). He also published 'L'Institut de beauté,' and 'Notre époque et le théâtre.'

**CAPUT MORTUUM** (Latin), literally, a dead head; a fanciful term much used by the old chemists to denote the residuum of chemicals when all their volatile matters had escaped; hence the word is figuratively used of anything from which all that rendered it valuable has been taken away. It is used in historical research in this sense.

**CAPUTIATI**, kă-pū-shī-á'ti (from Lat. *caput*, head), a Christian sect which arose in France in the 12th century, and so called because they wore as a distinguishing badge on their heads a leaden image of the Virgin Mary. They advocated liberty, equality and the abolition of all civil government. Hugo, bishop of Auxerre, was compelled to use military force to suppress them.

**CAPYBARA**, kă-pē-bā'ra, an aquatic rodent (*Hydrochoerus capybara*), of the family *Caviidae*, native to South America. It is the largest rodent known, being four feet long, and weighing nearly 100 pounds. It has a rough brown coat, a heavy flat head, small pig-like eyes and ears, and a blunt muzzle. Its feet are supplied with hoof-like claws, and its tail, unlike that of most rodents, is very short. The animal is herbivorous, browsing on grass along river banks, and often creating havoc in sugar plantations. It is awkward on land, but swims and dives well, and can remain under water a long time. The flesh is edible, except that of very old males. It is known throughout Spanish South America as carpincho, but is called water hog and water horse in British Guiana. Consult 'Proceedings of Zoological Society of London' (1894).

**CARABAO**, kă-ra-bā'ō, a small variety of water buffalo (*B. Bubalus*) found in the Philippines. See **BUFFALO**.

**CAR BUILDING INDUSTRY**. The memory of men still living is sufficiently elastic to stretch back to the beginnings of steam railroads in this country, and to comprehend the various changes by which the modern railway has become a highly organized and elaborately

equipped mechanism. We borrowed the railway from England, but developed it on our own lines. The invention of the locomotive at first simply furnished a mechanical power to transport freight in cars that had formerly been hauled by horses. Tramways were in use in the Hungarian mines during the 16th century; and Ralph Allen's English stone-car of 1734, with its flanged wheels and its hand-brake, is clearly the forerunner of the freight-cars of to-day.

The term "railway" was invented in 1775, when it was first used in Smeaton's reports on English transportation, a quarter of a century before steam was applied to locomotion. Thanks to the recent researches of Mr. Clement E. Stretton, we now know that the first persons ever conveyed by a locomotive on rails traveled, on 24 Feb. 1804, behind Trevethick's locomotive on the Pennyddarran cast-iron plate-way or tram-road to Merthyr-Tydvil, in Wales, a distance of nine miles. In order to transport long bars of iron and timber, the cars were made in pairs, coupled together by an iron draw-bar having a joint at either end. The cars had no sides, but in the middle of each was fixed a centre-pin upon which worked a cross-beam or bolster, and upon this cross-beam the timber or bars of iron were placed. On the occasion referred to the trucks were loaded with 10 tons of iron bars, and 70 persons stood on the iron. Here we have the origin of the bogie or truck, the invention of which has been claimed for this country, as we shall see hereafter. Also the capacity of the freight-car, fixed at the beginning at 10 tons, remained at that figure for half a century or more.

In 1812 John Blenkinsop of Leeds had a private car built to carry himself and his managers to his Middleton colliery, while the workmen rode on the coal-cars. On 27 July 1814, George Stephenson's first locomotive, Blucher, drew over the Kenilworth colliery line a passenger-car made by placing the body of Lord Ravensworth's four-in-hand coach on a wooden frame fitted with flanged wheels. This car was used for 20 years. On 27 Sept. 1825, the Stockton & Darlington Railway was opened, and trains of coal-cars were run, with one passenger-coach named the *Experiment*. This was the first passenger-car to be run regularly for the use of the public. It was placed on four wheels, and had a door at each end, with a row of seats along either side and a long deal table in the centre. This car was operated 10 days, until the novelty was worn off; and then the faster stage-coaches carried the passengers. It was not until 15 Sept. 1830 that the Liverpool & Manchester Railway opened its line with a train carrying 600 passengers, and immediately thereafter began to run the first regular passenger-trains.

It is a striking fact in the history of car construction that the English invented both the truck and the long passenger-car with the door at each end; and that these forms, once invented, were almost immediately discarded in England, so that it was left for this country to reinvent them and to make them the distinguishing features of American car building as contrasted with English construction. Indeed, it has been with great reluctance that we have ceased to claim them as original discoveries.

The fact that passenger trains, by displacing stages, threw out of use many of those vehicles, coupled with the other fact that the stage owners, submitting to the inevitable, often became railroad promoters, furnishes a reason why the early masters of transportation both used the stage-coach body as a matter of economy, and also built their new cars on the model in which the conveniences of travel had been most highly developed. The first passenger-coach used in Pennsylvania in 1832 was a stage-coach slightly enlarged. To be sure, the early prints show that in 1830 Peter Cooper's first locomotive hauled an open boat-shaped car from Baltimore to Ellicott's Mills, on the Baltimore & Ohio Railroad; but this model must have been adopted for economy's sake, because in 1833 that railroad placed in service the *Ohio*, a car, stage-coach in shape, with seats on top as well as inside.

As president Mendes Cohen well observed in his address before the American Society of Civil Engineers in 1892, the first important modifications in car-building were called forth by the speed developed in the locomotive. Naturally the wheels first demanded attention. The names of four men are connected with early wheel improvement. Mr. Knight improved the shape of the tread and flange; John Edgar and Ross Winans developed the chilled features; and Phineas Davis further improved and perfected the wheel by altering the disposition of the metal in the tread and the angle of the flange, and by introducing within the cast-iron wheel a wrought-iron ring of five-eighths or three-quarters of an inch round iron both permitted the chill and added strength to the wheel. Mr. Winans' shops turned out thousands of these wheels for use not only in this country, but also in Germany and Switzerland. From 30,000 to 50,000 miles represented the capabilities of a Winans wheel.

With increased speed came the need for increased steadiness, and it occurred to Ross Winans that by adopting the device of the bogie, or swiveling truck used in the transportation of freight, he could build an easy-riding passenger-car. A bogie-truck is a pair of wheels, or more commonly two pairs of wheels, connected by a framework, and having a very strong vertical central king-pin, on which one end of a locomotive or railway car is supported. The device facilitates rounding the curves of a railway track. In 1833 Mr. Winans constructed three long houses on wheels, each capable of seating 60 passengers. Having patented his invention, he was confronted by the fact that the principle he had used was one that had been utilized frequently on tramways, and finally the courts annulled the patent.

We now know that prior to 1830 England had three bogie-engines at work; that in 1831 Stephenson's John Bull, built for the Camden & Amboy road, was made into a bogie after it reached this country; that Horatio Allen used a bogie-engine on the South Carolina Railroad in 1832, the same year in which the bogie-locomotive *Experiment* was built for the Mohawk & Hudson Railroad. Moreover, the bogie principle was patented in England in 1812. Yet it is certain that the American passenger-car of to-day originated with the three passenger-coaches built in Ross Winans' shops

in 1833. England discarded the bogie principle for engines in 1830, and did not return to it until 1876; and that country to this day has not adopted the bogie for passenger- or freight-cars. In 1889, the Paris, Lyons & Mediterranean Railway adopted the bogie for certain passenger-cars; and in 1895 the Great Western Railway of England began to experiment with the bogie-truck. In America the Winans passenger-coach almost immediately supplanted everywhere the stage-coach form, which England still retains in a modified shape, excepting only on the Pullman cars, introduced into that country in 1874. With us not only the passenger-cars, but the baggage, mail and freight-cars, all were placed on swiveling trucks.

That the early railroads of this country were designed to carry passengers rather than freight is to be seen by their reports. The Baltimore & Ohio road, from 1 Jan. 1831 to 1 October carried over its 13 miles of track 5,931 tons of freight and 81,905 passengers; and so late as 1839 the Camden & Amboy carried only 13,520 tons of merchandise as against 181,479 passengers. In fact, the railways as freight carriers could not compete with the canals, which in those days were the traffic routes. In 1831 the Tuscarora & Port Carbon Railroad could not meet canal rates by 39¼ cents per ton, the railway charges being 40 cents, plus a toll of 15 cents per ton, while the canal rates were 10¾ cents, plus 5 cents toll.

Mr. John Kirby, describing from memory the freight-car of 1848, says that it was the same square box it is to-day; its capacity was from 6 to 10 tons; the roof was covered with cotton duck painted and sanded. The hot sun cracked this covering and let the water in on the freight, an annoyance common also to passenger-coaches of that day. Few freight-cars were used in New York State at that date, the Erie Canal being sufficient for summer freight. Wood was the universal fuel, so there was no coal transportation. Wooden brakeheads were used, and it required three men to turn the screw that pressed the wheels on and off the axles. The ripping of planks was done by hand, as was also the dressing up; and when one man had tools to grind, a fellow-workman turned the stone. Carpenters and car builders of six years' experience commanded \$1.12½ a day wages.

Viewed from the standpoint of to-day, the passenger-car of the early fifties, built at a cost of about \$2,000, was a combination of inconveniences. The cast-iron stove in the centre of the car broiled those who sat immediately around it, while the unfortunates one seat removed from its satanic glare shivered and froze. In summer the dust was intolerable, and, notwithstanding elaborate devices for ventilation, the dust problem did not begin to be solved before the appearance of the monitor roof or clearstory in 1860. Hot-water heating and the abolition of the deadly car-stove came with the Pullmans.

In 1856 Capt. (later Sir) Douglas Galton, of the Royal Engineers, was sent to America to investigate our railways. His report to the lords of the Privy Council for Trade gives a straightforward and unbiased account of his investigations. Perhaps there is extant no other report which so comprehensively discusses the

railway situation in the United States about that date.

"The practice of constructing railways [in America] in a hasty and imperfect manner," says Captain Galton, "has led to the adoption of a form of rolling stock capable of adapting itself to the inequalities of the road; it is also constructed on the principle of diminishing the useless weight carried in a train. The principle is that the body of the car is carried on two four-wheeled trucks, to which the body is attached by means of a pintle in the centre, the weight resting on small rollers at each side. The framing of the truck is supported on springs resting on the axles, and the pintle and rollers are fixed to a cross-beam which is attached by springs to the main framing; so that between the body of the car and the axles are a double set of springs. India-rubber springs are in general use, but they often become hard; consequently sometimes steel springs are used, with great advantage. Any side movement which might result from the slight play allowed to the cross-beam is counteracted by springs placed between its ends and the framing. An iron hoop attached to the framing passes under the axle on each side, so as to support the axle in case it should break."

The bearings Captain Galton found not unlike those used in England, but the use of oil as a lubricator was novel. He was told that under favorable circumstances the oil in an axle-box needed to be renewed but once a month; but that it was difficult to obtain good oil. The wheels were of cast-iron, with chilled tires; they were from 30 to 36 inches in diameter, weighed rather more than 500 pounds and were without spokes. When made by the best makers they would run from 60,000 to 80,000 miles before the tires were worn, and they cost from \$14.50 to \$17.00 each. The iron used in making wheels was of very superior quality; and so great was the practical skill required that but three firms in the United States could be relied on to furnish wheels of the first grade.

The most approved form of draw-bar was continuous under the car, and was attached to the elliptic springs, acting in both directions. The iron shackle was in general use, but some railways preferred an oak shackle 18 inches long, 2 inches thick and 6 inches broad. This block was bound with an iron band divided on each side at the centre, so that a car on leaving the rails would break the shackle transversely.

Already the automatic coupler for freight-cars was prefigured in a device by which the pin in the bumper of one of the cars was supported by means of a ball, so that the shackle of the on-coming car pushed back this ball and let the pin fall into its place. All passenger-cars and most freight-cars were supplied with brakes; and the Philadelphia & Reading Railroad was endeavoring to anticipate the day of train-brakes by an invention whereby a sudden check in the speed of the engine applied the brakes to the wheels of all the cars. The toilet, the car-stove and the ice-water tank all had established themselves in the best cars.

On the Illinois Central, between Cairo and Dubuque, some of the cars were filled with compartments in which the backs of seats turned up and so formed two tiers of berths

or sofas, for the accommodation of persons who might wish to lie down and were willing to pay for the privilege. The passenger-car had attained a length of 60 feet, though the 30- and 45-foot cars were more common; the baggage-cars, with their compartments for mail and express, were 30 feet long, and the freight-cars from 28 to 30 feet. In those days the freight-cars were constructed more strongly than were the passenger-coaches; a Baltimore & Ohio freight-car 28 feet long, and with a capacity of nine tons, itself weighed six tons.

Of necessity progress in car-building had to wait for the development of the railroads. The original roads were not constructed as through lines between the larger cities, but as the connecting-links between natural waterways, answering to the portages or carrying places of the old days when commerce was conducted in canoes. Often built as the result of local or State enterprise, a short line was sufficient to use up the scanty capital available, or to exhaust the willingness of the people to be taxed for public improvements. The great systems of to-day represent survivals of the fittest early ventures, and development according to environment. Thus the various small roads which traversed the present main line of the New York Central were not consolidated until 1853, and the same year the roads between Philadelphia and Pittsburgh came under one control. So late as 1862 there were five separate companies operating the lines between Lake Erie and Lake Michigan; and as each road had a gauge of its own, it was regarded as a triumph in car construction when freight-cars of compromise gauge were built to run over all five roads. In 1869, however, the Lake Shore & Michigan Southern lines came under a single head.

When in October 1865 a combination was formed among eight railroads to establish a fast freight line between New York and Boston and Chicago, the maximum difference in the gauges of the several lines was one inch; and this was compensated for by a broad tread wheel. Each company contributed a number of cars proportionate to its mileage, one car for every three (afterward increased to one for every two) miles. In 1865 the quota of the Lake Shore & Northern Indiana was 179 cars; while in 1894 that road's quota of Red Line cars was 2,200.

In 1862 the United States government conducted the greatest railroad business known up to that time. With headquarters at Nashville, the government operated 1,500 miles of road with 18,000 men, whose monthly wages amounted to \$2,200,000. The rolling stock consisted of 271 engines and 3,000 cars. No entirely new locomotives were built, but the 3,000 men employed in the locomotive repair shops pieced out fully equipped engines founded on a serviceable boiler or a pair of sound driving-wheels. Among the triumphs of the national car-shops were, first, a headquarters car for General Thomas, the car being 50 feet long, iron-plated, and provided with a kitchen, a dining-room, a sleeping apartment and an office; and, secondly, the hospital trains, in which the jars and jolts were reduced to a minimum. It was during the year 1864 that General McCallum and Colonel Wyman came to Detroit and summoned the managers of the

Michigan Car Company to stop all building then in progress and to work solely for the government. They gave a contract for a number of box- and flat-cars to be operated on Southern roads; and inasmuch as the gauge differed from that of the Northern roads, the new cars were loaded on flat-cars and sent to Cincinnati. The government officials fixed the price of the cars and made payment in certificates, some of which the company exchanged for materials, and the remainder were held until money could be obtained for them.

The enormous transportation business developed by the war, together with the labor conditions and the paper-money issues, combined to raise the price of cars; so that the standard freight-car of 1864, a car 28 feet long and with a capacity of 10 tons, cost \$1,000 or more. About 30 years later a car 34 feet long, with a capacity of 30 tons, and provided with automatic couplers, air-brakes and other improvements, could be purchased for about \$500.

When the war ended the managers of railroads were called on to face a heavy decline in both freight and passenger traffic, due to the disbanding of the armies. Money was not plentiful, cars were very expensive and the mania for extending lines into new territory had begun. Under these conditions the roads began a system of borrowing cars from the builders or from car-trust companies. The Michigan Car Company was probably the first to make contracts on a car-loaning basis; be that as it may, this company had at one time loaned to railroads between 6,000 and 7,000 cars, payment being made according to the car's mileage. With better times and better credit the roads began to buy cars for cash or on long time, as was most convenient; and loaning freight-cars to railroads on a mileage basis was practically discontinued. A majority of the refrigerator-cars, however, continued to be owned by private parties and run on a mileage basis. The reduction in the mileage rate practically killed the business of private ownership, since the new rate did not much more than pay for the repairs.

In the winter of 1868-69 the first Westinghouse air-brake was used on the Steubenville accommodation train running on the Pittsburgh, Cincinnati & Saint Louis Railroad. The Pennsylvania road adopted it, and since the automatic feature was added, in 1873, it has come into almost universal use on passenger-trains, while by far the larger proportion of new freight-cars built are equipped with it. In 1887 a train of 50 freight-cars made a triumphal tour of the great lines, and by repeated tests, under varying conditions, proved that the Westinghouse brake can stop a train in one-tenth the space required by the hand-brake. In 1867 Colonel Miller placed his patent platform, buffer, and coupler on three cars building in the shops at Adrian, Mich.; and with great rapidity the dangerous old platform, with its loose link coupling, disappeared. In 1860 the Post-Office Department began to demand more room from the railroad companies, and year by year the mail-cars were increased from 17 to 20 feet in length, then to 35, and finally to 60 feet.

The interchange of cars among the various roads made it necessary to adopt standards in car construction, in order to facilitate repairs

to cars when away from the home road. Some authority, too, was needed to settle disputes between roads, arising from charges for repairs; to investigate new brakes and couplers; and, in general, to keep the work of construction fully abreast of the times. The Master Car Builders' Association, organized in 1867, amply fills this need; and the reports of its annual meetings contain the latest word on all subjects relating to car-building. Its arbitration committee also acts as a court of conciliation for the various roads.

Car-building has undergone a revolution during the past 25 years, due in part to increased demands on the railways, and in part to improved methods of construction. The use of wood as a material is markedly less, and the use of steel is steadily increasing, so that both passenger and freight cars of recent date seem to be of better and more durable type than ever before. Modern cars are a development, built for service and long life, and to meet the numerous demands of shippers and the traveling public. The parlor car has developed into an entire series of sumptuous apartments on wheels built to transport those who want comfort and luxury in their journeyings, and are willing to pay for them; the difference in the needs of the commuters around a large city and of passengers going long distances has called for a differentiation in passenger cars. For express and mail service there has been developed a line of cars that enable business to be properly handled en route, avoiding delays at terminals. For freight transportation there have been put into use literally hundreds of styles of cars, adapted to convenient carrying of special goods of widely varying nature.

**Passenger Cars.**—The standard passenger car is termed a day coach, and is 78 feet long, 10 wide and 14½ high; it weighs 112,000 pounds, is practically all steel, and has 40 double seats, automatic windows, racks for coats, grips, etc., a toilet, ice-water supply, Pintsch gas or electric lights and minor conveniences. If for through traffic it has a vestibule, so that passengers can walk from car to car without exposure to the weather. The construction cost is about \$10,000. For suburban service, non-vestibuled cars are used, and many have cane-covered seats that do not hold the dust. There were 53,500 passenger cars in use on the steam railways of the United States in 1915, or about one car to five miles of tracks.

A cheaper grade of passenger car is known as the emigrant or tourist car, equivalent to the second-class car of Europe. Many companies use their older wooden cars for this service, but the cars built for this traffic are simply a cheap grade of car, with usually cane-covered seats, fewer conveniences and slight decoration.

The standard sleeping car is 72¾ feet long, of all-steel construction, has 24 berths and weighs 152,000 pounds. It is increasingly common to build them with two to a dozen separate compartments, like state-rooms on a steamboat, each compartment having two to four berths and toilet conveniences. Some sleepers are built with several compartments and the remainder of the car constructed as a parlor and observation compartment, so that a party or small number of passengers can have

the conveniences of both bedrooms and drawing-room. The form of sleeper that is alterable to a day coach, the berths folding away, appears to be less popular than formerly.

Observation cars, with extra large windows, and often with individual seats, have come into considerable use in transcontinental travel. The term parlor car is now used by the railways for a day coach, handsomely fitted up with individual chairs, and for which an extra charge is made. Sometimes these are called chair cars. The terms palace car and drawing-room car are going into disuse.

Smoking cars are run on practically all passenger trains, and have usually imitation leather covered seats. Sometimes they are provided with card tables. The cafe car is not only a smoker, but card-room and bar-room combined—a high-class café or saloon on wheels. The dining car is fitted up with a kitchen, and the passengers are expected to come in to the tables to take their meals, or sometimes the service is extended through the train. The buffet car is fitted up for a simpler class of meals and a less extended menu than the dining car.

The business car is a recent innovation, having tables, desks and stationery for correspondence; also typists and stenographers in attendance. The private car, built for railway officials and people who wish to travel in luxurious seclusion, is fitted up as a living suite of rooms, with hotel conveniences and elegant appointments.

**Sleeping Car.**—Improved railway travel may be said to date from 1836, when the first sleeping car was offered to the traveling public. In that year the Cumberland Valley Railroad of Pennsylvania installed a sleeping-car service between Harrisburg and Chambersburg. This first sleeping car was an adaptation of an ordinary day coach to sleeping requirements. It was divided into four compartments in each of which three bunks were built against one side of the car, and in the rear of the car were provided a towel, basin and water. No bed clothes were furnished and the weary passengers fully dressed reclined on rough mattresses with their overcoats or shawls drawn over them. Candles furnished the light, and the heat was supplied by box stoves burning wood or sometimes coal. Other similar cars were adopted soon after by various railroads and for a number of years these cars found an appreciative patronage, and temporarily served the patrons of the railroads. Improvements were negligible and the only justification for such cars existed in the ability of the passengers to recline at length during the long night hours. The first fundamental improvement came in 1858 when George Mortimer Pullman put several revolutionizing ideas to practical test by remodelling two Chicago and Alton coaches into sleeping cars. In these Mr. Pullman introduced his invention of upper berth construction by means of which the upper berth might be closed in the day time and also serve as a receptacle for bedding. Other improvements were worked out and tested, and from these first experiments were drawn the plans from which the first cars entirely constructed by him were made. These cars were popular with the traveling public but in 1864 Mr. Pullman put in service a model car, entirely built according to his own ideas, at the

then unprecedented cost of \$18,000. This car, named the *Pioneer*, had improved truck springs reinforced by blocks of solid rubber; it was a foot wider and two and a half feet higher than any car then in service. Other cars of the same type were soon put in service and were universally admired. Within a comparatively short period railroads adopted new and superior accommodations at the popular demand for the increased comfort and safety offered by the new type of sleeping cars. Various companies began the building of sleeping and parlor cars in competition with the Pullman Company, incorporated in 1867. The Gates Sleeping Car Company and the Wagner Palace Car Company were for a time serious competitors and from 1870 to 1890 the Wagner and Pullman companies were the strongest in the field. Through the control of better patents and in course of competition the Pullman Company soon became the only important sleeping-car company in the United States. Its business grew rapidly and now it builds and operates sleeping cars throughout the United States, Canada and Mexico on all important lines, and also builds other types of cars, both freight and express, for Europe, South America and England. A few railway companies operate their own sleeping cars. The general arrangement between the Pullman Company and the railroad companies, over whose lines it operates its cars, differs widely as between different companies. Where the average number of passengers traveling in Pullman cars per car mile is very high, as it is on the line between Boston and New York, the Pullman Company pays the railway company something for carrying the car on its trains. Where the passenger traffic in Pullman cars per car mile is very light the railway company pays a rental to the Pullman Company for its cars. The Pullman service has kept in advance in service and efficiency of all its competitors. Its standard has always been high. It was a pioneer in installing electric lighting and steam heating systems in its cars and many other devices tending to increased comfort and safety have been adopted and it is ever ready to adopt new ideas in the construction and equipment of its cars. Its service is superior to that on railways which operate their own sleeping cars. Its cars are now constructed entirely of steel and are especially designed to secure the safety and comfort of passengers. Their rates were found to be entirely reasonable after an exhaustive investigation by the Interstate Commerce Commission in 1910. To-day the Pullman Company operates 7,500 cars over 137 railroads, or a total of 223,489 miles of track. To operate these cars over 10,000 car employees are required, while 7,000 more are employed to keep the cars in repair, and maintain them in a clean and sanitary condition.

**Baggage and Combination Cars.**—The railways define a baggage car as one built for carrying trunks and passengers' baggage and having large side doors. There are usually end doors and a few windows. Where trains have short runs and consequently light demands for baggage, it is common to combine the smoker and baggage car in one, with a bulkhead dividing the compartments. Sometimes the baggage and mail are combined in a similar way, and a few cars are made with three compart-

ments, for baggage, mail and smoking. Baggage compartments are also sometimes built as parts of regular passenger cars.

**Freight Cars.**—There were 2,500,000 freight cars in service on the steam railways of the United States in 1917, and about 125,000 new cars of this class are being built annually. This is only a small increase in number, but the increase in carrying capacity is probably 6 to 8 per cent, owing to the larger size of the modern-built cars. Much of the recent construction is pressed steel, that is, soft steel plates for the car-bodies, sheared to size at the rolling mill, and pressed into form and riveted and bolted together. The larger steel plates of simple form are cold-pressed, those of intricate form and small parts are mostly hot-pressed. The bolsters and framework of the trucks are also now mostly made of steel by machine forging, the tie-rods and attachments are mostly steel and the wheels are either iron or steel. The notion that some car-wheels are of paper is a pleasing fiction, originating with some newspaper reporter. Its only basis is the use of paper in compound wheels placed between the two parts of a car-wheel to deaden the "ringing" or noise of vibration. These all-steel cars involve higher first cost than the wooden cars, but being made in larger sizes and having much greater life, are coming more and more into use. The typical old-fashioned wooden box car is 40 feet long, 8 feet 10 inches wide and 8 feet high, weighs 36,000 pounds and cost, before the war, \$1,300, having a carrying capacity of 60,000 pounds. The all-steel cars are built of capacities ranging from 80,000 to 120,000 pounds.

Box cars are ventilated when designed for carrying food stuffs and double-walled or insulated for fruit transportation. When provided with icing conveniences they are termed refrigerator cars, and are specially built for carrying meat, beer, produce, etc. Stock cars are built with stalls for horses and cattle and pens for sheep, swine or poultry. Flat cars are the cheapest railway cars, many of them costing not more than \$800. They consist simply of the running gear, that is, a pair of trucks, with a deck and brakes. Keepers are inserted in the sides of the deck in which uprights can be inserted to keep the load from falling off. They are used for carrying stone, ore, lumber, glass, ordnance and any heavy freight that will bear exposure to the weather. When provided with low sides they are termed gondolas, and may be used for conveying coal, coke, etc. Hopper cars are built with slanting bottoms and gates below, so that the contents can be discharged by opening the gates; two hoppers to a car is a common construction. Dump-cars usually are arranged to tip sideways so as to slide off the load. These are used for conveying earth, gravel and ballast for road filling. Tank cars are built for oil, acids and other fluids that have to be handled in large quantities, and they are usually cylindrical in form.

**Special Service Cars.**—The steam railways of the United States have in service 125,000 cars designed for their own use, a number twice as great as the total of passenger cars. Perhaps the most familiar of these to the public is the freight caboose, seen on the tail end of railway trains, and serving to house the

crew and carry their tools and supplies. There are repair cars with a general equipment of tools—traveling machine shops. Wrecking cars are supplied with very heavy and powerful cranes for lifting wrecked cars or locomotives that have left the track. Every railway has to keep them at convenient points for use in case of accident, but they also have their uses in construction work. Steam-shovel cars are utilized to dig sand and gravel from banks, and pile-driver cars for construction in boggy places. There are ditching cars for excavating, track-layer cars and an entire series of other special cars used for modern scientific railway construction and repair work. The snow-removal car plows, some of which have great rotating heads, are among those most readily noted by the public.

The smallest of all railway cars is the push-car, made of two pairs of wheels and a slight deck, designed for the convenience of track-workers. Next comes the handcar, with a hand lever connected by a crank to the wheels. A few active men can operate one for a short distance at almost railway speed. A new form of inspection car is an improvement on the handcar, having a small gasoline engine for working the lever.

**Street Railway Cars.**—Since power was applied to street railway cars they have increased in size and developed along lines similar to steam railway practice. The earlier electric cars were short and mounted on a single truck. As traffic developed the two-truck car came in, and is now the accepted type. Open cars with cross seats and a running board are favored for summer traffic, but the standard car has seats of railway pattern, the tendency being to substitute reversible seats for two persons in place of longitudinal side seats. The front and rear platforms are now generally enclosed, to protect the motorman and conductor from the weather. Electric light and heat are commonly supplied, though in some the car-stove burning coal is still in use. Since 1910, the "pay as you enter" type of car has become popular with the companies and passengers are detained in a rear vestibule until they have deposited their fares in a box.

For subways, all-steel car construction is preferred, and in some cases is obligatory by law. These cars have both side and end doors, for the quick transfer of passengers. Elevated electric railway cars for city traffic follow closely the lines of development of steam passenger cars, but are of lighter construction.

**Features of Construction.**—The typical modern railway car is the day coach. It has spokeless wheels of either cast iron, wrought iron or cast steel, with a steel tire shrunk on. The wheels are fixed solid on the axles in pairs, and two pairs of wheels form a truck, though eight-wheeled trucks have been built. The body of the car rests on and is fixed to each truck by a central pin on which it turns. There are rolls and springs for steadying the car and preventing jolting. Between the trucks, under the deck, is located the air-brake, consisting of a reservoir of compressed air, a brake-cylinder and connections. (See AIR-BRAKE). Cars are provided with couplers at the end of the car-deck and automatic couplers are now generally in use, which hook the cars together when gently bumped. The car roof

has a raised central section called the clear-story, in which ventilators are placed, so that air circulation may be maintained without drafts. The car-seats have been the subject of hundreds of patents, but the accepted form is now a metal framed seat for two, with double levers for reversing the back, which is ordinarily high. Both seat and back are cushioned, most commonly covered with plush. See RAILWAY.

**Statistics.**—There are 110 establishments in the United States manufacturing strictly railway cars. The American Car and Foundry Company and the Pressed Steel Car Company are the largest, but a large business is done by the Southern Car and Foundry Company, Standard Steel Car Company, the Pullman Company, Haskell & Barker Car Company and Western Steel Car and Foundry Company. Each railway has its own repair shops and many of these make cars, their output being about 15 per cent of the total production. In addition, a number of foundries and machine works make some cars as a side line, their production being about 9 per cent of the total. All these shops have a total capacity of nearly 300,000 cars a year, but rarely have more than 125,000 been made in a year. In 1909 the production was 101,243 cars, of which 1,601 were passenger, and 603 were for electrical use on trunk line terminals, and 2,089 were for street railways. It is estimated that there are in use now (1917) 2,800,000 cars of all sorts on the trunk line railways of the United States.

Railway cars are made by so many different concerns that are also engaged in other manufacturing that it is impossible to state with accuracy the capital invested in the business. The total manufacture, while given as 135,000, valued at \$165,000,000 in the 1914 census, is really much higher, because the large railways all maintain very large repair shops, and often cars are made of two-thirds new and classed as "repairs." These repair shops in 1914 added a value of \$243,000,000 to the rolling stock of the United States railways. Pennsylvania is the leading State in the steam-car building industry, with \$93,600,000 production in 1914; Illinois was next with \$41,496,000, Ohio third with \$33,286,000; and New York produced \$30,893,000. Indiana and California follow, but in other States the production is small.

CHARLES H. COCHRANE,

*Author of 'Modern Industrial Progress.'*

**CARABAS**, Marquis of, the exalted personage who figures in Perrault's story of 'Le Chat Botté' ('Puss in Boots'). The name is often applied to an extremely conservative aristocrat. In Disraeli's 'Vivian Grey' the Marquis of Clanricarde is satirized as the Marquis of Carabas.

**CARABIDÆ**, the family of *Coleoptera*, comprising the ground-beetles. See GROUND BEETLES.

**CARABINE**, or **CARBINE**. See SMALL ARMS.

**CARABOBO**, a state of Venezuela, bounded on the north by the Caribbean Sea; area, 2,984 square miles. The capital is Valencia, and the chief port Puerto Cabello. Coffee, cacao and sugar are cultivated. The village of Carabobo,

20 miles southwest of Valencia, was the scene of the battle fought 24 June 1821, which was decisive of the independence of Colombia.

**CARACAL**, a lynx-like wild cat of Africa and southern Asia, slender in form and usually red-brown in color. See **LYNX**.

**CARACALLA**, Roman emperor: b. Lyons 188 A.D.; d. 217. His real name was **MARCUS AURELIUS ANTONINUS BASSIANUS**, and he was the eldest son of Septimius Severus. He accompanied his father on his expeditions, notably to Britain; and on the death of his father he succeeded to the throne with his brother, Antoninus Geta, whom he speedily murdered. To effect his own security upward of 20,000 other victims were butchered. In 212 he gave citizenship to all free inhabitants of the empire, his motive being to increase revenue from the taxes on inheritances. His reign as sole emperor was occupied largely with military campaigns. Among the buildings of Caracalla in Rome the baths—*Thermae Caracallae*—near Porta Capena, were most celebrated, and their ruins are still magnificent. He was himself assassinated by Macrinus, the pretorian prefect, near Edessa, in 217.

**CARACARA**, a genus of large carrion-eating hawks of the tropical parts of America, with black and white plumage, the head somewhat crested, legs long and naked, and the general aspect vulture-like. They have increased greatly with the spread of the cattle-raising industry in South America, and have proved of much service as scavengers about the ranches and villages. They erect nests of sticks in trees or cliffs and lay only two eggs, heavily blotched and spotted. The species to which the name most strictly applies is *Polyborus cheriway*, which is found from Venezuela to Texas and southern California. Another prominent species is the carancho (*P. tharus*), numerous and well known all over Brazil and Argentina. Compare **CHIMANGO**. Consult Sclater and Hudson, 'Argentine Ornithology' (Vol. II, London 1889); Darwin, 'A Naturalist's Voyage' (London 1860).

**CARACAS**, Venezuela, city and capital of the United States of Venezuela, was founded in 1567 by Diego de Lazada, who called the city Santiago de León. But in popular usage a more distinctive name was adopted—that of the Caracas tribe of Indians, formerly inhabiting the valley in which the city is built. It was twice destroyed—in 1595, when it was sacked by the English, under Preston, and in 1766, when the French put it to sack and pillage. But it continued to grow, and played an important part in the war of independence against Spain, claiming the honor of having been the first colony in South America that succeeded in throwing off the yoke of Spain. Caracas was the birthplace of Simón Bolívar. The great earthquake of 1812 killed 12,000 persons and laid half the city in ruins. The last serious shock occurred in 1900. Its altitude being about 3,000 feet above sea-level, the climate is generally mild and agreeable, the temperature seldom rising above 82° F. (with 84.2 as a maximum), or falling below 65° F. (with a minimum of 48.2). Toward the end of December the temperature is lowest, and it is highest from June to September. Mean temperature, 66.2° F., lat. 10° 32' N., long. 67° 4' 45" W.

The streets cross each other at right angles, running due east and west, or north and south, and the principal thoroughfares are paved with stone, and have sidewalks of cement. The capitol building occupies an entire square, an area of more than two acres. It includes the halls in which both chambers of the national Congress hold their sessions. The rooms of the High Federal Court and the Departments of Public Instruction and the Interior are in the galleries on the east and west sides of the capitol. *La Casa Amarilla* (the Yellow House), official residence of the President of the republic, is situated west of the Plaza Bolívar. On the north side of the same square is the main post-office. Near-by are the archbishop's palace, the cathedral and the municipal palace. Opposite the southern façade of the capitol are the university buildings (Gothic architecture, with interior gardens); the old temple of San Francisco and the Exposition Palace, the western wing of which contains the Bolívar Museum, the headquarters of the Academy of History, and the corresponding branch of the Spanish Royal Academy. The national library and museum are housed by the university. Other characteristic buildings are: The National Pantheon, the Masonic Temple, the three markets, the National Benevolent Institute, the Arsenal, the Institute of Arts and Trades and the Municipal Theatre. Besides the Plaza Bolívar, the principal public squares are the Washington, Pantheon and Fifth of July (Independence Day). The cathedral, dating from 1614, the Basílica de Santa Ana, and the Santa Capilla, are noteworthy among the churches of the city. Interesting relics of the heroes of the struggle for liberty, Miranda, Bolívar and Páez, are shown in the National Museum. There are several promenades (called "Iron Bridge," "Paradise Avenue" and "Independence") and among the places of amusement are a Plaza de Toros, baseball grounds and a bicycle park. An important institution supported by the government is the Vargas Hospital. The Linares Hospital for children is maintained by private contributions. Leading clubs are the Union, German, Italian and Agricultural. Caracas does little manufacturing but is the centre of the export trade of the district, which produces cacao, coffee, tobacco, etc. Street railways are controlled by the Caracas and Bolívar companies. The city has cheap telephone service, furnished by two companies, and is lighted by gas and electricity. All telegraph lines throughout the republic are owned by the government. Four lines of railway start at Caracas, three of which are designed to place the capital in communication with the interior, while the most important runs to Port La Guayra. Pop. including the six suburban parishes making up the Federal district is about 90,000.

**CARACCIOLI**, ká-rá-chō'lō, Francesco, Italian admiral: b. Naples 1752; d. 29 June 1799. He was distinguished in the Neapolitan service, but entered the service of the Parthenopean Republic set up by the French republicans in 1799, and repelled a Sicilian-English fleet. When Ruffo took Naples, Caraccioli was arrested, and being tried by court-martial was condemned to death, and hanged at the yard-arm of a Neapolitan frigate. His corpse was thrown into the sea. The court-martial was ordered by Nelson, to whom the King had given

command of the Neapolitan navy. Nelson is said to have been influenced in his decision by the notorious Lady Hamilton.

**CARACTACUS**, British king. He was a son of Cunobelin, King of the Trinovantes, and in 43 A.D., when Plautius landed, was at the head of the Catuvellauni. Plautius and his lieutenant, Vespasian, who afterward became emperor, defeated the British forces under Caractacus on several occasions, the chief battle probably taking place about Wallingford. When the Romans had pushed well down the Thames the Emperor Claudius arrived and took part in further military operations, but his stay was a very short one. Caractacus now established himself in South Wales among the Silures, whence he took every opportunity of harassing the Romans. In 47 A.D. Plautius was replaced by Ostorius Scapula, and that commander completely defeated Caractacus in a battle somewhere about Shropshire, probably at Caer Caradoc. The wife, daughter and brothers of the British leader were captured, and Caractacus himself fled to the country of the Brigantes in the north, only to be delivered up by their Queen, Cartimandua, into the hands of the Romans. He was taken to Rome and made to take part in a triumphal procession. Here he was led before the Emperor Claudius and an assembly of the people. According to Tacitus ('Annales,' book XII, chapter XXXVII) when he came to the seat of the Emperor he stopped and addressed him, and so won upon the monarch by his noble behavior and pathetic speech that the other pardoned him. According to the Welsh Triads he lived four years longer, and his children became Christians and introduced Christianity into Britain. He is introduced among the dramatic personæ of Beaumont and Fletcher's play, 'Bonduca.'

**CARADOC GROUP**. See BALA BEDS.

**CARADOC SANDSTONE**, the name given by Murchison to a thickness of about 4,500 feet of sandstones, shales, grits, flags and sandy limestones on the border between England and Wales, which he made a separate series. Subsequent investigation has shown that the Caradoc series is of the same age as the Bala, and the series is sometimes called Bala and Caradoc by English geologists. The Caradoc and Bala beds are fossiliferous and have been used largely as the basis of comparison in geological study. The rocks are of the uppermost division of the Ordovician system of England. See ORDOVICIAN.

**CARAFE**, kă-raf', the French name for an ordinary glass bottle or decanter for holding drinking water.

**CARAFFA**, a celebrated Neapolitan family, which has produced several distinguished commanders and statesmen: 1. OLIVIERO, b. 1406; d. Rome 1511. He was made a cardinal by Pope Paul II in 1467. Sixtus IV appointed him his legate to Alfonso of Naples, and in 1472 made him admiral of his fleet against the Turks, from whom he captured Smyrna, and the port of Satalia in Asia Minor. 2. CARLO, b. Naples 1517; d. 1561. He served first in the Netherlands under the Spaniards, then entered the order of Malta, and was made a cardinal by his uncle Pope Paul IV, who, for his sake, stripped the Colonnas of their possessions. This involved them in a war with Philip of Spain, but the result proved favorable to the

Caraffa family. Paul IV who succeeded Pius IV appointed a commission of eight cardinals who tried Carlo and on 3 March 1561 put him to death for high treason. 3. ANTONIO, b. Naples 1538; d. 1591. He was made cardinal by Pius V, and entrusted with the superintendence of the congregation for the revision of the Bible, and an exposition of the canons of the Council of Trent. Under Gregory XIII he became librarian of the Vatican. He translated Theodoret's Commentaries on the Psalms, and the Orations of Gregory Nazianzus from Greek into Latin. 4. ANTONIO, another member of the family, distinguished himself in Hungary in the service of Austria, but made himself universally hated by his cruelty; d. Vienna 1693.

**CARAMBOLA**, the fruit of an East Indian tree of the same genus as the bilimbi, the *Averrhoa carambola*, order *Oxalidaceae*. It is of the size and shape of a duck's egg, of an agreeable acidulous flavor. The rind is yellow and smooth with five longitudinal ribs. In British India it is used for flavoring sherbets, tarts, etc., and is known as the caromandel gooseberry. The leaves are characterized by an extreme irritability and a tendency to display the phenomenon of sleep in plants.

**CARAMEL**. When sugar is gradually heated, it loses water and other substances, and is converted into a dark mass with a characteristic smell and taste. All materials containing sugar form the same substance, such as coffee, malt, chicory. This is crude caramel, which is used in cookery as a coloring and flavoring ingredient. It is a mixture of several bodies, of which three have been described: Caramelane, a brown bitter body, soluble in water; Caramelene, a dark brown body, also soluble in water, and possessed of great tinctorial power; and Caramelin, a black substance, of intense coloring power, which exists both in a soluble and insoluble modification. A kind of brown soft candy is also called caramel.

**CARAN D'ACHE**, kă-rôn d'âsh' (French for leadpencil), or POIRE, Emmanuel, French caricaturist and artist; b. Moscow, Russia, 1858; d. Paris, 26 Feb. 1909. His ambition was to be a military painter, but he is best known for his series of pictorial anecdotes contributed to *La Vie Parisienne*, *La Caricature*, *le Figaro illustré*, *le Chat Noir*, etc. Besides illustrating Bemadaky's 'Prince Kozakoff' and other celebrated books he published several albums of sketches, the 'Carnet de chèques' depicting the Panama scandals; 'Album de croquis militaires et d'histoire sans légendes'; 'Histoire de Marlborough,' etc. Consult Spielmann, M. H., Introduction to 'Works of Caran d'Ache' (London 1898).

**CARANGIDÆ**, kă-ran'jî-dê, a family of marine fishes, the pompanos. Among the more widely known members of the family are the leather jackets, pilot fishes, amber fishes, runners, horse mackerels, crevallés, moonfishes and pompanos. There are about 200 species in the family, and nearly all are good for food. They abound in the warmer seas, and many of them are remarkable for their graceful or strange forms.

**CARAPA**, a small genus of tropical trees of the family *Meliaceae*, with mostly imparipinnate leaves and regular flowers. A South

American species (*C. guianensis*) is a fine large tree, whose bark is in repute as a febrifuge. Oil made from its seeds (called carap-oil or crab-oil) is used for lamps, and masts of ships are made from its trunk. The wood is called crab-wood. The oil of the African species (*C. procera*), called *coondi*, *kundah* or *tallicoona* oil, is used by the negroes for making soap and anointing their bodies in order to protect them against insects. The oil of the South American carapa is used for the same purpose also.

**CARAPACE**, the upper part of the hard shell or case in which reptiles—turtles, tortoises, etc.—belonging to the order of the *Chelonia* are enclosed, the lower part being called *plastron*. The same name is also given to the upper part of the shell of the *Crustacea*, and to the case enclosing certain of the *Infusoria* (qq.v.).

**CARAPEGUA**, *kā-rā-pā-gwā'*, Paraguay, interior town 37 miles southeast of Asuncion. Settled in 1785 it is situated in a fertile country, producing cotton, tobacco, corn, sugar cane and manioc. It has modern public buildings, including a church and two schools. Pop. 13,000.

**CARAQUET**, *kā-rā-ke'*, Canada, port of entry, Gloucester County, New Brunswick, on the Bay of Chaleur and on the Caraquet Railroad. The settlement consists of Upper and Lower Caraquet and is noted for its fisheries. Pop. 4,621.

**CARAT**, derives its name from *qirrat*, which in Arabic signifies the pod of the *Erythrina abyssinica*, the coral tree of Abyssinia, the seeds of which have, from time immemorial, been used in the East in weighing gold, because they never vary in weight when once dry. It is a weight of three and a sixth troy grains, used in weighing pearls and precious stones, and also serves to express the relative fineness of gold. Twenty-four carats being assumed as the standard of gold perfectly free from alloy, every specimen, in proportion as it falls short of this purity, has a fineness of less than 24 carats—for example, if the alloy amounts to a sixth of the whole, it is 20 carats fine; or to a fourth, it is 18 carats fine.

**CARAUSIUS**, *kā-rō'shī-ūs*, Roman general: b. among the Menapii, in Gallia Belgica. He was sent by the Emperor Maximian to defend the Atlantic coasts against the Franks and Saxons; but being suspected of permitting those pirates to commit their ravages in order to increase his own plunder when he afterward captured their vessels, and foreseeing that he was likely to fall into disgrace, he landed in Britain and had himself proclaimed emperor by his legions (287 A.D.). In this province he was able to maintain himself six years by guarding the English Channel with his fleet. He became co-emperor with Diocletian and Maximian in 289; but under Constantine his reign came to an end. Boulogne fell in 293 and in the same year he was assassinated by one of his officers named Allectus. Consult Gibbon, 'Decline and Fall' (Vol. I, chap. XIII, ed. by Bury, with notes, London 1896); Webb, 'The Reign and Coinage of Carausius' (London 1908).

**CARAVACA**, Spain, town in the province of Murcia, about 40 miles west by north of the

town of Murcia. It occupies the side of a hill crowned by an ancient castle and overlooking the river Caravaca, here crossed by a stone bridge; is well built and has a handsome town-house and church, the latter with a lofty tower and some good sculptures and paintings. Its trade is chiefly in cattle, grain and manufactures of woolen and hempen goods, paper, soap, earthen and copper ware, chocolate and oil. Pop. 17,349.

**CARAVAGGIO**, *kā-rā-vād'jō*, Michel-Angelo Merisio (or Merisi) da, Italian painter: b. Caravaggio, in the Milanese, 1569; d. near Porto Ercole 1609. He was at first a journeyman mason, but soon applied himself to the study of painting, studied in Milan and Venice, and afterward went to Rome where he was for a time associated with Cesare d'Arpino and Prospero Orsi, and distinguished himself as the founder of the naturalistic school. His characteristic traits are vigor and truth of *chiaroscuro*, combined with excellent coloring. He was fond of introducing broad and deep masses of shade, whereby a great effect is given to the light. To aid him in producing this effect the room in which he worked was illuminated by a skylight, and the walls were painted black. He excelled in the painting of naked figures. His faults are obvious. Narrow and servile imitation of nature was his highest aim. Annibale Caracci and Domenichino were, perhaps, less distinguished than Caravaggio during their lives, but after their death were ranked higher because, without neglecting coloring and the study of nature, they aimed at correctness of design and dignity of conception. His violent character involved him in many difficulties. He died in consequence of wounds received in a quarrel. The painters who have been influenced by him most are Manfredi, Valentin, Guido Reni, Guercino, Domenichino and Ribeira, called *Espagnolet*. His first paintings are genre pieces, of which the best are 'Card Players' in the Sciarra Palace, Rome, and the 'Gipsy Fortune Teller' in the Palazzo dei Conservatori, on the Capitoline Hill. The works of his later life are large religious pieces, which aroused great opposition in Rome because he used to portray the saints as common types of humanity. 'Saint Matthew Writing the Gospel,' and the 'Death of Mary' are among those which were removed from the churches in Rome; the former being now in the Berlin Museum and the latter in the Louvre. The most renowned of his religious works and his generally accepted masterpiece is the 'Burial of Christ' now in the Vatican, but originally painted for the church of Santa Maria in Trastevere. The facial expressions of all of the figures are remarkable for the depth of the emotion portrayed. It shows great care in execution and harmonious grouping. Accuracy and realism are used in the representation of the figure of Christ. Numerous pieces ascribed to him are to be found in the various galleries of Europe, notably at Berlin and London; but it is doubtful if all are originals. Among his portraits may be mentioned one of himself in the Uffizzi at Florence, and that of the Grand Master of the Knights of Malta (Louvre). His influence as a master of realism in painting was widely diffused over Italy; and the Dutch Naturalists profited much by the careful study

of his works. Consult Baglione, 'Le vite de' pittori' (Rome 1649); Fornome, 'Michelangelo Caravaggio' (Bergamo 1907).

**CARAVAGGIO**, Italy, town and commune in Lombardy in the province of Bergamo, 24 miles east of Milan, on the Gera d'Adda. A steam tramway connects it with Monza and Milan. It is celebrated as the birthplace of the two great painters, Polidoro Caldara and Michelangelo Merisi, both called *da Caravaggio*. It was formerly surrounded by walls and defended by a strong castle. The site of its ancient fortified walls is now occupied by promenades, but the moat remains and is spanned by six bridges. Its principal church has some good paintings, and a lofty campanile. The commune is famous for its melons. Pop. about 10,000.

**CARAVAGGIO DA POLIDORO**, Italian painter: b. Caravaggio 1495; d. 1543. His real name was CALDARA, but he was surnamed CARAVAGGIO from his birthplace. He went to Rome in his youth and carried bricks at first for the masons who worked in the Vatican. He first felt a great desire to become a painter from seeing Giovanni da Udine and the other painters who were occupied in the Vatican. He formed a close friendship with Maturino of Florence, who assisted him with his advice. Caldara soon surpassed him, and exerted himself to introduce improvements in drawing, having always in view the antiques. Raphael employed him in the galleries of the Vatican, where he painted, under his direction, several excellent friezes. At Messina he executed an oil-painting, representing Christ bearing the cross (1534; in the Museum of Naples), which contains a number of beautiful figures, and proves his ability to treat the most elevated subjects. He has approached more than any one to the style and the manner of the ancients, particularly in imitating their bas-reliefs. His figures are correct, well distributed and arranged; the positions are natural, the heads full of expression and character. It is evident that he would have acquired great celebrity if he had undertaken greater works. He applied himself to the *chiaroscuro*, particularly to that kind of it which is called *sgraffiato*. He showed, also, much talent in his landscapes. At the sack of Rome in 1527 he fled to Naples, and on his return from that place to Rome, in 1543, he was murdered by his domestic. Consult Bertolotti, 'Artisti lombardi a Roma' (Milan 1881).

**CARAVAN**, a Persian word, used to denote large companies which travel together in Asia and Africa for the sake of security from robbers, having in view, principally, trade or pilgrimages. Such companies often have more than 1,000 camels to carry their baggage and their goods. These walk in single file, and the line is often four or five miles long. To avoid the excessive heat, they travel mostly early in the morning. As every Mohammedan is supposed to visit the tomb of Mohammed once at least during his life, caravans of pilgrims go to Mecca every year from various places of meeting. Of the various caravans which proceed to Mecca every year, the most important has always been the Syrian. The place at which it meets is Damascus, and here the pilgrims and merchants assemble many weeks before the day of departure, which is always fixed according to

the season of the year in which the feast of Bairam occurs, the pilgrims requiring to be at Mecca on the day of the feast. As these caravans serve mercantile as well as religious purposes, Mecca, on the arrival of the caravans, resembles a great fair, and this fair is indeed the most important in all the East. The journey from Damascus to Mecca and back occupies about four months. The leader of such a caravan to Mecca, who carries with him some cannon for protection, is called *Emir-el-Hadj* (Prince of the Pilgrims). Trading caravans choose one of their own number for a leader, whom they call Karwan Bashi. Besides a leader, each caravan has its servants, guides, military escorts and priests. Obedience is enforced by the leader in the matter of internal discipline, but in trafficking, each member is independent. Much information on the subject of caravans is to be found in the travels of Niebuhr, who made many journeys with them, and describes them, as is well known, minutely and faithfully.

**CARAVANSARI**, in the East, a sort of inn, situated in countries where there are no cities or villages for a considerable extent, to furnish travelers with a shelter. The building is generally spacious, enclosing a courtyard containing a fountain or well. Small unfurnished rooms constitute the interior, poorly ventilated and lighted. The interior court is entered at a large gateway, through which loaded camels may pass. Some of them are built with much splendor, though they are generally unfurnished, and the traveler is obliged to bring with him not only his bed and carpet, but also all his provisions and necessaries. In many, the hospitality is gratuitous. It is common for a pious Mohammedan to establish, during his life or by will, one or several of such caravansaries. This kind of benevolence is considered peculiarly agreeable to the Deity, and promotive of the eternal happiness of the founder. Sometimes persons are kept in these establishments to guide the caravans for some distance. See KHAN.

**CARAVEL**, formerly the name of different kinds of vessels; one used in Portugal of 100 to 150 tons burden; another, a small lateen-rigged fishing vessel used on the coasts of Normandy and Picardy of 10 to 15 tons; and a third, a large Turkish ship of war.

**CARAWALA**, *kā-ṛā-wā'la*, a large viper (*Hypnale nepa*) of Ceylon and southern India, numerous, and greatly dreaded by the natives, especially those who work in the pineapple plantations. It is of small size, rarely exceeding 20 inches in length, and has the extremity of the upturned muzzle covered with scales. Its poison has the peculiarity of not affecting the system until several days after the bite, so that proper remedies immediately applied will counteract the venom.

**CARAWAY**, an umbelliferous biennial plant (*Carum carui*), with a tapering fleshy root, a furrowed stem, and white or pinkish flowers. It produces a well-known seed used in confectionery, and from which a carminative oil is extracted and a spirit cordial distilled. The plants found wild in America are the descendants of naturalized European plants,

that have escaped from cultivation. It is largely grown in England, on strong and rich clays, and is sometimes sown with beans, but more usually with coriander and teazel, or coriander alone. After the coriander, which is only a preparatory crop, has been removed the plants of the caraway are singled out and repeatedly hoed and cleaned. It is cut about the beginning of July, and produces on an average about 900 pounds per acre. It is a favorite crop with the Dutch. The volatile oils in caraway render it of much service in medicine. The action of these oils is to stimulate peristalsis and thus overcome flatulency. They are further antiseptic and check excessive intestinal putrefaction. They act also as mild local anaesthetics and are useful in nausea and vomiting.

**CARAYON**, k̄a-r̄a-yōn, **Auguste**, French historian: b. Saumur, 31 March 1813; d. Poitiers, 15 May 1874. A distinguished Jesuit, he wrote 'First Canadian Missions of the Jesuits' (1864); 'Banishment of the Jesuits from Louisiana' (1865), and similar studies.

**CARBAJAL**, k̄ar-b̄a-h̄al', **Francisco**, Spanish soldier: b. Alavaro 1464; d. near Cuzco, 10 April 1548. He served in the army in Europe; went to Mexico in 1528; and when Pizarro appealed for help against the Inca uprising he was one of the force sent by Cortez to Peru. He was marshal under Vaca de Castro, in the battle of Chupas. He later took office under Gonzalo Pizarro, in the war against Diego Centeno and De la Gasca. At first he was triumphant over Centeno in the Collao, but at the battle of Sacsahuana, 8 April 1528, he was taken prisoner with Pizarro and executed. Because of his remarkable activity in this campaign, despite his years, he was known as the "Demon of the Andes." He was extremely cruel in his treatment of his enemies, but was not less noted for his humor which never failed him, not even at his own execution. Consult Markham, 'A History of Peru' (Chicago 1892).

**CARBALLO**, k̄ar-b̄al' yō, Spain, a town in the province of Coruña and near the coast of the northwestern extremity of the peninsula. It has warm mineral springs and baths. Pop. 13,513.

**CARBAZOTIC ACID**. See PICRIC ACID.

**CARBERRY HILL**, Scotland, a rising ground in Mid-Lothian, about seven miles southeast of Edinburgh, between Musselburgh and Ormiston, where Mary, Queen of Scots, surrendered herself to the confederate nobles of the kingdom, 15 June 1567, just before her confinement in Loch Leven Castle.

**CARBIDE**, in chemistry, a binary compound of carbon with a metallic element, or with certain of the non-metallic elements. Of the known carbides those of iron and calcium are most important. Carbide of iron occurs in steel, and is undoubtedly concerned in some manner, with the hardening of that metal, although the authorities are not agreed as to the precise rôle that it plays. The best-known carbide of iron is the one having the formula  $CF_2$ ; but Campbell has shown (*American Chemical Journal*, XVIII, 836) that a series of iron carbides probably exists, having the general formula  $C_nFe_m$ , and corresponding in a

certain sense to the hydrocarbon series  $C_nH_m$ ; so that when any one of the carbides of iron is treated with an acid, the corresponding hydrocarbon is set free. Calcium carbide is formed by the action of carbon upon lime at the temperature of the electric furnace. It has the formula  $CaC_2$ , and its commercial value depends mainly upon the fact that it is readily decomposed by water, with the copious liberation of acetylene gas (q.v.). Carbide of magnesium is not formed at the temperature of the electric furnace, probably because it is not stable at that temperature. It may be prepared, however, by the action of calcium carbide upon magnesium fluoride, in accordance with the equation  $CaC_2 + MgF_2 = CaF_2 + MgC_2$ . Like calcium carbide it is decomposed by water with evolution of acetylene gas, the yield being 50 per cent greater, per pound of the carbide, in the case of magnesium carbide. It is not unlikely that magnesium carbide will one day replace calcium carbide for the production of acetylene gas, on account of the larger yield; but this substitution cannot be made on a commercial scale until some cheaper mode of manufacture is found. The chemistry of the carbides is still in its infancy, but within the past few years, and largely owing to the splendid work of Moissan, many new bodies belonging to this class have been discovered. Gold, bismuth, lead and tin do not form carbides at the temperature of the electric furnace, nor do they dissolve carbon at that temperature. Platinum and iridium dissolve carbon freely, but deposit it again, upon cooling, in the form of graphite. Aluminum absorbs carbon freely, with the formation of  $Al_4C_3$ , and similar results are obtained with many other metals and metallic oxides. The carbides of chromium, molybdenum, titanium, tungsten and zirconium do not decompose water. Those of calcium, strontium, barium and lithium decompose it with liberation of pure acetylene; but the carbides of aluminum and beryllium yield pure methane, and carbide of manganese gives a mixture of equal parts of methane and hydrogen. Other carbides decompose water with more complex results. Thus the carbides of the rare metals of the cerium group yield complicated mixtures of hydrogen, acetylene, methane and ethylene, and the carbide of uranium gives all these products (except, perhaps, acetylene), and, in addition, copious quantities of various liquid and solid hydrocarbons. The carbides of sodium and potassium, which are best prepared by passing dry acetylene gas over the corresponding metals at a temperature of about 450° F., decompose water with liberation of acetylene. The carbides of titanium and of silicon are characterized by extreme hardness, and it is said that they will even cut the diamond with facility. Carbide of silicon is an exceedingly stable substance, and is now largely used under the trade name of "carborundum," as an abrasive material in the manufacture of grinding-wheels, whet-stones and polishing-cloth.

Moissan's researches with the electric furnace are reported chiefly in the *Annales de Chimie et de Physique*, and useful reviews of them have been printed at frequent intervals in *Nature*. Moissan claims to have been the discoverer of the crystalline carbide of calcium

that is now commercially familiar; but in the United States this honor is usually accorded to Mr. Willson, whose labors were certainly quite independent of those of Moissan. See CALCIUM CARBIDE; CARBORUNDUM; ELECTRO-CHEMICAL INDUSTRIES.

RICHARD FERRIS.

**CARBIDE FURNACES.** See ELECTRO-CHEMICAL INDUSTRIES.

**CARBOHYDRATE**, in chemistry, a compound consisting of carbon, hydrogen and oxygen, and having the general formula  $C_nH_{2n}O_p$ . As will be seen, the number of carbon atoms in a carbohydrate is always divisible by six, and the oxygen and hydrogen are present in the same proportion in which they occur in water. It is not implied, however, that the compound contains water as such, but only that the oxygen and hydrogen atoms are present in the proportion of two atoms of the latter to one of the former. It will also be observed that a carbohydrate and a hydrocarbon are two essentially different things, inasmuch as a carbohydrate contains oxygen, while a hydrocarbon is a compound containing no element but carbon and hydrogen.

The carbohydrates constitute a large and very important class of substances, embracing the starches, sugars, glucoses and gums, as well as cellulose. Their chemical relations are intricate, and are far from being thoroughly understood. Several schemes have been proposed for their classification, but owing to the present imperfection of our knowledge none is entirely satisfactory. The classification proposed by O'Sullivan is convenient, however, and will be adopted here.

**Class 1.—SACCHARANS:** Amorphous substances, having the general formula  $nC_6H_{10}O_5$ , soluble in water but insoluble in alcohol, and further characterized by the fact that when they are treated with acids they yield substances of the type  $nC_6H_{12}O_6$ , directly, and without the formation of intermediate compounds. Dextran, levulan, the amyloans and the galactans are examples. (These bodies are gums).

**Class 2.—SACCHARENS:** Substances possessing a certain amount of structure, having the general formula  $nC_6H_{10}O_5$ , insoluble in either water or alcohol, and transformed by the action of acids and certain ferments first into  $nC_{12}H_{22}O_{11}$ , and finally, by the action of acids, into  $nC_6H_{12}O_6$ . Cellulose, starch, inulin and tunicin are examples; the first two falling under "amylose" in the less elaborate classification which divides the carbohydrates merely into amylose, saccharose and glucose.

**Class 3.—SACCHARINS:** Amorphous substances, having the general formula  $nC_6H_{10}O_5$ , soluble in water, but insoluble in alcohol; converted by acids first into  $nC_{12}H_{22}O_{11}$ , and finally into  $nC_6H_{12}O_6$ ; and by certain ferments into  $nC_{12}H_{22}O_{11}$ . Glycogen, dextrin and malto-dextrin are examples.

**Class 4.—SACCHAROSSES (sugars).**

**Group (a).—SACCHARONS:** Sweet, crystallizable bodies, soluble in water and in moderately strong alcohol, having the general formula  $nC_{12}H_{22}O_{11}$ , and convertible by acids and sometimes by ferments into  $nC_6H_{12}O_6$ . Sucrose (cane sugar), lactose (milk sugar), maltose and raffinose are examples.

**Group (b).—GLUCOSSES:** Substances crystallizing, though not so readily as the members of the preceding group; having the general formula  $nC_6H_{12}O_6$ ; soluble in both water and alcohol; and converted by the prolonged action of acids into substances that are no longer carbohydrates. Some of these, such as dextrose, levulose and galactose, are fermentable by yeast; while others, such as sorbinose, are not fermentable.

**Group (c).—**Certain substances, such as inosite and scyllit, which probably belong in the aromatic series and bear no special resemblance to the other members of the carbohydrate family.

O'Sullivan has also a fifth class, including those substances which, though they may not be

carbohydrates in the strict sense, are nevertheless closely allied to the carbohydrates and are easily converted into them when hydrolysed. In this class he places the glucosides and certain of the gums, mucilages and pectins.

The carbohydrates are exceedingly important elements in the world's food supply, and may indeed be said to be essential to the maintenance of life. They are practically all of vegetable origin, and are derived ultimately from certain simple fundamental substances that are formed in the green leaves of plants. Under the influence of sunlight the chlorophyll contained in the leaves is competent to split up the carbon dioxide of the air, retaining the carbon and setting the oxygen free. The carbon that is abstracted in this way is caused to combine with the water that the leaves contain, with the production of carbohydrates; but the identity of the carbohydrate that is first formed in this way, and which serves as the starting-point for the others, is not yet established. According to the views of Sachs the "first obvious product" is starch, the formation of which he explained by the equation:

It appears more likely, however, that formic aldehyde,  $CH_2O$ , is the first product, as is indicated by the equation

and that the subsequent products are built up by polymerization.

Carbohydrate metabolism is one of the most important physiological processes of the animal body. The carbohydrates are the chief source of energy and heat in the body. Most of the carbohydrates are converted into maltose by the digestive processes. This, during the processes of absorption and assimilation, becomes dextrose, which sugar is the only normal sugar of the circulating fluids and the tissues. The dextrose is taken up by the blood, conveyed to the liver by the portal vein and a part stored up in the liver cells. Some of the dextrose is also stored in muscle, and certain portions of it are utilized by the nucleoproteids of the body. The fate of the glycogen of the body is to be oxidized into carbon-dioxide and water. The steps of this process of oxidation are very much involved, but it seems certain that an oxidizing ferment, perhaps from the adrenal glands, acting in conjunction with the pancreas, is largely influential in the process. A failure to bring about sufficient oxidation of the sugar in the body causes the well-known symptom of glycosuria, one of the features of diabetes (q.v.).

RICHARD FERRIS.

**CARBOLIC ACID**, a substance having a formula  $C_6H_5OH$ , possessing feebly acid properties, and occurring chiefly in that part of the distillate from coal-tar which passes over at temperatures between 310° and 440° F., known as the "middle oils" or "carbolic oils." It is also found in small quantity in the later distillate, between 450° and 520°, known as "creosote oil." Chemically, carbolic acid has the structure of an alcohol (q.v.), and is an aromatic compound derived from benzene by the substitution of the hydroxyl group, OH,

for one of the typical hydrogen atoms. It is also known as phenol, phenyl hydrate or phenyl alcohol.

Carbolic acid is obtained for commercial purposes almost exclusively from gas-tar. The carbolic oil is washed with a solution of caustic soda of a specific gravity 1.075 to 1.100. In quantity the solution is somewhat more than sufficient to extract all the carbolic acid, but not enough to take up all the cresylic acid also. The resulting phenate of soda solution is drawn off and is used to wash another portion of the oil, when the cresylate of soda is decomposed, and the cresylic acid is replaced by carbolic acid. In this way a solution consisting almost wholly of carbolate of soda is obtained. This is purified by blowing steam through it, as long as it carries away any oils. The purified phenate of soda is then decomposed by carbonic acid gas and a small quantity of sulphuric acid, and the carbolic acid set free floats on the surface and is skimmed off. The crude carbolic acid thus obtained contains about 15 per cent of water, and a little cresylic acid. It is purified by distillation and crystallization. A part remains liquid, and this is sold as liquid carbolic acid, or it is turned back to be worked up again. The drained crystals are treated with concentrated sulphuric acid and potassium bichromate, and redistilled. For medicinal purposes it is again distilled in glass vessels.

Carbolic acid, in the pure state, crystallizes in white, deliquescent needles, having a strong characteristic smell slightly suggestive of tar. The reddish color noted when it has been exposed to the air is attributed to minute traces of lead. It melts at 106° F., and boils, under ordinary atmospheric pressure, at about 360° F. Its specific gravity is about 1.07. It dissolves in alcohol, ether and many other organic liquids, but is only moderately soluble in water under ordinary atmospheric conditions. It readily absorbs a small quantity of water from the air, forming a hydrate which is fluid at temperatures above 63° F. If the liquid so formed is shaken with water, the greater part of the carbolic acid separates out upon standing, and the vessel is found to contain an upper layer consisting of water in which a small amount of carbolic acid is dissolved, and a lower layer of carbolic acid in which a little water is dissolved. It does not exhibit very marked acid properties, but dissolves in the alkalis with the formation of salts called phenates. It does not have a strong affinity for the alkaline bases, however, and from a strong solution of sodium phenate (for example) it may be again separated in the form of an oily liquid by the addition of another acid; the new acid appropriating the base to itself, and setting the carbolic acid free. A solution of carbolic acid, even when very weak, develops a red color when boiled with a solution of mercurous nitrate and nitrous acid. This reaction, which serves for the detection of carbolic acid, is said to be delicate enough to indicate one part of the acid in more than 100,000 parts of water. In the arts large quantities of carbolic acid are used in the manufacture of salicylic acid (q.v.), and it is an important source of picric acid and coralline in the dye-making industry. It is consumed in immense quantities in making high

explosives after transformation into picric acid.

*In medicine*, carbolic acid has many uses. It is highly poisonous to living matter, and is used extensively to kill bacteria. In surgery it is used to disinfect wounds, and as an antiseptic dressing in proportions of from  $\frac{1}{16}$ -2 parts of acid to 100 of water. It, or some of its derivatives or allies, is used to sterilize instruments and bed linen, the walls and floors of rooms (by washing) and dejecta. Internally, carbolic acid is used as a bactericide, limiting excessive intestinal putrefaction. It is also an anæsthetic, and is at times of service in irritability of the stomach. When used in too concentrated a solution it is an active caustic, causing a white, painless burn. Alcohol is an excellent antidote. Taken internally in pure form in doses over two to three drops it causes poisoning with a characteristic series of symptoms. There is burning in the mouth, fauces, œsophagus and stomach. The whitish scars of the lips and mouth are characteristic. There is great pain, with vomiting of large quantities of mucus, clamminess of the skin and restricted respiration. There is usually ringing in the ears, headache and vertigo; the urine may be suppressed, reddish or greenish; and death results with small, rapid pulse, collapse, and, may be, convulsions. Similar symptoms may develop slowly in sub-acute forms of poisoning. The urinary symptoms usually lead to the diagnosis. The treatment of the acute form of poisoning is the free use of gastric lavage, ingestion of alcohol usually in the form of whisky slightly diluted and the use of lime water, and solutions of sulphate of soda or sulphate of magnesia. Symptomatic treatment and careful nursing are necessary for other symptoms.

RICHARD FERRIS.

**CARBOLINEUM**, derived from the Latin word *carbo*, coal, *oleum*, oil, to form a trade name for a new commodity, is a distillation from coal-tar or bituminous shale, containing phenoloid hydrocarbons of a highly preservative nature. Extensive deposits from which carbolineum is obtained are found in the grape-growing countries bordering on the Rhine, various other parts of Europe and some places in America. The liquid in its commercial form is of a nut-brown color, but it is a stain rather than a paint. However, it can be washed off a person's hands with cold water without leaving any stain. Tests made with it prove that it has many times greater penetrating power than linseed-oil. It never crystallizes. When it has been painted upon wood and has become apparently thoroughly dry, its action does not cease. If the wood is then painted with a heavy coat of white-lead mixed with linseed-oil, the carbolineum will make its appearance through the paint in a short time. Consequently, any wood that is first treated with carbolineum cannot be painted without previous sizing. Owing to carbolineum being composed of heavy hydrocarbons, it is only slightly inflammable; but when ignited by holding a match in contact with the carbolineum for a short time, it burns with a bright red light, giving off considerable carbon in the form of a dense smoke. Large quantities of carbolineum are made by subjecting crude

anthracene (green oils) to heavy pressure, and adding zinc chloride and chlorine. There are also on the market imitations of carbolineum, made from the heavy oils of petroleum. These are deficient in the specific preservative qualities which have given the original carbolineum its reputation. As made from coal-tar, carbolineum is a substance with distinctive physical and chemical qualities. It distills between the temperatures of 570° and 735° F., following the creosote oils. Unlike the latter it has no destructive effect upon wood fibre, nor does it have to be applied under heat (350°) and pressure (125 pounds) as with creosote oils, cooking the wood and deadening its fibre. Once the outer layer of the wood is dry the carbolineum enters, leaving the pores open so that interior moisture escapes as the preservative makes its way in. The creosote oils close the pores and confine the interior moisture.

Carbolineum first came into use about the year 1876. The grape-growers of the Rhine valley were much annoyed with insects and sustained considerable loss by the rotting of the posts and poles used in their vineyards. It is said that Richard Avenarius, who was an officer in the German army, first suggested the use of carbolineum as a wood preservative.

Carbolineum is usually shipped in barrels and then put in small packages to accommodate the retail trade. It is retailed at about 75 cents per gallon. The most extensive users are the tanners, railroad companies, maltsters and farmers. Railroad ties and posts are dipped in it in an open tank before setting.

Some of the railroad companies after due experiment have made extensive use of it, even "painting" parts of the woodwork of their freight cars with it. It is used in a modified form by dyers. Farmers use it for painting hog-pens, chicken-coops and barns for the purpose of destroying lice and other vermin. The carbolineum may be applied directly to the skin of animals, without injury.

Considerable litigation has grown out of the promiscuous use of the word "carbolineum" by manufacturers. Richard Avenarius did not obtain a trade-mark on the word "carbolineum" when he first used it, and never obtained a patent on carbolineum, and many others began its manufacture under that commercial name. Eventually he filed the word "carbolineum" as a trade-mark in Austria, but subsequently his trade-mark was revoked and protection refused on the ground of the general use of the word. Also, he registered the word "carbolineum" as a trade-mark in the Patent Office of the United States, as No. 14,048, dated 8 Feb. 1887. His right to such use was questioned and considerable litigation ensued. The matter had not been settled definitely when, in 1917, American manufacturers were permitted to use German patents and trade-marks under license.

RICHARD FERRIS.

**CARBON**, a non-metallic element, existing in nature in large quantities, both in the free and combined states. It exhibits marked allotropy, at least three distinctly different forms of it being known. These are (1) amorphous carbon; (2) graphite; and (3) diamond. Amorphous carbon is formed when wood or coal or almost any vegetable matter is

heated strongly, out of contact with the air, and is familiar to everybody as charcoal, coke and lampblack. Graphite (q.v.) occurs native, and may also be artificially prepared in various ways. Diamond (q.v.), which is crystallized carbon, also occurs native in certain regions, and pure specimens that are devoid of color, or which have certain special tints, are highly esteemed as gems.

Carbon has the chemical symbol C, and an atomic weight of 12.005 if O=16, and 11.91 if H=1. The specific gravity of diamond is 3.51, that of graphite is from 2.11 to 2.26 and that of hard gas-coke is about 2.35. The linear coefficient of expansion of diamond (Fahrenheit scale) is 0.00000066 at ordinary temperatures, and that of graphite is 0.0000044. Graphite has an electrical conductivity of about one-twelfth of that of mercury, and hard gas-coke, about one one-hundredth. Diamond is practically a non-conductor. The specific heats of diamond and graphite are quite different at ordinary temperatures. Thus at 50° F. diamond has a specific heat of 0.113, graphite 0.160 and wood charcoal about 0.165. These values increase as the temperature rises, and at about 1100° F. all three varieties have a common specific heat of about 0.44.

Carbon is infusible, and insoluble in any known liquid at ordinary temperatures. It dissolves to a limited extent in melted cast iron, and in melted platinum it dissolves freely, separating out again in the form of graphite upon cooling. It is unaltered by the action of acids, except when some powerful oxidizing agent like chlorate of potassium or bichromate of potassium is also present. Chemically it is tetravalent in nearly all of its compounds. It combines with oxygen in three different proportions, with the formation of a monoxide CO, a dioxide CO<sub>2</sub> and a suboxide C<sub>2</sub>O<sub>3</sub>. It also forms, with hydrogen, a great number of compounds known as hydrocarbons (q.v.); and it combines with many of the metals to form carbides (q.v.). With hydrogen, oxygen, nitrogen and small quantities of other elements, it constitutes the entire substance of animals and plants; and the coal beds upon which our modern civilization is founded are composed of vegetable remains from which the elements other than carbon have been mostly expelled by the combined action of heat and pressure. See AROMATIC COMPOUNDS; CARBON COMPOUNDS; CHARCOAL; COAL; ELECTRO-CHEMICAL INDUSTRIES; DIAMOND; FATTY COMPOUNDS; GRAPHITE.

RICHARD FERRIS.

**CARBON BISULPHIDE.** See ELECTRO-CHEMICAL INDUSTRIES.

**CARBON BLACK**, the trade term given to black made from gas. It was originally called hydrocarbon gas black, and a black of a similar nature to that now made was manufactured both in this country and in Europe from artificial gas. The industry did not, however, assume any importance before 1872, when the first patent was obtained for producing this black from natural gas. Since that date, many patents have been taken out in connection with the manufacture of this black from natural gas, and at the present time there are 10 distinct processes in use.

The abundance of natural gas in the United States, and the automatic method used in making the black, have enabled manufacturers in this country to produce it at so much lower prices that little of this black is now made from artificial gas, and large quantities of the product are exported annually. The total production of carbon black in this country in 1914 was valued at \$900,630, of which about one-seventh was exported. See BLACKS.

**CARBON COMPOUNDS**, in chemistry, those compounds which contain the element carbon. These are of two classes, the organic and the inorganic, the former being by far the larger and more important; so much so that the chemistry of the carbon compounds is practically synonymous with "organic chemistry." Until within the past half-century it was thought by many authorities that the compounds that occur in animals and plants are essentially different in nature from those that are produced in the laboratory, and that they cannot be obtained without the action of the "vital principle." This idea received its first blow in 1828, when Wöhler prepared urea from substances that had been previously considered to be inorganic; yet as late as 1849 the great chemist, Berzelius, defined organic chemistry as "the chemistry of compounds formed under the influence of life." A vast number of substances that were formerly classed as organic have now been prepared in the laboratory, and the old classification of chemistry into organic and inorganic branches has broken down, the organic division being now more correctly called the "chemistry of carbon compounds."

The organic carbon compounds form a group of great complexity, and are apparently unlimited in number. The reasons for this are that carbon is quadrivalent; that it forms multitudes of compounds with hydrogen alone, in many of which more or less of the hydrogen can be replaced by other elements, with the formation of new and altogether different substances; that its chemical bonds are apparently powerful; and that it unites with elements of the most widely different nature.

In a general way, the better-known carbon compounds are mostly divided into two great classes, according to the type of the "graphical" or "structural" formula that must be used in order adequately to represent their chemical relations. The first class includes all those bodies whose structural formulæ are distinguished by the fact that the atoms (or radicals) that are present form "open" chains, which do not anywhere return into one another. The hydrocarbon "propane," which has the structural formula

is an illustration of this class. The "open chain" compounds are called fatty compounds, and are treated under that heading. The name was originally given because many of the substances that are included in the class have long been known in connection with fats and allied bodies; but it would be more logical to call them "methane derivatives," since they may be

considered to be obtainable from the hydrocarbon methane,  $\text{CH}_4$ , by a process of substitution.

The second great class of carbon compounds is distinguished by the fact that the structural formulæ that are required in order to exhibit the chemical properties of its members return into themselves, so as to form "closed" chains or rings, which (at least in the fundamental forms) contain six carbon atoms. Benzene is a familiar example. From the fact that many of the first known representatives were balsams, oils and resins, these substances are known collectively as aromatic compounds, and are described under that heading. A better name would be "benzene derivatives," since all the members of the class are derivable from benzene by substitution. See AROMATIC COMPOUNDS.

In addition to the aromatic and fatty compounds, others are known which do not properly come under either heading. Thus the structural formula of furfuran contains a closed ring, formed by the union of four atoms of carbon and one of oxygen. Closed rings, consisting of three, four and five atoms of carbon, are also known. The pronounced analogies and affinities that exist among the members of the aromatic and fatty groups, respectively, have forced those two groups upon the attention of chemists. Those compounds of carbon which are not strictly included within either have not yet been classified upon a similarly broad basis.

The principal phenomena of the carbon compounds are given under special headings. In addition to those already given, see, particularly, ISOMERISM; and RADICAL. For an excellent presentation of the whole subject, consult Hjelt, 'Principles of General Organic Chemistry.'

Among the inorganic carbon compounds the more important are dealt with under separate headings: see CARBONIC OXIDE, CARBON DIOXIDE and CARBON DISULPHIDE. With few exceptions the others are interesting chiefly as chemical substances, with no distinctive use in the arts. The most useful of all is

*Carbon tetrachloride* ( $\text{CCl}_4$ ), at first produced by exposure of chlorine and chloroform in mixture to the action of sunlight, it is now generally prepared by the chlorination of carbon disulphide in the catalytic presence of powdered aluminum chloride. It is a colorless liquid, with a pungent aromatic odor, boiling at  $170^\circ \text{F}$ . It is soluble in alcohol and ether, and is itself a solvent of fatty organic substances. Through this property it is of considerable importance in manufactures, replacing carbon disulphide, as its vapor is not inflammable. In its effects on the human system it closely resembles chloroform.

*Carbon trichloride* ( $\text{C}_2\text{Cl}_6$ ) is produced by exposing ethylene chloride (or other derivatives of ethyl and ethylene) to the action of chlorine in sunshine; or by heating propyl

chloride with iodine trichloride. It is colorless and nearly tasteless, and has an aromatic odor resembling camphor. It is insoluble in water, but dissolves in all oils and in ether and alcohol, from which it crystallizes in right rhombic prisms. It vaporizes at ordinary temperatures.

*Carbon dichloride* ( $C_2Cl_4$ ) is prepared by adding carbon trichloride in small portions to an alcoholic solution of hydrated potassium sulphide as long as sulphureted hydrogen is evolved. The liquid is then distilled, and the distillate diluted with water, upon which the carbon dichloride separates. It is a stable liquid at zero F. and boils at  $240^\circ$ . It dissolves in alcohol, ether and the oils, but not in water, acids or alkalis. It absorbs bromine, in direct sunshine, forming *carbon chlorobromide*.

*Carbon oxychloride* ( $COCl_2$ ), a colorless liquid obtained when a mixture of carbon monoxide and chlorine is exposed to sunshine; and also by heating a mixture of chloroform, potassium dichromate and sulphuric acid. Its boiling point is  $47^\circ$  F.

*Carbon suboxide* ( $C_3O_2$ ), or carbon carbonyl, discovered by Diels and Wolf in 1906, is formed by treating a solution of dibrom-malonyl chloride in ether with zinc shavings. The pure suboxide is a colorless liquid with a pungent odor resembling mustard oil, and is quite poisonous. It boils at  $44^\circ$  and is solid at  $-224^\circ$ . At low temperatures carbon suboxide is quite stable, but between  $30^\circ$  and  $60^\circ$  if even a trace of impurity be present, it polymerizes into a dark red solid. It is inflammable, burning with a bright blue flame and the emission of much smoke.

*Carbon nitride* ( $C_2N_2$ ), see CYANOGEN.

*Carbon subnitride* ( $C_3N_2$ ), at temperatures below  $70^\circ$  a solid substance crystallizing in fine white needles. Above  $70^\circ$  it is a liquid with an odor resembling cyanogen, boiling at  $170^\circ$ , and breaking into flame if heated to  $265^\circ$ .

*Carbon oxysulphide* (COS), a colorless gas soluble in water, with an odor resembling sulphureted hydrogen, and highly suffocative. It has the notable specific gravity of 2.10, and may easily be poured from one vessel into another. It is inflammable, passing when burning into carbon dioxide and sulphur dioxide. At zero F., and under a pressure of  $12\frac{1}{2}$  atmospheres it becomes a colorless and highly refractive liquid which dissolves sulphur, and mixes with either ether or alcohol, but not with water.

Several compounds of carbon and bromine are important to the student of chemistry. They are *carbon tetrabromide* ( $CBr_4$ ); *carbon tribromide*, or *hexabromide* ( $C_2Br_6$ ); *carbon dibromide* ( $C_2Br_4$ ); and *carbon bromide* ( $C:CBBr_2$ ). The last named is spontaneously inflammable in contact with atmospheric air, and highly explosive. From these carbon compounds with bromine springs an extended list of derivatives.

RICHARD FERRIS.

**CARBON DIOXIDE, CARBONIC ACID GAS, or CARBONIC ANHYDRIDE,**  $CO_2$ , is formed whenever carbon is burned in the presence of excess of oxygen or air. It is a colorless, odorless gas about 1.53 times as heavy as air, bulk for bulk, and soluble to a considerable extent in cold water, especially

when subjected to pressure. Its solution possesses feebly acid properties, and has a peculiarly pungent taste, on account of which the aqueous solution of the acid is greatly used as a constituent of various beverages. The effervescence accompanying the opening of a bottle of beer, soda-water or champagne is due to the escape of the carbon dioxide that was previously held in solution under pressure. Carbon dioxide occurs in great abundance in nature, both free and in combination with various elements in the form of carbonates. Carbonate of lime,  $CaCO_3$ , is one of the most common carbonates. It is formed when the gas is allowed to bubble up through a solution of lime water and exists in nature in vast masses as limestone and marble. (Other carbonates are described under the metals that constitute their bases). Carbon dioxide is a constant constituent of the atmosphere (see AIR), occurring even at the tops of mountains and in the air collected by balloons at great height. It is generated by the combustion of fuel, by respiration, by fermentation and by the decay of animal and vegetable matter. In some localities, too, immense quantities of the gas are emitted from the ground, or from mineral springs and wells, as at Saratoga Springs in the United States, and in the Grotto del Cane, the Cave of Montjoly in Auvergne, in the valley of Wehr, in the Eifel and at many other places in Europe. It is being simultaneously abstracted from the air by plants, which in the sunlight decompose the gas, fixing the carbon that it contains, and setting the oxygen free. Carbon dioxide has but feeble affinity for the bases with which it combines, and is readily displaced by almost any other acid. In preparing the gas for experimental purposes the usual method is to add a dilute mineral acid to pulverized marble or other carbonate, the carbon dioxide then being liberated continuously and in large quantities. On a large scale carbon dioxide is made by heating limestone to redness in closed retorts, at the bottom of which superheated steam is blown in. This passes up through the heated limestone carrying with it the liberated carbon dioxide, and through outlets at the top into coolers and compressors. Besides its large use in the manufacture of aerated drinks, carbon dioxide is used in sugar factories to clarify the cane juice after treatment with lime. It is also used to preserve wines from deterioration by certain molds, and other organisms which set up acetic fermentation. Wine thus treated is distinctly improved in quality. Carbon dioxide is the active principle in baking powders, being liberated from the soda carbonate by the acid constituent of the powder, and in its efforts to escape from the dough produces the lightening effect.

The critical temperature of carbon dioxide is about  $88^\circ$  F., and at any temperature lower than this it can be reduced to a liquid by the application of pressure. Liquid carbon dioxide is colorless. It will not mix with water, but dissolves readily in alcohol, ether and volatile oils. When the pressure is released, part of the liquid vaporizes rapidly, and the remainder solidifies through the production of intense cold. Solid carbon dioxide is a white mass resembling snow. It remains for some time open to the air without melting. Its interior temperature, however, as shown by a

thermometer sunk into the mass, is  $-110^{\circ}$  F. Its melting point is  $-70^{\circ}$ .

Poisoning by this gas frequently results in closed rooms crowded with people. The symptoms may be very slight, consisting of a mild indisposition, or they may be severe—headache, nausea, vomiting, etc. In poisoning in the severer grades there is cyanosis, coma and unconsciousness. Carbon dioxide is not in itself a fatal poison; it becomes so, however, in the absence of a sufficient supply of oxygen, death being produced by simple asphyxiation.

RICHARD FERRIS.

**CARBON DISULPHIDE**, or **SULPHO-CARBONIC ACID**,  $CS_2$ , a liquid formed when the vapor of sulphur is passed over red-hot charcoal and the resulting gases cooled in a condenser. Under normal conditions it is a very volatile, inflammable liquid, with a specific gravity of 1.29, and boiling at  $115^{\circ}$  F. It burns with a blue flame, giving off sulphurous and carbonic acid gases. Burned in a Bunsen burner, with proper precautions against explosion, it produces a flame of actinic power exceeding that of burning magnesium. A special light for photographic purposes is produced by burning a mixture of vapor of carbon disulphide and nitric oxide, which yields a bluish flame rich in actinic rays. Mixed with three parts of oxygen, or an equivalent (in oxygen) of atmospheric air, the vapor forms a dangerously explosive mixture. Practically the whole commercial supply of carbon disulphide is made from coke and sulphur in the electric furnace. (See **ELECTRO-CHEMICAL INDUSTRIES**). The commercial disulphide has an exceedingly disagreeable smell, but this is due to the presence of impurities. The pure liquid, produced by simple distillation, has a pleasant, ethereal smell. Carbon disulphide (or bisulphide) dissolves sparingly in water, in the proportion of 1 part in 1,000, forming a valuable disinfectant. It mixes freely, however, with alcohol, ether, benzene and the fixed oils in almost every proportion. It dissolves sulphur, phosphorus, caoutchouc and many other organic bodies that are almost insoluble in other menstrua, and it is to this property that it owes its commercial value. It is used in largest quantity in the rubber goods manufacture, not only in the preparation of a cement, but also in the making of rubberized cloth by coating or infiltrating with a thin solution of rubber. It is also used to dissolve the natural grease out of wool, and fatty oils out of seeds and oilpress residues, or oilcake; and in the recovery of oils from all kinds of waste material. In its purest refined state the disulphide is employed to extract the most delicate essential oils from aromatic seeds and spices, and perfumes from flowers. In quite another direction it is efficient in preserving furs and woollens from moths, as an insecticide upon infested plants and in the burrows of such animal pests as moles, gophers, woodchucks, etc., to destroy them. As a chemist's aid in quantitative analysis it is indispensable. It has a wide chemical interest as the most energetic of sulphurizing agents, aiding in the production of many sulphides not obtainable otherwise. Because of its high degree of volatility it is used in the production of low temperatures by its own evaporation. Under the air-pump a cold of  $-76^{\circ}$  F. has been attained by its use.

Poisoning by carbon disulphide is becoming very prevalent since the use of rubber goods has become so extensive. The symptoms of acute poisoning are due to a poisoning of the blood and a central paralyzing action on the nervous system. The blood action is that of a breaking up of the red blood cells, hæmolytic. This results in cyanosis, pains, headache, vertigo, nausea, vomiting, weakness, unconsciousness, coma and death. Such acute cases are rare, the poisoning developing as a rule much less rapidly. In workers in rubber factories, in which there is much vapor of  $CS_2$ , there develop disturbances of temper, loss of memory, pressure feelings on the head, heat, and the feeling as if the blood would burst through the skull, with headache. There may also be symptoms of irritation of the bronchi, coughing and roughness of the voice, etc. Treatment is fresh air and symptomatic.

RICHARD FERRIS.

**CARBON MONOXIDE**, or **CARBONIC OXIDE**,  $CO$ , is produced in addition to the dioxide, when carbon is burned with a limited supply of air or oxygen. It is also generated by passing carbon dioxide through a red-hot bed of carbon, in accordance with the equation  $CO_2 + C = 2CO$ . For experimental purposes the gas may be generated by decomposing oxalic acid by heating it with strong sulphuric acid, and passing the gases that are evolved through a solution of caustic soda or lime to absorb the carbon dioxide that is present. Another method is by passing electric sparks through carbon dioxide. It is evolved in large quantities in the manufacture of carbides, and is collected as a valuable by-product useful in the making of special steels. Carbon monoxide is a colorless gas with a density about 0.97 times that of air. It burns with a lambent blue flame that is often seen in coal fires that have been freshly supplied with fuel. Carbon monoxide is highly poisonous, producing first giddiness and then asphyxiation, as small a quantity as one-half of 1 per cent in the air breathed being fatal, and even as small a percentage as one-fifth of 1 per cent resulting in death if breathed for any length of time. It combines with the hæmoglobin of the blood, and destroys the efficiency of that fluid as an oxygen-carrying medium. Carbon monoxide poisoning is often followed by serious degenerative changes in the brain. This gas is often evolved by self-feeding stoves with deficient draft.

**CARBON OXYCHLORIDE.** See **PHOSGENE**.

**CARBONADO**, a massive, black or dark-gray variety of diamond, also called "black diamond." Though possessing the adamantine or resinous lustre of the crystallized variety, it is opaque and, therefore, of no value as a gem. It is the hardest substance known and this fact makes it the most desirable for use in diamond drills; it therefore sells for as high a price per carat as one carat rough gem diamonds (q.v.). Being without cleavage it is less brittle than the crystals, and owing to its somewhat porous structure, its specific gravity is less, 3.15 to 3.29. The commercial supply comes exclusively from the province of Bahia, Brazil, where it occurs in angular fragments which occasionally show a rough cubic outline.

**CARBONARI**, kār-bō-nā'rē (colliers, or more strictly, charcoal-burners), the name of a large political secret society in Italy. According to Botta's 'Storia d'Italia' the Republicans fled, under the reign of Joachim (Murat), to the recesses of the Abruzzi, inspired with an equal hatred of the French and of Ferdinand. They formed a secret confederacy, and called themselves carbonari. Their chief, Capobianco, possessed great talents as an orator. Their war-cry was "Revenge for the lamb mangled by the wolf!" When Murat ascended the throne of Naples he employed Maghella, a Genoese, in the Department of Police, and afterward as minister. All his efforts were directed to the union and independence of Italy, and for this purpose he made use of the Society of the Carbonari. The ritual of the Carbonari was taken from the trade of the charcoal burner. Clearing the wood of wolves (opposition to tyranny) was the symbolic expression of their aim. By this they are said to have meant at first only deliverance from foreign dominion; but in later times democratic and anti-monarchical principles sprang up. They called one another good cousins. No general union of the order under a common head seems to have been effected. The separate societies in the small towns entered into a connection with each other, but this union extended no farther than the province. The place of assembly was called the hut (*barraca*); the surrounding neighborhood was called the wood; the meeting itself was distinguished as the sale (*vendita*). The confederation of all the huts of the province was called the republic, generally bearing the ancient name of the province. The chief huts (*alta barraca*) at Naples and at Salerno endeavored to effect a general union of the order, at least for the kingdom; but the attempt appears to have been unsuccessful. The order, soon after its foundation, contained from 24,000 to 30,000 members, and increased so rapidly that it spread through all Italy. In 1820, in the month of March alone, about 650,000 new members are said to have been admitted; whole cities joined the Society. The military, in particular, seem to have thronged for admission. The religious character of the order appears from its statutes: "Every Carbonaro has the natural and inalienable right to worship the Almighty according to the dictates of his conscience." After the suppression of the Neapolitan and Piedmontese revolution in 1821, the Carbonari throughout Italy were declared guilty of high treason, and punished by the laws. Meantime societies of a similar kind had been formed in France, with which the Italian Carbonari amalgamated, and Paris became the headquarters of Carbonarism. The organization took on more of a French character, and gradually alienated the sympathies of the Italian members, a number of whom dissolved connection with it, in order to form the party of Young Italy, under Mazzini. Consult 'Memoirs of the Secret Societies of the South of Italy, particularly the Carbonari' (London 1821); Cantù, 'Il Conciliatore e i Carbonari' (Milan 1878); Johnston, R. M., 'Napoleonic Empire in Southern Italy, and the Rise of the Secret Societies' (London 1904); Bandini, 'Giornali e scritti politici clandestini della Carbonaria Romagnola, 1819-21' (Rome 1908).

**CARBONATES**, salts of carbonic acid ( $H_2CO_3$ ). The carbonates constitute a very important group of minerals. Among economically valuable minerals of this group are the iron carbonate, siderite ( $FeCO_3$ ), the zinc carbonate, smithsonite ( $ZnCO_3$ ), the basic copper carbonates, azurite ( $2CuCO_3 \cdot Cu(OH)_2$ ) and malachite ( $CuCO_3 \cdot Cu(OH)_2$ ), and the lead carbonate, cerussite ( $PbCO_3$ ). Among the important rock formers are calcium carbonate, calcite ( $CaCO_3$ ), and the double carbonate of lime and magnesia, dolomite ( $Ca, Mg$ ) $CO_3$ . Many other carbonates are known. See MINERALOGY; CARBON DIOXIDE; CALCITE, etc.

**CARBONDALE**, Ill., city, Jackson County, on the Illinois Central Railroad, 95 miles southeast of Saint Louis, Mo. In a farming and coal-mining region, it ships fruit, flour, live stock and coal, and has numerous industrial plants manufacturing railroad ties, bottles, bricks, flour, etc. Pop. 5,411.

**CARBONDALE**, Pa., city of Lackawanna County, situated on the Lackawanna River, 110 miles north-northwest of Philadelphia, and on the Erie, the Delaware & Hudson and the New York, Ontario and Western railroads. It is the centre of an important anthracite coal-field, and the principal industry is mining. A variety of other industries are represented, including foundries and machine shops, car shops, metal working plants, glass works and textile mills. The United States census of manufactures for 1914 recorded 43 industrial establishments of factory grade, employing 2,090 persons, of whom 1,897 were wage earners, receiving annually \$945,000 in wages. The capital invested aggregated \$2,896,000, and the year's output was valued at \$3,170,000; of this, \$1,639,000 was the value added by manufacture. As it is in a mountain region with fine scenery, it is also a summer resort. The city has a public library, emergency hospital, hospital for the criminal insane, fine Federal building, and a park in the heart of the city, containing a soldiers' monument. Settled in 1824, it was incorporated in 1851, and has adopted the commission form of government. Pop. (1914) 18,500.

**CARBONEAR**, kār'bōn-ēr, Newfoundland, a port of entry on the eastern side of the peninsula separating Trinity Bay from Conception Bay, 25 miles in a northwesterly direction from Saint John's. Pop. 3,540.

**CARBONIC ACID GAS**. See CARBON DIOXIDE; GASES, COMPRESSED.

**CARBONIC ANHYDRIDE**. See CARBON DIOXIDE.

**CARBONIC OXIDE**. See CARBON MONOXIDE.

**CARBONIFEROUS**, the name applied to the last period of the Paleozoic era, and to the system of rocks formed during that period. The Carboniferous has been variously subdivided, the following being the current usage of the United States Geological Survey:

Permian.  
Pennsylvanian (coal measures, Upper Carboniferous).

Mississippian (sub-Carboniferous or Lower Carboniferous).

Many geologists divide the Carboniferous into Lower and Upper, but give the Permian

the rank of a period. Mississippian and Pennsylvanian are terms derived geographically in the United States, and are not used abroad. A few American geologists consider that they too are of the rank of periods, and would discard the old term Carboniferous altogether. Permian is derived from the province of Perm, in Russia, and Carboniferous from carbon (coal) in the rocks of the system.

**Palæogeography of the Carboniferous in North America.**—The Mississippian opened with shallow epicontinental seas widespread over central United States, as at the close of the Devonian (q.v.). In the east the Pocono and Mauch Chunk formations are largely terrestrial, being a great series of delta and coastal plain deposits built up at the west edge of a land mass, Old Appalachia, which was persistent through several of the preceding periods, on the site of the present Piedmont, Coastal Plain, and farther east into the present Atlantic Ocean. In the seas of the great interior the sediments of the epoch are largely limestone. At the close of the Mississippian there was widespread emergence east of the Rocky Mountains, with folding in the Ouachitas and also in Europe. This emergence was accompanied by widespread erosion, and the Pennsylvanian rocks rest unconformably on the Mississippian and older beds. Throughout Pennsylvanian times most of eastern United States was low and swampy with luxuriant vegetation, which accumulated and was buried to form coal. Occasional submergences occurred and marine beds are intercalated with coal seams. The marine beds are more abundant in central than in eastern United States; and in the Rocky Mountains and Great Basin the sea persisted practically through the epoch, and the rocks are almost wholly marine. During the Permian the region east of the Mississippi River was land, and humid during the early part of the epoch, as shown by coal beds. West of the Mississippi River, the land gradually emerged during late Pennsylvanian and early Permian and the climate grew arid. Great salt lakes were extensive and beds of salt and gypsum are abundant. At the same time there were similar deserts in Germany, in which the great German salt deposits were formed. Strangely enough, other continents, even within the torrid zone, were undergoing glaciation at the same time, particularly Africa, Australia and India. These extreme conditions, together with the great period of folding that formed the Appalachian Mountains, wrought a profound change in types of plants and animals, and brought to a close not only the Carboniferous Period, but the Paleozoic Era as well.

As the rocks laid down in Carboniferous time furnish by far the greater part of the world's supply of coal, they have been very carefully studied in many different places and accurately mapped, so that more is known of the Carboniferous rocks than those of any other Paleozoic system.

The Lower Carboniferous or Mississippian series, in Nova Scotia and New Brunswick, is made up of thick beds of sandstone and limestone overlaid by limestones containing masses of gypsum. The total thickness of the series is 6,000 feet. In Pennsylvania the Lower Carboniferous series has a total maximum thickness of 4,000 feet of sandstone and shale. Farther west the Lower Carboniferous is rep-

resented largely by limestones with a maximum thickness of over 1,200 feet in southern Illinois. In southwestern Virginia are limestones, sandstones and shales of Lower Carboniferous Age, 2,000 feet thick, and containing a few workable beds of coal. In the Rocky Mountains the Lower Carboniferous rocks are, with few exceptions, limestones.

The rocks of the Upper Carboniferous or Pennsylvanian include the great coal fields of eastern North America. (For the origin of coal fields, see COAL). They are sandstones or conglomerates, grits, shales, clays, limestones and seams of coal. The total thickness of the Nova Scotia coal measures is 7,000 feet, and 76 distinct seams of coal are known. In Pennsylvania the coal measures have a total thickness of 4,000 feet. In Michigan the coal measures are about 300 feet thick; in the eastern interior (Illinois-Indiana) field 600 to 1,000 feet, and in the western interior field the thickness varies widely, reaching a maximum in Arkansas.

The Upper Carboniferous rocks cover wide areas in Utah, Colorado and Arizona; they also occur in the Black Hills in South Dakota, and in California, and British Columbia. They are generally limestones or sandstones and contain no coal beds. The distinction between Upper and Lower Carboniferous is not as sharp as in the Mississippi Valley. The total thickness of the whole Carboniferous series in Nevada and Utah is about 13,000 feet.

**Carboniferous in other Continents.**—In western Europe the Lower Carboniferous limestones reach from Ireland to Central Germany, with a maximum thickness in England of 6,000 feet, and are overlaid by coal measures. In Asia the Chinese coal measures are of Upper Carboniferous Age, and are underlaid by Lower Carboniferous limestone. In South America the Lower Carboniferous is mostly made up of sandstones, and the upper of limestones, with very few coal seams.

**Life of the Carboniferous.**—The plant-life of the Carboniferous Period showed some advances from the Devonian. The ferns were most abundant, some being like tall trees, others as small as the maidenhair fern of to-day. The most conspicuous growths in the Carboniferous forests were the Lycopods or club-mosses, now represented by insignificant forms, but then growing sometimes 75 feet or more high, with trunks three feet in diameter, and spreading branches (*Lepidodendron*). Other Lycopods (*Sigillaria*) had short, thick trunks with few if any branches. Still another group, the horse-tail rushes, were of far greater importance in Carboniferous times than now. Of these the *calamites*, with their tall, slender stems, must have been one of the commonest plant forms of the Carboniferous forest. No plant with conspicuous flowers existed.

Of animal life, corals were abundant; and the *Foraminifera*, especially the genus *Fusulina*, became of importance. The extinct blastoids were abundant, and the Carboniferous is the period in which the crinoids, or sea-lilies, reached their highest development. Sea-urchins were more plentiful than in the Devonian, but the trilobites were slowly dying out. Scorpions were fairly abundant, and the first true spiders appeared. The brachiopods were less abundant than in the Devonian. Bivalve

mollusks were numerous, among them being the first land shell. Of the fishes, the sharks were remarkably developed. Amphibians, which probably existed in Devonian, increased greatly in Carboniferous time, but belonged to an order now extinct, and were of moderate size, no species being over eight feet long. Consult Chamberlin and Salisbury, 'Geology' (Vol. II, New York 1907); Cleland, H. F., 'Geology, Physical and Historical' (New York 1916); Dana, 'Manual of Geology' (New York 1895); Geikie, 'Text Book of Geology' (London 1903) 'Report of the United States Geological Survey' (1900-01, part III). See COAL; CLAY; GEOLOGY.

CHARLES LAWRENCE DAKE,  
Assistant Professor of Geology and Mineralogy,  
University of Missouri, School of Mines.

**CARBONIFEROUS LIMESTONE**, or **MOUNTAIN LIMESTONE**, certain limestones of Lower Carboniferous Age, as named by Murchison and other English geologists. In the United States the silver-lead ores of Leadville and other Rocky Mountain camps, and the zinc and lead ores of southwestern Missouri, are in limestones of Carboniferous Age. See CARBONIFEROUS.

**CARBORUNDUM**, a trade name for silicon carbide (SiC). This compound is produced by heating sand and carbon together in the electric furnace. It is characterized by extreme hardness, and its principal use is for abrasive purposes, as a substitute for corundum and emery. It was discovered in 1891 by E. G. Acheson, and is now manufactured in large quantities in the great electric laboratories at Niagara Falls. The operation is carried on in a furnace in which the bed and ends are permanent, and the side walls temporary, being made up of loose firebrick for each charge treated. The furnace is 16 feet long and 5 feet wide. The electrodes enter the interior through the ends. They consist of clusters of carbon rods, interspersed with copper connections. The material used consists of 54.2 parts of sand, mixed with 9.9 parts of sawdust and 1.7 parts of common salt—the last acting as a flux. The amount of each charge is about 30,000 pounds, and this weight includes 34.2 parts of coke broken into pieces about the size of pea coal. A part of the charge is spread on the bed of the furnace so as not to touch the electrodes but up to their level. In the centre of this is built a core of coke connecting the electrodes. The remainder of the charge is then heaped upon the core, the walls being built up to a height of five feet, and the heap between them reaching eight feet. The current used is at the beginning of the process 165 volts and 1,700 amperes. Later this is reduced to 125 volts but increased to 6,000 amperes. The run continues for 36 hours, during which 1,000 horsepower is expended. The furnace is then allowed to cool for two days, when the walls are torn down and the contents removed. The coke core has been graphitized by the heat, and outside of this is a layer a foot thick of graphitic carbon. Next to this layer is the crystallized carborundum, amounting to about 6,700 pounds, and in addition there is about 5,000 pounds of amorphous silicon carbide. The carborundum is broken up in a crusher and the crushed material digested with sul-

phuric acid for three days at a temperature of 212° F. It is then washed, and after being kiln-dried it is graded by screens to the several degrees of fineness in which it is sold. Carborundum in powdered form is placed on the market in considerable quantities as carbide of silicon for the introduction of silicon into iron, the material being very readily dissolved by the fused metal. Since carborundum is infusible and is only oxidizable at extremely high temperatures in a large amount of free oxygen, it follows that the temperatures ordinarily generated for smelting ores and metals are much below its point of destruction. Finely powdered carborundum is made up into a highly refractory paste with fire clay, lime and sodium silicate, which is applied by means of a brush or otherwise to bricks which are intended to be used for building a furnace, or the bricks are actually immersed in the viscous liquid for a certain time. If the furnace has already been built, the paste can be painted on the surfaces exposed to the fire. It is stated that a coating one-twelfth of an inch thick will protect the bricks from the attack of the highest temperature that is ever produced by combustion methods in ordinary work.

RICHARD FERRIS.

**CARBUNCLE**, a general term used to describe any red garnet when cut *en cabochon*. Pliny and other early writers apparently applied the name "carbunculus" indiscriminately to ruby, ruby spinel and garnet. The best usage at the present time confines it to the almandite garnet when cut *en cabochon*, that is, with a rounded convex surface. Usually such stones are hollowed out at the back and a piece of metal foil is inserted in order to lighten the otherwise too dense red color.

**CARBUNCLE**, in pathology a deep infection of the subcutaneous tissues by means chiefly of the *Staphylococcus* organisms, which are always present in the air. These infections take place through minute cuts or the hair follicles and are located chiefly in the nape of the neck. In addition to the local discomfort graver constitutional symptoms such as fever, headache, loss of appetite and loss of flesh are present. The local discomfort is apt to develop into deep, painful burning and throbbing. Pus is formed and gradually makes its way to the surface through minute orifices, or the whole area breaks down into a sloughing ulcer with a hard, deep, angry centre called the "core." The whole process may take one or two months before complete recovery occurs. The treatment is dietetic, hygienic and surgical.

**CARBURETOR**. An essential adjunct to internal combustion engines of the explosion type, performing the twofold operation of vaporizing the fuel (gasoline, benzol or alcohol) and mixing this vapor with the proper proportion of air to form an explosive compound. The instrument consists of a tubular air-intake into which is projected the fuel tube. The liquid fuel is atomized into a fine spray by the rush of air past the open mouth of the tube through which the fuel is fed in a constant flow regulated by a float valve in a float chamber. The importance of the delicate adjustment of the carburetor appears in the fact that upon the accurate admixture of the air and fuel depends the smooth working of the

engine. The proportion of air to gasoline required under ordinary running conditions is 8,400 parts to one. In starting a cold engine, however, a larger percentage of gasoline is needed, and to supply this an auxiliary carburetor is sometimes arranged to cut in temporarily, until the engine gets warm. Many varieties of the carburetor are in existence, but all are the same in principle. Special forms of carburetor have been devised for kerosene and other liquid fuels, with but partial success. See **AUTOMOBILE**; **AUTOMOBILE ENGINE**; **INTERNAL COMBUSTION ENGINE**. Consult Bramley, F. H., 'Modern Carbureters' (London 1913); Brewer, R. W. A., 'Carburetion' (London 1913); Browne, A. B., 'Handbook of Carburetion' (New York 1916).

**CARCAGENTE**, kār-kā-hān'ta, Spain; town of Valencia province, on the river Jucar, at the junction of the Valencia-Murcia and Carcagente-Denia railways. The centre of a region of orange, palm and mulberry trees, it also cultivates rice extensively, for which climate and soil are particularly well adapted, and it has modern linen and silk mills. Carcagente is of great antiquity with interesting Roman ruins. Pop. 12,300.

**CARCANET**, kār'ka-nēt, a jeweled necklace or chain, an ornament referred to by Shakespeare, and by Tennyson in 'The Last Tournament.' Venice was famous for its manufacture of carcanets in the 15th century.

**CARCANO**, kār-kā'nō, Giulio, Italian poet: b. Milan 1812; d. 1884. He was appointed professor at the Academy of Fine Arts in Milan in 1859, and became a senator in 1876. He wrote a narrative poem, 'Ida della Torre,' while a student at Pavia (1834). His next work, 'Angiola Maria' (1839), had extraordinary success; it is a deeply sympathetic story of Italian family life, and is regarded as the highest type of that class in Italian. In the same vein is the volume 'Simple Narratives' (1843). He wrote also 'Damiano, the Story of a Poor Family' and other works. Consult Prina, 'Giulio Carcano' (1884); and Rizzi's preface in 'Lettere di Giulio Carcano' (Milan 1887).

**CARCAR**, kār'kār, Philippines, a city on the northern coast of the island of Cebu, situated on the Bay of Carcar, 23 miles from the city of Cebu. It is near the head of the bay and on the road running along the eastern coast of the island. Pop. 31,895.

**CARCARILLA**, the bark of a tree (*Croton eleuteria*), of the family *Euphorbiaceae*. This is a shrub of the Bahamas and now yields most of the cascarilla of commerce, although in former years other species were used. It contains tannic acid, volatile oils, cascarillin, a glycoside and some resin. In medicine it is used as an aromatic bitter in combination with other remedies for constipation, indigestion and loss of appetite.

**CARCASS**, in military language, an iron spherical case filled with combustible materials, which is discharged from a mortar, howitzer or gun. It does not burst, but has three fuseholes through which the flame rushes, firing everything within its influence. Carcasses are of considerable use in bombardments for setting fire to buildings, vessels lying in harbors, etc.

They will continue to burn for 8 or 10 minutes, and are not even extinguishable by water.

**CARCASSONNE**, kār-ka-sōn', France, capital of the department of Aude, on both sides of the river Aude and on a branch of the Canal du Midi, 53 miles south of Toulouse. It consists of an old and a new town which communicate by a bridge of 12 arches spanning the river. The old town is surrounded by a double wall, part of it so ancient as to be attributed to the Visigoths, and is defended by a castle. Its streets are narrow, dirty and desolate, forming a striking contrast to those of the new town, which is regularly built, and has many handsome modern houses. The principal buildings are the restored cathedral of Saint-Nazaire, the courthouse, the prefecture, the old market and the churches of Saint Michel and Saint Vincent. The town contains a lyceum, a teachers' college, a seminary, a public library and a museum. The boulevards are finely planted. The chief manufacture is that of woolen cloth which is exported chiefly to the Levant, the Barbary states and South America. Carcassonne also manufactures paper, leather, linen, soap, ironware and pottery, and there is also a considerable trade in wine, grain, brandy, fruit and leather. The whole department is represented at its November fair. The ancient city, Carcaso, in the province of Gallia Narbonensis, fell into the hands of the Visigoths about 725; it was ruled by viscounts from the 11th to the 13th century and was united to France in 1209. In 1247 King Louis the Saint founded the lower town. It was pillaged and burned by the Black Prince in 1355, and in 1566 a Huguenot massacre took place within its walls. Consult Fedie, L. 'History of Carcassonne' (Carcassonne 1888).

**CARCHEMISH**, kār'kēm-ish, an ancient city on the Euphrates, formerly thought to be the same as the Roman Circesium, but now more generally located near Jerabis, a village on the west bank of the Euphrates. The earliest known references to Carchemish are found in the Cuneiform texts in the British Museum (II Bu. 88-5-12, 163; 11 and 88-5-12, 19, 8.) It was the northern capital of the Hittites. Thothmes III met the people of Carchemish in battle about 1501-1447 a.c. and in 1140-05 b.c.; it was once captured by Tiglath-Pileser I. It was made to pay tribute by Asurnazirpal III, and Shalmaneser III, whose artists represented the famous fortress on the walls of Balawat, but was not finally subdued by the Assyrians until taken in 717 b.c. by Sargon II, who deported the inhabitants and settled Assyrians in the city. In 608 b.c. it was captured by the Egyptian Pharaoh, Necho. At this time Josiah, king of Judah, was killed (mentioned in 2 Chron. xxxv); but the city was retaken by Nebuchadnezzar in 605. Consult Rawlinson, G., 'The Five Great Monarchies' (2d ed., Vol. II, p. 67); Finzi, 'Ricerche per lo studio dell' antichità Assira' (pp. 257ff. 1872); Maspero, 'De Carchemis Ceppidi Situ et Historia Antiquissima' (1873); Schrader, 'Keilinschriften und Geschichtsforschung' (pp. 221ff. 1878); Delitzsch, 'Wo lag das Paradies?' (pp. 265ff. 1881), containing extracts from the notebooks of George Smith; Hoffmann, G., 'Auszüge aus syrischen Acten persischer Märtyrer' (p. 163,

1880); Sachan, 'Reise in Syrien und Mesopotamien' (pp. 168f. 1883); Müller, W. Max, 'Asien und Europa' (p. 263, 1893); Johns, in *Proceedings of the Society of Biblical Archaeology* (p. 141, 1899); Sarsowszky, in *Zeitschrift für Assyriologie* (pp. 377 seq. 1911); Ben-zinger, in Baedeker's 'Palestine and Syria' (1912).

**CARCINOMA.** A tumor of the epithelial-tissue type. See TUMOR.

**CARD INDEXING, Commercial,** the adaptation of the principle of the modern library card catalogue to the multifarious uses of industrial, mercantile and commercial life. Following the practical American development and improvement of the various Old-World principles and rules laid down for the cataloguing of libraries, and the establishment after 1876 of library bureaus for furnishing standard supplies, it was speedily recognized that card systems for facilitating the record of the affairs of business life and their multitudinous details, were henceforth to be—as in the case of the telephone, the typewriting machine and accessories—indispensable adjuncts to the equipment of every well-appointed office, store, factory or institution throughout the world.

The invention of time and labor-saving systems and devices of all kinds speedily followed, and now, any branch of any kind of business, from the simplest to the most complex, can advantageously install and use a card system, and procure standard supplies of blank or special printed ruled forms with full information as to their application for the keeping of accurate records of all affairs in the most practical way.

The development of commercial card systems also led naturally to a corresponding and commensurate growth of office furniture, fixtures and accessories for their accommodation, which include: box tray and drawer cases for card indexes; various kinds of folders, guides, indexes, storage and binding cases for vertical files; indexed transfer cases for flat files, elastic or expanding filing and other cabinets for document, check and mercantile reports, etc.; specially devised stands, tables, desks, etc.

For classifying work by separating miscellaneous information—grouping information of the same kind together—no other method has been found to equal the card-index system, the impossibility of keeping different facts about the same business or profession recorded in a bound book with any degree of sequence or order being now universally recognized. The card indexing system has proved of especial advantage, and is now extensively utilized in the offices of government, state and municipal departments, of railroad, telegraph, telephone, electric light, gas and waterworks companies, real estate and trust corporations, building and loan associations, fire, life and accident insurance companies, solicitors' and underwriters' agencies, benevolent societies, lodges, banks and other financial institutions, factories, wholesale commercial and mail order houses, publishers, advertising agencies, professional men, clergymen, lawyers, physicians, oculists, dentists, specialists, etc.

By means of the card index system, names, facts, figures of any description, recorded on cards of uniform size, are arranged alphabetically, numerically, territorially, chronologically,

or according to any suitably defined order in boxes, trays or drawers of cabinets of special design. Various plans, ranging from simple to complex, are used for special indexing. All, however, are transparently concise in arrangement and of facile adaptation for reference. The most simple form of card-indexing is the alphabetical-subject plan in which the name is indexed alphabetically and the subject indicated by different tab cards. In territorial card-indexes, the names are first classified by states, with alphabetical guides for each city or commercial community in the state, the cards bearing the records of firms or individuals being filed back of the alphabetical guides. Chronological card-indexes are divided into monthly, daily and alphabetical sections, distinguished by different colored cards, and back of each monthly guide is arranged a set of blank daily guides, so that cards may be filed in advance for attention on any day of any month. Each card with its record has an individual existence in its relations to others of the system, and is always to be found in its place, notwithstanding the cumulative and expansive principle of the index, which allows cards to be added or withdrawn as needed. Guide or signal cards of different colors with projecting edges or tabs facilitate the immediate finding of the card for rapid reference; the liberal use of these signal cards, carefully inserted in long lists of the same surnames, also obviates a considerable amount of handling and saves time, labor and the wear and tear of the cards.

One of the most ingenious uses of the card system for commercial purpose is its application to the keeping of ledgers, of which the loose-leaf ledger is an offshoot in the developing process of commercial card-indexing. The card ledger does away with the necessity of purchasing books, ledgers or binders and accounts can be posted, checked up, trial balance taken off and statements mailed in approximately half the time required for a book ledger. Accuracy is also promoted by each card representing one account only, which can be laid on the sales sheet or other original record, thus lessening the liability to error in posting. Each account being on a separate card is easily indexed, and no separate or cross-index is required; more perfect indexing is thus ensured; as the number of accounts increase year by year, sets of index cards, with as many subdivisions of the alphabet as desired to facilitate quicker reference, may be substituted for the original set. Statements can be taken off promptly at the first of the month, and where necessary, several clerks can do the billing at the same time, which is impossible with the book ledger. Open accounts only are kept on the regular file; all closed accounts are removed and indexed in a separate file, the only practical method of providing for closed accounts, which can be easily referred to as open ones. The card being removed from the files when the account is closed, and replaced when opened, also obviates the former necessity of transferring accounts from one ledger to another, at the end of each year. Finally the card index ledger can be profitably used for mailing and circular lists. Modern business houses no longer file their correspondence in the old letter boxes. There are various card systems, but the primal scheme is to have a cabinet in place

of the separate pasteboard letter boxes. This cabinet is divided into drawers, each deep and wide enough to hold the largest business letter-heads when standing in a vertical position. The drawers themselves are divided into compartments for classifying the letters and separated by manila dividers, between which are folders of heavy paper. Marginal index guides on the dividers afford a mechanism for quickly finding any name or classification desired. Supplementing this are various schemes involving different kinds of cabinets for cross-indexing cards, by which the subject matter of letters or the names of the writers as well as of the firms from which letters are received may be indexed. Consult Byles, B. B., 'The Card Index System' and articles in *System* (February 1912) and *Engineering Magazine* (July 1913).

**CARDAMINE**, kār'dā-mīn, a genus of plants of the family *Brassicaceae*, containing about 60 species with a very wide distribution. They are herbaceous plants with usually pinnate leaves, white or lilac flowers of the usual cruciferous type, and the silique fruit which characterizes a section of the family. One of the best-known European and American species is the cuckoo-flower (*C. pratensis*), growing in wet places from Vermont to New Jersey, westward to Wisconsin, and northward. *C. hirsuta* is a common weed in eastern North America, varying in size, according to soil, from 6 to 18 inches in height. The leaves and flowers of this species form an agreeable salad. Numerous other species also occur in North America.

**CARDAMOM**, the seeds of several species of plants of the family *Zingiberaceae*, perennial plants growing in Asia and Africa. The fruit is used as a stimulant and aromatic. Triangular capsules, from four to five inches in length, contain the seeds, which are of a brown color, a pleasant, aromatic odor and a warm, pepper-like taste. The cardamons known in the shops are produced by *Amomum augustifolium*, a Madagascar plant, and *A. cardamon*, a native of Sumatra and other Eastern islands. Those recognized in the United States pharmacopoeia, called true or officinal cardamons, and known in commerce as Malabar cardamons, are the produce of *Elettaria cardamomum*, a native of India. The seeds of cardamon are widely employed in medicine as the basis of vehicles for carrying disagreeable drugs, and also as carminatives and digestants. The volatile oils of cardamon act like other volatile oils in stimulating peristalsis, thus expelling excess of intestinal gases, and they also increase the gastric and intestinal secretions.

**CARDAN**, or **CARDANO**, Girolamo, Italian philosopher, physician and mathematician: b. Pavia, 24 Sept. 1501; d. Rome, 21 Sept. 1576. He was educated from his fourth year in the house of his father. At 20 he went to Pavia to complete his studies, and after two years began to explain Euclid. In 1524 he took the degree of doctor of medicine at Padua and spent the following seven years practising medicine at Sacco. He was subsequently professor of mathematics and medicine in Milan (1534). In 1552 he journeyed through Europe. He became professor of medicine at Pavia and at Bologna, where he

remained eight years. He was forced to resign from the university after his imprisonment on the charge of teaching heretical doctrines. Pope Gregory admitted him to the College of Physicians at Rome, where he continued until his death. His biographers differ with regard to his religious opinions, but he was lost in cabalistic dreams and paradoxes, and pretended to have a familiar demon from whom he received warnings, etc. All this excited the theologians against him, who even accused him of atheism, though the charge was without foundation. He believed so implicitly in astrology that he drew his own horoscope several times, and ascribed the falsehood of his predictions, not to the uncertainty of the art, but to his own ignorance. His two works, 'De Subtilitate Rerum' (1551) and 'De Varietate Rerum' (1545) contain the whole of his natural philosophy and metaphysics. Cardan wrote also on medicine, and his fame as a physician was very great. His highest claims to the gratitude of the learned rest on his mathematical discoveries. Cardan, it is said, was told that Tartaglia had discovered the solution of cubic equations, and obtained the secret from him by stratagem and under promise of silence, but published the method in 1545, in his 'Ars Magna.' The honor of giving his name to the invention has remained to him who first made it known, and it is still called the formula of Cardan. It is universally believed that Cardan discovered some new cases, which were not comprehended in the rule of Tartaglia; that he discovered the multiplicity of the roots of the higher equations, and finally the existence of negative roots, the use of which he did not, however, understand.

Besides the works already mentioned there remain also 'Practica Arithmeticae Universalis' (1539); 'De Vita Propria' and 'De Libris Propriis' (1571-75); 'Encomium Geometriae' (1535); 'De Regula Aliza, Excerptum Mathematicorum, Sermo de Plus et Minus' (1540-50). The standard collection of Cardan's works is that of Sponius (Lyons 1663). Consult Morley, 'Jerome Cardan' (London 1854); Rixner and Siber, 'Leben und Lehrmeinungen berühmter Physiker am Ende des XVI und am Anfange des XVII Jahrhunderts' (Sulzbach 1820); Firmiani, 'Girolamo Cardano, la vita e l'opere' (Naples 1904).

**CARDAUNS**, kār'downs, Hermann, German Catholic writer: b. Cologne, 8 Aug. 1847. He was educated at the universities of Bonn, Munich and Göttingen, lectured on history at Bonn in 1872-76 and from 1876 to 1907 was editor-in-chief of the *Kölnische Volkszeitung*. After 1907 he was engaged in literary work at Bonn. He also served as general secretary of the Görresgesellschaft after 1891; was president of the German Catholic Congress at Mannheim in 1902. He has published 'Die Reformation Bernensi' (1868); 'Papst Alexander III' (1874); 'Der alte Fuhrmann' (1875); 'Chroniken der Stadt Köln' (3 vols, 1875-78); 'Erzbischof Konrad von Hostenaden' (1880); 'Der Sturz Maria Stuarts' (1883); 'Friedrich von Spee' (1884); 'M. Stuart, 1566-68, Memoiren ihres Sekr. Cl. Nau' (1884); 'Die Erzählung Walters des Erpoeten,' a novel (1887; 1899); 'Die Abenteuer des Johannes Reusch,' novel (1888; 1908);

'Die Märchen Clemens Brentanos' (1895); 'Geschichte aus dem alten Köln' (1899); 'Der Stadtschreiber,' novel (1900; 1908); 'Alte Geschichte vom Rhein' (1901); 'Die Briefe der Dichterin Annette von Droste-Hülshoff' (1909); 'Die Entdeckung des Südpols' (1909); 'Fünfzig Jahre Kölnischer Volkszeitung' (1910); 'Der Kampf um den Nordpol' (1910); 'Aus dem Leben eines deutschen Redakteurs' (1912); 'Fünfzig Jahre Kartellverband' (1913); and contributions to newspapers and periodicals. Since 1886 he has edited *Vereins-Gaben der Görresgesellschaft*.

**CARDBOARD**, a thick paper, or aggregation of paper or paper-stock, made by pasting several sheets of paper together and compressing the product between rollers. The finest cardboard, or Bristol board, such as is used for visiting-cards and in the arts, is so made of white paper only, the enamel being produced by brushing China or Kremitz white, a fine variety of white lead, over the surface, drying and rubbing with a piece of flannel previously dipped in finely powdered talc, and polishing with a close-set brush. It is known as three-, four-, six- or eight-sheet board, according to the number of layers of paper. A cheaper grade of white cardboard is composed of coarse white paper for the inner layers and a finer facing paper on the outside. Another variety of cardboard is that used by boxmakers, and is made from coarse brown paper glued and rolled, and faced with white or colored paper, or unfaced, according to the use to which it is to be put. A coarser grade yet is known as millboard. This is used by bookbinders for the covers of books, by boxmakers and for other work in which strength is of more value than appearance. Fine qualities of millboard are also made to some extent. See **PAPER**.

**CARDEN, Sir Lionel Edward Gresley**, British Ambassador: b. 15 Sept. 1851. After education at Eton College, he went to Havana in 1877 as vice-consul, and in 1883 accompanied Sir S. St. John's special mission to Mexico. In 1885 he was appointed British consul in the city of Mexico, and until 1889 was British commissioner on the Mexican Mixed Claims Commission. From 1898 to 1902 he was consul-general and from 1902 to 1905 British Minister to Cuba. In 1911 he was appointed Envoy extraordinary and Minister plenipotentiary to the republics of Central America; in 1912 was created K.C.M.G.; and in 1913 went to Mexico as British Minister. His recognition of the Huerta government was regarded in some quarters as indicative of an anti-American policy.

**CARDEN, Sackville Hamilton**, British admiral: b. 1857; entered the navy in 1870, served in the Egyptian War of 1882, in Suakim in 1884 and with the Benin Expedition in 1897. After holding various commands afloat and ashore he became admiral superintendent of Malta dockyard in 1912. In the European War he commanded the British naval force that made the first attempt to break through the Dardanelles in February 1915, assisted by a French squadron under Rear-Admiral Guépratte. After operating for a whole month the great attack on the Narrows failed, with

a loss of three battleships and more than 2,000 men. The failure clearly demonstrated that ships alone could not force the passage. Vice-Admiral Carden was compelled by ill health to relinquish his command in March 1915. See **WAR, EUROPEAN—DARDANELLES CAMPAIGN**.

**CÁRDENAS**, kár'dá-nás, Cuba, a seaport in the province of Matanzas, situated on Cárdenas Bay, due east of Havana on the north coast of the island. It is connected with Havana by rail, and has a large trade in sugar and molasses. On 11 May 1898 the Spanish shore batteries and gunboats at Cárdenas attacked the United States vessels blockading the port, and in the engagement the United States torpedo-boat *Winslow* was disabled, and Ensign Worth Bagley (q.v.) and four sailors were killed. Pop. 32,028.

**CARDI**, kár'dé, Lodovico, surnamed **CIGOLI**, Italian painter and architect: b. on an estate in the Arno Valley known as Castelvechio, 12 Sept. 1559; d. Rome, 8 June 1613. The name by which he is commonly known, Cigoli, is that of the village near his birthplace. He studied painting under Allori in Florence and architecture under Buontalenti, who introduced him to Sante di Tito of the same city. His first important work dates from about 1581; it is a representation, in fresco, of Christ that the young artist made for the grand cloister of Santa Maria Novella at Florence. His most celebrated picture, 'The Lame Man Cured,' which unfortunately no longer exists, formerly adorned Saint Peter's at Rome. Sacchi thought that it was entitled to hold the first place among the pictures in Rome, after 'The Transfiguration' of Raphael and the 'Saint Jerome' of Domenichino. His 'Martyrdom of Saint Stephen,' executed for the convent of Monte Domini, his 'Tobias the Angel,' in the Hermitage at Petrograd, the 'Saint Francis,' in the Borghese, Rome, his own portrait, in the Uffizi, Florence, and 'The Flight into Egypt,' in the Louvre, Paris, are all noteworthy. "His influence was extraordinary," according to Thieme-Becker, because he was the founder, in Florence, of the baroque style as exemplified in painting.

**CARDIA**, the upper or cardiac orifice of the stomach, where the gullet or œsophagus enters it, as distinguished from the intestinal opening or the pylorus.

**CARDIAC MEDICINES**, medicines which act upon the heart. See **HEART**.

**CARDIALGIA**, an intense pain over the general heart region. It is usually due to stomach disturbance, heartburn, and is often accompanied by pains in the œsophagus. Heartburn is nearly always due to the presence of large amounts of gas, causing pressure. These gases usually accompany and cause an indigestion. See **HEART**.

**CARDIFF**, Ira D., American botanist: b. Stark County, Ill., 20 June 1873. After study at Knox College, at the University of Chicago and at Columbia University he was appointed 1906-07 assistant professor of botany, and 1907-08 professor at the University of Utah. In 1908 he became professor of botany at Washburn College, Topeka, Kan., and in 1909 director of the Washburn Summer School. He

was professor of botany in the University of Kansas summer school 1911-12. His contributions to *Plant World*, the *Botanical Gazette* and the *Torrey Botanical Club's Bulletin* made him well known to fellow botanists.

**CARDIFF**, Wales (Welsh, Caerdydd, perhaps the fortress on the Taff, but derivation uncertain), a municipal and parliamentary borough, raised to the rank of a city (with the title of lord mayor for its chief magistrate) by royal charter in 1905, a seaport on the Bristol Channel, the capital of Glamorgan and the largest town in Wales. The city is built on both banks of the river Taff, a mile above its junction with the estuary of the Severn (known as the Bristol Channel) and extends to the rivers Rhymney on the east and Ely on the west. It is 135 miles west of London, on the Great Western main line from London to New Milford and Fishguard (for Ireland).

**Geology.**—Almost every geological formation from the Silurian up to the coal measures is found in the ring of higher ground surrounding the plain of recent alluvial deposits on which the city stands.

**Trade and Development.**—The rapid increase of the last half century is due to the development of the coal trade consequent upon the construction of the Bute docks. The first dock, completed in 1839, was built by the second Marquess of Bute, and five great docks have since been constructed at a cost of £5,500,000. Their total water area is over 200 acres, and the shipments of coal exceed 20,000,000 tons per annum. There are also docks at the adjoining ports of Penarth and Barry. The coal is worked in collieries to the north (nearest colliery nine miles) and shipped at the docks below the city, which is singularly free from any evidence of the staple trade. The fine, wide streets, abundance of trees, freedom from smoke and other evidences of progressiveness are a surprise to visitors. Besides the dock operations, the most important works are the Cardiff Dowlais steel works, the Tharsis Copper Works, numerous ship repairing yards, extensive flour mills, biscuit works, ice and cold storage (with large import trade) and steam trawlers for the fishing industry. The import trade has been developed of late years and Cardiff is now the chief wholesale centre for supplying the teeming populations of the mining valleys of Glamorgan and Monmouth.

**Railways.**—The Great Western Railway and its connections provide a good and quick service to distant places, while the local railways constructed primarily for mineral traffic, the Taff Vale, Rhymney and Barry respectively, communicate with the districts adjacent. The Midland and London and North Western companies have good depots.

**Government and Public Works.**—The government of the city is vested in the lord mayor, aldermen and councillors. The oldest surviving charter, granted sometime before 1147, evidences the existence of rights and privileges extending to a much earlier time. Other charters were given by the feudal lords, and later by the Crown. Cardiff returns one member to the House of Commons.

**Public Buildings.**—The public buildings are being grouped in a park of 50 acres. The town-hall and law courts (cost, £330,000) are

completed, as are also the offices of the University of Wales, new buildings for the University College of South Wales and the Welsh National Museum. The secondary and elementary schools are modern, and efficiently equipped and administered, and special provision is made for blind, deaf and dumb, and defective children. Other public buildings include the post-office, custom-house, offices of the Board of Trade and Mercantile Marine, hospitals, etc. The castle, restored and extended at great cost by the third Marquess of Bute, is maintained as one of the residences of his successors.

**Libraries.**—The public libraries contain 156,000 volumes and include the largest collection of Welsh books and manuscripts in existence. The school library system of the city is one of the best in existence. The museum and art gallery, about to be merged in the National Museum of Wales, contains modern paintings and sculpture; Swansea, Nantgarw and other porcelain, and examples of pre-Norman sculptured stones and crosses.

**Churches.**—The only ancient church is Saint John's with a fine decorated tower, built in 1473, by Anne Nevill, who inherited the lordship of Glamorgan. She was the wife of Richard Nevill, Earl of Warwick ("the king-maker") and mother of Ann, wife of Richard III. There are numerous modern Episcopalian, Roman Catholic and Nonconformist churches. The ancient cathedral of Llandaff is just outside the city boundary.

**History.**—The Romans had an important station here, extensive remains of their fortifications having recently been discovered in the castle grounds. According to tradition, Cardiff was an important place under the Welsh princes before the Roman occupation; it was certainly a stronghold of the Welsh after the departure of the Romans, and was ravaged by Danes and Norsemen. After the Norman conquest the district was subdued by Robert Fitzhamon and his followers, who established a powerful Marcher Lordship with Cardiff as the capital. The Castle Keep was erected inside the Roman fortification by the Norman lords. The town and district were in the hands of the feudal lords for centuries, and the scene of several bitter contests between the Welsh and their alien masters. Cardiff was at this time surrounded by a high and massive wall and a moat, while the castle, with its law courts and other appanages of feudalism, was a very strong place, guarded by relays of soldiers supplied in rotation from the forces of the under lords, who had castles in the surrounding districts. The lordship reverted to the King in 1495 and was in 1550 granted, stripped of its feudal privileges, to Sir William Herbert, afterward first Earl of Pembroke, from whom it has descended to the Marquess of Bute.

During the civil war Cardiff was an important centre of operations, and was held by the forces of the King and of Cromwell in turn. It was visited by Charles I in 1645, who there sought to revive the loyalty of his followers, but with poor success. The decay of feudalism stripped the town of its importance and it continued to decline until the dawn of the era of coal and iron. Sir Thomas Button, the navigator, was a native of Cardiff.

**Population.**—In 1801 the population was 1,870, and 50 years later, 18,351. In 1911 it was 182,259.

**Bibliography.**—‘The Cardiff Records’ (6 vols., published by the city council); ‘Cardiff,’ an illustrated handbook, edited by Ballinger (1896).

JOHN BALLINGER,  
*Librarian of the Public Libraries.*

**CARDIGAN, Adeline Louisa Maria,** COUNTESS OF, Comtesse de Lancastre: b. 24 Dec. 1824; d. England, 25 May 1915. She was the daughter of Spencer de Horsey, M.P., a notable man of fashion in his day, and her mother was a daughter of the 1st Earl of Stradbroke. One of her brothers was a general in the army, and another an admiral in the British navy, while a son of the latter is a rear-admiral. Miss de Horsey was highly educated in several languages, ancient and modern, and was reported an expert in fencing, riding, dancing and music. In 1858 she married the Earl of Cardigan (q.v.), who died in 1868. She married, secondly, the Count de Lancastre Saldanha, a Portuguese nobleman, who died in 1898. She was a celebrated beauty in her day, and had known Tennyson, Wellington, Talleyrand, Theodore Hook and Tom Moore. In 1909 she startled British society circles with a volume of ‘Recollections,’ a collection of anecdotes of prominent people she had met in her early life. Some of the tales were of a scandalous nature and not all of them were true, which raised a storm of protest from the descendants and relatives of the people referred to. She was in her 91st year when she died, and it is not improbable that old-age garrulity and confused memory were responsible.

**CARDIGAN, James Thomas Brudenell,** EARL OF, English general: b. Hambleton, 16 Oct. 1797; d. 28 May 1868. He was educated at Christ Church, Oxford, and was gazetted 6 May 1824, as cornet in the 8th Royal Irish Hussars, under the courtesy title of Lord Brudenell. His family influence and wealth in England procured for him a rapid promotion, and in a few years he had attained the rank of major. Lord Brudenell was next, 3 Dec. 1830, made lieutenant-colonel of the 15th Hussars. He was a member of the House of Commons from the period of his coming of age in 1818, until 14 Aug. 1837, when on the death of his father, he became Earl of Cardigan. After his regiment returned from India Lord Cardigan got himself into difficulties with the officers, who, one by one, had to sell out until the feeling of the regiment broke into mutiny in what was known as the “black bottle quarrel.” This quarrel arose in 1840, while Lord Cardigan’s regiment was stationed at Canterbury. One of his officers, Captain Reynolds, having caused wine to be placed on the table in a “black bottle,” Lord Cardigan accused him of degrading the mess to the level of a pothouse. This led to angry words: Captain Reynolds was placed under arrest, demanded a court-martial, but this privilege was withheld from him, and, as the public thought, unjustly. The excitement created by this affair and by his subsequent misunderstanding with another officer, also of the name of Reynolds, had hardly subsided, when he fought a duel with Capt. Harvey Tuckett because this officer had censured his

conduct in the *Morning Chronicle*. Captain Tuckett was wounded, and Lord Cardigan tried before the House of Lords, but, although acquitted, public opinion was against him. His reputation, however, as an accomplished cavalry officer, and the satisfaction which the Duke of Wellington expressed in 1848 with the efficiency of the 11th Hussars’ Regiment, which was under Lord Cardigan’s charge, led to his promotion. On the outbreak of the Crimean War Lord Cardigan was raised to the rank of major-general and appointed brigadier in command of the light cavalry brigade. This brigade constituted the celebrated “Six Hundred,” whose charge at Balaklava will long be remembered as one of the bravest yet wildest feats, perhaps, ever told in the history of war. On that occasion (25 Oct. 1854), Lord Cardigan is said to have received from Lord Lucan, his brother-in-law, an order to capture certain guns from the Russians. A mile and a half had to be traversed, under fire, before the enemy could be met, and the Russian forces stood in formidable array in every direction. The enterprise seemed hopeless. Cardigan, however, led on the charge, and actually took the guns, his men cutting their way through the infantry support and through the cavalry, and then back again, under the play of the Russian batteries, but with fearfully diminished numbers, the survivors not exceeding 150. As the hero of this daring exploit, Lord Cardigan was received with great enthusiasm on his return to England and appointed inspector-general of the cavalry. The charges, however, subsequently alleged by the Crimean commissioners, tended to reduce the high estimate placed upon his services. He published ‘Cavalry Brigade Movements’ (1861). See **CARDIGAN, COUNTESS OF**.

**CARDIGAN,** Wales, a seaport town and municipal borough, capital of Cardiganshire, on both banks of the Teifi, about three miles from its mouth, and 42 miles northwest of Carmarthen by rail. The most noteworthy buildings are the ancient chancel of Saint Mary’s Church, a fine specimen of early Perpendicular architecture; the shire hall, Cardigan county school, etc. Cardigan Castle, originally built in the 11th century and famous in Welsh history, stands at the foot of an eminence near the bridge, two circular bastions only now remaining of it. Brick, tile and pottery works are here, and two iron-foundries are employed chiefly in the manufacture of agricultural implements. The salmon fishery is extensively carried on in the neighborhood, and many of the male population are engaged in the mercantile navy. Pop. 3,578.

**CARDIGANSHIRE,** Wales, a maritime county, having Cardigan Bay on the west and on the land side chiefly Carmarthen, Brecknock, Radnor and Montgomery; area 443,189 acres. The northern and eastern parts are mountainous, the southern and western districts more level. The soil in the vales is chiefly peat, capable of growing either grain or grass, by the application of lime; the higher grounds consist of a light sandy loam, and the mountains are composed chiefly of clay-slate. The agricultural produce is comparatively small. Cattle, sheep and wool are the staple commodities. The chief crops are barley and oats, very little wheat being grown. The lead mines still yield

largely, and zinc is obtained in several places. The coast-line is long, and many of the male population are sailors and fishermen. The principal towns are Cardigan, the county capital, Aberystwith, Lampeter, Tregaron and Aberaeron. There are manufactures of gloves and woollens. The county returns one member to Parliament. Pop. 59,870.

**CARDINAL-FISH**, a fish of the family *Cheilodipteridae*, characterized by two dorsal fins, the anterior of which consists of from six to nine spines. The anal fin is short and has only two spines. The scales are large and the color is often bright red, whence the name. They are especially abundant in the East Indian seas; but several species are found in America, one of which is known as "king of the mullets."

**CARDINAL FLOWER**, the name commonly given to *Lobelia cardinalis*, because of its large, very showy and intensely red flowers. It is a native of eastern North America, growing on the muddy banks of streams. The stems are two or three feet high, the flowers in racemes. It admits of cultivation and is much prized abroad, particularly in England.

**CARDINAL GROSBIRD**, or **RED-BIRD**, a large song-bird (*Cardinalis cardinalis*) of the finch family, very numerous in the southern United States. It migrates northward in spring, but never farther than Massachusetts. It is particularly distinguished for its loud, clear, sweet song, whose quality makes it popular as a cage-bird. It is a brilliantly red bird, with a vermilion head, its bill surrounded with a small band of glossy black, and having the long feathers of the crown erected into a conical crest. The female builds her nest, which is made of twigs, grasses, roots, etc., in bushes, and frequently breeds twice in a season, her bluish, brown-spotted eggs numbering about four. This bird is migratory only to a small degree, moving southward only along the northern limits of its range, and occasionally passing the winter in village gardens even in New England.

**CARDINAL NUMBERS.** See ALGEBRA.

**CARDINAL POINTS**, the four intersections of the horizon with the meridian and the prime vertical circle. They coincide with the four cardinal regions of the heavens, and are, of course, 90 degrees distant from each other. The intermediate points are called collateral points. See COMPASS.

**CARDINAL VIRTUES**, in morals, a name applied to those virtues to which all the rest are subordinate, or which comprehend all the others. The distribution of the virtues, which lies at the foundation of this notion, had its origin in the old Grecian philosophy, and the same number is found here as in the elements of nature. These principal virtues, as enumerated by Plato, are prudence, temperance, fortitude and justice. The first three seem to relate to the duties of man toward himself and to correspond with the triple division of the soul into the intellectual, the irrational (the seat of the sensual desires) and the seat of the affections. Justice either relates to our duties to others (God and men), or is the union of the three first virtues. This division appears to be peculiar to the old Pythagoreans.

Aristotle divided them still further. The Stoics, too, made the same division in their system of morals and Cicero introduced it into his 'De Officiis.' Plotinus and many New Platonists divide the virtues into four classes — civil or political, philosophical or purifying, religious, and, lastly, divine or pattern virtues; a division coinciding with the rest of his philosophical views. In Roman Catholic theological systems, the cardinal virtues follow Plato. But there is a prior division into theological and moral virtues, the former being faith, hope and charity. The imagination of artists has represented the cardinal virtues under sensible images. In modern times this division is regarded as useless in treating of ethics.

**CARDINAL VON WIDDERN**, kār'dē-nāl fōn vid'dērn, **Georg**, German military historian: b. Wollstein, 12 April 1841. He entered the army in 1859; was engaged in the war of 1866 and the Franco-Prussian War; and was professor of the military school at Neisse. He retired in 1890 and has since lived in Berlin. He wrote 'Der Rhein und die Rheinfeldzüge' (1869); 'Belgien, Nordfrankreich, der Niederrhein und Holland als Kriegsfeld'; 'Die Russischen Kavallerie-divisionen und die Armeepoperationen im Balkanfeldzüge' (1878); 'Das 76 Armeekorps und die 7 Kavallerie-division während ihrer selbständigen Operationen im Moselfeldzug bei Metz' (1886); 'Das Gefecht an Flussübergängen, und der Kampf an Flusslinien' (1890); 'Kritische Tage' (1900); 'Verwendung und Führung der Kavallerie 1870-71' (1903); 'Eroberungszüge der Polen im heutigen Deutschland' (1912).

**CARDINALS**, **College of**, an ecclesiastical body consisting of the highest dignitaries in the Roman Catholic Church. The name cardinal is applied to one of the principal advisers of the Supreme Pontiff as it is to the principal virtues or to the four points of the compass; etymologically cardinal is from *cardo*, hinge, pivot, tenon, point around which anything turns. In the 11th century the term cardinal appears to have come into use to designate the "bishops collateral to the Pope," those whose sees are in the neighborhood of Rome, and to the clergy of the principal churches, parishes or *tituli* of the city; but probably *cardinalis* was at first said of a principal church rather than of its ministers. Nor was the term cardinal at first restricted to designation of churches and their clergy in Rome and its vicinity; for a long time, even down to 1585, date of the bull *Postquam* of Sixtus V, which forbade the application of the term to any but members of the sacred college, it was customary to call the ecclesiastics attached to mother-churches or to all cathedrals even, *cardinales*. The use of the word *cardo* or its equivalent to express the relation of a bishop to his clergy and people is very ancient: Saint Ignatius, bishop of Antioch (d. about 202), speaks of the bishop of a church as the pivot on which it turned. Till the issuance of the bull *Postquam* the title of cardinals was currently bestowed, but not by authority from the centre, upon the clergy of cathedral chapters in countries beyond the Alps, as those of the sees of Bourges, Metz, Cologne, Compostella and other cities in Germany, Spain and France; even in Italy the same usage was common; for it was with the

name *Cardinalis* as with the name *Papa*: they both were originally applied to church dignitaries, to pastors and Church officers generally; later their application was restricted.

Ever since the reign of Nicholas II the cardinals have possessed the privilege of electing the Pope. The decree of Pope Nicholas (1059) provides that on the death of the Pope the cardinal-bishops shall assemble in council and then the rest of the sacred college shall join them. In naming the Pope the college must take into account the choice of the clergy and people; only in case no Roman priest is found eligible in every way, shall the choice fall upon one that is not a Roman. In the 12th century the sacred college comprised seven cardinal-bishops of the "suburbicarian" churches, Ostia, Rufina, Porto, Albano, Tusculum, Sabina and Palestrina; the cardinal-priests were 28, and were the rectors of as many churches in the city; there were 18 cardinal-deacons, of whom 14 belonged to the clerical staff of churches in the city and 4 to the papal court or household. The members of the sacred college are yet styled by the titles of churches in the city, but are no longer in any sense ministers of those churches or parishes. And, like other Church offices and Church dignities, the cardinalate became an object of ambition or of cupidity; popes bestowed the honor, princes and popes bestowed the dignity and the emoluments of episcopal and primatial sees, with the cardinalate annexed upon minors and infants; thus, John de Medici was raised to the cardinalate at the age of 14 years, being already vested with a number of highest Church dignities; and as late as 1740 a prince of the house of Bourbon was archbishop of Toledo and cardinal at the age of eight years.

According to the present constitution of the sacred college that body consists of 70 members—though very rarely indeed, if ever, are all the places filled. Of the 70 six are cardinal-bishops, and they are the ordinaries of sees in the neighborhood of Rome; 50 cardinal-priests and 14 cardinal-deacons. In 1916 the cardinal-bishops numbered 4, all Italians; the cardinal-priests 48, and of these 5 were Spaniards, 5 were Frenchmen, 2 German, 1 Belgian, 3 American, 3 British and Irish, 3 Austrians, 2 Hungarians, 1 Bohemian, 1 Portuguese, 1 Canadian, 1 Brazilian; the rest were Italians. There were 8 cardinal-deacons, among them 1 Dutch, 1 German; the rest were Italians.

The scarlet hat is distinctive of the cardinalial dignity, and above the double cross in the arms of the archbishop who is a cardinal is the figure of the scarlet hat with its tasseled pendants. The gown of the cardinal is scarlet (*purpura*, commonly rendered purple, but our "purple" in the language of the ritual is violet, *violaceus*). Hence "to receive the hat" means to be made a cardinal; and to aspire to the purple is to aim at the cardinalial dignity. Etiquette requires that a cardinal be addressed as Eminence; in English usually "your Eminence," and every cardinal is *eminentissimus*. A bishop or archbishop who is a cardinal uses such a formula as the following in official instruments (the example is taken from the approbation of a book by an archbishop of Mechlin or Malines in Belgium):

"Engelbert, by the divine mercy, cardinal-

priest of the holy Roman Church, of the title of Saint Bartholomew in the Island, archbishop of Mechlin, primate of Belgium," etc.

**CARDING**, the process which wool, cotton, flax, etc., are made to undergo previous to spinning, to lay the fibres all in one direction and to remove all foreign substances. The card formerly consisted of a number of iron teeth arranged in a piece of leather of various lengths and the material was combed by hand. For many years this work has been done by machinery, invented in 1738 by Lewis Paul, a Birmingham mechanic. The cards have fine, long teeth fixed on leather strips called card-clothing, which are arranged on a series of cylinders so placed that the material is carried from one to another, until removed by still another and much smaller cylinder called the doffer, from which it is stripped by a moving comb, and then by a series of rolls is delivered in the form of a ribbon into a can, when it is ready for the drawing-frame, on which it is prepared for spinning. Consult Murphy, 'The Textile Industry' (Vol. II, London 1912).

**CARDIOID**, a heart-shaped curve. It is produced by drawing a great number of chords from a single point of the circumference of a circle, prolonging each beyond the further crossing of the circumference to a distance equal to the diameter of the circle, and joining the free ends by a smooth curve. It is a special case of the limaçon, in which the extension of the chords is of any uniform length. The limaçon was invented by Pascal, early in the 18th century.

**CARDITIS**, *kär-dī'tis*, an inflammation of the heart. The word is not now used, since more definite terms are accessible to designate particular types of inflammation. Thus myocarditis is an inflammation of the heart muscle, endocarditis, of the lining membrane, the endocardium; pericarditis, of the external membrane, the pericardium.

**CARDONA**, *kär-dō'nā*, Spain, town in the province of Barcelona, on the right bank of the Cardoner, 50 miles north-northwest of Barcelona. It is a picturesque town of great antiquity, surrounded by Moorish walls and castle, and a church dating from the 14th century. In its vicinity is a hill of rock salt 265 feet high and three miles in circumference, which affords inexhaustible supplies of salt. Pop. 4,002.

**CARDOON**, a garden vegetable (*Cynara cardunculus*), of the natural order *Compositæ*. It so closely resembles the artichoke (*Cynara scolymus*) that some botanists consider the two species merely as horticultural varieties. The plant, which is a native of southern Europe and the northern part of Africa, is a thistle-like, tender perennial which is cultivated as an annual. Seed is usually sown in spring in a hotbed; the young plants are transplanted to the rich soil of the garden about four feet apart each way and kept cleanly cultivated until the leaves are nearly full grown, when the plant is tied up, covered with straw and earth, to blanch for two or more weeks. The thick leaf-stalks and the mid-ribs are the parts desired. In America the plant is not very popular except with the foreign population.

**CARDS**, pieces of cardboard, oblong in shape, bearing certain figures and spots; specifically, playing-cards used in various games of chance and skill. Playing-cards are probably an invention of the East, and some assert that the Arabs or Saracens learned the use of cards from the gypsies and spread them in Europe. The Chinese dictionary 'Ching-tze-tung' (1678) states that they were invented for the amusement of Sèun-ho's concubines in the year 1120 A.D. The course that card-playing took in its diffusion through Europe shows that it must have come from the East, for it was found in the eastern and southern countries before it was in the western. The historical traces of the use of cards are found earliest in Italy, then in Germany, France and Spain. The first cards were painted, and the Italian cards of 1299 are found to have been so. The art of printing cards was discovered by the Germans between 1350 and 1360. The Germans have, moreover, made many changes in cards, both in the figures and the names. The Lanzknechtsspiel, which is regarded as the first German game with cards, is a German invention. Of this game we find an imitation in France, in 1392, under the name of lansquenet, which continued to be played there till the time of Molière and Regnard, and perhaps still longer. The first certain trace of card-playing in France occurs in the year 1361, and Charles VI is said to have amused himself with it during his sickness at the end of the 14th century. The modern figures are said to have been invented in France between 1430 and 1461. It has been said that cards were known in Spain as early as 1332; but what is certain is that card-playing must have become prevalent in the course of the century, seeing it was prohibited by the King of Castile, John I, in 1387. Mr. De la Rue, the most extensive manufacturer of cards in England, obtained in 1832 a patent for various improvements in manufacture. The figures on cards had been generally produced by the outlines first being printed from copper plates, and the colors then filled by stencilling. Mr. De la Rue's process was to print them from colored types or blocks exactly in the same way as calico-printing, but all the colors being in oil.

As early as the 15th century an active trade in cards sprung up in Germany, and was chiefly carried on at Nuremberg, Augsburg and Ulm, the demand from France, England, Italy, Spain and other countries producing great prosperity among the manufacturers. In England the manufacture of cards flourished especially under Elizabeth. But no sooner had cards come to be generally used in Europe, than they were prohibited by several governments, partly from moral considerations, the first games being games of chance; partly from considerations of political economy, as in England, where the importation of foreign cards was considered injurious to the prosperity of home manufacturers. The prohibition, however, only tended to increase the taste for cards. In England, under Richard III and Henry VII, card-playing grew in favor. The latter monarch was very fond of the game, and his daughter Margaret was found playing cards by James IV of Scotland, when he came to woo her. The popularity which cards gradually obtained in England may

be inferred from the fact that political pamphlets under the name of 'Bloody Games of Cards,' and kindred titles, appeared at the commencement of the civil war against Charles I. One of the most striking publications of this kind was one in 1660 on the royal game of ombre. Pepys, in his 'Diary,' under the date of 17 Feb. 1667, states that on Sabbath evenings he found "the Queene, the Duchesse of York, and another or two, at cards, with the rooms full of ladies and great men."

The modern pack of cards, used in most of the familiar games, is 52 in number, containing four suits; clubs and spades (black) and hearts and diamonds (red). Thirteen cards compose a suit, consisting of king, queen, knave or jack, and 10 pip-cards ranging in number of spots from one (ace) to 10. The figures of the four suits are supposed to have been originally intended for symbolical representations of the four great classes of men, and the names attached to these figures in England arose from a misapprehension of the names originally assigned to them. Thus, by the hearts are meant the gens de cœur (cœur), the choir-men or ecclesiastics, and hence these are called copas, or chalices, by the Spaniards, whose word espada, sword, indicating the nobility and warriors of the state, has been corrupted into the English spade. The clubs were originally trèfles (trefoil leaves), and denoted the peasantry; while the citizens and merchants were marked by the diamonds (carreaux, square tiles). The word knave (German, knab, boy), was used, of course, in its older sense of servant, or attendant on the knights. The natural rank of the cards in each suit is, king highest, and so on down to ace lowest; but in many games this rank is varied, as in whist, where the ace is put highest of all, above the king; in écarté, where it is put between the knave and the 10; and in bézique, where it is made the highest, but where the 10 is put between it and the king; in quadrille, the rank of some of the cards is variable in every hand. Sometimes the pack of cards is reduced to 32, by excluding the six, five, four, three and two of each suit; it is then called a "piquet pack." An immense variety of games may be played with cards, some involving chance only, others combining chance and skill, the best furnishing intellectual amusement. There are round games, in which any number of persons may join, as poker, hearts, loo, etc.; games for four persons, as whist, in its different forms, and euchre; for two, as piquet, écarté, bézique, cribbage and pinochle, closely resembling bézique, and at present much played in the United States; and there is one game, solitaire, played in many ways, at which a single person often finds both restful diversion and pleasant occupation for the mind.

Consult Singer, 'Researches into the History of Playing Cards' (London 1816); Chatto, 'Origin and History of Playing Cards' (London 1848); Willshire, 'Descriptive Catalogue of Playing and Other Cards in the British Museum' (London 1876); Taylor, 'The History of Playing Cards' (London 1848); Merlin, R., 'Origine des cartes à jouer' (Paris 1869); Van Rensselaer, 'The Devil's Picture Books' (New York 1890); id., 'Prophetical, Educational and Playing Cards' (Philadelphia 1912); Jessel, 'Bibliography of Works in Eng-

lish on Playing Cards and Gambling' (London 1905); D'Allemagne, 'Les cartes à jouer' (Paris 1906), a very detailed account.

**CARDUCCI**, kâr-doo'chê, Giosue, Italian poet: b. Valdicastello, Tuscany, 27 July 1835; d. Bologna, 15 Feb. 1907. During his boyhood, which was spent in Tuscany, his father, a dissipated, hot-headed doctor, was his only teacher. An ardent admirer of Manzoni, Latin literature and the French Revolution, he inspired his son with his own love of literature, thus giving him early those ideas and sentiments that were, later on, to make him one of the great leaders of his country, and the most distinctive Italian innovator in literature of all time. 'I Promessi Sposi' the boy read and re-read until the characters of Manzoni's great work became living, breathing human beings to his vivid boyish imagination. 'Gerusalemme Liberata,' Rollin's 'History of Rome,' Thiers' 'History of France,' the 'Iliad' and the 'Æneid' were also his constant companions. In 1849 Dr. Carducci, owing to his revolutionary sympathies, was forced to take refuge in Florence, together with his family; and there Giosue was sent to school, where he proved an excellent student and incidentally read the works of the foremost French, German, Italian and English writers. His youthful poems attracted the attention of the rector of the Normal School at Pisa, then attached to the university, and he was admitted to this institution, receiving board and tuition free. He worked with furious energy, read omnivorously, wrote for the press and compiled an anthology of poetry. Graduating from the Normal School in 1856 he became teacher in the San Miniato Lycée, which he was forced to leave the following year on account of his liberal tendencies. In 1857 his first volume of poems appeared under the title of 'Rime.' He went to Florence with the intention of making literature his life work, but the suicide of his brother Dante and the death of his father in 1858 threw upon him the support of the family. Then began a long and bitter struggle against poverty. He wrote for magazines, tutored and lived, with the family, in a small, ill-furnished garret. For the *Edizione Diamante* he wrote articles covering almost every imaginable subject, and everything he did with the utmost care, devoting his days and nights to research; so that his work ever exhibited the ear-marks of the scholar. During his 10 years with the *Edizione* he produced literary material sufficient in volume and quality for the life work of most men. In 1859, after 10 years' engagement, Carducci married his cousin, Elvira Minicucci. The war with Austria, which broke out in the same year, inspired his poetic muse, and he began contributing stirring poetic odes to the press. Italy began to be curious about this young man who spoke with so much radical enthusiasm and authority. His poems to 'Vittorio Emanuele' and 'Alla Croche di Savia' received enthusiastic welcome, and the latter was set to music, sung in the theatres, recited in the schools and salons, whistled on the streets and repeated among the hosts of the army of liberty. Carducci was appointed professor of Greek in the Lycée of Pistola, a position he resigned in a few months to accept the professorship of literature in the University

of Bologna which he was destined to hold for 44 years. He continued working with the same prodigious energy, writing poetry and prose, editing works for the publishing house, preparing university lectures and making extensive researches. His earnestness, brilliant imagery, strong originality and oratorical powers attracted to his classes students from all over Italy and, later, from all over Europe, and Carducci became a name to conjure by. His graduated students formed Carducci societies for the propagation of his ideas round which the literary battle of the century in Italy had already begun. Never before had such lectures on literature been given in any university in Italy as Carducci furnished in his conferences on the 'Development of the National Literature' and its relation to the social history of the Italian people from the earliest days to his own time. In them he became the prophet of Italy whose glorious past he depicted as it had never before been painted. In her he saw Rome living over again in all the majesty and glory of Roman tradition. His intense patriotism brought all liberal, progressive Italy to his feet, and his ardent admiration of ancient Italy and Rome revived the "glorious paganism" of classical days. He attacked bitterly the literary, political and artistic views then generally accepted in Italy; and the more the battle raged the larger grew his classes and his followers which included most of the younger generation. He fought the suzerainty of Austria over Italy, the temporal power of the Catholic Church and the apathy of Italy herself. In turning away from Romanism he set his face against Christianity, as he knew it in Italy, and asceticism which he declared opposed to all progress, beauty and truth. This hatred showed itself in his 'Ode to Satan' (1865), the "immortal foe of autocracy and the banner-bearer of the great reformers and innovators in all ages." In 'Giambi ed Epodi' he struck a new and passionate note that roused all Italy and finally led to his suspension from his classes in the university (1868-70). 'Nuove Poesie' (1873), a collection of 44 new poems, added very greatly to his reputation at home and abroad and made his position secure. The 'Odi Barbare' (1877) had still greater success, the first edition being sold out in a few weeks. In these he discards rhymes and adopts the various metres of Horace with success, in lyrics of great beauty, force and originality.

Gradually, in his later days, Carducci, the ardent Republican, became a convert to monarchism and he was elected member of the Senate in 1890. His last volume of poems 'Ritmi e Rime' appeared in 1899. He resigned his professorship in 1904 and two years later he received the Nobel prize for literature. His published works, which treat of history, biography, political and other controversy, literary criticism, philosophy, lyrical, erotic, descriptive, pastoral and dramatic poetry are among the most extensive in the history of Italian literature. Consult Zanichelli, 'Opere de Giosue Carducci' (Bologna 1909); Chiarini, G. L., 'Carducci' (1913); Granett, R., 'Italian Literature' (1908); Holland, Maud, 'Poems of Giosue Carducci' (20 poems translated, 1907); Williams, Orlo, 'Giosue Carducci' (1914).

JOHN HUBERT CORNYN,  
Editorial Staff of *The Americana*.

**CARDWELL**, Australia, town of Cardwell County, Queensland, on Rockingham Bay, 800 miles direct northwest of Brisbane. Its fine harbor has a depth varying from 24 to 60 feet, accessible in all weathers. Dugong fishing and oil extracting, cedar lumber, canning meats, preserve and sauce manufactures are thriving industries, and minerals including gold and tin are found in the vicinity. Pop. 3,500.

**CARE SUNDAY**, sometimes taken to be the Sunday immediately preceding Good Friday; but generally used to signify the fifth Sunday in Lent. Same as Passion Sunday.

**CARÊME**, kâ-râm, Marie Antoine, French cook: b. Paris, 8 June 1784; d. there, 12 Jan. 1833. He was chef de cuisine to many celebrated persons, including Talleyrand, King George IV and one of the Rothschilds. He cooked for the Congress of Aix-la-Chapelle, Vienna and Laibach. He wrote 'Le pâtissier pittoresque' (2d ed., 1842); 'Le maître d'hotel français' (2d ed., 1842); 'Le pâtissier royal parisien' (1828); 'L'art de la cuisine française au XIX siècle' (1833).

**CARET**, kârâ, a turtle. See HAWKSBILL.

**CAREW**, kâ-roo', Richard, English antiquarian and poet: b. East Antony, Cornwall, 17 July 1555; d. there, 6 Nov. 1620. He was a member of the House of Commons, high sheriff of Cornwall in 1586, and the author of a much valued 'Survey of Cornwall' (1602); and an English translation of a portion of Tasso's 'Jerusalem Delivered' (1594), and from an Italian version of Huarte de San Juan, 'The Examination of Men's Wits.'

**CAREW**, Thomas, English poet: b. 1598; d. 1639. He was educated at Corpus Christi College, Oxford. Cultivating polite literature in the midst of a life of affluence and gaiety, he was the subject of much eulogy by Ben Jonson, Davenant and other writers of the period. He was made gentleman of the privy-chamber to Charles I. The King bestowed on him the royal domain of Sunning Hill, a part of Windsor Forest. In him was exhibited the not unusual transformation of the courtly and libertine fine gentleman into the repentant devotee. Carew is coupled with Waller as one of the improvers of English versification. The first collection of his poems was printed in 1640, and the last in 1824. His elegant masque of 'Cælum Britannicum' was printed both in the early edition and separately in 1651, and the whole were included in Chalmers' 'British Poets.' Carew was much studied by Pope, and Dr. Percy also assisted to restore him to a portion of the favor with which he has come to be regarded. Specimens both of the sublime and the pathetic may be found in his works; the former in his admirable masque, and the latter in his epitaph on Lady Mary Villiers. Recent editions are by Hazlitt for the Roxburghe Library (London 1870); by Ebsworth (London 1893); and by Vincent for the Muses Library (London 1899). 'Poems,' edited by Arthur Vincent in 1899, is the best edition of Carew.

**CAREX**, kâr'ëks, a genus of plants, belonging to the family *Cyperaceæ*, or sedges, and containing numerous species, which are found in nearly all parts of the world where vegetation can exist, on the driest upland as

well as the wettest marsh. The plants are perennial, often creeping, with mostly sharp-keeled leaves and solid triangular stems. The flowers are without perianth and unisexual, being grouped in spikelets. The male flowers have usually three stamens, the female having a single style with two or three stigmas. The number of known species is above 800, and of these the United States has about 300. Hardly any of them have any agricultural value, but *C. arenaria*, the sand-sedge, is of use in binding the sand on many seashores. In parts of the United States a poor quality of hay is made from some of the sedges. *C. morrowi* is an elegant variety with white-edged leaves cultivated by florists.

**CAREY**, Henry, English composer and poet: b. London 1696; d. there 1743. He is supposed to have been a natural son of George Saville, Marquis of Halifax. His first instructor in music was a German, named Linnert, but he was afterward more thoroughly trained under Roseingrave and Geminiani. He was inexhaustible in the invention of new, pleasing and often deeply pathetic melodies, to which he not infrequently furnished the words. His 'Sally in Our Alley' is still a well-known song. He has also been said to be the author of 'God Save the King,' but this appears to have been doubtful until substantiated by Chrysander. He supported himself by public and private teaching, but his whole life was a continued struggle with poverty, and it has been said that at last, in a fit of despair, he committed suicide (1743). His collected songs were published in 1740. Among other works are 'Teraminta' (1732) and other operas; 'Chrononhotonthologos,' "the most tragical tragedy ever yet tragedized" (1734), a burlesque; 'The Wonder, or An Honest Yorkshireman' (1735); 'The Dragon of Wantley' (1737); and the 'Musical Century, or a Hundred English Ballads' (1737; 3d ed., 1743).

**CAREY**, Henry Charles, American political economist: b. Philadelphia, 15 Dec. 1793; d. there, 13 Oct. 1879. He was the eldest son of Mathew Carey, and in 1814 became a partner in his father's bookselling and publishing firm, where he continued until 1835. In that year he published an essay on 'The Rate of Wages,' which he afterward expanded into 'The Principles of Political Economy' (1837-40). His other important works are 'The Credit System in France, Great Britain and the United States' (1838); 'The Past, the Present and the Future' (1848); 'The Principles of Social Science' (1858-59); 'Letters on Political Economy' (1860 and 1865); 'The Unity of Law' (1872). Originally a free-trader, he became an advocate of protection on the ground of temporary expediency; held that the growth of population was self-regulating; and was opposed to the theories of Ricardo and others on the law of diminished returns from the soil and on rent. He was also opposed to any arrangement on the subject of international copyright. Some of his works have been translated into other languages, and his writings have had considerable influence on economic writers such as Frédéric Bastiat and Dühring.

**CAREY**, James F., American Socialist leader: b. Haverhill, Mass., 19 Aug. 1867. He

received a common school education and learned shoemaking. In 1895 he was chairman of a convention at Boston, which amalgamated three national organizations of shoemakers into one union. In 1894 he was one of the leaders in the agitation of the unemployed on Boston Common, and the governor appointed him a commissioner of the unemployed, but he was not confirmed. He was later elected president of the Haverhill common council. In 1898, 1899 and 1900 he was elected to the Massachusetts house of representatives, twice defeating a combination of the Democratic and Republican parties. He was the first Socialist ever elected to political office in New England.

**CAREY, Mathew**, Irish-American writer and bookseller: b. Dublin, 28 Jan. 1760; d. Philadelphia, 16 Sept. 1839. An address to the Irish Roman Catholics emphasizing the oppression by the penal code brought about his expulsion from Ireland. Later he returned and established *The Volunteer's Journal*. But his radical views invited Parliament's distrust and he was imprisoned until the session was over. He came to the United States in 1788, and in Philadelphia began to publish the *Pennsylvania Herald*. He was subsequently connected with the *Columbian Magazine* and the American Museum. A few years later he became a bookseller and an extensive publisher. When the yellow fever epidemic was especially virulent in 1793, he spent great energy in combating it and wrote a history of the disease. In the same year he founded the Hibernian Society and in 1796, with Bishop White, established the first Sunday-School society. The best known of his political writings was his 'Olive Branch' (1814). It was an effort to promote harmony among political parties during the War of 1812. It passed through 10 editions. In 1819 he published his 'Irish Vindications' and in 1822 'Essays on Political Economy.'

**CAREY, Rosa Nouchette**, English novelist: b. London 1840; d. 1909. She began writing novels in 1868, and her fictions (of which she wrote nearly 40), in which the literary element is not a very strong feature, were very popular with girls, to whom they were excellently adapted. They include 'Wee Wife' (1869); 'Wooded and Married' (1875); 'Not Like Other Girls' (1884); 'Uncle Max' (1887); 'Only the Governess' (1888); and 'The Sunny Side of the Hill' (her last novel, 1908), etc.

**CAREY, William**, English Orientalist and missionary: b. Paulerspury, Northamptonshire, 17 Aug. 1761; d. Serampore, India, 9 June 1834. He was early apprenticed to a shoemaker, and continued to work at his trade till he was 24. With what assistance he could procure he acquired Latin, Greek and Hebrew, and studied theology. In 1786 he became pastor of a Baptist congregation at Moulton, and in 1787 was appointed to a similar situation in Leicester. In 1793 he sailed for the East Indies as a Baptist missionary, but became overseer of an indigo factory. He studied languages and natural history, and collected a rich store of Oriental knowledge. In 1800, in conjunction with Marshman, Ward and others, he founded the missionary college at Seram-

pore; the year following he became professor of Sanskrit, Bengali and Mahratta at the newly-erected Fort William College, Calcutta. In Serampore he had a printing-press for more than 40 different Indian languages, and issued various translations of the Scriptures. His first work was a Mahratta grammar. It was followed by other works, including a Bengali 'Lexicon,' in which he was assisted by Felix Carey, his son. Under his direction the whole Bible was translated into 6 and the New Testament into 21 languages or dialects of Hindustan; and considerable progress was made with the translation of the whole Scriptures into Chinese. He also edited Shroeder's lexicon of the Thibetan language and Roxburgh's 'Flora Indica,' in which a genus of plants which he discovered is named after him, *Careya*. He established an agricultural society at Calcutta, and a botanical garden, at his own expense, at Serampore. For biography consult Culross (London 1882) and Smith, G. (London 1885).

**CAREY ACT.** See RECLAMATION LAWS.

**CARGILL, Donald**, Scottish covenanting preacher: b. Rattray, Perthshire, about 1619; d. Edinburgh, 27 July 1681. He was educated at Aberdeen and Saint Andrews, and became minister of the Barony Church in Glasgow in 1655. At the Restoration he refused to accept collation from the archbishop and was exiled beyond the Tay. In 1679 he took part in the battle of Bothwell Bridge, where he was wounded, but succeeded in escaping to Holland. In 1680 he published, along with Richard Cameron, the 'Sanquhar Declaration.' In September of the same year he formally excommunicated King Charles II, Duke of York and other great personages. After avoiding pursuit for several months, in May 1681, he was captured, and at Edinburgh tried and sentenced, and 27 July was beheaded.

**CARGO**, in law, the entire amount of goods carried by a ship; also, loosely, persons collectively carried by a ship. The term is occasionally applied also to the invoice of the cargo. The bill of lading (q.v.) contains a list of the goods constituting the cargo. The goods on deck, although constituting a part of the cargo, are usually not covered by the insurance policy. The master of a coasting vessel is required by law to keep a record of the goods constituting the cargo, the shippers, consignees and various other particulars, all of which is entered in the cargo book. See FREIGHT.

**CARHART, Henry Smith**, American scientist: b. Coeymans, N. Y., 27 March 1844. He was graduated at Wesleyan University in 1869, and since then has taught physics and chemistry. In 1886 he was appointed professor of physics at the University of Michigan, where he remained until his retirement as professor emeritus in 1909. Professor Carhart devoted himself largely to the study of electricity, particularly the subject of standard cells and primary batteries, one of the best types of the former having been devised by him and known as the Carhart-Clark cell. He has been a delegate from the United States to several international electrical congresses. He has written 'Primary Batteries' (1891); 'University Physics' (1894); 'Electrical Measure-

ments' (1895); 'High School Physics' (1901); 'College Physics' (1910), and other books.

**CARHEIL**, k̄ā-rā-ē, Étienne de, French Jesuit missionary in North America: d. after 1721. He labored for more than half a century among the Canadian Hurons and Iroquois, and was long stationed at Michilimackinac.

**CARIA**, in ancient geography, the country forming the southwest corner of Asia Minor, bounded on the north by Lydia or Mæonia, from which it was separated by the Mæander; on the east by Phrygia, on the southeast by Lycia and on the south and west by the Mediterranean. Some confusion, however, exists in regard to its boundaries. Part of it was settled by Greek colonies of Ionians and Dorians, who dispossessed the original inhabitants. It was included in the dominions of Cræsus, King of Lydia, and on his overthrow by Cyrus was transferred to the Persian monarchy, under whose protection a dynasty of Carian princes was established. Halicarnassus was the residence of these sovereigns, among whom were the two celebrated queens, the first and second Artemisia. The progress of the Roman conquests ultimately extinguished the independence of Caria, and about 129 B.C. it was incorporated in the Roman province of Asia.

**CARIACO**, k̄ā-rē-ā'kō, Venezuela, a seaport in the state of Bermudez, situated to the east of the Gulf of Cariaco, near the mouth of a river of the same name, adjoining a large plain covered with plantations. Its trade is chiefly in cotton and sugar. The Gulf of Cariaco is 38 miles long, from 5 to 10 broad, from 80 to 100 fathoms deep, surrounded by lofty mountains. Pop. 7,000.

**CARIACOU**, k̄ār'ī-ā-koo, the name given to American deer of the genus *Cariacus*, found in all parts of North America up to lat. 43° N. It is smaller than the common stag, and its color varies with the seasons from reddish-brown to slaty-blue.

**CARIAMA**, sā-rē-ā'mā, a bird (*Cariama cristata*), a native of Brazil and Paraguay, where its loud scream is a familiar sound on the campos, and where it is domesticated and trained to guard fowls. With an allied Argentine bird (*Chunga burmeisteri*) it constitutes a family (*Cariamidæ*) of great zoological interest, combining as it does characters of the bustards, caracara eagles and cranes, with each of which it has been at times associated. It is larger than the common heron; the plumage is brown, finely waved with darker brown, whitish on the lower parts. It uses its legs rather than its wings in seeking safety. According to W. H. Hudson, the Argentine naturalist, it is of the family of one of the great extinct birds of Patagonia, *Phoropacos inflatus*. Consult *Proceedings Zoological Society of London* for 1889 and 1899.

**CARIB**, k̄ār'īb, a native American race which attained its highest development in the West Indies. Originating in the valley of the Orinoco, this race spread along the coasts, northward and southward, to a great distance, and especially from island to island of the Lesser and Greater Antilles and the Bahamas. At the time of the discovery of America its language was spoken, with dialectic variations,

from the coast of Florida to lower Brazil,—wherever large canoes could carry the swarming, warlike tribes. The Caribs were the vikings of South America. The race name survives in "Caribbean" Sea, "Caribbee" Islands, the word "cannibal," etc.; the race itself is still well represented at various points in South America. In the West Indies, however, the large native population disappeared rapidly after the Spanish conquest, Caribs and other tribes of the same stock (Arawaks, Lucayos, Boriqueños, etc.), either succumbing under the new conditions or losing their distinctive characteristics by blending with Europeans and Africans. Surviving groups of West Indian Caribs may be studied to-day in the island of Dominica. A few remained in Martinique and Saint Vincent up to the time of the volcanic eruptions in 1902. Great Britain deported 5,000 Caribs from Saint Vincent to the island of Ruatan in the Gulf of Honduras in 1796; thence they migrated to the Central American coast, where their numerous descendants have become a not inconsiderable element in the population of the mainland. In the 'Proceedings of the American Association for the Advancement of Science' (Vol. LI, 1902), Mr. J. Walter Fewkes of the Bureau of American Ethnology calls attention to the different characteristics which the Caribs displayed in different circumstances and localities. Thus the natives in the Bahamas, Cuba, Haiti and Porto Rico were mild, agricultural people who had lost in vigor, while gaining a rudimentary knowledge of the arts of peace, by their sedentary life. On the other hand, constant incursions from the home of the race (the Orinoco region in Venezuela) kept alive the savage customs and ferocious spirit of the Caribs of the Lesser Antilles. Such incursions took place even after the date of the Spanish settlements. The houses of the more peaceful Carib communities did not differ greatly from those of the peasantry in the same regions at the present time. In lieu of clothing, Carib men and girls covered their bodies, as well as their faces, with paint, to protect them from the bites of insects and the heat of the sun. A woven cloth of palm fibre, called *nayma*,—a breech-cloth with long ends,—was worn by the chiefs and the married women. For purposes of decoration, and to distinguish members of one family or community from those of another, designs of animals and plants were painted on the body. Their social organization closely resembled that of the North American Indians, the unit of organization being the clan, ruled by a *cacique* (chief). Combinations were sometimes formed by a number of caciques for mutual defense, and extensive territories were subjected to the control of the more ambitious leaders. Among the insignia of the cacique's rank were the gold disc called *guarim*, worn on his breast, and a stone amulet tied to his forehead. His numerous wives were practically slaves. Ex officio, he was a member of the priesthood. Columbus at first received the impression that the Caribs lacked spiritual insight; longer sojourn among them, however, convinced him that they worshipped many supernatural beings whom they represented by idols, called *semis*; they had temples for this purpose, in which rude idols were set up to be consulted as oracles by the priests. It is probable that belief in a future

life, although not universally held, as some authorities assert, was generally taught by the priests; and it is quite certain that the latter possessed great influence, being physicians to the people as well as ministers to the *semis*.

Like other savage races of the region from which they came, the Caribs were anthropophagi; yet the evil prominence given to them through the coining of the word *cannibal* (a Latinized form of *Carib*) is not wholly merited. The discoverers, finding a great number of human skulls in the Carib houses, jumped to the conclusion that each skull was the trophy of some revolting feast. In point of fact, the Caribs, being ancestor-worshippers, preserved these relics in honor of defunct members of their family. Consult Adam, 'Le Caraïbe du Honduras et le Caraïbe des Isles' (in *Internat. Amerik.-Kongr.*, Vol. XIV, 1904); Rat, J. N., 'The Carib Language as now Spoken in Dominica' (in *Journal Anthropol. Inst.*, Vol. XXVII, London 1897-98); Koch-Grünberg's 'Die Hiánakoto-Umana' (in *Anthropos*, Vol. III, 1908); id., 'Zwei Jahre unter den Indianern' (Berlin 1909-10).

MARRION WILCOX.

**CARIBBEAN**, kâr-î-bé'an, **SEA**, a part of the Atlantic Ocean occupying a basin 750,000 square miles in area, bounded by South and Central America and the Greater and Lesser Antilles. Its perimeter is wholly mountainous. Mountain folds (continued in submarine ridges from the Greater Antilles to Honduras) mark its limits on the north and south; but the volcanic chain of the Lesser Antilles rises on the east, and the volcanoes of Central America in the remote past formed a wall separating it from the Pacific on the west. Separating it from the Atlantic are steep submarine ridges, of which the Lesser Antilles are the summits. A portion of the broad equatorial stream, which flows from east to west, from the coast of Africa to that of Brazil, enters the Caribbean between the islands at the southern end of the Antillean chain: the waters of this sea, therefore, move from east to west and northwest, and seek an exit through the Yucatan Channel—a passage 120 miles wide between Cuba and the peninsula of Yucatan. On its South American coast are the gulfs of Paria, Triste, Darien, Venezuela, Cariaco; on the west are the Mosquito Gulf and the Gulf of Honduras. But the latter is too small to allow an outflow equal to the inflow into the Caribbean; so that, after the trades have forced the equatorial water into the Caribbean basin, it must remain there a considerable length of time, thus becoming superheated, before it passes into the Gulf of Mexico, where, owing to similar differences between the rate of inflow and outflow, the water becomes still more superheated before passing through the Florida Strait as the Gulf Stream. The main westerly current in the Caribbean, after passing through the Banks Strait, between the Mosquito Reef and Jamaica, is joined by the current of the Windward Channel. The trade-winds, blowing with a steady velocity across the Caribbean region, from east to west, make the surface of this sea much rougher than that of the Gulf of Mexico; they mitigate the tropical heat at all points where their influence is felt; and the moisture they bring from the Atlantic is precipitated in the form of abundant

rains against the eastern slopes of the mountains, both on the islands and the mainland. Hence the distinction between "windward" and "leeward" regions, insisted upon especially in the West Indies. The Gulf of Mexico, sheltered behind the Antilles and Yucatan, is practically a "leeward" expanse; but the summer climate of Texas and the great plains is somewhat modified by Caribbean trade-winds.

Recent studies of the Caribbean basin have disclosed its interesting submarine topography—"a configuration which, if it could be seen, would be as picturesque in relief as the Alps or Himalayas. Nowhere can such contrasts of relief be found within short distances. Some deeps vie in profundity with the altitudes of the near-by Andes. . . . Some of the depressions, like the Bartlett Deep, are narrow troughs, only a few miles in width, but hundreds of miles in length, three miles in depth, and bordered by steep precipices. . . . There are long ridges beneath the waters, which if elevated, would stand up like islands of to-day. . . . Again, vast areas are underlain by shallow banks . . . often approaching the surface of the water, like that extending from Jamaica to Honduras. . . . The greater islands and the mainlands are bordered in places by submerged shelves." (From 'Cuba and Porto Rico': see authorities below). All the islands are, then, to be regarded, from a physiographic point of view, as the "tops of a varied configuration, which has its greatest relief beneath the sea"; and some of these submarine valleys and mountains have yielded a surprising number of animal forms previously unknown. Dredgings in depths of over 2,000 fathoms have brought to light new species of crustacea, and forms resembling the fossils of past geological epochs are taken alive in those profound marine valleys. Many phosphorescent creatures are found; in certain places "dense forests of pentacrinid undulate on the bottom like aquatic plants"; on the submerged banks and in the shallows, coral polyps and mollusks are employed as actively now as ever, in extracting the lime carried in solution by the sea-water, to build its shells and corals which are so large a part of the rock-making material in all this region, from Yucatan to Porto Rico. The most important marine highways for Caribbean commerce are those on the north: the Windward, Anegada and Mona passages and the Yucatan Channel. The Caribbean has attained a new importance since the completion of the Panama Canal. It is now traversed by several world trade-routes directed to the Pacific through the canal. The United States has a naval base at Guantanamo Bay, Cuba; the British have bases at Bermuda and Jamaica; the Virgin Islands acquired by the United States from Denmark in 1916 and occupied 31 March 1917, form another naval base for the defense of the canal. Several steamship lines make winter cruises from New York. (For the origin of the name, see **CARIBS**). Consult Agassiz, 'The Gulf Stream' (in annual report Smithsonian Institute to July 1891, Washington 1893); Hill, of United States Geological Survey, 'Cuba and Porto Rico' (1898).

MARRION WILCOX.

**CARIBBEAN**, American Interests and Diplomatic Relations in the. The United

States has had a long historical interest in the Caribbean and its problems. This interest was early expressed by the long struggle to obtain trade with the British West Indies, the western desire for a trade outlet at the mouth of the Mississippi, the sympathy for the Spanish colonies in their struggle for independence and the American annexation of territories fronting on the Gulf. In the decade and a half after 1845 its continuation and increase was indicated by the Panama transit treaty with Colombia (then New Granada) in 1846, the ship canal agreement with Nicaragua in 1849, the famous Anglo-American Clayton-Bulwer treaty of 1850, a series of negotiations for the acquisition of Cuba and certain West Indian naval stations and various efforts to prevent the danger of European interference in Central America and the West Indies. In the Civil War American attention was attracted toward the Caribbean by the problem of blockading Confederate ports against blockade runners operating from certain West India bases; and after the war, the earlier propositions for greater influence in the region were kept alive by the memory of the difficulties and limitations of the American navy in maintaining the blockade of the Confederate ports, and also by the unsatisfactory conditions of Spanish rule in Cuba.

The Spanish-American War, resulting in the American possession of Porto Rico and the assumption of new international duties in Cuba, brought the vision of new economic and political advantages in the Caribbean and the realization of new responsibilities. The development following the war revolutionized the American national position. By the logic of events the United States was forced into a place of increasing importance in international leadership in the Caribbean. The construction of the Isthmian canal under American control, the logical conclusion of a long series of events and the immediate result of a wise diplomacy and policy which terminated a long period of irritating discussion and delay, attracted the attention of the United States to the necessity of larger responsibilities in the development of the Caribbean tropics to serve the world's needs.

Under the administrations of Roosevelt, Taft and Wilson, the general policy of the American government toward Caribbean countries was fundamentally the same in the assumption toward weaker neighbors of increasing responsibilities which might involve intervention to keep order. A positive policy, preventative rather than remedial, gradually supplanted the former negative or passive policy which involved intervention only after a wrong was done. In 1903, under President Roosevelt, the government extricated Venezuela from a humiliating experience with Germany and other European powers. In 1905 it assumed control of customs collection in the Dominican Republic, and soon thereafter exercised its treaty right to interfere in Cuba to preserve order. Later, under President Taft, it actively intervened to terminate a revolution in Nicaragua, and negotiated with Nicaragua and Honduras treaties for the extension of agreements similar to the one in force in the Dominican Republic. Later, under President Wilson, it retained forces in Nicaragua for the preservation of order, and sent a force of American

officials to the Dominican Republic to supervise the elections, and (in 1916) ratified convention arrangements for establishment of fiscal protectorates over Nicaragua and over Haiti. In 1917 the policy of increased police duties in the Caribbean also resulted in the acquisition of the Danish colonies.

The object lesson of Porto Rican development under American control, and of American supervision in Cuba and San Domingo—a practical demonstration that public order and security of life and property is an essential condition for economic development—has made a deep impression upon all Caribbean peoples.

As a result of the construction of the Panama Canal, the international importance of the Caribbean has greatly increased by the development of new trade routes which will make it the trade centre of the American tropics—the cross-roads of the western world; and the United States more than any other great power is concerned in the political ownership of the territory, the fiscal policies of their governments, the extent and direction of their foreign trade, the problems arising from the peculiarities of their population, their financial status, the exploitation of their natural resources, their foreign investments, the protection of health, and other problems which have a bearing on foreign policy and necessitate more intimate American relations with these communities.

JAMES M. CALLAHAN,  
*Professor of History and Political Science,*  
*West Virginia University.*

**CARIBBEE**, *kä-ri-bé'*, or **SAINT LUCIA BARK**, a bark sometimes substituted for cinchona (q.v.), though not containing its characteristic alkaloid. It is procured from the *Exostemma Caribæum*, a tree growing in the West Indies. This bark is in convex fragments, covered with a yellow epidermis and has a very bitter taste and very faint smell.

**CARIBBEE ISLANDS**, a name commonly given to that portion of the chain of Lesser Antilles between the Virgin and South American groups. See **ANTILLES**.

**CARIBE**, any of a group of small, robust, voracious fishes, often of singular form, and allied in structure to salmon, which abound in South American tropical rivers. They have numerous teeth, well fitted to biting out pieces of flesh, and instantly seize upon any disabled or soft-bodied creature in the water and devour it or worry it. Hook-and-line fishing is almost useless where these little bandits are numerous, as they rob the hooks of bait, or tear to pieces anything caught before it can be lifted out of their reach. They will even attack and badly wound human bathers. One of the best known and most dreaded is the piraya of the Amazon, which is said to come in crowds wherever blood is shed in the water. These fishes constitute the sub-family *Serrasalmoninae*, of the family *Characiniæ*, and are intermediate between the cyprinoids and the salmon-

oids. A distinguishing characteristic is the fact that the abdomen is serrated with sharp spines. Consult Gunther, 'Introduction to the Study of Fishes' (Edinburgh 1880).

**CARIBOU**, *kä-ri-boo'*, the name of two or more species of reindeer inhabiting Canada, which are of great importance as a source of food and clothing to the natives of Arctic and sub-Arctic regions, and also are of much interest to sportsmen. The caribou is so completely a reindeer (q.v.) that there seems little practical reason for separating it specifically from that of Europe, whence no doubt it came by migration in early Pleistocene time; and still less for the division of this very variable deer into the many species and subspecies that have been described "by those who believe that the infinite variations of nature must be followed by an infinity of names." It will be convenient, nevertheless, to follow the general practice and recognize two groups—the Arctic or Barren-Grounds caribou (*Rangifer arcticus*), and the Woodland caribou (*Rangifer caribou*).

The Arctic caribou is to be found from Greenland to Alaska wherever tundras and a few plains exist north of the limit of tree-growth, and on all the islands of the Polar Sea. This is in summer, when herbage springs up along the coasts and watercourses, and reviving lichens and mosses furnish abundant fare. The does and fawns scatter in little parties by themselves at this season, separated from the widely wandering stags. Their coats are gray or light brown, varying locally, and the summer-coat is acquired in July when the old winter-coat is shed. This new summer hair is long and soft, and is white at the roots, but tinted toward the end. As it grows and thickens the hair becomes brittle, the white base lengthens as fast as the brown tips wear or break off, and finally the color of the coat disappears and it is virtually white all over the body. Thus is acquired the white winter-coat characteristic of this species. As autumn approaches these caribou gather toward the south from the outlying coasts and islands, until huge herds are brought together and travel south to the northern edges of the Canadian forests, in whose shelter they pass the winter, shedding and renewing their antlers at that season. In the spring they go north as soon as the snow permits.

These semi-annual migrations are the harvest times of the Eskimos and northern Indians, and a successful attack on a helpless herd provides them with a supply of flesh and useful materials that ensures a comfortable winter; but the slaughter has been so inconsiderate that even on the Barren Grounds these herds are now small and scattered as compared with a century ago, and local famines are more and more suffered, or districts have been permanently abandoned by the inhabitants in consequence. Every edible part of the animal, even to the entrails and marrow of the bones, is eaten. From the bones and horns various implements are made, while the hide furnishes the best of clothing and bedding. The Arctic folks are as dependent on their caribou as are the desert-people on the camel.

The Woodland caribou has never been so necessary, although always valuable, to the Indians of central and southeastern Canada, except perhaps in Labrador, because there was

plenty of other game. This species is in general of larger size and darker color, and has heavier antlers with more points, than the Arctic species just described. It is variable in all respects; and two or three forms from the Rocky Mountains and westward have been called separate species; but the distinctions are obscure. The largest specimens recorded come from southwestern Alaska. This species avoided the open plains, but in summer once roamed through all the wooded region of Canada south to the Great Lakes and central New England. It is now to be seen in the United States only in northern Maine and along the rough northern border of Minnesota, and in Canada has been so threatened with extinction that it has long been protected by law. This decrease is owing mainly to the acquirement of fire-arms by all the Indians of the interior, and to the extension of settlements far toward the north; but it is largely due, also, to the work of sportsmen. To these men caribou hunting in autumn and early winter yields sport of a high order. This deer, sensitive in sight, hearing and smell, and exceedingly wary, affords an object of stalking-tactics so difficult as to make the getting within rifle range of, and finally obtaining, a "good bead," a feat to be proud of. An easier and more deadly way is to track and overtake a band on snowshoes, but this also requires great skill and endurance, and good shooting. The writings of sportsmen-travelers in all parts of Canada and Alaska abound in narratives of this sport, and describe the habits of this fine deer. Consult Elliot, 'The Deer Family' (in 'Sportsman's Library,' New York 1902); Ingersoll, 'Life of Mammals' (New York 1909); Seton, 'Northern Mammals' (New York 1909); Tyrrell, 'Report Canadian Geological Survey for 1896' (Ottawa 1897).

ERNEST INGERSOLL.

**CARICA** (from *caria*, a district of Asia Minor, whence it was supposed to have come), a genus of plants, the typical one of the order of Papayads (*Papayacea*). See PAPAUA.

**CARICATURE AND CARICATURISTS.** A tendency to burlesque and caricature is a feeling deeply implanted in human nature, and it is one of the earliest talents displayed by people in a rude state of society. An appreciation of, and sensitiveness to, ridicule, and a love of that which is humorous, are found even among savages, and enter largely into their relations with their fellow-men. When, before people cultivated either literature or art, the chieftain sat in his rude hall surrounded by his warriors, they amused themselves by turning their enemies and opponents into mockery. They laughed at their weaknesses, joked at their defects, whether physical or mental, and gave them nicknames in accordance therewith,—in fact, caricatured them in words, or by telling stories which were calculated to excite laughter. When the agricultural slaves were indulged with a holiday from their labors, they spent it in unrestrained mirth. And when these same people began to erect permanent buildings, and to ornament them, the favorite subjects of their ornamentation were such as presented ludicrous ideas. The warrior, too, who caricatured his enemy in his speeches over the festive board, soon sought to give a more permanent form

to his ridicule, which he endeavored to do by rude delineations on the bare rock or on any other convenient surface which presented itself to his hand. Thus originated caricature and the grotesque in art. In fact, art itself, in its earliest forms, is caricature; for it is only by that exaggeration of feature which belongs to caricature that unskilful draughtsmen could make themselves understood. The field of the history of comic, satiric literature and art is very large, and many nations, ancient and modern, Egypt, Greece, Rome, India, pagan and Christian are represented. During the period of transition from antiquity to the Middle Ages, the Roman *mimi* continued to exist, and the evolution of the religious and secular caricature of the period and of the caricatures preceding the Reformation was associated with the *mimi* performers who sung songs and told stories, accompanied with dancing and music, an ever-popular form of amusement. In the 4th century Saint Augustine calls these performances *nefaria*,—detestable things—and says, that they were performed at night. The songs as they are called continued to consist not only of general, but of personal, satire and contained scandalous stories, frequently accompanied by rough illustration or caricature, of persons living and well known to those who heard and saw them. The Reformation and Puritan periods furnish many amusing and historically illuminative specimens of caricature, domestic and political, as represented in the Flemish school of Breughel, the Italian school of Salvator Rosa and the French school of Callot of the 16th century. The commanding figure of the 17th century in caricature is William Hogarth, the Englishman, whose new style of design raised him to a degree of fame as an artist few men have ever attained. A little known fact is that Benjamin Franklin, the friend of Hogarth, to whom the dying artist wrote his last letter, also was a capital caricaturist, and used his skill in this way as he did all his other gifts and powers in behalf of his country and his kind. James Gillray was the prominent figure in English caricature in the latter half of the 18th century, Gavarini in France; George Cruikshank and John Leech in England were the noted caricaturists of the early part of the 18th century. The two great cartoonists of recent times have been Sir John Tenniel and Thomas Nast, the former being to all Europe what the latter was to all America, and in connection with these two can be said all that need be said of caricaturists of our time. True, Nast was practically alone in his field, and he did not work as long as did Tenniel, still, to judge him at his best, though the period was comparatively short, he stood high as a picture-maker of that class. Nast was as brave as his subject, Tweed, the New York city boss, was crooked, and the two furnished the best series of caricatures by far that have ever been seen in this, or, it might be said, in any other country. Nast, however, was not the draughtsman that Tenniel was, but what he lacked in artistic finish he made up in power and force of expression.

Since the day of Tenniel and Nast, caricaturing seems to have fallen into less virile hands. Tenniel and Nast each drew a caricature once a week, while now caricaturists

draw seven or eight in that time. Formerly the best caricaturists were employed on the weekly papers, while now the better class are employed on the great dailies. But the times have brought this about, not necessarily the caricaturists. Workingmen have no time to read, and a picture which may tell all at a glance means more to them than the ablest editorial that the combined editors of the country could write. A picture can be understood by all, whereas we have many languages and we speak but few, and read fewer. Words we forget, but pictures stay, filed away in our minds, and we refer to them on a moment's notice. Every day, as the pace quickens, and the press for time increases, we find our time for reading diminishes, thus the moving-picture excels the finest description ever written of the same thing.

We sometimes see so-called comic art, which is not comic, and that called caricature which is not true caricature. A man who draws a picture of a man with a broad grin and winking with one eye, or cross-eyed, or perhaps a man standing with one foot on his other, is not necessarily a caricaturist any more than is the man who puts big feet and big noses on every person he draws. A young caricaturist who had submitted a picture to a critic for his judgment and had received a severe lecture on the bad drawing it displayed made an attempt to hide behind the fact that it was a caricature, and therefore shouldn't be considered as the critic was considering it. Whereupon he replied: "No, never try to hide behind that. Remember one thing: that poor drawing is not caricature, and another, that all the bad artists in the country are not caricaturists. On the contrary, those who exaggerate the salient features must draw them even better, as more attention is called to a big nose or large ears if they are made conspicuously large, than would be the case otherwise."

But there is something else that a successful caricaturist must possess. That one thing, whatever it may be called, is of more importance than the art of drawing properly, and is a certain force of character, or of individuality which at once suggests strength of purpose and power. It can convey the feeling of sadness, of brute force, or excruciating mirth, yet many very fine draughtsmen who are styled caricaturists never draw with that spirit predominant, and without it their productions are not true caricatures.

Thus, in trying to be caricaturists, such men are robbed of the chance of being serious illustrators, in which work they might succeed; and they never succeed as caricaturists.

There are three kinds of good caricatures: First, the strong, powerful, almost brutal; second, the humorous, the one instantly compelling laughter; and last, but not the least in effect, the pathetic; a picture capable of causing men to weep. The most effective are the powerful and the pathetic. The humorous is indeed attractive, if not overdone, but you soon forget its meaning. It can attack any and all things, from the weather to the President, without offense. But the most effective caricature is one that the subject of it would rather you would not print. Probably none can be made more powerful than the pathetic when it is timed and tempered just right, as its appeal to

the sympathy is the surest way to the emotions. No caricaturist ever drew a caricature that would cause people to shed tears on seeing it, unless the artist shed tears when he drew it, any more than one could draw an angry political boss unless at the time of drawing one wore the same angry and hateful expression on one's own face. So with the humorist. One must wear a broad smile when he draws a man laughing, unless one is drawing him from life; and unless one is smiling when drawing smiling people, the subjects will seem to look and laugh only in mechanical fashion.

If the caricaturist is strong enough in his line to be called one, the first person he wins is himself. Once he has settled in his own mind that he is working for a just cause, it will be noticed at once that his work improves, and if he continues to study and put his heart and soul into it, others will be converted and he will acquire a following. If a cartoonist in his politics keeps side by side with his pictures he will be much more of a caricaturist than one who will work on a Democratic paper one day and the next on the Republican side. A young man in starting out should study and choose for himself and in that way he will find that he can lend more power and force to his work. It would be hard to imagine Thomas Nast being in private life a sympathizer with Tweed. The difficulty with caricaturists is that they are sometimes like the politician after the election, when he says: "No wonder the other side won; 'they bought us.'" What interest could one take outside of the mechanical reproduction if one knew that the caricaturist who had one year drawn powerful caricatures for one party would turn around the next year and work for the opposition. The power of a caricature becomes power only when the reader of the picture is convinced that that which is represented in the picture really did happen, and that cannot be done by a caricaturist if one day he is with the poor, and the next day with the rich; or in the same relation with any case that comes up.

The late John J. Ingalls said that the caricature did harm that good might follow. Caricatures, to be effective, should be founded on fragments of truth, though you are permitted to dig below the frost line. Without truth at the bottom they are powerless, and with truth at the bottom they are powerful and everlasting. Though Tweed, the man, is dead, Tweed, in the caricature, still lives, a prisoner in stripes, with ball and chain to his leg. A good caricature may be called an exaggeration of the truth. In these times there are great opportunities for the cartoonist. The billionaire will have to deal kindly and justly with his fellowmen, or else he will be more of a target than ever before, but the honest man need never fear a caricature; on the contrary, he can laugh and go about his business, and if he is attacked, the attacks will react in his favor. But they cannot be recommended as the steady diet for a dishonest person, since whether he has a conscience or not, if they don't bring him to justice they will give him many a sleepless night.

Caricature and Grotesque' (London 1875); Parton, J., 'Caricature and other Comic Arts' (New York 1877); Grand-Carteret, J., 'Les mœurs et la caricature en Allemagne, en Autriche et en Suisse' (Paris 1885); Everitt, W., 'English Caricaturists of the 19th Century' (London 1886).

**CARIES**, *kār'ī-ēz*, a form of local death in bone, due to a variety of agents. Caries is usually distinguished from necrosis, another type of local death in bone, by the slower disintegration of the bone affected by the carious process. Necrosis usually results in the death of large pieces of bone, with the formation of sequestra. Caries is a gradual disintegration without sequestration. Caries is the result of inflammation of the softer tissues in the bone spaces, and is due usually to some definite form of irritant. It may be that of a gas, such as chlorine, or phosphorus, the latter causing in match-works a form of caries of the jaw; but bacteria of tuberculosis and syphilis are the most frequent causes. Tuberculous caries is the most frequent form of the disease. See HIP JOINT DISEASE; TUBERCULOSIS. For caries of the teeth, see TEETH.

**CARIGARA**, *kā-rē-gā'ra*, Philippines, a town of the province of Leyte, situated on the north coast of the island, 22 miles west of Tacloban. It has a harbor formed by a bight extending 11 miles inland, carries on a considerable coast trade and is an important hemp port. Pop. about 16,000.

**CARIGNANO**, *kā-rēn-yā'nō*, Italy, a city in the province of Turin, 11 miles south of the latter on the left bank of the Po. It is surrounded by old walls, and has a handsome square ornamented with arcades, some fine churches, some silk-spinning mills and sugar-refineries. From this town is named a branch of the house of Savoy. Pop. 7,000.

**CARILLON**, *kā-rē-yōñ*, a kind of chime, played either by hand or clockwork on a number of bells, forming a complete series or scale of tones or semi-tones, like those of the organ or harpsichord. See CHIMES.

**CARIMATA**, *kā-rē-mā'ta*, or **KARIMATA**, a name applied to the strait between Borneo and Billiton; also to a cluster of a hundred islets and reefs (area, 57 square miles; pop. 500) in that strait; and lastly, to the principal member of the group, whose highest point reaches 2,600 feet, and is in lat. 1° 36' S. and long. 108° 54' E.

**CARINI**, *kā-rē'nē*, Italy, city in the province of Palermo, island of Sicily, 17 miles northwest of the city of Palermo. It is beautifully situated four miles from the sea, in a fertile region. It has a Gothic castle of the 14th century. In the vicinity are caves in which animal fossils are found. The Sicilian revolutionists were defeated here, 18 April 1860, by the Bourbon troops. North of the town was the ancient Hyccara, from which the Athenians carried off the 12-year-old Lais, who grew up to be so famous a courtesan. Fishing is the chief occupation. The district produces much corn and wine. Pop. about 14,000.

**CARINTHIA** (Ger. *KÄRNTHEN*), a duchy and crownland, between lat. 46° 24' and 47° 7' N., and long. 12° 35' and 15° 10' E., bounded on the north by Salzburg and Styria, on the

east by Styria, on the south by Carniola and on the west by Italy and Tyrol; area, 3,986 square miles. It is extremely mountainous, generally sterile, and one of the most thinly populated provinces of Austria. The arable land does not exceed 290,000 acres, but there are some fertile valleys, and a considerable extent of rich pasture land. It has several rivers and lakes. Of the former the principal is the Drave. All of them abound with fish. The country does not yield corn enough for the consumption of the inhabitants, who import the deficiency from Hungary. The cereals most extensively cultivated are rye and oats. Some wine is produced in Lower Carinthia, but it is of inferior quality. Cattle, sheep and horses are raised in considerable numbers, but the mines of Carinthia are the main sources of its wealth. The chief of these are lead, iron and calamine. Various kinds of gems are met with. Its operative industry is chiefly confined to the working of its metallic ores, though there are also manufactories of woollens, cottons, silk stuffs, etc., most of which are in Klagenfurt, the capital. Bessemer steel rails, wire, wire nails and bar-iron are produced in great quantities. Some machinery, firearms, textiles, leather goods, cement and wood pulp are exported. Klagenfurt is the centre of the railway lines, of which there are about 385 miles. The Diet consists of 37 members and the crownland sends nine members to the Lower House of the Austrian Reichsrat. The principal towns are Klagenfurt and Villach. Carinthia formed part of the empire of Charlemagne, and afterward belonged to the dukes of Friuli. It subsequently passed through various hands, and finally became an appendage of the Austrian Crown in 1321. In 1809 it was annexed to the empire of Napoleon, but was restored to Austria in 1814. Nearly all the inhabitants are Roman Catholics. The population of Klagenfurt, the capital, is 24,284; that of the crownland 396,200.

**CARINUS, Marcus Aurelius**, Roman Emperor: d. 285 A.D. He was the elder of the two sons of the Roman Emperor Carus, who conjointly succeeded to the throne on the death of their father, 284 A.D. His brother was supposed to have been murdered on his return from the East, and Carinus, ruling alone, became one of the most profligate and cruel of the Roman emperors. The soldiers having rebelled and proclaimed Diocletian emperor, Carinus collected the troops that were in Italy and marched into Mœsia to meet Diocletian and quell the revolt. A decisive battle was fought near Margus, in which Carinus gained the victory, but in the moment of triumph he was slain by one of his own officers, whom the vices of the Emperor had outraged.

**CARIPE**, *kä-rē'pā*, Venezuela, town situated in a valley in the northern part of the province of Bermudez. It was formerly the headquarters of the Capuchins, and contains the ruins of their church cloister. In the vicinity is the large cave described by Humboldt (2,800 feet from front to back and from 70 to 80 feet high) in which lives the bird known as guacharo, a kind of nighthawk. Pop. about 5,000.

**CARISBROOKE**, England, a village pleasantly situated near the centre of the Isle of

Wight, and overlooked by the ruins of its ancient castle, where Charles I was imprisoned 13 months, previous to his trial and execution. The castle and grounds cover 20 acres. Within the walls is a well 200 feet deep. The parish church of Saint Mary is a venerable structure, with a fine perpendicular tower containing a chime of bells. It was formerly attached to a Benedictine priory founded under William the Conqueror, but the priory no longer exists. In 1859 a Roman villa was discovered at Carisbrooke, and the place seems to have been a fortress at the time of the Roman occupation. Pop. 5,139.

**CARISBROOKE, MARQUIS OF**. See **BATTENBERG, PRINCE HENRY MAURICE**.

**CARISSIMI**, *kä-rēs'sē-mē*, **Giacomo**, Italian composer: b. Marino 1604; d. Rome, 12 Jan. 1674. In 1624-28, he was Kapellmeister at Assisi, and then became musical director of the church of Saint Apollinaris in Rome, and continued in that position until his death. He wrote many oratorios, cantatas and motets, and has been praised for his characteristic expression of feeling and his easy, flowing style. He deserves most honor for the improvement of the recitative, having given it a more expressive and natural language, and he greatly developed the sacred cantata. His oratorio 'Jonah' has been revived in recent times. It anticipates in the descriptive passages some of the effects since elaborated by the modern classical composers, and it is altogether distinguished by freedom, boldness and striking antiphonal imitations. Other works are 'Jephthah'; 'Judicium Salomonis'; 'Baltazar'; 'Jonas' (in Vol. II of Chrysander's 'Denkmäler der Tonkunst' 1856); 'Motets' (1664 and 1667); 'Masses' (1663 and 1667); 'Arie da camera' (1667); and 'Ars Cantandi' (3d ed. 1696). As a teacher Carissimi was greatly esteemed, Alessandro Scarlatti, Buononcini, Cesti, Kerll, Krieger and Charpentier being among his pupils.

**CARL, William Crane**, American organist: b. Bloomfield, N. J., 2 March 1865. He was educated in Paris under Alexander Guilmant; received the degree of Mus.D. from the University of New York 1911—Officier de l'Instruction Publique, and member of the French Academy of Music (conferred by the French government). He is organist and musical director of the old First Presbyterian Church, New York, and has given over 150 free organ concerts there; is director of the Guilmant Organ School, New York; inaugurated many of the large organs in America, including a series in Dawson City (Klondike); has appeared with the leading orchestras at expositions, and at music festivals. He toured Japan and made successful study of the music of the Orient. Author 'Masterpieces' (1898); 'Ecclesiæ Organum'; 'Festival Music for Organ' (5 vols.); 'Master-studies'; 'Novelties for Organ' (2 vols.); also anthems, songs and articles on musical subjects. A founder of the American Guild of Organists; membre de l'Alliance Française; member of the National Association of Organists and Fraternal Society of Musicians.

**CARLÉN**, *kär-län'*, **Emilia Smith Flygare**, Swedish novelist: b. Strömstad, 8 Aug. 1807; d. Stockholm, 5 Feb. 1892. In 1827 she married a physician named Flygare. In 1838 she published

her first novel, 'Waldemar Klein,' and among the best of her subsequent works are the 'Professor' (1840); 'A Year' (1846); 'The Brother's Bet'; and 'The Guardian' (1851). Several of her novels have been translated into English. After his death in 1833, she decided to devote herself to literature. In 1841 she married J. G. Carlén, a lawyer and poet. After his death in 1875, her literary activity ceased altogether, although her salon had been the centre of literary life at the capital. In 1878 she published a volume of 'Reminiscences of Swedish Literary Life.' She had clear insight into the conditions of human life, especially of life in the middle class, and she describes it with admirable fidelity. Characteristic are 'Gustav Lindorm' (1839); 'The Rose of Tistelön' (1842); 'The Maiden's Tower' (1848), all translated into English. Consult Svanberg, 'E. F. Carlén'; 'En studie' (Stockholm 1912); Schoeldstroen, 'E. F. Carlén' (ib. 1888).

**CARLETON, Guy**, 1st Lord Dorchester, British general and colonial governor: b. Ireland 3 Sept. 1724; d. Maidenhead, England, 10 Nov. 1808. He served under General Amherst at the second siege of Louisburg 1758, and under Wolfe in 1759 at Quebec, where he was wounded. In 1762 he greatly distinguished himself in the British attack on Havana. Sent out as lieutenant-governor of Quebec in 1766, he remained closely identified with Canada for well-nigh 40 years. He inspired the Quebec Act (1774); when the Revolutionary War broke out he was commander of the British army in Canada, defended Quebec with great skill, and, reinforced by a British squadron in May 1776, forced Benedict Arnold's army to retire. In 1782 he became commander-in-chief of the British army in North America and during his command peace was finally concluded. Again appointed governor of Quebec in 1786 he was soon rewarded with a peerage as Baron Dorchester. He helped to frame the Constitutional Act of 1791, which divided Canada into two provinces. He remained at Quebec until 1796, and died in England in 1808, aged 84. By defeating Arnold's attack on Canada, Carleton really saved British North America to Great Britain. He was a stern but humane officer, and was especially loved by the newly-conquered French whom he ruled in Canada.

GEORGE M. WRONG.

**CARLETON, James Henry**, American soldier: b. Maine 1814; d. San Antonio, Tex., 7 Jan. 1873. In February 1839 he took part in the "Aroostook War," relative to the northeast boundary of the United States, and later was commissioned 2d lieutenant in the 1st United States Dragoons. In 1846 he took part in Kearny's expedition to the Rocky Mountains, served on General Wood's staff in the Mexican War, received the brevet rank of major for gallantry at Buena Vista; and later was chiefly employed in exploring expeditions and against hostile Indians. In 1861 he was ordered to southern California, raised the famous "California column," and marched across the Yuma and Gila deserts to Mesilla on the Rio Grande. As commander of the Department of New Mexico he was active in a number of severe engagements. For his services he was brevetted major-general, 13 March 1865; became lieutenant-

ant-colonel of the 4th Cavalry, 31 July 1866; and was promoted colonel of the 2d Cavalry, June 1868, and ordered with his regiment to Texas. He wrote 'The Battle of Buena Vista' (1848).

**CARLETON, Mark Alfred**, American grain expert: b. Jerusalem, Ohio 1866. After studying at the Kansas Agricultural College he was appointed in 1894 cerealist in the United States Department of Agriculture. In 1898-99 he proceeded to Russia and Siberia to investigate agricultural conditions, and on his return introduced among several other new crops durum wheat. Durum wheat has now taken the place of the soft spring wheat varieties in Texas, Nebraska, Oklahoma and Kansas, with an annual yield estimated at \$40,000,000. His writings, chiefly bulletins of the United States Department of Agriculture, include 'Cereal Rusts of the United States, 1899'; 'The Basis for the Improvement of American Wheats' (1900); 'The Commercial Status of Durum Wheat' (1904); 'Barley culture' (1908); 'Ten Years experience with Swedish Select Oat' (1910); 'Winter Eymper' (1911).

**CARLETON, Thomas**, English soldier and administrator: b. Newry, County Down, Ireland, 1735; d. 1817. He entered the 20th Regiment in his 18th year, was present at the battle of Minden and served in Canada under his brother, Sir Guy Carleton, during the American Revolutionary War. He was first governor of New Brunswick, 1784-1817. In his administration of that province it was said that he showed "a generous contempt of his own private wealth, and an exact frugality in the management of that which belonged to the public."

**CARLETON, Will**, American poet: b. Hudson, Mich., 21 Oct. 1845; d. 1912. Soon after his graduation at Hillsdale in 1869, he traveled widely as a lecturer in the northern and western states, Great Britain and Canada. He is best known in literature by his ballads of home life, many of them having gained great popularity. His books include 'Poems' (1871); 'Farm Legends' (1875); 'City Ballads' (1888); 'City Legends' (1889); 'City Festivals' (1892); 'Rhymes of Our Planet' (1895); 'The Old Infant, and Similar Stories'; 'Young Folks' Centennial Rhymes'; 'Songs of Two Centuries' (1902); 'Drifted In' (1908); 'A Thousand Thoughts' (1908). He was also for a time editor of *Everywhere*, an illustrated magazine.

**CARLETON, William**, Irish novelist and short-story writer: b. Prillisk, County Tyrone, 20 Feb. 1794; d. Sandford, 30 Jan. 1869. His father was a farmer on a small scale. The son, intended for the priesthood from a tender age, spent his boyhood in pursuit of an education, and managed, in spite of difficulties, to acquire a fairly creditable one. With no other equipment, and without a penny in his pocket, he set out on foot from his native county, at about the age of 24, to seek his fortune, for he had long abandoned all ambition for the sacerdotal dignity. Arrived in Dublin, he decided to change his religion, and he became a member of the Established Irish Protestant Church. He subsisted for a time on some tuitions, and when he obtained a clerkship, with a salary of £60 a

year, in the Sunday School Society, he thought that he was provided for for life. On the strength of this clerkship and the income derived from some evening tuitions, he married Jane Anderson, his faithful and loyal companion for the remainder of his life; but before his first child was born he was ousted from his position in the Society. A period of school-mastering, first at Mullingar and afterward at Carlow, followed; but he eventually gravitated back to Dublin. At that time (1828), the United Kingdom was rocked to its base by the climax of the agitation for Catholic Emancipation. The Evangelicals, an aggressive party which had taken the Church of Ireland under its special protection, were then powerful in Dublin. For the propagation of their views they had a monthly publication, *The Christian Examiner*, and to this magazine Carleton was invited to contribute stories and sketches based on the superstitions of the Catholic Irish peasantry, a subject with which he was thoroughly acquainted. He made his first appearance in its pages in April 1828 with the first part of 'A Pilgrimage to Patrick's Purgatory,' in which several Catholic tenets and practices were savagely ridiculed. He continued to write for the *Examiner*, along much the same lines until December 1831. In the meantime, he brought out, in 1830, the first series of his inimitable 'Traits and Stories of the Irish Peasantry,' and he followed this up, in 1833, with the second series. Both collections are brimful of humor and pathos, the second containing, among other pieces, 'The Poor Scholar' and 'Tubber Derg,' two of the finest things he ever wrote. For some years Carleton contented himself with producing short stories and sketches, so that it became a by-word among his friends that a long novel, with an intricate and sustained plot, was beyond his range. 'Jane Sinclair' (1836) did not do much to dissipate this belief, but when 'Fardorougha the Miser' came out in 1837-38, it became evident that a new star had risen above the literary horizon. This pathetic novel excels in the portraiture of the vice of avarice: Fardorougha has been compared, and not unfavorably, with Molière's Harpagon in 'L'Avare' and with Balzac's Père Grandet in 'Eugénie Grandet.' In Honor O'Donovan Carleton has presented to us one of those heroines in humble life in whose delineation he admittedly excels.

The success of the *Nation* newspaper, founded in Dublin in 1842, gave a new direction to Carleton's thoughts. Hitherto his attitude had been, on the whole, one of satirical censure on the religion of the great majority of his fellow-countrymen and of more or less open hostility to Irish national aspirations. He now saw that, if he wished to be popular, he must espouse the popular side. Accordingly, in 'Valentine McClutchy' (1845), he made a regular right-about-face, and let himself go, almost without restraint, in attacking Orangeism, the Grand Jury system, the methods by which the Union was carried, the Charter Schools, absentee landlords with their conscienceless agents, the corruptions of Irish Protestantism, and even the practices and pursuits of the Evangelical party. 'Valentine McClutchy,' although loosely constructed, is yet instinct with the power of genius. Two of its characters,

Solomon McSlime, the hypocritical attorney, and Darby O'Drive, the apostatizing bailiff, are great original creations. This was Carleton's most prolific period. In rapid succession work after work flowed from his pen: 'Art Maguire,' 'Tales and Stories of the Irish Peasantry' (not to be confused with 'Traits and Stories'), 'Rody the Rover,' and 'Parra Sashta.' In 1846 he wrote 'The Black Prophet,' one of his best works, with two wonderfully contrasted heroines. This was followed in 1847 by the pathetic 'Emigrants of Ahadarra.' 'The Tithe-Proctor' (1849) showed another kaleidoscopic change. It gave mortal offense to many of his readers, both from the stand it takes regarding the Anti-Tithe War of the thirties, and from the aspersions deliberately cast in the preface on the character of the Irish people and the popular movements of the forties. 'The Squanders of Castle Squander' (1852) is also full of rancorous and bitter political and religious discussion. He is seen to greater advantage in 'The Black Baronet,' originally published in 1852 as 'Red Hall.' This is a story depicting love, ambition, and revenge, and has a most intricate and baffling plot, not discoverable until the very end. One of its great characters is Father MacMahon, the prototype of many of those clerical oddities who have since contributed to the gaiety of nations. The popularity, which Carleton won with 'Valentine McClutchy' and lost with 'The Tithe-Proctor,' he regained in full measure with 'Willy Reilly and his dear Colleen Bawn' (1855). The scene is laid in the days of the Penal Laws, and the obvious sympathy displayed with the cruelly oppressed Catholics restored the author to the affections of his warm-hearted and forgiving fellow-countrymen. The novel itself is poorly constructed, and the plot hinges on a series of improbabilities, but its subject has made it the most popular of Carleton's works. Other novels are 'The Evil Eye' (1860), 'The Double Prophecy' (1861), and 'Redmond Count O'Hanlon, the Irish Rapparee' (1862). Carleton wrote some verse and one play. His verses are generally of a pensive and meditative cast. His best and best-known poem is the ballad 'Sir Turlough, or the Churchyard Bride' (1830), which has been pronounced the most successful legendary ballad of modern times. His solitary play, 'The Irish Manufacturer, or Bob Gawley's Project,' produced at the Theatre Royal, Dublin, in March 1841, was not a success, and was withdrawn after a few nights. On some of his novels plays have been founded by other hands, and several of his books have been translated into French and German. From the time of his return to Dublin in 1828, Carleton's life was singularly uneventful. He was a devoted husband and father, and loved to spend his time in the bosom of his family. He was always poor, and nearly always in debt, and even a literary pension of £200 a year, which was granted to him in 1848, and which he drew for the remaining 21 years of his life, did not help materially to mitigate his financial troubles. Cancer of the tongue was the cause of his death, which occurred at Sandford, County Dublin, on 30 Jan. 1869. He died, as he had lived, in the profession of the Protestant faith. Carleton made some incursions into middle-class life, and even into the domains of higher

society, but it is with ordinary people, and especially with the peasantry, that he is in his element and entirely at home. No one ever understood or described the Irish peasant of 75 or 100 years ago as he did. The faction fight, the party fight, the courtship, the wedding, the christening, the death-bed, the wake, the funeral, the hedge school, the secret society, the workings of landlordism, the practices of the unjust and rapacious land agent, the eviction, the revenge, the piety, superstitions, customs, peculiar expressions, modes of thought and outlook on life of the people—he brings them all before us clearly, vividly, unmistakably. Consult O'Donoghue, D. J., 'Life of Carleton' (1896).

PATRICK J. LENNOX,  
*Professor of English Language and Literature,  
Catholic University of America.*

**CARLETON COLLEGE**, Minn., at Northfield was founded in 1866, and named in honor of William Carleton of Charlestown, Mass., who bequeathed for the purpose \$50,000. While conducted under Congregational auspices, its instruction is undenominational. The property valued at \$600,000 includes a campus and grounds of over 120 acres. The endowment is over \$1,000,000. There are well-equipped chemical, physical, biological and astronomical laboratories, a conservatory of music and growing library. There is a general annual attendance of over 400 pupils, with a college faculty of 34 professors and instructors.

**CARLETON PLACE**, Canada, town of Lanark County, Ontario, on a navigable tributary of the Ottawa called the Mississippi River, at the foot of Mississippi Lake, and on the Canadian Pacific Railway, 28 miles southwest of Ottawa, 46 miles northwest of Brockville. It has a fine water power, large lumber and shingle mills and woolen and iron manufactories; water and sewerage systems; and is lighted by gas and electricity. The neighborhood is a favorite camping ground for summer pleasure parties. Pop. 3,621.

**CARLI**, kār lē, **Giovanni Rinaldo**, COUNT, Italian economist and antiquarian: b. Capo d'Istria, 11 April 1720; d. 22 Feb. 1795. He was of an ancient, noble family, and early manifested an inclination for the study of the Middle Ages, with which he connected the study of *belles-lettres* and of poetry. In his 24th year the senate of Venice made him professor of astronomy and naval science. He published his works (1784-94) in 15 volumes, under the title 'Opere del Sig. Commendatore D. Gian Rinaldo, Conte Carli, Presidente,' etc., but this edition does not include his work on the coins of Italy 'Delle Monete' (3 Vols., 1754-60); and 'Delle Antichità Italiane' (5 vols., 1788-91). His complete works appeared in 18 volumes, 1784-94.

**CARLILE**, John S., American lawyer and statesman: b. Winchester, Va., 16 Dec. 1817; d. Clarksburg, W. Va., 1878. After admission to the bar in 1840 he settled at Beverly, Randolph County, and began the practice of law. From 1847 to 1851 he served in the State senate. He was also a delegate to the Virginia Constitutional Convention of 1850-51, and represented his district in Congress 1855-57. At the outbreak of the Civil War, he was an avowed Unionist. He was a member of the Wheeling Convention which established the

Reorganized Government of Virginia and urged quick action in the erection of a new State. He was elected to Congress in 1861 to represent the Wheeling district of the Reorganized Government of Virginia, but soon thereafter was promoted to the senate, where he served until 1865.

**CARLILE**, Richard, English freethinker and publisher: b. Ashburton, Devonshire, 8 Dec. 1790; d. London, 10 Feb. 1843. First apprenticed to a chemist, then to a tinman, he found employment in the latter line as a journeyman worker in London, where after reading Paine's 'Rights of Man,' he became a bold freethinker, and a publisher and purveyor of its forbidden literature. He reprinted William Horne's 'Parodies' and an imitation entitled 'The Political Litany' (1817), for which he underwent 18 weeks' imprisonment. In 1819 he was fined \$7,500 and imprisoned for three years for publishing the works of Paine and other freethought writers. While in prison he conducted the publication of the first 12 volumes of *The Republican* (1819-26), for which his wife was sentenced to two years' imprisonment. Started by the Duke of Wellington, a fund of \$30,000 was raised to prosecute Carlile's assistants, his property was confiscated, his sister was fined \$2,500 and with nine assistants received terms of imprisonment, ranging from six months to three years. Public opinion made the government discontinue the prosecutions. On his release Carlile started *The Gorgon*, a radical weekly periodical. Before his death he was again imprisoned for terms of three years, and of 10 weeks for refusing to pay church rates. He was the boldest agitator and the greatest factor for freedom of public speech and printing of his period.

**CARLIN**, Thomas, American politician: b. Kentucky 1790; d. 2 Feb. 1852. He removed to Illinois in 1813, and gradually accumulated wealth, and became known and respected among the scattered population about him. He was elected governor in 1838, and retained that office for four years, during a period of unusual and violent political excitement. Illinois, having engaged largely in internal improvements, suffered severely from the commercial revulsion which was then paralyzing the whole country. She was much in debt, and had within her borders no specie, and no available means of payment. The discussion of the slavery question, too, was then furious, and had just led to the tragic death of E. P. Lovejoy. At the same time the Mormons took up their position at Nauvoo, and politicians were beginning those movements for partisan ends which seemed likely to throw the State into anarchy, and which ended ere long in the violent death of the Mormon leader. That Governor Carlin, amid such a condition of affairs, was three times re-elected to the chief magistracy affords a sure indication both of his popularity and his force of character.

**CARLINE THISTLE**. See THISTLE.

**CARLING**, Sir John, Canadian statesman: b. Middlesex County, Ontario, 1828; d. 1911. He received early education in public schools; in 1839 he removed to London, Ontario, where he joined his father in the brewing and malting business. After serving in the public capacities of school trustee and alderman, he was elected

in 1857 Conservative member for London in the Canadian legislative assembly. From 1867-72 he represented London in both the House of Commons and the Ontario legislature, resigning his seat when dual representation was abolished. In 1862, he was Receiver-General; in 1867-71 Commissioner of Agriculture and Public Works; 1882-85 Postmaster-General; 1885-91 Minister of Agriculture. In 1891 elected to the senate, he resigned in 1892 but was reappointed in 1896. He received the honor of knighthood in 1893. His efforts on behalf of Canadian agriculture were of incalculable value.

**CARLINVILLE**, Ill., a city and county-seat of Macoupin County, 60 miles southwest of Springfield, on the Chicago & Alton and other railroads. It has a prosperous local trade and manufactures of bricks and tiles, agricultural implements, etc. There are coal-mines, oil and natural gas wells in the vicinity. It is the seat of Blackburn University, a Presbyterian institution. Its courthouse is considered one of the finest public buildings in the State. It was settled in 1833 and incorporated in 1865. Pop. 3,616.

**CARLISLE**, kār-līl', Charles Arthur, American business man: b. Chillicothe, Ohio, 3 May 1864. He received a public school education, and early in life began work on the Marietta & Cincinnati Railway as messenger boy. From 1884-86 he was connected with the *Ohio State Journal*; and in the latter year returned to railroad work in the freight department of the "Nickel Plate" road; in 1890 he was made purchasing agent of the "Burke System" of railroads; later became director of the Studebaker Brothers Manufacturing Company at South Bend, Ind., and in 1904 was elected president of the American Trust Company of South Bend. He is vice-president of the National Association of Manufacturers; is a member of the American Academy of Political and Social Science, and of the American Institute of Civics, and is prominent in charitable work and public affairs in his home city.

**CARLISLE**, George William Frederic Howard, English statesman and author, 7th earl: b. London, 18 April 1802; d. Castle Howard, 4 Dec. 1864. He was educated at Eton and at Christ Church, Oxford, where in 1821 he won the Chancellor's and the Newdigate prizes with a Latin and an English poem. He became earl 7 Oct. 1848, previous to which, as Lord Morpeth, he had traveled extensively in the United States. He was a long time attaché to the British embassy at Saint Petersburg. In the reformed House of Commons he represented the West Riding of Yorkshire, and under the Melbourne ministry was secretary of state for Ireland. In 1841 he was defeated in the West Riding by his Conservative opponents. In 1846, under the administration of Lord John Russell, he was appointed commissioner of woods and forests, and chancellor of the duchy of Lancaster. He was the first of the Whig noblemen of the official class to give in his adhesion to the views of the Anti-Corn Law League. In 1856 he delivered before the Mechanics' Institute at Leeds two lectures, since published, on the life and writings of Pope, and on the United States. Previous to the Crimean War, he made a tour in the east

of Europe, and published his 'Diary in Turkish and Greek Waters.' On the accession of Lord Palmerston in 1855, he was nominated lord lieutenant of Ireland, which office he held till the resignation of the Palmerston ministry in 1858. His works include 'The Life and Writings of Pope' (1851); a tragedy, 'The Last of the Greeks'; and a volume of 'Poems' issued posthumously. His 'Viceregal Speeches,' edited by J. Gaskin, appeared in 1866.

**CARLISLE**, John Griffin, American statesman: b. Kenton County, Ky., 5 Sept. 1835; d. 31 July 1910. He received a common-school education, studied law and was admitted to the bar in 1858. He served several terms in the State legislature. During the Civil War he actively opposed secession, and in 1866 and 1869 was a member of the State senate. He was lieutenant-governor of Kentucky, 1871-75; was elected to Congress, 1876, and five times re-elected. His ability soon made him one of the Democratic leaders. In the 48th, 49th and 50th congresses he was chosen speaker. In 1890 he was elected United States senator, but resigned in March 1893, to accept the portfolio of Secretary of the Treasury in President Cleveland's Cabinet. At the close of his term he settled in New York to practise law. In 1896 he opposed Bryan and made able "sound money" speeches.

**CARLISLE**, England, city, capital of Cumberland County, on the river Eden, eight miles from the Solway Firth, and eight miles from the Scottish border, 300 miles by rail northwest of London. One of the oldest cities of England, important during the Roman occupation, its nearness to the border made it a prominent military station in the wars between the English and the Scotch. The Norman castle built in 1092 is well preserved and is still used as a garrison fortress. In the Civil War Carlisle sided with the King against Cromwell, and in 1745 declared for the pretender. The bishop's see dates from 1133; the cathedral, built in the Middle Ages, has no great architectural interest. The city is well supplied with municipal institutions and its chief industries are the manufacture of cotton and woolen goods, iron foundries, railway workshops, tanneries and breweries. Pop. 46,500.

**CARLISLE**, Pa., borough and county-seat of Cumberland County, on the Cumberland Valley and Philadelphia and Reading railroads, 18 miles west of Harrisburg. It is the farming and manufacturing trade centre of Cumberland County, and is the site of Dickinson College, founded 1783, Metzger Female College and the United States Indian Training School. It has a national bank, large manufacturing establishments, Hamilton Library, Todd Hospital, and an assessed property valuation of \$3,000,000. The industries include machine shops, chain and switch works, axle factory, cotton-weaving and silk-throwster mills, body and gear works, ribbon mills, shoe factories, flour mills, hosiery, paper-box and carpet factories. Mount Holly Springs, in the mountains just outside the city, is a popular summer resort. The government is administered by a burgess elected for three years and a borough council. It was the headquarters of Washington during the Whisky Rebellion in 1794, and was bombarded by the Confederates in 1863. Pop. 10,303. Con-

sult Wing, 'History of Cumberland County, Pa.' (1879).

**CARLISLE INDIAN SCHOOL.** See UNITED STATES INDIAN TRAINING AND INDUSTRIAL SCHOOL.

**CARLISTS**, a Spanish political faction which advocated the claims of Carlos of Bourbon and his descendants to the Spanish throne. In 1833 the Carlists, whose chief strength lay in the Basque provinces, and who, because of their Catholic traditions and tendencies, were secretly favored by the Pope and the Eastern powers, raised the standard of revolt. They had the advantage until 1836, when Espartero inflicted on them a terrific defeat at Luchana. In August 1839 their commander, Maroto, treacherously made peace, and the remaining Carlists soon fled to France. In 1873 the grandson of the first pretender raised another revolt in the Basque provinces of Navarre and Biscay, but after several sharp conflicts the rebels were hemmed in along the north coast, and in 1876 the pretender and his chief supporters fled into France. See **CARLOS DE BOURBON**.

**CARLONE**, kār-lō'nā, the name of an Italian family of distinguished artists, who flourished in the 16th, 17th and 18th centuries. The most celebrated of them are: 1. **TADDEO**, a native of Rovio, who excelled in sculpture and architecture, and was employed principally in Genoa: b. 1543; d. 1613. 2. **GIOVANNI ANDREA**, eldest son of Taddeo: b. Genoa 1590; d. 1630 in Milan. He made great progress in painting under the tuition of Pietro Sorri in Stena, and, having afterward studied under Passignano, distinguished himself particularly by his frescoes, in which the freedom and spirit of design, the depth of expression, grandeur of conception and richness of coloring are admired. 3. **GIOVANNI BATTISTA**, brother of Giovanni Andrea: b. Genoa 1592; d. in Turin 1677. He was also a scholar of Passignano, and, like his brother, painted for years in Genoa, but ultimately entered the service of the Duke of Savoy. He excelled particularly in frescoes. 4. **ANDREA**, son of Giovanni Battista: b. 22 May 1639 in Genoa; d. there, 4 April 1697. He studied in Rome, in Venice (where he was powerfully influenced by the style of Veronese); lived for several years in Perugia and founded an academy of art there. The ancestor of this branch of the family was Giovanni Carlone, who came from Rovio to Genoa about 1570. Another branch is traced back to Scaria, near Rovio. Carlones of more or less artistic distinction are more than 50 in number, as shown in Thieme-Becker, Vol. VI, pp. 3-10.

**CARLOS**, Don, dōn kār'lōs, Infant of Spain, son of Philip II and Maria of Portugal: b. Valladolid, 8 July 1545; d. 1568. He was sickly, and one of his legs was shorter than the other. The extreme indulgence with which he was educated by Joan, sister of the King, confirmed his violent, obstinate and vindictive disposition. Recent historical research has proved that he was afflicted with hereditary insanity, which an accident (occurring in 1562) involving skull fracture, emphasized. In 1560 Philip caused him to be acknowledged heir of the throne by the Estates assembled at Toledo, and in 1562 he sent him to the University of Alcalá de Henares in

hopes that the study of the sciences would soften his turbulent character. Contemporary historians differ in the description of the Prince. According to some he had a thirst for glory, an elevated courage, pride and a love of power. According to others he was fond of whatever was strange and uncommon; an accident or opposition irritated him to frenzy; address and submission softened him. He is also represented as a favorer of the insurgents in the Netherlands, and in particular as an enemy of the Inquisition; yet he possessed neither knowledge nor principles, nor even sufficient understanding to be capable of liberal views. With him all was passionate excitement, which resistance converted into fury. Llorente, the historian of the Inquisition, has corrected the accounts of the character and fate of this Prince from authentic sources in his work on the Spanish Inquisition (q.v.). According to him Don Carlos was arrogant, brutal, ignorant and ill-educated. So much is certain, that at the Congress of Cateau Cambrésis (1559) the marriage of Don Carlos with Elizabeth, daughter of Henry II of France, was proposed; but Philip, being left a widower by the death of Mary of England, took the place of his son. Don Carlos is said to have loved Elizabeth, and to have never forgiven his father for having deprived him of her. Llorente proves, however, that Don Carlos never had fallen in love with the Queen, and that she was never too intimate with him. In 1563 Philip, who had no other heir than Don Carlos, considering him unfit for the throne, sent for his nephews, the archdukes Rodolph and Ernestus, to secure to them the succession to his dominions. Don Carlos, who lived in continual misunderstanding with his father, resolved in 1565 to leave Spain, and was on the point of embarking when Ruy Gomez de Silva, a confidant both of Philip and Carlos, dissuaded him from his resolution. In 1567, when the rebellion in the Low Countries disquieted Philip, Don Carlos wrote to several grandees of the kingdom that he had the intention of going to Germany. He disclosed his plan to his uncle, Don Juan of Austria, who told Philip what Don Carlos had confided to him. It is believed that he was touched by the sufferings of the people of the Netherlands. Philip himself seemed to believe that his son intended to go to the Netherlands. The Infant had often shown a vehement desire to participate in the government. But Philip, jealous of his own authority, treated his son coolly and with reserve, while he gave his confidence to the Duke of Alva, to Ruy Gomez de Silva, Don Juan of Austria and Spinola. Don Carlos conceived an invincible aversion to them. The architect of the Escorial, Louis de Foix, narrates the following story relating to Don Carlos, which has been preserved to us by De Thou. The Prince had always under his pillow two naked swords, two loaded pistols, and at the side of his bed several guns, and a chest full of other firearms. He was often heard to complain that his father had deprived him of his bride. On Christmas evening he confessed to a priest that he had resolved to murder a man. The priest, therefore, refused him absolution. The prior of the monastery of Atocha artfully drew from him expressions from which it could be inferred that he meditated an attempt upon his own

father. The story was then communicated to the King, who exclaimed, "I am the man whom my son intends to murder; but I shall take measures to prevent it." Thus Philip, impelled by hatred or fear, by policy or superstition, resolved on the destruction of his only son, in whom he saw only a criminal, unworthy of the crown. On the night of 18 Jan. 1568 while Don Carlos was buried in a deep sleep, Count Lerma entered his chamber and removed his arms. Then appeared the King, preceded by Ruy Gomez de Silva, the Duke of Feria, the grand prior of the order of Saint John, brother of the Duke of Alva, and several officers of the guard and state councillors. Don Carlos still slept. They awoke him: he beheld the King, his father, and exclaimed, "I am a dead man." Then, addressing Philip, he said, "Does your Majesty wish to kill me? I am not mad, but reduced to despair by my sufferings." He conjured with tears those who were present to put him to death. "I am not come," answered the King, "to put you to death, but to punish you as a father, and to bring you back to your duty." He then commanded him to rise, deprived him of his domestics, ordered a box of papers under his bed to be seized and committed him to the care of the Duke of Feria and six noblemen, enjoining them not to permit him to write nor to speak with any one. These guards clothed Don Carlos in a mourning dress, took from his chamber the tapestry, the furniture and even his bed. Don Carlos, full of rage and despair, caused a large fire to be kindled, under pretext of the extreme cold of the winter, and threw himself suddenly into the flames. It was with difficulty that he was rescued. He attempted by turns to finish his life by thirst, by hunger, by eating to excess. After Philip had endeavored to justify his measures to the Pope and the principal sovereigns of Europe, and had also given notice to the superior clergy, the courts of justice and the cities of his empire, of what had passed, he referred the case of the Prince, not to the Inquisition, but to the council of state, under the direction of Cardinal Espinosa, who was state councillor, grand inquisitor and president of the junta of Castile. This court is said, after a minute examination and hearing many witnesses, to have condemned him to death. Other accounts, however, state that he died of a malignant fever before any judgment was passed, after having taken the sacrament with much devotion, and having asked his father's pardon, 24 July 1568. The melancholy fate of Don Carlos has served as a subject for several dramas. The romantic story may be found in works by Lord John Russell and M. J. Chénier, and in the following: C. V. de Saint-Réal, 'Don Carlos, nouvelle historique' (Paris 1672); Schiller, 'Don Carlos'; Alfieri, 'Philip the Second'; de Campistrone, J. G., 'Andronic'; Otway, T., 'Don Carlos, Prince of Spain'; Núñez de Arce, 'Haz de Leña.' For a discussion of plays on this subject, by Ximénez de Enciso and Juan Pérez de Montlaván, consult Bacon, G. W., 'The Life and Dramatic Works of Doctor Juan Pérez de Montlaván' (1602-38) (in *Revue Hispanique*, Vol. XXVI, pp. 1-474, 1912). For the historical account consult Ranke, in 'Wiener Jahrbücher der Litteratur' (Vol. XLVI, Vienna

1829); Gachard, L. P., 'Don Carlos et Philippe II' (Paris 1867); Maurenbrecher, 'Don Carlos' (Berlin 1876); Prescott, 'Philip II' (Boston 1855); Hume, 'Spain: Its Greatness and Decay, 1479-1788' (Cambridge, 1st ed., 1898; 2d ed., 1899, reprinted 1905); Hume, 'The Spanish People' (London 1901).

**CARLOS I**, King of Portugal 19 Oct. 1889-1 Feb. 1908; b. 28 Sept. 1863; assassinated Lisbon, 1 Feb. 1908. He was son of King Luiz I and Queen Maria Pia who was the daughter of King Victor Emmanuel II of Italy; and was a descendant of King John IV, sometimes called "The Restorer"—that Dom João, Duke of Bragança, who was proclaimed king when the revolution of 1640 wrested (with English aid) Portugal from Spain. In 1905, when Carlos visited King Edward VII, the historic friendship of Portugal and England was strengthened. Carlos married Princess Marie Amelia, daughter of Philippe d'Orleans, Comte de Paris. Prince Louis Philippe, heir apparent, born 1887, was assassinated with his father, and Prince Manuel, born in 1889, was proclaimed King Manuel II 2 Feb. 1908, and exiled 5 Oct. 1910.

**CARLOS DE BOURBON**, DON MARIA ISIDOR, second son of Charles IV of Spain and brother of Ferdinand VII: b. 29 March 1788; d. Trieste, 10 March 1855. In 1808 he was compelled by Napoleon along with his brother, who had now succeeded to the throne, to renounce all claims to the succession, and was detained with Ferdinand in captivity at Valençay in France till 1814. In 1816 he married Maria Francisca d'Assis, daughter of John VI of Portugal, his brother, the King of Spain, having at the same time espoused another daughter of John as his second wife. This last marriage, like Ferdinand's first, having turned out unproductive of issue, a prospect opened to Don Carlos of succeeding to the crown, which almost assumed the shape of absolute certainty when a third marriage contracted by Ferdinand proved equally unsuccessful with the two former in producing an heir to the Spanish monarchy. On the death of Ferdinand's third wife in 1829 he again married, and, by a pragmatic sanction, the contingency of a female heir was provided for by the repeal of the Salic law, which excluded such from the throne. On 10 Oct. 1830, Maria Isabella, afterward Queen of Spain, was born. In 1832 Don Carlos' party succeeded by taking advantage of the King's imbecile condition in obtaining a repeal of the pragmatic sanction; but this advantage was temporary, as Ferdinand disowned his act on recovering the use of his reason. The following year Don Carlos was exiled with his wife to Portugal; and having refused to return to be present at the taking of the oath of allegiance to the young Queen, he was commanded by Ferdinand to retire to the Papal States. On 29 Sept. 1833 Ferdinand VII died, and a few days afterward his consort, the Queen-regent, repeated the order to his brother to quit the country. The latter, however, now announced himself as legitimate King of Spain, and was recognized as such by a considerable party who excited a civil war in his favor, and thenceforward were designated by the title of Carlists. After a course of hostilities extending over several years with varying success, he found himself obliged in 1839 to take shelter in

France. In the meantime he and his descendants had been formally excluded from the succession by a vote of the Cortes in 1836. On arriving in France the castle of Bourges was assigned him as a residence, and he was also detained a prisoner there for a considerable time owing to his refusal to make the renunciations demanded of him. In 1845 he resigned his claims in favor of his eldest son, and in 1847 was permitted to take up his abode in Trieste, where he died. Consult Baumgarten, 'Geschichte Spaniens' (Leipzig 1861); Butler-Clarke, 'Modern Spain' (Cambridge 1906) with a useful bibliography; Hume, 'Modern Spain' (London 1906), an account by one whose family took a considerable part in the events of the first half of the book, and who himself witnessed much of what is related in the last half.

**CARLOTA**, kār-jō'ta, Philippines, (1) a town of Negros Occidental, situated in the western part of the island of Negros, 20 miles south of Bacolod. Pop. 13,097. (2) A town in the eastern part of the island of Negros (Negros Oriental). Pop. 6,386.

**CARLOTTA (MARIE CARLOTTA AMÉLIE)**, Empress of Mexico: b. near Brussels, 7 June 1840. She was the daughter of Leopold I, King of Belgium, and married Maximilian, Archduke of Austria, 27 July 1857. In 1863 she went with her husband to Mexico and remained there till 1866, when the dissatisfaction against the empire forced her husband to send her from the land of their adoption to ask help in France. She could obtain no assistance from Napoleon III and went to Rome to appeal to the Pope. Before negotiations there were completed, her health gave way under the strain, and after the end of the empire and the execution of her husband (19 June 1867) she became totally insane. She was taken at first to the Château of Laeken, and afterward to the Château de Bouchoute, near Brussels, Belgium, where she was still living in seclusion at the time of the invasion of her native land and the beginning of the war in Europe.

**CARLOVINGIANS**, or **CAROLINGIANS**, the second dynasty of the French or Frankish Kings, which supplanted the Merovingians, deriving the name from Charles Martel or his grandson Charlemagne (that is, Karl or Charles the Great). Its origin is usually traced to Saint Arnulf, bishop of Metz (d. 641), whose grandson, Pepin of Herstal, held the office of mayor of the palace in Burgundy, Neustria and Austrasia. This Pepin of Herstal, who died in 714, left as his successor a young grandson; but the actual inheritor of his ability was Charles Martel, a natural son. Charles Martel became mayor of the palace in 714 to the Merovingian *roi fainéant* Childeric, and in this office was succeeded by his son Pepin le Bref, who in 751 deposed the merely nominal King and himself assumed that title. He was succeeded by Charlemagne and his brother Carloman (768-71). Charlemagne became sole king in 771, and extended greatly the dominions of the family. In 800 Leo III crowned him Emperor of the West. On his death in 814 he was succeeded by his son Louis the Pious, who divided his empire among his sons, and at his death, in 840, his son Charles the Bald became King of Neustria, the Spanish Mark and

Aquitania, and is therefore regarded as the founder of the French dynasty. He died in 877, and was succeeded by a number of feeble princes. The dynasty came to an end with Louis V who died in 987. The house of Capet followed it, and the Capets also traced their descent from Charlemagne, but only because they were connected by marriage with the Carolingians.

**CARLOVITZ**, or **CARLOWITZ**. See **KARLOWITZ**.

**CARLOW**, Ireland, an inland county in the province of Leinster, surrounded by Kildare, Wicklow, Wexford, Kilkenny and Queen's County. It is generally level or undulating except in the southeastern parts. The chief rivers are the Slaney and Barrow. From the remarkable fertility of its soil it is almost entirely an agricultural county, producing a great deal of butter, corn, flour and other agricultural produce for exportation. Agriculture is here carried on with as much skill and knowledge of recent improvements as anywhere in Ireland, and there is less poverty than in most parts. There is abundant limestone, and granite is quarried. Area 346 square miles. Pop. (1911) 36,252, of which 89.2 per cent are Roman Catholics.

**CARLOW**, Ireland, the capital of the county of Carlow, on the Barrow, 56 miles southwest of Dublin by rail, with which it is also connected by canal. It has two principal streets intersecting at right angles. A bridge of five arches leads over the Barrow to the suburban village of Graigue, in Queen's County. The principal public buildings are the Roman Catholic cathedral and college and the Protestant parish church. It is lighted by electricity, and has an excellent water supply. Carlow is the principal mart for the agricultural produce of the surrounding country, has brewing and corn milling industries, and anthracite coal is worked. On rising ground to the south stand the ruins of the ancient castle of Carlow, still presenting a very imposing appearance. In the Rebellion of 1798 Carlow was unsuccessfully attacked by the insurgent forces. Pop. (1911) 6,619.

**CARLSBAD**, kārłs'bät, Bohemia, a town on the Tepl, near its influx into the Eger, 116 miles west by north of Prague by rail. It is widely celebrated for its hot mineral springs, and is perhaps the most aristocratic of the watering places of Europe. In the season, April to October, the visitors may number from 50,000 to 60,000. Set in most lovely scenery 1,165 feet above sea-level, the town is well built and offers good accommodation for its guests. The temperature of the hot springs varies from 47° to 165° F. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of three feet from the ground. Altogether, the daily flow of the springs of Carlsbad is estimated at 2,000,000 gallons. Somewhere approaching 2,000,000 bottles of water are exported annually. The principal ingredient in the water is sulphate of soda. The whole town of Carlsbad appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. Ascribing its foundation to the Emperor Charles IV (1347), Carlsbad was made a free town by Joseph I. Here were

formulated in 1819 the reactionary Carlsbad Decrees (q.v.). Pop. 17,446.

**CARLSBAD, Congress of**, a conference of ministers representing Austria, Prussia and many small German states, which met at Carlsbad in August 1819 to concert measures to arrest the democratic tendencies then manifesting themselves in Germany. Its members recommended to their governments and to the German Diet the famous 'Carlsbad Decrees,' which were adopted by the Diet, 20 Sept. 1819. Among the most important of the decrees were those recommending severe press censorship, the establishment at Mainz of a central commission for the investigation of political intrigues, the suppression of the secret student organization, the Burschenschaft, and government inspection of the universities.

**CARLSBAD DECREES**, the resolutions adopted in the summer of 1819 at the conference of the German ministers at Carlsbad, for the suppression of the so-called Demagogic Movement. The fear of a far-spreading conspiracy against the German princes, which had been excited by the murder of Kotzebue by Karl Sand, was skillfully employed by Metternich as an excuse for combining the German governments for the extermination of Liberalism. The representatives of Austria, Prussia, Bavaria, Saxony, Hanover, Würtemberg, Baden, Mecklenburg, Nassau and Saxe-Weimar participated in the meeting. It was decided, that the censorship of the press should be rendered more strict, that the universities should be forbidden to spread liberal doctrines, that secret societies should be suppressed, and that a commission to sit at Mainz should be appointed to extirpate the revolutionary conspiracy which was supposed to exist. An attempt to determine more precisely the nature of the constitution permissible for the states of the German Confederation led to a stalemate between the conservative Austrians and the Würtembergers who already had a liberal constitution. This was only solved at the conference of Vienna the following year. (See METTERNICH). Consult de Martius, 'Nouveau recueil général des traités' (Göttingen 1846).

**CARLSBURG**, kärls'boorg, or **KARLSBURG**, Austro-Hungary, a royal free city (ancient Apulum) on the right bank of the Maros, 48 miles south of Klausenburg. It consists of an upper and a lower town, situated on opposite sides of the river, and communicating by a long bridge. It is defended by a citadel, and has a cathedral (dating from 1443) with a number of ancient monuments, a mint where the gold and silver obtained in Transylvania are purified and coined, an observatory with a good collection of instruments, an excellent library, a theological college, a gymnasium, arsenal and barracks. Pop. about 12,000.

**CARLSCRONA**, kärls'krö-na, or **KARLSKRONA** ('Charles' Crown'), Sweden, a seaport at the southern extremity of the peninsula, on the Baltic, capital of the län or province of Blekinge or Carlscrona, 55 miles east by north of Christiansand. It stands on several rocky islets connected with one another and with the mainland by bridges, has broad, clean but somewhat steep streets, with houses mostly

built of wood. The harbor is safe and spacious and the entrance is protected by forts. It was founded by Charles XII in 1680. As the chief Swedish naval station the town largely depends on the trade thereby occasioned, but it has also a considerable export trade in timber, tar, potash, fish, etc. Pop. 27,434.

**CARLSEN, Emil**, American artist: b. Copenhagen, Denmark, 19 Oct. 1853. He came to the United States in 1872 and studied art in Boston. Since 1891 he has lived in New York and has exhibited frequently there. His especial field is still life painting, but he is also favorably known as a landscape artist. His landscapes are sincere and direct in presentation, and his marines are particularly good in the movement of the water. He excels especially in line and in arrangement. Among his best known works are 'Sooty Kettle'; 'A Connecticut Hilltop'; 'The Rising Storm'; 'Night—Old Wyndham' (1905, Webb prize, Society of American Artists); 'Wind in the East'; 'A Lazy Sea'; 'A Stormy Afternoon' (1909); 'The Sky and the Ocean' (1914). He is represented in the Metropolitan Museum, New York, by a still life and two marines, of which 'Surf Breaking' is especially fine; also in the Brooklyn Institute Museum and the Worcester Museum. He received a gold medal at the Saint Louis Exposition in 1904, and is a member of the National Academy of Design and of the National Institute of Arts and Letters.

**CARLSHAMN**, kärls'häm ('Charles' Haven'), Sweden, a seaport town 27 miles west of Carlscrona, in a beautiful valley at the mouth of the Mie-A. It is regularly built, and its square market-place, planted on all sides with trees, has a fine appearance. It has an elegant townhouse, a good harbor and an active trade. Timber and articles of timber, granite, charcoal and fish constitute the chief exports. The manufactures are sail-cloth, sacking, tobacco, leather, etc.; and there is also some ship-building. It was founded in 1664. Pop. about 7,000.

**CARLSON, Anton Julius**, American physiologist: b. Bohuslan, Sweden, 1875. In 1891 he came to the United States, and after studying at Augustana College, Ill., and Leland Stanford University, he became instructor and assistant professor in physiology in 1904 at Woods Hole laboratory. In 1909 he received the appointment of professor of physiology at the University of Chicago. He is the author of 'Physiology of the Nervous System of the Snake and the California Hagfish' (1904) and of numerous articles in physiological journals on saliva and saliva secretion, on the thyroids, parathyroids and pancreas, lymph and lymph formation, heart and circulation.

**CARLSON, Fredrik Ferdinand**, Swedish historian: b. Upland, 13 June 1811; d. Stockholm, 18 March 1887. After leaving the University of Upsala, he became tutor to the royal family at Stockholm (1837-46). He returned to the university as professor of history (1849) and became rector (1860). He represented the university in the National Diet; later he sat for the Swedish Academy of Sciences (1858); and represented Gefleborg in the first chamber from 1873. He was appointed head of the Department of Public Worship, which post he held from 1863-70 and

again from 1875-80. He was prominent in public matters for many years, being Minister of Ecclesiastical Affairs, 1863-70 and again, 1875-78. He completed Geijer's 'History of Sweden' (7 vols., Stockholm 1855-85).

**CARLSRUHE**, kār-ls'roo-ü, or **KARLSRUHE** ("Charles' Rest"), Germany, the capital of the grand duchy of Baden, 39 miles north-northwest of Stuttgart. It was laid out in 1715, and is one of the most regularly built towns in Europe. The castle of the Grand Duke stands in the centre of the city, and from this point a number of streets radiate fan fashion, at regular distances from each other. Other streets intersect these in parallel circles. The roads leading to the city correspond to this regular disposition, which, as is apt to be the case in strictly regular cities, often leaves upon the traveler the impression of monotony rather than that of agreeable order. The city is ornamented with several beautiful public buildings, including the palace, in front of which is a bronze statue of the founder of the city, the Margrave Charles William, the Parliament house, town-hall, etc. The court library contains 150,000 volumes; there are also here several valuable museums and cabinets, a botanic garden, several institutions for the promotion of literature and the fine arts. The city has a largely developing trade in engines, carriage works, furniture, paper and plated goods. Pop. (1911) 134,313.

**CARLSTAD**, kār-l-stät, Sweden, town and the capital of the län of Vermland, on an island in Lake Wener formed by the two mouths of the Klar, and connected with the mainland by a bridge across either stream. It is beautifully situated, regularly built, is the seat of a bishop, and has a cathedral, gymnasium, townhouse, etc., and some trade in copper, timber, iron, machinery, tobacco, matches and grain, and also exports wooden ware and iron. The city was founded in 1584 and rebuilt after the fire of 1865. A conference between Sweden and Norway was held here in 1905 to decide on the discontinuance of the union between these countries. Pop. 17,000.

**CARLSTADT**, Andreas Rudolf Bodenstein, German theologian: b. Carlstadt, Franconia, 1480; d. Basel, Switzerland, 25 Dec. 1541. He is celebrated in the history of the Reformation for his fanaticism as well as his misfortunes. He studied at Erfurt (1500-03), Cologne (1503) and Wittenberg (1510), where he was finally appointed professor of theology in 1513. In 1515 he went to Rome to study law and took the degree of LL.D. His learning enabled him to render great support to Luther in his first steps for the introduction of a reformation. In 1520 he was included in the bull which condemned Luther; and his spirited appeal from the Pope to a general council, of which he gave the first example, as well as his opinion openly expressed, in favor of the marriage of the priesthood, was among the many proofs which he gave of his zeal for the Reformation. While Luther was at Wartburg Carlstadt's zeal urged him to acts of violence. He even instigated the people and students to the destruction of the altars and the images of the saints, greatly to the displeasure of Luther, who lost the friendship of Carlstadt by his opposition to his excesses. He publicly declared himself the

opponent of Luther, and the Elector Frederick banished him from the country in September 1524. Carlstadt then commenced the controversy respecting the sacrament, denying, in opposition to Luther, the bodily presence of Christ in the sacramental elements, and recognizing in the rite a token of remembrance simply. This controversy was carried on with the bitterest animosity; and Zwinglius having declared himself in favor of Carlstadt's doctrine, a dispute ensued between the Swiss and Wittenberg theologians which ended in the separation of the Calvinists and Lutherans. Carlstadt in the meantime being suspected, not without reason, of having taken part in the revolt of the peasants in Franconia, was obliged to wander through Germany, and being ultimately reduced to extreme distress, sought relief of Luther who procured him an asylum at Kemberg, on condition that he should refrain from the expression of his opinions. Here he lived nearly three years. His restless mind, however, soon led him to break his promise, by the publication of some writings in 1528; and he even went so far as to plot against Luther's person. To escape from the consequences of his conduct he repaired to Switzerland at the end of the same year, where he was appointed vicar of Altstadt, in the valley of the Rhine; in 1530, deacon at Zürich; and in 1534, vicar and professor of theology at Basel. Consult, for his biography, Jäger, J. C. (Stuttgart 1856) and Lindsay, 'History of the Reformation' (Vol. I, New York 1906). Many of his letters are in Olearius, 'Serinium Antiquarium' (Halle 1698).

**CARLSTADT**, Austria, a town in Croatia, 34 miles southwest of Agram, agreeably situated in a perfectly level and richly cultivated plain near the junction of the Kulpa, Korana and Dobra, which are here navigable. It consists of the town proper and the citadel, together with the suburb of Dubovac. It is the seat of a Greek bishopric, is tolerably well built and has an important trade. It also has a higher gymnasium and military school and has a distillery and a turbine rolling mill. Pop. 16,000.

**CARLSTADT**, N. J., borough of Bergen County, 10 miles north of Jersey City, on the Erie Railroad. It has brass, onyx and marble works, silk mills, cotton cloth mills, sable cloth works and air valve manufactories. It is governed by a mayor and council, the former being chosen for a period of two years. Pop. 3,807.

**CARLYLE**, kār-lil', Alexander, Scottish clergyman: b. Prestonpans, 26 Jan. 1722; d. Inveresk, 28 Aug. 1805. He was educated at the universities of Edinburgh and Glasgow, and afterward studied at the University of Leyden. Licensed as a preacher in 1747 he became minister of the parish of Inveresk, in Midlothian, where he continued to the end of his life. He was one of the leaders of the Moderate party in the Scottish Church, the party which, during the latter half of the 18th century, ruled with such predominating sway, and included the names of Robertson, Blair and Home among its members. As an eloquent debater and skilful ecclesiastical leader in the General Assembly he had no rival. He was of such striking personal appearance that he was called "Jupiter

Carlyle." He strenuously resisted all attempts to give additional influence to the popular element in ecclesiastical matters. He left behind him a well-known autobiography, which, though commenced in his 79th year, is a singularly interesting production, both from the vigor and sprightliness of its style, and the pictures which it presents of Scottish society in the 18th century, and the more or less intimate account it gives of such noted characters as Home, the dramatist, Adam Smith and David Hume. After remaining long in manuscript it was published in 1860, under the editorship of John Hill Burton.

**CARLYLE, Jane Baillie Welsh**, Scottish letter writer: b. Haddington, Scotland, 14 July 1801; d. London, 21 April 1866. She was the daughter of John Welsh, a Haddington surgeon, and was married to Thomas Carlyle (q.v.) 17 Oct. 1826. Her letters, edited by her husband, were published in 1883. Consult Ireland, 'Life' (London 1891); and 'New Letters and Memorials' (London 1903).

**CARLYLE, John Aitken**, English physician, brother of Thomas Carlyle: b. Ecclefechan, Dumfriesshire, 7 July 1801; d. Dumfries, 15 Dec. 1879. He studied at Edinburgh where he took his degree of M.D. in 1825, and later completed his education in Germany. He practised for a short time at London, where he was unsuccessful. He attempted literature for a while, assisting his brother in translating Legendre's 'Geometry.' He then received an appointment as traveling physician to Lady Clare (1831-37), and later to the duke of Buccleuch (1838-43). Retiring to a place near the Chelsea residence of his brother, he devoted himself to literary labors and in 1849 published a translation of Dante's 'Inferno,' a very scholarly and finished work. A very friendly relation existed between the brothers, as evinced by letters and the will of Thomas. Dr. Carlyle edited also Irving's 'History of Scottish Poetry' (1861).

**CARLYLE, Joseph Dacre**, English Orientalist: b. Carlisle 1759; d. Newcastle-upon-Tyne, 12 April 1804. He was graduated from Cambridge, became chancellor of Carlisle in 1793, professor of Arabic at Cambridge in 1795 and was subsequently appointed to the Turkish embassy. He published 'Specimens of Arabic Poetry' (1796); 'Poems' (1805), and a translation of an Arabic history of Egypt. His Arabic Bible was published in 1811, completed and edited by H. Ford, professor of Arabic at Oxford.

**CARLYLE, Thomas**, Scotch essayist, historian and miscellaneous writer: b. Ecclefechan, near Annandale, in Dumfriesshire, Scotland, 4 Dec. 1795; d. London, 4 Feb. 1881. Carlyle's ancestors were said to have come to Annandale from Carlisle, England, in the time of David II, but at the author's birth the immediate family was living in very straitened circumstances at Ecclefechan, where the grandfather, Thomas, was village carpenter and his five sons masons. The second of these, James, a man of "largest natural adornment," assertive, choleric, honest and pious, with an uncommon gift of forcible expression, married as his second wife Margaret Aitken, a woman of affectionate nature and piety of mind. By her he had four sons and five daughters, of whom

the eldest was Thomas. The third son, John Carlyle (q.v.), became distinguished as the translator of Dante. Thomas, like the other children, was brought up with much affectionate care. His parents intended him for the Church and gave him all the education in their power. He early learned his letters and soon became a voracious reader. At 10 he was sent to the grammar school at Annan, where, as a moody, sensitive child, he was much bullied by the other boys, and probably suffered acutely. At the age of 13 he was ready to enter Edinburgh University, which he attended from 1809 to 1814, without, however, taking a degree. His individuality did not readily allow itself to be molded to the academic routine. Finding himself unable, because of religious doubts, to enter the ministry, he went to Annan Academy as tutor in mathematics, in 1814. Later he taught at Kirkcaldy, where he made the acquaintance of Edward Irving (q.v.), one of his warmest friends. Irving's friendship was of great value to Carlyle, and his library enabled the latter to gratify his love of reading and to mitigate the distaste which he felt for teaching. In October 1818 the work became so repellent that he resigned from his school, saying that "it were better to perish than to continue school-mastering." Then he went to Edinburgh to try to earn his living.

The next three years were perhaps the most trying of his life. He was tormented to an uncommon degree by his lifelong enemy, dyspepsia, and as a result was greatly depressed in spirit. Uncertain what career to follow, trying his hand at many vocations and different studies, miserably poor, finding his only employment for a time in writing hack articles, he was "mentally and physically adrift" in the sense that is described in his "Everlasting No" of 'Sartor Resartus.' Toward the middle of 1821, however, he seems, by much resolution and energy of will, to have shaken off much of the depression, to have attained the position of the "Everlasting Yea." The men who at this time most influenced him were the Germans, particularly Goethe, the mystic Richter, and the philosopher Fichte. German literature was now his most absorbing study, and later this study bore fruit in his 'Life of Schiller' (1823-24), his translation of Goethe's 'Wilhelm Meister' (1824) and in several essays. These books mark his formal entrance into literature. Up to the time of their publication Carlyle's published writing had been a series of articles for Sir David Brewster's 'Encyclopedia,' a translation of Legendre's 'Geometry,' to which he prefixed an 'Essay on Proportion,' and miscellaneous hack work. The 'Life of Schiller' and the translation of 'Wilhelm Meister' met with favorable reviews, and the translation is usually regarded as one of the best of all renderings into English. While he was at work on these books he was (1822-24) tutor in a well-to-do family, the Bulls, from whom he received £200 a year for not disagreeable work. In spite of the kindness of his patrons, he managed, as was usual with him during life, to find much fault with his surroundings and to utter complaints with very little fairness or reserve. A trip (1824) to London and Paris broke the monotony of his existence, and gave him many new impressions and opinions in what was a critical period of his growth.

THOMAS CARLYLE

Returning to Scotland in 1825 he established himself at Hoddam Hill, a farm near the Solway, where he farmed and wrote. On 17 Oct. 1826, Carlyle, after a somewhat prolonged, vacillating and rather stormy wooing, succeeded in marrying Jane Baillie Welsh, a woman in many ways as remarkable as himself and distinguished as a descendant of John Knox. The humors and distempers of their married life have become proverbial and are to be found most fully recorded in Froude's biography. Both seem to have been extremely and unintelligently self-willed and so vain as to be wholly lacking in reticence about their domestic life. For two years they lived at Scotsbrig near Edinburgh, where they had the advantage of the intelligent society of the capital, and where Carlyle supported himself by writing for the reviews. In the *Edinburgh Review*, under the editorship of his friend Jeffrey (q.v.), he published, in 1827, his well-known essay on 'Richter' and 'The State of German Literature,' an article which led to the famous correspondence with Goethe. For several years the *Edinburgh* and other reviews were his only medium of publication. He essayed a novel but failed, and was disappointed in his attempts to secure the chair in moral philosophy at Saint Andrews and a professorship in London University.

In May 1828 the Carlyles removed to a lonely farm, Craigenputtoch, overlooking the Solway. Here he wrote his 'Essay on Burns,' one of his most sympathetic pieces of criticism (*Edinburgh Review*, 1828), several other essays of much importance, as 'Voltaire,' 'Novalis' and his 'Sartor Resartus,' the book for which he is perhaps most famous. Refused by several publishers, 'Sartor Resartus' first saw light in *Fraser's Magazine*, between December 1833 and August 1834, where it excited such a storm of protest that no separate English edition appeared till 1838. Meanwhile (1836) it first appeared in book form in America, where it was especially commended by Emerson. This most characteristic book of Carlyle purports to be a review by an English editor of a treatise by a learned German professor, Herr Teufelsdröckh, with whose life and opinions it deals. The book is written around the famous Philosophy of Clothes, designed by Swift (q.v.), and is in the main symbolical of Carlyle's creed at this time—that as clothes express the taste of the wearer, so life in all its forms may be regarded as the vesture of the mind. The idea is not a very original one, but is expressed with such oddity of phrase and image that it appears as profound as forcible. The most interesting feature is the account of the moral and spiritual attire of Teufelsdröckh, who is Carlyle himself. It is the querulous, stormy tale of early suffering, lack of sympathy from fellowmen, disappointment alike in the business of the head and the affairs of the heart, despondency and despair over the great question why man is in the universe, doubt and wavering, and final acceptance of the facts of existence with the hope of solution through stern endeavor. The book might be called a prose epic of the inner life, and it is wholly egoistic and anthropocentric.

In 1834 the Carlyles removed to London, where they settled in Cheyne Row, Chelsea, and here were their headquarters for the re-

mainder of their lives. Soon after the change he began his 'French Revolution,' which was completed in 1837 and which gave him much more reputation than he had heretofore enjoyed. During the same period he wrote the 'Diamond Necklace' and the articles on 'Mirabeau' and 'Sir Walter Scott,' the honorarium from which was of great benefit in his impecunious state. The success of the history enabled him, in the four following years, to gain audience for four series of lectures, 'German Literature,' the 'History of European Literature,' 'Revolutions' and the more characteristic 'Heroes and Hero-Worship.' Published in book form in 1841, this series remains to-day one of the most widely read of Carlyle's works and is perhaps the clearest expression of his philosophy of history. "As I take it," he says, "universal history, the history of what man has accomplished in this world, is at bottom the history of the great men who have worked there." The moral animus of the book is expressed farther on in the same introduction: "We cannot look, however imperfectly, upon a great man, without gaining something by him. He is the living light-fountain which it is good and pleasant to be near." Again, speaking of the Hero as a man of letters, he tells us the purpose of all his own writing: "The writer of a book, is he not a preacher, preaching not to this parish or that, on this day or that, but to all men in all times and places?"

The book may conveniently mark an important time in Carlyle's life. The pamphlet on 'Chartism' of 1840 had enunciated a doctrine, of a political sort, that "Might is right,"—"one of the few strings," says Nichol, "on which, with all the variations of a political Paganini, he played through life." About this time, in short, his ideas of history, of morals, of politics, of his own mission, seem to have crystallized. Furthermore, his circumstances had definitively bettered. His name was well known and he was able to refuse a chair of history at Edinburgh University and later another at Saint Andrews. In 1842 the death of Mrs. Carlyle's mother threw an income of at least £200 in the hands of the Carlyles and relieved them of the fear of penury.

From this time on Carlyle's work falls mainly into two main classes: (1) the lives of great individuals and (2) pamphlets of a quasi-political sort, powerful lashings of modern institutions. The most important of the latter, 'Past and Present,' written in seven weeks, appeared in 1843. Herein Carlyle commits a common and characteristic fallacy in comparing a charming picture of monastic England with some of the worst things of modern life, to the obvious disadvantage of the latter and, by extension and implication, to modern civilization as a whole. Nevertheless, the book makes a strong appeal to our humanity, and is perhaps the best example of Carlyle's many protests against modern barbarism. It is said to have been productive of good in factory legislation. Meanwhile he was engaged on an important work of the first class spoken of,—'Cromwell,' which, after three years' preparation, appeared in 1845. Carlyle, with characteristic thoroughness, spent a large part of the summers of 1842 and 1843 in visiting the battle-fields of the Civil War. It is significant that the "great man" was now, with Carlyle, not

necessarily a man of letters, as in his works previous to the 'French Revolution,' but a man of political prowess as well, and this tendency to exalt the man of might reached its climax in the 'History of Frederick II.' The years between 'Cromwell' and the beginning of 'Frederick' are marked by his notable 'Latter-Day Pamphlets' (1849), one of the most denunciatory of his books, and his 'Life of John Stirling' (1851), a dear friend who had died six years before and who, like Edward King and Arthur Hallam, is chiefly remembered through the work of a greater man. After a trip in the fall of 1851, with the Brownings, to France, where he met the chief literary celebrities of the time—and passed unfavorable comment on them as on all affairs French—he settled down to the planning of the 'History of Frederick II.' On the preparation of this work and the composition of it he was engaged for the next 13 years. His study was indefatigable and he made two trips to Germany, in 1852 and 1858, to study the battlefields of Frederick. In 1850 the first two volumes were published with great success, the third in 1862, the fourth in 1864 and the fifth and sixth in 1865. During the composition he had done practically no side work; a somewhat unintelligent dialogue, 'Ilias Americana in Nuce,' on the American War, and his 'Prinzenraub' are the only pieces.

The compilation of 'Frederick' marks the climax of Carlyle's life. It won for him recognition in England as the foremost of prose writers, and in Germany, too, his fame was naturally great. Even the Scotch decided to honor a prophet of their own country; he was elected lord rector of Edinburgh University, and in the spring of 1866 delivered the inaugural address, on the 'Reading of Books.' While on his trip he received news of the death of Mrs. Carlyle, which, in spite of their disagreements, was a severe blow to him and may be said to mark the beginning of his decline. He was over 70 years of age and the labor of 'Frederick' had left him worn and weary. Thereafter he wrote only three books of comparative importance. 'Shooting Niagara—and After,' of the type of 'Past and Present,' the 'Early Kings of Norway,' of the hero type, and 'Reminiscences of Jane Carlyle and of Jeffrey and Edward Irving,' written in the months following the death of his wife, but not published until after his death. His last public utterance, according to Froude, was a letter which he wrote, in May 1877, to the *Times*, protesting against the moral support which England was giving to Turkey in the war with Russia. His life at this time is described as one surrounded by honors and supported by a few staunch friends, but as one of growing weariness and desire to be at rest, until, after two years of physical feebleness, he died quietly in his 86th year.

Carlyle's character and place in literature have, since his death, as during his life, been subjects of much comment and of comment of the most diverse sorts. He has been extolled on the one hand as the greatest of prophets, the most eloquent of sages; and condemned, on the other, as the noisiest of egoists. It is therefore impossible to fix with any approximation his value as a character or as a man of letters, in the sense that Milton, Addison, Gray

and others may be tolerably well characterized. His severest critics, like Mr. Robertson, are undoubtedly right when they accuse him of inconsistency and irrationality and when they point out in his character certain elements of brutality and narrow egoism, and yet the fact remains that he has been the awakening force of many men and that there is a feeling abroad that he is one of the great names in English prose. Perhaps the most sensible of these opposing views may best be summed up in Huxley's words (letter to Lord Stanley, 9 March 1881): "Few men can have dissented more strongly from his way of looking at things than I; but I should not yield to the most devoted of his followers in gratitude for the bracing, wholesome influence of his writings when, as a very young man, I was essaying without rudder or compass to strike out a course for myself."

In view of such diverse opinions, all of which contain truth, it seems necessary merely to protest against those extremist views which have just been referred to. Whether one regards him as the wisest of men or the noisiest of hypocrites is, after all, a question of temper or of what one regards as valuable in the universe, and usually has value only as the expression of personal opinion. Carlyle's influence, like that of Dr. Johnson, is the personal influence of a powerful and upright man rather than that of a philosopher or a discoverer of new truth. His personal qualities as expressed in his writings—his integrity, his earnestness, his independence, his sincerity, his hatred of sham, cant and affectation, his vigor—are what count in his hold on people. As a system, his work, as his critics justly remark, is unscientific and untrue. His work, so voluminous and, on the face of it, consisting of translations, literary, biographical, historical essays and books, tracts of the times and satires, comes down to the glorification of a galaxy of interesting and, in different ways, powerful individuals: Schiller, Goethe, Cromwell, Frederick, himself (in 'Sartor Resartus') and others, and to the doctrine that their power is good. There is, of course, no means of testing the general truth of such views. They are really personal. He is, therefore, to be regarded as a seer, a prophet, a preacher, who feels deeply a, rather than *the*, meaning of life, and exhorts his readers to feel rightly and live rightly, to "do the duty which lies next them," to "work and despair not." These things he said with an impressiveness equaled by few men and to a very large body of listeners. See FRENCH REVOLUTION, THE; HERO AND HERO WORSHIP; SARTOR RESARTUS; FREDERICK THE GREAT.

**Bibliography.**—Of the numerous editions of Carlyle's writings the best, aside from his correspondence, is probably the Ashburton Edition, in 17 volumes. The 'Early Letters of Thomas Carlyle' (1886; 2d series, 1888); the 'Correspondence between Goethe and Thomas Carlyle' (1887); and the 'Correspondence of Thomas Carlyle and Ralph Waldo Emerson' (1883), edited by C. E. Norton are the best editions of his letters. Froude's 'Thomas Carlyle' (in 4 vols., 1882-84) is the great biography, and is, incidentally, the most censured biography of recent times, because of the frankness with which it discloses the domestic life of the Carlyles. Excellent short lives are those of

John Nicoll, in the 'English Men of Letters Series' (1894), Richard Garnett, in the 'Great Writers Series' (1887) (to which there is added a very full bibliography), and Sir Leslie Stephen, in the *Dictionary of National Biography*. The critical essays of Matthew Arnold, Emerson in 'Discourses in America,' Augustine Birrell, 'Ojiter Dicta', J. R. Lowell, 'Prose Works,' Vol. II, John Morley, 'Miscellanies,' Vol. I, J. M. Robertson, 'Modern Humanists,' the severest of Carlyle's critics, and Stephen, 'Hours in a Library,' Vol. III, may be cited as representing different views among the most eminent of modern critics. Consult also Froude's 'Letters and Memorials of Jane Welsh Carlyle' (1883); Roe, F. W., 'Carlyle as a Critic of Literature' (1910); Craig, R. S., 'The Waking of Carlyle' (1909); Wilson, 'Froude and Carlyle' (1898); Shepherd and Williamson, 'Memoirs of the Life and Writings of Thomas Carlyle' (1881); Wylie, 'Thomas Carlyle the Man and his Books' (1881).

WILLIAM T. BREWSTER,

*Professor of English, Columbia University.*

**CARLYLE, William Arthur**, Canadian mining engineer: b. Hamilton, Ontario, 1862. A graduate of McGill University in 1887, he afterward was appointed at his alma mater special lecturer in mining and metallurgy (1891-95), and in 1895 professor of mining and engineering. He was provincial mineralogist and director of the Department of Mines, British Columbia, for three years, and from 1898 to 1908 was general manager of the Rio Tinto Company's mines in Spain. In 1908 he settled in London, England, as a consulting engineer, and the following year received the appointment of professor of technology and metallurgy in the Imperial College of Science.

**CARLYLE, Ill.**, city and county-seat of Clinton County, 45 miles east of Saint Louis, on the Baltimore and Ohio Southwestern Railroad, and on the Kaskaskia River. It has flour mills and paper manufactories and a large trade in flour and grain. It contains a county courthouse and a hospital. Carlyle was in pioneer times a station on the Vincennes trail. The electric-lighting plant and waterworks are the property of the municipality. Pop. 1,982.

**CARMACK, Edward Ward**, American politician: b. near Castalian Springs, Sumner County, Tenn., 5 Nov. 1858; d. Nashville, Tenn., 9 Nov. 1908. He studied law and after admission to the bar practised his profession at Columbia, Tenn. He was member of the State legislature in 1884; was on the editorial staff of the Nashville *American* (1886-88), and in 1892 became editor of the Memphis *Commercial*. He served two terms in Congress as Democratic representative from the 10th Tennessee district 1897-1901, was United States senator 1901-07, and later editor of the Nashville *Tennessean*. In 1906 he contested the Democratic nomination for governor, but was defeated. He was assassinated 9 Nov. 1908 by Robin J. Cooper, son of his long-time bitter political opponent, Col. Duncan Cooper. He published 'Character; or, The Making of the Man' (1909).

**CARMAGNOLE, kār-mān-yō'la**, Francesco, Italian *condottiere*: b. Carmagnola, about 1390; d. Venice, 3 May 1432. His real

name was Bussone, but he adopted as his own the name of his birthplace. The son of a peasant, he was a herdsman in his youth; but enlisting in the service of the Duke of Milan (Filippo Maria Visconti), he rapidly rose in rank, and aided his master in regaining a great part of Lombardy, and in extending his possessions. The Duke, however, became suspicious of his loyalty, confiscated his property, cast his wife and children into prison and banished him; upon which Carmagnola entered the service of the republic of Venice, from which he received the appointment of generalissimo. He wrested Brescia from the Duke of Milan, and entirely routed his army at the battle of Macalo in 1427. After the battle he released his prisoners, which was frequently done at that time by *condottieri*, but incurring the suspicions of the Venetian senate for doing so, and his subsequent military operations not proving successful he was recalled to Venice, under the pretext that his advice was needed for affairs of state, placed under arrest, accused of treason, put to the torture and beheaded. His fate has been celebrated in Manzoni's tragedy, 'Il Conte di Carmagnola' (1820). Consult Brown, Horatio, 'Studies in Venetian History' (London 1907).

**CARMAGNOLE, kār-mān'yō'l'**, a name applied in the early times of the French republic (1792-93) to a song which was accompanied by a dance. The song contained 13 couplets and the following refrain:

" Dansons la carmagnole  
Vive le son, vive le son  
Dansons la carmagnole,  
Vive le son du canon."

The author and composer of the song are unknown. It is notable simply for its historical associations, not for the intrinsic merits of words or music. The song and dance were first used at the time of the indignation of the people on account of the veto allowed to the King on the resolves of the National Assembly. The Carmagnole was commonly sung and danced at popular festivals, executions and eruptions of popular discontent. Afterward the name was also applied to the national guards, who wore a dress of a peculiar cut, and to the enthusiastic supporters of the Revolution. Several members of the National Convention — Barère, for instance — by way of jest, gave this name to their communications to the assembly.

**CARMAN, Albert**, Canadian Methodist bishop and college president: b. Iroquois, Ontario, 1833. A pupil of Dundas Grammar School and of Victoria University, Cobourg, he was graduated in 1855. He received the appointment of professor of mathematics in Albert College, Belleville, in 1857, the following year being selected principal. Ten years later in 1868 he was appointed first chancellor of Albert University, to which standard, with a charter in all the faculties, he had raised Albert College by his persistent and successful work. From 1876 to 1883 he was bishop of the Methodist Episcopal Church, having been ordained minister in 1859. When the various Methodist bodies united in 1883, Carman became general superintendent for over 30 years. He was also a senator of Toronto and Victoria universities, a governor of Wesleyan Theological College, Montreal, and was one of the

founders of Alma Ladies' College, Saint Thomas. He made a missionary tour of the world in 1906. He was long known as a prominent force among the ranks of prohibitionists.

**CARMAN, Bliss**, Canadian poet and journalist: b. Fredericton, N. B., 15 April 1861. He was educated at the universities of New Brunswick, Edinburgh and Harvard. In 1890 he became office editor of the New York *Independent*, where he remained about two years; since then he has had editorial positions on *The Literary World*, *The Cosmopolitan* and several other magazines. In 1894 he was associated with the late Herbert S. Stone in founding the *Chap-Book*, the first of the little pocket magazines. He received the degree of LL.D. from the University of New Brunswick in 1906. His verse has been widely read and his successive volumes include 'Low Tide on Grand Prè' (1893); 'A Sea Mark' (1895); 'Behind the Arras' (1895); 'Ballads of Lost Haven' (1897); 'By the Aurelian Wall' (1897); 'Songs from Vagabondia,' joint author with R. Hovey (1894); 'More Songs from Vagabondia' (with Hovey) (1896); 'Last Songs from Vagabondia' (1900); 'A Winter Holiday'; 'St. Kevin,' a ballad (1894); 'St. Michaelmas' (1895); 'The Girl in the Poster' (1897); 'The Green Book of the Bards' (1898); 'The Vengeance of Noel Brassard' (1899); 'Ode on the Coronation of King Edward' (1902); 'From the Book of Myths' (1902); 'Pipes of Pan,' No. 1 (1902); 'Pipes of Pan,' No. 2 (1903); 'Pipes of Pan,' Nos. 3, 4, 5 (1904-05); 'Poems' (collected ed., 2 vols., 1905); 'Kinship of Nature' (1903); 'Friendship of Art' (1904); 'From the Book of Valentines' (1905); 'The Making of Personality' (1907) 'The Gate of Peace' (1907); 'The Rough Rider' (1909); 'A Painter's Holiday' (1911); 'Echoes from Vagabondia' (1912); 'Daughters of Dawn,' with Mary Perry King (1913); 'Earth Deities,' with M. P. King (1914).

**CARMARTHEN, or CAERMARTHEN** (Welsh, *Caer Fyrddyn*), South Wales, a seaport town, capital of Carmarthenshire, nine miles from Carmarthen Bay, Bristol Channel, and 14 miles northwest of Llanelly, on the right bank of the Towy. The principal buildings are the county hall, Saint Peter's Church, with some interesting monuments—one an altar tomb of the 16th century—and Saint David's Church. There are excellent schools, two infirmaries and a literary and scientific institution. There are some tin and lead ore works, cloth manufactories, slate quarries and iron foundries, and the salmon fishery is extensive. Carmarthen was the *Maridunum* of the Romans, and under the native Welsh Princes the capital of South Wales. Pop. 10,221.

**CARMARTHENSHIRE, or CAERMARTHENSHIRE**, South Wales, a maritime county and the largest of all the Welsh counties; extreme length, 45½ miles; breadth, 26 miles; area, 588,472 acres. It is mountainous generally, but not so rugged as some other Welsh counties. Some of the vales are beautiful, particularly that of Towy, which is 30 miles in length. This river and the Tave are the only navigable streams in the county. The valleys are fertile, and numerous herds of small black cattle are raised on the hills. The mineral products are copper, silver, iron, lead, coal,

marble and building stone. There are considerable fisheries. The Rebecca Riots (1843-44), in opposition to turnpike gates, originated in the county. Carmarthenshire returns two members to Parliament. Pop. 160,406.

**CARMAUX**, kâr-mô, France, a city in the department of Tarn, nine miles northeast of Albi by rail. It is one of the great coal-mining centres of France, the annual output sometimes reaching as high as 600,000 tons. Serious strikes and riots took place here in 1892. There are also glass manufactures. Pop. (1906) 8,618.

**CARMEL.** (1) A mountain ridge in Palestine, constituting part of Lebanon, on the southern frontier of Galilee, in the pashalic of Acca. It consists of several rich woody heights, separated by fertile and habitable valleys within a circuit of about 28 miles, and terminates at the mouth of the Kishon in a lovely plain, which forms the southern coast of the Gulf of Ptolemais or Acca, on the Mediterranean. Upon different parts of this mountain there are ruins of churches and monasteries from the time of the Christian kingdom of Jerusalem, and the cave which, according to tradition, was inhabited by the prophet Elijah. (2) A city of Judah, about eight miles southwest of Hebron. Eusebius mentions it and calls it a very great town. The modern city is Khirbet Kurmul.

**CARMELITES**, one of the four mendicant orders of the Roman Catholic Church; its full title is Friars of Our Lady of Mount Carmel. The order has, traditionally, a very ancient origin, but as a religious order approved by the Roman Catholic Church is contemporary with the Dominican and Franciscan orders. According to the legends the Carmelites trace the origin of their order back to the early days of the kingdom of Israel, the time of the prophets Elijah (Elias) and Elisha (Elisæus). Elias, in his early manhood, says the legend, retired for religious contemplation to Mount Carmel, and there, taught by an angel, gathered to himself a number of men of like disposition, and instituted a society of contemplatives for worship of the true God and the attainment of spiritual perfection. Among the disciples attracted to the school of religion were the youths who afterward were the minor prophets Jonah, Micah and Obadiah; and at a later period the renowned philosopher of Magna Græcia, Pythagoras, was numbered among the inquirers after the true religion and the science of divine things in this great school of the prophets: Pythagoras' instructor was the prophet Daniel. Elijah's wife instituted an order of female recluses. As pointing to the existence on Mount Carmel of some such institution as the legend postulates, reference is made to 1 Kings xviii, 19 and following; 2 Kings ii, 25; and 2 Kings iv, 25.

The world outside the precincts of those religious communities appears to have been entirely ignorant of this ancient institution till early in the 13th century, when Phocas, a Greek monk of Patmos, brought to the Latin Patriarch of Constantinople intelligence of the existence in olden time of a great monastic or eremitic establishment on Mount Carmel, of which traces still remained. The learned editors of the *Acta Sanctorum* were able to demonstrate that the present order owes its origin to the Crusader Berthold who, having become

a monk in Calabria, took up his abode on Mount Carmel in 1156, with 10 companions. For these Phocas petitioned the patriarch to formulate or to approve a rule of monastic or eremitical life. This was done, and afterward the rule was approved by Pope Honorius III in 1224. The connection of this order with the ancient school of the prophets, even if the traditional story be accepted, seems to lack proof. All that we are told which could give color to the claim that the new eremites are in the line of succession from the eminent school of prophets is, that in a vision Elias gave orders to the monk from Calabria to found a religious establishment on the ancient site. The community was expelled by the Saracens from its seat on Mount Carmel and took refuge in the West. One of the earliest houses of the Carmelite order in the West was founded at Alnwick in England; and about the same time, near the middle of the 13th century, Saint Louis the King, founded at Paris the first Carmelite house in France—the *Carmes*, of terrible celebrity in the great Revolution. Pope Innocent IV modified the rule of the order and assimilated it to the Dominican and Franciscan rule. One of the traditions represents Jesus and his mother as initiates of the ancient order; and Saint Simon Stock, sixth general of the order, an Englishman, received from the hands of the Virgin the scapulary of Mount Carmel with the assurance that whoso should die wearing that scapulary would surely not be damned. A relaxation of the primitive severity of the rule was permitted by Eugenius IV in 1431, and this led to a scission of the order into two sub-orders, the Conventuals or Calced (wearing shoes) and the Observants or Discalced (shoeless or barefooted). Pope Benedict XIII in 1725 permitted the order to add to the statues in Saint Peter's Church of founders of religious orders one to their founder, which was erected with the inscription: "Universus Ordo Carmelitarum Fundatori suo Sancto Eliæ prophetæ erexit" ("The whole order of the Carmelites erected this statue to their founder, Saint Elias the prophet"). The order of Carmelite nuns dates from the middle of the 15th century. In 1562 the great mystic Saint Teresa, who was a Carmelite nun, in virtue of a papal brief established a separate branch of the sisterhood, under a very severe rule: these are the Barefoot Carmelite Nuns. She then undertook to restore in the original order of Carmelite Friars the ancient severity of discipline, and succeeded; the result is the order or suborder of the Barefoot or Discalced Carmelites. The Carmelite order, in its several forms, has establishments all over the world. The headquarters of the order in America are at Niagara Falls.

**CARMEN.** Mérimée's short novel, 'Carmen,' is probably less known than the opera to which it gave its name. This story, like many of Mérimée's literary productions, appears merely as an incident in the course of more serious work. Indeed, it begins with an archaeological discussion and ends with a dissertation on gypsy dialects and manners. The intervening 90 pages contain however a vivid picture of gypsy life in Spain in its strangest and most picturesque features. Mérimée's travels in Spain, his acquaintance with the history of the country, its literature, its language and dialects,

including the difficult Basque and that of the Romani or gypsies, furnished him abundant material for his story. This material he handles in his impersonal manner, with a logical development, a precision and a finish of style which make of his works little gems of literary achievement. In spite of his detached attitude toward his characters, he endows them with an impressive or rather oppressive realism. Few characters in French literature are more skilfully drawn or more strongly alive than those found in Mérimée's stories. In 'Carmen,' the heroine is a romantic conception of the classic *Gitanilla* of Cervantes. She combines the virtues and vices of her race carried to extremes. In her many-sided rôles, either as cigarette-maker, a fortune teller, a secret agent of highwaymen and smugglers, or as the fun-loving dancer and the devoted nurse of her wounded companions, she is intensely passionate or revengeful, greedy or extravagant, selfishly sensuous or ideally self-sacrificing, but always exercises a strong fascination upon all of those who willingly or unwillingly come under her fateful influence. This fascination has transformed the hero, Don José, from an honest sergeant in the army into a smuggler, a bandit and a murderer, when, driven by jealousy, he stabs Carmen herself after he had gained undisputed possession of her by killing her gypsy husband in a trumped-up duel.

Although such adventures and strange pictures may startle and puzzle the reader, they nevertheless leave a strong impression because in spite of an exaggerated individualism, they show a solid humanistic foundation, and on the part of the author an accurate sense of observation even if tinged with a certain dilettantism and indifference bordering on cynicism. Dramatized by Meilhac and Halévy, 'Carmen' was set to music by Bizet and played for the first time in Paris on 3 March 1875; since then it has been one of the most popular operas of the French school. Consult Ives, George Burnham (translator), 'Carmen and other stories' (New York 1903).

L. A. LOISEAUX.

**CARMEN**, an opera comique in four acts by Georges Bizet (libretto by Meilhac and Halévy, founded on a tale by Prosper Mérimée) first produced at Paris on 3 March 1875. Not only Bizet's masterpiece, but the greatest opera that has come out of France, 'Carmen' was not at first a success, and the coolness of its reception is generally believed to have hastened the composer's death, which occurred three months later. The story of the beautiful Spanish gypsy, flirtatious and fickle, cruelly oblivious to the ruin she spreads, until her career is tragically ended by Don José, one of her lovers, is familiar to every opera-goer. There is no more popular song in the modern repertory than that of the Toreador with its graphic portrayal of the character of Escamillo, the bull-fighter. In the Habanera, sung by Carmen in the first act, use is made of an old Spanish song; but except in that instance, the music is all Bizet's and not the least noteworthy fact is its convincing Spanish color, as realistic and as warm as a Sorolla painting. The rhythmic lilt of the Seguidilla, with which Carmen subjugates Don José, and of her dance with castanets in the second act, is not easily

forgotten. Indeed, the whole score is a mine of rhythm of inexhaustible variety. The romantic charm of Michaela's aria in the third act is so compelling as easily to overcome the natural reluctance of the most celebrated prima donna to taking second place. While the Wagnerian influence is in a general sense present in the orchestral portion of Carmen, harmonically and rhythmically it is Bizet alone; and his originality and dramatic power as displayed in this work (think of the eloquent Fate *motif*) suggest that he might have risen to the greatest heights had he lived beyond the short 37 years of life permitted to him. It was Nietzsche who said: "Bizet was the last genius to discover a new beauty.—Bizet discovered new lands—the Southern lands of music." Carmen has always enlisted the powers of great dramatic singers. The original was Mme. Galli-Marie. Minnie Hauck introduced the rôle in London and New York. But the greatest of all Carmens was Emma Calvé, who made her American début in 1893. Her sensational performance was long before the public in this country and will not soon be forgotten.

LEWIS M. ISAACS.

**CARMEN SECULARE.** See HORACE.

**CARMEN SYLVA,** pen name of ELIZABETH, Queen of Rumania (q.v.).

**CARMI,** Ill., city and county-seat of White County, 150 miles southeast of Springfield, on the Louisville and Nashville Railroad and the Little Wabash River. It is the centre of an agricultural region and exports fruit, grain, flour, tile and lumber. It has flouring and saw mills, brick works, machine shops, a stove and heading factory, an ice factory, etc. Pop. (4910) 2,833.

**CARMINATIVES,** remedies that cause a warm, pleasant sensation in the stomach and act as stimulants to the muscles, causing peristalsis, thus relieving flatus; and that increase the flow of the gastric and intestinal secretions. Most of the drugs containing volatile oils are carminatives; as, the mint family, parsley, anise, fennel, caraway, cardamon, ginger, cinnamon, cloves, etc. See VOLATILE OILS.

**CARMINE,** the most splendid of all the red colors, is made from cochineal insect, or *Coccus cacti*. It was first discovered by a Franciscan monk at Pisa, while compounding some medicine containing cochineal, and in 1656 it began to be manufactured. The finest is that which is thrown down from an aqueous infusion by chloride of tin. This, after depositing, is collected and dried. The operations require the greatest care, for the brilliancy of the color is affected by the weather, light and temperature. The color produced by alum has a darker tint, and constitutes lake. Carmine, or carminic acid, is also the name given by chemists to the coloring matter of cochineal. The acid is a purplish body, extremely soluble in water and in alcohol. It forms salts with the heavy metals, and it yields various products when acted on by chlorine, nitric acid and other reagents. Carmine is used to some extent in dyeing, in water-color painting, to color artificial flowers, confectionery, etc.

**CARMONA** (ancient CARMO), a town in Spain, 20 miles from Seville, on a height overlooking a large plain covered with olive-trees.

It is well built, containing many handsome mansions belonging to the nobility, who though usually resident in Seville spend part of the year there. The principal square is well planted, and, among other edifices, possesses a handsome Gothic church with lofty spire. Another conspicuous object is a Moorish castle, flanked with massive towers, and there are two old Roman gates. The manufactures are chiefly woolen hats, leather and earthenware. Recent important excavations on the site of the ancient necropolis, to the west of the modern town, have brought to light a large number of tombs and funeral triclinia in almost perfect preservation. Considerable portions of the Moorish wall and Alcazar still remain. The city retained its prominence throughout the Middle Ages. It fell into the power of the Moors, but was recaptured by Saint Ferdinand of Castile in 1247. Consult M. Sales y Ferré, 'Estudios arqueológicos é históricos' (Madrid 1887). Pop. 18,855.

**CARMONTEL,** kâr-môn-têl, or **CAR-MONTELLE,** Louis Carrogis, French poet: b. Paris, 15 Aug. 1717; d. there, 26 Dec. 1806. He is best known by his 'Proverbes dramatiques' (10 vols., Paris 1768-81, new ed., 4 vols., Paris 1822). These are without much connection in themselves, being, in fact, only a series of dramatic scenes, but are well adapted for private theatres. The fertility of Carmontel was as extraordinary as his ease in writing. His 'Théâtre de campagne,' a collection of more than 25 comedies, was published in 1775 (4 vols.). He painted portraits, mostly profiles, of some of the most eminent persons of the 18th century. 'Proverbes et comédies posthumes de Carmontelle' was published, with a memoir by Mme. de Genlis (3 vols., Paris 1825).

**CARNAC,** kâr-nak, France, a Breton village in the department of Morbihan, on a height near the coast 18 miles southeast of Lorient, and remarkable for the so-called Druidical monuments in its vicinity. These consist of more than 1,100 rude blocks of gray granite, some of which are upward of 18 feet high, standing on end in the midst of a wide heath. They are in the form of unpolished obelisks, with the vertex reversed, and are arranged in 11 lines, forming 10 avenues, with a curved row at one end. There are many gaps in the lines; almost every house and wall in the vicinity is seemingly built from this artificial quarry. They are evidently of very ancient date, but their origin is unknown. At a distance of a mile and a half from Carnac there is a wonderful group of mounds called the Bossenno, and the remains of a Gallo-Roman town were uncovered in 1874. Pop. 3,250. Consult Lukis, 'Chambered Barrows and Other Historic Monuments in Morbihan' (1875); Miln, 'Excavations at Carnac' (1877-81); Worsfold, 'The French Stonehenge' (*British Archaeological Association Journal*. 1898).

**CARNALL,** Rudolph von, German mining engineer: b. Glatz 1804; d. 1874. He began the study of mining in Berlin in 1823, was connected with the mining industry in Upper Silesia and rose to be superintendent of mines and director of the general mining office in Breslau. He took part in founding the German Geological Society, lectured at the University

of Berlin on the science of mining engineering, and rendered important service to the development of German mining. He was councillor in the mines and mining section of the Prussian Ministry of Commerce from 1855 to 1861. The *Zeitschrift für das Berg-, Hütten- und Salinenwesen im preussischen Staate* was founded by him.

**CARNALLITE**, a hydrous double chloride of potash and magnesium, one of the principal potash-yielding minerals of the great German potash deposits at Stassfurt, Germany. In composition it consists of potassium chloride, 26.8 per cent, and magnesium chloride, 34.2 per cent. Its equivalent in potash is 14.1 per cent.

**CARNARVON**, kār-nār'vōn, **Henry Howard Molyneux** (4th EARL OF), English statesman: b. London, 24 June 1831; d. 28 June 1890. He received his education at Eton and Christ Church, Oxford, taking his degree in 1852. After this he spent several years in travel in the Orient. He succeeded his father in the earldom in 1849, and was secretary of state for the colonies, June 1866 to March 1867. He was chosen high steward of Oxford University and created D.C.L. (1859). During his secretaryship he devised a scheme for the federation of the British North American Colonies, subsequently approved by Parliament. He was again colonial secretary, 1874-78, and lord-lieutenant of Ireland, 1885-86. He published 'The Druses of Mount Lebanon' (1860); an address on Berkshire Archæology (1860); edited 'Reminiscences of Athens and the Morea by the late Earl of Carnarvon,' his father, and published translations of the 'Agamemnon' (1879), the 'Odyssey' (1886), and 'Prometheus Vincit' (1893).

**CARNARVON**, or **CAERNARVON**, Wales, a seaport town and parliamentary borough, on the southeast side of the Menai Strait, and capital of the county, 209 miles northwest of London. The ancient walls thrown around it by Edward I, and flanked by round towers, are still fairly entire. The magnificent castle or palace of Edward I, and in which Edward II was born, stands at the west end of the town, almost overhanging the sea, and is externally entire. Including its courtyards, etc., it covers about two acres of ground. There are extensive ironworks in the town, which supply machinery for steamers, etc. The chief exports are copper ore, coal and slates, of which the town is a centre of distribution for the neighborhood. It is much frequented by summer tourists. Consult Hartshorne, 'Carnarvon Castle' (in the *Archæological Journal*, Vol. VII, London 1850).

**CARNARVONSHIRE**, or **CAERNARVONSHIRE**, a maritime county of North Wales, having Carnarvon Bay on the west; Denbigh on the east; the island of Anglesea and the Irish Sea on the north and Cardigan Bay on the south. Its extreme length, southwest to northeast, is about 52 miles; extreme breadth, 20 miles, although the greater portion of it does not exceed seven or eight miles on an average; area, 365,986 acres. This county is traversed throughout its whole length by lofty mountains, including the Snowdon range, whose highest peak is 3,557 feet above the sea. There are other summits varying from 1,500

feet to more than 3,000 feet. Dairy farming, and cattle, horse and sheep breeding are the principal occupations of the farmer. The cattle and sheep are of a small breed. Lead, zinc and copper ores are found in the mountains in the south, and granite is worked; but slate is the principal mineral product of which there are extensive quarries at Bethesda. The county returns two members to Parliament. Pop. 125,043.

**CARNATIC**, kār-nāt'ic, former province of British India, on the east coast of the peninsula. Its limits were ill defined, but it is commonly thought to have extended from Cape Comorin to lat. 16° N., and from the coast line to an average of about 80 miles inland. It was formerly included in the dominions of the Nabob of Arcot, and the contentions arising from a disputed succession first brought the French and English into collision, and ended by the subjugation of the Carnatic under the British influence, which was completely effected in 1801. The Carnatic as one of the wealthy provinces has been the cause of endless native warfare and bloodshed, by which, whoever was victor, the unhappy cultivator suffered in the end; as each successive ruler, feeling his tenure uncertain, cared only to make revenue while the power lasted, an example which was but too closely imitated by his unscrupulous ministers and officials. The Carnatic is now included within the administration of the presidency of Madras.

**CARNATION**, a half-hardy perennial herb (*Dianthus caryophyllus*) of the family *Silenaceæ*, a native of southern Europe. It has more or less erect stems with enlarged joints, linear opposite leaves covered with a bloom, and solitary, variously colored, terminal, perfumed flowers, which naturally appear during summer, but which are produced artificially in certain varieties throughout the year. The plant has been in cultivation for its flowers for more than 2,000 years, but not until the early years of the 16th century did its flowers become greatly differentiated from their original flesh tint, which suggested the popular name (Latin *carnatio*). So numerous became the varieties that systems of classification were adopted. The popular European system of today is: (1) "Selfs," flowers of one color; (2) "flakes," flowers with yellow or white ground and striped with either rose, scarlet or purple; (3) "bizarres," resembling flakes except that they are striped with more than one color; (4) "picotees," with white or yellow petals margined with red, etc. The summer-blooming carnations which suggested this classification are little grown in America, but are very popular in Europe. They seem to demand a moist, cool climate. The group most cultivated in America, known as perpetual-flowering tree, or monthly carnations, originated in France about 1840 as the result of crossing and selection. The first of these varieties imported into America is said to have arrived in 1856, since when the growing of carnations under glass as a crop has developed. The extent of the industry is very great and is steadily growing. According to the census report of 1900 the value of the carnation crop in 1899 was about \$4,000,000, produced in about 9,000 American commercial greenhouses.

Propagation of the monthly carnations is usually effected by means of cuttings of young stems. When well rooted they are potted in good soil and kept until late spring, when they are transplanted to the open ground or to the benches where they are to blossom. A winter temperature ranging between 50° and 55° at night and preferably only 10° higher during the day is desirable. At the end of the winter they are thrown away.

The most common insect pests of the carnation are the red spider and the green aphid. The red spider thrives best in dry atmosphere, and is most easily controlled by syringing with water and evaporating (not burning) sulphur in the greenhouse once a week for about five weeks, when the insects become troublesome. The green fly or green aphid seems to thrive under any ordinary conditions. It is usually fought with tobacco fumes of various extracts of tobacco. Three fungous diseases are often troublesome, rust (*Uromyces caryophyllinus*), spot, or blight (*Septoria dianthi*), and anthracnose (*Volvetella Sp.*). These are largely prevented by judicious management, and when they occur may be controlled by destroying diseased plants and by spraying with Bordeaux mixture (See FUNGICIDE). Rust appears on the stems and leaves as blisters which break and expose brown spores. Spot consists of brown dots with black centres where the spores are borne. Anthracnose is characterized by grayish-brown spots. (Bailey, 'Cyclopedia of American Horticulture,' New York 1914). Thirty-seven acres of land are devoted to the raising of carnations at a nursery in Los Angeles, Cal. Nine greenhouses, each 200 feet long and 15 feet wide, together holding 35 tons of glass, are used to raise the young plants.

**CARNATION** (Latin, *caro, carnis*, "flesh"), in painting, the representation of the color of flesh. It is also used in the fine arts to signify the nude or undraped parts of a figure. The use of carnation requires very attentive study and great skill in the artist. It varies with the sex of the individual, with the classes and countries to which the subjects belong, with the passions, the state of the health, etc. The cheeks are, in a healthy subject, of a lively red; the breast, neck and upper part of the arms of a soft white; the belly yellowish. At the extremities the color becomes colder, and at the points assumes a violet tint, on account of the transparency of the skin. All these shades require to be softly blended. Two faults in carnation are chiefly to be avoided,—hardness, the fault of the masters of the 15th century, and too great weakness. Guido Reni not infrequently painted his flesh so that it appeared almost bloodless. The French school has gone farthest in this respect. The flesh of the followers of this school often looks like porcelain or wax. Titian and Rubens are unrivaled in carnation.

**CARNAUBA**, kār-nā-oo'ba, the Brazilian name of the palm, *Copernicia cerifera*, which has its leaves coated with waxy scales (whence the name wax-palm), yielding a useful wax by boiling. It withstands drought excellently. A slight saline composition in the soil produces the best trees. The fruit and pith are

eaten, the leaves, are variously employed and the wood is used in building.

**CARNEADES**, Greek philosopher: b. Cyrene, Africa, about 214 B.C.; d. 129 B.C. The date of his birth is uncertain. Cicero states he was 90 years old at the time of his death, which would place his date of birth in 219 B.C. He studied first under Diogenes the Stoic, but subsequently attended the lectures of Egesinus, who explained the doctrines of Arcesilaus; and succeeding his master in the chair of the Academy, he restored its reputation by softening the prevailing pyrrhonism and admitting practical probabilities. The doctrine of Carneades specifically was, that "as the senses, the understanding, and the imagination frequently deceive us, they cannot be the infallible judges of truth, but that from the impression made by the senses we infer appearances of truth, which, with respect to the conduct of life, are a sufficient guide." He was a strenuous opposer of Chrysippus, and attacked with great vigor the system of theology of the Stoics. He was an advocate of free-will against the fate of the same sect, and urged just the same difficulties in reconciling divine prescience with the freedom of human actions as have divided some contending sects of Christianity. One of the most distinguished events of his life was his being joined in an embassy to Rome with Diogenes the Stoic and Critolaus the Peripatetic, in order to gain the mitigation of a fine levied by the Roman Senate on the Athenians. This extraordinary embassy was successful, and Carneades so captivated the people by his eloquence, one day delivering a harangue in praise of justice, and on the next proving it to be an odious institution, that Cato the censor, fearful of its effect on the Roman youth, persuaded the Senate to send the philosophers back to their schools without delay. In his latter years Carneades became totally blind and continually complained of the shortness of life, lamenting that the same nature which composed the human frame could dissolve it. Consult Hicks, 'Stoic and Epicurean' (New York 1910).

**CARNEGIE**, Andrew, American iron-master, manufacturer and philanthropist: b. Dunfermline, Scotland, 25 Nov. 1835. None even of the mighty makers of their own fortunes began closer to absolute zero; certainly none who have owed success not to fortunate speculations, but to steady labor, sagacity and self-culture, the natural working of the highest powers on opportunities open to all and less to him than to most. His father owned a small hand-loom business, which was closed in 1848 by the competition of steam. He then emigrated to the United States and settled in Allegheny City, Pa. The 10-year-old child here became a bobbin-boy at 20 cents a day; his alertness in a few months brought him transference to an engine-room, his penmanship and arithmetic a chance to do clerical work. Next a telegraph messenger boy at Pittsburgh (with a mother and younger brother to support from his slender wages), he promptly mastered telegraphy, was soon given a place as operator, and won himself extra earnings and experience in composition as a newspaper telegraph reporter. Superior fitness brought him the post of telegraphic train dispatcher to the Pennsyl-

**CARNATION**

vania Railroad; then of secretary to its general superintendent, Colonel Scott; and in 1860, when his chief became vice-president, Mr. Carnegie was made superintendent of the Western Division. Meantime his business fortune had opened with the tentative adoption by the road, through his agency, of the Woodruff sleeping-car system, in which he shrewdly embarked some borrowed money; his expert knowledge made it investment, not speculation; and his dividends went partially into oil lands around Oil City, selected with equal judgment. At the outbreak of the war, Colonel Scott was made Assistant Secretary of War, and gave Mr. Carnegie charge of the eastern military railroads and telegraph lines, and of this department there was no complaint or scandal, and no breakdown except of Mr. Carnegie's health from overwork. He was also the third man wounded on the Union side, while removing obstructions from the Washington tracks.

Already a small capitalist, in 1862 the Pennsylvania road's experiments in replacing wooden with iron bridges led him to forecast the future monopoly of the latter, and organize the Keystone Bridge Works, which built the first iron bridge across the Ohio. To increase their profit by furnishing their own iron, he entered the field which has made him one of the industrial sovereigns of all time. The first step was the erection of the Union Iron Mills, furnaces and rolling mills; the last, after inspection of the Bessemer process in England, to establish it in this country in 1868. The story since is one of swift aggregation of plant to plant, till they have dominated their class, and become one of the chief industrial factors of the entire business world in this its greatest age. By 1888 he had acquired a controlling interest in his foremost rival, the Homestead Steel Works, and in seven other immense establishments centred around Pittsburgh; in 1899 he consolidated all these into one giant structure, the Carnegie Steel Company; and in 1901 he retired from business life, transferring his company at a valuation of \$500,000,000 to be merged into one still vaster, the United States Steel Corporation, formed by J. Pierpont Morgan. His United States residence is in New York; his summer establishment at Skibo Castle, in the extreme north of Scotland.

Such supreme success, fairly won in a struggle with the world, is of course the result of a supreme individual genius not to be taught or explained, but as the amount of work any one man can do unassisted is a trifle, the chief instrumentality is always the faculty of organization. Mr. Carnegie himself once said that the organization *was* the business; that if stripped at a blow of all his material property and business connections, but left his organization, in four years he would have re-established himself. But the organization is simply the men who work it, with their capacity of selecting capable subordinates, and understanding public needs and the means of supplying them; and this leaves the faculty of creating and sustaining it no nearer solution than before. In the last analysis it means a nicely accurate judgment of *men*, resulting from an intuitive gift informed and tested by long experience; and as men are not pawns, it implies the power of persuading them into and keeping them in alliance as well.

Always a generous and helpful man, he had definitely begun, a few years before his retirement, a new existence consecrated to public service, and to which he will owe enduring remembrance. Another generation would have forgotten the mere business man, however great; for after all it would have had steel from some source, if perhaps less cheaply; but it could not have had from lesser men, and would not have had from any, the splendid, judicious and permanently useful gifts with which he has endowed it, and which no change of social ideals can render obsolete or harmful. No one has ever so royally returned to the public what he had (to its own benefit) drawn from the public. This is his own expressed conviction of duty; that "surplus wealth is a sacred trust to be administered for the highest good of the people," and that sometime "the man who dies possessed of millions free and ready to be distributed, will die disgraced." But he is equally emphatic in declaring that indiscriminate giving is mostly sheer mischief, and that no person and no community can be permanently helped except by their own co-operation. Therefore, every gift of his to a community is conditioned on the latter supporting it; and all those to institutions are thought out, and so bestowed that they forward the work without impairing the springs of public interest, or the ties to the public, which must after all be their permanent stay. These gifts are mostly not to charities in the current sense, relief of material distresses, for which the spirit of human brotherhood should be adequate; but for that mental and spiritual cultivation which should raise communities out of the lowest plane of social evils. An apparent exception, which, however, is not charity but justice and business sense, is the endowment of \$4,000,000 given for an annuity fund to the workers at Homestead. The remainder of his benefactions may be divided broadly into institutions for research and the discovery of fertile new ideas; those for teaching the best of ideas and their practical appliances already known; and those for storing the results of knowledge and creation and distributing them to the public—in a word, universities, colleges and technical schools and libraries. Even the organs he has presented to several hundred churches may be classed in this category; as he genially observed, he is willing to endorse unreservedly all the utterances of the organs, but not of the preachers. The greatest single foundation will be the Carnegie institute at Pittsburgh an enormous technological school, with library, art gallery and every imaginable accessory,—the people's college of what he thinks the coming type,—which has received \$25,000,000 in all.

Next is the Carnegie Institution (q.v.) at Washington, to promote original research and enable original workers to use their whole time for study, experiment and creation; perhaps his most valuable benefaction ultimately, since new ideas are at once the scarcest and the most valuable items of the world's income, and the work of one great man outweighs that of 10 generations of small ones. Of the others, perhaps the most useful, considering the work, and the chief, is the gift of \$600,000 to the Tuskegee Normal and Industrial Institute in Alabama, conditioned on the trustees using enough of its income annually to free its president

from money cares and the need of "drumming" support for his college. Sixty-five libraries in New York have received \$5,200,000, one in Saint Louis \$1,000,000, and two in Detroit and San Francisco \$750,000 each; libraries at Homestead, Braddock and Duquesne \$1,000,000; and the universities in Scotland \$10,000,000. In 1905 he established the Carnegie Foundation of \$10,000,000, the income from which provides retiring pensions for teachers in colleges, universities and technical schools; and in December 1910 a Peace Fund of \$10,000,000; \$5,000,000 to the Carnegie Hero Fund Commission, Pittsburgh; \$1,500,000 to the Carnegie Hero Fund Trust, Dunfermline, Scotland; and the following amounts to various Hero Funds: France \$1,000,000; Germany \$1,500,000; Belgium \$230,000; Denmark \$125,000; Holland \$200,000; Sweden \$230,000; Switzerland \$130,000; Italy \$750,000; Norway \$125,000.

He has also given \$3,500,000 to the Carnegie Dunfermline Trust; \$1,500,000 for the Peace Temple at The Hague; \$1,500,000 to the Allied Engineers' Society; and his total benefactions exceed \$300,000,000, including over \$60,000,000 for over 3,000 municipal library buildings; also the building and grounds for the Pan-American Union, Washington, 1906; \$16,150,000 for Foundation for the Advancement of Teaching in United States, Canada and Newfoundland.

He is a life trustee of the Carnegie Corporation of New York (\$125,000,000) which was founded to carry on the various works in which he has been engaged and to which he announced in 1912 that he had given all his fortune except \$25,000,000. He was lord rector of Saint Andrew's University in 1901-02 and 1906, and of Aberdeen University in 1912.

Mr. Carnegie has also won fame as an author. His first works, 'Notes of a Trip Around the World' (1879) and 'Our Coaching Trip' (1882) were printed first for private circulation, but published in consequence of the great pressure for private copies. 'An American Four-in-Hand in Britain' (1883) and 'Round the World' (1884) followed; but his greatest success was attained with 'Triumphant Democracy' (1886), which sold 40,000 copies within two years. 'The Gospel of Wealth' (1900); 'The Empire of Business' (1902, since translated into eight languages); 'James Watt' (1906); and 'Problems of To-day' (1909) have maintained his reputation as a clear, forcible and interesting writer and thinker. Consult Alderson, 'Andrew Carnegie: the Man and His Work.'

**CARNEGIE**, Pa., borough in Allegheny County, five miles southwest of Pittsburgh, on the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Pittsburgh, Chartiers and Youghiogheny and the Wabash Pittsburgh railroads. It has a Carnegie library, an Elks' Home, a high school and a fine orphan asylum. It is the centre of a coal-mining region and has extensive steel works. There are also lead works and manufactures of granite ware and stoves. In 1914 there were 432 persons engaged in manufactures in 19 establishments, the salaries and wages amounted to \$328,000, the capital invested amounted to \$2,202,000, the value of the materials used was \$902,000, and the value of the products amounted to \$1,724,000. The borough was formed in 1894 by the consolida-

tion of Chartiers and Mansfield. It is governed by a burgess, who is chosen for a term of three years, and a council. Pop. (1910) 10,009; (1914) 11,000.

**CARNEGIE DESERT LABORATORY**, one of the most important of all the many research departments allied with the Carnegie Institution at Washington, situated near Tucson, Ariz. In connection with the department of botanical research, this laboratory was established in 1903 and almost at once took its place among the great institutions of the world. It concerns itself chiefly with the plant life of the desert, seeing how the impoverished plants which grow there can be made to thrive and improve and become of benefit to mankind, and is a movement of great agricultural import.

The equipment of the Carnegie Desert Laboratory is in proportion to the elaborate work undertaken there. The area of ground embraced for experimental work comprises 860 acres, situated just west of Tucson. Within this tract Tunamoc Hill rises to a height of 800 feet above the lower mesas. These topographical features present a wide range of varied conditions for plant growth. The laboratory proper is located half-way up the hill, and the entire grounds are fenced in. The laboratory forms three sides of a quadrangle 126 feet long with a short axis of 85 feet. Besides this is a small glass house for experimental purposes along special lines, and also a workroom.

The laboratory is conducting interesting work on Alpine and Austral plantations, located on the mountains, for the furtherance of which work it is provided with a complete pack equipment, including two pairs of heavy rawhide kyacks suitable for transporting instruments without damage. Although the greater part of the departmental work is carried on here, it is essential to a comprehensive study of desert plant life to explore distant as well as adjacent arid regions and much important work has also been carried on in the Salton Basin, where it has been established that the highly specialized flora is of comparatively recent origin. This basin and its accompanying vegetation have suggested experiments relative to the influence of altitude and climatic factors upon vegetation. To carry on these, plantations have been established on the Santa Catalina Mountain at various altitudes, ranging from 2,300 feet to 8,000 feet in height. Thermometric observations are made at each of these plantations. Culture has also been carried on at the tropical station at Cinchona, island of Jamaica, for comparisons. In order to obtain more complete comparisons the establishment of a station is now being contemplated in the San Francisco Mountain in northern Arizona, having an elevation of about 12,000 feet. Notable experiments have also been made in demonstrating the movements of vegetation over desert areas, and the distribution of native and alien plants. This study has been greatly facilitated by a topographical survey and a geological survey, both of which were conducted under the direction of the University of Arizona. Twelve well-defined plants were considered by the staff in this field of science, and various stations established, to demonstrate correlate plant be-

**ANDREW CARNEGIE**

havior with known factors of environment, with special attention to water supply, conditions of soil, exposure and drainage.

Other notable work of the laboratory has been the measurements of bodies of certain succulents in which the storing of water has been developed; experiments in the physiology of stomata, covering research in relation to the colors in flowers. In this, convincing data have been collected through the agency of the dark room, starvation and feeding. Similar investigation has been made in regard to the topography of chlorophyll masses, one of the distinct characteristics here noted being the depth to which the chlorophyll has been deposited in some desert plants, primarily, it is believed, because of the highly intensified light of the desert regions. Experiments have also been carried on in regard to the habits of roots in the desert regions, with comparative results obtained in the New York Botanical Gardens and data from the Jamaica institution. A great deal of highly interesting work has also been done in studying the water storage capacity of certain desert plants. Many specimens which grow in the desert have developed this capacity to a remarkable extent in order to tide them over through the long droughts which often occur there. The work of the Carnegie Desert Laboratory is thorough and exhaustive. It is not spectacular, since years are often required before even a single fact can be absolutely assured, but the work is cumulative in its nature, and in the future its importance will be adequately realized by the nation at large, and particularly by that portion of the population which is interested in the deserts of the West and other cultivation.

**CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE**, an institution created and maintained by a fund of \$10,000,000 set apart by Andrew Carnegie in 1910. The purpose of the Endowment, as outlined by one of its prominent active members, Dr. Nicholas Murray Butler, president of Columbia University is "to work for the promotion of peaceful development of civilization by aiding and developing, supporting and directing the forces needful to bring about the prevention of war, the perfection of means for the establishment of arbitral justice between nations, and the development of a world congress or parliament, a high international court, and an international police, and to take such steps and promote such undertakings as shall bring about the substitution of law and justice for war as a means of settling international disputes and difficulties."

The trustees selected by Mr. Carnegie to receive the fund and administer its income met at Washington on 14 Dec. 1910. At this meeting Mr. Carnegie read a letter informing the trustees of his gift of \$10,000,000 in 5 per cent first mortgage bonds, the revenue of which, he stated, "is to be administered by you to hasten the abolition of international war, the foulest blot upon our civilization." The donor made no restrictions of the gift, but left discretionary with the trustees the expenditure of \$500,000 annually accruing from the fund; he did not attempt, moreover, to outline future action as regards the measures, methods and policies that were to be adopted to the end of accomplishing the purpose specified. The only stipulation made was that the trustees were to "keep unceasingly in view, until it is attained, the speedy

abolition of international war between so-called civilized nations." The original trustees selected by Mr. Carnegie were: United States Senator Elihu Root, representative of the United States at The Hague Tribunal; Nicholas Murray Butler, president of Columbia University; Henry S. Pritchett, president of the Carnegie Foundation for the Advancement of Teaching; Joseph H. Choate, former Ambassador to Great Britain; Albert K. Smiley, educator and humanitarian; Charles W. Eliot, president-emeritus of Harvard University; James Brown Scott, solicitor for the State Department; John W. Foster, ex-Secretary of State; Andrew J. Montague, ex-governor of Virginia; Congressman William M. Howard, Lexington, Ky.; Congressman James L. Slayden, San Antonio, Tex.; Judge Thomas Burke, Seattle, Wash.; Andrew D. White, ex-Ambassador to Germany; Robert S. Brookings, lawyer, Saint Louis, Mo.; Samuel Mather, banker, Cleveland, Ohio; J. G. Schmidlap, railroad man, Cincinnati, Ohio; Arthur W. Foster, regent of the University of California; Robert A. Franks, banker, Hoboken, N. J.; Charlemagne Tower, ex-Ambassador to Germany and Russia; Oscar S. Strauss, Ambassador to Turkey; Austen G. Fox, lawyer, New York; John Sharpe Williams, senator-elect from Mississippi; Charles L. Taylor, chairman of the Carnegie Hero Commission; John L. Cadwalader, lawyer, New York; George W. Perkins, financier, New York; Cleveland H. Dodge, philanthropist and financier; Luke E. Wright, ex-Secretary of War; Robert S. Woodward, president of the Carnegie Institution.

At their first meeting these 28 trustees accepted the fund by formal resolution, and appointed a committee on organization which at the next meeting, held in Washington on 9 March 1911, presented the following statement of the aims and purposes of the Endowment:

"That the objects of the corporation shall be to advance the cause of peace among nations, to hasten the abolition of international war, and to encourage and promote a peaceful settlement of international difficulties, and, in particular—(a) To promote a thorough and scientific investigation and study of the causes of war and of the practical methods to prevent and avoid it; (b) to aid in the development of International Law, and a general agreement on the rules thereof, and the acceptance of the same among nations; (c) to diffuse information, and to educate public opinion regarding the causes, nature, and effects of war, and the means for its prevention; (d) to establish a better understanding of international rights and duties, and a more perfect sense of international justice among the inhabitants of civilized countries; (e) to cultivate friendly feelings among the inhabitants of the different countries, and increase the knowledge and understanding of each other by the several nations; (f) to promote a general acceptance of peaceable methods in the settlement of international disputes; (g) to maintain, promote, and assist such establishments, organizations, associations, and agencies as shall be deemed necessary or useful in the accomplishment of the purposes of the corporation, or any of them."

At this same meeting the following officers were elected: President, Elihu Root; vice-president, Joseph H. Choate; secretary, James Brown

Scott; treasurer, Walter M. Gilbert (temporary appointment).

At the same time the by-laws of the association were drawn up, and provision was made, *inter-alia*, for the establishment of an executive committee (consisting of the president, the secretary and five trustees), which at its first meeting, held likewise on 9 March 1911, decided to divide the work of the Endowment into three divisions: (1) *The Division of Intercourse and Education*, to promote the objects specified in sections (c), (e), (g); (2) *the Division of Economics and History*, to promote a scientific investigation and study of the causes of war and of the practical means to prevent and avoid it, as specified in section (a); (3) *the Division of International Law*, to promote the objects specified in sections (b), (d), (f). These three divisions may be described as popular, scientific and juristic, departments in which the work of the Endowment naturally falls. Thus the main activities of the Endowment were established on definite lines, and a world-wide co-operation in each branch of its work was planned. It was decided to inaugurate a series of conferences with foreign publicists, economists and statesmen, to be held in European cities, and a large number of eminent and influential men of all nationalities were invited to take a more or less active part in the propaganda.

While the outbreak of the European War in the summer of 1914 seriously interfered with the carrying-out of the program, that catastrophe only emphasized the incalculable importance and need of the work to which the Endowment is dedicated. War itself, indeed, is throwing light on the main problem, that of preventing war, and is bringing the solution of the problem nearer. On 20 April 1917, the trustees of the Endowment unanimously adopted a formal resolution, declaring their "belief that the most effectual means of promoting durable international peace is to prosecute the war against the Imperial German government to final victory for democracy, in accordance with the policy declared by the President of the United States." On the same day, moreover, a sum of \$500,000 was appropriated, by formal resolution, "for the reconstruction of devastated homes of Belgium, France, Serbia or Russia." The main office of the Endowment is located in Washington, D. C., while a branch office is located in New York, where the directors of the divisions of intercourse and education and of economics and history have their desks; the director of the division of international law, who is also secretary of the Endowment, has his office at the Washington headquarters.

PAUL B. THOMAS.

**CARNEGIE FOUNDATION.** The Carnegie Foundation for the Advancement of Teaching had its inception on 16 April 1905, with a fund of \$10,000,000. The act of incorporation was passed by Congress and approved by the President of the United States on 10 March 1906. The aim of this institution is the establishment of an agency to provide retiring allowances for teachers in colleges, universities and technical schools of the English-speaking countries of North America, and to serve the cause of higher education by advancing and dignifying the profession of the teacher in

these higher institutions of learning. In order to be admitted to the retiring allowance system of the Foundation, the essential work of an institution must be that of higher education and of such a character that graduation from a four-year high school course, or equivalent training, constitutes a prerequisite therefor.

A technical school, to be eligible, must have entrance and graduation requirements equivalent to those of the college, and must offer courses in pure and applied science of equivalent grade.

Institutions which maintain a course or courses for which high-school graduation, or equivalent training, is not required for admission, must present to the Foundation the number of students and the names of the teachers in such course or courses; also, separately, the number of students of whom high-school training, or the equivalent, was required for admission, and the names of the teachers engaged exclusively in instructing the latter class of students.

No institution will be accepted which is so organized that stockholders may participate in its benefits.

Institutions of higher learning are recognized as eligible, under the following conditions:

1. Colleges, universities and technical schools of requisite academic grade, not owned or controlled by a religious organization, whose charters specifically provide that no denominational test shall be applied to trustees, officers, teachers or students.

2. In the case of colleges, universities and technical schools, not owned or controlled by a religious organization, the trustees of such institutions are asked to certify that, notwithstanding the lack of specific prohibition in the charter, "no denominational test will be imposed in the choice of trustees, officers or teachers, nor in the admission of students, nor will denominational tenets or doctrines be taught to the students." Upon the passage of such resolution by the governing bodies of such institutions, they may be recognized as entitled to the benefits of the Foundation, so far as considerations of sectarian control are concerned.

An institution not supported by taxation must have a productive endowment of not less than \$200,000 over and above any indebtedness of the institution.

A tax-supported institution must be in receipt of an annual income of not less than \$100,000.

Retiring allowances are granted in the colleges, universities and technical schools on the accepted list of the Foundation on two distinct grounds: (1) To a teacher of specified service on reaching the age of 65; (2) to a teacher after 25 or 30 years of service in case of physical disability. To these two main divisions the trustees have added many extra conditions.

At the instigation of the Carnegie Foundation, a plan for an exchange of teachers between the United States and Prussia was put into effect in 1908. This plan has been in active operation ever since. During the year 1910 a sensation was created in educational circles through the rejection by the Foundation of several western colleges which did not, in the opinion of the trustees, come up to the require-

ments set by Mr. Andrew Carnegie in his deed of trust. In the same year, Mr. Morris Llewellyn Cooke, a member of the American Society of Mechanical Engineers, undertook at the instigation of the Carnegie Foundation a detailed study of some of the American institutions of learning, with a view to ascertaining whether they were being conducted in a proper manner and whether or not the large sums of money being expended by all of them were put to the best and most practical uses. In the course of his investigation Mr. Cooke examined at length the departments of physics at the universities of Harvard, Columbia, Toronto, Wisconsin and Princeton, at Haverford and Williams colleges, and at the Massachusetts Institute of Technology. His opinion was considered of great importance, it being the first time that a practical business man had officially applied the principles of practical business to the system of education in the United States. His verdict was that there was a very decided waste apparent at all of the institutions he visited. In his report he allowed facts to speak for themselves for the most part and rarely uttered any direct criticism, although he did take occasion to score the life tenure of professorships where they occurred, the committee system of management and the stress laid on the importance of research work. Mr. Cooke declared that he found researches being pursued in some of the colleges for which no possible excuse was offered, except by the man who happened to be conducting them, and he believed that altogether too much attention was uniformly paid to this branch of collegiate work.

Owing to the requirements already mentioned for admission to the benefits of the Foundation Fund, the list is somewhat limited of institutions which can apply for pensions. In welcoming eligible institutions to this limited list, the Foundation has sought to distribute them not only geographically, but among colleges of different types. In 1915, 73 institutions shared in the pension fund. Twenty were small colleges of the type of Middlebury College in Vermont and Franklin College in Indiana. Twenty-five were strong colleges like Williams College in Massachusetts and Colorado College in Colorado. The remaining 28 were about equally distributed between universities like Lehigh University in Pennsylvania and Tulane University in Louisiana, and a similar group of the strongest universities in the country, whether privately endowed like Harvard in the East or State-supported like the University of California in the West. According to the ninth annual report for the fiscal year 1914-15, the income received from the general endowment of the Foundation was \$696,038.60; from the endowment of the division of educational inquiry, now kept as a separate budget item, \$50,358.34. The total expenditures under the general endowment were \$669,532.99, of which \$510,750.97 went to pay the retiring allowances and pensions in institutions on the accepted list of the Foundation, and \$124,112.80 to allowances and pensions to individual officers, teachers and widows in institutions outside of this list. Forty-four allowances were granted during the fiscal year, involving an expenditure of \$70,900. The number of deaths during the year was 15, making a

net increase of 29 to the number of allowances and pensions in force, which at the end of the year were 432, with a total grant of \$687,370. The grants made during the year represented in all 32 institutions. The trustees held in trust at the close of the fiscal year under the general endowment securities of the face value of \$14,129,000; under the division of educational inquiry \$1,250,000. The Foundation and its work have received considerable adverse criticism and opposition. "The spectre of a baneful educational influence" writes President Henry S. Pritchett, "exercised by a remote agency upon the policy of struggling colleges and universities is one that has been successfully invoked in some quarters. The apprehension that college professors could be influenced in their attitude by the pensions they are to receive rests upon two misconceptions; the first, as to the methods of administration. The teacher in the associated colleges does not deal with the Foundation at all. He deals entirely with his college and receives his pension from the college exactly as he receives his salary. The other misapprehension rests upon a misconception of the character of the American college professor. The university teacher in America has a fairly stiff backbone. Nothing would so arouse his opposition as any effort, however indirect, to control his opinions about education, college administration or any other subject. The sole opportunity the Foundation has to influence the educational judgment of professors is through its publications, and these have weight only as they are sound and prove in the end to be wise."

**CARNEGIE HERO FUND.** During 1904, through the munificence of Mr. Carnegie, a fund called the Carnegie Hero Fund was created for adequately rewarding such persons as should perform deeds of heroism which would otherwise receive no appreciation beyond a possible paragraph in a daily newspaper. Mr. Carnegie endowed the Fund with \$5,000,000, the expenditure of which was to be directed by a commission of his own naming, of which Mr. Charles L. Taylor was appointed president. In his deed of trust to the commission Mr. Carnegie expressed himself as having long felt that heroes and those dependent upon them should be freed from pecuniary cares resulting from their heroism. In establishing the Fund it was his purpose to place in a somewhat better pecuniary position than before those following peaceful vocations who have been injured in heroic efforts to save human life, and, in case of their death, to provide for the widows and children as long as that should be necessary and advisable. He made the stipulation, however, that no grant was to be continued unless it were soberly and properly used and unless the recipients remained sober, respectable, well-behaved members of the community. In all cases a medal of gold, silver or bronze, according to which the deed in question was believed by the commission to call for, was to accompany each grant, and, in cases where no monetary aid was called for, an appropriate medal was in any event to be awarded, setting forth the heroic deed it commemorated. Subsequent resolutions and by-laws passed by the commission govern the operative work of the Fund, but the broad,

general lines of its scope remain those which Mr. Carnegie recited. It has been widely praised for its work on all sides, and has been an incalculably powerful factor in relieving people in want whose real worth was fully revealed for the first time perhaps through their deeds of unselfish heroism.

The field embraced is the United States, the Dominion of Canada, the colony of Newfoundland and the waters thereof.

Such acts must have been performed on or after 15 April 1904 and brought to the attention of the commission by letter addressed to the manager, Oliver Building, Pittsburgh, Pa., within three years of the date of the act. Up to 1915 the commission had awarded 723 bronze, 387 silver and 18 gold medals; \$1,249,656 had been awarded for disablement benefits and for educational and other specific purposes, and for the dependents of heroes who lost their lives. Pensions in force on 31 Dec. 1915 amounted to \$79,200 annually. The commission had also awarded \$169,462 for the relief of sufferers from disasters; Brockton, Mass., \$10,000; California earthquake, \$54,462; Monongah Mines, W. Va., \$35,000; Darr Mine, Pa., \$25,000; Lick Branch Mine, W. Va., \$10,000; McCurtain Mine, Okla., \$15,000; Jed Mine, W. Va., \$10,000; and for the relief of Ohio and Indiana flood sufferers, \$10,000.

**CARNEGIE INSTITUTION OF WASHINGTON.** This institution was founded by Andrew Carnegie on 28 Jan. 1902, with an endowment of \$10,000,000 of registered 5 per cent bonds; to this fund he added \$2,000,000 on 10 Dec. 1907, and \$10,000,000 on 19 Jan. 1911. The Institution was originally organized under the laws of the District of Columbia and incorporated as the Carnegie Institution, but was reincorporated by an act of the Congress of the United States, approved 28 April 1904, under the title of The Carnegie Institution of Washington. The articles of incorporation of the Institution declare in general "that the objects of the corporation shall be to encourage in the broadest and most liberal manner investigation, research and discovery, and the application of knowledge to the improvement of mankind." Three principal agencies to forward these objects have been developed. The first of these involves the formation of departments of research within the Institution itself, to attack larger problems requiring the collaboration of several investigators, special equipment and continuous effort. Eleven such departments have so far been established. The second provides means whereby individuals may undertake and carry to completion investigations not less important but requiring less collaboration and less special equipment. The third agency aims to provide adequate publication of the results of research coming from the first two agencies and to a limited extent also for worthy works not likely to be published under other auspices. The Institution is placed under the control of a board of 24 trustees, which meets annually in December to consider the affairs of the Institution in general, the progress of work already undertaken, the initiation of new projects and to make necessary appropriations for the ensuing year. During the intervals between the meetings of the trustees the affairs of the Institution are conducted by

an executive commission chosen by and from the board of trustees and acting through the president of the Institution as chief executive officer. A view of the history of the Institution may be gained from the contents of the 'Year Books' and from its other more formal publications, general and classified lists of which may be had on application. The publications themselves, numbering over 300, may be found in nearly all the greater libraries of the world. The executive offices of the Institution are in its Administration Building, 16th and P streets, northwest, Washington, D. C.

**CARNEGIE TECHNICAL SCHOOLS,** Pittsburgh, Pa., a co-educational institution founded by Mr. Andrew Carnegie with an endowment of \$4,000,000. The schools are housed in five buildings. The United States Geological Survey has established in Machinery Hall the main laboratory of the Chemical Division, Technologic Branch, where investigations of fuels from all parts of the country are conducted. The courses in the schools are arranged for day and night students. There are four departments: 1. The School of Applied Science, offering preliminary and specialized courses in the fields of engineering and chemical practice. The time for completion of the course depends on the aptitude and application of the individual students; (2) the School for Apprentices and Journeymen, which gives general training to supplement the usual apprenticeships in order to counteract the dangers of specialization and over-emphasis of the practical as opposed to the theoretical sides. Courses as given during slack seasons, etc.; (3) the School of Applied Design, offering courses in architecture and interior decoration. The standards for admission are high school or equivalent certificate and an entrance examination; (4) the Margaret Morrison Carnegie School for Women, giving training in the home-making arts, dress-making and design and secretarial work. Candidates are admitted on personal interview if they are over 18, and by examination if they are under 18.

**CARNEGIE YACHT.** The *Carnegie* is one of those little known developments which prove, first, how far from perfection the science of to-day is, and, on the other hand, how far it has advanced even within a quarter of a century. The peculiarity of this yacht is that it is non-magnetic; in other words, the only magnetic steel on board her is the compass.

The compass does not, as common thought conceives, point directly to the pole. It is deflected by the variations in the magnetic influence of the earth, by the presence of large masses of iron on board ship and by the neighborhood of certain mountains and islands of volcanic origin. Along the inner passage from Seattle to Alaska the attraction from shore affects a ship's compasses a mile away. Navigation to-day involves the possession of correct information as to these variations of magnetic attraction. This information the *Carnegie* is engaged in securing.

The yacht is neither owned nor controlled by the man for whom she is named. She was built from the funds of the Carnegie Institution of Washington, founded by Andrew Carnegie, and was launched on 12 June 1909. In six weeks, with the appliances on board, a single

cruise enabled her officers to discover systematic errors of importance in the best charts now available. For 10 years the existence of these errors had been more or less suspected, and thousands of observations had been taken by skilful and experienced navigators without definite results. The information gained by the *Carnegie* is accepted as correct by the leading hydrographic offices of the world.

The best that the commanders of iron vessels have been able to do, hitherto, has been to entrust the examination of their compasses to a professional adjuster, who, when his work is completed, furnished what is called a deviation card showing the corrections or errors of the compass on the various headings of the ship. The investigations of the *Carnegie* will enable the steamer captain to check up these adjustments with full knowledge of the correct or undisturbed variation, or direction of the compass, in all waters he is likely to traverse. Hitherto the captain's only means for this "checking up" was by personal astronomical observations when the state of the weather permitted. From the aid of the *Carnegie*, he will soon be able to know exactly how the compass would point were it mounted on a non-magnetic vessel. Comparing this with his compass as adjusted, he has the satisfaction and security of being able to make his calculations on a mathematical certainty.

The ingenuity of the *Carnegie's* construction merits the attention of even the casual reader. Her dimensions are: Length over all, 155½ feet; length on load water-line, 128½ feet; beam, molded, 33 feet; mean draft, 12 feet 7 inches; displacement, 568 tons; registered tonnage, 246. The materials used were mainly white oak, yellow pine, Oregon pine, and teak. The fastenings are locust treenails, copper and Tobin bronze bolts and composition spikes. The anchors—four in number—are of manganese bronze with a total weight of 5,500 pounds.

There are no anchor chains; instead, three 11-inch hemp cables are used. She is of brigantine rig, with 12,900 square feet of plain sail; riggings, special Russian hemp; metal work on spars, rigging and blocks, of bronze and gun-metal. The auxiliary power consists of one 150 indicated horse-power producer gas engine, built practically of non-magnetic metals, such as bronze, copper and non-magnetic manganese steel. There are two non-magnetic 20-foot whale-boats and one 16-foot gig. The cooking ranges and refrigerating plant are of bronze or copper. The cutlery is Mexican silver. The *Carnegie* is the first sea-going vessel equipped with a producer gas engine. In calm weather a day's run can be made with auxiliary power alone, of 144 nautical miles, at a cost of \$7 for coal consumed. The scientific staff consists of 7 men, and the crew of 14.

Before the building of this unique little vessel (described as a yacht for convenience in entering port, and making arrangements with customs, etc.), the magnetic observers of the Carnegie Institution had sent its brigantine, the *Galilee*, on cruises amounting in the aggregate to 60,000 miles. Its magnetic observers had penetrated to nearly every part of the earth, and have been, and still are, co-operating with various polar expeditions, securing magnetic data in those regions. The result is a set of

magnetic charts for the greater part of the earth at least, the first which can be said to be based upon uniformly and systematically acquired data. The good will and co-operation of every civilized country have been manifested in this great work.

The usefulness of the *Carnegie*, and of the various forms of work akin to that which she has done, has practically no limitations for the simple reason that not only has the magnetic state of our globe been hitherto unascertained with certainty, but it is constantly changing. This became known as early as 1634, when Henry Gellibrand noted that since 1584 the easterly direction of the compass had changed by seven degrees. Obviously, this affects more or less every survey that is made. Hence the work of the Carnegie Institution extends not only over the sea but also on land. The work by sea is, however, of far greater significance from the point of view of the security of human life, since a variation of a minute fraction in the compass may result—as has been the case once or twice—in the wrecking of a liner on rocks supposed to have been correctly charted. On 8 June 1914, after refitting at New York the *Carnegie* left for an expedition in the North Atlantic. After visiting Norway, Spitzbergen in the latitude of 79° 52', and Iceland, and covering 10,600 miles, she returned to her base station at Greenport, Long Island, 9 Oct. 1914. She refitted at Brooklyn for a longer cruise during 1915-16, in southern latitudes (50° to 75°), where magnetic observations required supplementing.

**CARNEIA**, national festival of the ancient Spartans celebrated in honor of Apollo, and in the Spartan month Carnejos. The festival lasted nine days, during which the Spartans were not allowed to enter on a hostile campaign. It was originally a herdsman's festival, but at Sparta had assumed a military character. The men bivouacked in booths, in nine divisions, and all the exercises were governed by the commands of the herald. There were musical contests, and a singular foot race, in which one man was pursued by a number of others. If he was caught, it was a sign of good luck; his escape foreboded evil.

**CARNEIRO**, kār-ná' rō, Joaquim da Silva, Portuguese engraver and writer: b. Oporto in 1727; d. Lisbon 1818. When 12 years of age removed to Brazil, where he lived 17 years. As he began early to display his artistic talents, he was placed under the tuition of Joao Gomez, the celebrated engraver, at Rio de Janeiro. In 1756 he returned to Europe to complete his studies where, in 1769, he became the head of the royal engraving school at Lisbon, and later was made teacher of design in the royal college. He studied art for a time in Rome and did some of his best work there. He was also a prolific writer and translator of technical books relating to the engravers' art, and author of a great number of engravings of high merit for which he is chiefly remembered, especially for 'The Child Jesus carried by Saint Joseph,' and the even more celebrated picture, 'The Annunciation of the Virgin Mary.'

**CARNELIAN**. See CORNELIAN.

**CARNIFEX FERRY**, W. Va., place at which occurred a battle of the Civil War, 10 Sept. 1861. On 23 August Gen. John B.

Floyd, who had marched from Lewisburg, crossed to the north side of Gauley River at Carnifex Ferry with five regiments of Virginia infantry, 100 cavalry, and five guns, aggregating about 2,600 men. The 7th Ohio had been guarding the ferry, but had been recalled to within six miles of Gauley Bridge, and then ordered to return to Cross Lanes, two miles from Floyd's position, which it reached in the night of the 25th. Early on the morning of the 26th Floyd advanced, surprised the regiment while at breakfast, and routed it, killing and wounding 45 and capturing 96. About 200 men escaped to Gauley Bridge and about 400 were collected and led by Major Casement to Charleston on the Kanawha. Floyd's intention in crossing the Gauley was to force the retreat of Gen. J. D. Cox from Gauley Bridge down the Kanawha Valley, whither he proposed to follow him and make a raid of 50 miles into Ohio, but Gen. H. A. Wise, who commanded one of his two brigades, had refused to obey his order to cross the Gauley, upon which Floyd abandoned his idea of invading Ohio, and entrenched his position in a bend of the Gauley, both flanks resting on the precipices rising abruptly from the river. The presence of Floyd north of the Gauley gave General Rosecrans some uneasiness, and turned his attention from the Cheat Mountain region where he had been confronting Gen. R. E. Lee. Leaving Gen. J. J. Reynolds to oppose Lee, he drew troops from posts in the rear and assembled at Bulltown seven and a half regiments of Ohio infantry, two batteries of artillery and three companies of cavalry, which were formed into three brigades, commanded by Gen. H. W. Benham and Cols. E. P. Scammon and R. L. McCook. On 9 September he marched from Bulltown, crossed Big Birch Mountain, drove the 36th Virginia and a company of cavalry from Summersville, on the morning of the 10th, and followed to Cross Lanes, which he reached at 2 P.M., and heard that Floyd was entrenched about two miles distant. Benham, commanding the leading brigade, was ordered to advance cautiously and feel Floyd closely, but not to engage him until the entire column came up, unless he saw a good opening. Benham drove in Floyd's pickets, and believing that he was in full retreat, pushed rashly forward in the face of a severe artillery fire, becoming closely engaged and making some spirited charges upon Floyd's works, which were repulsed. He then called for help. Rosecrans hastened up the brigades of Scammon and McCook, and going to the front, was surprised that the reconnaissance ordered had developed into a severe and badly conducted engagement. It was too late to withdraw without giving the appearance of defeat; other efforts were made, in which Scammon and McCook participated; but it was growing dark, the men were exhausted after their march of 17 miles, and Rosecrans withdrew, intending to renew the fight in the morning. During the night Floyd recrossed the Gauley, destroyed the foot-bridge behind him, sunk the ferry-boat and, with Wise, retreated to Sewell Mountain. The Union troops, fully exposed and not well handled, had 17 killed and 141 wounded. The Confederates, well protected by log-works, had none killed and 21 wounded. Consult 'Official Records' (Vol. V) and 'Battles and Leaders of the Civil War'

(Vol. I, New York 1887, ed. by Johnson and Buel).

E. A. CARMAN.

**CARNIOLA** (German, *KRAIN*), Austria, a province with an area of 3,856 English square miles. It is bounded by Carinthia on the north, Styria on the northeast, Croatia on the east, southeast and south, and Istria and Görz on the west. It is covered with lofty mountains, some of which are about 10,000 feet high, and, generally speaking, is one of the most unfertile regions of the empire. Some districts, however, produce considerable quantities of wheat, barley, wine and, in the south, fruits of various kinds and excellent flax. There are some iron, lead and quicksilver mines, the latter exceedingly rich. It abounds in clays and valuable stones, and in coal and marble. There are considerable manufactures of iron, fine linen, lace, woolen cloth, flannel, worsted stockings, leather, wooden articles, etc. Its chief exports are steel-ware, quicksilver, hats, linens, glasswares, wax, wine, lignite, flour, etc.; principal imports — salt, oil, fruit, coffee, sugar, tobacco, cloths, cattle, etc. Nearly 300 miles of railway lines, with Laibach, the capital, as the centre, facilitate the commerce of the crownland. There are about 380 elementary schools, attended by over 75,000 children. Carniola is represented in the Lower House of the monarchy by 11 delegates, of whom two are drawn from the landed aristocracy, three from the towns, five from the rural communities, and one elected by the people at large. Its own Diet consists of 36 members drawn from the same classes and in about the same proportion. Nearly 94 per cent of the people are Slovenes, and the remainder consists of Germans, Serbo-Croatians and Italians. Almost the entire population belongs to the Roman Catholic Church. Carniola was made a duchy in the 12th century, under the dominion of the counts of Tyrol, who became extinct in 1335, and were succeeded by the earls of Görz. After the Treaty of Vienna, in 1809, it was ceded to France, and incorporated in the kingdom of Illyria. In 1814 it came again into the possession of Austria. Capital, Laibach with a population of 36,547. Pop. 525,083.

**CARNIVAL.** The same views which led men to propitiate the higher invisible powers by gifts, sacrifices and purifications, also introduced fasts, abstinence from pleasure, and penances. By fast is meant an abstinence from the usual means of nourishment, in order to mortify the appetites, and thereby to propitiate the Deity. In every nation of importance customs of this kind are found. Their historical origin is in the religious customs of the East, where the priests were originally the physicians of the people, and prescribed these fasts as a part of the regimen necessary in this warm region, as well as from religious views. Fasts are observed to this day in the East. The religions of the Persians and the Hindus, those of the Mohammedans, and of the worshippers of the Lama, insist much on fasts. Few traces of them are found in the religion of the ancient people of the North. The earliest Christians fasted on the vigils (q.v.). The fasts on the *jejunia quatuor temporum*, which continued for three days every quarter of the year, were penances, as was that of the period of 40 days (before Easter, or rather before Good Friday,

*Quadragesima*), which was called, by way of excellence, the fast, and which commemorated the 40 days' fast of Jesus in the wilderness. With regard to the origin of Christian fasts, opinions differ. The most common is, that Telesphorus, bishop of Rome, in the middle of the 2d century, first instituted the 40 days' fast as a rule of the Church. By Pope Gregory the Great, about 600, Ash Wednesday was made the beginning of the fast, and the day before was called fast eve, because in the night of this day, at 12 o'clock, the fast began. This fast was preceded by a feast of three days, very obnoxious to the strict zealots. "Christians," it is said, "on these days deliver themselves up to voluntary madness, put on masks, exchange sexes, clothe themselves like spectres, give themselves up to Bacchus and Venus and consider all pleasure allowable." This is the origin of the present carnival, or *Fasching*, as it is called in the south of Germany, and which continues in that country from Twelfth Day to Ash Wednesday. The name carnival is derived from the Latin *caro*, *carnis*, flesh, and *vale*, farewell (according to Ducange, from the Latin denomination of the feasts in the Middle Ages, *carnis levamen*, solace of the flesh), because at that time people took leave of flesh. Previously to the commencement of their long abstinence, men devoted themselves to enjoyment, particularly during the last three days of the carnival. The carnival is nothing but the Lupercalia of the Christian Romans, who could not forget their pagan festivals. At least it greatly resembles the Saturnalia which were celebrated annually in December, with all kinds of mirth, pleasure and freedom, in honor of Saturn, and the golden age when he governed the world, and to preserve the remembrance of the liberty and equality of man in the youth of the world. In Rome, the carnival brought to view, in a lively manner, the old Saturnalia in a new form. During the last days of the carnival, and particularly during the day which preceded the long fast, mummeries, plays, tricks and freedom of every kind abounded. From Italy, the modern Saturnalia passed to the other Christian countries of Europe. The wealthiest class commenced their amusements 8 or 10 days before Ash Wednesday, the middle classes two or three days, the poor only observed one day (the *Fastnacht* of the Germans). In the amusements of this period the dramatic poetry of Germany had its origin, after the cities had attained a flourishing condition. Its first traces appeared in the 13th century. The mummeries of the carnival produced the idea of adopting some character, and carrying it through. To please the multitude, and make the laugh more certain, the manners of common life were caricatured. These exhibitions afterward became more cultivated and developed. On fast eve persons in disguise sometimes went from one house to another, to make sport with their friends and acquaintances. A merry society of this kind formed a plan to represent some scene in their disguises, and hold a regular conversation at one of these mummeries. The unknown players received praises, entertainments or presents. Encouraged by this success, the company grew stronger, their fables and speeches became longer by degrees, until they attained to regular representations of human life. It was in Nuremberg, renowned for its

wares and its wit, that the first fast eve's play was produced, coarse and frolicsome, to suit the taste of the citizens. The earliest of these pieces that have come down to us date from 1450-70; they have a near relationship to the masques of the English and the farces of the French, as have the spiritual fast eve's plays, religious burlesques, to the Mysteries and Moralities. In Italy the carnival is now celebrated with the greatest show and spirit at Rome. It lasts for the 10 days preceding Ash Wednesday, certain observances taking place on certain days. Some days, for instance, are devoted to the throwing of comfits, or of small plaster pellets that take their place, these being flung from the balconies of the houses upon the persons in the streets—especially in the Corso—who retaliate in the same way, and in order that they may do this many of them are mounted upon lofty cars or other vehicles, all being masked. On other days the finest equipages move along in procession, and flowers instead of comfits are thrown. Races of riderless horses in the Corso are another prominent feature of carnival time. After sunset on Shrove Tuesday everybody carries a lighted taper (these being known as *moccoletti*), and each tries to extinguish as many others as he can while keeping his own alight. Venice, Turin, Milan, Naples, Florence, etc., also celebrate the carnival with more or less ceremony, and the same can be said of various towns of the south of France, Nice in particular. The carnival at Rome has been excellently described by Goethe. In Germany the carnival is celebrated with brilliancy only in the Catholic cities of the Rhine Valley, Mayence, Bonn, but above all Cologne. In Protestant countries, generally, the feast is not observed to any extent. In the United States the principal observance of this nature is that held annually at New Orleans. Various civic organizations take part in a great street pageant, in which are elaborate tableaux, brilliantly illuminated and placed on vehicles. Historic, poetic and other scenes are artistically portrayed often at great expense. In Paris a fat ox (*bauf gras*) was led in the procession, followed by a child in a triumphal car, who is named "king of the butchers." From this taking place on the Tuesday (Mardi) preceding Ash Wednesday the festival came to be known under the title Mardi Gras, which name is now generally applied to such festivals in America and elsewhere. See PAGEANT.

**CARNIVORA**, broadly, those animals which prey upon other animals; but in a restricted sense, that order of mammals more or less adapted for predatory life and including most animals popularly called beasts of prey. To this order the cat, dog, bear and seal belong. The head is small in proportion to the bulk of the body, and the skin is well covered with hair. The limbs, four in number, are fully developed, and are adapted either for walking or swimming. Two sets of teeth, deciduous or milk and permanent, are always developed in succession, and in both sets incisors, canines and molars, are distinguishable. The order is divided into two groups, the *Fissipedia*, which include such animals as the lion, wolf, bear, etc., whose life is terrestrial; and the *Pinnipedia*, or those which are specially adapted for aquatic life. The Carnivora are found in

all parts of the world except Australia and New Zealand, where flesh-eating marsupials prevail. The ermine is probably the smallest specimen of this order, being but a few inches in length. The largest is the bear, some of the latter weighing as much as a ton. The carnivores serve as a check on the too rapid multiplication of herbivores, rodents, etc. From this class man has derived two valued pets—the dog and the cat. With the other genera of the order his relations are those of constant warfare. Some genera he hunts for their fur or flesh, others for sport, others he kills to protect his domestic animals. In civilized areas, consequently, the larger carnivores disappear entirely or to a great extent, and the result is the increase of various pests, as rats, mice, etc. In lands less civilized the larger carnivora hold their own even against man, tigers, lions and leopards killing thousands of human beings annually.

1. *Fissipedia*.—All the carnivores of this division, except the sea-otter (*Enhydra*), have six incisor teeth in each jaw, the canine teeth are prominent, and one of the molar series in each jaw is usually compressed laterally, so as to present a cutting edge. The toes are furnished with claws, and the anterior limbs are used for seizing and holding prey as well as for walking. The skull is contracted behind the orbits, so as to give an hour-glass form when seen from above. The hollow formed by this constriction on each side of the head is bridged over by the wide zygomatic arch, and thus gives room for the powerful muscles of mastication. The lower jaw is articulated to the skull, so that it can only be moved up and down. The incisor and canine teeth are represented by the

formula  $\begin{matrix} 3-3 & 1-1 \\ i- \\ 3-3 & 1-1 \end{matrix}$ . The teeth behind the

canines increase in size from before backwards,

and vary from  $\frac{4-4}{3-3}$  in the cat, to  $\frac{8-8}{8-8}$  in the

South African otocyon, the total number of teeth of all kinds ranging from 30 to 48. The posterior teeth are divided into premolars and molars; the last of the premolar series in the upper and the first of the molar series in the lower jaw presenting the lateral compression and trenchant margin which earns for them the name of sectorial or carnassial teeth. Behind the carnassial teeth the molars have tuberculated crowns. The stomach is simple and undivided, and, as a general rule, is more rounded in the flesh-eating genera. The limbs terminate in digits, which are never fewer than four, and are furnished with sharp claws, which in the *Felida* are retractile within sheaths of the integument on the dorsal surface of the toes. In walking, the extremities of the toes are applied to the ground, as in the "digitigrade" cat and dog; or the whole sole of the foot is put down, as in the "plantigrade" bear. The six families included under the fissipede carnivores are: (1) *Felida*: lion, tiger, leopard, cat, etc. These present the highest type of the carnivorous structure. The claws are retractile. (2) *Canida*: wolf, dog, jackal, fox, etc. The claws are not retractile, and the gape is longer. The toes in this and the previous family are five on the anterior and four on the posterior extremities. (3) *Hyenida*: myæna, aardwolf, etc.

The hyenas have the anterior limbs longer than the posterior, and both terminate in four toes. The skull and dentition approximate to those of the *Felida*. (4) *Viverrida*: The supple elongated bodies of these animals are intermediate between those of the cats and the martens. Some, as the civet, genet, zibet, have the claws retractile; in others, as the ichneumon and rasse, they are not retractile. Those mentioned are digitigrade, but the suricate of Central Africa is plantigrade. In this family glands are found under the tail, the secretions of which have powerful odors. The diet of this family is not purely animal. (5) *Mustelida*: The members of this family have elongated bodies with short limbs, terminating usually in five-toed feet with retractile or non-retractile claws. The marten, weasel, polecat, glutton or wolverene, constitute one sub-family of exclusively terrestrial life. The badgers, the skunks and the like constitute another division. (6) *Ursida*: In this family the carnassial tooth is no longer trenchant, but tuberculated. All are plantigrade, but the habits and aspect vary considerably, and include, besides the bears, the raccoons, panda and several lesser forms. The raccoon and its allies are sometimes made a family with the name *Procyonida*. See MAMMALIA; BEAR; CAT; DOG, etc.

2. *Pinnipedia*.—The aquatic carnivores comprise three families, represented by the walrus or sea-horse, the eared seals and the common seals. They are related to the preceding families through the otters and the bears, and agree in having the extremities modified into swimming organs or flippers, and the teeth more uniform in character. See SEALS; WALRUS.

**CARNIVORA, Fossil.** A few remains of animals regarded as belonging to the *Carnivora* have been found in rocks of Eocene Age, but they are extremely generalized forms, and have a doubtful, if any, connection with the earlier creodonts (see CREODONTA). The Miocene rocks have yielded more, but still of very generalized or "synthetic" types, suggesting the ancestry of the dogs and civets; one is the European fossil genus *Cynodictis*, called a "viverrine dog," because it combines rudely characteristics of the fox and civet. "This," says Ernest Ingersoll ('Life of Mammals' New York 1909), "shades off into the many species of *Galecyon*, and of *Amphicyon*, plantigrade animals existing in all parts of the Miocene world, and varying in size from that of a small fox to that of a long-bodied bear,—a huge combination of wolf, mungoos, and bear! Others of the same or a later time are more nearly typical civets, or stand between such and the linsangs, or connect civets and weasels; while at the beginning of the next, or Pliocene, period, there appears a curious animal, the ictithere, which completely unites the civets with the hyenas. *Amphicyon* was plantigrade and had other bearlike characteristics. Besides it, as we know from Miocene fossils, lived another animal (*Hemicyon*), which was more dog than civet, plus bearlike features; and later we find *Hyenarctos* still more ursine, so that these represent a line of change from bearlike dogs into doglike bears, and connect the *Amphicyon* stock with the true bears and raccoons. In a similar way fossil forms of the Upper Eocene

and Lower Miocene connect the civet stock with the apparent ancestors of the fur-bearers (weasels, badgers, otters, etc.). It is not, indeed, until the late Miocene, near the end of the Tertiary period, that the groups of Carnivora as we now see them became distinctly set apart from one another by the dying out of the old intermediate stock forms." Consult Osborn, 'Age of Mammals' (New York 1910); Scott, 'History of Land Mammals in the Western Hemisphere' (New York 1913).

**CARNIVOROUS PLANTS**, plants of various genera which subsist partly upon insects and other small animals which they entrap in various ways. The apparatus in each case is a modified leaf or part of a leaf, and in some cases the modifications are so curious, so well adapted to the use to which they are put, and so perfect in action, that the plants seem almost intelligent. The object sought by these plants seems to be to supply themselves with nitrogenous food, which is generally in meagre supply where they usually live—undrained swamps. Probably, too, such carnivorous plants as do not live in these habitats formerly did, but have not yet lost the use of the apparatus. A case of this kind is exhibited by the genus *Utricularia* (see **BLADDERWORT**). In this genus various species provided with active bladders, which act like eel-traps, live submerged in ponds; other species, also possessing active but less perfect and useful traps, live in the marshy soil of swamps. Still others live on dry ground, but these have usually abortive traps. The conclusion is that as the ponds became swamps, and the swamps were converted into dry land, the supply of nitrogenous food increased, and hence the traps became aborted, because they were no longer needed.

Probably the most nearly intelligent of these carnivorous plants is the Venus' fly-trap (*Dionaea*), found in North Carolina. The trap (leaf-blade) consists of two pieces hinged together. On the margins are bristles, and in the interior a few sensitive hairs, which, when touched, act like a trigger, and the apparatus closes. Should an insect cause this action the bristles will prevent its escape and the trap will remain closed until digestion is complete, when it will open, cast out the indigestible portions and be ready for another victim. If the trap fails to catch its prey, or if it be sprung by something it cannot utilize, it will open again in a short time. In the sundew (*Drosera*) the leaves are not provided with glandular hairs, which close over the insect that alights upon the leaf, and a glistening sticky substance holds it fast until its digestible parts are absorbed by the plant.

In the pitcher-plants (*Sarracenia*, *Nepenthes*), the pitcher consists of a tube-like leaf either with or without a lid or hood. Around the mouth there is usually a sugary secretion which acts as a lure. The insect that alights cannot escape because the tube is lined with hairs that force him downward to the bottom of the tube, which is usually partly filled with water. Some other genera in which the carnivorous habit is developed are *Darlingtonia*, *Aldrovandra* and *Pinguicula*. Consult Darwin, 'Insectivorous Plants.'

**CARNOCHAN**, kār'nō-kān, John Murray, American surgeon, famous for his bold and

skillful operations: b. Savannah, Ga., 4 July 1817; d. New York, 28 Oct. 1887. He studied at Edinburgh and at various European universities; and began his practice in New York in 1847. In 1851 he became professor of surgery at the New York Medical College, and surgeon-in-chief to the State Immigrant Hospital. At one time he cured neuralgia by excising the whole trunk of the second branch of the fifth pair of nerves. In 1852 he tied the femoral artery to cure exaggerated nutrition. He also tied the primitive carotid artery on both sides, to cure elephantiasis of the neck. In 1853 he excised the entire radius, in 1854 the entire ulna. He published a treatise on 'Congenital Dislocations' (1850); a translation of Rokitauský's 'Pathological Anatomy,' and 'Contributions to Operative Surgery' (1858 and 1877-86), besides numerous monographs of value on subjects connected with his profession.

**CARNOT**, kār-nō, Lazare Hippolyte, French statesman and journalist, second son of the following: b. Saint Omer, 6 April 1801; d. 16 March 1888. He studied for the law but was debarred from practice for refusing to take the oath of allegiance to the Bourbons. He was of liberal opinions, became a disciple of Saint Simon, and wrote the 'Exposition générale de la doctrine Saint Simonienne,' the authorship of which was, with his consent, ascribed to Bazard. He became editor of *Le Producteur*, a radical journal of the day. But as soon as Saint Simonism assumed the form of a religious creed, Carnot parted with his friends, and became a journalist, and the chief editor of the *Revue encyclopédique*. He was also entrusted with the publication of Grégoire's and Barères 'Mémoires.' He was elected to the Chamber of Deputies in 1839, and re-elected in 1842 and 1846. After the revolution of February 1848, he was Minister of Public Instruction until 5 July, and improved, as such, the condition of the teachers, rendered the normal schools free and established free lectures. In 1848 he was elected to the Constituent, and 10 March 1850, to the Legislative Assembly. After the *coup d'état* of December 1851, he left France; during his absence, he was elected a member of the *corps législatif*, but refused to take the oath. He was re-elected in 1857, but again refused to serve. He did not take his seat until 1864, and was made a life senator in 1875. He spoke for the last time in 1888, a few weeks after his son Sadi had been elected President of the Republic, and was the author of 'Mémoires sur Carnot par son fils' (2 vols., 1861-64); 'La Revolution française' (2 vols., 1867); 'Lazare Hoche' (1874); and with M. d'Angers, 'Mémoires de Bertrand Barère' (4 vols., 1842-43). For his biography, consult the Proceedings of the Académie des Sciences, Morales et Politiques (Paris, January 1894); also Hubbard, 'Une famille républicaine: les Carnots' (Paris 1888).

**CARNOT**, Lazare Nicolas Marguerite, French soldier and statesman: b. Nolay, Burgundy, 1753; d. Magdeburg, 2 Aug. 1823. From his youth he exhibited an uncommon talent for the mathematical and military sciences, entered the corps of engineers, and rose in office by the favor of the Prince of Condé. He published, afterward, 'Mathematical Essays,' which

caused him to be elected a member of several learned societies. His eulogy on Vauban received the prize of the Academy of Dijon. In 1791 he was appointed deputy to the Constituent Assembly, but at first took part only in military affairs. On his proposal the officers of the nobility were removed from the army, and others substituted from the citizens. He also proposed that implicit obedience should only be demanded of the soldier in presence of the enemy, at other times he should have all the privileges and rights of the citizen; a strange proposal to come from a military chief. As a member of the convention he voted for the death of Louis. In the following March he was sent to the Army of the North, where he put himself at the head and repulsed the enemy. On his return to the convention he was made a member of the Committee of Public Safety. The influence of Carnot in the military operations now began to be more deeply felt. In possession of all the plans deposited in the archives of Louis XIV, he organized and directed the French armies; and his direction undoubtedly contributed very much to their success. After the fall of Robespierre he was often accused, but always acquitted, because his duty had been to take care of the defense of the country, and he could not be made answerable for the cruel decrees of Robespierre, in which Carnot's name, as he was a member of the committee, was of course to be found. At the establishment of the Directory in 1795 Carnot was chosen a member, and for some time maintained an important influence. Barras at length succeeded him in the Department of War, and was ever after his enemy. His plan for the overthrow of Barras was unsuccessful, and with some others he was sentenced to transportation on the 18th Fructidor (4 Sept.) 1797. He fled to Germany and published a defense, which was eagerly read in Paris, and by the exposure of the conduct of his former colleagues hastened their overthrow on the 30th Prairial (18 June) 1799. After the 18th Brumaire Carnot was recalled, and appointed *inspecteur aux revues*, and two months later, in April 1800, Minister of War. He soon after retired into the bosom of his family, but was called to the tribunate, 9 March 1802. He often opposed the views of the government, voted against the consulship for life, and his was the only voice raised against the proposal for the Imperial dignity. He remained, however, a member of the tribunate till it was abolished, passed the next seven years of his life in retirement and published several valuable military works. In 1814 Napoleon gave him the chief command at Antwerp. He connected a vigorous defense with a careful regard for the interest of the city, which, by the command of Louis XVIII, he afterward surrendered to the British General Graham. He still retained his titles and his honors, but as a firm republican he could never expect the favor of the court; particularly as, in his memorial to the King, he openly and severely censured the measures of government, in consequence of which he was passed over in the new organization of the Academy of Sciences. When Napoleon was once more at the helm of state in 1815, he made Carnot count and peer of the empire, and pressed upon him the Ministry of the Interior. Carnot discharged the difficult duties of this office with his usual in-

tegrity. After the Emperor's second fall he was made a member of the provisory government of France, and was afterward the only one of the members of it comprehended in the ordinance of 24 July. He retired to Cerney, where he employed his pen on political subjects; then to Warsaw with his family; and finally to Magdeburg. Among Carnot's writings the most valuable are his 'Essai sur les machines'; 'Réflexions sur la métaphysique du calcul infinitésimal'; 'Sur la géométrie de position'; 'De la défense des places fortes'; 'Exposé de la conduite politique de Carnot, depuis le 1 Juillet 1814.' In Magdeburg Carnot published 'Mémoire sur la fortification primitive'; and a volume of poems. He was rigid in his love of virtue, a scholar, a general and an inflexible republican. He was universally esteemed, both in France and in foreign lands, and was honored by all parties. Consult Arago, 'Eulogy of Carnot' (in Vol. I of Arago's 'Œuvres complètes,' Paris 1854).

**CARNOT, Marie François Sadi**, President of the French Republic, grandson of Lazare Nicolas Carnot (q.v.): b. Limoges, 11 Aug. 1837; d. Lyons, 24 June 1894. He was educated at the École Polytechnique and became a civil engineer. His construction of the large tubular bridge at Colognes-sur-Rhône brought him to the public's attention. He was stationed as government engineer at Annécly in 1870 and in 1871 M. Gambetta appointed him prefect of the Seine-Inférieure, entrusting him with the duty of seeing to the defenses of his department, a task which he fulfilled with great ability. After Paris capitulated, he resigned, to become deputy from Côte d'Or in the National Assembly. In 1876 he was elected member of the new Chamber of Deputies; the year following, secretary to that Chamber; and occupied an important post with the Public Works Committee, becoming its minister in 1880-81, and was re-elected in 1885 in M. Brisson's Cabinet; in 1886 he became Minister of Finance, retaining this post under Brisson's successor, De Freycinet. In 1887 he was elected President of the French Republic in succession to M. Jules Grévy, but before his term of office had expired he was assassinated at Lyons by an Italian anarchist named Caserio. Consult Hubbard, 'Une famille républicaine, les Carnot' (Paris 1888).

**CARNOT, Nicolas Léonard Sadi**, French physicist: b. Paris, 1 June 1796; d. there, 24 Aug. 1832. He was educated at the polytechnic school; in 1814 he entered the engineer corps, where he served until 1823, becoming captain in 1826. In 1824 he published his book, 'Réflexions sur la puissance motrice du feu,' in which he laid down the principle that the efficiency of a thermodynamic engine is proportional to the amount of heat transferred from the source of heat to the condenser; and that heat passes only from a warmer to a colder body. This is called the second law of thermodynamics and is known also as Carnot's principle. It is also significant that he observed the principle of the constant quality of energy, a theory which was later developed as that of the "conservation of energy." An English translation of his great work was made by R. H. Thurston; Kelvin's elaboration is appended (New York 1890).

**CARNOTITE**, a mineral first described in 1899, and now one of the most important ores of uranium. It is a hydrous vanadate of uranium and potassium, its formula being, perhaps,  $K_2O \cdot 2U_2O_5 \cdot V_2O_5 \cdot 3H_2O$ . Radium has been shown to be present in it and radiographs may be made from the crude mineral. It seems likely that it will become an important ore of radium. It is a canary-yellow crystalline powder, usually occurring disseminated through sandstone, but sometimes in earthy masses of considerable richness. Its chief locality is in Montrose County, Colo., but it has recently been reported from Utah.

**CARNUTES**, *kär-nütéz*, or **CARNUTI**, an ancient tribe living in central Gaul, at war with Cæsar in 52 B.C., having joined Vercingetorix. Cæsar burnt their chief town, called Cenabum. Augustus made the Carnutes, a "civitas foederata" (an allied state) and permitted them to retain their own institutions. Their chief city was also called Carnutes. Consult Holmes, 'Cæsar's Conquest of Gaul' (2d ed., Oxford 1911).

**CARO**, *kä'rö*, **Annibale**, Italian author: b. Civita Nuova 1507; d. 1566. In 1543 he was appointed secretary to Pietro Ludovico Farnese, Duke of Parma and Piacenza, who entrusted him with several missions to Charles V. After the assassination of the Duke his own life was in considerable danger. He took refuge in Parma, and was treated in a friendly manner by the new Duke, Ottavio Farnese, whose two brothers, the cardinals, Ranuccio and Alessandro, took him successively into their service. With the latter he remained from 1548 to his death in 1566, and received from him several ecclesiastical preferments. Caro devoted himself chiefly to the study of numismatics and the Tuscan language, and his pure and elegant style in verse and prose soon became generally admired. His translation of the Æneid in blank verse is excellent. After his death appeared a translation by him of Longus, and of Aristotle's 'Rhetoric'; also 'Rime' (1569), and 'Lettere familiari' (1572-75), the former of which are admired for the elegance of the verse, and the latter as models of beautiful Italian prose. The best editions of Caro's works were published in Venice (1757), in Milan (1806), and a volume of selected works appeared in Florence (1864).

**CARO**, **Elme Marie**, French philosopher: b. Poitiers, 4 March 1826; d. 13 July 1887. He studied at the Stanislas College and the Ecole Normale, graduating in 1848. He was at first professor in several provincial universities, and, having received the degree of doctor, was appointed master of conferences at the Ecole Normale (1858). In 1861 he became inspector of the Academy of Paris; in 1864 professor of philosophy; in 1874 a member of the French Academy. He married Pauline Cassin, the author of 'Péché de Madeleine.' He was a very popular lecturer on Christianity. He contributed to magazines; and wrote 'L'Idée de Dieu' (1864); 'La Philosophie de Goethe' (2d ed., 1880); 'Etudes morales sur le temps présent'; 'Mélanges et portraits' (1888).

**CARO**, **Jakob**, German historian: b. Gnesen, 2 Feb. 1836; d. 1904. He was educated at Berlin and Leipzig, traveled in Galicia and southern Russia, and in 1863 became lecturer

at the University of Jena and later professor; in 1868 he was professor at Breslau. He has written 'Das Interregnum Polens 1856' (1861); 'Liber Cancellariæ Stanislai Ciolek' (1871-74); 'Lessing und Swift, Studien über Nathan den Weisen' (1869); 'Aus der Kanzlei Kaiser Siegmunds' (1879); 'Das Bündniss zu Canterbury' (1880); 'Beata und Halszka, eine Polnisch-Russische Geschichte aus dem 16. Jahrhundert' (1880); and a continuation of Röpell's 'Geschichte Polens.'

**CARO**, Mich., village and county-seat of Tuscola County, on the Cass River, 25 miles southeast of Bay City, on the Michigan Central and the Detroit, Bay City and Western railroads. It contains flour mills, grain elevators, lumber mills, foundries, machine shops, beet-sugar refinery, telephone works, marble yards, brick and tile works, harness factories and a fireless cooker manufactory. Beans and sugar beets are extensively cultivated in the neighborhood. Pop. 2,272.

**CAROB**, *kär'öb*, a tree, *Ceratonia siliqua*, of the family *Casalpiniaceæ*, native of the Mediterranean region, now widely cultivated in warm countries. It is known also as algaroba, karoub, carouba and Saint John's bread. It has shining pinnate leaves, racemes of red flowers, and flat pods 4 to 12 inches long filled with a pulp in which are embedded numerous seeds. The pods are an important forage crop in some countries, being eaten by all kinds of stock, and they are frequently used for human food, the sweet pulp being very palatable. They are reputed to be the locusts and wild honey found by Saint John in the wilderness, hence one of the common names. Thousands of tons of the pods are imported into England annually to be ground and used for stock-feed. In the United States they are sometimes seen on fruit-stands. The seeds are said to have been the original carat weight of goldsmiths.

**CARÖE**, *ka'rö-ç*, **William Douglas**, English architect of Danish parentage: b. Liverpool 1857. He was educated at Trinity College, Cambridge, and studied architecture with the eminent architect, John L. Pearson. He is architect to Southwell Cathedral, to the dean and chapter of Canterbury and to the ecclesiastical commissioners. Among his principal works are the archbishop's palace at Canterbury; bishop's palace at Bristol; Saint David's Church at Exeter; Wycombe Abbey School; the Jubilee Monument to Queen Victoria at Mentone, France. He has also restored many buildings of historic interest. He was president of the Architectural Association in 1895.

**CAROL**, a song of praise sung at Christmas or Easter. It originally meant a song accompanied with dancing, in which sense it is frequently used by the old poets. It appears to have been danced by many performers, by taking hands, forming a ring and singing as they went round. It has been said that the oldest carol was that sung by the heavenly host when the birth of the Saviour was announced to the shepherds on the plains of Bethlehem. It is probable that the practice of singing carols at Christmas-tide arose in imitation of this, as the majority of the carols declared the good tidings of great joy; and the title of Noël, nowells or nouvelles, applied to carols, would seem to bear out this idea. Carol singing is of

great antiquity among Christian communities, as the carol by Aurelius Prudentius, of the 4th century, will show. The Middle Ages were especially familiar with these songs. The first authorization for a collection of such carols to be made was issued to Thomas Tysdale (1562). For a while they disappeared under the Puritan régime, but with the Restoration a new book appeared called 'The New Carols for the Merry Time of Christmas, to Sundry Pleasant Tunes.' In England, the custom of "waits," i.e., groups of boys and men who go about singing in the village, still prevails in some sections. ('Hark the Herald Angels Sing,' (1739) and 'While Shepherds Watched Their Flocks by Night' are two well-known carols. Collections have been made by H. R. Bramley and Sir J. Stainer under the title 'Christmas Carols, Old and New' (London 1874); and by Martha E. Rickert, 'Ancient Christmas Carols, 1400-1700' (New York 1910).

**CAROLAN**, or **O'CAROLAN**, kār'ō-lān, Turlogh, Irish musical genius: b. near Nobber, County of Westmeath, about 1670; d. 1738. Having lost his sight at the age of 16, he studied the harp, and in after life not only maintained himself thereby, but even became famous. A collection of his ballads was published during the 18th century, but others have been handed down by the peasantry.

**CAROLI**, Pietro Francesco, Italian painter: b. Turin 1638; d. Rome 1716. He studied painting at Venice, Florence and Rome, and was professor in the Academy of Rome at his death. He is celebrated for his careful execution and beautiful coloring, and excelled particularly in perspective, of his skill in which he has left excellent specimens in his drawings of the interior of some of the Roman churches. Consult de Boni, F., 'Biografia degli artisti' (Venice 1840).

**CAROLINA**, P. R., town 15 miles southeast of San Juan, with which it is connected by rail. It is well built, has a fine climate and is in good sanitary condition. It contains a city hall, public schools and churches. Dairy farming and sugar-planting are the chief industries. Pop. 3,250.

**CAROLINA**, kār-rō-lē'na. This name is generally given to a famous law of the German Empire, of the year 1532, under Charles V, which he himself called an ordinance of criminal procedure (*Peinliche Gerichtsordnung*). From him it was a later period called *Constitutio criminalis Carolina*, or shortly *Carolina*. The arbitrary administration of justice, the disorder and cruelty which had become customary in the courts of Germany, where many a process was begun and ended with torture, and persons were sentenced even to death without regular process, gave occasion to this law. From the beginning of the peace of the land the necessity of such a law was felt throughout the country; but it was difficult in this, as in all other cases, to make the different members of the empire agree on one general measure. The Baron Johann von Schwarzenberg was chiefly instrumental in introducing this ordinance. He became Minister of State of the Prince-bishop of Bamberg, and succeeded in procuring an ordinance of criminal procedure for Bamberg to be drawn up and published in 1507. The same was also adopted in 1510 by the Margrave of Bran-

denburg and Franconia; and at last a law of criminal procedure for the empire at large was passed by the Diet at Ratisbon, in 1532. The Carolina contains 219 articles, which regulate the standing and oaths of judges, the character of witnesses, the penalties of different crimes, and the circumstances in which torture at that time common in criminal jurisprudence should be applied. Several German princes, as the Elector of Saxony, the Elector of Brandenburg, and of the Palatinate, protested against it, in order to protect the laws of their states and their own privileges against the legislative power of the Emperor; but at last the Carolina was established in almost every part of the empire. From the connection of Switzerland with Germany, and the fact that several Swiss towns were Imperial cities, German laws frequently passed into Switzerland, and the Carolina became the law by which even the Swiss troops in the service of the kings of France were governed until the French Revolution. Consult Zöpfl, 'Die peinliche Gerichtsordnung Kaisers Karl V' (Leipzig 1883); Esmein, 'Histoire de la procédure criminelle en France' (Paris 1882, pp. 300ff.); Daguin, F., 'Introduction d'un code de procédure pénale allemande' (Paris 1884, pp. 30ff.).

**CAROLINA**, Original Constitution of. For many years after the subversion of the old English order by political and religious insubordination, 1642-60, the dominant idea of the conservatives was to prevent its recurrence, as with the conservatives after the French Revolution; and their chief dread was of republicans and dissenters. It is an almost grotesque incident of this reaction, that by far its narrowest embodiment came from a liberal philosopher and an unbelieving incendiary politician,—John Locke and Lord Shaftesbury (Anthony Ashley Cooper). A group of eight noblemen, headed by the famous Lord Clarendon, and including Shaftesbury, were granted, on 24 March 1663, a tract called the province of Carolina, after Charles II; as extended 30 June 1665, it included the present North and South Carolina and Georgia, and in theory stretched west to the Pacific. "To avoid erecting a numerous democracy," in their own words, they had Locke, who was Shaftesbury's secretary, draw up (whether on his own lines or Shaftesbury's is a moot point) a form of government called the "Fundamental Constitutions," which is a classic for impractical absurdity even among Utopias. The mass of the people (not alone, be it remembered, the future immigrants, but a considerable population already living "there in pure democracy") were to be hereditary "leet-men," or serfs of the soil. Next above them was a sort of upper middle-class commons called "lords of the manor," who could let out 10-acre tenant farms. Over both (as the charter gave the proprietors the right to create titles of nobility other than English ones) were a fantastic self-perpetuating colonial *noblesse*, of "landgraves" and "caciques." Crowning the whole were the proprietors; the eldest was "palatine" or viceroy, the others were admiral, chamberlain, high constable, chief justice, chancellor, high steward and treasurer. The "leet-men" held three-fifths of the land; the nobility and "lords of the manor" one-fifth, not to be alienated after 1700; the proprietors the remaining fifth. The prov-

ince was divided checkerboard fashion into squares, first of counties; then each county into eight "seigneries" for the proprietors, eight "baronies" for the nobility (each seignory and barony to contain 12,000 acres, perpetually annexed to the title), and four "precincts," and each precinct into four "colonies" for the serfs. There was a parliament; but the commons were carefully kept powerless by giving them only 10 members out of 50, making only freeholders of 500 acres eligible to seats, and electing them for life; with the further proviso that land-graves could sit in either house at will, and vote on the same measures in both. All initiative was in a supreme executive council, which prepared and submitted all legislation to Parliament; and the proprietors had a veto on all. Each proprietor had a superior court at which he presided in person or by proxy; each nobleman held a court-leet for his barony, and there were precinct courts. The laws were worthy of this closet constitution. The English Church was established and supported by public taxation, in a province inhabited largely by Quakers, and the rest by Scotch Presbyterians, Huguenots, Lutherans, etc. No one could live or hold property in or be a freeman of the province who did not acknowledge God, and that he is to be publicly worshipped. Every person above 17 not a member of some church, or who did not subscribe the "Fundamental Constitutions" and promise in writing to defend and maintain them, should be an outlaw. There was a severe censorship of the press, of ceremonies, of fashions and of sports, in the hands of the nobility. Paid lawyers were prohibited; thus compelling the commons to put themselves under a relation of "clientage," in Roman fashion, to the nobility to avoid ruin. All commentaries on the constitution or laws were forbidden. This constitution was to replace one under which the people were ruled by a council of 12, chosen half by the proprietors and half by the assembly; that assembly consisting of 12 elected freeholders, so that the people had 18 out of 25 votes; with entire freedom of religion, civil marriage, security for five years from suit on cause arising outside of the country (for protection of emigrant debtors), exemption from taxation for the first year and no political or social superiors anywhere. That is, free Englishmen in virtual democracy were to become at a blow the serfs and villeins of the time of the Norman Conquest. The proprietors bound themselves by solemn compact to maintain this incredibly foolish instrument as unalterable forever, and evidently expected men to emigrate to a savage wilderness on such terms. Five successive forms of this constitution were promulgated before its entire abandonment in 1693, each in turn proclaimed permanent and unalterable; and the result, especially in Albemarle County (afterward North Carolina), was simple anarchy. The people set them utterly at naught; and while the former system had been legally abolished, it continued in force by sufferance. Resistance to law as a first principle of life became ingrained in them; and the character of the colony was long and deeply injured by the quarter-century of attempt to force its people, new and old, into this iron mold of extreme feudalism. For further history see NORTH CAROLINA; SOUTH CAROLINA.

**CAROLINA ALLSPICE.** See CALYCAN-THUS.

**CAROLINA-PINK, MARYLAND PINKROOT, or WORM-GRASS,** names given to the *Spigelia marilandica*, a plant of the order *Loganiaceae*, bearing scarlet flowers, and having a root used as a vermifuge. It occurs in rich woods and extends from New Jersey west, north and south to Wisconsin and Texas.

**CAROLINA RIDGE,** in geology, the name given to an elevation of the bottom of the Atlantic Ocean off North Carolina, that occurred in Miocene time. It deflected the Gulf Stream and caused a great change in climate along the Atlantic Coast. See MIOCENE; TERTIARY PERIOD.

**CAROLINE, The,** an American steamboat used in 1837 by the American sympathizers with the Canadian insurgents under William Lyon Mackenzie (q.v.). The latter, after years of agitation, had gathered a band of insurgents in December, and attempted to seize Toronto, capture the lieutenant-governor and his cabinet and proclaim a republic. He was defeated, and fled to Navy Island on the British side of the Niagara River. Some hundreds of American sympathizers joined him, and he set up a "provisional government," issued paper money and offered bounties for volunteers and a reward for the apprehension of the lieutenant-governor. On 29 December an American steamer, the *Caroline*, crossed over to his camp from Schlosser on the American side, laden with reinforcements, provisions and munitions; and returning, lay at Schlosser that night full of men presumably ready for a similar trip the next day. The Canadians, incensed at this outrageous violation of neutrality, sent over an armed party in boats to enforce it. They boarded the *Caroline*, hustled the passengers and crew ashore, killing one man (Amos Durfee) on shore in the fray, towed the vessel out into the stream, set it on fire and sent it over Niagara. A great uproar ensued. President Van Buren issued a proclamation ordering the neutrality laws to be respected, and, calling out the militia under Winfield Scott, he then demanded reparation from the British government. The latter naturally showed no great alacrity in responding. Shortly afterward, one Alexander McLeod came over to the American side, boasting that he was one of the boarding party and had killed one of the *Caroline's* men with his own hand. He was arrested, indicted by the grand jury for the murder of Durfee and imprisoned to await his trial. Fox, the English Minister, demanded his release; the Secretary of State (Forsyth of Georgia) replied that he was in the hands of justice in New York State and must await its course; Lord Palmerston thereupon assumed for the English government full responsibility for the assault on the *Caroline* and again demanded his release. But Fox in his letter curiously added that the government had every reason to believe that McLeod was not one of the boarding party; in which case, of course, he was either a mendacious braggart or a common murderer, and the matter of the *Caroline* was irrelevant. Webster, now Secretary of State, replied, ignoring this point, that if the case were in a Federal court the President would order a *nolle prosequi* entered; but it being in a State

court, he could only await its action, and if it did not discharge McLeod, the case should go up to the United States Supreme Court. In the July term of 1838 a writ of *habeas corpus* was sued for in the New York Supreme Court, but refused. McLeod was acquitted, however, and the whole affair dropped. See CANADA — DIPLOMATIC RELATIONS OF THE UNITED STATES WITH.

**CAROLINE AMELIA ELIZABETH**, Queen of England, wife of George IV, King of Great Britain and Hanover, second daughter of Duke Charles William Ferdinand of Brunswick: b. 17 May 1768; d. London, 6 Aug. 1821. She was married to the Prince of Wales, afterward George IV, in 1795. After the birth of her daughter, Charlotte Augusta (7 Jan. 1796), her husband abandoned her, declaring that no one could force his inclinations. This was the beginning of the disgraceful dispute between the two parties, which lasted till the death of Caroline, and exposed her honor to repeated accusations from her husband. The Princess of Wales lived retired from the court, at a country-seat at Blackheath, till 1808. In 1813 the contest was renewed between the two parties, the Princess of Wales complaining, as a mother, of the difficulties opposed to her seeing her daughter. In 1814 the Princess obtained permission to go to Brunswick, and afterward to make the tour of Italy and Greece, in which the Italian Bergami was her confidant and attendant. Many infamous reports were afterward circulated, relating to the connection between the Princess and Bergami. When the Prince of Wales ascended the throne, 29 Jan. 1820, he offered her an income of £50,000 sterling, on condition that she should renounce the title of Queen of England, and every title appertaining to that dignity, and should not again return to England. She refused the proposal, returned to England, 5 June, and the next day entered London amid public demonstrations of welcome. She was now tried for adultery, but not convicted, and in this trial Brougham acted as the Queen's attorney-general. Though banished from the court, the Queen still lived at Brandenburg House, maintaining a style suitable to her rank. She was refused admission to Westminster Abbey on the occasion of the coronation of her husband, on 19 July 1821, and published a protest in the newspapers. Her tomb at Brunswick has a very short inscription, in which she is called the unhappy Queen of England. Consult Nightingale, 'Memoirs of Queen Caroline' (London 1820); Adolphus, 'Life' (London 1821); Huish (London 1821); Wilk (London 1822); also Clerke, 'Life of Her Majesty Queen Caroline' (London 1821).

**CAROLINE BOOKS**, or **LIBRI CAROLINI**, a theological work in four books, prepared under the direction of Charlemagne (Carolus Magnus), in connection with the disputed question of image worship that seriously agitated the Church during the reign of that monarch. The second synod of Nicæa had given its approval to the use of images, agreeing in this point with the views of the Eastern Church. Owing to a misunderstanding of the Nicæan canons through a bad translation, which seemed to make the Eastern synod declare that the worship due to God alone, *latría*, should be

paid to images, the 'Libri Carolini' severely reviewed the doctrine. The condemnation of image worship as formulated in the Caroline Books does not, however, bear upon the inferior honor, *dulia*, paid to the saints and their images, or that given to the Virgin, *hyperdulia*. The author is unknown. Consult Hefele, 'Conciliengeschichte' (Vol. III, bk. XX, chap. II, 2d ed., Freiburg 1877).

**CAROLINE ISLANDS**, a large archipelago in the north Pacific Ocean, between lat. 3° and 12° N., and long. 132° and 163° 6' E., and between the Philippines and the Marshall Isles. Area, about 560 square miles. It contains many groups, embracing in all about 525 islands and islets. Many of them are mere coral reefs, little elevated above the ocean. The most westerly group is the Palaoas, or Pelæw Islands, which contain seven large and many small ones, all of coral formation. The next group, Yap or Gouap, lies northeast of the last. In its chief island, which is mountainous, precious metals have been found. The other principal groups are Lutke, Mortlock, Simiavin, Enderby and Hogoleu. The most easterly island is Ula-lan. The most important vegetable productions are palms, bread-fruit trees and bananas. Copra is also an important product, while some of the islands also yield shells. The commerce is mostly in the hands of the German Jaluit Company, which has stations on every important island. The inhabitants, numbering about 55,000, though mainly Micronesians, include various races, and have made very different degrees of progress in civilization. In the central groups they are of a handsome physical type, active and industrious, and have some commerce. On the east generally, and on the west, with the exception of the Pelew Islands, the inhabitants, though apparently of the same stock, are far less advanced. The islands were discovered in 1527 by the Portuguese, who gave them the name of Sequeira. In 1686 they were annexed and renamed in honor of Charles II by the Spaniards, who soon changed the name to New Philippines. After several futile missionary attempts in the 18th century, Spain took little active interest in the group until August 1885, when the German flag was raised over Yap. A serious dispute followed this act, and the question being submitted to the Pope as arbitrator, he decided in favor of Spain, reserving special trade privileges to Germany. In 1887 disturbances broke out at Ponapé, in which the governor, who had arrested one of the American Protestant missionaries, was killed by the natives; but the rising was soon suppressed. In February 1899 Germany purchased from Spain for about \$3,300,000 the Caroline and Pelew Islands, and all of the Ladrões, but Guam, which had been ceded to the United States in the treaty of peace that ended the Spanish-American War. Consult Christian, 'The Caroline Islands' (1899); Furness, 'Island of Stone Money' (1910); Salesius, 'Die Karolinen Insel Jap' (1904).

**CAROLINE MATILDA**, Queen of Denmark, daughter of Frederick Louis, Prince of Wales: b. 1751; d. Celle, Hanover, 10 May 1775. She was married in 1766 to King Christian VII of Denmark. She became the object of court intrigues caused by the jealousy of the grandmother and stepmother of her hus-

band. These led to the execution for treason of Counts Struensee and Brandt, who were of the Queen's party, and to the imprisonment of the Queen herself, who was liberated through the interference of her brother, George III of England. She received a pension of £5,000 and was allowed to retain the title of Queen. She spent her last years in a castle at Celle, Hanover. Her last hours are described in a small work, 'Die Letzten Stunden der Königin von Dänemark.' Consult Lagrèze, 'La reine Caroline-Mathilde' (Paris 1887), and Wilkins, 'A Queen of Tears.'

**CAROLINGIANS.** See CARLOVINGIANS.

**CAROLUS**, a gold coin struck in the reign of Charles I, and originally 20 shillings in value, afterward 23 shillings. The name was given also to various other coins.

**CAROLUS-DURAN**, *kā-rō-lūs-dū-rān*, **Auguste Emile**, French portrait painter: b. Lille, 4 July 1838; d. Paris, 18 Feb. 1917. His name was originally Charles Emile Auguste Durand. He studied under Souchon at the Lille Academy of Art, and afterward in Paris, where he copied the old masters in the Louvre, especially Velasquez and Leonardo. In 1861 he obtained the Wicar prize for painting and went to Italy and Spain, continuing his study of Velasquez, who remained his chief model. During his stay in Rome he completed his first important work, 'The Evening Prayer.'

His first painting to receive a medal was a historical subject, 'l'Assassine,' in 1866. It was presented to the Lille Museum by the French government. After 1866 Mr. Carolus-Duran turned his attention to portraiture, and in 1869 exhibited 'The Lady with the Glove,' a full length portrait of his wife in outdoor costume. The portrait was placed in the Luxembourg. Mr. Carolus-Duran made a specialty of painting portraits of women and children. He had painted portraits of the Duchess of Marlborough, the Marchioness d'Adda, the Princess de Wagram, Mrs. Astor, the Countess of Warwick, the Comtesse Castellane, Queen Maria Pia of Portugal and the Princess Obolinsky. His first exhibit in America was at Philadelphia during the Centennial Exposition of 1876. He exhibited a portrait of Mlle. Sophie Croizette, a well-known actress, who was his sister-in-law. He made several trips to this country. On one occasion he gave a lecture at the Chase School of Art and illustrated it by painting a portrait. In 1889 he was made commander of the Legion of Honor and was made a director of the French Academy at Rome in 1905. He also was made president of the Société Nationale des Beaux-Arts and was a member of the Institute. He painted a series of historical and genre subjects, among them being 'The Bathers'; 'Gloria Mariæ Medici,' a decorative composition for a ceiling in the Louvre; 'The Burial of Christ'; 'Dawn' and 'The Vision.' His portraits of men included those of Pope Pius X, Emile de Girardin, Gounod, Gustave Doré and Alphonse Carr. In his younger days Mr. Carolus-Duran gave fencing exhibitions and was known as one of the best swordsmen in France. He also showed skill as a sculptor. He married Mlle. Pauline Marie Croizette, herself an artist. Mme. Carolus-Duran received a medal at the

Salon of 1875. The couple had a son who joined the French army.

Mr. Carolus-Duran was commander of the Order of Leopold, grand officer of the Order of Saint Maurice et Lazare, commander of the Order of Charles III of Spain, commander of the Order of Christ de Portugal and grand officer of the Legion of Honor. He received the Grand Croix of the Order d'Isabelle la Catholique of Spain and the Medaille de Sauvetage. Consult Muther, 'History of Modern Painting' (New York 1907) and the biography by Alexandre (Paris 1902).

**CARON**, *Réné Edouard*, Canadian statesman: b. Sainte Anne, Lower Canada; d. 1876. He was educated at the Quebec Seminary and Collège Saint Pierre and called to the bar of Lower Canada in 1826. He was mayor of Quebec 1833-37 and was a member of assembly 1834-36. He was called to the legislative council in 1841, of which he was speaker 1843-47 and 1848-53. After holding office in the La Fontaine-Baldwin and Hincks-Morin governments, he became a judge of the Superior Court of Quebec, and afterward of the Court of Queen's Bench. He was one of the judges of the special Seigniorial Court, which in 1855 adjudicated on the questions arising out of the abolition of seigniorial tenures in Lower Canada.

**CARORA**, *kā-rō-rā*, Venezuela, city of the state of Lara, situated 95 miles south of Coro and 40 miles southwest of Barquisimeto on a tributary of the Tocuyo River. It was founded by the Spaniards in 1572. It has a considerable trade in gums, rubber and cochineal, tanneries and the raising of cattle, horses and mules are the chief industries. The city dates from the Spanish foundation of 1572. Pop. 6,000.

**CAROTID ARTERY**, either of the two great arteries which convey the blood from the aorta to the head and the brain. In the article on the aorta (q.v.) the origin of the carotid arteries is described—that from the right side springing from the innominate artery to supply most of the right side of the head; that on the left side arising directly from the aorta to supply all of the structures of the left side of the head. Apart from these slight variations in their origin on the two sides, the carotid arteries and their branches are practically duplicated in the two halves of the head. Thus the main branches, the common carotids, soon branch into two, the external and internal carotids. This division takes place about the level of the thyroid cartilage. The external carotid supplies the upper part of the front and side of the neck, the tongue, larynx, pharynx, face, the pterygoid regions, the upper part of the back of the neck, the scalp and the major portions of the brain membranes. The internal carotid soon enters the skull and supplies the greater part of the brain tissue, the orbital structures (the eye, etc.) and portions of the brain membranes. The branches of homologous arteries of the two sides anastomose somewhat, although many of the arteries of the brain are terminal arteries and do not anastomose. Occlusion of one of these vessels in the brain usually results in permanent injury. In deep cuts of the throat these arteries may be involved, but they lie very deep as a rule

and are not often severed. (Morris, 'Anatomy'; Gray, 'Anatomy').

**CAROTIN** (Lat. *carota*, "a carrot"), the coloring-matter of the carrot. It always accompanies chlorophyll and xanthophyll in the chloroplast, and is the coloring matter of some petals, fruits and other plant organs. The substances described by the terms erythrophyll, chrysophyll and etolin are probably carotin. Carotin is a hydrocarbon of the empirical formula  $C_{40}H_{56}$  and is closely related to xanthophyll, which has the formula  $C_{40}H_{48}O$ , and is possibly an oxidation product of carotin. It differs from xanthophyll in its ease of crystallization, solubility in various solvents, slightly different melting points and spectra. It may be extracted from the chopped carrot by the action of carbon disulphide, in which (as also in benzene) it is very soluble. It crystallizes in small, red plates, which are insoluble in water and in alcohol. A similar compound, called "hydrocarotin," is also known.

**CAROTTO** (kā-rō'tō) **FAMILY**. 1. **GIAN FRANCESCO**, jān frān-chēs'kō, Italian painter: b. Verona 1470; d. there 1546. He studied under Liberale at Verona and under Andrea Montegna at Mantua. His earlier productions are in imitation of the style of Montegna; but at a later period the study of the works of Leonardo da Vinci and Raphael produced a decided change. Carotto is not distinguished by the grandeur of his conceptions, but excels in character and expression, and in the softness and warmth of coloring. Verona contains most of his works. Among these is the 'History of Tobias,' a series of pictures in the church of Saint Eufemia. Others are the fresco of the 'Annunciation' (San Girolamo 1508); the altar of San Fermo Maggiore (1528); various frescoes and panels in San Giorgio in Braida and several panels in the Pinacoteca Comunale. Good examples of his art are in the Castello, Milan, the Chiesa di Carità, Mantua, in the Uffizi and Pitti, Florence, and in the museums of Dresden, Budapest, etc., 2. **GIOVANNI**, jō-vān'nē, Italian painter: d. 1555. He was the brother of Gian, and his pupil. He was chiefly an architectural painter and is celebrated for his copies of ancient ruins. He is also said to have given instruction to Paul Veronese.

**CAROUGE**, kā-roozh', Switzerland, a town of the canton of Geneva, on the left bank of the Arve, opposite Geneva, with which it is connected by a bridge. It has machine works, foundries, dye works and manufactures of watches. Founded in 1780 by one of the Sardinian kings as a rival of Geneva, the capital of the province of Carouge, it was ceded to Switzerland in 1816. Pop. (1911) 7,890.

**CARP**, a name applied to many fishes belonging to the *Cyprinidae*. The members of this family inhabit fresh waters and are extremely numerous in genera, species and individuals. It is estimated that there are more than 1,000 species. One group of the family, found in North America, includes fishes known as suckers, buffalo-fishes, redhorses and mullets, while another group contains the minnows, dace, fatheads, chubs, etc. They are all soft-finned fishes, with a stout, serrated spine, which stands in front of both the dorsal and anal fins. There are no teeth in the mouth, but they are

developed in the pharyngeal bones; that is, in the throat. The flesh is not of the best quality and is full of fine bones. The name carp is especially applied to one fish—*Cyprinus carpio*. This was introduced into North America from Europe by the United States Fish Commission, but it came originally from Asia. It inhabits our streams and lakes, where it is increasing rapidly in numbers. It reaches a length of two feet and may attain a weight of 40 pounds. It is a scaly, compressed, robust fish, with well-developed barbels and dorsal fin, and a short anal one; it is of brownish hue. Owing to its hardness, its durability under extreme temperatures, the facility with which it may be raised because of its adaptability to sluggish ponds and swampy lakes, it might form an important element in the fish food-supply of the North American interior, since farmers can raise it easily in their mill-ponds. It feeds upon vegetable fare, larvæ, insects, etc., and during the winter months hibernates, at which time it requires no food. The eggs, also, are very hardy, and number several hundred thousands to each individual. They adhere to aquatic grasses and weeds.

The carp is usually covered with large scales; but one variety of it, the "mirror carp," has only a few large scattered scales; while another species, the "leather carp," is wholly without scales. Consult the publications of the United States Fish Commission, and Gill, 'Smithsonian Miscellaneous Collections' (Vol. XLVIII, Washington 1907).

**CARP-SUCKER**, a common and little-valued fresh-water fish of the genus *Carpiodes*, related to the buffalo-fishes and suckers. It is found throughout the central part of the United States, takes its name from its carp-like form, averages about two feet in length and is a dull green above, grading into silver beneath.

**CARPACCIO**, kā-r-pā'chō, Vittore, Italian artist: b. Venice about 1450; d. 1525. He was one of the most celebrated masters of the old Venetian school, and was the rival of Bellini and the last Vivarino. He studied probably with Bastiani, and came also under the influence of Gentile Bellini. All that is known of his life is that he belonged to Venice, of which he has reproduced in the background of his pictures the streets and monuments. His distinguishing characteristics are natural expression, vivid conception, correct arrangement and great variety of figures and costumes. He also excelled as an architectural and landscape painter. His favorite employment was the dramatic representation of sacred subjects, several of which he has illustrated by a series of paintings. Of these the most celebrated are the histories of Saint Ursula and Saint Stephen. The former, consisting of nine pictures, is now in the Academy of Venice, and has been engraved; the latter, in five pictures, is in Paris, Milan and Berlin. The 'Madonna and Child Enthroned,' supposed to be an earlier production, is in the National Gallery, London. He also painted a number of smaller pictures. The latest research on Carpaccio may be found in the monograph by Ludwig and Molmenti (Milan 1906; trans. by Cust, London 1907).

**CARPANI**, kā-r-pā'nē, Giuseppe, Italian dramatist and writer on music: b. Villalbese, near Milan, 28 Jan. 1752; d. Vienna, 22 Jan.

1825. Having prepared for the profession of the law, he afterward devoted himself to literary pursuits, and produced a great number of plays and operas, partly translations and partly original. In 1792 he was editor of the *Gazetta di Milano*, and wrote violent articles against the French Revolution. He was obliged to leave the city after the invasion of the French and went to Vienna, where he was appointed censor and director of the theatre. In 1809 he accompanied the Archduke John in the expedition against Napoleon. Under the title of 'Haydine,' he published a series of curious and interesting letters on the life and works of his friend Haydn, the composer. These letters, published in a French translation as an original work by L. A. C. Bombet, or, as other biographers state, by Beyle (known under the *nom-de-plume* of STENDHAL), gave rise to a great literary controversy, in which Carpani vindicated his authorship most successfully. Consult Tipaldo, 'Biographa degli Italiani illustri' (giving a complete list of the works of Carpani); Colomb, M., 'Notice sur la vie et les ouvrages de M. Beyle' (1846).

**CARPATHIAN MOUNTAINS**, a range of mountains in central Europe, forming for the greater part of their extent a natural boundary of Hungary, in the shape of a semi-circular belt of nearly 800 miles in length, extending from Orsova on the Serbian frontier, to Pressburg. Its breadth is considerable, reaching a maximum of 240 to 250 miles, between the Banat and Transylvania. The Carpathian chain may be divided into two great sections, the East and the West Carpathians, the former curving from the mouth of the Nera to the source of the Theiss, and forming the boundary between Austria and Rumania; the latter proceeding from the sources of the Theiss and the Pruth, and terminating on the banks of the Danube west of Pressburg, and forming the boundary between Hungary and Galicia. To the western Carpathians belongs the remarkable group of the Tatra, in which is situated the culminating summit of the whole system, the Gerlsdorf Peak, 8,737 feet. Several other peaks exceed 8,000 feet. The loftiest summit of the eastern Carpathians reaches an elevation of 8,318 feet. The most remarkable and frequented passes are those of Teregova, leading from Orsova to Temeswar; of Vulkava, forming the valley in which the Schyl flows; and of the Rothen-thurm, in a gorge formed by the Aluta at the foot of Mount Szurul. The outer bend of the Carpathians is much steeper than that which descends toward the valleys of Transylvania and Hungary. The only important rivers which actually rise in the chain are the Vistula, the Dniester and the Theiss. Small lakes abound in the interior of the mountains, some at great elevations and of great depth. The formation of the Carpathians took place mostly in the Tertiary period, and was practically completed at the end of the Miocene. The eastern part of the Carpathian chain, from Orsova to the source of the Burcza, near Kronstadt, is entirely composed of primitive rocks. These are succeeded by grauwäcke, which extends to the sources of the Theiss, and is only interrupted by a primitive group between the pass of Borgo and the source of the Viso. A great chain of trachyte appears on the frontiers of the Bukovina and stretches to the point where the Aluta

begins to flow southwest. To the west of this chain, on approaching the plains, an extensive tract of sandstone belonging to the coal formation begins to appear and covers the greater part of Transylvania. Tertiary formations surround the vast plains of Hungary, which consist of a rich alluvium and must once have been the bed of a lake. Basalt frequently occurs, but no distinct traces of extinct volcanoes have been found. The Carpathian range is rich in minerals, including gold, silver, lead, quicksilver, copper and iron. Salt occurs in beds which have sometimes a thickness of 600 or 700 feet and are apparently inexhaustible. On the plateaus corn and fruit are grown to the height of 1,500 feet; higher up the mountain steeps are covered with forests of pine, oak, beech, chestnut and fir, some of them as high as 5,500 feet. Bears, lynxes and wolves are numerous in the forests. About 6,000 feet seems to be the vegetable limit. Above it a few lichens may be found, but in general nothing is seen but bare, steep rocks, many of them in the form of conical peaks. There are no glaciers nor perennial snow fields. Numerous passes across the system facilitate communication between Hungary and her neighbors to the east. See HUNGARY; GALICIA; RUMANIA.

**CARPATOS**, kār'pa-thōs, an island in the Ægean Sea, now called Scarpanto. In ancient times it belonged to Rhodes. It has been under Italian rule since 1912. It is situated midway between the island of Rhodes and Crete. It is 31 miles long and 8 miles in extreme breadth. Area 126 square miles. It has bare mountains, reaching a height of 4,000 feet. There are ruins of towns in several places. Pop. about 8,000, mostly Greek workers in wood and fishermen.

**CARPEAUX**, Jean Baptiste, zhōn bāp'tēst kār-pō, French sculptor: b. Valenciennes, France, 14 May 1827; d. Courbevoic, near Paris, 12 Oct. 1875. He studied at the School of Architecture in Valenciennes, and later went to Paris, becoming a pupil of Rude and of Duret. In 1854 he obtained the Prix de Rome. His bronze 'Neapolitan Boy' attracted notice; and 'Ugolino and His Four Sons' (1863), also in bronze, though it defied the canons of sculpture, made him famous. He settled in Paris in 1862. His masterpiece, a marble group, 'The Dance,' in the façade of the New Opera in Paris, fully showed his dramatic power and the exuberance of his imagination; but it provoked much hostile criticism as involving an attempt to stretch beyond their natural province the limits of the plastic art. The most notable of his later works are the great fountain in the Luxembourg Gardens, representing 'Four Quarters of the World Sustaining the Sphere'; a monument to Watteau at Valenciennes, and a painting of 'Napoleon in His Coffin' in the same museum. For his originality and virility he has been ranked with Rodin, Rude and David d'Angers. In painting he exhibited the same fearless handling of theme. Paris contains several thousand of his drawings; the Louvre possesses many of these as well as notable portrait busts of Alexandre Dumas fils, Napoleon III and the Princess Mathilde. Consult biographies by Claretie (Paris 1875); Chesneau (ib. 1880). Consult also Gonse, 'La sculpture française' (ib. 1895).

**CARPEL**, the leaf forming the pistil. Several carpels may enter into the composition of one pistil. See FLOWER.

**CARPENTARIA**, Gulf of, a large gulf indenting the northern coast of Australia, named for its discoverer, Pieter Carpenter. Cape York Peninsula, the northern extremity of Queensland, is on the east and Arnhem Land on the west. It contains a number of islands, among them Groote Eylandt, Sir Edward Pellew Islands and Wellesley Islands. Its maximum width is about 400 miles and its length 460 miles, stretching from lat. 11° to 17° 30' S. and from long. 136° to 142° E. The land around is generally low.

**CARPENTER**, Charles Carroll, American naval officer: b. Greenfield, Mass., 27 Feb. 1834; d. Jamaica Plain, Mass., 1 April 1899. He was promoted commodore 15 May 1893 and rear-admiral 11 Nov. 1894; was commander-in-chief of the United States Asiatic squadron from 27 Aug. 1894 till 9 Nov. 1895; and was retired on reaching the age limit, 28 Feb. 1896. During the summer of 1895 he rendered invaluable service in China in protecting American missionaries and in co-operating with United States Minister Charles Denby and the British and Chinese authorities to preserve peace, particularly after the Kucheng massacre.

**CARPENTER**, Edmund James, American journalist: b. North Attleboro, Mass., 16 Oct. 1845. After graduation from Brown University in 1866 he engaged in business until 1878, when he entered journalism. He was for many years on the editorial staffs of Providence, New Haven and Boston papers, and is contributing literary reviewer to the Boston *Transcript*. He has published 'A Woman of Shawmut: a Romance of Massachusetts Bay Colony, 1640' (1892); 'America in Hawaii' (1898); 'The American Advance' (1903); 'Long Ago in Greece' (1906); 'Roger Williams' (1909); 'The Pilgrims and their Monument' (1911); 'Memoirs and Letters of James Kent, LL.D.' in collaboration with William Kent; is also the author of many editorials, newspaper articles, literary reviews, translations and verses. In 1905 he received the degree of Litt.D. from Brown University.

**CARPENTER**, Edward, English socialistic writer: b. Brighton, England, 20 Aug. 1844. He was educated at Trinity Hall, Cambridge, and was for some time fellow and lecturer there, as well as curate under the noted F. D. Maurice. In 1874 he gave up his fellowship and left the ministry, and until 1881 lectured on science and music in university extension work. He has since devoted his time to literary work, market gardening and socialist propaganda. In 1884 he visited the United States in order to meet Walt Whitman. He has published 'Towards Democracy'; 'Love's Coming of Age'; 'Angels' Wings'; 'Adam's Peak to Elephantia'; 'Iolaus: an Anthology of Friendship'; 'Days with Walt Whitman'; 'The Drama of Love and Death'; 'The Healing of Nations,' etc.

**CARPENTER**, Francis Bicknell, American painter: b. Homer, N. Y., 6 Aug. 1830; d. New York, 23 May 1900. He studied with Sanford Thayer at Syracuse, N. Y. (1844), and in 1852 became an associate of the National Academy. Among his works are a portrait of

President Fillmore, in the City Hall, New York; a portrait of President Lincoln, in the capitol at Albany, N. Y.; and the 'Emancipation Proclamation' (1864), in the capitol at Washington. While executing the last-named painting he was closely associated with President Lincoln, and his observations during this period are embodied in his book entitled 'Six Months in the White House with Abraham Lincoln.'

**CARPENTER**, Fred Warner, American diplomat: b. Sauk Centre, Minn., 12 Dec. 1873. He received a public school education, studied law at the University of Minnesota, in 1898 was admitted to the bar and was stenographer to a law firm for several years. He became private secretary to William H. Taft, governor of the Philippines in 1901, continuing while Mr. Taft was Secretary of War and during part of his term as President. He was appointed Minister to Morocco in 1910, and 1911-13 was Minister to Siam.

**CARPENTER**, Joseph Estlin, English Unitarian scholar: b. Ripley, Sussex, 5 Oct. 1844. He was educated at University College, London, and Manchester New College (now at Oxford). He was minister of Oakfield Road Church, Clifton, 1866-69, and of Mill Hill Chapel, Leeds, 1869-75; was lecturer in Manchester New College, 1875-1906, and principal, 1906-15. He is one of the very foremost living authorities as a Sanskrit scholar and biblical critic, and besides editing Ewald's 'History of Israel' (Vols. III-V) and translating Tiele's 'Outlines of the History of Religion,' is the author of 'Life and Work of Mary Carpenter' (1879); 'Life in Palestine'; 'The First Three Gospels: Their Origin and Relations' (1890); 'The Bible in the Nineteenth Century' (1903); 'James Martineau, Theologian and Teacher'; 'The Historical Jesus and the Theological Christ'; 'Comparative Religion' (1913). With Rhys Davids he has edited the 'Sumairgala Vilasini' (1886); and the 'Digha Nikaya' (1889). With Harford-Battersby he has also edited the Hexateuch according to the revised version.

**CARPENTER**, Lant, English Unitarian clergyman: b. Kidderminster, 2 Sept. 1780; d. at sea, 5 April 1840. Designed for the ministry, he was sent in 1797 to the Northampton Academy. That school being temporarily discontinued, young Carpenter was placed at Glasgow College, where, however, he did not continue the length of time necessary to take his degree. Leaving college in 1801, he spent some time in teaching, and as librarian of the Athenæum, Liverpool. At Liverpool, Carpenter's views were so clearly in sympathy with those of the Unitarian denomination generally that he received several invitations to the pastoral charge of Unitarian congregations, and a call to a professorship in their college at York. In 1805 he accepted a call to Exeter, where he continued for 12 years. In 1806 the University of Glasgow gave him the degree of LL.D., although he had applied only for the degree of M.A. From Exeter he removed to the pastoral charge of the Unitarian congregation at Bristol (1817), where he continued until his death, which occurred by falling from a vessel between Naples and Leghorn, while on a tour for his health. Dr. Carpenter's piety was of an eminently practical turn. The instruction

of children was an object of constant interest. Amid all his pastoral and literary labors he always found time and energies to devote to juvenile instruction, and, even against the prejudices of his congregations, established Sunday-schools among the children of Exeter and Bristol. In his pastoral charges at Exeter and Bristol he was active in co-operation with others in the establishment of libraries, schools, savings banks and institutions for general improvement and welfare. His published works are mainly theological and doctrinal, in support of the Unitarian sentiments he had early espoused. Among his more important works are 'An Introduction to the Geography of the New Testament'; 'Unitarianism, the Doctrine of the Gospel' (1809); 'Examination of the Charges Against Unitarianism' (1820); 'Harmony of the Gospels'; 'Systematic Education' (2 vols., 1815); 'Principles of Education' (1820); and a volume of sermons. Mild in controversy, faithful in humane labors and practically devoted to the improvement of society, Dr. Carpenter was greatly respected even by those who were his most staunch antagonists in theology. Consult his 'Memoirs,' edited by his son, R. L. Carpenter (London 1842).

**CARPENTER, Louis George**, American engineer: b. Orion, Mich., 28 March 1861. He was graduated at Michigan Agricultural College in 1879, and after serving there as instructor in mathematics and engineering took post-graduate courses at the University of Michigan and Johns Hopkins University. In 1888 he became professor of engineering at the Colorado Agricultural College and meteorologist and irrigation engineer at the Agricultural Experiment Station, and organized the first systematic course in irrigation engineering given in any American college. He founded the American Society of Irrigation Engineers in 1891. He was special agent of the United States artesian wells investigation in 1890, and in 1899 was appointed director of the Agricultural Experiment Station at the Colorado Agricultural College. He is a member of many American and foreign engineering societies. He has published government reports, 'Artesian Wells in Colorado' (1890); 'Irrigation Progress in Colorado' (1891); and many papers on irrigation.

**CARPENTER, Margaret Sarah**, English painter: b. Salisbury, England, in 1793; d. London, 13 Nov. 1872. Her first studies in art were obtained from the collection of Lord Radnor at Longford Castle, and later she competed for several years for the prizes offered by the Society of Arts, several times successfully, and once being awarded the gold medal for the study of a boy's head. In 1814 she went to London, where she secured for herself a wide reputation as a portrait painter; in that year her exhibits of a portrait of Lord Folkestone at the Royal Academy and the pictures 'Fortune-Teller' and 'Peasant Boy' at the British Institution at once gained for her great popularity and marked the beginnings of her rapid rise. In 1866 upon the death of her husband, W. H. Carpenter, keeper of the prints and drawings in the British Museum, she was granted by the Queen an annual pension of £100. Between the years 1816-66 she exhibited

147 pictures at the Royal Academy, 50 at the British Institution and 19 at the Society of British Artists. Chief among her pictures are 'Lord Kilcourse and Lady Sarah de Crespigny' (1812); 'Lord Folkestone' (1814); 'Mr. Barrington' (1815); 'Sir Henry Bunbury' (1822); 'Lady Eastnor' (1825); 'Lord de Tabley' (1829); 'Justice Coleridge' (1830); 'Lady Denbigh' (1831); 'Mrs. Herries' (1832); 'Lady King, daughter of Lord Byron' (1835); 'Archbishop Sumner' (1852), etc. In the National Portrait Gallery are also three portraits from her brush—those of Richard Parkes Bonington, the painter; John Gibson, the sculptor; and Patrick F. Tytler, the historian. In the South Kensington Museum are three pictures: 'Devotion' (1822); 'The Sisters' (1840); and 'An Old Woman Spinning.' Consult Clayton, E. C., 'English Female Artists' (Vol. I, pp. 386-88, 1876).

**CARPENTER, Mary**, English philanthropist; b. Exeter, 3 April 1807; d. Bristol, 15 June 1877. She was the eldest daughter of Lant Carpenter (q.v.). Her special work was for the neglected children of the poor and young criminals. She established a number of schools and reformatories, including the Red Lodge, a girls' school at Bristol, of which she was superintendent. She visited India in 1866, 1868, 1869 and 1875; and came to the United States and Canada in 1873, where she spoke on prison reform. She wrote 'Reformatory Schools for the Children of the Perishing and Dangerous Classes' (1851); 'Juvenile Delinquents' (1853); 'Our Convicts' (1864); and 'Six Months in India' (2 vols., 1868). Consult Carpenter, J. E., 'Life of Mary Carpenter' (London 1879).

**CARPENTER, Rolla Clinton**, American engineer: b. Orion, Mich., 26 June 1852. He studied at the Michigan Agricultural College, M.S., LL.D.; was graduated at the University of Michigan in 1875; student Cornell, M.M.E., 1888; was professor at the Michigan Agricultural College, 1878-90; professor of experimental engineering, Cornell University, since 1890; member American Society Mechanical Engineers (vice-president; chairman Committee on Research); American Society Civil Engineers; American Society Mining Engineers; American Society Heating and Ventilating Engineers (president, 1898); Society Automobile Engineers (vice-president); consulting engineer for Helderberg Portland Cement Company, Cayuga Lake Portland Cement Company, Quaker Portland Cement Company, Great Northern Portland Cement Company, Belleville Portland Cement Company, Atlas Portland Cement Company, Kosmos Portland Cement Company, California Portland Cement Company and others; has constructed numerous power stations for electric railways and has had active charge of many engineering constructions; patent expert in several important cases; judge of machinery and transportation, World's Fair, Chicago, 1893, Pan-American Exposition, Buffalo, 1901, Jamestown Exposition, 1907; member of committee to report to President of United States respecting slides in Panama Canal 1915-16; author 'Experimental Engineering' (7 eds., 1890, 1902, 1909); 'Heating and Ventilating Buildings' (7 eds., 1898, 1902, 1909); and numerous papers

in 'Transactions American Society Mechanical Engineers,' 'Transactions Heating and Ventilating Engineers,' etc.

**CARPENTER, William**, English editor and author: b. Saint James, Westminster, 1797; d. Colebrooke Row, Islington, 21 April 1874. Being the son of a poor tradesman he was put to work early in life and obtained no education, but entering the service of a bookseller he soon learned to speak fluently several ancient and modern languages, and took great interest in the study of biblical subjects. With William Greenfield he edited the *Scripture Magazine*, which was later known as 'Critica Biblica' (4 vols., 1824-27); in rapid succession he became editor of *Shipping Gazette* (1836); *Era* (1838); *Railway Observer* (1843); *Lloyd's Weekly News* (1844); *Court Journal* (1848); *Sunday Times* and *Bedfordshire Independent* (1854). He issued a publication 'Political Letters' (1830-31), which he claimed was not liable to the stamp duty on newspapers, but at his trial in 1831 was convicted and imprisoned for some time. Carpenter wrote many treatises on the subject of political reformation and from 1851-53 was honorary secretary to the Chancery Reform Association. Among these works are 'The Elector's Manual' (1832); 'The Political Text-book' (1833); 'Peerage for the People' (1841); 'The Corporation of London as it is and as it should be' (1847). Of his other publications the most noteworthy are 'Sancta Biblica' (1825); 'Anecdotes of the French Revolution of 1830' (1830); 'Life and Times of John Milton' (1836); 'The Biblical Companion' (1836); 'Relief for the Unemployed: Emigration and Colonization Considered' (1841); 'A Comprehensive Dictionary of English Synonyms' (6th ed., 1865); 'An Introduction to the Reading and Study of the English Bible' (3 vols., 1867-68), etc.

**CARPENTER, William Benjamin**, English physiologist and naturalist: b. Exeter, 29 Oct. 1813; d. 19 Nov. 1885. He was the eldest son of Lant Carpenter (q.v.); was educated in his father's school at Bristol, and in 1833 entered University College, London, as a medical student. Two years later he went to Edinburgh University, where he was graduated as M.D. in 1839; and in that year also he produced his first important work, 'The Principles of General and Comparative Physiology.' In 1844 he was elected a fellow of the Royal Society and also obtained the Fullerian professorship of physiology at the Royal Institution. From 1847 to 1852 he was editor of the *British and Foreign Medico-Chirurgical Review*, was one of the editors of the *Natural History Review*, and in 1856 he was appointed registrar of the University of London, a post which he resigned in 1879. He wrote several well-known works on physiology, one of which has been already referred to. Others are 'Principles of Mental Physiology' (4th ed., 1876) and 'Principles of Human Physiology' (1846, new edition by H. Power 1881). Still other works of his are 'Introduction to the Study of the Foraminifera' (1862); 'The Microscope and Its Revelations' (1868; 6th ed., 1881); 'The Physiology of Temperance and Total Abstinence' (1853); 'Zoology and the Instincts of Animals' (1857); 'Mesmerism and Spiritualism' (1877); 'Nature and Man' (1888); besides many papers in sci-

entific journals. He took a leading part in the expeditions sent out by the government in 1868-70 for deep-sea exploration in the north Atlantic and contributed largely to the discussion of ocean circulation. He advocated the doctrine of vertical circulation independently of Dr. Lenz of Saint Petersburg, who in 1845 had begun to advance that theory. He was chosen president of the British Association at Brighton in 1872.

**CARPENTER, William Henry**, American philologist: b. Utica, N. Y., 15 July 1853. He received a university education at Cornell and Johns Hopkins, and at Leipzig and Freiburg universities; became instructor in rhetoric and lecturer on North European literature in Cornell University in 1883; instructor of German and Scandinavian languages in Columbia University, 1883-89; assistant professor of Germanic languages and literature in the same institution, 1889-90; adjunct professor, 1890-95; and in 1895 professor of German philology there. Since 1912 he has been provost of the university. He is vice-president of the Germanistic Society of America and editor of the *Germanistic Society Quarterly*; and trustee and secretary of the Columbia University Press. He is a member of the Authors and Century Clubs of New York. He has published several works in the line of his specialty, and has contributed largely to dictionaries and encyclopædias and to magazines and reviews.

**CARPENTER-BEE**, a species of bee (*Xylocopa virginica*) which burrows into dead tree-trunks, lumber and even into woodwork of buildings. It is a large, black-bodied bee, as big as the biggest bumblebee. Its burrow is about half an inch in diameter, runs horizontally across the grain of the wood for a short distance, then forms a tunnel at right angles to this entrance, running sometimes 12 to 18 inches. When the tunnels are complete, the cells are made and supplied with pollen. The cells are about seven-eighths of an inch long, and are separated from each other by partitions made of sawdust glued together. When the eggs, which are laid one in each cell, are hatched, the larvæ feed on the pollen-deposit until they are ready to bore their way out. The carpenter-bee will use the same burrow again and again, and its home is sometimes utilized by other species of bees.

**CARPENTERS' HALL**, Philadelphia, on the south side of Chestnut street between Third and Fourth. It was built shortly after 1770 (as an assembly house and club) for the carpenters' guild of that city, and probably for civic uses if desired. In 1774 it became famous as the chosen meeting-place of several conventions for the liberation of the colonies. The first was on 15 July, when the committee of correspondence of the colony appointed a session of committees from each county, as "the most effective means toward a union." Later, on 5 September, the first Continental Congress met in its "plain but spacious rooms" on the lower floor, although the State House had been offered them. Behind its closed doors were prepared the papers which Chatham said ranked with the greatest of the world. The second Congress also began its sessions there, 10 May 1775.

**CARPENTRAS**, kār-pān-trā, France, a town of the department of Vaucluse, situated 16 miles northeast of Avignon. In Roman times it was known as Carpentoracte, was a place of importance and possessed many handsome edifices, of which a few traces are left. The principal structures are an aqueduct, which crossed the valley of the Auzon by 48 arches; a Roman triumphal arch, a Gothic cathedral, a museum containing a collection of Phœnician bas-reliefs and the library containing 50,000 volumes. Carpentras has a considerable local trade, and weekly markets, which are among the most important in southern France. It was formerly the seat of a bishopric, and Pope Clement V had his residence there in 1313. The chief products are leather, wax, chemicals and fruit. It has also a considerable trade for its manufactures of silk, dyed fabrics and hats. Pop. 11,390.

**CARPENTRY**, the art of combining pieces of timber to support a weight or sustain pressure. The work of the carpenter is intended to give stability to a structure; that of the joiner is applied to finishing and decoration. The scientific principles of carpentry are founded on the doctrines of the composition and resolution of mechanical forces, and a knowledge of these doctrines, either theoretical or practical, is indispensable to the skilled carpenter. To go into the principles of the art would be merely to explain a particular application of these mechanical forces, which would be beyond the scope and limits of this work. An explanation of the terms employed in carpentry may, however, be useful to the general reader. The term "frame" is applied to any assemblage of pieces of timber firmly connected together. The points of meeting of the pieces of timber in a frame are called "joints." "Lengthening" a beam is uniting pieces of timber into one length by joining their extremities. When neatness is not required this is done by "fishing." In this mode the ends of the beams are abutted together, and a piece of timber placed on each side and secured by bolts passed through the whole. Sometimes the parts are indented together, and pieces termed "keys" are notched into the beams and side pieces. When it is desirable to maintain the same depth and width throughout the beam, "scarfing" is employed. This is cutting from each beam a part of the thickness of the timber, of the length of the intended joint, and on opposite sides, so that the pieces may be jointed together and bolted or hooped. In bolting scarfs, side plates of iron are used to protect the wood. When greater strength is required than can be produced by a single beam, "building" and "trussing" beams are resorted to. Building beams is combining two or more beams in depth so as to have the effect of one. In trussing the beam is cut in two in the direction of its length, and supported with cross-beams, as in roofing. "Mortise" and "tenon" is a mode of jointing timber. An excavation called a mortise is made in one piece and a projecting tongue to fit it, called a tenon, in the other. The tenon is confined in the mortise by a pin penetrating it laterally through the side of the mortised beam, or by an external strap of iron passing round the mortised beam and rivetted in the one terminating in the tenon. The timber

frame-work of floors is called "naked flooring." It is of three kinds—single, double and framed. Single flooring consists of a series of joists stretching across the whole void from wall to wall, without an intermediate support. The flooring boards are laid on the top of these, and the ceiling of the lower story fixed to the under side. Double flooring consists in laying binding joists across the floor about six feet apart, crossed above by bridging joists and also crossed below by the ceiling joists. Framed flooring is provided with girders or beams in addition to the binding, bridging and ceiling joists. To prevent the transmission of sound, a double ceiling of lath and plaster is sometimes used, but generally pugging is inserted between the roof and the ceiling. "Cornice bracketing" consists in rough wooden profiles of the room cornices, which are afterward lathed around and plastered. Partitions, when not required to bear weight, are formed by laying along the floor a piece of timber called a "sill," together with a corresponding piece along the ceiling joists, the space within being filled with vertical pieces called "quarters," to which the lath is nailed. When the partition has weight to support, it has to be trussed with posts and braces. The timbers which support the steps of a wooden staircase are termed the "carriage." They consist of two pieces of timber inclined to the "rake," or projection of the steps, and termed "rough strings," which may rest upon a piece of timber projecting horizontally from the upper wall, called a "pitching" or "apron" piece, which also supports the joists of the landing or "half pace." The "roof" is the framework by which the covering of a building is supported. It may consist of a series of timbers which are called "rafters" with the ends resting on the opposite walls, and the other ends meeting in a point. When loaded with the weight of the covering, this framework would be apt to thrust out the roof; a third piece is consequently added, which, like a string, connects the lower extremities of the rafters and prevents them from spreading. This is called a "tie," and the whole frame a "couple." When the tie is of such a length that it is apt to droop in the middle, or "sag," by its own weight, a fourth piece is added to unite it directly with the apex of the rafters; this is called the "king-post." If the rafters, too, are liable to sag, cross pieces called "struts" are introduced, uniting their centres with the centre of the tie. Instead of the king-posts and struts, the centre of each rafter may be joined to the tie by a piece falling perpendicularly on the latter, and to each other by a piece running across parallel to and above the tie, forming a parallelogram with the perpendiculars and the section of the tie enclosed by them. The suspending pieces are called "queen-posts," and the horizontal one a "collar-beam." The whole frame, constructed in either way, is called a truss. The trussed frames are placed at intervals of about 13 feet apart, and support horizontal pieces called "purlins," which run the whole length of the roof and support the common rafters with their covering. Ship carpentry is a special form of carpentry. The timbers are larger and heavier and of the harder kinds of wood. These must be shaped to the curved lines of the vessel and properly beveled to make close joints. This branch of carpen-

try is now confined to small vessels such as yachts, coasting schooners, barges, scows, etc.

The principal instruments used in carpentry are saws, as the circular-, band- and tenon-saws; planes, as the jack-plane, smoothing-plane, molding-plane, etc.; chisels, gouges, brad-awls, gimlets, descriptions of which will be found in their places. See BUILDING; CABINET-MAKING; JOINERY; SHIPBUILDING.

**CARPET** (Lat. *carpere*, to "pluck" or "card," as wool), a thick woolen fabric used for covering floors. The word originally meant (in old French) a coarse cloth in which packages were wrapped for packing upon the backs of men and animals. As man advanced in civilization and desire for comfort, he began to use his packing *carpite* as a wrap for himself and to cover his feet and limbs at night. From that he began to use it to protect his sandaled feet from cold stone floors. Then the material was made finer and gradually embellished with colors and designs. The art progressed most rapidly in the cold mountain districts of western Asia—Persia, Turkey, Syria. The people of these regions had time, patience and a love for things beautiful. They produced wonderful results with wool, camel's hair, or goat's hair, combined with a flaxen warp. All their work was (and still is) done most laboriously by hand on looms of the crudest sort. These fabrics of the better sort are almost indestructible with ordinary wear. Carpets are still in use in some of the palaces of Persia which have been constantly used since the end of the 16th century.

When woven floor-coverings were first used by man is hard to tell. Fragments of what might be such are found in Egyptian excavations indicating a possible use of them as early as 3000 B.C. That the skins of animals and rush mats were used by prehistoric man as protection from the cold stone of the cave dwelling is certain. Cyrus the Great had wonderful carpets when he placed Persia at the forefront of nations. Alexander found them in use in his victorious march through Asia to India.

The art of carpet-making in its best sense still remains with the Orient. No Occidental possesses the matchless patience properly to weave by hand the marvelous creations of the Far East. Some of the Indian carpets approach the fineness of those of Persia. The jute and cotton rugs of Japan, and the grass mattings of China, are samples of this art in poorer material.

In the United States there are samples of native workmanship which compare well with the productions of the East. The work of the Navajo Indian in particular is very quaint and perfect. His rugs or blankets, colored with native pigments and laboriously woven by hand, will wear for many years. Cortez found the palaces of Montezuma covered with grand rugs, many of them made of the skins of humming-

birds sewn together. See CARPET AND RUG INDUSTRY.

**CARPET-BAGGERS, CARPET-BAG GOVERNMENTS.** The admission of the Southern negroes to the franchise after the war involved their organization and leadership, and their representation in State and national offices by intelligent whites. As no Southern whites of character would undertake what they regarded as a crusade against civilization, the task fell to Northern Republicans. Those who undertook it were of all grades of personal integrity and honesty of purpose, from sincere old-fashioned abolitionists to mere scalawag adventurers; but they had one characteristic in common: the lack of property interests in the South to make its injury theirs. Hence the name, implying that their only possessions were in their carpet-bags. The name was at first given only to those whose one motive for residence there was election to office by aid of the negro vote; and the purpose of many was voiced in the utterance of one high official, that when he could no longer hold office from there he would no longer live there. But the régime of monstrous plunder and social and industrial ruin which the system brought on, the levying of fraudulent taxes, and the piling up of huge State debts for the future, soon effaced all distinctions. All Northerners who upheld the system or tried to protect the negroes' voting rights were confounded under the name; all State governments in any way protected from overthrow by United States troops were "carpet-bag" governments; and finally the entire years of Reconstruction, and that attempt itself, are compendiously known as the "Carpet-Bag Régime."

**CARPET-BEETLE**, a small beetle (*Anthrenus scrophulariæ*), often wrongly called "buffalo bug." In the grub or larval state, it is injurious to carpets and similar fabrics. It is an active, brown, hairy larva, the size of a grain of wheat, which works in a hidden manner from the under surface, sometimes making irregular holes, but more frequently following the floor-cracks and cutting long slits in a carpet. This insect was brought from Europe about 1874, and is abundant in the New England States and westward to Kansas. The adult insect is a minute, broad-oval beetle, about three-sixteenths of an inch long, with a red stripe down the middle of the back. When disturbed it folds up its limbs and feigns death. As a general thing the beetles begin to appear in the autumn, and continue to issue, in heated houses, throughout the winter and following spring. Soon after issuing they pair, and the females lay their eggs in convenient spots. The eggs hatch in a few days, and the larvæ develop rapidly. Their development is retarded by cold weather or by lack of food, and they may remain alive for an indefinite period. When, under normal conditions, the larva reaches full growth, the yellowish pupa is formed within the last larval skin, from which the beetle emerges later. The beetles are day-fliers, and when not engaged in egg-laying are attracted to the light. They fly to the windows, and may often be found upon the sills or panes. The carpet-beetle is very difficult to exterminate, and the best preventative is the use of movable rugs on hard-wood

floors. Suspected carpets should be taken up, beaten, sprayed out of doors with benzine, and then be well aired. Before relaying the carpet, tarred roofing-paper should be laid upon the floor.

Another similar pest is the black carpet-beetle (*Attagenus piceus*), whose larva is readily distinguished from the buffalo-bug by its cylindrical shape and lighter color. It is not so fond of working in cracks and cutting long slits in carpets, and in general is not so dangerous a species as the other. It sometimes produces in feather-beds a peculiar felting of the ticking. It has also been known to infest flour-mills, and is to a certain extent a feeder upon cereal products. Two years are required for its development from egg to beetle. Consult Howard and Marlett, 'Household Insects' (United States Department of Agriculture, Washington, 1896).

**CARPET AND RUG INDUSTRY.** Like many American industries, the manufacture of carpets had its beginnings in the Old World.

Probably the first carpetings made on a large scale were made in an establishment founded by Henry IV, King of France, at the Louvre in 1607. This establishment was followed in 1627 by one called the "Savonnerie" at Chailiot, the building having previously been used as a soap factory, and by one at Beauvais, established in 1664 by Colbert, minister of Louis XIV. Many of the weavers employed in these factories were Protestants and the revocation of the Edict of Nantes in 1685 caused a tremendous emigration of these people to other countries, more particularly to England, Holland and Flanders. Thus in England in 1735 we find that in the town of Kidderminster the manufacture of ingrain carpetings had been established, and although carpet-making had been attempted as far back as the reign of Edward III at Bristol, it did not gain a permanent foothold in the country until after the immigrations from France. In 1745 the Earl of Pembroke established a factory at Wilton in which he employed only French weavers, and this was followed in 1750 by an establishment founded at Fulham by a Capuchin friar for the manufacture of Savonnerie carpetings, but this was a failure.

The manufacture of Brussels carpet was introduced into England from Flanders, where it undoubtedly originated, by John Broom, who put the first loom into operation in 1749. This loom, though the secret of its operation was carefully guarded, was copied, and within a short time there was a number of similar looms in operation, and so successful were the makers of this kind of carpet that Kidderminster rapidly became the centre of trade for this class of goods.

With the opening up of trade with the colonies, the carpet manufacturers of the Old World began to look westward for new markets, and along with the early settlers came men who had learned the art of weaving and were seeking new fields in which their energies might have full sway.

Of the early carpet dealers in this country the first records are meagre, but in Parker's New York Gazette, issue of 30 June 1760, an advertisement appeared reading as follows: "J. Alexander and Company have removed their store to Mr. Kayne's house on Smith Street, where Mr. Proctor, watch-maker, lately lived,

where they sell check handkerchiefs, linens of different kinds, lawns and minonets, Scot's carpets, broad and narrow cloths, shoes of different kinds, undershirts, hats, stockings, with several other goods; Fine Scot's barley and herrings. Also a choice parcel of Old Madeira in pipes." Thus we see that carpets were sold in this country as early as the middle of the 18th century, but the manufacture did not commence until many years after the introduction.

The history of carpet-making in America may be divided into two periods, the first covering the times when all carpets were made on hand looms, and extending up to the year 1841, when the perfected power loom was introduced; the second period extending from 1841, when Erastus B. Bigelow of Boston, Mass., brought forth his perfected power loom and completely revolutionized the methods of carpet-making, up to the present time.

The earliest records show that W. P. Sprague was the pioneer in the weaving of carpets, and in 1791 opened a factory in Philadelphia for the manufacture of Axminster carpeting. It was the importation of this style of carpet that first suggested the principle of the protective tariff duty. At the time Alexander Hamilton, as Secretary of the Treasury, transmitted a message to the House of Representatives in which he recommended that a duty of 2½ per cent be laid on all imported carpets "to which the nature of the articles suggests no objection, and which may at the same time furnish a motive the more to the fabrication of them at home, toward which some beginnings have been made." This factory was followed in 1804 by one at Worcester, Mass., owned by Peter and Ebenezer Stowell, in which were six looms invented and constructed by themselves.

The manufacture of ingrain carpets in this country was begun early in the 19th century, the first ingrain mill probably being that established in 1810 by George M. Conradt, a native of Würtemberg, Germany, at Frederick City, Md. There carpets were made on a hand loom, on a drum having rows of pegs similar to the cylinder of a music box, by which the harness was worked. In 1821 a factory was established in New York by John and Nicholas Haight, with J. W. Mitchell, a Scotchman, who had come from Kilmarnock, the centre of the ingrain trade in Scotland, as superintendent. In 1825 Alexander Wright, who was the superintendent of a factory at Medway, Mass., owned by Henry Burdette, attempted to learn the processes of the Jacquard system, but was unable to gain any knowledge of them because the secrets were so jealously guarded that he was not even permitted to enter the mill. He thereupon went to Scotland, and after purchasing the best hand looms on the market and securing mechanics to operate them, returned and started the manufacture of carpets on a scale which for those times was very extensive. The factory was in 1828 sold complete to the Lowell Manufacturing Company, the machinery and looms being transferred to their new mill in Lowell upon its completion. Alexander Wright was the first superintendent of this mill, and together with Claude Wilson, one of the mechanics whom he had brought with him from Scotland, devised many improvements in the Jacquard loom, making it simple in construction, eliminating the more complex parts in the machinery,

and making the operation more easy and certain. Of course these looms did not reach a state of perfection till many years afterward, and the machinery was so expensive, the operation so tedious, and the skill required so great, in the making, that it was thought the demand for carpets would not justify such an outlay, but through perseverance and the gradual introduction of improved methods the efforts put forth by the Lowell company were amply repaid, and the founders lived to see the establishment become one of the largest carpet factories in the country.

In 1840 the carpet industry was started in New York by Robert Beattie, followed in 1841 by E. S. Higgins and Company, who engaged in the manufacture of ingrain carpetings. In 1844 Alexander Smith started a factory at West Farms, N. Y. In 1845 John Bromley commenced to manufacture in Philadelphia and was practically the pioneer in what has grown to be the largest manufacturing centre of the country; where more yards of carpet of all grades are made than in any other city in the world, and where some of the finest factories in the world are located.

At this period the manufacture of carpet in this country was far from being a large industry. In Massachusetts there were seven factories in operation; in Connecticut there were four; in New York, eight; in New Jersey, four; Maryland had one; and in Pennsylvania there were only five, all of which were in or near Philadelphia. Of the total number of looms then in operation, 1,500, probably not more than 1,250 were used for ingrain, the others being used for the manufacture of Brussels, damasks, Venetian or rugs. The largest mills then were: The Lowell company, operating 150 looms; W. H. McKnight, Saxonville, Mass., 150 looms; Orrin Thompson, Thompsonville and Tariffville, Conn., 250 looms; and W. H. Chatham, Philadelphia, 160 looms, while numbered among them were the first plants of such concerns as the Hartford Carpet Company, Robert Beattie and Sons, E. S. Higgins Carpet Company and McCallum and McCallum.

It was in 1841 that the second period in the history began. Erastus B. Bigelow (q.v.), a young medical student in Boston, 20 years of age, in 1839 became interested in the weaving of coach-lace, and started in to improve on the machinery, by which this class of goods was made, with the result that inside of two years he had brought forth an invention by the use of which the cost of the manufacture of these goods, which had been 22 cents a yard, was reduced to three cents. The same year he introduced a power loom for weaving ingrain carpets, raising the product of eight yards a day possible on the hand loom to 10 or 12 yards, and later, after making several improvements, extending this total to 25 or 27 yards a day. He also invented and patented the power loom for weaving Jacquard Brussels, Wilton and tapestry carpets. He was, however, unable to interest any of the manufacturers in his inventions and finally started a plant of his own at Clinton, Mass., and which was later organized as the Bigelow Carpet Company, now one of our greatest and most progressive companies. The exclusive right to use his process of manufacture in England was at once purchased by the Crossleys of England and A. & E. S. Higgins

of New York, and the Roxbury Carpet Company of Massachusetts acquired the use in the United States of his loom for tapestry and velvet during the term of the patent.

To John Johnson of Halifax, England, belongs the credit of first manufacturing tapestry Brussels and velvet carpetings in this country. He began operations at Newark, N. J., in a mill with 25 looms, but this later was moved to Troy, N. Y., and in 1855 was purchased by the Roxbury Carpet Company and moved to Roxbury, Mass. The product of these looms originally was 5 yards per day; in 1856 it had advanced to 16 yards under the management of the Roxbury company, and now the average output per loom ranges from 60 to 65 yards, mainly possible through the introduction of the Bigelow inventions.

In 1856 Halcyon Skinner, a mechanic in the employ of Alexander Smith at his West Farms factory, began his investigations into the construction of a power loom with the intention of making one himself of superior capabilities, and the result of his labors was that about a year later his patent was brought forth, but owing to the destruction of the mill by fire it was not until 1864 that his loom was put into operation in the new factory which Smith had built at Yonkers, N. Y. In January 1877 Skinner invented his power loom for the manufacture of moquette carpetings and later several important improvements were made on this, not only by him but by his sons, Charles and A. L. Skinner. This increased the output of one and one-half yards a day, the result of the labors of two men and a boy, to about 11 yards a day, and this has gradually been increased till the output now reaches about 15,000,000 yards a year, made on 1,000 power looms and employing over 5,000 people.

Of the more recent inventions the most interesting is perhaps that of James Dunlap of Philadelphia, who patented a process of printing tapestry carpeting in the cloth, a marked improvement over all other previous methods because of the fact that the coloring matter was pressed down into the roots of the pile and extended entirely through the fabric.

The employment of power looms for making rugs is comparatively modern. The importation of Oriental hand-made rugs led to imitations being woven, and so successful was this branch of the industry that a large proportion of dwellings is now supplied with one-piece rugs in place of carpeting made in breadths.

Ingrain was the first machine-made carpet to be widely introduced. It was first manufactured as a two-ply cloth, with two colors of yarn, the pattern on one side appearing in reverse colors on the other side. Later a three-ply was made with concealed cotton string warp. No pile is used with either two- or three-ply. Ingrain has also been known as Kidderminster or Scotch, from the place of its origin.

Brussels, like most carpets, is made with a pile. This is a thick, hair-like surface given to a fabric, so that the weaving is covered. A cut pile leaves short, protruding ends, as in plush; an uncut pile leaves protruding loops. In Brussels the pile is uncut, being looped tight, these loops forming the pattern. The body fabric may be woven of linen, cotton or jute; dyed worsted is used for the pile.

Wilton carpets or rugs, sometimes known as imperial Brussels, and also velvet, are made similarly to Brussels, except that the pile is cut automatically in the loom during the process of weaving.

Axminster carpet, sometimes termed chenille Axminster, has a fluffy thick pile, with a linen or hemp warp and chenille filling. This chenille cord may be of worsted or other material, but its distinguishing characteristic is that it has four or more soft threads.

Tapestry carpet resembles Brussels, being really an imitation, more loosely woven, and having the warp-yarn forming the pile colored, or printed in the warp. Upon tapestry are built various tufted fabrics as moquette. Persian or Smyrna rugs have usually a linen or hempen warp and filling, and a pile or tufts of colored wool twisted about the warp. The Turkish rug is very similar, but the manner of attaching the tufts is different.

Rag carpet is a separate industry, carried on by a considerable number of very small concerns, mainly by some lone weaver, who has a suitable loom, and makes a living by weaving up the rags saved by economical housewives of the neighborhood. There are no statistics of the rag carpet industry.

In 1849 there were 116 establishments making carpets and rugs in the United States. They employed over 6,000 hands, and their product in that year was worth \$5,400,000. In 1914 there were only 97 factories, but the volume of business had increased many times, and some of the factories, as in Philadelphia and Yonkers, are very large. The wage earners numbered 31,309, besides 1,720 salaried men. Nearly half the employees were women and children, and their average earnings were under \$10 weekly. The salaried men averaged \$33 weekly. The capital invested was \$85,153,000, and the annual product was valued at \$69,128,185, of which \$25,847,962 was the value added by manufacture. The industry experienced its greatest growth during the decades from 1880 to 1890, and from 1900 to 1910, showing 50 per cent gain in each 10-year period specified. Pennsylvania was the leading State in the industry almost from its inception, but New York State was in the lead in 1914. Each of these States produces about one-third of the carpets and rugs manufactured in the country. Massachusetts was third with 16 per cent, and no other State made much showing. There are now about 12,000 carpet and rug looms in operation, and the annual yardage manufactured is close to 100,000,000.

Axminster and moquette carpets and rugs ranked first in respect to quantity produced in 1914, and also in respect to value. The output reported for that year was 15,742,835 square yards, valued at \$18,578,693.

Tapestry Brussels carpets and rugs had the second largest output in respect to quantity, 13,614,354 square yards being produced, the decrease since 1909 being 20.3 per cent. In respect to value, however, this class of products occupied fourth place, being led by Axminster-moquette, tapestry velvet and Wilton.

Tapestry velvet carpets and rugs ranked third as to quantity and second as to value of output in 1914, and showed pronounced increases in both respects as compared with the

1909 figures. The production in the later year was 13,227,819 square yards, valued at \$12,867,635, representing increases of 24.1 per cent in quantity and 42.5 per cent in value as compared with 1909.

Wilton carpets and rugs which ranked fifth in respect to quantity and third in respect to value in 1914, also showed pronounced gains, the output in that year amounting to 5,616,263 square yards, valued at \$11,929,605, and representing increases of 5.1 per cent in quantity and 17.9 per cent in value over the corresponding figures for 1909.

The remaining products of the industry—consisting of body Brussels carpets and rugs, ingrain carpets and rugs, Smyrna rugs, Colonial or rag rugs, wool and paper-fibre rugs, other wool rugs, and other products—were valued at \$15,899,605 in 1914. The production of body Brussels, ingrains and Smyrna rugs showed pronounced declines in 1914 as compared with 1909.

The chief constituent material of the carpet and rug industry is wool, either in raw or in partially prepared form. The raw wool used in 1914 amounted to 52,552,449 pounds and cost \$10,493,743. Woolen and worsted yarns also constituted important materials. Of woolen yarn, 21,626,360 pounds, costing \$5,821,848, was used; of worsted yarn 9,267,278 pounds, costing \$4,592,906; of materials other than wool, yarn made of jute, ramie and other vegetable fibre is of greatest importance, the amount consumed being 59,148,266 pounds, costing \$6,040,186; cotton yarn to the amount of 24,619,137 pounds, costing \$4,637,673; and linen yarn amounting to 7,602,200 pounds, costing \$1,414,824.

More than three-fourths of the mills purchased the yarn which they used in weaving carpets, there being only 22 establishments which bought the wool, hair or cotton, and themselves spun the yarn they consumed. These establishments produced, for their own consumption, 35,615,821 pounds of woolen, 10,253,791 pounds of worsted and 2,068,435 pounds of cotton yarn. Thus the total amount of woolen yarn used in the manufacture of carpets and rugs was 57,242,181 pounds; of worsted yarn, 19,521,069 pounds; and of cotton yarn, 26,687,572 pounds.

**CARPET-SNAKE**, the name of two different snakes, given in reference to the variegated pattern of their coloration. (1) An Australian python, about six feet long when fully grown, and beautifully marked, but subject to much variation. "The more typical specimens are black above, each scale with a yellowish dot, with yellow spots . . . more or less arranged in rows. The under parts are yellow." It is widely distributed and numerous in Australia, except in the northern deserts, and is now regarded as a variety (*variegata*) of the diamond python (*Python Spilotes*). In their habits they are quite alike. They frequent open, stony ridges, well supplied with water, or the banks of swamps and lagoons, where they find the small mammals and young waterfowls on which they feed; they also spend much of their time in trees. (2) A viper (*Echis carinatus*) of northern Africa, and southern Asia, buff in color, marked with whitish spots and dark Y-shaped marks on the head. It rarely exceeds two feet in length, but

is very active and highly venomous, is semi-nocturnal in habits and causes the death of many persons annually, especially in southern India.

**CARPET SWEEPERS.** Carpet sweepers of a crude pattern were made in England hundreds of years ago, but not until 1876 was this device seriously considered as a time-saving, labor-saving household article. Several attempts had been made in this country as early as 1856 to produce a satisfactory carpet sweeper, but all fell short of the requirement. To Mr. M. R. Bissell is due the credit of producing the first carpet sweeper that did its work properly and satisfied the user, and millions of Bissell carpet sweepers are now in use throughout the world. It consists of a brush enclosed in a wooden or metal dustpan carried on four wheels, which also cause the brush to revolve. A later type is fitted with an air pump and in this the dust is drawn into the dustpan by suction as in the vacuum cleaner.

It is justly claimed for the carpet sweeper that it is at once the modern sanitary device for sweeping carpets and rugs; that it performs the work in one-quarter the time the corn broom requires and with 95 per cent less effort; that it raises no dust, thus protecting the furniture, draperies, bric-a-brac, etc.; that it confines all the dangerous germs within the pan receptacles, after which the contents can be burned or buried, thus promoting health and cleanliness at the same time.

The carpet sweeper has been constantly improved until to-day it is a thing of beauty as well as utility, and its use is recommended by the leading physicians of the world. As dust is admittedly a carrier of disease, it is clearly apparent that the sweeper is invaluable as a health-promoting appliance in the home, confining as it does all the dust and dangerous germs, to say nothing of its labor-saving, time-saving qualities. Where power or electric current is available the vacuum cleaner is fast displacing the early type of mechanical sweeper. In the vacuum cleaner the dust is drawn into a receptacle by suction. See VACUUM CLEANER.

**CARPI**, kār'pē, Italy, a town in the province of Modena and nine miles north of the city of Modena. It is the seat of a bishopric, suffragan to Bologna. It is surrounded by walls, defended by a citadel, and has two cathedrals, a seminary and manufactures of straw hats and spun silk. The neighborhood produces rice, wheat, hemp and flax. The chief industry, however, is the cultivation of the silkworm. Carpi was formerly the capital of the principality of Carpi. Pop. (1911) 27,465.

**CARPIO**, Manuel, mā'noo-ēl kār'pē-ō, Mexican poet and physician: b. Casamaloapan, 1 March 1791; d. 11 Feb. 1860. He studied medicine, translated the 'Aphorisms' of Hippocrates (Mexico 1823); and became professor of physiology in the University of Mexico. Entering political life he became a leader of the Conservatives. In 1825 and 1848 he was deputy, in 1851 senator and in 1853 councillor of state. Several editions of his 'Poesias' have been published, the latest at Vera Cruz and Paris in 1883.

**CARPOPHORE**, a stalk of a sporocarp; the stalk raising the gynecium above the whorl of the stamens, as in *Passiflora*. Also a pro-

longation of the axis between the carpels, as in *Umbelliferae*.

**CARPUS**, in anatomy, the bones between the forearm and hand, the wrist in man, or corresponding part in other animals. See HAND.

**CARPZOV**, kār'psōf, the name of a German family which has furnished several eminent jurists and theologians. The founder of the family was Simon Carpzov, burgomaster of Brandenburg, in the middle of the 16th century. He had two sons: Joachim, who at his death at Glückstadt in Holstein, in 1628, was commander-in-chief of the Danish army; and Benedict, b. 22 Oct. 1565; d. 26 Nov. 1624. He was appointed professor of law at Wittenberg in 1595, became chancellor of the Dowager-Electress Sophia at Kolditz, but afterward returned to Wittenberg. A second Benedict, son of the former, b. Wittenberg 1595; d. 1666; became assessor of the Supreme Court and professor of law at Leipzig in 1645, then councillor of the Court of Appeal and member of the privy council at Dresden. He was one of the most eminent jurists of his day, and is the author of several valuable legal works; but is justly censured for the severity and cruelty of his proceedings. He is said to have signed the death-warrants of not fewer than 20,000 persons. JOHANN BENEDICT CARPZOV, his brother (b. Rochlitz 1607; d. 1657); became professor of theology at Leipzig, and is famed as the author of the 'Systema Theologicum' (1653). He left five sons, one of whom, JOHANN BENEDICT (b. 1639; d. 1669), became professor of theology and pastor of Saint Thomas' Church at Leipzig, distinguished himself by his knowledge of Hebrew language and literature and translated several rabbinical works. Another member of the family, JOHANN GOTTLÖB CARPZOV, born at Dresden in 1679, became professor of Oriental languages at Leipzig, and died as superintendent at Lübeck in 1767. He was one of the most eminent theologians of his time, and wrote, among other treatises, 'Critica Sacra Veteris Testamenti' (1728); 'Introductio in Libros Canonicos Veteris Testamenti.' On the family of Carpzov, see Dreyhaupt, 'Beschreibung des Saalkreises' (Beilagen zu Theil 2 S. 26).

**CARQUINEZ**, kār-kē'nēs, or **KARQUENAS**, a strait between Contra Costa and Salano counties, California; its greatest width is two miles and its length seven miles; it is navigable, and connects the bays of San Pablo and Suisun. Benicia is on the north and Martinez, Port Costa and Crockett are on the south shore.

**CARR**, Dabney, American colonial politician: b. 26 Oct. 1743; d. May 1773. He was graduated at William and Mary College in 1762 and entered the profession of law. He was a member of the house of burgesses of Virginia, and moved and eloquently supported a resolution to appoint a committee of grievances and correspondence, in consequence of British encroachments. His resolution was adopted, 3 March 1773. He married a sister of Jefferson, by whom he is described as a man of sound judgment and inflexible purpose, mingled with amiability, and of a fanciful eloquence.

**CARR**, Eugene Asa, American army officer. b. Concord, N. Y., 20 March 1830; d.

1910. He was graduated at the United States Military Academy in 1850, and joined the Mounted Rifles. He accompanied the Sioux Expedition in 1855, and was active in suppressing the insurrections on the Kansas border in 1856. In 1860 he was engaged in a campaign against the Comanche Indians. He was in active service throughout the Civil War, commanding the 4th division of the Army of the Southwest and subsequently acting as commander of the same army. He commanded a division in the Vicksburg campaign in 1863, and led the assault on the works of that city, 18 May. In December 1863 he was assigned to the Army of Arkansas. At the close of the war he was promoted to brigadier-general, United States Army, and brevetted major-general of volunteers. In 1868-69 he was engaged against the Sioux and Cheyenne Indians, and afterward took part in other expeditions against hostile Indians. He fought in 13 engagements with Indians, was four times wounded in action, and received a congressional medal of honor and the thanks of the legislatures of Nebraska, Colorado and New Mexico. He was retired in 1893.

**CARR, Joseph Bradford**, American military officer: b. Albany, N. Y., 16 Aug. 1828; d. Troy, N. Y., 24 Feb. 1895. He joined the militia in 1849, and rose to the rank of colonel. In 1861 he was appointed colonel of the 28th New York Volunteers, and led them at the battle of Big Bethel and in McClellan's Peninsular campaign. He took part in the battles of Chancellorsville and Gettysburg, and for his bravery throughout the war he was brevetted a major-general of volunteers. After the war he became prominent in Republican politics in New York State, and was elected secretary of state in 1879, 1881 and 1883. In 1885 he was an unsuccessful candidate for lieutenant-governor.

**CARR, Joseph William Comyns**, English art critic and dramatist: b. 1 March 1849. He was educated at London University and was admitted a barrister of the Inner Temple in 1869. He has been English editor of *L'Art* and art critic of the *Pall Mall Gazette*. He has published 'Drawings by the Old Masters' (1877); 'The Abbey Church of Saint Albans' (1878); 'Examples of Contemporary Art' (1878); 'Essays on Art'; 'Papers on Art'; 'A Fireside Hamlet'; 'The United Pair'; 'The Naturalist'; 'The Friar'; 'Forgiveness'; 'King Arthur'; 'Some Eminent Victorians'; 'Coasting Bohemia.'

**CARR, Lucien**, American archæologist: b. Troy, Lincoln County, Mo., 15 Dec. 1829; d. Cambridge, Mass., 27 Jan. 1915. He was graduated at Saint Louis University in 1846. Having marked literary ability he turned to journalism, and from 1848 was connected with the *Missouri Republican*. Editorial work began to undermine his health and he retired for a time to the country, where he devoted himself to study. In 1867 he removed to Cambridge, which was his home for the rest of his life. Having early taken an interest in the study of the Indians and of American archæology, he was soon recognized as an expert in that field, and after the establishment of the Peabody Museum he was closely associated with its work, serving as assistant curator of the

museum from 1877 to 1894. With Prof. N. S. Shaler of the Lawrence Scientific School he wrote 'Prehistoric Remains of Kentucky.' Among his independent publications are 'The Mounds of the Mississippi Valley Historically Considered' (1883); and an historical volume on Missouri (1888).

**CARR, or KER, Robert, Viscount ROCHESTER, EARL OF SOMERSET**, a British politician: b. Scotland; d. July 1645. He followed James I to England, when that monarch became Elizabeth's successor. James chose him as his chief favorite and adviser, knighted him, gave him a seat in the House of Lords and assisted him in his schemes for a marriage with Lady Essex. The latter after procuring a divorce was married to the Earl, and in 1615 the couple were tried for the murder of Sir Thomas Overbury, who had been Carr's confidant in the amorous intrigue with Lady Essex. They were condemned to death but pardoned. Somerset lived in obscurity until his death. Consult Ranke, 'History of England, Principally in the 17th Century' (Vol. I, Oxford 1875); Gardiner, 'History of England' (Vol. II, London and New York 1889); the latter's article in the 'Dictionary of National Biography' (Vol. IX); Archbishop Abbot 'The Case of Impotency in that Remarkable Tryal An. 1613 Between Robert, Earl of Essex, and Lady Frances Howard' (London 1715); Amos, 'The Great Oyer of Poisoning' (London 1846).

**CARR, SIR Robert**, British commissioner in New England: b. Northumberland; d. Bristol, England, 1 June 1667. He was appointed to that office by Charles II in 1664, in conjunction with Nicolls, Cartwright and Maverick. In 1664, Nicolls and Carr captured New Amsterdam from the Dutch, calling it New York, in honor of the King's brother, the Duke of York, after James II. Carr forced the Swedes and Dutch on the Delaware into a capitulation. He returned to Boston in 1665, but met with stubborn opposition from the authorities, who refused to acknowledge his commissionership, as did also the people of New Hampshire. Maine, however, submitted and was governed separately from Massachusetts from 1666-68.

**CARRACCI, kâr-râ'chê, or CARACCI, Agostino**, Italian artist: b. Bologna 1558; d. Parma 1602. One of a family of artists who founded the Bolognese or Eclectic school of painting. He was a brother of Annibale Carracci, and distantly related to Lodovico Carracci, under whose guidance he studied art. He studied painting under Fontana and engraving with Tibaldi and Cornelis Cort. He attained great mastery in engraving, and engraved more pieces than he painted, in order, it is said, to please his brother Annibale, who became envious of his fame after one of Agostino's pictures had obtained a prize in preference to one of his own, and another excellent picture—'The Last Communion of Saint Jerome' (now in Pinacoteca of Bologna, 1592)—had gained his brother universal admiration. In 1600 Agostino accompanied Annibale to Rome, and assisted him in designing and painting the Farnesian Gallery. He painted the two principal features of the long walls, the 'Triumph of Galatea' and the 'Rape of Cephalus.' As many persons said that the en-

graver worked better than the painter, Annibale removed his brother, under the pretext that his style, though elegant, was not grand enough. Agostino went then to the court of the Duke of Parma, and painted there a picture representing the heavenly, the earthly and the venal love. There was only one figure wanting when, exhausted by labor and mortification, he retired to a Capuchin monastery where he died. He wrote a treatise on perspective and architecture. As an engraver he deserves great praise, and often corrected the imperfect outlines of his originals. He left behind 278 plates, a large number of which are original. He was distinguished for his exactness in drawing, his harmonious composition and the extreme delicacy of his coloring. For bibliography see CARRACCI, LODOVICO.

**CARRACCI, Annibale**, Italian painter: b. Bologna 1560; d. Rome 1609. He worked first with his father, who was a tailor. By the advice of Lodovico Carracci he learned drawing, and made the most astonishing progress, copying first the pieces of Correggio, Titian and Paul Veronese, and painting, like them, small pictures, before he undertook large ones. In the academy founded by the Carracci he taught the rules of arrangement and distribution of figures. He is one of the greatest imitators of Correggio. His 'St. Roque Distributing Alms,' now in Dresden, was the first painting which gave him reputation. His 'Genius of Glory' is likewise celebrated. In the Farnesian Gallery at Rome, which he, aided by his brother Agostino, painted (1600-04), there breathes an antique elegance and all the grace of Raphael. You find there imitations of Tibaldi (who painted at Bologna about 1550 with Nicolo del Abate), of Michelangelo (the style, indeed, somewhat softened), and the excellencies of the Venetian and Lombard schools. Outside of Bologna he is acknowledged as the greatest of the Carracci. In that city, however, Lodovico is more admired. Agostino, perhaps, had more invention, and Lodovico more talent for teaching; but Annibale had a loftier spirit, more spontaneity, naïveté and naturalness, and his style is more eloquent and noble. His atelier in Rome was the workshop of many famous artists, among them Domenichino and Albani. He was buried at the side of Raphael in the Pantheon. His best picture is that of 'The Three Marys,' now at Castle Howard, in Yorkshire, England. He excelled in landscapes, many of which may be found in Paris, Petrograd, Madrid, Florence and especially in the Palazzo Doria Panifili, Rome. Consult Tietze, "Annibale Carraccis Gallerie in Palazzo Farnese und seine römische Werkstätte," in 'Jahrbuch der kunsthistorischen Sammlungen des allerhöchsten Kaiserhauses XXVI' (Vienna 1906); Schmerber, 'Betrachtungen über die italienische Malerei im 17ten Jahrhundert' (Strassburg 1906).

**CARRACCI, Lodovico**, lō-dō-vē'kō, Italian painter: b. Bologna 1555; d. 1619. He was the eldest of the three Carracci, and is regarded as the chief founder of their school. He was the son of a butcher, and appeared at first to be more fit for grinding colors than for transferring them to canvas. But his slowness did not arise from deficiency of talent, but from

zeal for excellence. He detested all that was called ideal, and studied only nature, which he imitated with great care. At Florence he studied Andrea del Sarto, and enjoyed the instruction of Passigano. He went to Parma for the purpose of studying Correggio, who was then imitated by almost all the Florentine painters. At Bologna he endeavored to gain popularity for his new principles among the young artists, and united himself with his relatives, Agostino and Annibale Carracci, whom he sent in 1580 to Parma and Venice. In 1589 they established an academy for painters at Bologna, called the "Accademia degli Incamminati" (i.e., "of those on the right way"), which they directed jointly till 1600, the year of the departure of Agostino and Annibale for Rome. From that time till his death Lodovico was sole director. The academy was so successful that similar institutions in Bologna had to be closed. Among his most famous pupils were Domenichino and Guido Reni. His first principle was, that the study of nature must be united with the imitation of the best masters. He soon gave an example of this principle in his 'Prophecy of John the Baptist,' in the monastery of the Carthusians, imitating in single figures the style of Raphael, Titian and Tintoretto. With his two relatives he painted the frieze of the Palazzo Magnani, showing the 'Story of Romulus'; the frieze of the Palazzo Sampiere, in which his share was the 'Battle of a Giant with Zeus'; the frescoes of the monastery of Santa Maria in Bosco, representing scenes from the lives of Saint Benedict and Saint Cecilia. The finest works of Lodovico are in Bologna, especially in the picture gallery or *Pinacoteca*, and among them are 'The Annunciation'; 'The Transfiguration'; and 'St. George and the Dragon.' For the cathedral of Piacenza he painted in 1608-09 two large canvasses representing the 'Burial of Mary' which are now in the Galleria Farnese, Parma, and a series of fine frescoes; in the sanctuary, 'Choruses of Angels,' a 'Limbus,' and in the arch over the tribune 'Angels Strewing Flowers.' In the same year, he executed 'Conversion of Saint Paul' for the Munich Gallery. He excelled in architectural views and in drawing, and in general was very thorough in all the branches of his art. He also executed several fine engravings. Consult "Die Malerschule von Bologna" in Dohme, 'Kunst und Künstler Italiens' (Vol. III, Leipzig 1879); Bolognini-Amorini, 'Vite dei pittori ed artefici Bolognesi' (Bologna 1843); id., 'Le vite di Lodovico, Agostino, Annibale ed altri dei Carracci' (Bologna 1842); contemporary accounts by Malvasia, 'Felsina pittrice' (Bologna 1678; new ed., 1841); Baglione, 'Le vite dei pittori dal pontificato del Gregorio XIII' (Rome 1649).

**CARRAGEEN**, kār'ra-gēn, **CARRAGEEN**, or **IRISH MOSS**, a name applied to several species of marine algæ found abundantly near Waterford, Ireland, at a place called Carrageen, from which the name is derived. It abounds also on the rocks in other localities in Great Britain and Ireland, and is found on the east coast of North America. The species from which the carrageen of commerce is chiefly derived is seaweed called *Chondrus crispus*. The frond is thick, cartilaginous,

somewhat fan-shaped, and repeatedly forked; color, various shades of purple or green. It is gathered from the rocks, washed, bleached in the sun and dried, and is then the Irish moss of commerce. In hot water it swells up, and on boiling it dissolves. The results of the analysis of Irish moss are somewhat discordant; but the main constituent is a mucilage, which differs from gums, starches and jellies by not giving their characteristic reactions. It is nutritious, and is substituted for animal jelly and starches in the preparation of soup, jellies, creams and similar dishes. It is of value in pulmonary troubles, and is also used by painters and others in preparation of size. It is sometimes confounded with Iceland moss, which is a lichen. See ICELAND MOSS.

**CARRARA**, kār-rā'rā, Italy, city in the province of Massa-e-Carrara, Tuscany, on the Lavensa, near the Mediterranean, and 60 miles west-northwest of Florence, and in a valley surrounded by the marble hills to which it owes its celebrity. An academy of sculpture is established here, and several artists have their residence, attracted by the convenience of obtaining marble almost cost-free. Carrara has some fine churches, an academy of the fine arts, a statue of Garibaldi. From 400 quarries 4,500 workmen cut and ship more than \$1,000,000 worth of marble yearly, and 600 quarries in the neighborhood help to swell the total. The finest and whitest Italian marble, of which the most valuable varieties are Polvaccio, Bettogli and Crestola, is found in the valley of Torano, although in recent years the bluish marble of Bardiglio has come into favor. The Romans, whose tools are frequently discovered, called the stone "marmor lunense," from the city of Luni, whose ruins are about three miles distant from Carrara. There is a museum containing numerous statues and Roman antiquities, also several fine churches. Pop. (1911) 49,492. See CARRARA MARBLE.

**CARRARA**, kār-rā'rā, **MARBLE** (so called from the city of Carrara), the variety of marble generally employed by statuary. It is a white crystalline limestone, sometimes with black or purplish veins, and occurs in deposits of enormous extent — veritable "marble mountains." Carrara marble, which was formerly supposed to be a primitive limestone, is now considered an altered sub-carboniferous limestone. The plutonic action to which it has been subjected has served to obliterate the traces of fossils. The mountains containing the marble are situated a few miles from the sea, and reach the height of over 5,000 feet. Although the quarries have been worked for 2,000 years, having furnished the material for the Pantheon at Rome, the supply is still practically inexhaustible. Those quarries supplying the pure white marble used for statuary are the most valuable. The so-called "Carrara district," embracing the communes of Carrara, Massa, Pietrasanta, Seravezza, Stazrema and Arni, is the centre of the marble industry. Carrara and Massa are the two most important, the former having a population in the city of 21,000 people, with an additional 21,000 in the mountain villages surrounding it and forming part of the commune. These villages are inhabited almost entirely by quarrymen and the laboring class. The commune of Massa has a population of

about 24,000. Broadly speaking, the entire male population of these two communities is actively engaged in some branch of the marble industry. There were in 1901 in the district 611 quarries in active operation, of which 345 are at Carrara, 50 at Massa and the rest distributed among the places named above. In addition to these, there are perhaps double this number which have been opened and afterward abandoned as being unproductive, or in which, for various reasons, active work has for the time being ceased. Under the sanction of ancient laws, the mountains where the quarries are found are the property and under the direct control of the municipality of the district in which they are located. Applications for leases are made to the syndic of the town, and within a reasonable time, after survey, etc., the concession is granted. The concession is permanent, the only condition being that the grantee should formally renew it every 30 years, pay the annual rent, and work the property. The rent is merely nominal. Failure to pay it for two successive years or to develop the property in the same length of time renders the concession void. Quarries thus leased may be sold or transferred, or left as an inheritance by the grantee at any time, without formal permission from the grantor. Until 1890 most of the output of the quarries was transported to the local mills, and to the Marina for shipping, by ox-teams. But now the quarry railroad, completed in 1890, greatly facilitates this transportation. From Carrara it makes the difficult ascent of the mountains, through many tunnels and over high viaducts, to a point some 1,500 feet above the sea-level. Tremendous obstacles were overcome in the construction of these 15 miles of railroad, the completion of which cost about \$4,000,000. Although largely patronized by the quarry owners, it has not as yet entirely supplanted the former method of hauling by ox-team. The United States is represented by a consular agent. The buildings of the city of Carrara are of marble, and in the churches of Sant' Andrea (13th century) and of the Madonna della Grazie are splendid marble statues of Rossi, Garibaldi and Mazzini. There is also a museum containing numerous statues and Roman antiquities.

**CARRARAY**, Philippines, a small island about 30 miles long and 6 miles wide. It has coal deposits. The population is sparse and wholly uncivilized, subsisting by trade with the neighboring islands of Samar and Luzon.

**CARRÉ**, kār-rā, Michel, French dramatist: b. Paris 1819; d. Argenteuil, near Paris, 27 June 1872. He first published a volume of Poems, 'Folles rimes'; then turned to the drama and wrote 'La jeunesse de Luther' (1843) and 'Scaramouche et Pascariel.' He then worked in collaboration with other authors, especially with Jules Barbier. With him he wrote many dramas, vaudevilles and opera librettos, several of which met with much success; among their joint works are 'Van Dyck à Londres' (with Narrey, 1848); 'Jobin et Nanette' (with Battu, 1849); and 'Le Tourbillon' (with Deslandes, 1866); 'Galatée' (1852); 'Faust et Marguerite' (1859); 'Lalla Raukh' (1862); 'Romeo et Juliette' (1867); 'Mignon' (1867); 'Hamlet' (1868); 'Paul et Virginie' (1876).

**CARREL, ká-rèl, Nicolás Armand,** French writer and republican leader: b. Rouen, 8 May 1800; d. 24 July 1836. He was educated at the military school of Saint Cyr. He entered enthusiastically into several of the secret political societies which were numerous in France after the restoration of the Bourbons. In 1819, when lieutenant of the garrisons of Belfort and Neubreisach, he became implicated in a conspiracy, and though his conduct escaped investigation he was removed with his regiment to Marseilles. He resigned his commission to take an active part in the politics of his time. Finally settled in Paris, he zealously prosecuted his historical and political studies, and became intimate with Thiers, Mignet and Augustin Thierry, particularly the last. He published a 'History of the Counter Revolution in England,' and in 1830 united with Thiers and Mignet in editing the *National*, which soon rose to be the leading opposition newspaper. After the revolution his colleagues joined the government, and he was left with the chief direction of the paper, which still continued in opposition. In 1832 the *National* became openly republican. Carrel was mortally wounded in a duel with Émile de Girardin. He has been called the Bayard of republican journalism. Littré republished his articles under the title, 'Œuvres politiques et littéraires' (5 vols., 1854-58).

**CARREÑO, ká-rá'nyô, Teresa,** Venezuelan pianist: b. Caracas, 22 Dec. 1853. She was educated by her father and by Julius Hoheni; in 1862 she appeared as a concert player in New York and attracted the interest of Gottschalk, who gave her some instruction especially in regard to playing his own compositions. She has traveled widely in America, and given many concerts; she not only has a high rank as a pianist, but also has won success as a concert singer, and has published a number of musical compositions. Her first husband was Sauret, the violinist, from whom she was divorced; she has also married and divorced Tagliapietra, the singer, and Eugene d'Albert, the pianist. In 1902 she married the younger brother of her second husband. A woman of many talents, she composed a string quartet, piano pieces of the salon order and the Venezuelan national hymn; she won admiration as a concert singer, and, while managing an opera company, successfully wielded the baton during the absence of the conductor. The chief traits of her playing are brilliancy, dash and masculine vigor, for which she gained the appellation of "the Valkyr of the piano." The softer qualities are not greatly in evidence, but her intellectual grasp and breadth of interpretation place her among the greatest pianists.

**CARREÑO DE MIRANDA, Juan,** Spanish painter: b. Avilés, Asturias, 25 March 1614; d. Madrid 1685. He was a pupil of Bartolomé Román and Pedro de Las Cuevas in Madrid, and became court painter to Philip IV and Charles II. He painted many portraits and excelled in religious subjects. He succeeded Velasquez as the first portrait painter of the Spanish court. As a colorist the Spaniards rank him with Titian and Vandyke. His principal paintings are a 'Magdalen in the Desert,' at Madrid; a 'Holy Family,' at Toledo; and a 'Baptism of our Saviour,' at Alcalá de

Henares. His principal surviving frescoes were commissioned in 1669 by Velasquez and painted with the assistance of Francesco Rizi. They are at Saint Antonio de los Portugeses in Madrid and at the cathedral in Toledo. Consult Beruete y Moret, 'The Madrid School of Painting' (London 1909).

**CARRER, kár'rér, Luigi,** Venetian poet: b. Venice 1801; d. 23 Dec. 1850. He was professor of philosophy at Padua from 1830 to 1833, when he went to Venice, where he conducted a literary journal for nine years, during which time he was also appointed by the municipal council professor in the school of arts and sciences, and director of the museum. Here he published several works, the most popular of which is 'L'Anello di sette gemme,' a poetic description of the history and customs of Venice. His works were published with a biography by Crespan (Venice 1869) and by Abrate, 'L'opera poetica di L. Carrer' (Turin 1905).

**CARRERA, kár-rá'ra,** the name of three brothers distinguished as Chilean revolutionists — José Miguel, Juan José and Luis. The chief of them, José Miguel, was born at Santiago, 15 Oct. 1785; d. 5 Sept. 1821. They were the sons of a rich landholder in Santiago, Don Ignacio Carrera. José Miguel Carrera became a major in the Spanish army. The revolution attracted him to Chile where he became a member of the junta in 1810, usurping the presidency, and, in 1811, becoming military dictator. His internal administration was most effective. He established the newspaper *La Aurora*, the first paper in Chile. In 1813 he was deposed and succeeded by O'Higgins. The brothers Juan José and Luis were apprehended in 1817 near Mendoza, on a political charge, and having been first induced to attempt an escape, were brought to trial and executed 18 March 1818. José Miguel raised a body of troops to revenge their death, and a conspiracy was formed in his favor; but it was detected and suppressed, and he himself being defeated and taken prisoner, was executed on the same spot as his brothers. A bronze statue to José Miguel was erected at Santiago, Chile, 1864.

**CARRERA, Rafael,** Guatemalan revolutionist: b. Guatemala 1814; d. there, 14 April 1865. He was of mixed Indian and negro blood. In 1837 he placed himself at the head of a band of insurgent mountaineers. Enlisting the sympathies of the Indian population, the rebellion spread. Carrera was in turns courted and caressed by members of the opposite factions which divided the government. In February 1838, he occupied the city of Guatemala with 6,000 Indians, and succeeded in restraining his followers from anticipated pillage and massacre. Having secured his victory, he became dictator in 1840, and from 1844 to 1848 was President of Guatemala; was re-elected in 1852, and made President for life in 1854. He recalled the Jesuits, who in 1767 were banished, and in 1863 he engaged in war with Salvador. After capturing San Salvador, the capital, he deposed President Barrios and appointed Dueñas in his stead.

**CARRERA, Valentino,** Italian dramatic poet: b. Turin, 19 Dec. 1834. He was connected with the Italian Customs Department

until his retirement from office in 1878. He is one of the most original dramatists of Italy, especially in comedy. Among his many comedies, vaudevilles, etc., the play which won for him a wide reputation was 'La quaderna di Nanni' (1870), a perfect picture of Florentine life. Other works are 'Galateo nuovissimo' (1875), 'Bastoni fra le ruote' (1884) and 'La filosofia di Giannina' (1885). A collective edition appeared in Turin in 1887-90 (4 vols.).

**CARRERE, John Merven**, American architect: b. Rio de Janeiro, Brazil, 9 Nov. 1858; d. 1 March 1911. He was of American parentage and his education was obtained in Switzerland. He was graduated from the École des Beaux Arts, Paris, in 1882, and since 1884 was a partner in the firm of Carrere & Hastings, New York. The firm rapidly acquired a distinguished reputation for the imaginative and artistic quality of its work, strongly colored by French influence. The first important commissions of the young practitioners were the Ponce de Leon and Alcazar hotels at Saint Augustine, Fla. Other early works were the Central Congregational Church at Providence, R. I., and the Mail and Express and Edison buildings in New York. The list of their later works is very long; by far the most notable is the Public Library of New York, erected at a cost of over \$8,000,000 from designs which won the prize in a competition in which many of the ablest architects of the country were employed. He died 1 March 1911, as the result of an accident. The body was laid in state in the still unfinished Public Library, and the great throngs that pressed to view it attested the high regard in which he was held.

**CARRHÆ**, kār'rē, the name of the site of an ancient city in northwestern Mesopotamia, supposed to have been the biblical Haran. It is famous in history for the disastrous defeat of Crassus by the Parthians, 53 B.C.

**CARRIACOU**, kār-rē-ā-koo', the largest of the Grenadine Islands, in the British West Indies, seven miles long and from two to four broad. It is well cultivated and produces good crops of cotton. The town and harbor of Hillsborough are on its west side. Area, nearly 11 square miles. Pop. (1911) 6,886.

**CARRIAGE**, a general term for vehicles of all sorts, especially wheeled vehicles; in a narrower sense confined to those vehicles that carry persons only, for pleasure or business. The carriage is as old as the wheel. The first man who cut two slices from a tree-trunk and mounted them on an axle was the builder of the first carriage. The early Egyptians and Assyrians knew how to make wheels, as evidenced by carvings on their monuments. Some of these show a wheel made with tire and spokes, a construction indicating considerable mechanical knowledge.

Wheels held in place by wooden pins in the axle, a pole to which the horses were attached, and a rude box open at the rear, constituted the early chariots. These and the primitive carts were always two-wheeled. Four-wheeled carriages came into use with the formation of comparatively smooth roads, being ill adapted to rough and unkept highways. The earliest vehicles were made almost wholly of wood, pinned together, the holes being often burned

in, and the parts tied with thongs. The Romans made use of the two-wheeled *carruca* (from which word "carriage" is derived), but although chariots of war and carts for transportation were comparatively common from early times, the carriage proper, for conveying persons, was in very slight use before the 16th century.

As late as 1550 there were only three coaches in all Paris, and the stage coach did not make its appearance in England until 1555. When the coach and covered carriage first came into use they were considered fit only for women and children, men scorning to seek such protection from the weather as is afforded by a covered vehicle. By the opening of the 17th century the coach had become popular, and not only crowned heads, but titled families, commonly employed them, emblazoned with their arms and decorated to the highest degree. Some of the most beautiful and elegant handiwork of that period was expended in the ornamentation of coaches. Elaborate painting, upholstery and joiner-work combined to produce the most sumptuous of vehicles. No such extreme effort at display has characterized carriages of later generations.

About 1625 the hackney coach came into existence in London, and the hired cab soon became an established institution. The increase of post-roads and general improvement in highways caused a gradual increase in private carriages and wheeled vehicles of all sorts during the 17th and 18th centuries. The bodies of these early carriages and coaches were suspended by leather straps, and depended on these, in combination with the springiness of the timber employed, to reduce the shocks and jolts to the occupants. That they were jolty enough to afford considerable exercise can be testified to by those who have taken up the modern sport of coaching in imitation of the old-time tally-ho coach. About 1700, steel springs were introduced, but they did not make very rapid headway. The C spring was a radical improvement, but gave way to the elliptic spring, which was invented in 1804 and remains in use to the present day. The rubber-tired wheel was borrowed from the bicycle about 1875, and still further added to the comfort of carriage riders, while the pneumatic tire of more recent date affords the latest refinement of comfort.

The various wheeled vehicles that may be grouped under the name "carriage" embrace a wide nomenclature, the best known being here grouped.

*Auto-car, Auto-truck, etc.* A car, truck, etc., having an automatic engine. See AUTOMOBILE.

*Barouche*, a four-wheeled, falling top carriage, with low body, two inside seats facing, and an outer driver's seat.

*Berlin*, a four-wheeled covered carriage having a rear seat behind the body.

*Britzka, or Breet*, a four-wheeled Russian carriage with falling top and a rear seat uncovered.

*Brougham*, a four-wheeled covered carriage with outer driver's seat, and the fore body cut under so as to turn short. The *miniature brougham* seats only two.

*Buckboard*, a very simple form of carriage, in which a springboard of wood takes the place of the springs, the seat being placed in the centre of the springboard.

*Buggy*, a light carriage with either two or four wheels, and with or without a top.

*Cab* (short for *cabriolet*, but of more general meaning), a carriage licensed to carry passengers for hire, usually closed, with an outer driver's seat.

*Cabriolet*, a two-wheeled (later four-wheeled), two-seated, covered carriage with falling top.

*Calash*, or *Calèche*, a two-wheeled carriage with a falling or folding top, a seat for two passengers and a narrow seat on the dashboard for the driver; much used in Canada. The top itself is also called a calash.

*Car*, (1) An automobile with two or more seats; (2) a railway carriage; (3) a carriage of unusual magnificence, as for use in a procession; (4) a van; (5) one of various special forms of vehicle, as the Irish jaunting-car.

*Carryall*, a four-wheeled covered carriage, light and commodious, having two or more seats.

*Cart*, (1) a two-wheeled, light, topless pleasure vehicle; (2) a heavy two-wheeled springless vehicle, with a strong box, for carrying rough material.

*Chaise*, originally a two-wheeled, one-horse vehicle with a top, the body being hung on straps; later, a light, topless, four-wheeled carriage of varying construction.

*Chariot*, the early two-wheeled war-carriage; also a light 18th-century coach, with one inner seat and a driver's seat.

*Coach*, a four-wheeled covered carriage of large size, having two or more inner seats and one or more outside—a tally-ho; also, a two-seated four-wheeled cab, or large hack.

*Coupé*, a four-wheeled carriage, low-bodied, with an outer driver's seat.

*Curricie*, a simple form of two-wheeled two-horse carriage.

*Dog-cart*, a light pleasure cart with back-to-back seats, the rear seat covering a box to carry a dog or dogs.

*Drag*, a form of coach or tally-ho, sometimes uncovered.

*Drosky*, a long-bodied, four-wheeled Russian carriage. In its primitive form the body is a plank on which the passengers ride astride; also, in some European cities, a public hack.

*Fiacre*, the French name for a public cab.

*Gig*, a very light, small-bodied, two-wheeled, one-horse vehicle, with seat for one.

*Hack*, a hackney coach; loosely, any cab.

*Hackney Coach*, a four-wheeled coach kept for hire.

*Hansom*, or *Hansom Cab*, a two-wheeled, low-bodied, one-horse, covered carriage, having a single seat closed in with front doors, and a seat for the driver behind.

*Jaunting-Car*, a light two-wheeled, sometimes four-wheeled, vehicle having a perch in front for the driver, and longitudinal seats extend over the wheels, and a well between them for baggage.

*Landau*, a coach-like vehicle having a top, the forward part of which is removable and the rear part folding.

*Landaulet*, a one-seated landau.

*Omnibus*, a four-wheeled covered carriage with long body, seats running longitudinally, a rear door with steps; often with seats on the roof.

*Phaeton*, a light pleasure carriage of varying construction, usually low-bodied.

*Rockaway*, a four-wheeled pleasure carriage with two seats and permanent top.

*Sociable*, a four-wheeled topless pleasure carriage, with facing seats.

*Stage*, a four-wheeled carriage of large size, with several seats inside and on top, for long journeys; called also stage coach; loosely, an omnibus.

*Sulky*, a two-wheeled carriage, of skeleton construction, with a seat for one directly on the shafts.

*Surrey*, a light four-wheeled box carriage with two seats and often side-bars.

*Tally-ho*, a four-in-hand coach.

*T Cart*, a pleasure cart having a T-shaped body.

*Trap*, a pleasure carriage; a term used very loosely.

*Van*, a very large covered wagon for conveying bulky articles, as furniture.

*Victoria*, a four-wheeled carriage with falling top, a seat in the body for two and an elevated driver's seat cut under.

*Wagon*, a heavy four-wheeled vehicle, usually with rectangular box, for carrying goods, sometimes with removable seats, and often with removable top.

*Wagonette*, a light wagon for pleasure riding, with longitudinal seats facing each other, and entered by steps and a door in the rear.

To these might be added many more compound names, as top-buggy, box-buggy, post-chaise, etc. It is difficult sometimes to draw the line of distinction absolutely between many of the forms of carriages here named. Even the very common names of "coach" and "cab" overlap in use, that which one would call a cab in one part of the country being known as a coach in some other section.

The important parts common to the typical form of carriage are as follows: Body, seat, top, hood, dashboard, apron, step, springs, running-gear, perch, forward gear, clip, fifth-wheel, tongue, shafts, swingletree, doubletree, axle, wheel, hub, spoke, felloe, tire. The body of a carriage is commonly made of selected hard wood, ash, oak, hickory, etc., being preferred. It is put together with iron braces, screws, mortises, and tenons, and glue. The top, if permanent, is supported on selected wood uprights, or, if falling, is framed of iron or steel rods that fold up and open into a braced position. Leather, canvas and leatherette are used as coverings. The gear, axles, shafts, poles, etc., are commonly of wood, selected with special reference to straight grain and consequent strength. The parts are largely reinforced with metal at all points where special strength or resistance to friction is essential. The tendency is to increase the use of metal to replace wood, and many carriages are made with steel axles and side-bars.

The fifth-wheel is the circular device in which the forward axle turns, and is made of iron or steel. The axles have metal boxes, which in the old style are lubricated with axle-grease, but in many modern vehicles roller-bearings are being substituted that run with very little or no lubrication. The regulation wooden carriage-wheel has spokes let into the hub and felloes, the whole being held together

by the pressure of an iron tire. Instead of making a wheel in the form of a flat disc, the practice is to make it dishing; that is, with the spokes inclining slightly away from the body of the carriage. The reason for this is that a vehicle wheel that is one of a pair receives the most strain when the vehicle is on an incline tipped to one side. In this position of severest strain the spokes of the wheel on the lower side nearest the ground bear the weight, and when dished are inclined to the best position to receive the load.

This dishing of the wheel produces a necessity for placing the axle box slightly out of alignment. A dished wheel running on a straight axle tends to bear against the end nut and work off the axle. By drawing the axle skein slightly inward at the forward side this tendency is overcome and the wheel runs true. The wire wheel, or bicycle wheel, as it is commonly called, is made on a different principle, and dishing of the spokes and drawing of the axle are unnecessary. In these wheels the hub may be regarded as suspended from the tire, and the wire spokes are so spread that they receive the strains due to an inclined roadway to as good advantage as would the spokes of a dished wooden wheel.

Previous to 1850 most carriages were built by wheelwrights, assisted by blacksmiths, and the wheelwright's shop was to be found beside the blacksmith's shop in nearly every village. The development of carriage manufactories changed all this. The carriage factories buy their lumber and hardwood and supplies in large quantities, and use up the raw material in a more economical manner than could the wheelwright; but their greatest advantage is the use of special machinery.

The term "railway carriage" was commonly employed in the early days of railroads, and is still in use in Great Britain, where "coach" is, however, the technical word, but in the United States it has given way almost wholly to the shorter and more distinguished "car". See **CAR BUILDING INDUSTRY**.

CHARLES H. COCHRANE,

*Author of 'Modern Industrial Progress.'*

**CARRIAGE AND WAGON INDUSTRY.** Probably one of the most salient features in the progress of the world and one which has added greatly to the sum-total of human happiness has been transportation by means of vehicles. The attempt to discover the birthplace of the industry and the study of the advancement in the art of construction are of great interest not only for the history itself, but for the fact that in it are bound the true history of the advancement of the world; the histories of peoples, long forgot, who have contributed largely to the comfort and ease which we now enjoy. The historical records of which we are possessed prove that mankind has utilized wheels as a means of transportation from the earliest periods. The float was undoubtedly the first means of constructive transportation and from this we find the inventive genius of man devising all manner of conveyances for use on land. First came the sledge and this gradually developed into a more perfect mode of conveyance, mounted on rollers, until we have the axle and the wheel. The roller made from a tree trunk with the centre shaped

down so as to make a rotating axle was the most primitive form of wheel. The next move came in the shape of the substitution of two shorter sections of tree trunk attached to a rotating axle; then came the stationary axle on which the wheels revolved. Carts drawn by men and by oxen and innumerable chariots may be seen on the great sculptured stones now in the British Museum, taken from the ruins of the city of Nimrod near Nineveh. The body is framed up with posts and a top rail and the basket is made of handsome wicker-work; the wheels are about 42 inches in height, well proportioned, have six spokes and over them is an arched guard to prevent anything from coming into contact with them. On another slab, the king's chariot with an elegant canopy overhead, and carrying also the charioteer and an arms-bearer, is shown. The next noteworthy advancement was in the cart wheel, which was similar in shape to that now in use in the inland districts of Mexico. The Assyrian Empire, though founded prior to that of the Egyptians, did nothing whatever to advance the methods in construction, and it was left to the Egyptian to originate and develop the more perfect chariot, which for centuries afterward was the sole means of land transportation and which was connected with all great undertakings. In Biblical, mythological and all ancient history, chariots form an interesting and important part. In Biblical history the chariot is frequently referred to; the strength of a nation was determined by the number of chariots in its army. Pharaoh gave much time and thought to the improvement and use of the chariot, with such effect that he was enabled to overtake the children of Israel in their flight, although his whole army was eventually engulfed in the Red Sea. In the New Testament we find the word "carriage" referred to as baggage. "After those days we took up our carriages and went to Jerusalem." During these years the chariot developed and finally wagons for use on the farm made their appearance, some having two and others four wheels. To the Etrurians must be given the credit for first putting into use the canopy. Solomon tells in one of his songs of a beautiful stage coach which he built for his "Beloved," of cedarwood, having a canopy of wonderful beauty and richness, supported by pillars of gold. According to Herodotus (450 B.C.), the Scythians built and had in daily use two-wheeled carts with a platform and basket and thatched with the reeds among which these people lived, and when not in use these baskets were taken off the carts and used as tents. The Greeks and Romans had of course made use of the horse in drawing their chariots, and in the story of the Trojan War, Achilles is described as dragging the body of Hector, lashed to his chariot, around the walls of Troy.

There was little of luxury in any of the vehicles of ancient days; the chariot with all its splendor and decoration was a comfortless thing without springs; even the triumphal and funeral cars of early history were springless; their demand and use for other than warlike or agricultural purposes was limited; but as the world progressed so did the vehicle, and though the improvement was slow, it was nevertheless sure. The *Arcera* was developed and first used in Rome as an ambulance; then fol-

lowed the *Lectica* and the *Basterna*, similar to the *Palanquins* of India to-day, superbly decorated and upholstered in finest silk, with cushions stuffed with rose leaves. Following this came the *Carpentum*, decidedly a ladies' vehicle, which became very popular and was named in honor of Carmenta, the mother of Evander, the leader of the Arcadian colony into Latium. Then followed the *Carruca*, from which our modern name of "carriage" undoubtedly comes. This was a gorgeous affair, mounted originally upon one wheel after the fashion of a modern wheelbarrow, but later on two and then four wheels. The Romans considered it a great honor to ride in a *Carruca* and those vehicles were often highly decorated in gold, silver and ivory. As the *Carruca* became the popular vehicle for pleasure use, the *Chariot* for warlike purposes, so did the *Benna* come into general use as the popular vehicle for agricultural purposes. Julius Caesar (55 B.C.) brought back with him from his triumphant visit to Britain a chariot that surpassed for destructiveness and convenience any then known, indicating that other nations were making progress in the manufacture of vehicles even beyond the confines of Rome.

During the "Imperial Reign of Terror" under the brutal ruler, Nero, we find but slight improvement in construction, although vehicles were extensively used. The practice of letting out vehicles for hire is of quite respectable, not to say hoary, age, for Suetonius, a noted Roman biographer and historian, mentions the custom as very general in his day, 150 A.D., and in his writings refers to these hired vehicles under the name of *Rheda*, the *Rheda Meritoria*, and the *Vehiculæ Meritoria*, both the latter on the order of a hackney coach open and closed.

When the world awakened from its apparent long sleep of the Middle Ages, during which the art of vehicle construction, like all other arts, sank into oblivion, manufacturing was revived and from this awakening, about 1400 A.D., very marked improvements are found. Emperors and kings vied with each other in the effort to outshine and outclass one another, and through this rivalry we note substantial advancement. In 1550 it is said that there were but three coaches in Paris, and within the next century we find the feudal lords throughout continental Europe supplying themselves with the most extravagant and luxurious of equipages, some costing more than \$10,000 each. The artist's skill was employed, poets sang beautiful songs in their praise, and the epidemic spread, creating an eager desire in all to out rival their neighbors. Legislators became alarmed and a bill was introduced into the British Parliament seeking "to restrain the excessive use of coaches." Taylor, the poet, complained as follows:

Carroaches, coaches, jades and Flanders mares,  
Do rob us of our shares, our wares, our fares;  
Against the ground we stand and knock our heels,  
Whilst all our profit runs away on wheels.

Stow, in his survey of London, gives credit to Gulliam Booner, a Dutchman, who in 1564 became the Queen's coachman, as being the first to bring coaches into England. In 1582 the French King presented to Queen Elizabeth an exceedingly marvelous "coache" with four of the fairest white "moiles." This wonderful

state coach, with its highly ornamented and canopied body, was without springs. It was a sort of triumphal car for state parades. Her usual mode of locomotion was by water or on horseback. Captain Bailey introduced hackney coaches into England in 1625, and by his wide-awake advertising methods, made them the talk of all London.

Carriages without wheels were in use as late as the 17th century and were known as litters and were supported upon the backs of horses by means of shafts attached before and behind the litter. Carriages on wheels propelled otherwise than by horses are to be found in Japan, known as the *Jinrikisha*, and are drawn by a man running between the shafts. The modern vehicle has assumed almost limitless shapes and forms, and ages of progress lie between the gorgeous chariots and state cars of the ancient Romans and the modern buggy. From the old time stage coach we have progressed to the dray or tally-ho; we no longer have the post-chaise or the curricule; but many of the olden types are still to be seen, of course with many changes and improvements, of which the American buggy probably represents the acme of development of the carriage-maker's art. Many of these types have been imported from abroad, among them the English brougham, named for Lord Brougham; the landau, taking its title from the German town where it originated; and a few specimens of the Irish jaunting-car, which were so popular in their native land. In 1834 the hansom cab was patented by Mr. Hansom, and this originally was a square body hung in the centre of a square frame, with two wheels seven feet six inches in diameter and of the same height as the vehicle. The hackney coach was purely an English product, but to-day we see its lineal descendant in the American hack.

It was not, however, until after the middle of the 17th century that the manufacture of carriages gained much impetus, but from that time we find the brains and ingenuity of the American constantly making changes and improvements and, while the progress was slow but steady, the industry took a wonderful place in the history and development of our nation. All vehicles prior to 1750 were absolutely springless as previously stated; the running gears were very imperfect; the leather thorough-brace, which preceded the steel spring and which gave the first relief from the jolting of the old dead-axle carriage, was the first step in advancement in this line. The body of the carriage was suspended on these thorough-braces which were stretched from upright iron jacks at each end of the running part, and gave the carriage a long swinging motion, which, even though extremely uncomfortable, was far superior to the jolt caused by the springless vehicle. Next came the spring jack, made of steel plates, and which later was given a sweeping curve, and from which our more modern C spring evolved. The elliptic spring came into use about 100 years ago, and at about the same time the Collings axle was invented.

The post-chaise began to be used as a general means of travel in the beginning of the 18th century. It was a rambling affair, the body hung very high on leather straps, the wheels were far apart, and the postilions rode the "near" horses. This was improved upon until

we see the stately chariot with its richly draped coachman's seat, but which, however, was not used except at state functions or at royal receptions. Before the Revolution, very little manufacturing was done in this country, the main business being repairing. The aristocracy of those times living in the large cities imported their coaches, carriages and phaetons from England and France, and of course the manufacturing end of the business languished through lack of customers. The number of repair shops grew as the number of vehicles increased and in all the large cities these establishments thrived, employing, for the most part, the skilled workmen who came from England, Ireland and Scotland.

The Revolution had left its mark upon the land, and during the times of poverty and distress which followed there was little use made of vehicles of any kind except among the wealthier class, and it was fortunate for the mechanics and tradesmen that this class found the means of transportation inadequate and insufficient to cope with the amount of travel made necessary by the foundation of the new republic. The next development was the chaise set upon two wheels, and it became very popular and came into greater demand as the prosperity of the country grew. It was known as the shay and became the subject of the well-known poem by Oliver Wendell Holmes, entitled 'The One-Horse Shay.' At the beginning these chaises were built without dashers, had high wheels and the tops were stationary. This style of vehicle grew to be very popular and for some years there were no changes made in construction.

In the early part of the 18th century the stagecoach was introduced into England and in 1745 the first line was established between London and Edinburgh, a distance of 400 miles, and it was stated "that a two-end glass coach machine, hung on steel springs, exceeding light and easy, would go through in 10 days in summer and 12 in winter, the passengers lying over during the Sabbath at one of the villages on the route." They were introduced into the United States some years later and it is a mistaken idea that the stagecoach was unknown in America prior to 1810, for William Brant, attorney for General Hancock, states that in 1776, when Hancock married Dorothy Quincy, he took her by stage coach to Philadelphia on his wedding journey. The roads at this time were little better than bridle-paths and in them were many ruts or quagmires, making travel uncertain, slow and uncomfortable. In 1770 President Quincy of Harvard College wrote as follows of the stage journey between Boston and New York: "The carriages were old and shackling and much of the harness made of ropes. One pair of horses carried us 18 miles. We generally reached our resting place for the night, if no accident intervened, at 10 o'clock, and after a frugal supper, went to bed, with a notice that we should be called at 3 o'clock next morning, which generally proved to be half past two, and then, whether it snowed or rained, the traveler must rise and make ready by the help of a horn lantern and a farthing candle, and proceed on his way over bad roads, sometimes getting out to help the coachman lift the coach out of a quagmire or rut, and arriving at New York, after a week's travel, wondering at the

ease, as well as the expedition, with which our journey was effected." In 1791, there were only 1,905 miles of post-roads in the United States, and in these roads were many bottomless sloughs, and corduroy bridges which consisted of logs laid crosswise over swamps sometimes for long distances, but with the improvement of the roads and the advancement of civilization we find the industry of vehicle construction developing and spreading in America. Military roads and post-roads were built by the government across the mountains of Virginia, connecting the East with the valley of Ohio; through the forests of Maine to the town of Houlton on the New Brunswick frontier, and also in other parts of the country. Stage lines were established on these roads and thrived; much capital was invested; the business rapidly grew, and the returns from the investments proved enormous. Factories began to spring up here and there. The great Canastota wagon, with its broad wheels and canvas-covered body, and drawn by six or eight horses, came into use in New York, New Jersey and Pennsylvania for the transportation of freight and passengers. Troy, N. Y., became famous for its coaches and wherever used they were sure of patronage; Salem and Worcester, Mass., loomed up as manufacturing centres, but the most famous was undoubtedly the Concord coach, originally made in Concord, N. H., by the house of Abbot, Downing & Company, who later, in 1815, moved to Salem, Mass.

The War of 1812 further helped the industry in that it threw us upon our own resources and started the emigrant and pioneer toward the great unknown West. This necessitated the emigrant wagon or prairie-schooner as it was called, and after that the lighter farm wagon. Stylish carriages and fine coaches began to come into demand in all the large cities. Boston, New Haven, Bridgeport, Newark, all had flourishing shops, and New York, Philadelphia, Baltimore and Wilmington were rapidly coming to the front. A considerable trade with the planters in the West Indies grew up, the vehicles being exchanged for the products of the plantations. These vehicles, which were two-wheeled and had very long shafts, were known as volantes. The wheels were placed in the rear, thus throwing a large portion of the weight on the horse's back, and besides this, the postilion rode the horse, giving him a double load.

As the emigration toward the West became greater and greater, the establishment of permanent factories and repair shops became necessary and the volume of business began to assume considerable proportions. One of the first to enter this new field was John Studebaker, who in 1835 settled at Ashland, Ohio, and there opened a small shop, though it remained, however, for his five sons to lay the foundation of the business at South Bend, Ind., operating under the name of Studebaker Brothers Manufacturing Company, and who are now among the largest of the 4,870 carriage and wagon manufacturers in the United States. It is a far cry from a village blacksmith shop with its solitary forge and one anvil to the marvelously equipped factories now operating, and when one considers the vast output (1,600,000 carriages, wagons and sleighs annually) he wonders where the markets are and where the purchasers are to be found. In

the early part of the 19th century, the business was carried on by what was known as the "dicker" system. Money was seldom used in the transactions; the woodworkers, blacksmiths, etc., taking parts in exchange or as they said, "swapping," and the final settlement was made in the finished carriage. This involved less chance of being in debt, and, according to the old operators, was much safer than the cash payments. But the country rapidly outgrew this system and well-organized and well-equipped shops took their places, and it seems as though we have almost reached the limit in quick and cheap methods of production, but undoubtedly the inventive genius of the American will continue to assert itself along this line and, instead of retrograding, we shall advance and always keep abreast of the times.

The modern system of factory production, making all parts in large quantities, and using special machinery, template and dies has to a great extent lessened the labor and cost of production; hence the cheapness in the price of vehicles at the present time. Of course there are many different grades of vehicles made in this country and, while in some instances the price is a fair indication of the quality of stock employed in the making, yet the tendency of the times is that the best grade of workmanship and material obtainable shall be put in all styles of vehicles, regardless of price, and the manufacturer who disregards this tendency may some time regret it. There is no reason why the downward rush of the selling price, which has been made possible only by the decline in the cost of production, should lower the quality or grade of the article produced; nor is this true of the large manufacturer in this country, who, realizing that the average American has neither the time nor the ability to make a close examination of the construction, and would not if he had, is perfectly willing to pay well for a good article, and who is bound by this trust put in him to give to the public the finest grade of work which the highest skill and care of the best designers and mechanics can produce. The most noteworthy feature in vehicle construction at the beginning of the 20th century is the rapidly increasing use of rubber tires. These tires first came into use about 1890, but were used mainly for trotting sulkies or runabouts and were not adaptable for the majority of pleasure vehicles for some time. The tires were then made solid and universally approved and broader tires were later adopted, especially in wagons to carry heavy loads, owing to the strong movement for good roads throughout the United States.

In 1872 the Carriage Builders National Association was founded by the leading manufacturers of the country. Realizing the necessity of having skilled workmen for the trade, a fund was raised to establish a school in New York city, where carriage drafting and construction was to be taught. This was a great success and has contributed largely to the advanced methods now in use in all our modern factories.

From the census tables it is apparent that there was a fair growth in number of establishments doing business during the 10 years from 1890 to 1900 but a decline from 1900 to 1905, which decline continues. The invested capital has increased, but the number of wage

earners is reduced. The total production showed a gain of 10 per cent from 1900 to 1905, but since then has been stationary. The development of the automobile in place of the carriage and of the auto-truck in place of the wagon is, of course, responsible for the slowing down in the carriage and wagon industry.

This loss is in part compensated for in that carriage factories make a vast number of automobile tops and other parts and fittings of motor vehicles. The United States census of manufactures for 1914 classes carriages and wagons together as one industry, and the figures show that it is still large and prosperous. In that year there were built 558,492 family and pleasure carriages of the value of \$34,193,518; and 572,613 wagons, three-fourths of which were farm wagons; and 1,287 miscellaneous buses, vans, etc.; besides 54,700 sleighs and sleds. There are 5,320 establishments, which produced \$135,792,357 worth of vehicles, with an invested capital of \$175,474,000, and employing 52,540 workers. To the above might be added the 622 establishments which make materials sold to carriage and wagon builders, with products of \$16,500,000 above the cost of their materials and over 17,000 employees. If the children's carriage industry be added this gives a count of 84 more factories, with 5,769 employees, turning out over \$4,000,000 worth of goods.

Ohio and Indiana are the leading States in the carriage building industry, closely followed by Pennsylvania and New York. There are also a considerable number of factories in Illinois, Michigan, Wisconsin, Missouri, Kentucky and Massachusetts.

J. M. STUDEBAKER.

**CARRICKFERGUS**, kâr-rîk-fêr'gûs, Ireland, a seaport town in the county of Antrim, 10 miles by rail northeast of Belfast. It is a municipal borough, and also a county of itself, called the county of the town of Carrickfergus. It comprises an area of about 25 square miles, of which only 120 acres is embraced in the town proper, the remainder belonging to the territory of the county. The Bay of Carrickfergus is a small indentation on the north side of Belfast Lough. It is memorable in history as the landing-place of King William III, who disembarked on its shore at the quay of the town of Carrickfergus on 14 June 1690. The castle stands upon a rock projecting into the bay and is still maintained as a fortress, having a number of guns on the walls and a small garrison. The public buildings, besides the Episcopal, Roman Catholic and other churches, are a town-hall, courthouse, market-house, etc. Pop. about 9,000.

**CARRIER**, Common. See COMMON CARRIER.

**CARRIER**, kâ-rê-â, Jean Baptiste, French Jacobin: b. Yolet, near Aurillac, 1756; d. Paris, 16 Dec. 1794. At the beginning of the Revolution he was an obscure attorney, but in 1792 was chosen a member of the convention. He aided in the establishment of the revolutionary tribunal, 10 March 1793, and exhibited the wildest rage for persecution. He voted for the death of Louis XVI, demanded the arrest of the Duke of Orleans, 6 April 1793, and contributed greatly to the outbreak of 31 May. On 8 Oct. 1793 he was sent to Nantes with a

commission to suppress the civil war and finally put down the Vendéans. Multitudes, informally and precipitately condemned, were executed daily; but Carrier resolved to destroy the prisoners by numbers at a time and without a trial. He first caused 94 priests to be conveyed to a boat with a perforated bottom, under pretense of transporting them, but in reality with a view of having them drowned by night. This artifice was repeated a number of times, and the victims were of every age and of both sexes. These wholesale murders by drowning were called *noyades*. It has been estimated that 15,000 individuals perished in this manner. The banks of the Loire were strewn with the dead, and the water was so polluted that drinking it was prohibited. Out of terror people refrained for a time from drawing public attention to these atrocities, but at last the truth began to become known and Carrier was recalled. Shortly after the fall of Robespierre he was arrested and brought before the revolutionary tribunal, which condemned him to death, and he was guillotined accordingly.

**CARRIER-BELLEUSE**, *kä-rë-ä-bél-léz*, **Albert Ernest**, French sculptor: b. Anizy-le-Chateau, 12 June 1824; d. Paris, 3 June 1887. He was a pupil of David d'Angers, and while studying was compelled to earn his living by making models for the manufacturers of bronzes. His first work, a marble statue representing 'The Death of General Desaix,' brought him to the notice of the public (1859); and it was followed a few years later by a *Bacchante*. 'The Messiah,' a group now at Saint Vincent de Paul's at Rome, won him the medal of honor 1867. Toward the close of his life he was director of the art department of the porcelain works at Sèvres. His works include marble sculptures and terra-cotta busts; among them are 'Angelica'; 'Madonna and Child' (in the church of Saint Vincent de Paul in Paris); 'Sleeping Hebe'; 'Forsaken Psyche'; and of busts of remarkable truthfulness to life of Gauthier, About, Renan, where he is seen at his best.

**CARRIER-PIGEON**. See **HOMING PIGEON**.

**CARRIER SHELL**, or **MASON SHELL**, a gastropod mollusk of the genus *Phorus*, which covers its shell with grains of sand, shell, coral, etc. These bits are fastened by an exudation from the mantle, and are apparently protective in their purpose.

**CARRIERA**, *kä-ryä'ra*, **Rosalba**, an Italian miniature painter: b. Venice 1675; d. 1757. After learning lace-making from her mother she applied herself to decorating snuff-boxes. After this she studied miniature and pastel, but soon surpassed her teachers and became known throughout Italy. Her early portraits include those of Maximilian II of Bavaria, Frederick IV of Denmark, 12 Venetian ladies, portrait of the artist and her sister Naneta (at the Uffizi Palace) and August the Strong, who was one of her early patrons. In 1720 she paid a visit to Paris, where she was enthusiastically received and elected a member of the Royal Academy. Her picture of reception was 'Muse Crowned with Laurel.' She kept a very interesting diary in Paris, which has been published by the Abbé Vianelli (1793). In 1721 she re-

turned to Venice and visited Modena, Parma and Vienna. Her colors are extremely delicately laid; and her works, though often faulty in design, are full of a vivacious charm, which ranked her as the leading miniature and pastel painter of her day and comparable with Correggio. Specimens of her art are to be found in all the galleries of Europe, especially at Dresden and in the Louvre. 'The Four Seasons' (Dresden), six pastel portraits (Royal Gallery, Venice) and the portrait of the Princess Pia di Savoia Valcarel are excellent examples. In her old age she became blind and died insane. There are good biographies by Sensier (with a translation of her diary, Paris 1865), Von Hoerschelmann (Leipzig 1908) and Malamani (Milan 1910).

**CARRIÈRE, Moritz**, German philosopher: b. Griedel, Hesse, 5 March 1817; d. Munich, 19 Jan. 1895. He studied philosophy at Giessen, Göttingen, Berlin and in Italy. In 1849 he became professor of philosophy at Giessen and after 1853 held that position at Munich. He was a defender of Christianity, opposed Ultramontanism and was of the liberal school. He also took high rank as an art critic. Among his published works are 'Der Kölner Dom als freie deutsche Kirche' (1843); 'Abälard und Heloise' (1844); 'Die Religion in ihrem Begriff' (1841); 'Die philosophische Weltanschauung der Reformationszeit' (1847); 'Das Charakterbild Cromwells' (1851); 'Die Kunst im Zusammenhang der Kulturentwicklung und die Ideale der Menschheit' (5 vols., 3d ed., 1876-86); 'Ästhetik' (2d ed., 1873); 'Geschmack und Gewissen' (1882). His 'Gesammelte Werke' (14 vols.) appeared in Leipzig in 1886-94.

**CARRIÈRES, Louis de**, French theologian of the Roman Catholic Church: b. Auvilè 1662; d. Paris, 11 June 1717. In 1689 he joined the Congregation of the Oratory and became well known as a theologian. At the request of Bossuet he published a 'Commentaire littéral de l'Écriture' (24 vols., 1701-16), reprinted Paris 1872.

**CARRINGTON, Edward**, American soldier: d. Charlotte County Va., 11 Feb. 1749; d. 28 Oct. 1810. He was lieutenant-colonel of General Harrison's artillery regiment, quartermaster-general under General Greene, a delegate to the Continental Congress and foreman of the jury in Aaron Burr's trial for treason.

**CARRINGTON, Edward Codrington**, American lawyer: b. Washington, D. C., 10 April 1872. He was educated under private tutors; was admitted to the Maryland bar in 1894 and has practised in Baltimore and New York. He is a member of the firm of Carrington & Carrington of Baltimore and New York, and specializes in corporation law. Governor Goldsborough appointed him a member of his staff with the rank of colonel. He was campaign manager for Theodore Roosevelt in Maryland in 1912, and was delegate-at-large to the Republican National Convention in Chicago the same year. He signed the call for the Progressive National Convention in 1912, and later became delegate-at-large to same; was a member of the Progressive National Committee 1912 and chairman of the Maryland Progressive State Committee. After the presi-

dential election of 1912, he led a movement in Maryland, having for its object the union of the Republicans and Progressives. He was the regular Republican nominee for the United States Senate in 1914, but was defeated. He is a member of the Maryland State Bar Association. Mr. Carrington is interested in many large enterprises, is president of The Americana Corporation and treasurer of the J. B. Lyon Company, Albany, N. Y.

**CARRINGTON, Fitzroy**, American print expert and lecturer: b. Surbiton, Surrey, England, 6 Nov. 1869. He was educated in the island of Jersey at Victoria College, and came to the United States in his 17th year. From 1892-1913, a period of 21 years, he was connected with the art firm of Frederick Keppel & Company, in 1899 becoming a member of the firm. He became known by his illuminating analytical introductions to art editions of works such as Danté, 'New Life'; 'The Queen's Garland' (Elizabethan verse); Rossetti's 'Pictures and Poems'; William Morris's 'The Doom of King Æriscus'; 'The King's Lyrics' (1899); 'The Shepherd's Pipe' (1903); 'The Pilgrim's Staff' (1906). He published 'Prints and their Makers' (1912) and was editor of the unique *Print-Collector's Quarterly* from 1911 to 1913, when he retired from business to become lecturer on the history and principles of engraving at Harvard University, and curator of prints at the Museum of Fine Arts, Boston.

**CARRINGTON, Henry Beebe**, American lawyer, soldier and historian: b. Wallingford, Conn., 2 March 1824; d. 1912. He was graduated at Yale in 1845; taught at Tarrytown, N. Y., 1846 and at Yale Law School 1847; began the practice of law in Columbus, Ohio, in 1848, and took an active part in the anti-slavery movement. In the convention which met in 1854 to organize the Republican party, Carrington was a member of the committee appointed to correspond with persons in the different States with a view of making the movement national. In 1857 he was adjutant-general on the staff of Governor Chase and organized the State militia in preparation for war. In 1861 he was appointed colonel of the 18th United States infantry, served through the Civil War, and afterward was in service on the plains; was wounded in war with Sioux Indians and retired in 1870; he became professor of military science and tactics in Wabash College, Ind., a position which he held till 1873. In 1890 he took a census of the Six Nations and the Cherokees. He wrote 'Russia as a Nation' (1849); 'American Classics'; 'Ad-sa-ra-ka, Land of Massacre'; 'Battles of the American Revolution' (1876); 'Washington the Soldier'; 'The Washington Obelisk and its Voices' (1887); 'Lafayette and American Independence' and other works.

**CARRINGTON, Paul**, American statesman: b. Charlotte County, Va., 16 March 1733; d. 23 Jan. 1818. He was graduated at the College of William and Mary. During the Revolution he was a member of various conventions and of the Committee of Safety; opposed the Stamp-Act resolutions of Patrick Henry; became a member of the Court of Appeals, and in the Virginia convention voted for the adoption of the Federal constitution.

**CARRINGTON, Richard**, English astronomer: b. Chelsea, 26 May 1826; d. November 1875. Carrington entered Trinity College, Cambridge, in 1844, to prepare for the Church, but his scientific tendencies being awakened by the lectures of Professor Challis he turned his attention to astronomy. He held the post of observer at the University of Durham from 1849 to 1852. He was elected a fellow of the Royal Society (7 June 1860). His work 'Observations on the Spots on the Sun' (1863) furnished data that materially affected the study of solar physics.

**CARRION CROW**, any of several large carrion-eating birds. The only true carrion crow (*Corvus corone*) is found in England. It is larger than a crow, of black plumage and with feathered neck. It is seldom seen in flocks, and lives upon carrion, small mammals, eggs and birds. In the southern United States the name is locally given to the black vulture (*Catharista atrata*), a bird closely related to the turkey-buzzard (q.v.), but smaller, and resembling it in habits and public service as a scavenger. Its bluish and spotted eggs number from one to three and are placed in a nest built under logs and bushes.

**CARRION-FLOWERS**, certain species of the genus *Stapelia* (natural order *Asclepiadaceæ*), so called because of their putrid odor. See SMILAX.

**CARRIZO MOUNTAIN**, a prominent peak in the northeastern corner of Arizona; altitude 9,420 feet. It consists of a laccolith or core of igneous rock which has uplifted the Dakota sandstone capping its summit. Consult W. B. Emery (in *American Journal of Science*, Vol. XLII, p. 349, 1916).

**CARROLL, Charles**, "of Carrollton," American patriot: b. Annapolis, Md., 20 Sept. 1737; d. Baltimore, 14 Nov. 1832. He attended several schools abroad; studied law in Paris and London, where he became a member of the Inner Temple; returned to his native country in 1764. In 1775 he became a member of the "Committee of Observation" at Annapolis and in the same year was chosen member of the provincial convention. In 1776, he was one of the commission sent to persuade Canada to join the War of Independence. He was elected to the Continental Congress in 1775, and with the other members signed the Declaration of Independence, on 2 August of the following year. To make certain his identity, he added "of Carrollton" to his signature, thus distinguishing himself from another by using the name of his family mansion. After many more years of important public service to the State of Maryland and to the new republic, as drafter of the Maryland constitution, State senator, congressman, again senator (1789) and member of the Maryland and Virginia Boundary Commission, in 1804 he withdrew to private life at Carrollton, which was his patrimonial estate. There as his life advanced he became an object of universal veneration. He survived by six years all the other signers of the Declaration. Consult Latrobe, J. H. B., 'Life' (Philadelphia 1824); Mayer (ed.), 'Journal of Charles Carroll of Carrollton during his Visit to Canada in 1776, as One of the Commissioners from Congress' (Baltimore

1845); Rowland, 'Life of Charles Carroll of Carrollton' (2 vols., New York 1898).

**CARROLL, Henry King**, American clergyman and editor: b. Dennisville, N. J., 15 Nov. 1848. He was on the staff of *Hearth and Home* (Methodist), and from 1876 to 1898 was religious and political editor of the *Independent*. He has written 'The Religious Forces of the United States'; and many reviews, reports and miscellaneous papers. He supervised the compilation of religious statistics for the 11th census, and in 1898 was appointed to prepare a report on the internal conditions of Porto Rico. In 1900 he became a secretary of the Methodist Episcopal Church Missionary Society. He was executive secretary of the western section of the Ecumenical Methodist Conference of 1911. Besides government reports and numerous reviews, he has published 'Missionary Growth of the Methodist Episcopal Church' (1907).

**CARROLL, Howard**, American journalist and politician: b. Albany, N. Y., 1854; d. New York, 30 Dec. 1916. After his family moved to New York he was educated in the old Henry street grammar school in that city. His later education was completed by study at Hanover, in Germany, and at Geneva. He then (1877) became a reporter on the *New York Times*, and later received a roving commission from the *Times* as a political correspondent. While engaged in this political work he became acquainted with the late John H. Starin, whose daughter he married. Some time spent as special correspondent in Washington was followed by his reporting the yellow fever epidemic in the South. He was a close friend of President Arthur, but declined when President Arthur offered to make him his private secretary and later Minister to Belgium. General Carroll for many years never missed a Republican national convention and had a country-wide acquaintance among the Republican leaders, who entertained much respect for his ability. He was chief of artillery in the New York National Guard from 1895 to 1898. During the Spanish-American War he was inspector-general of the New York troops. General Carroll, whose father had died while leading his brigade in the 2d Army corps at the battle of Antietam, was well qualified for his post. While in Hanover he had for three years studied fortification and drilled with the Polytechnic Cadet Corps. General Carroll was a thorough German scholar and was able to use this language in some of his campaign work. His interest in German affairs caused the Kaiser to bestow on him the order of the Red Eagle. He was the author of several books and plays, among his books being 'Twelve Americans, Their Lives and Times,' 'A Mississippi Incident' and 'The American Countess.' General Carroll was president of the Sicilian Asphalt Paving Company and a director in the Boston Asphalt Company, Sicily Asphaltum Company, Ulster Stone Company and the Fultonville National Bank.

**CARROLL, John**, American prelate: b. Upper Marlborough, Md., 8 Jan. 1735; d. Georgetown, D. C., 3 Dec. 1815. He was a cousin of Charles Carroll of Carrollton and first Roman Catholic bishop in the United States. At the age of 13 he was sent to

Europe to be educated. He studied at Saint Omer for six years and later at the University of Louvain. He was professor (1759-71) at Saint Omer's and Liège; then, becoming a Jesuit, he was made prefect of the Jesuit College at Bruges. On the suppression of the Jesuits in 1774, he returned to the United States. In 1784, at the suggestion of Franklin, he was appointed superior of the Roman Catholic clergy in the United States; was made bishop in 1789; and in 1808 was created archbishop of the archdiocese of Baltimore. Georgetown College was founded by Bishop Carroll in 1791. Consult Shea, 'Life and Times of the Most Rev. John Carroll' (New York 1888), being Volume II of his 'History of the Catholic Church in the United States'; Brent, 'Biographical Sketch of the Most Rev. John Carroll' (Baltimore 1843); White's 'Appendix' to Darras' 'History of the Catholic Church.'

**CARROLL, John Joseph**, American Roman Catholic clergyman: b. Enniscrone, County Sligo, Ireland, 24 June 1856. He came to the United States in infancy, was educated in Saint Michael's College, Toronto, Ontario, and at Saint Joseph's Theological Seminary in Troy, N. Y. He became assistant priest in the Cathedral of the Holy Name, Chicago, in 1880, and subsequently rector of Saint Thomas' Church there. He is a Gaelic scholar of prominence and has written 'Notes and Observations on the Aryan Race and Tongue' (1894); 'Prehistoric Occupation of Ireland by the Gaelic Aryans' (1908); 'Tale of the Wanderings of the Red Lance' (1909); translation into Gaelic verse of 'The Rubaiyat' of Omar Khayyam (1909).

**CARROLL, Lewis**. See DODGSON, CHARLES LUTWIDGE.

**CARROLL, Iowa**, city and county-seat of Carroll County, on the Chicago Great Western and the Chicago Northwestern railroads, 98 miles northeast of Omaha, Neb. It has manufactures of tractor engines, wire fencing and wire novelties, etc.; roller and flour mills, ice factory, cream factory, marble, cement and brick works, and owns and operates municipal waterworks. The settlement of Carroll dates from 1867. Pop. (1910) 3,546.

**CARROLLTON, Ga.**, city and county-seat of Carroll County, 50 miles southwest of Atlanta, on the Little Tallapoosa River, and on the Central of Georgia Railroad. It has extensive cotton, fruit and live stock interests and contains flour mills, rolling mills, foundries, cottonseed-oil mills, machine shops, fertilizer works, broom factories, brick and marble yards. The city owns the waterworks. Pop. 3,297.

**CARROLLTON, Ill.**, city and county-seat of Greene County, 55 miles southwest of Springfield, on the Chicago & Alton Railroad. It has a large trade in the products of the region, has flour mills, a public library and a county courthouse. The city operates the water supply system. It was settled in 1819 and laid out in 1821. Pop. 2,323.

**CARROLLTON, Mo.**, city and county-seat of Carroll County, 65 miles northeast of Kansas City, on the Atchison, Topeka & Santa Fé, the Chicago, Burlington & Kansas City and the

Wabash railroads. It has flour mills, wagon and harness factories, foundry and machine shops, agricultural implement works, furniture works and a creamery. It has in addition a poultry-feeding station and is the commercial centre for a thriving agricultural region. It was settled in 1819 and incorporated in 1830. It contains a monument erected by the government to Gen. James Shields. Pop. 3,453.

**CARROLLTON**, Ohio, village and county-seat of Carroll County, 25 miles southeast of Canton, on the Wheeling & Lake Erie Railroad. It is located in an agricultural region which also has deposits of clay, coal and natural gas. It has manufactories of pottery, rubber, toys, granite and paving brick. The village owns the waterworks. Pop. 1,730.

**CARRON OIL**, a mixture of equal parts of linseed oil and lime water, much used as a dressing for burns. It has no particular advantages over other simpler and neater dressings, notably vaseline or oxide of zinc ointment. Its name is derived from its use in the Carron Foundry, Scotland.

**CARRONADE**, an iron gun introduced in 1779 by the director of the Carron Foundry, in Scotland, from which it took its name, said to have been invented in 1752 by General Melville, and first used in the American Revolutionary War. See **ORDNANCE**.

**CARROT**, a biennial plant (*Daucus carota*) of the family *Apiaceæ*. It is a native of Europe, introduced into America, and is known as a troublesome weed upon poor land, especially in the eastern United States. It is more favorably known by its cultivated varieties which are said to have been derived originally from Holland prior to the 16th century, since when it has become deservedly popular in all temperate climates. Certain large-rooted varieties are raised for stock feeding. The most popular culinary varieties are small, rapidly growing plants with diversely formed roots. Since they are most used as a flavoring in soups, stews and other dishes which have not become specially popular in America, they are less cultivated here than in Europe. The plants succeed best in a warm, friable, rich soil, well supplied with moisture, free from stones, weeds, etc., and in the best physical condition. The seed may be sown in drills one-half foot apart as soon as the ground has become warm, since they are slow to germinate and since the seedlings are very tiny. A few radish seeds of an early maturing variety are usually planted with them to break the soil and indicate the positions of the rows, so that cultivation may be commenced early. The radishes are pulled when they reach edible size and the carrots given clean cultivation, the plants being thinned to stand two or three inches apart. When they reach edible size they are bunched and marketed. The larger growing kinds are planted in rows 24 to 30 inches apart and the plants thinned to three or four inches. When mature they are stored in pits or root cellars. Few diseases attack the carrot and the few harmful insects are usually controlled by their parasites.

The average percentage composition of carrots is: Water, 88.6; nitrogen-free extract, 7.6; carbohydrate, 1.3; protein, 1.1; fat, a trace; ash, about 1 per cent. They resemble other root and tuber vegetables in their succulence

and nutritive value. They are greatly relished by stock, especially horses, but are usually replaced in American rations by cheaper foods.

**CARROUSEL**, *kä-roo-sél'*, formerly an exhibition of various knightly exercises, as riding at the ring, throwing the spear, etc., which were celebrated at the courts of princes on festival occasions with great pomp and splendor. They are very ancient, but are first mentioned in history in 842, on occasion of the meeting held by Charles the Bald and Louis the German. They were superseded by tournaments, but when these had fallen were again revived. Their introduction or revival in France took place after tournaments had fallen out of fashion in consequence of the accident which ended in the death of Henry II. Similar fêtes had already long existed among the Moors, Spaniards and Italians. These exhibitions were common during the continuance of the old French monarchy. The Place du Carrousel in Paris was so called from one of these fêtes given there in 1662, in honor of Mademoiselle de la Vallière. The greatest extravagances were enacted at these displays. Recitations accompanied them, some verse in outrageous taste and full of absurd allegorical personages, being usually recited in honor of the heroine of the fête, although genuine dramatic performances were sometimes given by professional actors. A revival of the carrousel was attempted in Berlin in 1750. In the United States the name carrousel is applied to a merry-go-round, a machine with a revolving circular platform and fixed wooden horses, etc., upon which both children and grown people ride for amusement.

**CARRUTH, (Fred) Hayden**, American journalist: b. near Lake City, Minn., 31 Oct. 1862. He studied at the University of Minnesota 1881-82, and began his journalistic labors at Minneapolis and afterward had a country newspaper in Dakota 1883-86. He was on the editorial staff of the *New York Tribune* 1888-92; had charge of the Editor's Drawer department of *Harper's Magazine* 1899-1901. Since 1905 he has been on the editorial staff of the *Woman's Home Companion*; is a frequent contributor to many magazines, such as *Youth's Companion*, *Saturday Evening Post*, *Collier's*, *Century*, etc. He has published 'The Adventures of Jones' (1895); 'The Voyage of the Rattletrap' (1897); 'Mr. Milo Bush and Other Worthies' (1899); 'Tracks' End' (1911).

**CARRUTH, William Herbert**, American scholar and author: b. Osawatomie, Kan., 5 April 1859. He was educated in the University of Kansas and at Harvard, and was professor of German in the former institution from 1887 to 1913. Since 1913 he has been professor of comparative literature and head of the English department at Stanford University. He has published 'Schiller's Wallenstein with Introduction and Notes' (1894); 'Scheffel's Ekkehard' (1895); 'Schiller's Wilhelm Tell' (1898); 'Auswahl aus Luther's Deutschen Schriften' (1899); 'Schiller's Die Braut von Messina' (1901); 'Otis' Elementary German Grammar' (1904); 'German Reader' (1904); 'Letters to American Boys' (1907); 'Each in His Own Tongue and Other Poems' (1909); translator of Cornill's 'History of the People of Israel' (1898) and Gunkel's 'Legends of

Genesis'; and is a contributor to philological journals and literary magazines.

**CARRYING-TRADE**, a phrase used in political economy and also in commercial transactions. It usually refers to the commerce of different countries with each other, and is most frequently applied to carriage by sea. In a purely commercial sense the carrying-trade is simply the carriage of commodities from one place or country to another, irrespective of the mode of conveyance. In political economy the term is used in a special and restricted sense. In considering the entire commerce of a country it may be found that a part of that commerce is not directly with any one foreign country, but consists in supplying facilities for the conveyance of goods from one foreign country to another. The ships of the United States, for example, may be employed in carrying goods between India and China. This is called a carrying-trade. The carrying-trade does not consist merely in the occasional charter of vessels to foreign merchants for a foreign voyage. Though this may be included in it, its regular organization implies more than this. A ship-owner, instead of lending his vessels incidentally to foreign merchants, may build or purchase them expressly for the purpose of conveying goods between different foreign ports at his own risk, and may even invest capital in merchandise to be so conveyed. It is to this abnormal development of commerce that the term carrying-trade in its restricted sense is applied. It is an investment of capital common in the case of commercial communities which have acquired great surplus wealth, or from the limited range of their territory have few home investments. From the earliest time the principal commercial communities, especially the great trading cities of antiquity and those of the Middle Ages which have formed communities in themselves, have embarked largely in this kind of commerce.

**CARSON, Christopher**, popularly known as **KIT CARSON**, American mountaineer, trapper and guide: b. Madison County, Ky., 24 Dec. 1809; d. Fort Lyon, Colo., 23 May 1868. While yet an infant his family emigrated to what is now Howard County, Mo. At 15 years of age he was apprenticed to a saddler, with whom he continued two years, when he joined a hunting expedition. The next eight years of his life were passed as a trapper, which pursuit he relinquished on receiving the appointment of a hunter to Brent's fort, where he continued for eight years more. At the expiration of this time, he chanced to meet Frémont, by whom he was engaged as guide in his subsequent explorations. In 1847 Carson was sent to Washington as bearer of dispatches, and received an appointment as lieutenant in the rifle corps of the United States army. In 1853 he drove 6,500 sheep to California, a difficult but successful undertaking, and on his return to Taos was appointed Indian agent in New Mexico. He served in the Federal army during the Civil War, attaining the rank of brevet brigadier-general. Consult Bradley, 'Winning the Southwest' (New York 1912); Sabin, 'With Carson and Frémont' (Philadelphia 1912).

**CARSON, SIR Edward Henry**, Irish Unionist leader: b. Dublin, 9 Feb. 1854. He was educated at Trinity College, Dublin, was

called to the Irish bar in 1889, and became solicitor-general for Ireland 1892. He was called to the English bar in 1894; and was solicitor-general for England in the Unionist administrations 1900-06. He became very prominent during the passage of the Irish Home Rule Bill in 1912; organized the resistance of Ulster to that measure; inaugurated and was the first to sign the Solemn League and Covenant which pledged the Ulster Protestants to resist, by force of arms if necessary, submission to a Dublin Parliament; and he was the head of the provisional government nominated in 1913 to administer the province in that event. This work of organization and the ensuing political campaign entailed enormous inroads on his time and strength, and in order to carry it through he surrendered a great practice at the bar that was yielding him an income of \$100,000 a year. For a time it appeared as if civil war might be the issue; when the Great European War intervened to put an end, for a time at least, to factional strife in Ulster; and Sir Edward's energies became devoted to stimulating the government to stronger measures with a view to winning the war. He became Attorney-General in the Asquith Coalition Government in June 1915, but resigned on 18 October following, owing to divergencies of view, mainly on the Balkan question. He negotiated with Mr. Lloyd-George and Mr. Redmond the provisional agreement on the Irish question, which, as modified by the Cabinet, was repudiated by the Nationalist members, and subsequently withdrawn. On the occasion of that withdrawal, on 24 July, he made in the House of Commons what was perhaps the greatest speech of his life, and one which showed that the European War had sensibly altered his horizon when he declared that it would be a good thing for Ireland if he and Mr. Redmond could shake hands on the floor of the House, and gave a contingent hint that Ulster might become reconciled to Home Rule and desire inclusion, if she saw the rest of Ireland well governed by a Dublin Parliament.

**CARSON, Hampton Lawrence**, American publicist: b. Philadelphia, Pa., 21 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, and became a lawyer, rising speedily to prominence by speeches and addresses on topics of the time. He has written 'History of the Supreme Court of the United States'; 'The Law of Criminal Conspiracies as Found in American Cases'; 'History of the One Hundredth Anniversary of the Promulgation of the Constitution of the United States'; also many papers in law journals and addresses. He is a lecturer on law at the University of Pennsylvania.

**CARSON CITY**, Nev., city, capital of the State and county-seat of Ormsby County, on the Virginia & Truckee railroad, 32 miles southeast of Reno. The city is in a mining and agricultural district, and is the location of a branch mint, a Federal building, State capitol, State prison, an orphans' home and an Indian school. The business is mainly connected with mining, agriculture and lumbering. Here are railroad and machine shops, etc. Carson City is only 12 miles from Lake Tahoe, and on account of its beautiful scenery at the base of the Sierra

Nevada is a popular summer resort. The State prison is two miles southeast of the city, and a United States government Indian school is three miles to the south. Founded in 1858, it became the capital of Nevada in 1861 and was chartered as a city in 1875. Pop. 2,500.

**CARSON RIVER**, a river of Nevada, rising in the Sierra Nevada and flowing northeast for about 150 miles. It then divides, and the main branch flows into Carson Lake, a small lake with no apparent outlet. The other branch flows in the opposite direction and is lost in Carson Sink.

**CARSTAIRS**, or **CARSTARES**, **William**, Scottish clergyman of political eminence: b. Cathcart, near Glasgow, 1649; d. 1715. He pursued his studies at the universities of Edinburgh and Utrecht. He returned to Scotland with the view of entering the ministry, but after receiving a license to preach resolved to return to Holland. As he was to pass through London, he was employed by Argyle and his party to treat with the English exclusionists and became privy to the Rye-house plot. On the discovery of that conspiracy he was apprehended. After a rigorous confinement in irons he was subjected to the torture and endured this trial with great firmness; but being afterward deluded with the hopes of a full pardon, and assured that his answers should never be made evidence against anyone, he submitted to make a judicial declaration. Being released he returned to Holland, and was received by the Prince of Orange as a sufferer in his cause. The Prince made him one of his own chaplains and procured his election to the office of minister of the English congregation at Leyden. He accompanied the Prince in his expedition and always remained about his person, both at home and abroad. During this reign he was the chief agent between the Church of Scotland and the court, and was very instrumental in the establishment of Presbyterianism, to which William was averse. On the death of William he was no longer employed on public business; but Anne retained him as her chaplain-royal and made him principal of the University of Edinburgh. When the union of the two kingdoms was agitated he took a decided part in its favor. The memory of Carstairs is for the most part revered by his countrymen as that of an enlightened patriot; and few men of active power and influence have steered between parties more ably and beneficially. Consult McCormick, "Life of Carstairs," prefixed to 'State Papers and Letters Addressed to William Carstairs' (London 1774); and Story, 'Character and Career of William Carstairs.'

**CARSTENS**, **Asmus Jakob**, Danish painter: b. Saint Jürgen, near Schleswig, 10 May 1754; d. 26 May 1798. He was a miller's son, but received a superior education from his mother. He had a youthful passion for painting, but after his mother's death was placed in a mercantile house. After quitting his master, he went to Copenhagen, where he struggled for seven years, supporting himself by portrait painting, at the same time working on a large historical picture on the 'Death of Æschylus.' He went to Italy after finishing this work, then lived at Lübeck for five years, toiling on in obscurity, when he was introduced by the poet Overbeck to a wealthy patron, by whose

aid he went to Berlin, where the merit of his 'Fall of the Angels,' a colossal picture, containing over 200 figures, gained him a professorship in the Academy of Fine Arts. Two years' labor in Berlin enabled him to accomplish his cherished wish to go to Rome and study the works of Michelangelo and Raphael. His best works were designs in aquarelle and painting in fresco; he rarely painted in oil. His cartoons at Weimar have been engraved by Müller. Homer, Pindar, Aristophanes and Dante supplied him with his best subjects; and among the painters who endeavored to infuse a classic spirit into the fine arts of the 18th century, he holds a prominent position. His works are distinguished by correctness of form and outline, gracefulness of attitude and loftiness and vigor of expression; but they frequently exhibit a certain harshness, arising from too close imitation. He was often defective in anatomy and perspective and, having begun late to paint in oil, was unacquainted with the secrets of coloring. Consult Fr. Pauli, 'A. Carstens' (Berlin 1876) and Fernow, 'Carstens Leben und Werke' (new ed. by Riegel, Hanover 1867).

**CART** (A. S. *craet*, Gaelic *cairt*; connected with "car"), a carriage with two wheels, fitted to be drawn by one horse or other animal and used in husbandry or commerce for carrying many sorts of goods. There are various descriptions of carts used in agriculture, and for many kinds of agricultural work the cart is preferable to the wagon. The ordinary cart for heavy goods has no springs, but there are many carts provided with springs. In France and Germany, the carrier's cart is built to carry heavy loads. Other varieties of cart are the dump cart, constructed so that it can be emptied by tilting the body; the dogcart, originally used for conveyance of sporting dogs; gad-about, a lower form of dogcart; the white-chapel cart, for tandem driving; the gig, with a single seat; the Canadian calash, with a low seat for the driver; the trotting sulky, used with race-horses; and numerous road carts.

**CARTAGENA**, *kär-tə-jě'nā*, Colombia, capital of the department of Bolívar, founded 21 Jan. 1533, by Pedro de Heredia. Early in the 17th century it ranked next below Mexico among the cities of the Western world, and was called "Queen of the Indies." At that time its inhabitants numbered about 20,000, of whom 3,000 were Spaniards; it was strongly fortified, and one of the main entrepôts of commerce between the hemispheres—a distinction due, in part, to its proximity to the Isthmian route, but even more to the excellence of its harbor, which is one of the best on the northern coast of South America. As the principal stronghold of Spanish America, it was repeatedly attacked: by a French fleet in 1544; by the English under Drake in 1585; again by the French in 1697; and by the English under Vernon in 1741. The town remained Spanish until 1815, when Bolívar took it; but the same year it was surrendered to the royalists, after a memorably heroic defense; and finally it was taken by Republican forces 25 Sept. 1821. Its population at present is little more than one-half the number accredited to it three centuries ago. Cartagena is situated in lat. 10° 25' 48"

N., long. 75° 34' W. Its temperature averages 82° F., and its location is unhealthful. The city is surrounded by the old fortifications and possesses a cathedral, two fine churches, a government building, a college, seminary and a theatre. The town manufactures chocolate and candles, and exports cattle, hides, fine woods, precious stones and tobacco. Pop. 14,000.

**CARTAGENA**, Spain, a city and fortified seaport and naval arsenal in the province of Murcia, and 27 miles south-southeast of the city of Murcia. Its harbor is one of the largest and safest in the Mediterranean. The city, located at the northern end of the harbor, is surrounded by a lofty wall, flanked with bastions. The principal buildings are the cathedral dating from the 13th century, now converted into a simple parish church; the old castle, supposed to date from the foundation of the city by the Carthaginians; the barracks, arsenal, presidio or convict establishment, the military hospital, the Hospital de Caridad, the artillery park, the observatory, the convents of Saint Augustine and Monjas, and several other convents and churches. Great improvements have been made recently in the accommodation for shipping by the construction of moles, wharves, breakwaters and a floating dock. Lead smelting is largely carried on; and there are also in the neighborhood rich mines of excellent iron, which are connected with the harbor by means of a tramway about eight miles in length. Esparto grass, compressed by hydraulic power, is largely shipped; other exports are metallic ores, wine and fruit. Timber, coal and codfish are the principal imports. Cartagena (ancient Carthago Nova) was founded by the Carthaginians about 228 B.C., and it was the Carthaginians who first worked the copper mines. It was taken by Scipio Africanus 210 B.C., and afterward became a Roman colony. In 425 A.D. the Vandals largely destroyed it; and in 711, after having been in possession of the Visigoths, it again suffered destruction at the hands of the Saracens. Under them it became an independent principality, which was conquered finally by James I of Aragon in 1276. In 1585 it was sacked by the English fleet under Sir Francis Drake. When Spain possessed her colonies and was in a flourishing condition, Cartagena was one of her most important naval stations and carried on a very extensive commerce. In 1873 a body of communists obtained possession of the city and fortifications, but they were compelled to surrender in the following year. Pop. (1911) 102,542. In 1870 the population was 26,000.

**CARTAGO**, kār-tā'gō, Colombia, town in the valley of the Cauca, 150 miles west of Bogota on the Viegá, a tributary of that river. Its trade is principally in dried beef, pigs, fruits, coffee, cacao and tobacco. The sugar-cane thrives well here. Cartago is the entrepôt for the trade of Santa-Fé-de-Bogotá. The climate is hot, but dry and healthful. Pop. about 10,000.

**CARTAGO**, Costa Rica, city, formerly capital of Costa Rica, now capital of the province of Cartago, on the right bank of a river of its own name, 14 miles east-southeast of San José. It was once a place of considerable commercial importance, and had a population

of about 37,000. It was so ruined by an earthquake 2 Sept. 1841, that only 100 houses and a church were left standing. It had already been superseded both as a capital and a seat of commerce by San José. The railroad from San José to Limon passes through it. Near the town are the springs of Aguacaliente, and also Mount Cartago or Irazu, an active volcano, rising 11,480 feet above the sea-level. The town has a considerable coffee trade, and derives much importance from its position on the inter-oceanic railway. Pop. about 4,536.

**CARTAS OF FEIJÓO**. The 'Cartas' (Letters) and 'Teatro crítico universal' (Treasury of Universal Criticism) of the Benedictine monk Benito Gerónimo Feijóo y Montenegro, constitute collectively one of the most important contributions made to Spanish thought during the 17th century, the period of its awakening from the political and intellectual stagnation consequent upon the collapse of the Hapsburg dream of world dominion. They are associated with the earlier days of Spanish journalism, when miscellanies of encyclopædic character had not yet given way before the periodical press. The 'Letters,' as well as the essays of the 'Teatro crítico,' a prior and more vigorously written work, cover a wide range of topics, from natural history and the then known sciences, education, history, religion, literature, philology, philosophy and medicine, down to superstitions, wonders and salient points of contemporary journalistic interest, all in a spirit of candor and cool judgment, which proved to be of decisive influence in the assault upon 18th century Peninsular scholasticism. The style, especially in the letters, is encumbered by the prolixity of formal eloquence, while philologists have questioned its purity. Nevertheless, Feijóo's was a comprehensive, catholic mind, familiar with the European thought of his day to an extent unprecedented among his countrymen. In temper and content, Feijóo is suggestive of the inchoateness of Montaigne, with his mixture of the rational and the fabulous, rather than of the polished sophistication of Addison and Steele. His fame spread quickly throughout Europe, but in the advancement of learning, his writings have been relegated to a place of mere historical interest. It has been commonly said that a monument should be erected to Feijóo, at the foot of which all his works should be burned. The 'Teatro' was first published at Madrid (1726-41) the 'Cartas' at the same city (1742-60). In the edition of 1777 they occupy nine and five volumes respectively, to which three supplementary volumes must be added. A modern reprint occurs in volume 56 of the 'Biblioteca de Autores Españoles,' with an introduction by Vicente de la Fuente. Consult also Bazán, Emilia Pardo, 'Feijóo.'

JOHN GARRETT UNDERHILL.

**CARTE**, Thomas, English historian: b. Clifton-upon-Dunsmoor, Warwickshire, April 1686; d. near Abingdon, 2 April 1754. He was educated at University College, Oxford, and Cambridge, where he received his M.A. in 1706. He took holy orders in 1707 and was appointed reader at Abbey Church, Bath; on account of his allegiance to the Stuarts he resigned. His first publication was entitled 'The Irish Massacre Set in a Clear Light, etc.,' in

which he defended Charles I. from the common charge of secretly instigating the rebellion and massacre in Ireland in 1641. During the rebellion of 1715, a warrant was issued for his apprehension, which he eluded by concealment; and later when it was supposed that he was concerned in a conspiracy, and a reward of £1,000 was offered for his capture, he escaped to France. Here he collected material for an English edition of the 'History of Thuanus' (de Thou). At length Queen Caroline procured leave for his return to England. His important work, the 'Life of James, Duke of Ormonde,' was published in 1735-36, and gained him great reputation, especially with the Tory party. In 1744 he was arrested on a suspicion of being employed by the Pretender, but was discharged. His other works include illustrations for the 'History of Thuanus' (edited by S. Buckley, 7 vols., 1733). He published three volumes of his 'History of England' between 1747 and 1752, the fourth, which brought down the history to 1654, not appearing until after his death. The character of this work is deservedly high for research. Numbers of his manuscripts are preserved in the Bodleian Library, Oxford. Hume and other historians have been indebted to it, but the prejudices of the author are everywhere conspicuous. Consult Nichols, 'Literary Anecdotes' (Vol. II, London 1812-15), and his 'Literary Illustrations of Literary History' (London 1817-58, Vol. V. pp. 152-56).

**CARTE BLANCHE**, kárt blānch, a blank sheet of paper with an authoritative signature, to be filled up with such conditions as the person to whom it is given may think proper; hence absolute freedom of action.

**CARTE DE VISITE**, kárt dè vè-zèt, literally a visiting card, a photographic likeness executed on a card somewhat larger than a visiting card, and usually inserted in a photograph album. For an historical account of these "Cartes" consult 'La Grande Encyclopédie' (Vol IX, pp. 568-69).

**CARTEL**, an agreement for the delivery of prisoners or deserters; also, a written challenge to a duel. A cartel-ship is a ship commissioned in time of war to exchange prisoners; also to carry proposals between hostile powers, and is not permitted to carry instruments of warfare.

**CARTER, Elizabeth**, English poet and linguist: b. Deal, 16 Dec. 1717; d. London, 19 Feb. 1806. She was the daughter of Dr. Nicholas Carter, a clergyman of Kent, and was educated by her father, soon becoming master of Latin, Greek, French and German; to which she afterward added Italian, Spanish, Portuguese, Hebrew and Arabic. She was for 50 years the friend of Dr. Johnson to whose *Rambler* she contributed two papers. Several of her poetical attempts appeared in the 'Gentleman's Magazine' before she attained her 17th year, and these procured her much celebrity. In 1739 she translated the critique of Crousaz on 'Pope's Essay on Man,' and in the same year gave a translation of Algarotti's explanation of the Newtonian philosophy. She published a translation of 'Epictetus,' in 1758.

**CARTER, Franklin**, American educator: b. Waterbury, Conn., 30 Sept. 1837. He was

educated at Yale, at Williams and at the University of Berlin, and received many honorary degrees. He began his professional career at Williams, where he was professor of French and Latin 1865-68 and of Latin 1868-72. In 1872 he became professor of German at Yale, and during this period studied theology and was licensed to preach. In 1881 he was chosen president of Williams College and administered the affairs of this office with signal ability until 1901, when he resigned. He lectured on Theism in Williams College 1904-10, and is president at the Clarke School for the Deaf since 1896; fellow of the American Academy of Arts and Sciences. He published 'Life of Mark Hopkins' (1892); and a translation of Goethe's 'Iphigenia in Tauris' (1870).

**CARTER, Sir Frederic Bowker Terrington**, Newfoundland jurist: b. Saint John's, Newfoundland, 12 Feb. 1819; d. Saint John's 28 Feb. 1900. He was called to the Newfoundland bar in 1842, served in the Newfoundland assembly from 1855 to 1878, and two years later became chief justice of Newfoundland. He was created K.C.M.G. in 1878.

**CARTER, George Robert**, American politician: b. Honolulu, Hawaii, 28 Dec. 1866; was educated at Phillips Andover College and Yale University. In 1891 he was appointed Hawaiian consul at Seattle, Wash. He returned to Honolulu in 1896 and was governor of Hawaii by appointment of President Roosevelt 1903-07.

**CARTER, Henry**. See **LESLIE, FRANK**.

**CARTER, James Coolidge**, American lawyer: b. Lancaster, Mass., 14 Oct. 1827; d. New York, 14 Feb. 1905. He was educated at Harvard, and his admission to the bar took place in New York in 1853. He was counsel for the city of New York in the famous case of the people against William Tweed, and in 1875 was appointed a member of the commission to devise a system of municipal rule for the cities of the State of New York. In 1892, he shared as counsel in representing the claims of the United States to the Bering Sea tribunal. He published 'The Proposed Codification of Our Common Law' (1883); 'The Provinces of the Written and the Unwritten Law' (1889); 'The Ideal and Actual Law' (1890); 'Law: Its Origin, Growth and Function' (1907).

**CARTER, James Madison Gore**, American author, teacher, lecturer: b. Johnson County, Ill., 15 April 1843. He was educated at the State Normal University, Saint John's College and Northwestern University Medical School. He served in an Illinois regiment during the Civil War, being captured and taken to Libby Prison. Was professor of pathology and hygiene 1891-95; clinical and preventive medicine 1895-99; professor emeritus since 1900, at the College of Physicians and Surgeons, Chicago. Among his works are 'Outlines of Medical Botany of the United States' (1888); 'Catarrhal Diseases of the Respiratory Organs' (1895); and 'Diseases of the Stomach' (1902); and various monographs on medical and literary topics.

**CARTER, Jesse Benedict**, American classicist: b. New York city, 16 June 1872. He studied at New York and Princeton universities, at Berlin, Leipzig, Göttingen and Halle.

From Latin instructor in 1895 and assistant professor in 1898, he became professor in 1902 at Princeton University. He had lectured on Roman religion at the University of Wisconsin in 1900, and in 1904 was appointed professor of Latin at the American School of Classical Studies in Rome, three years later (1907) being made director. His published writings include 'De Deorum Cognominibus' (1898); 'The Roman Elegiac Poets' (1900); 'Epitheta Deorum' (1902); Virgil's 'Æneid' (1903); 'The Religion of Numa' (1906); 'The Religious Life of Ancient Rome' (1911), etc. He also translated Huelson's 'Forum' (1906), and wrote a 'Memorial Service to J. Pierpont Morgan' (1913).

**CARTER, Louise Leslie**, American actress: b. Lexington, Ky., 1862. Her stage career began 10 Nov. 1890, when she appeared in the 'Ugly Duckling' in New York. Her other rôles have been the Quakeress in 'Miss Helyett'; Maryland Calvert in 'The Heart of Maryland'; Zaza in 'Zaza'; Madame Du Barry in 'Du Barry'; and Adrea in 'Adrea.' She was married to William L. Payne 13 July 1906. Consult Strang, 'Famous Actresses.'

**CARTER, Samuel Powhatan**, American naval and military officer; b. Elizabethtown, Tenn., 6 Aug. 1819; d. Washington, D. C., 26 May 1891. After attending Princeton for a short time he became a midshipman in 1840, fought in the Mexican War in coast attack, and in 1856 took part in the capture of the barrier forts, Canton, China. In 1861 he was detailed to go to Tennessee, where he started the Tennessee brigade. All through the Civil War he was of great service to the government, and for his gallantry was brevetted major-general of volunteers. He returned to the navy and from 1869-72 was commandant of the Naval Academy at Annapolis. In 1882 he was promoted rear-admiral on the retired list.

**CARTER, Thomas Henry**, American politician: b. Scioto County, Ohio, 30 Oct. 1854; d. 1911. He was bred to farming, but later became a lawyer, removing to Montana in 1882. He was Montana's first representative in Congress (1891), United States senator from that State from 1895 to 1901, chairman of the National Republican Committee in 1892-96, and was appointed in 1900 United States commissioner to the Saint Louis Exposition. He served a second time as United States Senator in 1905-11, and in the latter year was appointed a member of the international boundary commission of the United States and Canada. In 1901 he spoke for 16 hours against the river and harbor bill with appropriations for \$50,000,000.

**CARTER, William Harding**, American army officer and author: b. Nashville, Tenn., 19 Nov. 1851. He is a graduate of the United States Military Academy, West Point, N. Y.; was on duty on the Western frontier, 1873-97; promoted from captain of cavalry, by selection, to major and assistant adjutant-general, and to duty at War Department, 1897-1902; promoted from colonel to brigadier-general and duty on the War College Board 1902-03. He was a member of the General Staff to 31 Dec. 1903; was sent to England and Europe to investigate remount systems 1903. He has held the following commands: Department of Visayas,

Philippine Islands 1904-05; Department of Lakes 1906-08; provisional division, manœuvres, regulars and national guard, 1906-08; Department of Missouri, 1908-09. He was promoted to major-general, 13 Nov. 1909; Department of Luzon, Philippine Islands 1909-10; to the General Staff, 1910-12; Manœuvre Division, Texas, 1911; Central Division, 1912-13; Central Department, 1913-14; Second Division (Mobile Army) Texas, 1913; Hawaiian Department, 1914-15; retired from active service, 19 Nov. 1915. He received medal of honor "for distinguished bravery in action," and is author of 'The American Army'; 'From Yorktown to Santiago with the Sixth Cavalry'; 'Old-Army Sketches'; 'Horses, Saddles and Bridles'; 'Giles Carter of Virginia' (genealogical memoir).

**CARTER-COTTON, Francis L.**, Canadian editor and statesman: b. Yorkshire, England, 1847. After early education in England, he emigrated to Canada, and settled at Vancouver, B. C., where he founded the *Daily News-Advertiser* in 1886 and became its editor. A Conservative, he was elected a member of the British Columbia legislature in 1890, and was appointed minister of finance 1898-1900; a position to which his writings and speeches on financial and economic questions added considerable weight. He was chief commissioner of lands and works (1906-10), and subsequently president of the council. He was elected first chancellor of the University of British Columbia in 1902, and in 1906 endowed a professorship of pure and applied mathematics in the McGill University College of British Columbia.

**CARTERET, kâr'te-râ, Antoine Alfred Desire**, Swiss statesman and fabulist: b. Geneva, 3 April 1813; d. there, 29 Jan. 1889. His political career was long and brilliant; and in literature he made a name with pleasing 'Fables' (1873), and a novel, 'Two Friends' (1872), descriptive of Genevese customs. For the history of his political career see 'La Grande Encyclopédie' (Vol. 9).

**CARTERET, kâr'te-rêt, SIR George**, English provincial proprietor: b. Saint Ouen, Jersey, between 1609-17; d. 14 Jan. 1680. He had a distinguished career in the British navy, was an active supporter of the royalist cause, was made lieutenant-governor of the island of Jersey and vice-admiral. He manifested an interest in colonization and received a royal grant, "in perpetual inheritance," of certain lands in America "to be called New Jersey," the name being taken from the island of which he had been governor. In 1651 he surrendered to the Commonwealth and served for a time in the French navy, returning to England at the Restoration. He was made treasurer of the navy in 1661 and suspended in 1669 for mismanagement of funds. Nevertheless he was appointed deputy treasurer of Ireland in 1667 and continued in royal favor. In 1664 he was made joint proprietor with Lord Berkeley of the province of New Jersey under a grant from the Duke of York, and in 1676, when the province was divided, East Jersey fell to his share. He was one of the first proprietors of Carolina.

**CARTERET, John, EARL GRANVILLE**, British statesman: b. 22 April 1690; d. Bath, 2 Jan. 1763. He received his education at West-

minster School and Christ Church College, Oxford. From Oxford he proceeded to London, plunged into the political and social excitements of the period, made the acquaintance of Swift and in 1710 married Lady Frances Worsley. Entering the House of Lords on 25 May 1711, as second Baron Carteret, he espoused the side of the Whigs, then led by Stanhope and Sunderland, and in 1714 made his first speech in the House of Lords in support of the Protestant Succession. On the accession of George I Carteret became a lord of the bedchamber. In 1719 he was appointed by Stanhope Ambassador Extraordinary to Sweden, and succeeded in arranging two treaties of peace, the first between Sweden, Hanover and Prussia, and the second between Denmark and Sweden. In 1721 he was appointed to one of the two foreign secretaryships, that for the "Southern Department" of Europe, and as such, attended, in 1723, the congress of Cambria, which attempted the settlement of differences between Germany and Spain, and accompanied George I to Berlin. In 1724 Carteret was appointed lord lieutenant of Ireland. Though he came into collision with Swift over the Drapier prosecution, the two ultimately became warm friends. Between 1730 and 1742 Carteret took the lead in the House of Lords of the party opposed to Sir Robert Walpole. When this opposition succeeded in overthrowing Walpole, Carteret became the real head of the administration, but was driven from power by the Pelhams in 1744. In the same year he became Earl Granville on the death of his mother, who had been created Countess Granville in her own right. In 1749 he became Knight of the Garter, and from 1751 to his death was lord president of the council under Henry Pelham. Consult Balantyne, 'Lord Carteret: A Political Biography' (London 1887); Lecky, 'History of England in the 18th Century' (New York 1878-91); and Mahon, 'History of England' (Vols. II-IV, London 1836-54).

**CARTERET, Philip**, English provincial governor: d. 1682. He was appointed governor of the province of New Jersey by the proprietors, Berkeley and George Carteret, and was given power to grant land to settlers. He reached New Jersey in 1665, bringing with him about 30 settlers, and settled at Elizabethtown. He avoided trouble with the Indians by adopting the wise policy of buying the land from them or requiring the colonists to do so. In 1672 he went to England for a time, but returned in 1674, and during his absence New Jersey was in the possession of the Dutch for a year, 1673-74. In 1676 when the division of the province into East and West Jersey was completed he became governor of East Jersey, holding the position till his death, although the office was contested by Sir Edmund Andros, governor of New York, who demanded control of New Jersey as well.

**CARTERVILLE, Ill.**, city in Williamson County, 100 miles southeast of Saint Louis, on the Illinois Central and the Saint Louis, Iron Mountain and Southern railroads. Coal mining is the principal industry. Pop. 2,971.

**CARTERVILLE, Mo.**, city of Jasper County, on the Frisco and the Missouri Pacific railroads, 10 miles southwest of Carthage, the

county-seat. Carterville was founded in 1875 in a rich lead-mining and zinc silicate-bearing region and has smelters, foundry and machine shops, iron works, boiler works and stone quarries. Pop. (1910) 4,539.

**CARTERSVILLE, Ga.**, city and county-seat of Bartow County, 45 miles northwest of Atlanta, on the Seaboard Air Line, the Western and Atlantic and the Nashville, Chattanooga and Saint Louis railroads. The city is the centre of a region producing cotton, fruit and grain in abundance and of a mining district with rich deposits of gold, graphite, iron, manganese, ochre and other minerals. The industrial establishments comprise cottonseed-oil mills, fertilizer works and cotton mills. The city has a county courthouse and a public library. The electric-lighting plant and water-works are the property of the municipality. The commission form of government was adopted in 1911. Pop. 4,067.

**CARTESIANISM**, the philosophy of René Descartes (q.v.) and his school, among whom may be reckoned Geulincx, Malebranche, Arnauld, Nicole, and even many who stood outside the circle of professional philosophers like Bossuet and Fénelon. Spinoza and Leibnitz have much in common with Descartes in standpoint and method, but the divergencies of their systems from his are too great to justify us in classifying them as Cartesians. Among the many noteworthy points in Descartes' system we may mention the deliberate determination to doubt everything that could intelligibly be called in question. This was not scepticism, but a principle of method that he employed to enable him to reach something absolutely certain. This basal fact he found in the famous proposition, "I think, therefore I am" (*Cogito ergo sum, je pense donc je suis*). No doubt could shake the certainty the ego possesses of its own existence. Moreover, Descartes finds in consciousness certain ideas that are not due to experience and not the product of the imagination. These ideas he pronounces connate, original possessions of the mind. Among them the chief is that of the conception of God as an infinite and all-perfect being. Now the presence of this idea, Descartes argues, proves the actual existence of God as its cause, for no finite being can be the author of the idea of infinity. Having thus established the existence of God, Descartes maintains that the veracity of God warrants us in believing that whatever we perceive through the medium of clear and distinct ideas must be true. Adopting the traditional notion of substance he holds that besides the infinite substance, God, there are two finite created substances, namely, matter or extended substance, and mind or thinking substance. These have no attributes in common, and are absolutely opposed to each other. Thus his philosophy is a Dualism (q.v.). In the human organism these two substances are united. The soul has its seat in the pineal gland, and at this point receives influences from the body, and in turn controls and governs the direction of bodily movements. Descartes' account of the physical world is given in terms of the mechanical theory, the principles of which he was one of the earliest thinkers to formulate clearly. All bodies are extended, figured, substances, without any internal prop-

erties or differences. Everything that takes place in the physical world consists in the movement of an extended body. Thus the sciences of physical nature can be comprehended in a mathematical physics which has for its data the size, shape, velocity (amount of motion) and direction of the various bodies of which the physical world is composed. God at the beginning created bodies with a fixed quantity of motion and rest; and since God is unchanging, this amount is subject to no increase or diminution. From this statement, which is couched in scholastic language, has come, through a closer analysis of conceptions, the modern principle of the conservation of energy. Descartes' view of the relation of body and mind was not satisfactory even to the members of his own school, and led to the doctrine of Occasionalism and with Spinoza to a thorough-going Parallelism (q.v.). He also left to his successors the further elaboration of the problem regarding the relation of the one infinite substance, God, to the two created substances. In the 'Passions de l'âme' he made an important contribution to the psychology of the emotions, deriving all forms of emotional experience from the six primary emotions, wonder, love, hate, desire, joy and grief.

Professor of Logic and Metaphysics, Cornell University.

**CARTHAGE** (conjectural native name, the Phœnician *Kereth-hadeshoth*, new city, from which the Greek *Karchēdon*, and the Roman *Carthago* are supposed to have been derived), the most famous city of Africa in antiquity, capital of a rich and powerful commercial republic. It was situated on the north coast, not far from the modern Tunis. According to tradition, Dido, fleeing from Tyre, came to this country, where the inhabitants agreed to give her as much land as could be compassed by an ox-hide. Dido cut the hide into small thongs, with which she enclosed a large piece of land. Carthage was founded, according to Aristotle, 287 years later than Utica. Becker supposes it to have been a joint colony or factory, in the Anglo-Indian sense, of Tyre and Utica. The actual date of its foundation is much contested. The date commonly given is 878 B.C. The history of Carthage is usually divided into three periods. The first is the epoch of its gradual rise; the second that of the struggles with other states occasioned by its extended power; the third that of its decline and fall. These epochs interlock each other, and it is only as a matter of convenience that we can interpose exact dividing dates between them. The first epoch has been extended as far as to 410 B.C.; the second limited to the period chiefly distinguished by wars with Greece, 401-265; the third is the period occupied with the Roman wars, and ending with the fall of Carthage.

Carthage appears early to have been independent of Tyre. There existed, however, a close relationship between them, due to affinity of race and religion. This appears from various incidents in their history, as when the Tyrians refused to follow Cambyses in a contemplated attack on Carthage, and when Alexander, having attacked Tyre, the women and children were sent to Carthage. There is no evidence that the government of Carthage was ever monarchical. She appears soon to have acquired an ascendancy over the earlier Tyrian colonies, Utica, Tunis, Hippo, Leptis and Hadrumetum. This was probably gained without any effort as the result of her material prosperity. The rise of Carthage, then, may be attributed to the superiority of her site for commercial purposes, and the enterprise of her inhabitants. Her relations with the native populations, as is evident from her subsequent history, would always be those of a superior with inferior races. Some of them were directly subject to Carthage, others contributed to her strength by recruiting her armies, although frequently in hostility with her. She established colonies for commercial purposes along the whole northern coast of Africa, west of Cyrenaica, and these colonies enabled her to maintain and extend her influence over the native tribes. These colonies, together with most of the earlier Phœnician colonies subject to her, possessed little strength in themselves, and easily fell a prey to an invader; hence they were in the end a source of weakness, although it is not easy to see how her prosperity could have been attained without them. It is only after the north of Africa has thus been placed at her command that Carthage appears formally on the stage of history. One of her earliest recorded contests is that with Cyrene, when the boundary between the two states was fixed, to the advantage of Carthage, at the bottom of the Greater Syrtis, the Carthaginian envoys, according to the traditional story, consenting to be buried on the spot. The immediate wants of the city were provided for by the cultivation of the surrounding territory, which alone was directly dependent on her.

Commerce naturally led Carthage to conquest. The advantages, both for the promotion and protection of her trade, of possessing islands in the Mediterranean, led to her first enterprises. Expeditions to Sicily and Sardinia appear to have been undertaken before the middle of the 6th century. The war was carried on in the latter half of this century by Mago and his sons Hasdrubal and Hamilcar. At the same time a war arose with the Africans on account of the refusal of the Carthaginians to continue the payment of a ground-rent for their city. In this the Carthaginians were unsuccessful, but at a subsequent period they achieved their object. Sardinia was their first conquest. They guarded it with the utmost jealousy. The Romans, by the first treaty 509 B.C., were allowed to touch at it; but this permission was withdrawn in the second. It was the entrepôt of their trade with Europe, and lessened their dependence on their own territory for corn. They founded its capital, Caralis, now Cagliari. They soon after occupied Corsica, where they united with the Tyrrhenians, its previous possessors, against the Greeks. Sicily was already occupied by

Greek and Phœnician colonies. The latter, on the decline of Tyre, seem to have fallen under the dominion of Carthage, which gave her a footing on the island. The Greeks were still the more powerful party, and the Carthaginians occupied themselves in promoting dissensions among their cities. When the Greeks were occupied with the Persian invasion, they organized a great expedition to take possession of the island, in which they landed 300,000 men, contributed by all their dependencies. Among these Sardinians, Corsicans and Ligurians, the latter from the gulfs of Lyons and Genoa, are enumerated. They were totally defeated by Gelon, tyrant of Syracuse, and their leader slain, in the battle of Himera, 480 B.C. The Balearic, and many smaller islands in the Mediterranean, had already been occupied by the Carthaginians. Spain had also been colonized by them with peaceable commercial settlements. No other great enterprise took place in the first period of her history.

The war with the Greeks in Sicily was renewed in 409. Hannibal, the son of Gisco, landed an army at Lilybæum, in the spring of that year, and reduced Selinus and Himera. In a subsequent expedition Agrigentum was subdued. A pestilence seconded the efforts of Dionysius and saved Syracuse, 396 B.C. A treaty put an end to the war in 392. The struggle between the Greeks and the Carthaginians continued with varying success throughout the remainder of this period. Its most remarkable event was the invasion of Africa by Agathocles, 310 B.C. Defeated in Sicily by the Carthaginians, to avert the total ruin of his affairs, he raised an army and passed over to Africa. The most extraordinary success awaited him, showing at once the weakness of the hold which Carthage had of her external possessions on the continent, and the danger she constantly encountered from factions and dissensions within the city itself. Agathocles was the precursor of Scipio. After the death of Agathocles the Carthaginians renewed their enterprise in Sicily, and had nearly completed its conquest when the Greeks called in the aid of Pyrrhus, who for a time arrested their progress, 277-75 B.C. Notwithstanding numerous and disastrous defeats in their contests with the Greeks, the Carthaginians seemed, after the departure of Pyrrhus, to have the conquest of Sicily at length within her power. A dissension with the Mamertines, their former allies, called in the Romans, and with their invasion, 264 B.C., the third period of Carthaginian history begins.

The First Punic War, in which Rome and Carthage contended for the dominion of Sicily, was prolonged for 23 years, 264 to 241 B.C., and ended, through the exhaustion of the resources of Carthage, in her expulsion from the island. The Second Punic War, conducted on the side of the Carthaginians by the genius of Hannibal, lasted 17 years, 218 to 201 B.C., and after just missing the overthrow of Rome, ended in the complete humiliation of Carthage. The policy of Rome, at the end of this war, in placing Carthage, disarmed, at the mercy of her African enemies, and raising her a powerful opponent in Masinissa, occasioned the Third Punic War, in which Rome was the aggressor. It lasted only three years, but served to throw a halo of glory round the fall of Carthage, in whose total ruin it ended. This war, begun 150

B.C., ended, in 146 B.C., in the destruction of the last vestige of its power.

The repeated and not always unsuccessful struggles of Carthage with her African neighbors, in the very midst of her schemes of foreign conquest, indicate the marvelous tension to which a power inherently so weak was wrought in those great enterprises which virtually grasped at the supremacy of the world. In this matter the experience of Carthage was not unparalleled by that of Rome; but the great difference between them was that the former was surrounded by alien tribes, the latter by races kindred in language and manners, with whom, after conquest, she could easily unite. The invasion and conquest of Spain, begun by Hamilcar and carried on by Hasdrubal and Hannibal, and which led to the Second Punic War, can only be mentioned in passing.

Carthage perished leaving no historians to tell her tale; hence many interesting circumstances in her history can never be known, and what is preserved has the color of partial and often hostile authority. Recent excavations show that the streets crossed each other regularly at right angles. The long streets ran parallel to the quays and were distant from each other about 150 feet. The inhabitants are said to have numbered about 700,000 in 149 B.C. No foreign traders were allowed at any of her western colonies, and only the port of Carthage was open to foreigners. Traders found elsewhere were drowned. The revenue to cover her great military and naval expenditures appears to have been derived from tribute imposed on the neighboring subject races, from mines in Spain and from import duties on her vast commerce. Her merchant ships reached to every coast and island of the Mediterranean, and even to Britain and the Baltic shore. Her caravans penetrated far into the Dark Continent to the gold districts of the Niger and up the Nile. Many citizens, however, were not engaged in commercial pursuits, but cultivated large estates by means of slaves. The constitution of Carthage has occupied much of the attention of scholars, but still remains in many points obscure. The name of king occurs in the Greek accounts of it, and the first Carthaginian general who is recorded to have invaded Sicily and Sardinia is called Malchus, the Phœnician for king, but the monarchical constitution, as commonly understood, never appears to have existed in it. The officers called kings by the Greeks were two in number, the heads of an oligarchical republic, commonly called *suffetes*, the original name being considered identical with the Hebrew *shofetim*, judges. These officers were always chosen from the principal families, and were elected annually. It is not known if they could be re-elected. There was a senate of 300, and the citizens were divided into classes similar to the Roman tribes, *curiæ* and *gentes*. There was a smaller body of 30 chosen from the Senate, sometimes another smaller council of 10. Various other officers are mentioned, but the particulars regarding them are often obscure, and sometimes contradictory.

After the destruction of Carthage, her territory became the Roman province of Africa. A curse was pronounced upon the site of the city, and any attempt to rebuild it prohibited. The attempt was, however, made 24 years after her

fall, by Caius Gracchus, one of the leading men of Rome. The same plan was entertained by Julius Cæsar, and it was accomplished by Augustus. The new city became the seat of the proconsul of Old Africa in place of Utica, and continued to flourish till the Vandal invasion. It became distinguished in the annals of the Christian Church. Cyprian was its bishop, and Tertullian is supposed to have been a native of it. Genseric made it the capital of the Vandal kingdom in 439. Belisarius took it in 533, and named it Colonia Justiniana Carthago. It was taken and destroyed by the Arabs, under Hassan, in 647. A few miserable hamlets and ruins mark its site. In recent times many excavations have been made, uncovering parts of the ancient walls and remains of the harbors; the citadel, the forum and the amphitheatre have been almost completely excavated, and have yielded many small objects and inscriptions, principally those from tombs of Punic and Roman times.

The religion of the ancient Carthaginians was essentially that of their Phœnician ancestors. They worshipped Moloch or Baal, to whom they offered human sacrifices; Hercules, the patron deity of Tyre and her colonies; As-tarte, and other deities, which were identified with the heavenly bodies, but propitiated by cruel or lascivious rites. Their religion was considerably modified by their intercourse with the Greeks. After their defeat by Gelon he made it a condition of peace with them that they should abandon human sacrifices. Some of their deities were identified with those of the Greeks, and they adopted others of that people, and no doubt received also some of their ideas regarding them. Consult Arnold's and Mommsen's histories of Rome; Smith, R. B., 'Carthage and the Carthaginians' (London 1877); Church, A., 'Carthage, or the Empire of Africa' (New York 1886); Davis, N., 'Carthage and Her Remains' (London 1861); Meltzer, 'Geschichte der Karthager' (Berlin 1913); Moore, 'Carthage of the Phœnicians in the Light of Modern Excavation' (London 1905); de Sainte-Marie, E. de, 'Mission à Carthage' (Paris 1884); id., 'Atlas archéologique de la Tunisie' (Paris 1893); Audollent, 'Carthage romaine' (Paris 1901); also 'Comptes Rendus de l'Académie des Inscriptions et Belles Lettres' (Vol. XXVIII, Paris 1901), and map issued in 1907 by the French Minister of Public Instruction.

**CARTHAGE, Ill.**, city and county-seat of Hancock County, on the Chicago, Burlington and Quincy and the Wabash railroads, 32 miles south of Burlington, Iowa. It is noted as the place where Joseph Smith, the Mormon prophet, was imprisoned and killed in 1844. Carthage was settled in 1837 and received a city charter in 1883. It operates its own waterworks. Carthage (Lutheran) College was opened here in 1872. Pop. 2,373.

**CARTHAGE, Mo.**, city and county-seat of Jasper County, in the southwestern part of the State, on Spring River, and on the Saint Louis & San F., Missouri Pac., Iron M., Carthage and Western and Southwest Missouri Electric railroads, 150 miles south of Kansas City. It is the centre of a fertile farming and fruit-raising region, and in the vicinity are rich mines of zinc and lead and extensive quarries of marble

and building stone. The city exports large shipments of stone, marble, grain, flour, strawberries and other fruits, poultry, live stock and hides. It has 10 large quarries, zinc and stone works, bed-spring, shoe, overall, broom and cigar factories, flour mills and machine shops. There are five banks with \$450,000 capital and an annual business of \$2,000,000; and daily and weekly newspapers. Carthage has a county courthouse (cost \$100,000), government post-office building (cost \$90,000), a public library, high school building (cost \$110,000), good public schools, a business college and a piano school. The following churches are represented: Presbyterian, Congregationalist, Baptist, Methodist (North and South), Episcopal, Christian, Roman Catholic, Christian Scientist, Dunkard and Adventist. The site of the city was first settled in 1833 by Henry Piercy. On 28 March 1842 it was made the county-seat and named Carthage. The town was practically destroyed in the Civil War (see **CARTHAGE, BATTLE OF**) and has been almost entirely rebuilt since 1866. The government is vested in a mayor and 10 councilmen elected for a term of two years. Pop. (1910) 9,483.

**CARTHAGE, N. Y.**, village of Jefferson County, at the terminus of the Black River Canal and on the New York Central Railroad 18 miles east of Watertown. With West Carthage, joined by a bridge across the Black River, it forms a busy manufacturing centre with paper mills, machine shops, foundries, ice plants, house woodwork and furniture factories, brick works, etc. The village operates its own waterworks and maintains a public library. Pop. of West Carthage, a separately incorporated village, 1,393; of Carthage 3,563.

**CARTHAGE, Battle of.** On 17 June 1861, Gen. Nathaniel Lyon, U. S. A., drove the Confederates from Boonville, Mo., and Claiborne F. Jackson, the disloyal governor of Missouri, ordered a concentration of the State troops, who adhered to him, in the southwestern part of the State, to unite with the Arkansas troops, under the command of Gen. Ben. McCulloch. Anticipating McCulloch's movement into Missouri, Lyon ordered Gen. T. W. Sweeney, with three Union regiments, a small detachment of regulars and some artillery, from Saint Louis to Springfield. These were pushed forward by rail to Rolla and thence by road, and 28 June Col. Franz Sigel, with the 3d Missouri, arrived at Sarcoxie, southwest of Springfield, and 15 miles southeast of Carthage, Jasper County. Here Sigel learned that Gen. Sterling Price, with about 800 Missourians, was near Neosho, 22 miles south, and that Jackson, with other State troops, was to the north, 15 or 20 miles beyond Lamar, marching south. He concluded to move first on Price to disperse him, and then turn north on Jackson, his object being to prevent a junction of the two forces, and to open communication with Lyon, who was marching south from Boonville; but when he started after Price, on the morning of the 29th, he heard that he had retreated to join McCulloch, upon which he turned his thoughts toward Jackson, but continued his march to Neosho, where he was joined a few days later by Colonel Salomon, with the 5th (Union) Missouri. Captain Conrad's company of the 3d was left to hold Neosho, and on the 4th of July Sigel, with the two regiments and two bat-

teries of four guns each, marched to Spring River, a short distance southeast of Carthage, where he heard that Jackson, with over 4,000 men, was but nine miles in his front in the direction of Lamar. On the morning of the 5th, with about 1,000 men and eight guns, he advanced slowly, his train three miles in the rear, driving back the enemy's mounted skirmishers, and about nine miles beyond Carthage came upon Jackson's troops in line of battle on elevated ground, four divisions under command of Gens. James S. Raines, John B. Clark, M. M. Parsons and W. Y. Slack, numbering nearly 5,000 men, 1,200 of whom were unarmed. About 1,800 were mounted men, armed with shotguns, and judiciously posted on the flanks of the infantry. Jackson had eight guns. After some skirmishing Sigel, at 10 o'clock, brought up seven guns and opened fire, which was promptly returned, but not effectively, for, being in want of proper ammunition, the Confederate guns were charged with pieces of chain, iron spikes, broken iron and round stones or pebbles. After a desultory artillery fire of three hours the Confederate horsemen advanced from both flanks and making a wide circuit, to avoid Sigel's artillery, began to close in on him and threaten his train, whereupon, disposing four guns in rear and two on either flank he fell back, harassed at every step, until he reached Carthage, where he made a stand. But, as the enemy was still pressing hard on him, working on both flanks and threatening the road to Springfield, he again fell back, skirmishing all the way, some two or three miles beyond Carthage, where pursuit ended, and Sigel marched to Sarcoxie, and thence by way of Mount Vernon to Springfield, where Lyon joined him on the 13th. The Union loss was 13 killed and 31 wounded, to which must be added the loss of Conrad's company of 94 men surprised and captured at Neosho, on the 5th, by Churchill's Arkansas regiment of McCulloch's command. The Confederate loss was about 30 killed and 125 wounded. The day after the engagement Jackson marched from Carthage and met McCulloch and Price coming to join him. Consult Official Records, Vol. III; Century, 'Battles and Leaders of the Civil War' (Vol. I).

E. A. CARMAN.

**CARTHAGE, New.** See CARTAGENA.

**CARTHAGENA.** See CARTAGENA.

**CARTHUSIANS**, an order of monks in the Roman Catholic Church founded in 1084 by Saint Bruno (q.v.), a priest of the diocese of Rheims and principal of the theological school there. Displeased with the impiety of his bishop, Bruno and several friends sought solitude in the diocese of Grenoble, and settled in a bleak and rocky wilderness near that city, called Cartusium (La Grand Chartreuse). The rule was at first not written, the followers imitating Bruno. The order was very rigid, prescribing perpetual silence, abstinence from flesh, habitual wearing of the cilicium or horse-hair shirt, the eating of meals only once a day, excepting festival days. A Carthusian monastery covered a great deal of ground. It consisted usually of the great cloister around which were separate houses or "cells" of the monks; the lesser cloister with cells of various officials; workshops of lay brothers, chapter-

house, refectory, etc. The time of the monks was spent in oral and silent prayer, in manual labor and in study and a little recreation. The organization was democratic. The prior, who was elected by the professed monks of the community, was the general of the order. The visitors and priors formed the governing body, and all of these might be removed or reinstated at will. The officials assisting the prior were the vicar, or vice-prior, the procurator, the temporal administrator, the coadjutor, or host, the antiquior, who takes the vicar's place, the sacristan and the novice master.

A written rule was given to the Carthusians in 1129, by Guigo, the fifth prior. It comprised the hitherto unwritten laws of Saint Bruno, and additional rules for the government of the then much larger establishment. The order grew slowly. In 1300 there were but 39 monasteries. The order extended to Spain, England and even to Mexico. The original house, La Grande Chartreuse, existed, the troublous times of the Revolution excepted, down to 1903, when it was suppressed. In 1907, there were seven monasteries in Italy; four in Spain; the largest of all at Parkminster, Sussex, England; one in Germany, Switzerland and Austria. Some of the distinguished Carthusians were Saint Hugh, Saint Stephen, Saint Arthold and the famous copyists and authors, Ludolf of Saxony, Tromby, Sirius, Denis the Carthusian and Henry of Kalkar.

An order of Carthusian nuns was formed in the priorship of Saint Anthelm, about 1245. The arrangement of their day, with a few exceptions, is the same as that of the monks. Among the famous nuns have been Roseline of Villeneuve and Blessed Beatrix of Ornacieux. (See CHARTREUSE). Consult Heimbucher, 'Orden und Kongregationen der katholischen Kirche' (Paderborn 1907); 'La Grande Chartreuse par un Chartreux' (Lyons 1898); Le Couteux, 'Annales Ordinis Cartusienensis' (8 vols., Montreuil 1901). The best description of Carthusian life is Thorold, 'Six Months at the Grande Chartreuse' (in the *Dublin Review*, April 1892).

**CARTIER, kâr-tyâ, Sir George Etienne**, Canadian statesman: b. Saint Antoine, Verchères County, Quebec, 6 Sept. 1814; d. London, 21 May 1873. He claimed descent from the family to which Jacques Cartier belonged; was among the followers of Papineau in the rebellion of 1837, distinguishing himself for his courage, but ultimately was obliged to take refuge in the United States. Returning when amnesty was decreed, he resumed the practice of law and attained to some eminence in his profession. He entered the Canadian Parliament as a Conservative in 1848, became a Cabinet Minister in 1855, and from that time till his death was closely associated with the English-speaking Conservative leader, Sir John A. Macdonald (q.v.). Cartier was Prime Minister 1858-62. When Canadian Federation was set on foot he took a prominent part in the negotiations, and it was under his leadership, aided by the Church, that French-speaking Canada was reconciled to the Federal system. He carried on the negotiations with the Hudson Bay Company which resulted in the surrender to Canada of the company's rights in the Northwest, and it was he who carried through the Canadian

Parliament the bill creating the province of Manitoba. This bill embodied elaborate safeguards for Roman Catholic separate schools, but its provisions were swept away in the well-known later agitation for a uniform school system in Manitoba. Perhaps Cartier's principal domestic achievement was the enactment in 1864 of the Civil Code for what is now the province of Quebec. In 1868 he was created a baronet to reward his services in establishing the new Dominion. He carried through the Canadian House of Commons in 1872 the first charter of the Canadian Pacific Railway. When Sir John Macdonald's government fell in 1873, Cartier was involved in the discredit to his chief, springing from what is known in Canadian history as the Pacific Scandal. Sir John Macdonald relied greatly upon Cartier's influence with the French Canadians, which, however, had declined before his death. See De Celles' 'Cartier' in the 'Makers of Canada' series.

GEORGE M. WRONG,  
*Professor of History, University of Toronto.*

**CARTIER, Jacques**, French navigator: b. Saint Malo, 31 Dec. 1491; d. 1 Sept. 1557. After gaining some experience in fishing-fleets off the Labrador coast, he commanded an expedition to North America in 1534, entering the Strait of Belle Isle and sailed down the whole west coast of Newfoundland. He discovered Magdalen and Prince Edward Islands which he took for the main shore. He decided to wait before exploring further, and returned to Saint Malo. In 1536, he set sail again and, passing through the Strait of Belle Isle, anchored on the 9th of August in Pillage Bay. He named this the Saint Lawrence, and the name was gradually given to the entire river. In the same year he took possession of the mainland of Canada in the name of Francis I. The next year he sailed up the Saint Lawrence as far as the present Montreal. In 1541 he went out as captain-general in command of a first detachment of ships to prepare the way for Roberval, who had been named viceroy. Finding, however, that his chief did not arrive, after he had waited some time, he returned to Saint Malo. The natives usually received him well, but when about to return from his second voyage he treacherously kidnapped Donnaconna, one of the chiefs, and some others, in order to show them in his native country. In 1544 he set out to bring Roberval back. From this time until his death he gave technical advice in nautical matters and acted as Portuguese interpreter. His book, 'Discours du voyage fait par le capitaine Jacques Cartier aux terres neuves de Canada,' was published in 1598. A critical edition has been published by the University of Toronto and the best English version is that by James Phinney Baxter, published at Portland, Me., 1906.

**CARTILAGE**, one of the primary tissues of animal structures, of the connective-tissue class (q.v.), characterized by its peculiar basement substance. The most abundant form of cartilage is the hyaline variety, but there are also fibrous and fibro-elastic cartilages. Hyaline cartilage, particularly abundant on the ends of the bones, is whitish and translucent, firm and elastic. The cells are imbedded in an abundant homogeneous basement substance

which is made up largely of chondrin. Fibrous cartilage is less abundant, and its basement substance is fibrillated. It is found about the intervertebral cartilage masses, about the joints and around the tendons of some of the larger muscles. The fibro-elastic form is found only in certain structures,—the epiglottis, the larynx, the Eustachian tube and in the external ear. Cartilage tissues protect the ends of the long bones by reason of their firm elasticity. They provide strong, firm and yet moveable structures, where bone, by reason of its rigidity, would not be serviceable, as in the epiglottis, larynx, etc. See **JOINTS**.

**CARTON, Richard Claude**, English actor and playwright: b. 1856. His real name is R. D. Critchett, and he early appeared in plays in Bristol and London. After being known as a collaborator with Cecil Raleigh on 'The Great Pink Pearl' (1885); 'The Pointsman' (1887); and 'The Treasure' (1888), he produced two original sentimental plays, 'Sunlight and Shadow' (1890); and 'Liberty Hall' (1892; revived New York 1913). Among his light comedies are 'The Home Secretary' (1895); 'The Tree of Knowledge' (1897); 'Lord and Lady Algy' (1898); 'The Ninth Waltz' (1900); 'A Clean Slate' (1902); 'The Rich Mrs. Repton' (1904); 'Lorrimer Sabiston, Dramatist' (1909); 'The Bear Leaders' (1911); 'A Busy Day' (1912).

**CARTON, Sydney**, the hero in Dickens' 'Tale of Two Cities.'

**CARTOON** (It. *cartone*, from Lat. *charta*, paper) a term having various significations. In painting, it denotes a sketch on thick paper, pasteboard or other material, used as a model for a large picture, especially in fresco, oil, tapestry and sometimes in glass and mosaic. In fresco painting, cartoons are particularly useful, because in this a quick process is necessary, and a fault cannot easily be corrected. In applying cartoons, the artist commonly traces them through, covering the back of the design with black-lead or red chalk; then, laying the picture on the wall or other matter, he passes lightly over each stroke of the design with a point, which leaves an impression of the color on the plate or wall; or the outlines of the figures are pricked with a needle, and then, the cartoon being placed against the wall, a bag of coal-dust is drawn over the holes, in order to transfer the outlines to the wall. In fresco painting, the figures were formerly cut out and fixed firmly on the moist plaster. The painter then traced their contour with a pencil of wood or iron, so that the outlines of the figures appeared on the fresh plaster, with a slight but distinct impression, when the cartoon was taken away. In the manufacture of a certain kind of tapestry the figures are still cut out, and laid behind or under the woof, by which the artist directs his operations. In this case the cartoons must be colored. In very modern times the term is commonly applied to pictures caricaturing notable characters or events of the moment. See **CARICATURE** AND **CARICATURISTS**.

Among the most famous cartoons in existence are those executed by Raphael for the celebrated tapestries of the Vatican, which were made at Arras, and hence called Arazzi. Two sets of these tapestries were ordered by Leo X, one for the Vatican and the other for pres-

entation to King Henry VIII. The second set, or fragments of it, are still in existence on the Continent. The cartoons lay for a time neglected at Arras, and have repeatedly fallen into neglect again, so that out of 25, the original number, only seven remain, and these have had to be restored. They were purchased at the advice of Rubens by Charles I about 1630. On the sale of his effects they were purchased by the order of Cromwell for the nation, but again fell into neglect in the time of Charles II. William III had them restored, and built a gallery for them at Hampton Court, where they remained, until in 1865 they were lent to the South Kensington Museum. The subjects of the seven are: (1) Paul Preaching at Athens; (2) The Death of Ananias; (3) Elymas the Sorcerer Struck with Blindness; (4) Christ's Charge to Peter; (5) The Sacrifice at Lystra; (6) Peter and John Healing the Cripple at the Beautiful Gate of the Temple; (7) The Miraculous Draught of Fishes. The cartoons have been repeatedly engraved, among others by Dorigny, Holloway and Gribelin. They have also been extensively made known by photographs. Other celebrated surviving examples are Mantegna's nine cartoons of the 'Triumph of Julius Cæsar,' now preserved at Hampton Court.

The cartoon of the School of Athens, carried to Paris by the French, and a fragment of the battle of Maxentius and Constantine, are preserved in the Ambrosian Gallery at Milan. There are, likewise, cartoons by Giulio Romano in the Sala Borgia, by Domenichino and other Italian masters, who caused their pictures to be executed, in a great degree, by their scholars, after these cartoons. The value set upon cartoons by the old Italian masters may be seen by Giovanni Armenini's 'Precetti della Pittura' (1687). In later times large paintings, particularly in fresco, were not executed so frequently. The artists also labored with less care, and formed their great works more from small sketches. In modern times some German artists have prepared accurate cartoons. Among them is Cornelius, whose cartoons for his fresco paintings in Munich have acquired much celebrity. He prepared, too, a cartoon for the fresco picture representing 'Joseph Interpreting the Dream.' Overbeck and Julius Schnorr may also be mentioned for their cartoons.

**CARTOUCHE**, kâr-toosh, Louis Dominique, French robber: b. Paris about 1693; d. Châtelet, France, 28 Nov. 1721. He was the leader of a noted company of robbers, and being captured was broken alive on the wheel in 1721. His life has formed the subject of a modern French drama, and was formerly represented on the English stage. Consult Maurice, 'Cartouche, histoire authentique' (Paris 1859).

**CARTOUCHE**, or **CARTOUCH** (French *cartouche*). (1) A wooden case about three inches thick at bottom, and girt round with marline, holding 200, 300 or 400 musket-balls, with 8 or 10 iron balls weighing one pound each, to be fired from a mortar, gun or howitzer for the defense of a pass, retrenchment, etc. Such missiles have been superseded. In French military language *cartouche* signifies the entire charge of a firearm. (2) In architecture, sculpture, etc., an ornament represent-

ing a scroll of paper, being usually in the form of a table, or flat member, with wavings, whereon is some inscription or device. (3) The name given by the French literati to that oval ring or border which includes, in the Egyptian hieroglyphics, the names of persons of high distinction. (4) In heraldry a name given to a sort of oval shield, much used by the Popes and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on.

**CARTRIDGE**, a case of paper, parchment, metal or flannel suited to the bore of firearms, and holding the exact charge, including, in the case of small arms, both powder and bullet (or shot). In loading with the old style of cartridge for muzzle-loading rifles before the Civil War, the paper over the powder was bitten or twisted off and the powder poured in, the bullet being then inserted and rammed home. In the first breech-loaders similar cartridges were used but trouble developed through the escape of gas from the breech to the mechanism and the metallic cartridge was developed to obviate this difficulty. At first copper was used, with the priming in the rim, but the danger of accidental discharge being very great the primer was placed opposite the centre of the head in a small cap outside the case, for which brass was now used. The cartridges used for breech-loading rifles contain the powder in a case of solid brass, and have the percussion-cap by which they are ignited fixed in the base. Such cases can be refilled and used a number of times in succession. Cartridges for shot-guns are similar to those for rifles, but are usually of less solid construction, being commonly of strong paper with a base of metal. Those for large guns are usually made of flannel and contain only the powder, the projectile being loaded separately. Machine guns became possible after the advent of metallic small-arms ammunition, and in turn developed it. This kind of gun increased in calibre and fixed ammunition continued to be used and many difficulties in manufacture were overcome. Cartridge cases now are generally drawn from one piece in dies, whether they are small or large cases. Blank-cartridge is a cartridge without ball or shot. It is used for practice, salutes or signals. A dummy cartridge has no powder, and is used for drill purposes only. Cartridges for blasting are filled with dynamite or other explosive. See **AMMUNITION**.

**CARTRIDGE-PAPER**, a thick paper originally made for the manufacture of cartridges, but extensively used in the arts, its rough surface giving it an advantage for drawing upon, as a wall paper and for other purposes.

**CARTWRIGHT**, Edmund, English clergyman and inventor: b. Marnham, Nottinghamshire, 24 April 1743; d. Hastings, Sussex, 30 Oct. 1823. He was educated at University College, Oxford, and having taken orders in the Church, obtained first the living of Brampton, near Chesterfield, and afterward that of Goadby-Marwood, in Leicestershire. It was, however, only after he had reached 40 years of age that his attention was first turned to the subject on which his claim to remembrance is founded. In the summer of 1784 he began to investigate the subject of mechanical weaving,

and experiment regarding improvements. His efforts were crowned with success, and in April of the following year he brought his first power-loom into action. It was not, in fact, in respect of economy of labor, any advance upon the ordinary hand-loom; but the idea which subsequent improvements have carried so far in advance of hand-loom weaving was there. The introduction of Cartwright's loom was opposed both by manufacturers and workmen; and the first mill erected for them, containing 500 looms, was burned down. His attention once turned in the direction of mechanical improvement, he continued to make progress in discovery. He not only perfected his power-loom, but took out 10 patents for different inventions, among which was one for combing wool. He also assisted Robert Fulton in his steamboat experiments. He expended much of his means in these investigations, and in 1809 he received as an acknowledgment of their value a grant from Parliament of £10,000, which relieved him from straitened circumstances, although, it is said, it did not cover his expenditure. He also received premiums for various improvements from the Society of Arts and the Board of Agriculture. His life was published by his daughter (London 1843).

**CARTWRIGHT, John**, English reformer, brother of Edmund Cartwright (q.v.): b. Marnham, Nottinghamshire, 17 Sept. 1740; d. London, 23 Sept. 1824. He entered the navy in 1758, and became a first lieutenant in 1766. In 1774 his attention was turned to politics. In his 'Letters on American Independence' (Independence of America considered as supremely useful and glorious to Great Britain), written in this year, he advocated a union between the colonies and the mother state, under separate legislatures, and argued this great question on the foundation of natural, inherent right; maintaining "that the liberty of man is not derived from charters, but from God, and that it is original in every one." In 1775 he was appointed major of the Nottinghamshire militia, and after several ineffectual attempts on the part of government to remove him from that post, his dismissal was finally accomplished in 1792, in consequence of an act of Parliament. In the American war Lord Howe was desirous of having him with him in America; but Major Cartwright, although always eager for promotion in the navy, refused the proposal, alleging that he could not fight in a cause which he disapproved. From this time he devoted himself to the favorite objects of annual parliaments and universal suffrage. He was the author of a Declaration of Rights, distributed by the Society for Constitutional Information. The French Revolution was warmly welcomed by Cartwright. In the trials of Tooke, Hardy, Thelwall and other reformers, Cartwright was present as a witness, and displayed much firmness and fearlessness. By his writings, public addresses, etc., he continued to promote the work of reform and constitutional liberty; and as late as 1820 was tried for conspiracy and sedition, for advising the inhabitants of Birmingham, which had then no parliamentary representative, to send what he called their "legislatorial attorney" to the house; but he escaped with a fine of £100. Major Cartwright was not a political reformer only. The plan of making the slave-trade piracy is said to have

been first developed in his 'Letters on the Slave-Trade.' A statue has been erected in London to his memory. A list of his writings has been edited by his niece, F. D. Cartwright, 'The Life and Correspondence of Major Cartwright' (2 vols., London 1826).

**CARTWRIGHT, Peter**, American Methodist clergyman: b. Virginia, 1 Sept. 1785; d. near Pleasant Plains, Ill., 25 Sept. 1872. He was ordained in Kentucky in 1806, and in 1823 removed to Illinois, where he labored for nearly half a century. He also sat in the State legislature there, and in 1846 was defeated by Abraham Lincoln in an election for congressman. Admired for his eloquence and strong common sense, he was also loved for his quaint eccentricity of manner, and possessed great influence in his own denomination. He published many pamphlets, among which the best known is 'Controversy with the Devil' (1853). Many of the stories of his adventures with the backwoodsmen are found in 'Fifty Years a Presiding Elder,' and 'Autobiography of Peter Cartwright' (New York 1856). Consult Stevens, 'Observations on Dr. Cartwright and the Backwoods Preacher' (London 1869).

**CARTWRIGHT, Sir Richard John**, Canadian statesman: b. Kingston, Ontario, 4 Dec. 1835; d. 24 Sept. 1912. He was educated at Trinity College, Dublin, and entered the Canadian Parliament in 1863 as a Conservative, but on account of a disagreement with Sir John A. Macdonald joined the Liberal party. He was Minister of Finance from 1873 until 1878; and Minister of Trade and Commerce, 1896-1911. He was a member of the Joint High Commission of 1897 appointed to settle outstanding questions with the United States, and was in favor of the establishment of freer trade relations with that country. He was created G.C.M.G. in 1879.

**CARTWRIGHT, Thomas**, English Puritan divine: b. Hertfordshire 1535; d. Warwick, 27 Dec. 1603. He studied theology at Cambridge and was elected to a scholarship at Saint John's College there in 1550. He was active in defending the new religious opinions then current at Cambridge. He withdrew in Mary's reign from the university and was a law clerk for a time. He suffered imprisonment and exile more than once for his nonconformist opinions. He was a learned man, and at one time professor of divinity at Cambridge. He made a visit to Geneva, where he met Theodore Beza. In 1572 he returned to England just at a time when intense excitement was being caused by the publication of 'Admonition to the Parliament,' written by Field and Wilcox. Cartwright espoused the cause of the authors, who were imprisoned, and defended the book in a second 'Admonition to the Parliament.' This was answered by Whitgift and was followed by another paper from Cartwright. The controversy led Hooker to publish his 'Ecclesiastical Polity.' In 1573 Cartwright, learning of a warrant being issued for his arrest, fled to the Continent. His chief books are 'A Confutation of the Rhenish Translation'; 'Harmonia Evangelica'; and a criticism of Hooker's 'Ecclesiastical Polity.' Consult Dexter, 'Congregationalism' (New York 1880); Mullinger, 'Thomas Cartwright' (In Dict. Nat. Biog., Vol. IX).

**CARUCATE**, kār'ù-kât, in mediæval times, as much land as one team could plow in the year. The size varied according to the nature of the soil and practice of husbandry in different districts.

**CARUPANO**, kâ-roo'pâ-nô, Venezuela, seaport of the state of Bermudez, on the north coast of the peninsula of Paria, with a lighthouse and good roadstead. The surrounding district is fertile, and has mines of copper, sulphur, silver, lead and lignite. The city exports cotton, dyewoods, cocoa, coffee, fish, etc., and manufactures hats, ropes, soap, brandy, sugar and earthenware. Pop. about 9,000.

**CARUS**, kâ-rûs, **Julius Victor**, German zoologist: b. Leipzig, 25 Aug. 1823; d. 1903. After studying at Leipzig, Würzburg and Freiburg, he became at the age of 26 keeper of the Oxford museum of comparative anatomy. In 1853, two years after his return to his native city, he was appointed professor of comparative anatomy and director of the Zoological Institute there where subsequently he was made professor extraordinarius of zoology. Among his numerous writings are 'System der tierischen Morphologie' (1853); 'Handbuch der Zoologie'; and 'Geschichte der Zoologie.' He has translated most of Darwin's works into German and in 1878 became editor of the *Zoologischer Anzeiger*.

**CARUS**, Karl Gustav, German physician and physiologist: b. Leipzig, 3 Jan. 1789; d. Dresden, 28 July 1869. He became professor of obstetrics at the Medical Academy of Dresden, and then royal physician, being subsequently a privy councillor. He published a great number of writings covering a wide field of science, including medicine, physiology, anatomy, psychology, physics, painting, besides memoirs of his life. Among these are 'System der Physiologie' (1838-40); 'Lebenserinnerungen und Denkwürdigkeiten' (1865-66); 'Lehrbuch der Zootomie' (1818); 'Über den Blutkreislauf der Insekten' (1827); 'Psyche' (1851).

**CARUS**, Marcus Aurelius, Roman Emperor: b. Neronia, Dalmatia, about 222 A.D.; d. near Ctesiphon, Mesopotamia, 283. His father was an African and his mother a noble Roman lady. He was proclaimed emperor by the legions, on the assassination of Probus, 282. He caused justice to be executed upon the assassin. He gained a signal victory over the Sarmatians, and prosecuted the war against the Persians. Undertaking the campaign in mid-winter, and making a rapid march through Thrace and Asia Minor, he ravaged Mesopotamia, made himself master of Seleucia and carried his arms beyond the Tigris.

**CARUS**, Paul, American philosophical writer: b. Ilsenburg, Germany, 18 July 1852. He was educated in the universities of Strassburg and Tübingen, and has been a resident of Chicago for several years, where he is editor of *The Open Court* and *The Monist*. Under his direction the Open Court Publishing Company has done fine service in putting before the public valuable works on philosophy and religion. He has published 'The Ethical Problem'; 'Fundamental Problems'; 'The Soul of Man' (1891); 'Primer of Philosophy'; 'Truth in Fiction'; 'Monism and Meliorism' (1891);

'The Religion of Science' (1893); 'The Philosophy of the Tool'; 'Our Need of Philosophy'; 'Science: a Religious Revelation'; 'The Gospel of Buddha'; 'Kanna'; 'Nirvana'; 'Homilies of Science'; 'Chinese Philosophy'; 'The Idea of a God'; 'Buddhism and Its Christian Critics'; 'The Dawn of a New Era'; 'Kant and Spencer'; 'The Nature of the State'; 'The History of the Devil' (1900); 'Whence and Whither?'; 'Eros and Psyche'; 'God: an Inquiry into Man's Highest Ideals' (1908); 'The Mechanistic Theory, and the non-Mechanical' (1913); 'The Principle of Relativity' (1913); 'Truth on Trial: a critique on Pragmatism'; 'Philosophy as a Science'; 'Goethe: the man and his work'; 'Nietzsche; and other Exponents of Individualism' (1914); 'Venus and Woman as the Cosmic Principle.'

**CARUSO**, Enrico, Italian operatic tenor: b. Naples, 25 Feb. 1873. At the age of 11 he began to sing in the churches of his native city. He studied under Guglielmo Vergine for three years, and was also a pupil of Lamperti and Concone. He made his debut in 'L'Amico Francesco,' at the Nuovo Teatro, Naples, in 1894; and later toured Italy and Sicily and was engaged for four seasons at La Scala, Milan. He attracted general attention in 1896 in 'Traviata' at the Teatro del Fondo, Naples. Engagements followed at Petrograd, Moscow, Warsaw, Rome, Paris, Lisbon and Buenos Aires. He was everywhere hailed as one of the most promising young tenors Italy had produced. He came to the United States in 1903 and was received with great acclaim. His repertoire includes more than 40 operas (chiefly Italian). He created rôles in Giordano's 'Fedora'; Mascagni's 'Le Maschere'; Franchetti's 'Germania'; Puccini's 'Bohème'; 'Madame Butterfly' and 'The Girl of the Golden West.' Since his first appearance in 1903 he has become the chief attraction of the Metropolitan Opera House Company in New York, his voice being one of extraordinary beauty and power, though lacking the highest artistic refinement and expression, while his acting does not rise above the conventional. Consult Wagenmann, J. H., 'Enrico Caruso und das Problem der Stimmbildung' (Altenburg 1911).

**CARUTTI DI CANTOGNO**, kâ-rût'tê dè kân-tôn'yô, Domenico, BARON, Italian historian and publicist: b. Cumiana, 26 Nov. 1821; d. Turin, 1909. As a young man he took to romance writing, but was speedily absorbed in politics and rose to great distinction. When he resumed the pen, it was to compile such solid works as 'History of the Reign of Victor Amadeus II' (1856) and 'History of the Reign of Charles Emmanuel III' (1859), which are interesting and scholarly. In 1884 he became president of the Royal Commission on the Study of National History at Turin and in 1889 was made senator of the kingdom. Other works, in addition to those mentioned above, are 'History of the Diplomacy of the House of Savoy' (Turin 1876); 'Count Umberto I' (Florence 1878); 'Poems' (Rome 1872) and an essay on Propertius.

**CARVAJAL**, kâr-vâ-hâl, Gaspar de, Spanish missionary: b. Spain, early in the 16th century; d. Lima, Peru, 1584. He entered the Dominican order and went to Peru in 1533.

In 1538 he accompanied the expedition of Gonzalo Pizarro to the countries east of the Quito as chaplain. He was appointed sub-prior of the convent of San Rosario at Lima; after the pacification of Peru he was sent to the mission of Tucuman and after working among the Indians there was made vicar-national of the province of Tucuman. With the aid of the Dominicans, whom he brought into the country, he established several Indian towns and Spanish colonies. He wrote 'Descubrimiento del Río de las Amazonas' unedited until 1894.

**CARVAJAL, Tomas José Gonzales**, Spanish statesman and author: b. Seville, 21 Dec. 1753; d. 9 Nov. 1834. He was educated in Seville, where he studied theology and jurisprudence, becoming also famed as a Latinist. He was appointed in 1795 governor of the new colonies in Sierra Morena and Andalusia, and protested against the French invasion of Spain in 1808. From 1809 to 1811 he served as commissary in the Spanish army against Bonaparte; in 1813 became Minister of Finance; relinquished these offices to assume the directorship of the Royal University of Isidro, where he became involved in difficulties by establishing a professorship of constitutional law. He was arrested and detained in prison from 1815 to 1820, when the revolution reinstated him at San Isidro. A counter revolution brought his opponents into power, and he was exiled from 1823 to 1827. However, at the time of his death he was member of the supreme council of war, of the military department of the Spanish and Indian boards and a grandee of Spain. He learned Hebrew at the age of 57 in order to translate the Psalms. This translation has gained for him a high reputation for poetical power. He also wrote metrical translations of the other poetical books of the Bible and other works in prose and verse, of which the high quality brought him membership in the Real Academia Española and in the Real Academia de la Historia. The Spanish Academy included his name in the 'Catálogo de autoridades de la lengua castellana.'

**CARVALHO, kār-vāl'yō, José da Silva**, Portuguese statesman: b. Beira 1782; d. 3 Feb. 1845. He studied law at the University of Coimbra, and became a judge in 1810. His prominent part in the revolution of 1820 caused him to become a member of the provisional government. He was a member of the regency and appointed Minister of Justice until 1823, when, on the downfall of the constitutional government, of which he was a foremost champion, he was obliged to resort to flight to England, where he remained until 1826, when he returned to Lisbon, but Dom Miguel's success again compelled him to leave. Eventually he was named a member of the council of guardianship instituted by Dom Pedro for the young Queen, Donna Maria, and succeeded in negotiating the first English loan for Portugal. Having accompanied Dom Pedro to the Azores, he filled, on his return to Portugal, important offices, and became Finance Minister in 1832. In 1835 he retired with the Palmella administration, and was presently obliged to leave for England, where he remained until 1838, when a general amnesty was proclaimed. He returned in 1842. When the constitution of Dom Pedro was re-established, he became councillor of state.

**CARVALHO, Paez de Andrade, Manoel de**, Brazilian politician: b. about 1795; d. Rio de Janeiro, 18 June 1855. Elected temporary President of Pernambuco in December 1823, he led a revolt the next year against Pedro I, the Emperor, and on 2 July 1824 announced a republic entitled 'Confederação do Equador.' On the suppression of the revolt in October, Carvalho fled to England, but subsequently returned to Brazil and was a senator from 1835.

**CARVELL, Frank Broadstreet**, Canadian legislator: b. Bloomfield, County Carleton, New Brunswick, 14 Aug. 1862. He was graduated LL.B. at Boston University in 1890, and called to the bar of his native province in the same year. He represented Carleton in the provincial assembly as a Liberal, 1899-1900; resigned his seat in the latter year to contest (unsuccessfully) the same county for the Dominion House of Commons, but was elected in 1904 and has since retained the seat. He made his mark in the House in the debates on the administration of the Militia Department under the Borden government during the Great War, and his searching criticisms on the subject were followed by investigation by a commission appointed by Parliament but he supported (1917) the principle of compulsory military service with which that government identified itself, and on that question voted against his leader, Sir Wilfrid Laurier. In October 1917 he became Minister of Public Works in the Union government of Sir Robert Borden.

**CARVER, John**, first governor of the Plymouth colony: b. England, about 1575; d. Plymouth, Mass., April 1621. He joined the Leyden colony of English exiles about 1608, and as their agent assisted in securing a charter from the Virginia Company and in selecting and equipping the *Mayflower*. He was elected governor, probably 11 Nov. 1620, after the *Mayflower* reached Provincetown, showed great ability and judgment in governing the infant colony after the landing at Plymouth, and established by a treaty with the Indians peaceful relations that remained for many years undisturbed. He was re-elected in March 1621, but died a few days afterward. His chair and sword are still preserved as Pilgrim relics.

**CARVER, Jonathan**, American traveler: b. Stillwater, N. Y. (the universal ascription to Connecticut is an error), 1732; d. London 1780. He embraced a military career, and in the French War of 1756 commanded a company of provincials, in the expedition across the lakes against Canada. When peace was concluded in 1763, Carver undertook to explore the vast territory which Great Britain had gained. His object was to acquire a knowledge of the manners, customs, languages, soil and natural productions of the nations and region beyond the Mississippi, and to ascertain the breadth of the continent by penetrating to the Pacific over its widest part, between lat. 43° and 46° N. He accordingly set out from Boston in 1766, and having reached Michilimackinac, the remotest English post, applied to Mr. Rogers, the governor, for an assortment of goods as presents for the Indians dwelling in the parts through which his course was to be directed. Receiving a portion of the supply which he

desired, and a promise that the residue should be sent to him at the falls of Saint Anthony, he continued his journey. But not obtaining the goods at the appointed place, in consequence of their having been disposed of elsewhere by those to whom the governor had entrusted them, he found it necessary to return to La Prairie du Chien. He then, in the beginning of the year 1767, directed his steps northward, with a view of finding a communication from the heads of the Mississippi into Lake Superior, in order to meet, at the grand portage on the northwest side of that lake, the traders that usually came about this season from Michilimackinac, from whom he intended to purchase goods, and then to pursue his journey. He reached Lake Superior in good time; but unfortunately the traders whom he met there could not furnish him with any goods, as they had barely enough for their own purposes, and, in consequence, he was obliged to return to the place whence he first departed, which he did in October 1768, after remaining some months on the north and east borders of Lake Superior, and exploring the bays and rivers that empty themselves into that body of water. He soon after repaired to England with the view of publishing his journal and charts, and of obtaining reimbursement for the expenses which he had incurred. Having undergone a long examination before the lords commissioners of trade and plantations, he received permission to publish his papers; but when they were nearly ready for the press an order was issued from the council-board, requiring him to deliver immediately into the plantation office all his charts and journals. He was, consequently, obliged to repurchase them at a great expense from the bookseller to whom he had disposed of them—a loss for which he received no indemnification, but was forced to be satisfied with that obtained for his other expenses. He had fortunately kept copies of his papers, and he published them 10 years afterward in Boston, while in the situation of a clerk of a lottery. His works are 'Travels Through the Interior Parts of North America' (1778); 'Treatise on the Culture of the Tobacco Plant' (1779); 'The New Universal Traveler'; 'Literary History of the American Revolution.' Consult 'The Carver Centenary' (1867 published by the Minnesota Historical Society); Bourne, E. G. (in the *American Historical Review*, January 1906).

**CARVER, Thomas Nixon**, American economist: b. Kirkville, Iowa, 25 March 1865. He studied at Iowa Wesleyan University, the University of Southern California, Johns Hopkins and Cornell; was professor of economics at Oberlin College from 1894 to 1900, when he became assistant professor of political economy at Harvard University and full professor in 1902. In 1913 he was given charge of the rural organization service of the Department of Agriculture to investigate the marketing and distribution of farm products. A frequent contributor to economic reviews, his published works include 'The Theory of Wages adjusted to Recent Theories of Value' (1894); 'The Distribution of Wealth' (1904); 'Sociology and Social Progress' (1905); 'Principles of Rural Economics' (1911); 'The Religion Worth Having' (1911-12).

**CARVING**, as a branch of sculpture, the art of cutting a hard material by means of a sharp instrument: but there are extended uses of the term, as shown below.

The term is generally employed for work which is strictly decorative as distinguished from grand sculpture; thus the wrought stone leafage, scroll work and even animal forms in a Gothic porch, are *carving* in common parlance, and so are the human figures of the porch if they are conventional or stiff, as often happens in mediæval work. In a Roman temple or a neo-classic edifice the leafage of Corinthian capitals or of any panel or string-course would be called *carving*, while the statues and even the reliefs of human subjects would be spoken of as sculpture (q.v.). Small pieces, even of human subjects, such as decorative statuettes and groups, are spoken of as carving, and these may be wrought in wood, ivory, bone, marble, and other stones, and even in hard and semi-precious stones, such as agate and jade. The carvings of the Chinese and Japanese are especially in demand in Western lands, because of their picturesque beauty. When they are of wood they are often painted, gilded or lacquered with a rich polychromatic effect.

Throughout the middle ages of Europe, ivory statuettes, backs of mirrors and purely ornamental objects were treated in the same way, the carving being helped out by color and gold with extraordinary results.

Carving, when done in very hard material, such as rock crystal and jade, requires much use of the drill, in which case the meaning of the term must be extended to include the result produced by a rapidly revolving pin with emery powder or the like. One of the most ingenious and useful purposes to which carving has been converted in more modern times is that of engraving wood-cuts or blocks for printing. (See WOOD-ENGRAVING). Carving has been applied to almost innumerable uses in manufactures as well as in art. Some of these applications have given way to the art of engraving in metal and other processes, but new ones are continually arising. The first carving-machine was invented about 1800, and many others have since been patented.

**CARY, Alice**, American poet: b. near Cincinnati, Ohio, 26 April 1820; d. New York, 12 Feb. 1871. When quite young she began writing sketches and poems for the press, and in 1852 she, with her sister, Phoebe (q.v.), removed to New York, where they lived during the rest of their lives. In 1850 the sisters published a volume entitled 'Poems by Alice and Phoebe Cary.' Alice soon after published 'Cloverbrook, or Recollections of Our Neighborhood in the West' (1851-53); 'Lyra, and Other Poems' (1853); 'Hagar, a Story of To-day' (1852); 'Married, not Mated,' a novel (1856); 'Lyrics and Hymns'; 'The Bishop's Son'; 'The Lover's Diary' (1867); and 'Snow Berries: A Book for Young Folks' (1869). The verse of the Cary sisters still retains a hold upon the affections of readers and not a few lines of theirs have become familiarized by frequent quotation. While living in New York they attracted about them a circle of literary people, and for 15 years their Sunday evening receptions were a feature in the literary life of the city. Consult Ames, Mary C.,

'Memorial of Alice and Phoebe Cary' (New York 1873).

**CARY, Annie Louise**, American singer: b. Wayne, Me., 22 Oct. 1842. She studied in Milan, made her operatic debut in Copenhagen in 1868, had a successful European career for three years, and returned in 1870 to the United States, where she won great popularity and remained, with the exception of one brilliant European tour, until 1882, when she married Charles M. Raymond, and retired from the stage while her voice was still unimpaired. Since then she has sung only in private or for charity. She created, in New York, the part of Amneris in 'Aida' (1873).

**CARY, Archibald**, American statesman: b. Virginia, about 1730; d. Chesterfield, Va., September 1786. He early became a member of the House of Burgesses, and in 1764 served on the committee which reported the address to the King, Lords and Commons, on the principles of taxation; and in 1770 was one of the signers of the "Mercantile Association," which pledged its members to use no British fabrics thereafter, the design being to resist by practical measures the encroachments of the government. In 1773 he was one of the celebrated committee of correspondence by which the colonies were united into one great league against Parliament. When the State government was organized he was returned to the senate, where he presided with great dignity and efficiency. At this time occurred the incident with which his name is most generally connected. The scheme of a dictatorship had been broached, and without his knowledge or consent Patrick Henry was spoken of for the post. In the midst of the general agitation Cary met Henry's half-brother in the lobby of the assembly, and said to him: "Sir, I am told that your brother wishes to be dictator. Tell him from me, that the day of his appointment shall be the day of his death, for he shall find my dagger in his heart before the sunset of that day." The project was speedily abandoned. He was a good representative of the former race of Virginia planters, delighting in agricultural pursuits, in blooded horses and improved breeds of cattle, which he imported from England, and attended to with great care.

**CARY, Henry Francis**, English clergyman, translator of Dante: b. Gibraltar, Spain, 6 Dec. 1772; d. London, 14 Aug. 1844. In 1790 he entered Christ Church, Oxford, and he took orders in 1796. In 1796 he was presented to the vicarage of Abbot's Bromley, Staffordshire, and in 1800 he removed to Kingsbury, in Warwickshire, another living to which he had been presented. His studies while at college had embraced a wide range of Italian, French and English literature, and in 1805 he gave proof of his Italian scholarship, as well as of his poetic powers, by the publication of the 'Inferno' of Dante in English blank-verse, accompanied by the Italian text. The entire translation of the 'Divina Commedia' was accomplished in 1814, and the work was now published complete, but it lay unnoticed for several years, till Samuel Taylor Coleridge drew attention to its merits. It has since been recognized as a standard English work. Cary subsequently translated the 'Birds' of Aristophanes (1824), and the 'Odes' of Pindar, and wrote a continuation of Johnson's 'Lives of the English Poets,' and a series

of 'Lives of Early French Poets.' He was for some time curate of the Savoy, London, and in 1826 was appointed assistant keeper of printed books in the British Museum, which office he resigned in consequence of his being passed by on the appointment of Mr. Panizzi in 1837 to the office of keeper of the printed books. The government in 1841 granted him a pension of £200 a year as a recognition of his literary abilities; and he devoted himself henceforth to the annotation of a new edition of his translation of Dante, and to editions of the English poets, Pope, Cowper, Milton, Young, etc. He was buried in Westminster Abbey. His son, Henry Cary, has written a 'Memoir' (London 1847).

**CARY, Lott**, American negro slave: b. Virginia 1780; d. Africa 1828. He educated himself, became a Baptist minister, purchased the freedom of himself and his two children for \$850, and joined the colony sent in 1822 to Liberia, where he performed inestimable services in behalf of the new republic. He was acting as vice-agent with full power when he was accidentally killed while making cartridges for defense against the slave traders.

**CARY, Lucius**. See FALKLAND.

**CARY, Phoebe**, American poet and prose-writer, sister of Alice Cary (q.v.): b. Cincinnati, Ohio, 4 Sept. 1824; d. Newport, R. I., 31 July 1871. She contributed numerous sketches to various periodicals; and with her sister published several books, among which are 'Poems and Parodies' (1854); and 'Poems of Faith, Hope and Love.' She will be longest remembered as the author of the popular hymn beginning, 'One Sweetly Solemn Thought.' Consult Trent, 'A History of American Literature' (New York 1903).

**CARY REBELLION**, in North Carolina, an outcome of the religious and political disturbances set going by the constitution of Locke and Shaftesbury, whose laws and discriminations survived itself. (See CAROLINA, ORIGINAL CONSTITUTION OF). One of these, requiring an oath to support the constitution and laws, debarred the Quakers (who were among the most influential of the early settlers, and by no means inclined to submit peaceably to oppression) from voting or holding office, or being witnesses in criminal suits. The establishment of and taxation for the Church of England was a common grievance to all the colony, nearly all its population being dissenters; and there were other obnoxious ordinances. At this time Albemarle County (North Carolina) had its separate deputy governor, appointed by the governor of the entire colony; and in 1704 Sir Nathaniel Johnson so appointed Robert Daniel, a churchman, and "landgrave" or hereditary noble and councillor. He tried to enforce the laws; and one John Porter, an influential Quaker, shortly went to England to complain of him and of vexatious legislation against his sect. One of the proprietors, John Archdale (q.v.), ex-governor, was himself a Quaker, and induced the other proprietors to remove Daniel; and Johnson appointed Thomas Cary, a Carolina merchant, said to have been Archdale's son-in-law, in his place. Cary, however, felt bound to enforce the laws, and again the Quakers complained. Cary was removed (the

accepted account says he was in ill odor with the proprietors for having been short in his accounts as collector of revenue for them); and this time the appointment of a deputy for Albemarle was taken from the governor, and a new proprietary council formed, with Porter and several other Quakers on it. On Porter's return to America in 1707, he convened the council, which elected William Glover, a churchman, president. Glover insisted on enforcement of the laws as before, and Porter's party turned against him, declared his election illegal, struck a bargain with Cary and elected him president in Glover's place. Glover and his section refused to recognize the validity of the new election, and held their meetings in one room of the executive mansion, while Cary and his councillors met in the other. Daniel, as a landgrave, was ipso facto a councillor, and sat alternately in both. Each party issued writs for election to the assembly, and it seems to have held without formal recognition of either; but Cary's party held the majority. In 1710 Edward Hyde, a relative of Clarendon's, was appointed deputy governor by the proprietors, and came out in August 1710 to assume office. His commission was to be taken from Tynte, who had succeeded Johnson; but Tynte had died, and Hyde had only his letters from the proprietors to show. The Cary party, however, was glad to acknowledge him so long as it held the power and he confirmed it; but the next assembly was held by its enemies; Hyde apparently aided it in enforcing the laws in favor of the Church, and Cary's party promptly refused to acknowledge his authority and made open war on him. Cary attacked Edenton with two armed vessels, but was repulsed, and Hyde called on Governor Spotswood of Virginia for help. Spotswood admitted that the revolters were "dangerous incendiaries," but said the country was almost inaccessible, and he had only militia; but finally sent some of his marines from the guard-ships at Hampton Roads. Cary, with his chief men, Levy, Truitt, etc., thereupon went to Virginia, apparently for temporary refuge, declaring that they would go to England and appeal to the proprietors. Spotswood took them at their word, and sent them, seemingly against their will, to England; and they disappear from history. That they were discharged, however, is apparent from a circular letter of Lord Dartmouth to the colonies, at this juncture, to send no more prisoners to England for trial without proof of their guilt. At home, the burgesses refused to provide for the defense of the colony unless they could have share in the government and what they held to be their rights; and the result was a fearful desolation in a war which soon broke out with the Tuscaroras.

**CARYATIDES**, or **CARYATIDS**, *kar-i-ät'i-dēz*, in architecture, a name used to designate female figures made to support a roof, cornice, etc., instead of columns. The goddess Artemis (Diana), who had a temple in Caryæ, a Peloponnesian city, was for this reason called *Karyatis*. In honor of her, virgins danced in a festive procession during an annual feast, which suggested to architects the idea of adopting the images of virgins to serve as columns. Thus Lessing and others explain the name and form of the caryatides. Another explanation of their origin is the following: The inhabitants of

Caryæ allied themselves with the Persians in their war with the Greeks. The Greeks, on the successful termination of that struggle, exterminated the males of Caryæ, and reduced all the women to slavery. As a mark of infamy, and to perpetuate the memory of the transaction, the architects of the time made statues representing these women in the servile office of supporting entablatures. The figures are distinguished by gracefulness and quiet dignity of pose. There are fine examples in the Erectheum at Athens and British Museum. Consult Homolle, in *Bulletin de Correspondance hellénique* (Vols. XXIII, XXIV, Paris 1899).

**CARYOCAR**, *kä-rī'ō-kär*, a genus of plants belonging to the family *Caryocaraceæ*, consisting of lofty trees, natives of tropical America, which produce good timber. They have evergreen, ternate or pinnate leaves, and flowers in racemes. *C. nuciferum*, a species abundant in British Guiana, yields the kidney-shaped souari-nuts, or butternuts. Other species are *C. glabrum* and *C. amygdaliferum*.

**CARYOPSIS**, the small, peculiar, one-seeded, dry indehiscent fruit of the grasses, as wheat, barley, etc.

**CARYOTA**, a genus of palms, with doubly pinnate leaves, the best-known species of which (*C. urens*) is a native of most of tropical Asia. It supplies an inferior kind of sago, and from its juice is made toddy or palm-wine. The leaf-stalks yield kittul fibre, which is used in making baskets, brooms, etc.

**CARYSPORT REEF**, a dangerous coral reef near the southern extremity of Florida, lat. 25° 13' N., long. 80° 13' W., lying about five miles east of Key Largo, on which is erected a lighthouse of the first order, 106 feet high.

**CASA**, *kä'zä*, **Giovanni della**, Italian writer: b. Mugello, near Florence, 1503; d. Rome, 14 Nov. 1566. He studied in Bologna, Florence and Rome, and entered as an ecclesiastic into the service of the two cardinals Alessandro Farnese, the first of whom in 1534 ascended the papal chair, under the name of Paul III. He rose through various offices in the Church, including the archbishopric of Benevento, till Paul IV made him his private secretary. His most celebrated work is 'Galateo, ovvero de' Costumi' (1560), a manual of good-breeding, to which another book, 'Degli Uffizi communi tra gli Amici Superiori e Inferiori,' forms a supplement. This last is a translation of his Latin treatise, 'De Officiis Inter Potentiores et Tenuiores Amicos.' The best and most complete edition of his works appeared at Venice (1752).

**CASA BRACCIO**, *bräch'ö*, Italian romance, by Francis Marion Crawford, published 1896. The first half of the novel is much the better.

**CASA GRANDE**, *grän'dä*, or the **CASA GRANDE RUIN** (see **NATIONAL PARKS AND MONUMENTS**), the Spanish name (signifying "large house") of the ruins of a prehistoric building in Arizona, near the Gila River, about 12 miles from Florence, Ariz., and somewhat farther from the Casa Grande station. It is the best-preserved structure of a type which was widely distributed. The space enclosed by

the walls now standing measures about 43 by 59 feet; and the walls, which are high, show that there were three habitable stories. A large area surrounding this building is covered with mounds and débris of other buildings, indicating that there was originally a considerable settlement on the site. It was set aside, as the most interesting object in a small reservation, by executive order dated 22 June 1892, under the act approved 2 March 1889. By presidential proclamation of 10 Dec. 1909 the boundaries of the reservation were changed by the elimination of 120 acres on which there were no prehistoric ruins and the inclusion of a tract of equal size adjoining the reservation on the east, on which are located mounds of historic and scientific interest. Casa Grande was a ruin when discovered. Since that time the identity of its builders has furnished a theme for speculation; and although it has been ascribed to the Aztec, the better opinion seems to be that the ancient people who inhabited this building were not closely related to any tribes of the Mexican plateau, whose culture was different from that of the sedentary tribes of Arizona. The walls are of a fawn color slightly tinged with red. They are constructed of a cement called *caliche*, composed of lime, earth and pebbles; this was made into blocks, which were laid in courses. Consult Fewkes, J. W., detailed report in Twenty-eighth Annual Report Bureau American Ethnology.

**CASABIANCA**, *kä-zä-bë-än'kä*, Louis, French naval officer: b. Bastia, Corsica, 1755; d. 1 Aug. 1798. With the Comte de Grasse, he took part in the American Revolution. He sat in the National Convention of 1792; and in 1798 was captain of the flagship *L'Orient* in the expedition to Egypt. He was mortally wounded at the battle of the Nile, 1 Aug. 1798; the ship caught fire; his 10-year-old son would not leave him, and both were killed by the exploding of the ship. The story of their death is the subject of Mrs. Hemans' well-known poem.

**CASAL**, *kä-säl'*, Julián del, Cuban poet: b. 1863; d. 1893. He was a half morbid striver after the super-æsthetic and a pronounced lover of the luxury and elegance of the Orient and of Paris. Endowed with a fervid imagination and a strongly poetic touch he found followers not only in Cuba, but throughout Latin America, and later in Spain itself. None of the countries that he loved and whose manners and customs and modes of thought he imitated, had he ever visited. Highly colored were his mental pictures of them, by wonderful visions from the land of imagination and of dreams in which he lived. Yet, with all his love of beauty, luxury and elegance, he was very much a pessimist and his discontent with life finds constant expression in his writings. He handled the sonnet with a master-hand and made it do duty in picturing the many phases of life into which his active imagination constantly led him. His work covers a wide variety of subjects, ranging from clear-cut pictures of heroic characters of classical Greece, to sketches of native life in Havana, in prose and poetry, and side-stepping at times into politics, society and biography. Casal was an intimate friend of Rubén Darío, the Nicaraguan poet and leader of poetic thought throughout Latin America from 1895 to 1915; and the latter borrowed a number of his reactory

ideas from the young Cuban poet, whose writings in *La Habana Elegante* and other periodicals had early made him the leading figure of his day in Cuban literature. Among Casal's published work are 'Hojas al Viento' (1890); 'Nieve' (1891); 'Bustos y Rimas' (prose, 1893). In a study of Joris Karl Huysmans, he displays his critical ability and his love of the exotic and sensuous. Consult Meza, Ramón, 'Julián del Casal' (Havana 1910).

**CASAL**, or **CAZAL**, Manoel Ayres de. See CAZAL.

**CASALE**, *kä-sä-lë*, or **CASALE DE MONFERRATO**, Italy, city in the province of Alessandria, on the right bank of the Po, 18 miles north-northwest of Alessandria. The citadel, founded by Duke Vicenzo in 1590, was one of the strongest in Italy, and within recent years the fortifications have been greatly strengthened and extended. In 1640 the Spaniards were defeated here by the Duc d'Harcourt, and the possession of the town was repeatedly contested by the Austrians and French during the wars of Napoleon. Casale was the capital of the ancient Montferrat. It is the seat of a bishop and of a district court of justice, and has a cathedral which is said to have been founded in the 8th century. Its church of San Domenico, containing a tomb in memory of the Princess Palæologi, is remarkable for the elegance of its design, and several fine works of art are found in other of its churches. The mediæval history of Casale goes back to its settlement in 730 by Lintprand, on the site of the ancient Roman city Bodincomagus. The church of San Ilario replaced the former pagan temple of worship which stood here. In 1215 Casale was almost totally destroyed by its neighbors, but in 1220 was rebuilt and in 1292 became the property of the marquises of Montferrat. Modern Casale has tramway communication with the neighborhood and nearby is the famous Sacro Monte di Crea with its 18 chapels. Cement, liqueurs, silk, fertilizers, tools and machinery, constitute the chief industries. Pop. about 34,000.

**CASALE PUSTERLENGO**, *püs-tër-lën'-gö*, Italy, town in the province of Milan, southeast of Lodi, beautifully situated in a fine plain between the Po and the Adda. It has a trade in Parmesan cheese. In 1796 the Austrians were attacked here by the French, and driven back to Lodi. Pop. 7,000.

**CASALMAGGIORE**, *kä-säl-mäd-jö'rë*, Italy, a town in the province of Cremona, 15 miles north of Parma, and 22 miles southeast of the city of Cremona (with which there is railway connection), on the left bank of the Po. There are a cathedral and other churches, theatre, etc. The manufactures include pottery and glass-ware, leather and chemicals; and there is a trade in wine, grain, hemp and cheese. In 1448 the Venetians were defeated here by Francesco Sforza. Pop. 17,500.

**CASALS**, Pablo, Spanish violoncellist: b. Vendrell, Catalonia, 1876. He studied at Barcelona with Garcia and Rodereda, and in 1894 in Madrid with Breton. He made his début in 1898 at one of the Concerts Lamoureux in Paris. His success was immediate and he devoted himself to the concert stage. He has

toured Europe and both North and South America where he has been met with much acclaim. His interpretation is excellent and his technique perfect. As a composer, he has won recognition with two symphonic poems, several smaller works for orchestra and numerous pieces for piano and cello and for piano and violin.

**CASAMICCIOLA**, *kā-sā-mē'chō-lā*, Italy, favorite watering-place on the island of Ischia, beautifully situated in a valley on the north side of Monte Epomeo, with hot springs (158° F.), baths, hotels, etc. The season extends from June to September. By the earthquake of 28 July 1883, the place was almost entirely destroyed, and even at present, although the government has aided in its rebuilding, a considerable part of the town is in ruins. Pop. (1911) 3,490.

**CASANARE**, *kā-zā-nā're*, a river of the Republic of Colombia, which rises in the mountains of Chita, flows through a region called by the same name, and after an easterly course of 180 miles empties into the Meta, lat. 5° 58' N. It is navigable for small craft.

**CASANOVA**, *kā-sā-nō'vā*, **Francesco**, Italian painter: b. London 1727; d. Brühl, near Vienna, 1805. He studied in Florence under Simonini. He went to Venice with his parents, was in Paris in 1751, but after a brief stay went to Dresden, where he remained from 1752-56. Here he studied and copied the paintings of Wouverman. He acquired renown as a painter of battle pieces, and was admitted to the Academy of Fine Arts in 1763. Catherine II of Russia employed him to paint her victories over the Turks. He settled in Vienna in 1785, and the gallery there contains several of his paintings. At Paris he was painter to the King. Among his pictures are 'The Battle of Freiburg,' 'Hannibal Crossing the Alps' and 'The Battle of Lyons.'

**CASANOVA DE SEINGALT**, *kā-sā-nō'vā dē sāi-gāl*, **Giovanni Giacomo**, Italian adventurer: b. Venice, 2 March 1725; d. Düx, Bohemia, 4 June 1798. The year of his death is uncertain, some maintaining that he lived until 1803. He was the son of an actor and actress; he studied law at Padua, but gave this up to study for the priesthood. He was expelled from the Seminary of Saint Cyprian for a scandalous intrigue, and was also imprisoned for a short time. The influence of his mother procured him a place in the establishment of Cardinal Acquaviva, but he did not retain it long; and after visiting Rome, Naples, Corfu and Constantinople, in the characters of diplomatist, preacher, abbot, lawyer and charlatan, he was imprisoned at Venice in 1755, but escaped owing to his wonderful keenness and skill. In his travels throughout Europe he formed associations with many distinguished characters, Louis XV, Rousseau, Voltaire, Suvoroff, Frederick the Great and Catherine II. His most celebrated work is his 'Memoirs' (1828-38), in which he relates with a cynical freedom the whole of his extraordinary adventures, and presents a picture of society without conventional disguise. Among his dupes were Mme. de Pompadour, Frederick the Great, and even that other prince of charlatans, Cagliostro.

Besides his 'Memoirs,' Casanova was the author of several works of history or imagination in French and Italian, which show the versatility of his genius. The most remarkable are 'Récit de sa Captivité' (1788), and a translation in verse of the Iliad. His 'Memoirs' are now recognized as of important historical value as a portrayal of private life in the 18th century. A complete critical edition is in preparation by Brockhaus of Leipzig from the original text. The general reliability of the 'Memoirs' is attested by 'Lettre di donne a G. Casanova,' edited by Ravá (Milan 1912). Consult Ravá, 'Contributo alla bibliographia di G. Casanova' (Turin 1910); Maynial, 'Casanova et son temps' (Paris 1911); Symonds, 'Casanova at Düx' (in *North American Review*, 1902).

**CASARTELLI**, **Louis Charles**, English Roman Catholic prelate and writer: b. Manchester, England, 14 Nov. 1852. He was educated at the Salford Grammar School, Ushaw College and Louvain University. He was ordained to the priesthood in 1876; was professor at Saint Bede's College, Manchester, 1877-91, and was rector there from 1891-1903. He edited *Illustrated Catholic Missions* in 1889-1903 and from 1900-03 was professor of Zend and Pahlavi languages at Louvain University. In 1903 he was consecrated bishop of Salford. He has been lecturer on Iranian languages at Manchester University. In 1908-10 he was president of the Dante Society of Manchester and of the Manchester Egyptian Association. He represented the universities of London and Manchester at the jubilee of Louvain University. He is president of the Manchester Oriental Society and member of the Royal Asiatic Society. He has published 'Lectures on Commercial Geography' (1884); 'La philosophie religieuse du Mazdéisme sous les Sassanides' (1884); 'Traité de médecine Mazdéenne' (translated from Pahlavi 1886); 'Sketches in History' (1906). He contributed to the 'Catholic Encyclopedia'; was a collaborator in 'Encyclopædia of Religion and Ethics.' He is a frequent contributor of articles on religious and Oriental topics to periodicals.

**CASAS**, *kā'sās*, **Bartolomé de las**, Spanish prelate, better known as "the Apostle of the Indies:" b. Seville 1474; d. Madrid, July 1566. In his 19th year he accompanied his father, who sailed with Columbus, to the West Indies. Five years afterward he returned to Spain, and pursuing his studies he entered the priesthood. He accompanied Columbus in his second voyage to Hispaniola (Haiti), and on the conquest of Cuba settled there, and distinguished himself by his humane conduct toward the oppressed natives. He set at liberty the Indians who had fallen to his share in the division; and so much was he interested for them, that in 1516 he went to Spain to lay a statement of their case before King Ferdinand, whose death at that time prevented any measures for their benefit. The regent, Cardinal Ximenes, however, appointed a commission to examine circumstances on the spot, and to determine accordingly. Las Casas was to accompany them, with the title of Protector of the Indians. The commissioners found that it was impossible to liberate the Indians, and therefore en-

deavored to secure their humane treatment; but Las Casas, still dissatisfied, remonstrated so warmly that he was obliged to take refuge in a convent from the rage of the planters. He again returned to Europe; and on the accession of Charles V, in consequence of his representations, the council appointed a chief judge to re-examine the points of controversy between the partisans of Indian liberty and the colonists. Las Casas, in his zeal for the Indians, became the author (or the encourager at least) of the slave-trade, by proposing to purchase negroes from the Portuguese in Africa to supply the planters with laborers, of the want of whom they complained; and this was unfortunately put into execution. He next applied for a grant of an unoccupied tract, in order to try his own plan with a new colony. This he at length obtained, and with 200 persons, whom he persuaded to accompany him, landed at Porto Rico in 1521, but found that an expedition was advancing to ravage this very tract, and convey its inhabitants to Hispaniola as slaves. He endeavored in vain to prevent the threatened danger, and with the few who still adhered to him returned to Hispaniola to solicit succor. During his absence the natives attacked the colonists with such success that in a short time not a Spaniard remained in that part of South America. Las Casas, in despair at the failure of his project, retired to the Dominican convent at Saint Domingo, and assumed the habit of the order. Notwithstanding his retirement his zeal in the cause of the Indians did not abate; and being sent on a mission to Spain by a chapter of his order at Chiapas in 1542, he pleaded their cause with his pristine warmth, and composed his famous treatise 'Brevisima Relacion de la Destrucción de las Indias,' in which he exposed the cruelties practised by the Spaniards. His unremitting perseverance at length obtained a new set of laws and regulations, by which the natives were greatly relieved. In 1544 he returned to America as bishop of Chiapas, but left it three years later, and resigned his bishopric in 1550. Besides the treatise above named he wrote 'Historia de las Indias.' This was first printed in 1875-76. It is one of the most notable of books, not only in its contents,—as a history of Spanish discoveries from 1492 to 1520, and a contemporary Spanish Catholic criticism as well as story of Columbus,—but in the circumstances which prevented its publication for more than 300 years, and which still leave it inaccessible except to readers of Spanish. Consult Llorente, 'Œuvres de las Casas' (1822); Quintana, 'Vidas de Españoles Célebres'; Helps, 'Life of Las Casas and Spanish Conquest' (Philadelphia 1868); Fabie, 'Vida y Escritas de Las Casas' (Madrid 1879); Sabin, 'Works of Las Casas' (New York 1870); Prescott, 'Conquest of Mexico' (Philadelphia 1902); MacNutt, F. A., 'Bartholomew de Las Casas' (New York 1909).

**CASAS GRANDES**, *kā'sās grān'dās* (Span. "great houses"), a town in Chihuahua, Mexico, on the Casas Grandes or San Miguel River, 35 miles south of Llanos, and 130 miles southwest of El Paso, remarkable for a number of ruins, apparently relics of an aboriginal race. These ruins are found about half a mile from the small Mexican village, partly on the

declivity of a small hill, and partly on the plain at its foot. They consist chiefly of the remains of a large edifice of the pueblo type, built entirely of a substance resembling adobe, mud mixed with gravel and straw and formed into blocks 22 inches thick and about three feet long. The portions which must have been constructed of wood have entirely crumbled away. The outer walls are almost all prostrate, except at the corners, and were probably only one story high; the inner walls are better preserved, varying in height from 5 to 50 feet, and being in some cases five feet thick at the base. The portions remaining erect seem to indicate an original height of from three to six stories. The doorways have the tapering form noticed in the ancient structures of Central America and Yucatan, and over them are circular openings in the partition walls. The stairways were probably of wood and placed on the outside. Clavigero, in his 'History of Mexico,' tells us that the building, according to popular tradition, was erected by the Mexicans in their peregrination, and that it consisted "of three floors, with a terrace above them, and without any entrance to the lower floor. The door for entrance to the building is on the second floor, so that a scaling ladder is necessary." The main features of the edifice seem to have been three large structures connected by ranges of corridors or low apartments, and enclosing several courtyards of various dimensions. The extent from north to south must have been 800 feet, and from east to west about 250 feet. A range of narrow rooms lighted by circular openings near the top, and having pens or enclosures three or four feet high in one corner, supposed to be granaries, extends along one of the main walls. Many of the apartments are very large, and some of the enclosures are too vast ever to have been covered by a roof. About 200 feet west of the main building are three mounds of loose stones and 200 feet west of these are the remains of a building, one story high and 150 feet square, consisting of a number of apartments ranged around a square court. The inhabitants of this communal structure seem to have disappeared long before the Spaniards noticed the ruins in the latter part of the 17th century. Throughout the northern part of Mexico the name Casas Grandes is applied to deserted buildings of a similar type.

For some distance south the plain is covered with tracts of ancient buildings, and for 20 leagues along the Casas Grandes and Llanos rivers are found artificial mounds from which have been dug up stone axes, corn-grinders and various articles of pottery, such as pipes, jars, pitchers, etc., of a texture far superior to that made by the Mexicans of the present day, and generally ornamented with angular figures of blue, red, brown and black, on a red or white ground. The best specimens command a high price in Chihuahua and neighboring towns. On the summit of a mountain, about 10 miles from the ruins above described, are the remains of an ancient stone fortress, attributed to the same people who built the Casas Grandes, and probably intended as a lookout. See PUEBLOS.

**CASATI**, *kā-sā'tē*, Gaetano, Italian explorer in Africa: b. Lesmo, Italy, 1830; d. Como, 7 March 1902. He entered the army of Piedmont at 21, and resigning in 1879 went

to Africa, commissioned by the Società d'Esplorazione Commerciale d'Africa. He followed the Welle River and explored the basin of the Bahr-el-Ghazal. He joined his countryman, Gessi Pasha, there, but the schemes of the Mahdi in 1883 shut him up in the Niam-Niam region with Emin Pasha. At the request of the latter he consented to act as "President" in King Kabba Rega's country, but after being at first well treated by that monarch he was later condemned to death. Escaping with great difficulty to the Albert Nyanza Lake, and losing all his notes and manuscripts, he was finally rescued by Emin Pasha in 1888. The expedition of Stanley came a little later to the relief of both. On his return to Italy Casati published a volume descriptive of his adventures, entitled 'Dieci anni in Equatoria.'

**CASAUBON**, kă-zō-bôn, Isaac, Swiss classical scholar and theologian: b. Geneva 1559; d. London about July 1614. In his ninth year he spoke Latin fluently. In his 19th year he entered the university at Geneva, where he studied Greek, theology, the Oriental languages, etc., and in 1582 succeeded Portus as professor of the Greek language. In 1586 he married the daughter of the famous printer, Henry Stephens. In 1596 he accepted a professorship of Greek and *belles lettres* at Montpellier, but held it only two years. In 1600 Henry IV invited him to Paris. His Protestantism, the jealousy of other scholars, and perhaps his rather unyielding character, were the occasion of many unpleasant occurrences, for which, however, he was indemnified by the office of royal librarian. After the death of Henry IV in 1610 he went to England on the invitation of the archbishop of Canterbury, where he was received with distinction, was presented with a prebend in Canterbury Cathedral, and had a pension conferred on him by James I, with whom he was a great favorite. He was buried in Westminster Abbey. Casaubon was a liberal theologian, a man of extensive learning, a good translator and an excellent critic. As a critic, he commented on Diogenes, Laertius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, Dionysius of Halicarnassus, Athenæus, Pliny the Younger, etc. Nearly all the ancient classics are indebted to his valuable researches. His profound dissertation on the satirical poetry of the Greeks and the satire of the Romans ('*De Satyrica Græca Po. si et Romanorum Satira*') deserves particular praise. His theological writings are of less value. His diary, which had been preserved by his son, Meric, was edited by Russell (Oxford 1850) under the title of 'Ephemerides.' Casaubon's 'Letters' were published at Rotterdam (1709). A 'Life of Casaubon' was written by Mark Pattison (1875; id. ed., ed. by Nettleship, Oxford 1892). Consult also Nozelle, 'Isaac Casaubon, sa vie et son temps' (Paris 1897).

**CASAUBON**, Meric, son of the preceding, Swiss classical scholar in England: b. Geneva, 14 Aug. 1599; d. Oxford, 14 July 1671. He went to school at Sedan, and in 1611 followed his father to England, and studied at Eton and Christ Church, Oxford. He held successively several livings in the Church, when the revolution, which brought Charles I to the scaffold, deprived him of his income. Still he rejected the proposal of Cromwell to write the history

of his time, as also the invitation of Queen Christina to live in Sweden. On the return of the Stuarts he was rewarded for his loyalty by restoration to his offices in the Church, which he held till his death. Besides various works in Latin, he wrote several in English on theological and other subjects. Through the efforts of Charles I, he became doctor of divinity. He also wrote some critical works on the classics, a treatise, '*De Verborum Usu*' (1647), etc.

**CASBIN**. See KASBIN.

**CASCA**, Publius Servilius, Roman statesman: d. 42 B.C. He assisted in the assassination of Julius Cæsar in 44 B.C., and, according to Plutarch, he struck the first blow, in the back of the neck.

**CASCADE MOUNTAINS**, a range in the western United States and Canada, the northward continuation of the Sierra Nevada (q.v.). The range begins in California near the Oregon boundary and extends across Oregon and Washington into British Columbia. It parallels the Pacific coast at a distance of from 100 to 150 miles. The Columbia River and the Klamath have cut their way across the southern portion of the range and the Fraser River passes across the northern end. The range is extremely rugged in outline. The greater part of its mass is composed of igneous and volcanic rocks. Firs, pine and hard wood cover a goodly portion of the slopes. The highest peaks are Mount Shasta, 14,380 feet; Mount Hood, 11,225 feet; Mount Jefferson, 10,200 feet; Mount Rainier (Tacoma), 14,363 feet; Mount Baker, 10,500 feet; Mount Adams, 12,470 feet. Some summits are recently extinct volcanoes and there are large snowfields, which feed several glaciers. The range was first folded about the close of the Jurassic. During Tertiary time it was re-elevated, with the outpouring of great lava sheets.

**CASCAPEDIAC RIVER**, Great, a river of Canada, in the province of Quebec, flowing southeast into Chaleur Bay. Its length is 150 miles.

**CASCAPEDIAC RIVER**, Little, a river of Canada, in the province of Quebec, east of the Great Cascapediatic, and with an almost parallel but shorter course.

**CASCARA SAGRADA**, the bark of a northwestern tree (*Rhamnus Purshiana*, or California buckthorn), of the natural order *Rhamnaceæ*. The composition of cascara is extremely complex, but its main action is due to the volatile oils, the anthracene resins, at least three, the amaroids and the tannin, malic and oxalic acids. It stimulates peristalsis, increases the intestinal juices and has marked effects on general excretion. It is an excellent laxative and one of the very best cathartics for habitual and chronic constipation. It is best used in the form of a fluid extract. Because of its valuable properties, many patent drugs with similarly sounding names have been foisted on the public. These mostly contain other and more powerful and pernicious cathartics. See BUCKTHORN.

**CASCO BAY**, a bay on the southwest coast of Maine. It is about 20 miles wide and so deep as to constitute one of the best harbors

of the world, for all kinds of vessels. It contains many islands. Portland is located on the west side.

**CASE, Augustus Ludlow**, American naval officer: b. Newburg, N. Y., 3 Feb. 1813; d. Washington, D. C., 17 Feb. 1893. He entered the navy as a midshipman in 1828. In the Mexican War he took part in the capture of Vera Cruz and Tabasco, and during the Civil War served as fleet captain of the North Atlantic blockading squadron. He took part in the capture of Forts Hatteras and Clark, and cut out the blockade-runner *Kate*, under the fire of the forts at New Inlet, N. C. He was a lighthouse inspector in 1867; chief of bureau of ordnance, 1869; commander of the European squadron in 1873; was placed in command of the fleet at Key West at the time of the *Virginus* affair; and was retired in 1875, with the rank of rear-admiral.

**CASE, Leonard**, American philanthropist: b. Cleveland, 27 June 1820; d. 6 Jan. 1880. He was graduated at Yale College in 1842, and continued to pursue literary and scientific studies, contributing to the best magazines. Inheriting from his father a large estate in the city of Cleveland, he deeded a certain part of it for the founding and maintenance of an educational institution, which was incorporated after his death as the Case School of Applied Science (q.v.).

**CASE, Theodore Spencer**, American physician: b. Jackson, Ga., 26 Jan. 1832; d. Kansas City, Mo., 16 Feb. 1900. He was graduated at Marietta College in 1852 and at the Starling Medical College, Columbus, Ohio, in 1856. In 1883 he received the honorary degree of Ph.D. from the University of Kansas. Subsequent to the receipt of his medical degree he settled in Kansas City, and from 1860 to 1861 edited the *Medical Review* there, also holding the office of alderman in 1860. He became second lieutenant of the 25th Missouri infantry in June 1861, and later captain and assistant quartermaster. In February 1865, he was made colonel and quartermaster-general of Missouri, and in 1866-68 was curator of the University of Missouri. From 1873 to 1885 he was postmaster of Kansas City and in 1885 became professor of chemistry in Kansas City Medical College. He edited the *Kansas City Review of Science and Industry* from 1877 to 1885, and in 1886 became president of the Kansas City real estate and stock exchange.

**CASE, Thomas**, English philosophical scholar. He was educated at Rugby and Balliol College, Oxford, was Waynflete professor of moral and metaphysical philosophy at Oxford from 1889 to 1910, and was appointed president of Corpus Christi College in 1904. He has published 'Materials for History of Athenian Democracy from Solon to Pericles' (1874); 'Realism in Morals' (1877); 'Physical Realism' (1888); 'Saint Mary's Clusters' (1893).

**CASE**, in grammar, a form, modification or inflection of a noun or pronoun, indicating or corresponding to its relationship to some other word or words in a phrase or sentence, as, John (nominative case) speaks; John's (possessive) dog barks; John beats his dog (objective). In adjectives, case is merely sympathetic, the adjective agreeing in case with the noun which it qualifies. In English, nouns

undergo only one inflection representing a different case from the nominative or general form of the noun; all other cases are represented either by prepositions or by the position of the noun in the sentence, the nominative case usually preceding the verb, the objective or accusative following it. The single inflected case in English is the possessive or genitive (John's). English pronouns have three cases—nominative, genitive and accusative, as *he, his, him*. The last often serves as a dative. Adjectives undergo no modifications in English. In Sanskrit there are eight cases—nominative, accusative, instrumental, dative, genitive, ablative, locative and vocative. In Latin there are six cases—nominative, genitive, dative, accusative, vocative, ablative. In Greek there are five, the ablative not being used. In both Latin and Greek there are traces of a locative case. In French, Italian, Spanish and Portuguese, the nouns have no case-inflections. In German both nouns and adjectives are inflected for case. There are four cases in German—nominative, genitive, dative, accusative.

In law, the word has various meanings. An "action upon the case" is one in which damages are sued for, for some cause of complaint where the injury done is not direct, as in trespass, but consequential. A "case stated" is a statement prepared by one court for the decision of a point of law by a superior court. A "special case" is a written statement of facts agreed on by two or more litigants in an action, in order that a court may decide their legal effect. In the United States the term is used in brief for "case on appeal," meaning the statement laid before a court of appeal by an appellant and presenting the complete record of the original trial in the lower court. Thus the appellate court is allowed to review the findings as well as the points of law involved and here case differs from a "bill of exceptions" in which points of law only are submitted for the consideration of the appeal court. "Case reserved" is a statement drawn by counsel and certified by the judge, to be used as a basis for argument on points of law before a full bench of the court.

In letter-press printing, a case is a receptacle for types, generally made of wood, 34 inches long, 15 inches wide and 1¼ inches deep, and divided into compartments or "boxes," each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case; the upper one has 98 boxes, and contains the capitals, small capitals and some other signs that are only occasionally required in composition; the lower one has 54 boxes, and holds the letters of the small characters, figures, spaces and most of the points. Thus the small characters are habitually spoken of by printers as "lower-case" letters, and the capitals, etc., as "upper-case" letters. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. The different sizes of the boxes in the lower case depend upon the comparative frequency with which the several letters occur in the composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter *e*, which is most run upon in the English language, has a box much larger than any of the other compart-

ments, and is placed directly in front of the compositor. In the upper case the boxes are of uniform size, and the letters are placed in nearly alphabetical order, the comparatively rare occurrence of capitals rendering it less important which letter is nearest the compositor's hand. Cases are mounted in a slanting position upon a frame of convenient height.

Cases are named from their use or construction, as "Italic case," a two-third case for holding Italic type; "two-third case," a single case in which two-thirds of the space is equivalent to the ordinary lower case, and the remaining third is occupied by the capitals, etc.; "job case," a single case suited to holding a small job font of type; "rule case," a case for holding brass rule; "sort-case," a case for containing "sorts." The manufacture of cases has received a serious set-back since the introduction of type-composing machines. See PRINTING.

**CASE-HARDENING**, the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust and capable of taking on a better polish. Fire-irons, gunlocks, keys and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed, and heated to redness with powdered charcoal or cast-iron, the malleable iron taking carbon from either of these to form a skin of steel upon it; the heated objects are then cooled in cold water, or in oil when they are of a delicate nature. Yellow prussiate or potash or parings of leather have also been a good deal used for coating iron articles with steel by heating them together. Some chemists consider that in this case nitrogen combines with the iron and effects the hardening. The coating of steel is very thin, seldom exceeding one-sixteenth of an inch. Where a thicker coating is needed the articles are treated several times. The so-called "Harveyizing" process of hardening steel armor plate is similar to case-hardening in that the surface is made very resistant to the entrance of projectiles by heat treatment in carbon, while the back is softer and tough in order to resist the smashing effect of the projectile after it has penetrated the hardened surface. A Swedish ironmaster has found that a very excellent case-hardening is obtained by treating iron or steel objects with a mixture of animal matter, such as rasped leather or horn, and arsenious acid dissolved in hydrochloric acid, and heating as usual. Charcoal alone is also used with success.

**CASE SCHOOL OF APPLIED SCIENCE**, The, at Cleveland, Ohio, founded by Leonard Case (q.v.) of that city. In 1877 a deed of trust was executed setting apart certain real estate for the support of the institution, the deed to take effect upon his death, which occurred in 1880. The Case School was incorporated 29 March 1880. Instruction began in 1881, with a class of 16 students, the school being carried on from that time until the summer of 1885 in the old Case homestead. A commodious building having been erected for the use of the school, it was occupied at the beginning of the term in September 1885. A year later the building with all that it contained was destroyed by fire. It was promptly

rebuilt and occupied in 1888. Since that time several additional buildings have been erected, with superior apparatus and appliances. The Case School of Applied Science offers six regular courses of instruction, each requiring four years. They are civil engineering, mechanical engineering, electrical engineering, mining engineering, physics and chemistry. There are 53 professors and instructors and 557 students. The degree of bachelor of science is granted to all who complete one of the regular courses. That of master of science may be conferred upon graduates who have devoted at least one year exclusively to graduate study. Professional degrees, namely, civil engineer, mechanical engineer, electrical engineer and engineer of mines may also be conferred after one year of graduate study or after professional work in positions of responsibility, for three years after graduation. The property left by Mr. Case as an endowment for the support of the school is valued at about \$2,500,000, and the amount invested in buildings and equipment is about \$1,000,000. The school derives its support in part also from tuition fees. Its government rests with a corporation consisting of 20 men, from whom six, known as trustees, are selected.

**CASE-SHOT**, a projectile formed by putting a quantity of bullets into a cylindrical tin box called a "canister," that just fits the bore of the gun. In case of necessity, the canister is filled with broken pieces of iron, nails, stones, etc. The case is closed at both ends by a disc of wood or iron. Shot of this sort is thrown from cannons and howitzers, and is very injurious to the enemy, because the balls contained in the canister spread, diverging in proportion to the distance. The balls vary in weight, according to the character of the ordnance, from one or two pounds to half an ounce each. The range within which case-shot are used sometimes extends to 500, but seldom exceeds 200 to 300, yards. It is also called "canister-shot." The shrapnel-shell, in its present cylindrical shape, may be considered a variety of case-shot. See ORDNANCE.

**CASE-WORM**. See CADDIS-FLY.

**CASEIN**, kă'sē-in (Lat. *caseus*, "cheese") a colloidal substance resembling albumen in its general constitution, and obtained from milk. The older chemists gave the name "casein" both to the precipitated substance that is now known by that name, and to the corresponding substance as it exists in solution in the milk; but it is the scientific practice at the present time to distinguish the latter as "caseinogen." Caseinogen is the principal nitrogenous constituent of milk, in which it occurs to the extent of about 3 per cent, forming 80 per cent of the proteid content. It is precipitated by a curdy mass, when acetic acid or a mineral acid is added to milk that has been previously diluted by the addition of its own bulk of water. If the caseinogen so prepared is made into a paste and then treated with a small quantity of rennet, the mass sets at once into a solid clot, consisting of true casein; but Hammarsten has shown that if the caseinogen is first washed entirely free from calcium phosphate, rennet is without action upon it. The precise function of the calcium phosphate is obscure, and the same may be said of the chemical relations of

the proteids in general. If rennet is added to fresh milk a bulky deposit of casein and butter fat comes down immediately; but to obtain the casein in pure form, the oily matters in the milk should be first removed by the action of a centrifugal separator. Caseinogen is not precipitated by heat, nor does it (like fibrinogen) coagulate spontaneously. The coagulation observed when milk is boiled is due to the albumen present, and not to the casein; and that which occurs upon standing may be due either to the generation of lactic acid through the fermentation of the lactose present, or to the rennet-like action of the ptomaines liberated by micro-organisms that happen to fall into the milk from the air. According to the analyses of Chittenden and Painter, the elementary percentage composition of casein is as follows: Carbon, 53.30; hydrogen, 7.07; nitrogen, 15.91; sulphur, 0.82; phosphorus, 0.87; oxygen, 22.03. Casein is insoluble in water, alcohol or ether, but dissolves easily in alkaline solutions. It also dissolves in very weak hydrochloric acid, from which it is again precipitated upon the addition of the same reagent in more concentrated form. Casein for commercial purposes is prepared almost wholly from cow's milk. The milk is first put through a centrifugal separator to remove the fat, and then from 4 to 6 per cent of caustic alkali is added. The milk is then run into a vat, and dilute sulphuric acid is added, the whole being stirred constantly. When the curd has settled it is washed with cold water and drained on cheesecloth filters. It is pressed in a cheese press as dry as possible, and then broken up into very small pieces in a curd mill; after which it is dried at a low temperature in a vacuum. The chief use of casein in the arts is as a glue. In this form it is widely utilized in the wall paper industry in the production of washable wall papers, and also in the production of enameled papers, in which casein glue is used as the binder for the materials of the enamel coating. It is also used in the making of erasable tablets, paper "slates," etc. As a binder for various "fillers" many solid articles are produced in imitation of ivory and tortoise-shell. A compound of casein and lime is made use of in the dyeing industry for "animalizing" cotton fabrics so that the fibres will retain the colors applied to them. In medicine, casein is being more and more employed, its combination with certain drugs immensely enhancing their efficacy. This is particularly marked in the administration of iodine, phosphorus, arsenic, mercury and iron, as well as many alkaloids and organic compounds. See PROTEIDS. Consult Hammarsten-Mandel, 'Physiological Chemistry' (New York 1914); Sherer, R., 'Casein: Its Preparation and Technical Utilization' (London 1906).

**CASEMATES** (Sp. *casa*, "a house," and *matar*, "to kill"), in fortification, vaults which are proof against bombs, and which may be constructed under a parapet and provided with embrasures or ports through which guns are fired. They may serve, at the same time, as a place for keeping the heavy ordnance and various stores, and in case of necessity as habitations for the garrison or shelter for sick or wounded.

**CASEMENT, Sir Roger**, Irish revolutionist: b. Ireland, 1 Sept. 1864; executed in Lon-

don, 3 Aug. 1916. Though born in Ireland, Casement was of English parentage and a Protestant by creed. He entered the British consular service at the age of 28, and served in the Niger Coast Oil Rivers Protectorate from 1892 to 1895, when he was appointed consul in the Portuguese province of Lorenzo Marques. In 1898 he was made consul for the Portuguese possessions in West Africa, south of the Gulf of Guinea. During the war in South Africa he was engaged on special service at Cape Town in 1899 and 1900, and on the conclusion of hostilities he was decorated with the Queen's medal. In 1900 Casement was transferred to the Belgian Congo, and in 1901 was appointed to act as consul also for part of the French Congo. In 1905 he was made a C.M.G. and in the following year was appointed consul for the state of São Paulo. His next promotion took place in 1908, when he was made British consul-general at Rio de Janeiro. Between 1909 and 1912 he was employed in making inquiries relative to the rubber industry atrocities, and retired on a pension in 1913 after an honorable and useful career. He received his knighthood in June 1911, on which occasion he wrote the following letter to the Secretary of State for Foreign Affairs:

"I find it very hard to choose the words with which to make acknowledgment of the honour done me by the King. I am much moved at the proof of confidence and appreciation of my services on the Putumayo, conveyed to me by your letter, wherein you tell me that the King had been graciously pleased, on your recommendation, to confer upon me the honour of knighthood. I am indeed grateful to you for this signal assurance of your personal esteem and support. I am very deeply sensible of the honour done to me by his Majesty. I would beg that my humble duty might be presented to his Majesty, when you may do me the honour of conveying to him my deep appreciation of the honour he has been so graciously pleased to confer upon me. I am, dear Sir Edward Grey," etc.

In view of his tragic end and the circumstances that brought it about, this expression of Casement's sentiments was strangely at variance with his subsequent action during the European War. Suspicion was first directed toward him a few months after the war broke out, when it became known that Casement was moving about at large in Germany at a time when all British subjects in that country were either interned or under police supervision. Questions were asked in the British Parliament, and Casement's pension was withdrawn on 30 Sept. 1914, up till which time it had been paid to him. A large number of British prisoners of war had fallen into German hands between September and December 1914. In the latter month a great many Irish soldiers were collected in a large camp at Limburg, apparently for a special purpose. These prisoners were assembled on several occasions and addressed collectively and individually by Casement, who moved about the camp freely with the full approval of the German authorities. He introduced himself as Sir Roger Casement, the "organizer of the Irish volunteers." Telling the men that he was forming an Irish brigade, he invited all Irish prisoners to join it. Those who agreed, he said, would be sent to Berlin as the guests of the German government, and that, if Germany won a sea battle, the "Irish brigade" would be landed in Ireland to fight against England. In the event of Germany losing the war, each man would receive from

Casement or the German government \$50 or \$100 and a free passage to America. Those who renounced their allegiance were given a green uniform with a harp worked on the collar and provided with German side arms. About the middle of April 1916 Casement and an Irish soldier named Bailey, together with a "Mr. Monteith," were put on board the German submarine U-19 at Wilhelmshaven. They sailed round the Shetlands and the west coast of Ireland. Meanwhile, a small Wilson liner, disguised as a timber ship and carrying 10 machine guns, bombs, 20,000 rifles and millions of cartridges, had been sent from Germany to a place near Tralee. When the submarine had reached as near land as possible before dawn, Casement, Monteith and Bailey were put into a collapsible boat, armed with revolvers and ammunition. The boat overturned and the adventurers had to wade ashore, where they buried the weapons. Casement remained behind; the other two made their way to Tralee by land. On Good Friday, 21 April 1916, the British sloop *Bluebell* was patrolling near Tralee when she sighted a suspicious vessel flying the Norwegian ensign and with four of those ensigns painted forward and aft on each side. In reply to signals she said she was the *Aude*, bound from Bergen to Genoa. The ship was ordered to follow the *Bluebell* to harbor, but when about a mile and a half from the Daunt Rock lightship (near Queenstown), the *Aude* suddenly raised two German naval ensigns and blew up, sinking immediately. The crew, who had destroyed the ship, clambered into two boats and surrendered to the *Bluebell*. The collapsible boat from the submarine was found by a farmer at four in the same morning on which Casement had landed. A tin box containing pistol cartridges was exhumed. The police searched the neighborhood and discovered Casement hiding in an excavation known as McKenna's Fort. He gave his name as Richard Morton, of Denham, Buckinghamshire, and described himself as an author. He was taken to Ardfert Barracks, and on the way dropped a paper, which was found to be a cipher code. Some of the sentences read, "Cannons with plenty of ammunition are needed. Send them to —"; "Send more explosives," etc. Casement was taken to England the next day and handed over to the metropolitan police, when he disclosed his identity. He was tried before the lord chief justice and a jury on 26 June, found guilty of high treason and sentenced to death. The penalty was carried out at Pentonville Prison, at 9 A.M. on 3 August. Many prominent persons both in Great Britain and the United States made strenuous efforts to save Casement from the gallows, but in vain. The grounds on which the British government refused a reprieve—after Casement's appeal had failed—were thus stated by Lord Robert Cecil in Parliament: "No doubt of Casement's guilt exists. . . . The only ground for a reprieve would be political expediency, a difficult ground to put forward in this country. This country never could strain the law to punish a man for the same reason that it could not strain the law to let him off. . . . The Irish rebellion began with the murder of unarmed people, both soldiers and police. No grievance justified it and it was purely a political movement organ-

ized by a small section of Irish people who still hate England and was assisted by Germany. . . ." Shortly before his execution Casement was received into the Roman Catholic Church. He was unmarried. In November 1917 the *Volksrecht* of Zürich, Switzerland, the official organ of the Swiss Social Democrats, published a number of German official documents relating to Casement's activities in Germany. One of them gives the agreement signed between Casement and the German Foreign Minister, Herr von Zimmermann. Nine of these documents were reproduced in the *New York Times* of 16 Dec. 1917. See IRELAND—REVOLUTION.

**CASERTA** (formerly *TERRA DI LAVORO*), a province of Italy, north of Naples, along the Mediterranean Sea. Its chief industries are agriculture and cattle raising; there are also some flourishing manufactures. Area, 2,033 square miles. Pop. 749,414.

**CASERTA**, *kä-zär'tä*, Italy, capital of the province of Caserta, 17 miles northeast of Naples. It is the seat of a bishop, and contains many fine buildings. The principal edifice is a palace, one of the finest in Europe, a large and richly decorated structure commenced in 1752 by Charles III of Spain, and designed by Vanvitelli. This magnificent edifice forms with its four courts a huge rectangle, whose south side is 830 feet long and 134 feet high, and has 37 windows in each story. Through the middle of the rectangle runs a splendid colonnade 541 feet long, from the centre of which rises the beautiful marble stairway with 116 steps. The chapel of the palace is richly decorated and contains many noteworthy works of art. The theatre of the palace has 40 boxes and 12 Corinthian columns of African marble from the palace of Serapis at Pozzuoli. The water for its fountains is brought 26 miles from Mount Taburno by an aqueduct which crosses the Maddeloni Valley on a daringly constructed bridge, 1,700 feet long and 190 feet high, and situated among gardens adorned with numerous ancient and modern statues. The principal manufactures are silk goods, carpets, linen, etc. The district produces excellent fruit and wine. About two and a half miles to the northeast is Caserta Vecchia (Old Caserta), the new town being distinguished as Caserta Nuova. In 1860 Caserta was the headquarters of Garibaldi and his army. The province of Caserta is the ancient Campania Felix. Pop. 33,000.

**CASEY**, Silas, American army officer: b. East Greenwich, R. I., 12 July 1807; d. Brooklyn, 22 Jan. 1882. He was graduated from the United States Military Academy at West Point in 1826; served in the Mexican War, being present at the battles of Contreras, Churubusco, Molino del Rey and the siege of Chapultepec. When the Civil War broke out he was given charge of organizing the volunteers near Washington; later served in the Army of the Potomac, and won much distinction at Fair Oaks; was president of the board to examine candidates for officers of colored troops in 1863-65; brevetted major-general, U. S. A., 13 March 1865; and retired in 1868. His publications include 'System of Infantry Tactics' (1862); and 'Infantry Tactics for Colored Troops' (1863).

**CASEY, Thomas Lincoln**, American military engineer: b. Sackett's Harbor, N. Y., 10 May 1831; d. Washington, D. C., 26 March 1896. He was graduated from West Point in 1852, and entered the engineer corps of the army. During the Civil War he was superintending engineer of defenses on the coast of Maine, and on special duty with the North Atlantic squadron in the first expedition against Fort Fisher. In 1865 he was brevetted colonel for gallant services during the war. In 1868 he was put in charge of one of the departments in the chief engineer's office at Washington; in 1873 was sent abroad for professional service; and in 1877 was placed in charge of the construction of the state, war and navy building, and of the Washington aqueduct, and also of the Department of Public Buildings and Grounds. Later he built the White House conservatory and the Army Medical Museum, completed the Washington monument and took charge of the construction of the Congressional Library. He was president of the board of engineers for fortifications at New York in 1886-88; was promoted chief of engineers and brigadier-general in 1888; and was elected to the National Academy of Sciences in 1890.

**CASEY, Timothy**, Canadian Roman Catholic bishop: b. Flumeridge, County Charlotte, New Brunswick, 20 Feb. 1862. He was educated at Saint Stephen Grammar School, Saint Joseph's College, Memramcook, and Laval University. After his ordination to the priesthood in 1886, he became successively curate at Fredericton, rector of the cathedral of Saint John, chancellor of the diocese, and rector of Saint Dunstan's Church, Fredericton. In 1899 he was appointed bishop of Utica and coadjutor to Bishop Sweeny of Saint John, being consecrated 11 Feb. 1900, and he succeeded to the bishopric 25 Mar. 1901. He was appointed archbishop of Vancouver 2 Aug. 1912. He attended the Eucharistic Congress at Montreal in 1910, and is known as an ardent temperance reformer.

**CASGRAIN, kās-grān', Henri Raymond**, French Canadian author: b. Rivière Buelle, Quebec, 1831; d. Quebec 1904. He was educated at Collège Sainte Anne and Quebec Seminary, and was ordained to the priesthood in 1856. He relinquished the ministry in 1872, owing to an affection of the eyes, and subsequently devoted himself to literature. His works include 'Légendes Canadiennes' (1860); 'Histoire de la Mère Marie de l'Incarnation' (1864); 'Histoire de l'Hôtel-Dieu de Quebec' (1878); 'Pèlerinage au Pays d'Évangéline,' which was crowned by the French Academy (1885); 'Biographies Canadiennes' (1885); 'Montcalm et Lévis' (1891); 'Une Seconde Acadie' (1894); 'Les Sulpiciens et les prêtres des Missions étrangères en Acadie' (1897).

**CASGRAIN, Philippe Baby**, Canadian lawyer, statesman and historian: b. Quebec 1826. A student of Saint Anne's College, he was admitted a lawyer in 1850, and for several years was deputy prothonotary of the provincial Superior Court, before becoming clerk of the Circuit and Revision Court. From 1872 to 1891 he was a Liberal member of the House of Commons, prominent in public affairs and notably in a program for a Canadian navy. He was also known for high historical and literary

gifts and on three occasions, 1898, 1899 and 1906 was elected president of the Literary and Historical Society of Quebec. Besides numerous contributions to the *Transactions of the Royal Society of Canada* and the *Transactions of the Quebec Literary and Historical Society*, his published writings include: 'Letellier de Saint Just et son temps' (1885); 'La fontaine de Champlain à Quebec' (1888); 'La vie de Joseph-François Perrault' (1898); 'Les Plaines d'Abraham' (1900); 'Seconde bataille des Plaines d'Abraham et de Sainte Foye' (1900); 'La maison de Montcalm' (1902); 'La maison de Borgia' (1904); 'Le moulin de Dumont' (1905); 'Cadet, sa maison et sa résidence à Quebec' (1906); 'A Few Remarks on Various Gallicisms and French Locutions in the Plays of Shakespeare' (1907); 'La Chapelle et le tombeau de Champlain' (1907); 'Notre système judiciaire' (1911).

**CASGRAIN, Thomas Chase**, Canadian statesman: b. Detroit, 28 July 1852; d. 29 Dec. 1916. He was educated at Quebec Seminary and Laval University, Montreal. He was called to the bar of Quebec in 1877, and was junior counsel for the Crown at the trial of Louis Riel for high treason at Regina in 1885. He was returned to the provincial assembly of Quebec in the Conservative interest 1886-90, 1892-96, holding office as attorney-general 1891-96. He was chairman of the Royal Commission appointed in 1894 to revise and amend the civil procedure. He represented Montmorency in the House of Commons, 1896-1904. He opposed the Taft-Fielding reciprocity agreement of 1909. He was appointed a member of the International Joint Commission in 1911, and was chairman of the Canadian section, and held the office of Postmaster-General in the Borden administration from 1914 until his death, during which period he represented Quebec County.

**CASH REGISTER**, an automatic device for recording all transactions handled in retail stores. It is probably the most antique, and yet in its improved form the most modern device known to commerce. More than 6,000 years ago the ancients used a registering device known as the Abacus (q.v.) for the purpose of showing visibly to the buyer and seller the amount purchased.

The modern cash register was invented by Jacob Ritty, of Dayton, Ohio, patented 1879, it being suggested to him by the dial on a steamship which recorded the number of revolutions of the propeller. The first practical cash register was a crude device which punched holes in a strip of paper. By counting the number of holes the merchant could tell how much money he should have in his cash drawer. The present day cash register is a combination adding machine and printing press, which, by its perfect mechanism, provides a record of all transactions handled. It tells instantly how much business each clerk has done; how many customers each clerk has waited on; who, if anyone, has made a mistake; the total amount of money taken in; the number of change, received on account and paid out transactions handled. It issues a receipt, which bears printed figures of the amount of the transaction, the initial of the clerk who handled it, the consecutive number of the sale, the kind of sale and the date. In

addition, this receipt contains the merchant's name and address, together with any advertising he may care to use. Some registers do not issue a receipt, but print the same information on a sales slip inserted in the register. This receipt or slip is wrapped in the package with the goods going to the customer. At the same time the receipt is issued, the miniature printing press prints the detail of every transaction that occurs upon a roll of paper locked up inside the register. This gives the proprietor full information concerning every detail of his business, offering him at a glance facts showing the progress of his store, as well as the industry of each clerk.

The object of the cash register is to stop mistakes, remove temptation, eliminate carelessness, increase trade and increase profits. It furnishes information concerning a business which could be obtained in no other way except through a large amount of detail work. It protects the money received by providing a correct account of all incoming cash, and accounts for the money paid out, and at the same time provides a record of the amount of credit business handled. It not only indicates the amount of each and every transaction, as well as the initial of the clerk who handled it, but at the same time transmits the amount indicated to various sets of adding wheels, and also prints that amount on the receipt going to the customer. A receipt going to the customer bearing printed figures of the transaction makes it necessary to record the correct amount on the register. This ensures the proprietor that he will get an accurate record of every transaction handled in his business. More than 2,000,000 of these machines are in use the world over. See **CALCULATING MACHINES**.

**CASHAN** or **KASHAN** or **KASHIN**, Persia, a town in the province of Irak-Ajeme, noted for its production of shawls, silk stuffs and other goods. It is one of the most flourishing towns in Persia, and has a royal palace, numerous mosques, colleges, bazaars and baths. The inhabitants are noted for their industry, and besides shawls and silk stuffs already mentioned, they manufacture copper goods, gold and silver articles, brocade and cottons. They also carry on an active trade in agricultural produce, and carry on commerce with all parts of the Orient and with Europe by way of Ispahan. The silk stuffs produced at Cashan are held in high esteem, and are worn by the Shah and his entourage. Foreigners from the West who have visited the place have found the inhabitants, who belong chiefly to the Shiite sect of Mohammedans, more enlightened and liberal in their treatment of strangers than most Orientals. Many of the merchants are very wealthy, but are compelled by the oppressive exactions of public officials to hide their riches as much as possible from view. The interior of the homes of some of them, which present a neglected aspect on the outside, are said to be palatial in splendor. The province of Irak-Ajeme, in which Cashan is situated, has nearly the same boundaries as the country known to the ancients as Great Media, or Media Proper. It is the most productive portion of Persia, fertile and with a flourishing trade. Cashan has a population of about 30,000. See **PERSIA**.

**CASHEL**, Ireland, town in Tipperary County, about 49 miles northeast of Cork;

noted as containing the most interesting ruins in Ireland. These consist of a Gothic cathedral founded in 1169; a stone-roofed chapel, built in 1127; Hore Abbey, founded in 1272; the palace of the Munster kings; and a round tower, 80 feet in height and 50 feet in circumference. They are built on the Rock of Cashel, an elevation 300 feet high, and form the summit of the slope which the town occupies. Here was held the great synod, in 1172, when the Irish priests first acknowledged the authority of the English Church and state. Cashel is a Roman Catholic archdiocese. Dean Swift was a native. Pop, 2,813.

**CASHEW** (a corruption of *acajou*, the French form of the native Brazilian name *acajiba*), a tree (*Anacardium occidentale*) of the order *Anacardiaceae*, common in the West Indies. It is a spreading tree, from 20 to 40 feet high, and is a native of the tropics. It has alternate, obtuse, ovate leaves, and bears bunches of red, scented flowers. The juice of the stem is used as a varnish; and an aromatic drug is prepared by decoction and maceration of several parts of the tree, afterward consolidated by evaporation. The nut is small, kidney-shaped, ash-gray, about an inch long, and is seated on the end of a large fleshy receptacle varying in size from that of a cherry to a medium-sized pear. The shell consists of three layers, the outer and inner of which are hard and dry, but the intermediate layer contains a quantity of black, extremely acrid, caustic oil, which is destroyed by roasting the nuts before eating them. The oil is applied to floors in India and elsewhere to protect them from the attacks of white ants. In the West Indies it is put into wine, especially old Madeira, to which, it is said, it imparts an especially agreeable flavor. It is also used in chocolate. A gum with properties similar to those of gum arabic is obtained from the plant.

**CASHEW-BIRD**, *kāsh'ō-bērd*, another name for the galeate curassow. See **CURASSOW**.

**CASHGAR**, or **KASHGAR**, Turkestan, the capital city of the Chinese dependency of eastern Turkestan, in the province of Sin-Kiang or Kashgaria. It is situated on the Kizil-Daria or Kashgar River, in a position of strategic importance, 100 miles northwest of Yarkand, and comprises an old and a new town. They are both surrounded by mud walls and moats, and the new town is also defended by a citadel. The latter was built in 1838, is strongly garrisoned and contains the palace of the Chinese governor. There are considerable manufactures of cotton, gold and silver cloths, carpets, etc., and an extensive trade, its position at the junction of several great routes making it the emporium of much of the commerce of central Asia. It was the capital of an independent kingdom till conquered by the Chinese during the 18th century. In 1865 it revolted but was again subdued in 1876-77. The civil government of the region is in charge of a Chinese official, with the rank of Laotai. Pop. about 62,000. Consult Lansdell, 'Chinese Central Asia' (1894); Younghusband, 'The Heart of a Continent' (1904).

**CASHIBO**, *kā-shē'bō*, or **CACHIBO**, a savage tribe of Panoan stock living near the Ucayale River, a tributary of the Amazon, in

eastern Peru. They are said to eat their old people at death, and have repeatedly killed the white missionaries who attempted to convert them. The men are bearded and wear long skirts. The women go entirely naked until after marriage.

**CASHIER, To**, in a military sense to dismiss from the service by annulling or withdrawing an officer's commission. It is not an official term in the United States, and is commonly construed among military men as having a more disgraceful significance than "dismissal," although there is no analogy or precedent in the use of the word by leading English authors to support this construction. Macaulay uses the term in the sense of simple dismissal or annulment of commission. Nevertheless in ordinary military parlance it means dismissal in disgrace, and its use in any other sense is regarded as unjustified.

**CASHMERE, or KASHMIR**, a principality in the northwest of Hindustan, subject to a Maharajah belonging to the Sikh race, but under British protection and supervision. It is an irregularly shaped mountainous region, noted for its gorgeous scenery and the healthfulness of its climate. It is composed of various provinces or districts, of which Cashmere proper is the most famous and interesting. It is situated in the southwestern portion of the state, and largely consists of an elevated valley intersected by the Jhelum. Besides Cashmere proper, the state embraces the territory of Jamoo, Balti or Iskardo, and Ladakh and Gilghit. The whole principality thus formed is estimated to cover about 84,432 square miles, and its population in 1911 was 3,158,126. It extends from about lat. 32° to 37° N. and from about long. 73° to 80° E. Srinagar is the capital. The territory of Jamoo, which forms the most populous portion of the principality, lies to the north of the Punjab, between the spurs of the Himalaya Mountains leading up to Cashmere and enclosed by the upper courses of the Chenab and Ravee. Its chief town is of the same name. Balti, also called Little Tibet, is an elevated region on the upper Indus, to the north of Kashmir proper, lying to the southwest of the Karakorum Mountains, and having for its capital Iskardo or Skardo. Ladakh, also called Middle Tibet, lies to the southeast of Balti, between the Himalaya and Karakorum Mountains, and is also traversed by the Indus. Its passes form some of the most important media of communication for central Asia. Its capital is Leh on the Indus. Gilghit is a district on the northwest of Balti. Sheep are largely kept by the inhabitants; and the main crops grown are maize, cotton, saffron, tobacco, hops, wheat, barley and beans. Butter is one of the exports. Within recent years great activity has been shown in improving means of communication, but in many parts of the country wheeled traffic is unknown, and there are only a few miles of railway. Educationally it is the most backward part of India, with 98 per cent of illiterates. An independent monarchy until 1586, it was thereafter successively ruled by Moguls, Afghans and Sikhs, and was placed under British protection in 1846. The present Maharajah, Sir Pertab Singh, is a distinguished soldier, and fought in Flanders with the British army in the Great European War.

The language of the people is called Kashmiri and is descended from the Middle Indian vernaculars, and is thus ultimately related to the Sanskrit, although many Arabic and Persian words have been adopted into it. The language has no written literature of native origin, but portions of the Bible have been translated into the vernacular. The script in which it is written is generally Persian; but the older Sharada alphabet, derived from the Devanagari, is sometimes used. Kashmiri folk literature is rich in tales and proverbs, many of which have been published in Knowles' 'Dictionary of Kashmiri Proverbs and Sayings' (London 1885); and 'Folk-Tales from Kashmir' (ib. 1888). Ethnological and anthropological information of value will be found in the following works: Duke, 'Kashmir Handbook' (Leipzig 1903); Pirie, 'Kashmir' (New York 1909); Bruce, 'Kashmir' (ib. 1911); Grierson, 'Manual of the Kashmiri Language, comprising Grammar, Phrase-Book, and Vocabularies' (2 vols., Oxford 1911); Neve, Arthur, 'Thirty Years in Kashmir' (London 1913).

**CASHMERE GOAT.** See GOAT.

**CASIGURAN BAY**, *kā-sē-goo-rān*, an inlet on the east coast of the province of Principe, Luzon, Philippine Islands, reached through Casiguran Sound. The sound is about nine miles long from Cape Ildefonso to a narrow passage affording access to the bay. The bay itself is about three-quarters of a mile long and two and a half miles wide. Its depth is some 16 to 26 fathoms.

**CASIMIR**, *kās-i-mēr*, properly **KAZIMIERZ** ("founder of peace"), was the name of many Polish princes and kings. (1) **CASIMIR I**: b. 1015; d. 1058. During his minority he was under the regency of his mother and was driven from the kingdom with her. In 1041 his power was re-established, and through his efforts the predominance of Christianity was decided in Poland. (2) **CASIMIR II**, the Just: b. 1145; d. 1194. He was a son of Boleslas III, and ascended the throne in 1179. He pushed his armies into Volhynia and Lithuania and reconquered several places formerly belonging to Poland. He abolished tithes and other illegal imports and in 1180 convened an assembly at Lenczyca, which in time became the Polish Senate. In 1185 he repulsed an attack by the Hungarians and four years later was in conflict with his brother Miciaslas, who aimed to seize the throne. In 1192 he fought the Prussians. He renewed with the Hungarians the treaty fixing the Carpathians as the boundary between the two nations. (3) **CASIMIR III**: b. 1309; d. 5 Nov. 1370, called Casimir the Great, who succeeded his father, Vladislav Loketek, as king of Poland in 1333, was the most distinguished of this name. He added Little Russia and Red Russia to his dominions, and repelled the Tartars, who then threatened Poland. He founded the University of Cracow (1364), as well as several schools and hospitals, and showed great anxiety for the advancement of the arts and of learning in his kingdom. In 1347 he caused a new code of laws to be compiled, and protected the peasants, on which account he was called the peasants' king. He had a Jewish mistress who procured for her nation great liberties and protection. With him the line of the Piasti, which

had ruled in Poland for nearly 530 years, became extinct. (4) CASIMIR IV: b. 1427; d. 1492. He was the second son of Ladislaus II Jagiello; was crowned King of Poland in 1447, three years after the death of his elder brother, Ladislaus III, at the battle of Varna. His reign was epoch-making for Poland. The kingdom was threatened from three sides. On the south the Turks were encroaching and aiming to capture Constantinople. On the northeast the Muscovites were beginning to spread and make their weight felt, while on the northwest the Teutonic Knights were ever seeking aggrandizement at the expense of Poland. After 13 years of conflict Casimir finally subdued the Teutonic order and by the Treaty of Thorn (1466) compelled them to cede West Prussia to Poland. Casimir was one of the great statesmen of his age, was possessed of profound political sagacity, great common sense and great patience and moderation. His only subjects gave him more trouble than his powerful enemies from without. The nobles threatened to depose him and from his time onward Poland became more and more an aristocracy. His personal character was marked by extreme simplicity and sobriety. Consult Morfill, 'Poland' (New York 1893); Sokolowski, A., 'Illustrated History of Poland' (Vienna 1904).

**CASIMIR-PÉRIER**, pá'ryā, **Jean Paul Pierre**, fifth President of the French Republic: b. Paris, 8 Nov. 1847; d. there, 11 March 1907. He was the grandson of Casimir Pierre Périer, famous Premier of Louis Philippe. He entered public life as secretary to his father, A. V. C. Périer, who was Minister of the Interior during the presidency of Thiers. In 1871 he was decorated with the Legion of Honor for bravery in the Franco-Prussian War. In 1874 he became general councillor of the Aube and two years later was sent to the Chambre des Députés as representative of that department, and was always re-elected until he reached the presidency. He also held under-secretaryships in the departments of Public Instruction and War. Despite the monarchist traditions of his family Casimir-Périer sided with the Republican group of the Left. He refused to vote the expulsion of the princes in 1883, and resigned as deputy when the law was enacted. In 1890-92 he was vice-president and in 1893 president of the chamber. On 3 December of the latter year he became Prime Minister under Carnot and president of the council. He resigned in May 1894 and was re-elected president of the chamber. On 24 June 1894, after the assassination of Carnot, Casimir-Périer was elected, on the first ballot, to the presidency of the republic. He retained the office only six months, surprising the world by resigning on 15 Jan. 1895 and retiring to private life. The reasons impelling him to resign were stated by him to be the restrictions imposed on the President under the constitution. He found himself ignored by his ministers who failed to consult him or even to keep him informed on important questions and business of state. He remained strictly aloof from politics for the remainder of his life, and engaged in mining. At the Dreyfus trial, Casimir-Périer's evidence, as opposed to that of Mercier, greatly aided the cause of the accused officer.

**CASINO**, ká-sē'nō, or **MONTE CASINO**, a celebrated Benedictine abbey in Italy, in the Neapolitan province of Caserta, near the small town of Cassino and about 45 miles from the city of Naples, founded by Saint Benedict of Norcia in 529 on the site of a temple of Apollo. It was the original home of the Benedictine order. It is situated on a mountain, from which it derives its name, near the ruins of the ancient Casinum, and is approached by a well-paved and winding road. The abbey, after having suffered repeated reverses, finally became considerable for its privileges and its wealth, and in the 11th and 12th centuries was the seat of science, particularly of medicine, the celebrated school of Salerno having been founded by the monks of Monte Casino. The church is very magnificent, although overloaded with ornament, and contains the tomb of the founder. The present buildings were erected from 1637 to 1727. The library and archives contain 50,000 printed books and 30,000 incunabula. The monastery has served as a place of refuge to several sovereigns and pontiffs, and was formerly much visited by pilgrims and travelers, who were entertained free of expense. It is still visited by travelers or tourists, but it is no longer a conventual institution, being enrolled as a national monument in 1866. The railway from Rome now passes near it. Consult Clausse, 'Les origines bénédictines' (Paris 1899); Rickenbach, 'Monte-Cassino von seiner Gründung bis zu seiner höchsten Blüte unter Abt Desiderius' (Einsiedeln 1884-85); Taeggi, 'Paleografia artistica di Montecassino' (Monte Cassino 1876 *et seq.*); Tosti, 'Storia della badia di Montecassino' (Rome 1889-90).

**CASINO**, a name generally given to a kind of club-house or place of amusement, containing rooms for dancing, playing at billiards, etc. The word is originally Italian, being a diminutive of the Italian word *casa*, signifying a house; and was at first applied to small houses which the nobles of Florence, Venice and other Italian cities often possessed at a distance from their ordinary residences, and which were devoted to purposes of social enjoyment.

**CASIRI**, kā-sē'rē, **Michael**, orientalist and Syro-Maronite clergyman: b. Tripoli, Syria, 1710; d. Madrid, 12 March 1791. He studied in the College of Saint Peter and San Marcellino; and in 1734 entered the clerical profession. The following year he accompanied the learned Assemani to Syria, where he was going, at the command of the Pope, to attend the synod of the Maronites, and in 1738 gave, at Rome, an exact account of the religious tenets of the Maronites. He afterward taught in his monastery the Arabic, Syrian and Chaldean languages, theology and philosophy; and in the year 1748 was invited to Madrid, where he was appointed to an office in the royal library. In 1749 he devoted his attention, by the King's orders, to the library of the Escorial, of which he subsequently became the superintendent. Here he collected the materials for his celebrated work, 'Bibliotheca Arabico-Hispana' (2 vols., 1750-70), which enumerates in 1,851 articles the manuscripts of the Escorial library, perhaps the richest in Europe in Arabic manuscripts. This work, though not entirely free from errors, contains very important information and valuable extracts, and is indis-

pensable to every orientalist. In the Madrid National Library are other interesting manuscripts of Casiri, including a copy and Latin translation of an ancient Arabic version of the canons of the Visigothic Church.

**CASKETS**, *The*, a group of rocks in the English Channel, seven miles west of Alderney. They have often been fatal to vessels, and, in 1119, Prince William, son of Henry I, and his suite, perished here. In 1744 the *Victory* ship of war, of 110 guns, also was shipwrecked upon them. On the highest there is a lighthouse. Victor Hugo has immortalized them in his 'Toilers of the Sea.'

**CASLER**, *John Overton*, American soldier: b. Frederick County, Va., 1 Dec. 1838. He served in the Confederate army during the Civil War and was a prisoner of war from February to May 1865. He lived in Texas 1877-89, and has since been a resident of Oklahoma City, where he is justice of the peace. He is the commander of the Oklahoma division of United Confederate Veterans, and has published 'Four Years in the Stonewall Brigade' (1893); 'Lilian Stuart, the Heroine of the Rappahannock' (1889).

**CASORIA**, ka-so-re'a, Italy, town in the province of Naples (Napoli), six miles north-northeast of Naples. It has four fine churches and is the residence of a district judge. Silk and wine are produced in the neighborhood. Pietro Martino, the painter, was born here. Pop. about 14,000.

**CASPARI**, kās-pā'rē, *Karl Paul*, German Church historian: b. Dessau, 8 Feb. 1814; d. 11 April 1892. He was born of Jewish parents, and studied in Leipzig and Berlin. He was converted to Christianity in 1838, and subsequently became instructor of theology in the University of Christiania, Norway, in 1847. He became full professor in 1857. His Arabic grammar is in high repute, and his contributions to the study of the Old Testament include works on Obadiah, Isaiah, Micah and Daniel. He published besides the 'Grammatica Arabica' (1844-48); the 'Beiträge zur Einleitung in Jesaga' (1848); 'Alte und neue Quellen zur Geschichte des Taufsymbols und der Glaubensregel' (1879).

**CASPE**, kās'pā, Spain, town in the province of Saragossa, 12 miles north-northeast of Alcañiz, left bank of the Guadalque, near its confluence with the Ebro, on several small hills and in the intervening valleys. It has paved streets, one principal and nine smaller squares, a handsome Gothic college and two churches, several chapels, three schools a townhall and prison in a suppressed convent, an hospital and several public fountains. Olive and mulberry trees are extensively cultivated, and coal and iron are mined in the neighborhood. Manufactures—wine, oil and soap. Some trade is also carried on in grain and cattle. A congress of Aragonians, Catalonians and Valencians assembled here in 1412 to settle the royal succession. Pop. 8,427.

**CASPER**, Wyo., town and county-seat of Natrona County, 150 miles northwest of Cheyenne, on the Platte River, the Chicago, Burlington and Quincy and the Chicago and Northwestern railroads. It contains a Carnegie library, the Wyoming General Hospital, and is

the site of Fort Casper. It has extensive interests in live stock, oil and wool. The town owns the waterworks. Pop. 2,700.

**CASPIAN GATES**, a name given to the Russian fortress Dariel, situated in a narrow defile of the Caucasus, on the Terek, 80 miles north of Tiflis.

**CASPIAN SEA**, a large lake or inland sea between Europe and Asia, now nearly surrounded by Russian territory but having Persia on the south; 730 miles in length from north to south, and from 130 to 270 in breadth; area about 170,000 square miles; the largest isolated sheet of water on the globe. The water is less salt than that of the ocean, of a bitter taste and of an ochre color, without ebb or flow. In some places it is exceedingly deep, yet it abounds in shallows, so as to prevent the navigation of ships which draw more than 9 or 10 feet of water. The level of the Caspian Sea is considerably lower than that of the ocean. Among the rivers which flow into it are the Volga, Ural, Terek and Kur. In ancient times the Oxus (Amoo Daria) also flowed into it. It has no outlet. The fisheries here, which are very valuable, occupy and train many seamen. Sturgeons and sterlets are caught in great quantities, and there are also salmon-trout, perch, *Silurus glanis*, two kinds of carp and porpoises; seals abound in the upper coasts, and tortoises between the mouths of the Volga and the Ural. In the northern region the first fishing season, called the caviar season, occurs between March and May, when the Volga, Ural, etc., are getting cleared of ice. The second season is in July, when the sturgeon descend the rivers; and the third open-sea fishing goes on from September to November. The only ports at all worthy the name on or near the Caspian are Astrakhan, Baku, Derbend and Astrabad (in Persia). The navigation is at all times difficult and often perilous. Steam packets are now established on this sea. The Russians have also a fleet of war vessels in the Caspian, and a new naval station has been established at Krasnovodsk, on the east side of the sea. By means of river and canal there is water communication between the Caspian and the Black Sea, Baltic and White Sea.

**CASS**, *Lewis*, American statesman, diplomatist and soldier: b. Exeter, N. H., 9 Oct. 1782; d. Detroit, Mich., 17 June 1866. In 1800 he removed to Marietta, Ohio, where he entered on the study of the law. He was admitted to the bar in December 1802, and soon after established himself at Zanesville, where he gradually acquired practice. In 1806 he was elected to the Ohio legislature. He served in the first year of the second war with England and in 1813 was appointed governor of Michigan Territory, holding office till July 1831. Michigan at this time had no territorial legislature, and the business of selecting laws for it from the codes of the States devolved on Governor Cass and the territorial judges. Governor Cass was also ex officio superintendent of Indian affairs for the territory, which then included what now constitutes the two States of Michigan and Wisconsin, and this remained for several years the most important part of his duties. Of all this extensive territory, it was only a little tract bordering on Lake Erie and the Detroit River to which the Indian title had not been ex-

tinguished. Within the bounds of his Indian superintendency, ultimately made to embrace all the tribes northwest of the Ohio, there were reckoned to be 40,000 Indians, mustering at least 9,000 warriors. The recent hostilities, and the distrust and suspicions of the Indians, occasioned by the constant calls upon them for additional cessions of land, rendered this office one of great delicacy and difficulty. But Governor Cass, while steadily carrying out the policy of acquisition, succeeded also in maintaining the respect, and even in securing the affection of the Indians. In 1817 he obtained, in conjunction with Governor McArthur, a cession of most of the remaining Indian lands within the State of Ohio, with adjoining tracts in Indiana and Michigan, to the extent of 4,000,000 acres in the whole. This cession removed the Indian barrier hitherto intervening between the settlements of Ohio and those of Michigan. In 1819 he met the Chippewas at Saginaw, and obtained a cession of lands in the peninsula of Michigan to the extent of 6,000,000 acres. As yet the northwestern regions were very imperfectly known. At the suggestion of Governor Cass, an expedition, in which he himself bore a conspicuous part, and of which an account has been published by Schoolcraft, was set on foot in 1820, for exploring the northern shore of Lake Superior, and the course of the upper Mississippi. The next year, by a long, circuitous river navigation, he visited Chicago, then nothing but a military post, with a wide wilderness all about it, and there made a treaty with the Chippewas, Ottawas and Potawatamies, by which a large additional tract was obtained, completing the extinction of the Indian title to the peninsula of Michigan south of Grand River. In 1828 he made two treaties, one at Green Bay, the other at Saint Joseph's, by which many millions of acres were credited to the United States. Up to his resignation of the office of governor of Michigan, in July 1831, he had concluded 22 treaties with the Indians, by which cessions had been acquired in Ohio, Indiana, Illinois, Michigan and Wisconsin, to an amount equal to nearly or quite a fourth part of the entire area of those states. When President Jackson reconstructed his Cabinet in August, 1831, Cass was appointed Secretary of War. The policy of the removal of the Indians, especially the southern tribes, to districts west of the Mississippi, had been warmly espoused by General Jackson. The defense of this policy, which had elicited much criticism and a warm opposition, was ably entered upon by Secretary Cass in his first annual report. In 1836 he was appointed Minister to France, a post which he held till 1842. He was on excellent terms with Louis Philippe, of whose character he gave a very friendly and favorable account in his 'King, Court and Government of France,' published in 1840, originally as an article in the *Democratic Review*. By far the most remarkable incident of his diplomatic career occurred just at its close, in his attack on the quintuple treaty for the suppression of the slave trade. He was United States senator (1845-48), and having opposed the Wilmot Proviso, became the Democratic candidate for President in 1848, but was defeated. He returned to the Senate in 1849, and was Secretary of State (1857-60), resigning because President Buchanan would not consent to strengthen the

garrison at Fort Sumter. He wrote 'History, Traditions and Languages of the Indians' (1823); 'France, Its King, Court and Government' (1840). See 'Lives' by Schoolcraft (Albany 1848); Smith, W. L. G. (New York 1856); McLaughlin, Andrew C. (Boston 1891); Young, 'Life and Public Service of General Lewis Cass' (Detroit 1852).

**CASSABA** or **KASSABA**, kās-sā-bā, Turkey-in-Asia, town of Manisa Tanjak, 63 miles by rail east of Smyrna. It is noted for the 'melons of Cassaba' which are widely exported, along with cotton, silk and other produce. Pop. 23,000.

**CASSAGNAC**, kās'sān'yāc', **Bernard Adolphe Granier de**, French journalist and Bonapartist: b. Aviron-Bergelle, 11 Aug. 1806; d. Château de Coulommé, 31 Jan. 1880. He studied at Toulouse and then began his career at Paris as contributor of literary criticisms to the *Journal des Débats*. He embraced the cause of Romanticism and his attacks on the conservatism of Racine were the talk of Paris. In 1840 he was sent by the government on a mission to Antilles, where he married a Creole. On returning to France he devoted himself to politics and published a 'Histoire des classes ouvrières et des classes bourgeoises'; a 'Histoire des classes nobles et des classes anobles,' a 'Monographie de l'église de la Madeleine'; and a romance entitled 'Danaë.' During the revolution of 1848 he left Paris, but returned in 1850 as a Bonapartist. He became editor of the *Pouvoir*, *Le Réveil*, *Le Pays*. His entire career was filled with duels, lawsuits, arrests and other sensational indiscretions. After the revolution of 4 September, he left France and published *Le Drapeau* which was sent gratuitously to the prisoners interned in Germany. In 1876 he was chosen deputy by the Anti-Republican party. He defended the Jesuit cause and opposed the creation of departmental normal schools. In addition to the works mentioned above he wrote 'Histoire de la Révolution française' (1850); 'Histoire du Directoire' (1851-56); 'Histoire des Girondins'; 'Histoire populaire de Napoléon III.' His works are not authentic. They are highly colored, superficial but rich in a vigorous journalistic style.

**CASSAGNAC**, **Paul-Adolphe Marie Prosper Granier de**, son of Adolphe; had a career and a reputation not dissimilar to those of his father. He was born 2 Dec. 1842; d. at Saint Loir-et-cher, 4 Nov. 1904. He was taken prisoner at Sedan in 1871, and underwent eight months' confinement in Silesia. His violent advocacy of Bonapartism led him into innumerable duels, and he was on several occasions summoned for libelous articles in the *Pays* and other newspapers. He was also a vigorous supporter of General Boulanger. After the death of the Prince Imperial de Cassagnac supported Prince Victor Napoleon. After 1884 he edited a journal known as *L'Autorité*. He wrote a 'Histoire de la troisième République' (1875); 'Empire et royauté'; 'Memoires de Chislehurst'; and in collaboration with his father, 'Histoire populaire abrégée de Napoleon III' (1874-75).

**CASSANDER**, King of Macedon, son of Antipater: b. about 354 B.C.; d. 297 B.C. He disputed the sovereignty of Macedon with Polyperchon, whom Antipater had appointed regent

at his death in 319 B.C. Allying himself with Ptolemy and Antigonus, he conquered Athens; captured Olympias, the mother of Alexander the Great, and put her to death; and connected himself with the royal family by marrying Thessalonica, half-sister to Alexander. He joined, in 315 B.C., the coalition against the growing power of Antigonus; murdered the rightful heir to the throne, Alexander Ægus, and his mother Roxana; and took the title of king in 306 B.C., which was confirmed to him by the decisive battle of Ipsus in 301 B.C. In 297 he was succeeded by his son Philip.

**CASSANDRA**, also called **ALEXANDRA**, daughter of Priam and Hecuba, and twin-sister of Helenus. Both children, according to tradition, were playing in the vestibule of the temple of the Thymbrean Apollo, not far from Ilium; and having stayed there too late to be carried home, a couch of laurel twigs was prepared for them in the temple. When the nurses went to them the next morning they found two serpents at the side of the children, which, instead of injuring them, harmlessly licked their ears. This miracle produced a still greater one: the hearing of the children was rendered so acute that they could distinguish the voices of the gods. Cassandra subsequently spent much of her time in the temple of Apollo, who, becoming enamored of her charms, disclosed to her all the secrets of the prophetic art, and in return demanded her love. But Cassandra, when her curiosity was satisfied, refused the dishonorable reward. Apollo, incensed at this, solemnly decreed that her prophecies should never find belief. She frequently and continually foretold the destruction of Troy, and warned her countrymen in vain against the deceitful horse. When Troy was conquered, and Cassandra, with the other maidens, fled to the temple of Minerva, Ajax, son of Oileus, tore her from the altar, deflowered the virgin in the sacred place, and dragged her away to the other female slaves, with her hands tied. On the division of the booty she fell to Agamemnon, who carried her as his slave and mistress to Mycenæ. Clytemnestra murdered them both. Agamemnon had twins by her—Teledamus and Pelops, who were put to death by Ægisthus. The ancients regarded this rape of Cassandra as a most infamous atrocity. It has often afforded a subject to poets and sculptors. The Locrians, the countrymen of Ajax, were afflicted on this account for many years with storms, and their country was desolated with the plague. Æschylus tells her story in the 'Agamemnon.'

**CASSANDRA**, the most westerly of the three tongues of the Chalcidic peninsula, between the gulfs of Salonica and Cassandra. Its ancient name was Pallene. The Gulf of Cassandra was anciently Toronaicus Sinus.

**CASSANO D'ADDA**, kās-sā'nō dād'dā, Italy, town in the province of Milan, and 16 miles north-northeast of the town of Milan, pleasantly situated on a hill on the right bank of the Adda. It is very old, and built mostly of bricks. A bridge of 800 paces connects it with the opposite bank of the river. There are numerous silk-mills. Its military position on the right bank of the Adda has caused it to be the scene of several battles. Here Ezzelino da Romano, the leader of the Ghibellines in Italy,

in the time of the Emperor Frederick II, was defeated in 1259; here also Prince Eugene was defeated in 1705, by the Duc de Vendôme, and the French under Moreau, by Suvaroff in 1799. Pop. of commune 9,150.

**CASSAREEP**, kās'sa-rēp, **CASSIREEPE**, or **CASSIRIPE**, the concentrated juice of the roots of the common or bitter cassava (*Manihot utilissima*), flavored by aromatics, and deprived of its poisonous properties by boiling. It is used to give a relish to soups and other dishes, and forms the basis of the West Indian "peppercot."

**CASSAS**, kās-sā, Louis François, French landscape-painter and architect: b. Azay-le-Féron, 3 April 1756; d. Versailles, 2 Nov. 1827. A pupil of Jean-Jacques Lagrenée, he journeyed in Italy and in the Levant. On his return he was appointed inspector and professor of design at the Gobelins in Paris. From the materials collected in his travels have been compiled 'Voyage pittoresque de la Syrie, de la Phénicie de la Palestine, et de la Basse Egypte' (30 vols., Paris 1799), and 'Voyage historique et pittoresque de l'Istrie et de la Dalmatie' (1802, with 69 copper plates). The original drawings for both works were oil paintings, and they were deposited in the Bibliothèque Royale. His 'Galerie d'architecture des différentes peuples,' a collection of models of restorations of ancient architecture, has been placed in the Ecole des Beaux Arts in Paris.

**CASSATION**, a term used in the courts on the continent of Europe. It is derived from the Middle Ages, and signifies the annulling of any act or decision if the forms prescribed by law have been neglected, or if anything is contained in it contrary to law.

**CASSATION**, Court of (*Cour de Cassation*), one of the most important institutions of modern France, which gives to the whole jurisdiction of that country coherency and uniformity without endangering the necessary independence of the courts. It was established by the first National Assembly, and has been preserved in every essential respect, under all the changes of the Revolution and Restoration. It has been maintained even in those districts which, by their union with France became subjected to French laws, but by the Peace of Paris again became part of the Prussian monarchy. In France, as early as the reign of Louis IX (1226-70), though a separate court of justice had come into being, petitions were presented to the King by appellants from the decisions of the courts. In later times appeals to the parliaments, as the highest courts of the kingdom, came into use, and their decisions were not liable to be set aside by the ordinary forms of law. Yet the parties were allowed to dispute even these decisions if they were founded upon errors of fact or violated undisputed principles of law; and by an ordinance of 1302 it was provided that the parties should be allowed royal letters for the defense of their rights against the decisions of the Supreme Courts (*lettres de grâce de dire contre les arrêts*), which should be issued from the chancery (by the chancellor of France). The case was then sent back to the Parliament for further investigation, but was examined and decided in the presence of the king himself, or

of a special commissioner. An abuse, however, crept in of transferring these cases to the royal council, where they were decided by officers called *maîtres des requêtes*. These letters received the name of *lettres de proposition d'erreur*, and during the civil commotions at the end of the 14th century began to be more frequently presented to the council, which, as soon as one party complained of the partiality of the parliaments, transferred the case to its own bar, and obstructed the course of justice by *lettres d'état*, suspensions of the process, on the pretext of the absence of one of the parties in the service of the king. Under the Chancellor Poyet (1538-42), this abuse reached its highest pitch; but the Chancellors Olivier (1545-51) and Hôpital (1560-68), the two great reformers of French jurisprudence, limited the use of these *lettres* till, by the Ordinance of Blois (1576), all the provisions against the decisions of the parliaments were reduced to these three:—the *proposition d'erreur*, for an error of fact; *requête civile*, to restore the parties to their former condition on account of the fraud of one of the parties or the mistakes of the attorney; and *cassation* (petition for abrogation), for violation of forms or settled principles of law. By the famous Order of Procedure of 1667 the first of these provisions was abolished, but the province of the *requête civile* and *cassation* was enlarged and more precisely defined. The former was always brought before the court itself and decided there, the latter before the council. For this purpose, in the *conseil privé*, or *conseil des parties*, a particular committee was formed, consisting of the chancellor, the four Secretaries of State (Ministers of the Departments), the Council of State, and all the *maîtres des requêtes* (in 1789, 78 in number). The decisions of this committee were too much influenced by the will of the king and the ministers, and by various other circumstances, so that they did not enjoy great respect, though they often exposed acts of great injustice on the part of the Parliament and other high courts. It was therefore abolished in the first National Assembly, and its place supplied by an independent court—the *tribunal de cassation* (decrees of 27 Nov. and 1 Dec. 1790), which was retained in all the constitutions and received under the Imperial government (1804) the name *cour de cassation*, which it still retains. It consisted, according to the organization of 1800, of 48 members, chosen from the Senate, on the nomination of the consuls, who elected their own president from among themselves. The appointment of president was afterward vested in the emperor. In the *Charte Constitutionnelle* of 1814 the number of members of the *Cour de Cassation* was fixed at 49, at which it still remains. The members are appointed for life by the President of the Republic, and consist of a first president, three presidents of sections, and 45 councillors, a public prosecutor, the procureur-général and 6 substitutes, the *avocats-généraux*. The Minister of Justice, or Keeper of the Seals (*garde des sceaux*) has the right of presiding on certain occasions. This court never decides on the main question at issue, but on the competency of the other courts and on the petitions to have their decisions reviewed or annulled, and assigns the question to another court if a decision is to be set aside for an evident violation of the forms

or the principles of the law. For this purpose it is divided into three sections or chambers:—the *chambre des requêtes*, which decides on the admissibility of the petitions in civil cases; the *chambre de cassation civile*; and the *chambre de cassation criminelle*. After a decision has been reversed, if a second court decides the same case in the same way, and an appeal is entered again, the Court of Cassation must either request an authentic explanation of the law from the government, or at least all the three sections must unite, to pronounce a second reversal or cassation; and if a third decision is the same as the preceding, the court before which the case is again brought must submit to the doctrine of the Court of Cassation on the point of law in dispute. This system, which dates from 2 April 1837, gives great authority to this court in matters of jurisprudence. According to the law in force before 1837, the court before which a case was brought for decision a third time was not required to adopt the views of the Court of Cassation, but after the third decision there was no further appeal. The government, however, in that case gave an authentic interpretation of the law if there was any occasion for so doing. Until the end of 1852 there was a similar Court of Cassation for the Prussian province of the Rhine, but in 1853 its jurisdiction was transferred to the supreme Prussian tribunal sitting at Berlin. The sentences of the Court of Cassation are not only recorded in the journals of the courts, the decisions of which are reversed, but published likewise in an official bulletin, by which consistency and uniformity are preserved. The tribunal of cassation has enjoyed from its commencement the respect and confidence of France, and has numbered among its members several of the most distinguished lawyers; as the President Henrion de Pansey, the councillors, Chabot, Merlin and Carnot. The court possesses disciplinary powers over the judges of other courts, and the procureur-général over other procureur-généraux. See APPEAL; COURT.

**CASSATT, Alexander Johnston**, American railway president: b. Pittsburgh, Pa., 8 Dec. 1839; d. Philadelphia, Pa., 28 Dec. 1906. He was educated in the University of Heidelberg, and the Rensselaer Institute, Troy, N. Y., and in 1859 was employed as civil engineer in surveying a railroad route in Georgia. He entered the service of the Pennsylvania Railroad as rodman in 1861, became general superintendent of the Pennsylvania system and general manager of the lines east of Pittsburgh, 1871-74; third vice-president, 1874; and first vice-president, 1880. He resigned this last-named post in 1882, but was elected a director in 1883, and in June 1899 was elected president of the Pennsylvania system and was the successful procurer of the terminal for this railroad in New York city. He was president of seven companies, and a director in 23, including transportation, banks and trust companies.

**CASSATT, Mary**, American artist: b. Pittsburgh, Pa., about 1855. In 1875 she went to Europe to study art, and lived for some years in Spain, where she gave particular attention to the works of Velasquez. Removing to Paris, she was influenced by the work of Manet and Legas, and exhibited in the Impressionist Exposition about 1880. In 1898 she exhibited some

of her works in New York city. Returning to Europe, she established a studio in Paris, where she has since lived. She has gained considerable fame as an etcher, ranking among the first of the modern artists in this medium. Her subjects are almost invariably women and children, particularly mother and child, in the environment of home. The children, especially, are depicted with truth, originality and a remarkable power of observation, but without prettiness. Among her best-known paintings are 'The Bath'; 'Breakfast in Bed'; 'Mother's Caress'; 'In the Garden'; 'At the Mirror'; 'Maternity'; 'Child Playing with a Dog'; 'Child's Toilet'; 'In the Box.' Miss Cassatt is represented in the Luxembourg by 'The Young Mother,' a pastel; in the Metropolitan Museum, New York, by 'Mother and Child,' and in the museums of Boston and Worcester by similar subjects. She is also known for her tinted etchings, the best known of which is a series of 10 entitled Maternity.

**CASSAVA**, kās-sā'va, **MANIOC**, mǎn'i-ōk, or **MANDIOC**, a South American shrub (*Manihot utilisissima*) belonging to the natural order *Euphorbiaceæ*, sub-order *Crotoneæ*. There are two forms, popularly known as bitter and sweet, both of which are widely cultivated in tropical America for their fleshy, cylindrical, starchy roots, which form a large part of the food of the natives, and from which tapioca is made. They have also been introduced into other warm countries, especially Africa, and have quickly gained important positions as food crops.

The plant, which attains a height and breadth of four feet or more, is rather bushy, since its numerous knotty, brittle, pithy stems have many palmate leaves. The flowers, which appear in midsummer, are green or yellowish and inconspicuous and are succeeded by wing-angled capsules. The best results are obtained on light, sandy, well-drained soils. The land is prepared as for corn, but instead of planting seed, stem cuttings are covered by the plow, and when the plants appear they are cultivated with the same implements used in corn-growing. In about seven months the white soft roots, which occasionally weigh 30 pounds, and are sometimes three feet long and three inches thick, are dug by hand, washed, grated or ground to pulp. The juice, or poisonous part, is carefully pressed out, and when boiled, becomes the delicious sauce called casareep (q.v.), much esteemed by epicures. The flour that remains after pressure is formed into thin, round cakes and baked. To a European accustomed to eat bread, these, though sweetish and not unpalatable, have an insipid taste. If placed on close vessels, and preserved from the attacks of insects, cassava bread may be kept for several months without injury.

Poisoning by the bitter cassava is due to the presence of minute quantities of hydrocyanic acid (q.v.). This is a very common ingredient of many fruits and seeds, but usually is modified as the fruit ripens. The general process of manufacture of cassava destroys or drives off the free hydrocyanic acid.

The natives of South America throw a number of cakes of cassava together to heat, after which they soak them in water, which causes a rapid fermentation to take place; and from the

liquor thus obtained they make a very sharp and disagreeable, but intoxicating, beverage, which will not keep longer than 24 hours without spoiling.

From the pure flour of cassava is formed the substance called tapioca, which is frequently used for jelly, puddings and other culinary purposes. This is separated from the fibrous parts of the roots by taking a small quantity of the pulp after the juice is extracted and working it in the hand till a thick, white cream appears on the surface. This, being scraped off and washed in water, gradually subsides to the bottom. After the water is poured off the remaining moisture is dissipated by a slow fire, the substance being constantly stirred, until at length it forms into grains about the size of sago. These become hard by keeping, and are the purest and most wholesome part of the cassava. The starch of cassava, separated from the fibre by the usual processes, is known as Brazilian arrowroot.

The roots of another species of this shrub, called sweet cassava (*Manihot aipi*), the juice of which is not poisonous, are usually eaten with butter, after being roasted in hot ashes. They have much the flavor of chestnuts, and are an agreeable and nutritive food, containing about 30 per cent of carbohydrate materials. The roots of the sweet cassava are also used as stock-food and to make glucose and starch. Florida is the only State in which sweet cassava has attracted much attention, but it seems to be not very profitable there on account of the high price of labor and fertilizers. Consult United States Department of Agriculture, Bureau of Chemistry, Bulletins 44 (1894), 106 (1907), and Farmer's Bulletin 167 (1903).

**CASEGRAINIAN TELESCOPE**, a form of the reflecting-telescope in which the great speculum is perforated like the Gregorian, but the rays converging from the surface of the mirror are reflected back by a small convex mirror in the axis of the telescope, and come to a focus at a point near the aperture in the speculum, where they form an inverted image, which is viewed by the eyepiece screwed into the tube behind the speculum. In use this telescope thus possesses the convenience that the observer looks directly through the tube at the object to be examined, exactly as in using the more usual refracting telescope. Moreover, as in all reflecting telescopes, the light, as it is merely reflected, is not separated into its component colors, as is the case when it passes through a lens. For this reason reflecting telescopes are widely used in certain branches of astronomy, especially in spectroscopic and photographic work. In particular, an enormous Cassegrainian telescope has been completed (1916), for use in the new Dominion Astronomical Observatory at Victoria, Canada. The mounting of this instrument is by Warner and Swasey of Cleveland, Ohio; the great 72-inch mirror was figured by the John A. Brashear Company of Pittsburgh.

**CASSEL**, kās'sél, or **KASSEL**, formerly the residence of the Elector of Hesse-Cassel, and now the chief town in the Prussian province of Hesse-Nassau, lies on the Fulda, 35 miles southwest of Göttingen and 91 miles north-northeast of Frankfurt-on-the-Main. It is divided into the Altstadt, or Old Town; the

Ober Neustadt, or Upper New Town; the Unter Neustadt, or Lower New Town; and the new West Quarter; all but the third being on the left bank of the river. Cassel has several fine squares, or open areas, on the principal of which, the Friedrichsplatz, stands the electoral palace, an indifferent structure; and next to it the museum, a handsome building, containing a library of 235,000 volumes, and many valuable MSS, including the Hildebrandslied dating from the 8th century. The brothers Grimm were librarians here from 1814 to 1830. The Murhard Public Library contains 155,000 volumes. At one end of this area is a handsome triumphal arch and war monument overlooking the Fulda Valley, in which is the Karl-saue, finely laid out, and forming a favorite promenade. On this side of the city are also the building for the courts and government officers, the Bellevue palace containing the academy of arts, and the handsome picture gallery containing some fine examples of the old masters, especially the Flemish and Dutch. The other more noticeable public areas are the Königsplatz, in the form of a circle; the Friedrich-Wilhelmsplatz, with an ornamental fountain; the Ständeplatz, a broad tree-planted avenue, etc. The most noteworthy church is the Protestant church of Saint Martin, with a nave of the 14th and a choir of the 15th century. An observatory is likewise situated here. Cassel is the seat of the provincial and district government and of the supreme provincial court. The town's affairs are administered by a municipal council of 48 and an executive board of 21 members. There is a modern sewage system and a copious water supply, and the town owns and operates gasworks, an electric-light plant and a slaughter house. There are numerous educational institutions, including two gymnasia, three municipal high schools and a score of technical schools. There are many hospitals and other charitable institutions. Cassel has excellent railway facilities, and two electric street-railway lines accommodate the city traffic. It is the seat of a United States consulate. Cassel has iron-foundries and machine-shops, works for railway-carriages, mathematical instruments, pianos, gloves, jute works, etc. The town dates from the year 913, when, under the name of Chassala, it was the residence of King Conrad I. It received its first municipal rights in the 13th century from the landgraves of Thuringia. In the Seven Years' War it was several times captured by the French. Landgrave Frederick II sent 12,000 Hessians to aid the British in the American Revolution and was paid \$22,000,000. In 1807 it was made the capital of the newly-formed kingdom of Westphalia. In 1866 it was occupied by Prussian troops and became a part of Prussia. In the vicinity is Wilhelmshöhe, the ex-electors' summer palace the temporary residence of Napoleon III after Sedan. Pop. about 107,000.

**CASSELS, SIR Walter** (GIBSON PRINGLE), Canadian judge: b. Quebec city, 14 Aug. 1845. He was educated at the high school, Quebec, and Toronto University, and graduated B.A. in 1865. He was admitted a barrister in 1869, became one of the leaders of the Ontario bar, and held briefs in many important causes. He was appointed a judge of the Exchequer Court of Canada in 1908, and was knighted in 1917.

**CASSIA**, a genus of leguminous plants, of the family *Cesalpniaceae*, inhabiting the tropical parts of the world, consisting of trees, shrubs or herbs, the leaflets of several species of which constitute the well-known drug called senna. That imported from Alexandria is obtained from *C. acutifolia*. *C. fistula* is found wild in India. Its legumes contain a quantity of thick pulp, which is a mild laxative and cathartic, and enters into the composition of the confection of cassia and the confection of senna. It belongs to the sugar class of laxatives, its properties being due for the most part to the water-attracting properties of sugar while in the intestinal canal. The leaves and flowers are also purgative. The bark and roots of several of the Indian species are much used in medicine. "Cassia bark" is a common name for the bark of an entirely different plant, *Cinnamomum cassia*, belonging to the laurel family. It is much imported into Europe, mostly from China, and is also called "*Cassia lignea*." Its flavor somewhat resembles that of cinnamon, and as it is cheaper it is often substituted for it, but more particularly for the preparation of what is called oil of cinnamon. The cassia of the Bible was probably cassia bark. Cassia buds, which are similar in flavor, are the unripened fruits of this tree.

**CASSIANUS**, otherwise called **JOANNES MASSILIENSIS** and **JOANNES EREMITA**, early theological writer and zealous advocate of the monastic system: b. about 360, probably in Provence; d. Marseilles about 435. It is certain however, that he traveled extensively in the East, spent a few years in Bethlehem, traveled to Egypt and seems to have visited the hermits in the desert. He was deeply attached to Saint Chrysostom and when the latter, through the intrigues of his opponents, was removed from the episcopal chair, Cassianus was sent with Germanus to Rome to present a memorial from the clergy who adhered to Chrysostom. Here he became personally acquainted with Pelagius. About 415 he went to Marseilles, where he continued a course of restless activity as a presbyter till his death. He founded a monastery and a convent on the principles laid down by him in his works 'De Institutis Cœnobiorum' and 'Collationes Patrum Sceticorum' (that is, 'Conferences of the Fathers in the Desert of Sketis'). The views advanced in these works, and still more the strong leaning which he showed to the dogmas of Pelagius, involved him in a controversy with Augustine. He ultimately modified his opinions so far as to adopt the system to which theologians have given the name of Semi-pelagianism, holding that man, since the fall, is not absolutely incapable of good, but, on the contrary, both derives from nature the seeds of virtue, and is able of himself to commence their primary development, though he requires the aid of divine grace to bring them to maturity. These views found great favor with the monks of France, and long maintained their ground in opposition to the efforts of Augustine and his friend Prosper of Aquitania. At the desire of Leo, then Pope, he wrote against Nestorius his 'De incarnatione Domini' in seven volumes. The best edition of the works of Cassianus is that of Frankfort (1722, fol.). They are found in the English translation by E. C. S. Gibson in volume IX of 'Nicene and

Post-Nicene Fathers' (2d series, London and New York 1884). Consult Harnack, A., 'History of Dogma' (Vol. V, pp. 246ff., 253ff.); Moeller, W., 'History of the Christian Church' (Vol. 1, pp. 368-70).

**CASSIN, John**, American ornithologist: b. near Chester, Pa., 6 Sept. 1813; d. Philadelphia, 10 Jan. 1869. He resided in Philadelphia from 1834, and excepting a few years partially given to mercantile pursuits, devoted himself to the study of ornithology. He contributed descriptions of new species and synoptical reviews of various families to the 'Proceedings' and the 'Journal' of the Philadelphia Academy of Natural Science; and his more elaborate publications are 'Birds of California and Texas' (1862), containing descriptions and colored engravings of 50 species not given by Audubon; 'Mammalogy and Ornithology of the Wilkes Exploring Expedition' (1858); 'Ornithology of the Japan Expedition'; 'Ornithology of Gilliss's Astronomical Expedition to Chile'; and the chapters on rapacious and wading birds in the 'Ornithology of the Pacific Railroad Explorations and Surveys' (Washington 1858); 'The Birds of North America' (1860). His works are the result of careful research, and are especially valuable for their descriptions and classification of many birds not given in the previous works of Wilson and Audubon. According to Coues he was the only American ornithologist as familiar with the birds of the Old World as with those of America.

**CASSINI, kas-sé'nē, Arthur Pavlovitch**, Russian diplomat: b. 1835. He began his public career in 1855, being attached to the Department of Foreign Affairs. He held various minor diplomatic offices in Europe and in 1891 became Minister at Peking, during the war with China and Japan successfully advancing Russian interests. He became Minister at Washington in 1897 and later the first Russian Ambassador to the United States. In 1905 he went as ambassador to Madrid and represented Russia at the Algeciras conference.

**CASSINI, Giovanni Domenico**, Italian astronomer: b. Perinaldo, near Nice, 8 June 1625; d. Paris, 14 Sept. 1712. He studied at Genoa with the Jesuits. Chance turned his attention to astronomy, in which he made such rapid progress that in 1650 the senate of Bologna bestowed on him the first professorship of astronomy at the university. He worked out more correct tables of the sun and a more precise determination of its parallax. By an observation at Città della Piave he discovered the shadows cast by the satellites of Jupiter on the disc of that planet when they are between it and the sun. By means of these he corrected his theory of the motion of the satellites; he also determined the period of Jupiter's revolution. In 1668 he published his 'Ephemerides of the Satellites of Jupiter.' In 1671 he became director of the observatory at Paris and in 1673 became naturalized as a French subject. He discovered four new satellites of Saturn and the zodiacal light; proved that the axis of the moon is not perpendicular to the plane of the ecliptic, and showed the causes of her libration. The laws of this motion are one of his finest discoveries. He also wrote observations on the Indian calendar.

He believed that the planetary orbits were not ellipses, but members of a family of curves called after him Cassinian ovals (q.v.). The meridian commenced by Picard and Lahire was continued by Cassini in 1700 to the extreme limits of Roussillon, and when measured 100 years later showed a difference of only 21 toises (about 134 feet). His 'Opera Astronomica' was published at Rome in 1666.

**CASSINI, Jacques**, French astronomer: b. Paris, 18 Feb. 1677; d. Thury, department of Oise, 16 April 1756. He was the son of Giovanni Domenico Cassini and succeeded him in his post at the Paris observatory. In 1694 he was admitted into the Academy of Sciences. His labors to determine the figure of the earth are well known. The first measurement of 1718 made the degrees of the meridian shorter toward the north than toward the south, whence it was concluded that the earth was an oblate spheroid. Cassini continued the measurement, and maintained this opinion in his work 'De la grandeur et de la figure de la terre.' In order to settle the question the Academy was commissioned in 1733 to measure the whole length of France from Brest to Strassburg. Cassini directed this undertaking, but was led into some errors by the defective instruments of former observers. The astronomical tables which he compiled were published at Paris in 1740. He compiled the first tables on the inclinations of the orbits of Saturn's satellites and ring. In addition to his astronomical works, he wrote several essays on subjects in natural philosophy, etc.

**CASSINI, Jacques Dominique, COMTE DE**, French astronomer: b. Paris, 30 June 1748; d. Paris (?), 18 Oct. 1845. He was the son of Cassini de Thury and succeeded his father in 1784 as director of the Paris observatory. He was a member of the Academy, and a statesman of ability as well as a mathematician. In 1789 he completed the topographical work which was begun by his father. The 'Atlas National' was a reduction of it on a scale of one-third. Cassini was arrested by order of the revolutionary tribunal. He escaped with life, but lost the copper-plates of the 'Carte de France,' which had cost 500,000 francs. Napoleon made him a count of the empire.

**CASSINI DE THURY, tü-rē, César François**, French astronomer: b. Paris, 17 June 1714; d. 4 Sept. 1784; son of Jacques Cassini. He was a member of the Academy from his 22d year, and director of the observatory in 1756. He undertook a geometrical survey of the whole of France in 1744. When the support of the government was withdrawn in 1756, Cassini formed a society for advancing the requisite sums, which were to be repaid by the sale of the maps constructed from the survey. The work was almost entirely finished when he died.

**CASSINIAN, or CASSIAN OVAL**, the locus of a point the product of whose distances from two fixed points is constant. It varies in shape as the constant product and the distance between the fixed points are differently chosen, and may break up into two separate but symmetrical figures. A special form is that of Bernouilli's lemniscate. Its general Cartesian

equation referred to its axes of symmetry is  $(x^2 + y^2 + a^2)^2 - 4a^2 x^2 + a^4 = m^2$ , and the corresponding polar equation is  $r^4 - 2a^2 r^2 \cos 2\theta + a^4 = m^2$ .

See Briot et Bouquet, 'Géométrie analytique' (4th ed., Paris 1890; tr. Chicago 1896).

**CASSINO**, Italy, until 1871 known as SAN GERMANO, city of Caserta province, on the Rapido, 85 miles southeast of Rome. Of great historic interest, and the seat of the celebrated monastery of Monte Cassino, nearby are interesting ruins of the village of M. Terentius Varro where, according to Cicero, Antony led a dissipated life, also a ruined amphitheatre built by Ummidia Quadratilla, a Roman lady of whom Pliny writes in his letters. Popes and emperors resided at San Germano and here Frederick II and Gregory IX effected a peace in 1230. It was the scene of an Austrian victory over Murat 16 March 1815. Pop. 14,220.

**CASSINO**, a game at cards usually played by four persons (although more can enter the game), two on each side. In it the ten of diamonds, technically called big cassino, counts two; and little cassino, the two of spades, counts one. The points possible to be scored in one deal (exclusive of sweeps) number 9. They are: Big cassino, 2; little cassino, 1; cards, 1; spades, 1; each ace, 1=4. A sweep is counted when a player takes up all the cards on the table. The object sought in the game (besides the points already enumerated) is to arrange the cards on the board in combination so that the sum of the spots on the cards thus combined may equal those on one card in the hand of the player, who has the right to take as many cards from the board as he can thus combine; or he may capture any card from the board the counterpart of which he has in hand. This can be done also by playing cards from the hand in such a manner that the sum of the spots on these cards and on cards on the board equals that on a card in the player's hand.

**CASSIODORUS**, Flavius Magnus Aurelius, Roman historian and statesman, who lived from about 468 to 568. He entered the service of the Ostrogoth king of Italy, Odoacer, at the age of about 20 years and under him and his successor, Theodoric, was treasurer of the kingdom and councillor, administering his office with extraordinary prudence in a most difficult time. As statesman, scholar and historian he kept alive the lamp of the Græco-Roman learning after the overwhelming of the ancient civilization by the barbarians. After a term of 50 years in public station he withdrew to a monastic institution founded by himself in his native province, Bruttium, and there spent the remaining 30 years of his useful life, imbuing his monks with a love of the ancient learning and employing them in copying the ancient texts of profane no less than of religious writings. He may be regarded as the father of the monastic *Scriptorium* to which modern learning is indebted for a great part of what has come down to us of the ancient literature and of the history of the West in those troublous times. He composed manuals of rhetoric and grammar which were used as textbooks in the schools of the Middle Ages till the revival of the ancient

learning, which inspired men with a longing for the ancient knowledge. Of great service also were his works 'De Artibus ac Disciplinis Liberalium Litterarum' (of the liberal arts and courses of study), and his 'De Institutione Divinarum Litterarum' (instruction in scriptural knowledge); but above all his 12 books of 'Epistolæ Variæ' (various letters), containing decrees of the Ostrogothic kings, upon which is based the whole history of Italy under the rule of those barbarian potentates. This collection was first printed at Augsburg 1533. With one Epiphanius he made a compendious Latin version, entitled 'Tripartita Historia' (tripartite history) of the history of the Church as written by the three Greek historians, Socrates, Sozomen and Theodoret, and continued Socrates' history to the year 518. An edition of his complete works was printed at Rouen in 1679 and at Venice in 1729. His 'Life' was written by the eminent Benedictine, Sainte Marthe, and published in Paris in 1694. His works are published in Migne, 'Patrologia Latina' (Vol. LXIX). Consult Sandys, 'A History of Classical Scholarship' (Vol. I, especially pp. 258-270, Cambridge 1906).

**CASSIOPEIA**, käs-i-ō-pe'ya, in Greek mythology, daughter of Arabus and wife of Cepheus, King of Ethiopia, to whom she bore Andromeda. She dared to compare her own beauty to that of the Nereids, who, enraged thereat, besought Poseidon for vengeance. The god, in compliance with the request of the water-nymphs, laid waste the dominions of Cepheus by means of a deluge and a dreadful sea-monster.

In astronomy Cassiopeia is a conspicuous constellation in the northern hemisphere, situated next to Cepheus. In 1572 a new and brilliant star appeared in it, which, however, after a short time, gradually diminished, and has been identified by Hinal and Plummer with a reddish, 11th-magnitude variable which is still visible. The five brightest stars in the constellation of Cassiopeia are arranged in the form of a straggling W, which is easily recognized.

**CASSIQUIARI**, käs-sē-kē-ā'rē, or **CASSIQUIARÉ**, a deep rapid river of South America, in Venezuela, branching off from the Orinoco, and forming a water-way by which that river has navigable communication with the Rio Negro. It leaves the Orinoco in lat. 3° 10' N.; long. 66° 20' W., about 20 miles west of Esmeralda, and, after a southwest course of 128 miles falls into the Rio Negro near San Carlos, in lat. 2° 5' N.; long. 67° 40' W. It is estimated to carry off about a third of the water of the Orinoco, being 100 yards broad where it leaves that river, and about 600 yards at its junction with the Rio Negro. By means of this river, the Rio Negro, the Amazon and its tributaries, it is practicable to sail from the interior of Brazil to the mouth of the Orinoco.

**CASSITERIDES**, käs-sī-tēr'i-déz, a name derived from the Greek *kassiteros*, tin, and anciently applied, but with no uniformity or precision, to the tin district of Cornwall, to the Scilly Isles or to small islands off the north-west coast of Spain.

**CASSITERITE**, native dioxide of tin, SnO<sub>2</sub>, crystallizing in the tetragonal system, and

also occurring uniform and in rolled grains. The crystals are usually brown or black, brittle with an uneven fracture, and with a specific gravity of from 6.8 to 7.1, and a hardness of from 6 to 7. Ordinary massive or crystallized cassiterite is often called "tinstone," especially in England; "wood tin" is a botryoidal form, "stream tin" is the mineral in small rolled pebbles found in the streams or placer deposits and is formed by the disintegration of stanniferous rocks. Cassiterite is the most important ore of tin. It occurs in Cornwall (England), Saxony, Bohemia, Galicia, Greenland, Sweden and in Australia, the Malay Peninsula, Banca, Bolivia and Mexico. In the United States it is found in small amounts in various States, and it has been mined to some extent in Virginia, in South Dakota and in San Bernardino County, Cal.

**CASSIUS**, kăsh'ūs, **Andreas**, German physician who was born in the first half of the 17th century at Schleswig; d. Hamburg 1673. He was graduated at Leyden in 1632, was physician to the Duke of Holstein and bishop of Lübeck, and practised at Hamburg. His name is best known in connection with a purple color obtained from gold, which was briefly described in a treatise published by his son in 1685.

**CASSIUS**, Purple of. See PURPLE OF CASSIUS.

**CASSIUS LONGINUS**, Gaius, the friend of Brutus, was the quaestor of Crassus, and preserved the few troops of that general who escaped from the bloody battle with the Parthians. With these he defended Syria against the Parthians till the arrival of Bibulus. In the famous civil war that broke out between Pompey and Cæsar he espoused the cause of the former, and, as commander of his naval forces, rendered him important services. When Cæsar, after the victory of Pharsalia, was in pursuit of Pompey, he advanced with a few vessels, while crossing the Hellespont, against a fleet of 70 sail commanded by Cassius, and called upon him to surrender. The latter, astonished by his daring courage, surrendered at his summons. Cæsar pardoned him, and afterward bestowed various honors on him; but Cassius, who had always cherished feelings of bitter hatred toward Cæsar, joined in the conspiracy against him, and, with the aid of several fellow-conspirators, assassinated him, 44 B.C. He then, together with Brutus, raised an army to maintain the cause of their faction. They were met by Octavianus and Antony, who professed themselves the avengers of Cæsar, at Philippi. The wing which Cassius commanded being defeated, he imagined that all was lost, and killed himself, 42 B.C.

The name is also applied to a Roman jurist who flourished about 3-75 A.D., consul in 30, proconsul of Asia (45-50). After serving as governor of Syria, he was banished for his loyalty to the memory of Cassius, the murderer of Cæsar. In the reign of Vespasian, he was recalled. His book, 'Libri Juris Civilis' was used by Justinian in his codification. See BRUTUS; CÆSAR.

**CASSIVELLAUNUS**, kăs-i-vě-lō'nūs (in Shakespeare's 'Cymbeline,' CASSIBELAN), a noble and warlike British chief of the Catuvellauni, who, when Cæsar invaded Britain in

54 A.C., held sway over several tribes living to the north of the Thames, and led the resistance to the advance of the Roman general. Having advanced to the Thames, Cæsar found the Britons under Cassivellaunus posted on the north bank of the river prepared to dispute his passage. He crossed, however, without much difficulty, but the British charioteers persistently harassed his line of march. The Trinobantes, a tribe of Essex and Middlesex, soon sent in their submission to Cæsar, and as their example was followed by others, Cassivellaunus found himself unable to oppose resistance to the Romans. His stronghold, which contained many cattle, was captured by Cæsar; and an attempt made to storm Cæsar's naval camp proving unsuccessful, Cassivellaunus sued for peace, gave hostages and promised an annual tribute. Consult Cæsar, 'Gallic War' (bk. V).

**CASSOCK**, a name formerly applied to a long loose gown worn over the other garments, in which sense the word is found in Shakespeare. It is now applied to a long, close-fitting garment worn by priests and clerics and in Catholic countries forming the ordinary dress of the priest. In the Roman Catholic Church, priests wear a black cassock; bishops and other prelates, purple; cardinals, red; and the Pope, white. In the Anglican Church, black is worn by all three orders of clergy, but bishops on state occasions often wear purple.

**CASSOWARY**, a corruption of the Malayan name for ratite birds of the family *Casuariidae*, inhabitants of the Papuan Islands and Australasia, and forming, with their near allies the emus, the group *Megistanes*. They are large birds, the females standing five or six feet high (males are less in stature), and are clothed in hair-like feathers, which appear double, as the aftershaft is as large as the feather proper; these may reach a length of 12 inches or more on the rump, where they drape over the invisible tail. This coat is glossy black in both sexes and all species, whose distinguishing marks are found in the varying colors about the head. Like other ratite, or "wingless" birds, the wings are so reduced as to be hidden beneath the drooping plumage, except the ends of five stiff quills; these wings are quite useless for either flight, or aid in running, but are of some service as weapons. The legs are extremely stout, and are actuated by powerful muscles; and the three toes are armed with strong scratching-claws. The special feature of this family of birds, however, is the head, which is almost naked of feathers, and carries a crest, "helmet," or "casque" of spongy bone which in some is flattened, and in others rises into a triangular or a pyramidal boss. The beak is stout, and keeled on top. The neck is naked, and in most cases adorned with one or more pendent wattles. These naked parts, and the head and helmet are brilliantly colored, differing in the various species of which 10 have been described. Thus the *Casuarinus papuanus* of New Guinea is described as having "a dusky-black casque, blue head, throat and fore-neck, gray-green occiput and auricular region, and orange hind-neck, changing into rosy flesh-color toward the sides." All the others are nearly as gaudy.

The cassowaries are forest-keeping birds, and have become very wary since their

jungles were invaded by hunters. They are swift runners, hurling themselves forward with a peculiar striding gait, and bounding over obstacles. They are almost omnivorous, but feed mainly on berries, fallen fruit, bulbs and insects scratched out of the forest floor. They defend themselves vigorously when at bay, kicking powerfully in any direction, and striking with wings and beak. Yet they are tamable, and are kept like fowls by the natives of some districts. They are hunted in Australia for the sake of their skins from which are made mats, rugs, feathered ornaments, etc. The nest is a rough structure on the ground in a thicket. The three to six eggs are green, and incubation is done mainly if not exclusively by the cock-bird. Consult Salvatori, 'Ornitologia della Papuasia' (Turin 1882); Rothschild, 'Trans. Zool. Soc. of London' (1901); Evans, 'Birds' (New York 1900).

ERNEST INGERSOLL.

**CAST**, in the fine arts, is an impression taken by means of wax or plaster of Paris from a statue, bust, bas-relief or any other model, animate or inanimate. In taking a cast from a living person's face, it is necessary, first, to anoint the eyebrows and eyelashes, and any hairs about the cheeks and temples, with a little sweet-oil; then to insert two tubes (oiled also) of pasteboard into the nostrils, so that breathing may be performed through them; a handkerchief is then to be tied loosely over the face, and the head sloped backward in an elbow chair or sofa. Powdered and calcined plaster of Paris is then mixed with spring water to the consistence of cream, and poured in between the face and handkerchief to the depth of half an inch. On becoming fixed or hard, it is removed and left to dry. When dried thoroughly it is well soaked with linseed oil, and an impression may then be taken from it, in plaster of Paris or soft clay; the hollow cast being first split longitudinally down the nose, so that the object cast may be more easily removed.

It ought to be observed that all models should be divided into several pieces or joints; thus, in that covering any round body, one side must be covered first with the plaster, and the sides pared with a knife, and smeared with clay and water, then the remaining part of the object covered with plaster, and a joint will thus be formed between the two parts; for, wherever the mixture of clay and water has been applied with a hair brush, the cast will not adhere, and therefore will be easily separated with the blunt edge of a knife. It is usual also to make small pits or depressions of the size of small buttons, on the edges of the joints of molds so that they may lock together well when added, and thus fit closely.

Plaster casts are varnished by a mixture of soap and white wax in boiling water. A quarter of an ounce of soap is dissolved in a pint of water, and an equal quantity of wax afterward incorporated. The cast is dipped in this liquid, and after drying a week is polished by rubbing with soft linen. The surface produced in this manner approaches to the polish of marble. When plaster casts are to be exposed to the weather, their durability is greatly increased by saturating them with linseed oil, with which wax or resin may be combined. When intended to resemble bronze, a soap is

used made of linseed oil and soda, colored by the sulphates of copper and iron. Walls and ceilings are rendered waterproof in the same way.

**CAST, or CASTING-LINE**, a gut line used in angling, from two to four yards in length, having artificial flies attached to it at intervals of about two feet. For trout fishing the line is generally made of braided waterproof silk, and a leader of silkworm gut attached to the end of the line.

**CAST IRON, Malleable.** Malleable cast iron is a grade of metal which has a special composition, such that when annealed for a continued period of time it becomes malleable, can be bent and twisted. The castings, when taken from the sand of the foundry, are very hard and brittle. The fracture is dead white (the ordinary iron casting appearing gray to black when freshly broken).

The tensile strength of a good malleable casting should run between 42,000 and 48,000 pounds per square inch, though for ordinary purposes 35,000 pounds is quite good enough. Castings have been made running up to 63,000 pounds per square inch, but these would not be soft enough for general use, being better adapted for conveyor chains and castings which must not stretch. The elongation of a malleable casting runs between 2.5 to 7 per cent measured in two inches. The transverse strength measured by a 1 inch square bar, placed on supports 12 inches apart, and load applied at the centre, should be from 3,000 to 5,000 pounds for high quality material, and at least 2,500 for the ordinary product. The resilience of a malleable casting may be taken as eight times as high as a gray-iron one. Hence the great advantage of using malleable castings to resist shock. In fact where the shocks are light and often repeated, this casting will stand up better than a steel one.

The malleabilization of cast iron has been known since the early part of the 18th century. The first record we have is by Réaumur in 1722. He states that a hard casting, by being embedded in ore and kept at a high temperature for a number of days, changed its structure and became soft and malleable. The process as then practised is still in vogue, and all attempts to hasten or otherwise modify it have not given continuously good results. The fundamental principle upon which the whole bined carbon in a white casting of a suitable process rests is the conversion of the composition to an amorphous form of carbon, which remains in the casting as a mechanical admixture. It is not crystalline like graphite, but in other respects behaves like it, and is determined chemically in the same manner.

To understand this, let us consider the two great divisions of cast iron — the Gray and the White. In the former we have nearly all the carbon present in a mechanical admixture, as graphite flakes situate between the crystals of the iron proper. But little carbon is present in the combined state, and if less than 0.20 per cent, the casting is dead soft. If the combined carbon is as high as 0.80 per cent, the rest of about 3 per cent being in the form of graphite, the casting will be a hard one. Now in the case of the white irons, the carbon is nearly all combined, and almost no graphite in mechanical admixture is present. Hence an exceedingly

hard material is the result. It is the object of the malleablizing process to convert this chemically combined carbon in a white iron, or in a hard gray one for that matter, to an amorphous form, to which the name "temper carbon" has been given (from "Temperguss," German for malleable casting). Any graphite present in the original casting is not changed, but with long-continued heat gives an opportunity for the entrance of oxygen, with ruinous results to the casting. Hence the short annealing of gray castings to benefit them, while the white casting can be annealed for six days, and then re-annealed again, without seriously hurting its strength.

There are two tendencies in the malleable casting industry, which result in different grades of metal. In Europe, from whence the process came, and where the irons used are not as pure, the annealing process is carried out longer than here, and hence much of the carbon present is removed from the casting by oxidizing it out. The result is a very ductile casting, but with a gray to white fracture (the fracture of a steel however, not of a hard white iron). The castings, moreover, are nearly all very light. In this country, with better irons, we have shortened the anneal to get just the conversion of

per foot, but in annealing one-half of this is taken up by expansion, and hence the ordinary gray iron shrinkage is allowed for in making the patterns. For special work, however, it will pay to watch the action of the metal in the sand mold, and due allowances should be made in the pattern for abnormal contractions on the part of the casting, so that the dimensions of the annealed casting may come out all right.

As the metal when ready to pour may not always be of the desired temperature (in fact the temperature changes during tapping, going up steadily), it is best to pour the thin castings first, provided the iron be hot enough for this, then the medium weight castings, and finally the thick ones. By this time the metal will be very hot and the danger from excessive mottling avoided. Great care should be exercised to see that patterns are so proportioned that no shrinkage occurs in the interior of the metal. This is certain to take place at abrupt changes of section, at sharp angles and in heavy parts. Hence all sharp junctions on patterns should have fillets, and where great changes of section cannot be avoided, chills should be placed against the work. This will send the shrinkage into the interior of the casting where it will not matter so much.

FIG. 1.—Longitudinal Section of Air Furnace for Malleable Castings

the carbon, without attempting to burn it out by prolonged annealing, and hence we have a black heart in the casting. This is especially noticeable as we make very heavy work, comparatively speaking. Sections of one inch are common, and even heavier work is done, but with the use of chills in casting them, so that the carbon be surely all combined, and the casting dead white before the annealing is begun. Otherwise, if more than a slight mottling is present in the fracture, the casting is sure to come out "rotten" in strength (as it is called) when leaving the anneal. The temperature of the bath of molten metal has an important bearing on this, for with a very hot metal, heavy sections can be cast and still have their fracture white, while the same castings would be gray were the bath of melted metal colder.

Recent developments have brought about a division of the American "black-head" malleable process into the making of very low carbon, soft, but weak castings on the one hand, and medium carbon, strong, but stiff castings on the other. The former is for general use, and the latter for specification work of very high grade.

The contraction of a white casting, as made for malleable purposes is  $3/16$  inch to  $5/16$  inch

In general three things affect the state of a hard casting which will allow it to anneal properly or not. First the chemical composition of the metal itself. Second the thickness of the sections of the casting, and third the pouring temperature. The last two items have been gone over above. It remains to give specifications for the first. The most powerful agent affecting the state of the carbon present in a casting is the silicon. As it is necessary to have a casting white in fracture as it leaves the sand, the silicon must be very low. Then with the proper pouring temperature, and when poured into sections suitable for the composition employed, the results will be good. Naturally this will principally depend upon the thickness of the work made, as this cannot be changed, and then upon the heat of the iron, which can be regulated by careful melting. The thinner the castings, the higher the silicon the mixture can stand. Thus for pipe fittings, the silicon may run up to 1 per cent in the casting. For exceptionally heavy sectioned castings the silicon may have to run down as low as 0.45 per cent in order to get the best results. When charcoal irons were used exclusively (these standing more punishment in melting than the coke irons of the present day),

the silicon oftentimes ran as low as 0.28 per cent in a casting and still this was first-rate. The general average, however, for all around medium and fairly heavy work is 0.65 per cent silicon in the casting, which means about 0.85 per cent to 0.90 per cent in the mixture; 0.45 per cent may be considered the lowest range for heavy work, and 1.25 per cent the highest for the lightest of castings.

The phosphorus should not exceed 0.225 per cent, the manganese not over 0.30, the sulphur as low as possible, preferably not over 0.05 in the casting, though in Europe, where the long anneal counteracts this evil, the sulphur goes very high, sometimes even up to 0.40 per cent.

The lower the total carbon, down to 2.75 below when trouble arises, the stronger will be the casting. (The total carbon may be run as low as 2.25, but only with the best of melting and annealing practice). Hence steel scrap is added to make the metal low in its carbon content. This is a much better plan than to refine the iron in the process to get the carbon low. In general it is best to simply melt a mixture, and then get it out of the furnace as quickly as possible, in order to get it away from oxidizing

FIG. 2.—Section Through Fire-Box of Air Furnace for Malleable Castings

influences as quickly as may be. Five to 10 per cent of steel may be added, also malleable scrap, if necessary. In a 10-ton heat the best proportion of the mixture is five tons of pig iron, one ton malleable scrap, 500 pounds steel scrap and the balance the sprues of the previous work. The practical effect of these steel and other additions is about as follows: 100 pounds, wrought iron scrap equal 250 pounds steel, equal 2,000 pounds malleable scrap. Mixtures thus arranged come out about the same in strength, all other things being equal.

Charcoal iron is now being used only where the source of supply is close, and its cost is but a dollar or two over the best "Coke Malleable" or "Bessemer Malleable," as coke irons made specially for the malleable foundry are called (the last named being a Bessemer iron with the phosphorus a little higher than is allowed for steel). It is best to use these classes of "malleable" instead of the so-called "off" pig irons, for they are made with an extra amount of coke, and are much less oxidized than the irons blown under poor furnace conditions.

The mixtures used in the malleable foundry are as follows: Where the cupola is used for

malleable castings in addition to making pots for annealing, the regular mixture as used for the air furnace or open hearth furnace must be reduced slightly in silicon, as the cupola burns out less of this element. Hence about 0.25 per cent is to be added to the amount of silicon required in the casting. In the case of the furnaces, about 0.30 per cent to 0.35 per cent must be added. For pots it is advisable to use good pig irons and to utilize salamanders and the large scrap pieces that are unsafe to put into the furnace. The silicon in the pots as cast should be about 0.60 per cent and hence about 0.85 per cent should go into the cupola.

The mixtures for air furnace and the open hearth furnace are about the same. Possibly the air furnace should have a little more silicon, as it is under the influence of the gases from combustion longer. There is also necessary an occasional use of ferrosilicon, especially in the open hearth, as through accident the metal may be badly burnt and the addition of ferrosilicon brings about the proper composition, though the metal should not be put into castings, but cast into pigs, to be fed subsequently into the regular mixtures in small quantities at a time. About 250 to 500 pounds ferrosilicon is usually all that is necessary for this purpose. The actual amount can be calculated at the time from the supposed loss of silicon in the bath.

Malleable castings are made in the cupola, the air furnace, the open hearth furnace, the electric furnace and in the crucible. The last named process is now only practised in Europe, being too expensive in this country, though turning out a most excellent product. The cupola process makes the poorest castings, as the metal is in contact with the fuel in this method. Hence the absorption of sulphur and oxidizing influences which are partly avoided in other processes. The peculiar constitution of the metal as cast makes it necessary to anneal it at a temperature some 200 degrees F. higher than ordinary air-furnace iron, which means a greater expense for wear and tear on the ovens and annealing pots. This class of castings is therefore only used for the cheaper grades of malleable casting, such as pipe fittings and hardware castings, where great strength is not essential, and enough ductility is had to satisfy the demands made on the work. The selling price is also about half a cent a pound less than the high grade metal.

The bulk of the malleable castings made in this country comes from the air furnace. This is an excellent melting process, can be manipulated easily, is not too expensive, and will probably continue to be the method used in most of our malleable works. The air furnace, as used for malleable purposes is somewhat different than that used for making rolls and gun castings. It is illustrated herewith.

The entire roof can be taken off in sections, called "bungs," so that the sand bottom can be made, and the charge put in. Where more than one heat is made without remaking the bottom, only a few bungs are lifted away after the first heat and the furnace is charged quickly, so as to keep it hot as long as possible. Firing is done at one end, and the charge when ready is tapped at one side, or both if two spouts are provided. It is very important to get a heat out quickly, as the metal is continu-

ously oxidizing while in the furnace, after it has reached the proper composition. A 10-ton heat, when poured into small castings often takes three-quarters of an hour to tap, and hence the first iron and the very last may be two different things. Hence the dividing up of the work to get the class of metal best suited to the castings to be made. The amount of coal used to melt in a well-constructed air furnace is four pounds iron to one pound coal. In the case of the cupola, while ordinary gray iron practice requires one pound coal to every eight pounds iron, in malleable work, it takes one pound coke to only four pounds iron, or just the same as good air furnace practice. It is but just to say, however, that in many foundries of the country the air furnaces are so poorly constructed, kept in repair and operated that oftentimes one pound coal melts only two pounds iron.

Bottom is made placing layers of fire sand, that is, sand with about 98 per cent silica, and very free from fluxing impurities, on the brick-work and burning or partly fusing it together. The layers are about one inch thick, and are

heat still has to run until ready to tap. After the iron has melted, the slag is skimmed off, and this gives a good chance for refining action, which means the burning out of silicon. The test plug is always taken after skimming, which is often done for the second time. When the heat is tapped, the men take it off in hand ladles, and pour the molds, throwing the iron into them as quickly as possible so that the necessarily small gates do not prevent the metal from filling the molds by chilling and resulting in "short pours."

The open hearth process (see STEEL—CRUCIBLE PROCESS) is by far the best one in general use, but is confined to those works where great quantities are made year in and year out. Thus there are several works where about 80 tons of castings are made daily, and in which the use of the open hearth is a paying proposition, especially as the same furnace can be used for making acid steel heats in place of malleable cast iron, as desired. The fuel consumption for the open hearth corresponds to one pound coal for six pounds iron melted; showing a considerable economy over

FIG. 3.—Longitudinal Section Through Fire-Box of Annealing Oven for Malleable Castings

repeated until the proper shape is made. It takes from four to five hours to melt a 10-ton heat after this is charged, depending upon the quality of the bituminous coal used, and the condition of the furnace. From 6 to 10 heats can be made on the same bottom, with but little repairing, but the usual run is from two to four. In order to know when the heat is ready, a test plug, so called, is cast. This plug is about of a diameter equal to the heaviest section of the castings to be made. It is about eight inches long, and the mold for it is made by simply pushing the pattern into the sand in a box. The metal is taken from the bath by a small ladle dipped into it as deeply as possible. After pouring, as soon as the iron is set, the plug is grasped with a tongs, is dipped into water to cool it and then broken across. The fracture is observed, and if properly crystalline, and with but little or no mottling, the heat is ready to tap. If there is too much mottling, that is, too much graphite left, the process is continued to burn out more silicon, and also get the metal hotter, and another test plug taken. Experience will tell just how long a

all other methods. The use of a gas producer system, however, where natural gas is not available, makes the installation an elaborate one, and not desirable where the proper help is not available.

In the case of the open hearth, the furnace is always hot, and hence a heat is finished about an hour sooner than in the air furnace. The iron gets hotter, and can be taken out in five-ton ladles to be distributed afterward and as the metal is not as long in contact with the gases as in the air furnace process, it is of better quality. The most economical size of furnace is the 20-ton, with the crane ladle to take off the metal in large quantities, so that tapping is not so long continued a matter as in the air furnace. The latest patented invention to assist in this is the application of two or more spouts to the furnace, so that metal may be taken out at different levels. In this way the surface of the bath, which is punished most by the gases, may be taken off first. Then while this is being poured off, the next part of the heat, now the top, is again taken off, and finally if three spouts are used, the bottom may

be taken out as long as half an hour afterward without any deterioration or change in the metal.

From the foundry the castings, after shaking out the molds, go to the hard tumbling room, where they are freed from the adhering sand. This is done by means of tumbling barrels into which the castings, and a supply of "stars" made of the same hard iron, are placed. Where castings are liable to crack by this tumbling about, sticks of wood are introduced so that as they strike them, no damage is done. Where delicate castings are made, these are pickled in dilute sulphuric or in hydrofluoric acid.

After cleaning the hard castings, they are

has been allowed to get too low in silicon, or "high" as it is called, in contradistinction to "low" iron, where the silicon is too high, and the metal mottled or even gray, the sand is apt to burn on so hard that the tumbling all day does not remove it all. Here the sand blast is excellent.

From the sorting room the castings go to the annealing room, or rather to a part of it in which the packing is done. To anneal the hard castings they are placed into so-called "saggers" or annealing pots. These are simple, box-like shells, with no bottom, about one inch thick, and say 18 inches x 24 inches x 15 inches high. Three or four of these are placed

FIG. 4.— Plan of Annealing Oven for Malleable Castings

carefully sorted out, the cracked or otherwise defective pieces thrown out, to go back into the furnace again, and the good ones are sent into the annealing room. Where castings are made which crack as soon as they cool, on account of their shape, such as the hand wheels of freight cars for braking purposes, these while still red hot in the sand, are taken into small ovens where they are kept quite hot for a time, and are then allowed to cool very slowly with the oven. In this way they will not be cracked before going into the annealing ovens. The modern tendency is to introduce the sand blast for cleaning, as this removes every particle of sand from the hard castings. Where the iron

over each other, and on a "stool" high enough to allow a free circulation of the gases under it. The castings are carefully placed in these pots and packed with "scale" in such a way that when red hot the whole may not settle and warp the work. This scale is puddle scale, hammer scale, or even iron ore. For that matter, as the process is more of a conversion of the combined carbon into the "temper carbon" the castings can be packed in fire clay or sand and good results obtained. But the puddle scale seems to give the best results, with greatest cheapness. The flakes that fall from the annealing pots, these lasting only for 7 to 14 heats, can be crushed

and make the finest kind of packing material, being pure oxide of iron, and no further scale than the initial lot need be purchased.

The pots, properly filled, are covered with a "mud" made of the sand rolled off the hard castings mixed with water. The joints of the pots are also carefully daubed up with this mud; the pots are introduced into the oven, either run in by a special carriage in the old style ovens, or lowered in from the crane in the new ovens, the tops of which can be removed. The ovens are now fired and within 36 to 48 hours the full temperature of 1,350 degrees F. in the coldest portion of the coldest pot is reached. This temperature is kept up preferably 60 hours, and the oven then allowed to cool slowly before the pots are withdrawn. The ovens are so constructed that they are heated inside and under the whole bottom, so that a difference of not more than 100 degrees F. throughout the portion filled with work may exist.

After the pots are taken out, they are dumped, the castings taken from the scale and the former sent to the soft tumbling room. Here they are packed with small pieces of annealed malleable castings, or with wood and leather, such as old shoes, etc., so that the adhering scale is removed, and a fine coat of graphite is given them. They come out shining black, and can be shipped direct, or else coated with asphalt, as required. Sometimes the castings must be straightened which should always be done cold, either by drop hammer or hydraulic press. Test plugs are usually cast on the important work, so that breaking these off on inspection the quality of the metal in the particular casting is revealed at a glance. Test bars for physical test should also be taken off with the first and last portion of every heat, so that all work from that heat can be traced and its quality known. The test bar has the further advantage of showing up the condition of the furnace, poor working on the part of which is immediately detected by a white rim on the casting.

The production of malleable castings in this country runs up to the enormous figure of 1,000,000 tons annually. In Europe about 75,000 tons are made in the same time. Most of the large companies now make steel castings in addition, as malleable cast iron, though most excellent for shock, is not strong enough to stand under the terrific strains that are now put on the structures where this work is used. Thus the 100,000-pound cars now require steel couplers, as the malleable ones tear apart, yet the latter will stand all the bumping that comes along while steel will not. The principal use for malleable castings is for railroad work. Next comes agricultural machinery. After that a great variety of work, such as pipe fittings, hardware, machine parts, chain links, tools, etc. The demand is constantly growing, and while steel was supposed to be replacing the malleable casting, this has not turned out to be the case.

RICHARD MOLDENKE,

*Specialist on Metallurgy of Cast Iron and Expert in Malleable Castings.*

**CAST IRON PIPES.** See PIPES.

**CAST STEEL,** blister steel which has been broken up, fused in a crucible, cast into ingots and rolled. The process of making cast steel

was invented by Benjamin Huntsman, of Attercliff, near Sheffield, in 1770. See STEEL — OPEN HEARTH MANUFACTURE; STEEL — THE BESSEMER PROCESS; STEEL — ELECTRICAL PROCESSES OF MANUFACTURE; STEEL — MANUFACTURE OF CRUCIBLE; STEEL — SPECIAL OR ALLOY STEELS.

**CASTAGNO,** kās-tān'yō, **Andrea del,** Italian painter: b. Castagno, Tuscany, about the end of the 14th or beginning of the 15th century; d. Florence, 9 Aug. 1457. Being early deprived of his parents, who were extremely poor, he was employed by his uncle to tend cattle in the fields, and in that situation, by his surprising and untutored essays in the art, attracted the notice of Bernardetto de Medici, who placed him under the tuition of one of the best masters Florence then afforded. He was greatly influenced by the works of Donatello. At first he painted only in distemper and fresco. His drawing is bold but his color is crude. On the return of Cosimo de Medici he was commissioned to paint portraits of his opponents. These he portrayed hanging by their feet on the walls of the Palazzo de' Medici, which won him the nickname of "Andreino degli Impiccati." He is the author of a series of 'Héros' and 'Sibylles' at Legnaia; where are also life-size figures of Dante, Petrarch, Boccaccio, Niccolo Ceccianote, founder of the Chartreuse at Florence; Farinata degli Uberti, liberator of his country; Pippo Spano, the conquerer of the Turks, and the fine equestrian statue of Niccolo da Tolentino. In the monastery Degli Angeli are several religious works, including a crucifixion. Another is at the Santa Maria Novello. Vasarie's story concerning the murder of Domenico Veneziano in order to procure his art of coloring in oils has been discredited, since it has been proved that Domenico survived him by several years and finished his paintings at the Santa Maria before Andrea was called there. Consult the monograph by Waldschmidt (Berlin 1900); Crowe and Cavalcaselle, 'History of Painting in Italy' (Vol. II); Muntz, E., 'Histoire de l'art pendant la Renaissance' (Vol. I, 1889).

**CASTAIGNE, André,** ān-drā kās-tān, French artist: b. Angoulême 1861. He studied at the Suisse Academy and at the École des Beaux Arts in Paris; he exhibited at the Paris Salon in 1884 and several times in later years. Among his pictures are 'Dante and Beatrice'; 'The Deluge'; 'Portrait of Vicomte de Dampierre'; and 'After the Combat' (in the Peabody Gallery at Baltimore). In 1890 he came to the United States and remained here until 1895. He was director of an art school in Baltimore and in 1891 began the illustrating work by which he is best known to the American public. His first work of this character was 'The Forty Niners' Ball' in the *Century Magazine* for May 1891; since then he has illustrated for several of the leading magazines; his designs include the pictures of the Texas cowboys in *Scribner's Magazine* and the World's Fair drawings and illustrations for 'Polly' in the *Century*. He illustrated B. I. Wheeler's 'Life of Alexander the Great' (1900). On his return to France he became instructor in the Colarossi Academy and opened a studio in Paris. He published 'Fata

Morgana,' a novel dealing with the art life of Paris and illustrated by himself (1904). His work is characterized by spirited movement and dramatic feeling. Consult *The Critic* (Vol. XXIII, 57); *The Bookbuyer* (XII, 506).

**CASTALIA**, a celebrated fountain in Greece, the sacred spring of the Delphic oracle, at which all the pilgrims to Apollo's shrine were obliged to purify themselves. It issues from a fissure between two peaked cliffs, which form the summit of a semi-circular range of rocks, anciently called the Phædrades. These immediately adjoin Mount Parnassus, and rise to the height of 2,000 feet. The Castalian spring was said to impart poetic inspiration to those who drank of it, but it was only latterly by the Roman poets that it was invested with this attribute. It is now called the Fountain of Saint John, from a small chapel dedicated to Saint John which stands near its source.

**CASTALIDES**, kās-tāl'ī-dēz, the Muses, so called from the fountain Castalia (q.v.), at the foot of Parnassus (q.v.).

**CASTALIO**, kās-tāl-yō, Sébastien, **CAS-TELLIO** or **CASTELLION**, French theologian: b. Dauphiny 1515; d. Basel, 20 Dec. 1563. His original name was Châteillon. Through the influence of Calvin he was made professor of classical literature at Geneva. Having quarreled with the reformer, who caused his banishment in 1544, he repaired to Basel, where he taught the Greek language; but as his stipend did not suffice to support his numerous family, he was compelled to employ part of his time in agricultural labors. His writings include 'De Hæreticis,' a treatise opposing the punishment of heresy by civil authority, a Latin translation of the Bible, the best edition of which is in folio, Basel 1573, and a French translation of the Bible, dedicated to Henry II of France. Consult Buisson, 'Life of Castalio' Paris 1892). He defended the right of free discussion in a collection of maxims compiled from various sources.

**CASTANEA**, a trade name for the Brazil-nut and a genuine name for the chestnut (qq.v.).

**CASTANETS**, small wooden rattles, made in the shape of two bowls or cups, fitted together and tied by a string, and then fastened

to the thumbs. The fingers being rapidly struck upon them, a tremulous sound is produced, which marks exactly the measure of the dance. Something similar to this was the *krotalon* of the ancients, who also made use of small cymbals in their dances and festivals in honor of Bacchus. It is probable, however, that they had their origin in the East, and were brought by the Moors into Spain. Here, too, they received their name *castañuelas*, from being commonly made of the wood of the chestnut (*castaño*), or from their color. They are still in use in Spain, and here and there in the south of France. The charm of variety has also procured for them a place in ballets and operas.

**CASTANHEDA**, kās-tān-yā'dā, **Fernao Lopez de**, Portuguese historian: b. Santarem about 1500; d. Coimbra, 23 March 1559. His father having been appointed to an important post in India, he was taken thither in youth, and was thus led to make the careful and unremitting researches embodied in the 'Historia do descobrimento e conquista da India pelos Portuguezes' (1551-61), a work upon which Camoens drew largely in the course of his epic activity. It has been translated into French, Spanish, Italian and English.

**CASTAÑOS**, kās-tā'ñōs, **Don Francisco Xavier de**, Duke of Bailén, Spanish military officer: b. Madrid, 22 April 1756; d. Madrid, 24 Sept. 1852. Educated in military science in Germany, at the age of 16 he became captain of Grenadiers, of the Savoy Regiment, and distinguished himself in the reconquest of Minorca. On the invasion of the country by Napoleon, he received the command of a division of the Spanish army, and in July 1808 compelled 18,000 French, under General Dupont de l'Etang, to surrender at Bailén, but was in turn defeated by Lannes in November of the same year at Tudela. Under Wellington he served as general of the 4th Spanish *corps d'armée*, and took part in the battles of Albuera, Salamanca and Vittoria. In 1815 he was placed at the head of the Spanish army for the invasion of France, which was rendered unnecessary by the victory at Waterloo. In 1825 he was called to the State Council, where he became a decided opponent of the Carlist party. He was made Duke of Bailén in 1833 and in 1843 became guardian of the Queen Isabella.
